Infoprint Server Operation and Administration
Note:
Before using this information and the product it supports, read the information in "Notices" on page 509.

This edition applies to these IBM products:
• Version 1, Release 13 of z/OS (program number 5694-A01)
• Version 2, Release 1 of Infoprint Coaxial Printer Support for z/OS (program number 5655-N62)
This edition applies to all subsequent releases and modifications until otherwise indicated in new editions.
This edition replaces S544-5745-11.

About this publication

This publication helps you operate and administer Infoprint® Server. It describes how to:

- Start and stop Infoprint Server
- Use Infoprint Central
- Manage the IP PrintWay™ basic mode transmission queue
- Use SDSF and JES commands to work with output data sets on the JES spool
- View Infoprint Server messages
- Create entries in the Printer Inventory using ISPF panels or Printer Inventory Definition Utility (PIDU) program
- Define NetSpool printer logical units (LUs) to VTAM®
- Use information in SMF type 6 accounting records

It also contains reference information, including:

- Attributes that you can specify with PIDU
- Options that IP PrintWay transmits to InfoPrint® Manager for AIX® or Windows®
- Sample ISPF panels
- Sample printer definitions.

In this publication:

- VTAM refers to the Communications Server SNA Services element of z/OS.
- TCP/IP refers to the Communications Server IP Services element of z/OS.
- PSF refers to PSF for z/OS® and to the AFP™ Download Plus feature of PSF.

Who should read this publication

This publication is for these audiences:

- System operators who need to start and stop Infoprint Server daemons, NetSpool, IP PrintWay basic mode.
- Help desk operators who need to work with Infoprint Central or with the IP PrintWay basic mode transmission queue
- Administrators who need to create entries in the Infoprint Server Printer Inventory and define NetSpool printer logical units to VTAM

You should be familiar with z/OS UNIX® System Services, TCP/IP, VTAM, the job entry subsystem (JES), and Print Services Facility® (PSF) for z/OS if you use it.

How to read syntax diagrams

This section explains the general notations that this publication uses in syntax diagrams. For ease of reading, this publication breaks some examples into several lines. However, when you enter a command, enter it all on one line. Do not press Enter until you have typed the entire command.

| | • lprafp command |
Preventive Service Planning information

Before installing Infoprint Server, you should review the current Preventive Service Planning (PSP) information, also called the PSP bucket. You should also periodically review the current PSP information. The PSP upgrade ID depends on your z/OS operating system, for example: ZOSV1R13. The subset for Infoprint Server is: INFOPRINT.

To obtain the current PSP bucket, contact the IBM Support Center or use z/OS SoftwareXcel (IBMLink). If you obtained z/OS as part of a CBPDO, HOLDDATA and PSP information is included on the CBPDO tape. However, this information might not be current if the CBPDO tape was shipped several weeks prior to installation.

Infoprint Server migration information

This section lists publications that can help you migrate from previous releases of z/OS and from IP PrintWay basic mode to IP PrintWay extended mode.

<table>
<thead>
<tr>
<th>Publication</th>

**Infoprint Server online help**

The Infoprint Server ISPF panels contain integrated online help for each panel and field. To view the help, place your cursor on a panel or in a field on a panel and press the Help function key (F1).

Infoprint Central contains an integrated online help system. To view the help system, select the question mark (?) in the left navigation bar. To view the help for a particular Web page, select the question marks (?) or the Help buttons on the Web page.

**The z/OS Basic Skills Information Center**

The z/OS Basic Skills Information Center is a Web-based information resource intended to help users learn the basic concepts of z/OS, the operating system that runs most of the IBM mainframe computers in use today. The Information Center is designed to introduce a new generation of Information Technology professionals to basic concepts and help them prepare for a career as a z/OS professional, such as a z/OS system programmer.

Specifically, the z/OS Basic Skills Information Center is intended to achieve the following objectives:

• Provide basic education and information about z/OS without charge
• Shorten the time it takes for people to become productive on the mainframe
• Make it easier for new people to learn z/OS.

To access the z/OS Basic Skills Information Center, open your Web browser to the following Web site, which is available to all users (no login required):
http://publib.boulder.ibm.com/infocenter/zos/basics/index.jsp
How to send your comments to IBM

We appreciate your input on this publication. Feel free to comment on the clarity, accuracy, and completeness of the information or give us any other feedback that you might have.

Use one of the following methods to send us your comments:
1. Send an e-mail to printpub@infoprint.com
3. Mail the comments to the following address:
   IBM Corporation
   6300 Diagonal Hwy 002J
   Boulder, CO 80301-9270
   U.S.A.

Include the following information:
- Your name and address
- Your e-mail address
- Your telephone or fax number
- The publication title and order number:
  z/OS V1R13.0 Infoprint Server Operation and Administration
  S544-5745-12
- The topic and page number related to your comment
- The text of your comment.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you.

IBM or any other organizations will only use the personal information that you supply to contact you about the issues that you submit.

If you have a technical problem

Do not use the feedback methods listed above. Instead, do one of the following:
- Contact your IBM service representative
- Call IBM technical support
Summary of Changes

This document contains terminology, maintenance, and editorial changes to improve consistency and retrievability. Technical changes or additions to the text and illustrations are indicated by a vertical line to the left of the change.

Changes made in z/OS Version 1 Release 13

This document contains information that was previously presented in z/OS Infoprint Server Operation and Administration, S544-5745-11, which supports z/OS Version 1 Release 12.

New Information:

- The Infoprint Server common message log can now contain messages from PSF for z/OS. See Chapter 9, “Viewing messages,” on page 57.
- The output of the aoplogu command includes new values in the “program” field. See “Format of messages in the common message log” on page 59.
- Information about enhancements to the IP PrintWay extended mode e-mail function has been added. See “Selecting the e-mail protocol” on page 160.
- Information about new IBM transform products has been added. See Chapter 15, “Planning printer definitions for transforms,” on page 225.
- Information about these new attributes for PSF FSA definitions has been added:
  - direct-download
  - display-afdpdp-status
  - inline-ptoaca-objects
  - paper-length
  - paper-width
  - report-line-mode-conversion-paper-length-errors
  - transmit-recovery-pages
  - use-line-mode-migration-linect
  See “Attributes for the fsa object class” on page 330.
- Information about these new attributes for IP PrintWay job-election rules has been added:
  - lower-page-limit
  - lower-record-limit
  - upper-page-limit
  - upper-record-limit
  See “Attributes for the job selection rule object class” on page 361.
- Information about these new attributes for printer definitions has been added:
  - embedded-headers
  - inline-text
  - inline-message
  See “Attributes for the protocol object class” on page 418.
- Information about this new attribute for PSF FSS definitions has been added:
  - log-messages
See “Attributes for the psf-fss object class” on page 436.
• The E-mail Protocol panel in a printer definition shows these new fields:
  – Embedded headers
  – Inline text and line data
  – Inline message
See “E-mail Protocol panel” on page 464.
• The Job Selection Rule panel shows these new fields:
  – Record limit: Lower
  – Record limit: Upper
  – Page limit: Lower
  – Page limit: Upper
See “ISPF panel for an IP PrintWay job selection rule” on page 467.
• The PSF FSS definition panel shows this new field:
  – Log messages
See “ISPF panel for a PSF FSS definition” on page 468.
• The PSF FSA definition panel for AFP Download Plus shows these new fields:
  – Direct download
  – Display status
  – Paper length
  – Paper width
  – Presentation text objects (PTOCA)
  – Recovery pages
  – Report Line-Mode Conversion paper-length errors
  – Use Line Mode Migration LINECT
See “ISPF panel for a PSF FSA definition for AFP Download Plus” on page 475.
• The PSF FSA definition panels for channel-attached, SNA, and TCP/IP printers show this new field:
  – Use Line Mode Migration LINECT
See “ISPF panel for a PSF FSA definition for a channel-attached printer” on page 469, “ISPF panel for a PSF FSA definition for an SNA-attached printer” on page 473, and “ISPF panel for a PSF FSA definition for a TCP/IP-attached printer” on page 471.

Changed information:
• Information about starting the z/OS UNIX sendmail daemon has been corrected to say that the daemon does not need to be started unless you want to use sendmail aliases or receive sendmail messages. See Chapter 6, “Starting sendmail,” on page 41.

Changes made in z/OS Version 1 Release 12

This document contains information that was previously presented in z/OS Infoprint Server Operation and Administration, S544-5745-10, which supports z/OS Version 1 Release 8 through Release 11.

New Information:
The actions that you can do in Infoprint Central are shown in “Infoprint Central actions” on page 45.

A new guideline has been added for the Response timeout field (response-timeout attribute) in an IP PrintWay printer definition for the VTAM protocol. See “Setting timeout values” on page 181 and “response-timeout” on page 394.

Information about the job name that IP PrintWay sends to a PJL printer has been added. See “Tracking the number of printed pages (extended mode)” on page 187.

The Printer Inventory Definition Utility (PIDU) display-fully command has been added. See “display-fully—show attributes of a printer definition plus included components” on page 285.

The ISPF field name for each printer attribute has been added. See “Attribute listing” on page 293.

These new printer attributes have been added:
- fail-on-transform-error
- send-messages-on-failure
- send-separator-pages
- transform-trailer-error-page

See “Attributes for the processing object class” on page 398 and “Attributes for the fsa object class” on page 330.

The Fail on error and Trailer error page fields have been added to the ISPF panel for the Processing section and Processing component of a printer definition. See “ISPF panel for the Processing section or component” on page 458.

The Send messages on failure and Send separator pages fields have been added to the ISPF panel for a PSF FSA definition for AFP Download Plus. See “ISPF panel for a PSF FSA definition for AFP Download Plus” on page 475.

Changed information:
- The “Readers’ Comments - We’d Like to Hear from You” section at the back of this publication has been replaced with a new section “How to send your comments to IBM” on page xix. The hardcopy mail-in form has been replaced with a page that provides information appropriate for submitting readers comments to IBM.

Deleted information:
- Information about IBM Infoprint XML Extender for z/OS (5655-J66) has been removed because IBM no longer supports this product.

Changes made in z/OS Version 1 Release 8 through Release 11

This document contains information that was previously presented in z/OS Infoprint Server Operation and Administration, S544-5745-09, which supports z/OS Version 1 Release 8 through Release 11.

It contains information for these Infoprint Server PTFs:
- PTF UA39898: Adds support for color management resources and communications failure messages in the Printer Inventory.
- PTF for APAR OA24243: Adds support for form-feed controls in IP PrintWay extended mode and in the Printer Inventory.
New Information:

- The `highlight-communications-failure-message` attribute has been added. See "highlight-communications-failure-message" on page 339.
- The `inline-color-management-resources` attribute has been added. See "inline-color-management-resources" on page 340.
- The `form-feed` attribute has been added. See "form-feed" on page 390.
- The `Form feed` field has been added to the IP PrintWay Options ISPF panel. See "ISPF panel for the IP PrintWay Options section or component" on page 462.
- The `Highlight communications failure message` field has been added to the PSF FSA, TCP/IP ISPF panel. See "ISPF panel for a PSF FSA definition for a TCP/IP-attached printer" on page 471.
- The `Color management resources` field has been added to the PSF FSA, AFP Download Plus ISPF panel. See "ISPF panel for a PSF FSA definition for AFP Download Plus" on page 475.

Changes made in z/OS Version 1 Release 8 through Release 11

This document contains information that was previously presented in z/OS Infoprint Server Operation and Administration, S544-5745-08, which supports z/OS Version 1 Release 8 through Release 11.

It contains information for these Infoprint Server PTFs:

- PTF UA30006: Adds support for line-termination controls in IP PrintWay extended mode.
- PTF UA31145: Adds support for the AFP to PDF transform that InfoPrint Transform Manager for Linux provides.
- PTF UA37619: Adds support for AFP Download Plus and for the Printer Inventory for PSF. Also provides sample job AOPLOGUS in SYS1.SAMPLIB.

New Information:

- Infoprint Central now lets you work with AFP Download Plus senders. See Chapter 7, "Using Infoprint Central," on page 43.
- Infoprint Server now provides a new AOPLOGUS job in SYS1.SAMPLIB to run the `aoplogu` command as a batch job. See "Viewing messages in the common message log" on page 57.
- IP PrintWay extended mode now lets you specify the line-termination control in a printer definition:
  - A migration action has been added for the `Line termination` field when you migrate to IP PrintWay extended mode. See "IP PrintWay basic mode and extended mode fields" on page 145.
  - Information has been added to the description of the `Line termination` field. See "Converting line data to a text data stream" on page 193.
  - Information has been added to the description of the `line-termination` attribute. See "line-termination" on page 391.
  - The `Line termination` field is now in a different position on the IP PrintWay Options ISPF panel. See "ISPF panel for the IP PrintWay Options section or component" on page 462.
- The `aoprxf.so` filter now supports the AFP to PDF transform that InfoPrint Manager for Linux provides:
  - Information has been added about the new `output-format` transform attribute. See "Filter options for the aoprxf.so filter" on page 229.
- An example has been added for specifying the AFP to PDF transform in a printer definition. See “Example 2. Specifying the aoprxf.so filter for the AFP to PDF transform” on page 233.

- You can now specify a new type of PSF FSA definition for AFP Download Plus:
  - Value afp-download-plus has been added for the fsa-type attribute. See “Attributes for the fsa object class” on page 330.
  - A new ISPF panel has been added for the AFP Download Plus FSA definition. See “ISPF panel for a PSF FSA definition for AFP Download Plus” on page 475.
  - The ISPF panel for AFP Download Plus contains new fields. This table shows the new field names and the corresponding PIDU attribute:

<table>
<thead>
<tr>
<th>Field on ISPF panel</th>
<th>PIDU attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bar code objects (BCOCA™)</td>
<td>inline-bcoca-objects</td>

</tr>
</tbody>
</table>

For information about the fields on the ISPF panel, see the ISPF help for the field. For information about the PIDU attributes, see “Attributes for the fsa object class” on page 330.

**Changed information:**
- Ricoh now owns these former IBM products:
  - lprafp command
  - InfoPrint Manager for AIX
  - InfoPrint Manager for Windows
  - InfoPrint Transform Manager for Linux
  - Network Printer Manager for the Web
Fields on the ISPF panels for PSF FSS definitions and PSF FSA definitions now display additional default values. See Appendix B, “ISPF panels,” on page 455.
Part 1. Operation

Chapter 1. Operation roadmap

Chapter 2. Starting and stopping Infoprint Server daemons

Chapter 3. Starting and stopping the NetSpool task and NetSpool LUs

Chapter 4. Starting and stopping IP PrintWay FSAs (basic mode)

Chapter 5. Using the IP PrintWay transmission queue (basic mode)

Chapter 6. Starting sendmail

Chapter 7. Using Infoprint Central

Chapter 8. Working with output data sets on the JES spool using JES commands and SDSF

Chapter 9. Viewing messages
Chapter 1. Operation roadmap

This section can help you determine which operational tasks you need to do to use the Infoprint Server components customized by your installation. Table 4 lists the components of Infoprint Server, the operational tasks, and the topics that describe the required tasks.

Note: All components of Infoprint Server require that you start the Printer Inventory Manager.

Table 4. Summary of Infoprint Server components and operational tasks

Chapter 2. Starting and stopping Infoprint Server daemons

You can start and stop these Infoprint Server daemons:

- **aopd**, a Printer Inventory Manager daemon
  This daemon manages the Printer Inventory.

- **aophinvd**, a Printer Inventory Manager daemon
  This daemon maintains the Historical Inventory, which contains information about Infoprint Server output data sets that are not on the JES spool.

- **aopippdxp**, the IPP Server daemon
  This daemon supports printing from remote clients that use the Internet Printing Protocol (IPP).
  The JES job name of the **aopippdxp** daemon is AOPIPPD.

- **aoplogd**, a Printer Inventory Manager daemon
  This daemon manages the common message log.

- **aoplpd**, the line printer daemon (LPD)
  This daemon supports printing from remote clients that use the TCP/IP line printer requester (LPR) protocol.

- **aopnetd**, the NetSpool daemon
  This daemon, together with the NetSpool task, supports printing from VTAM applications such as CICS® and IMS.

- **aopoutd** and **aopwsmnd**, the IP PrintWay extended mode daemons
  These daemons select output data sets from the JES spool and send them to remote printers in a TCP/IP network.

- **aopsapd**, the SAP Callback daemon
  This daemon handles callback notification for the SAP Output Management System (OMS). It starts automatically when a print request is received from SAP R/3.

- **aopssbd**, a Printer Inventory Manager daemon
  This daemon maintains a search database, which Infoprint Central uses.

- **aopsnmnd**, the SNMP subagent daemon
  This daemon provides printer status information for PSF-controlled printers to the z/OS SNMP agent for viewing with an SNMP manager.

- **aopssid**, an Infoprint Central daemon
  This daemon communicates with JES to display information and do actions on output groups (print jobs) and PSF printers.

- **aopsubd**, the Print Interface subsystem daemon
  This daemon processes output data sets that specify the Print Interface subsystem on the SUBSYS parameter of the DD statement.

- **aopxfd**, the Infoprint Server Transform Manager daemon
  This daemon manages other transform daemons, which transform data from one format to another. The Infoprint Server Transform Manager daemon starts and stops transform daemons that are configured in the **aopxfd.conf** configuration file.

These topics describe how to do these tasks:

<table>
<thead>
<tr>
<th>Task</th>
<th>See page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starting Infoprint Server with the aopstart command</td>
<td>6</td>
</tr>
</tbody>
</table>
Tip: You can use MVS™ automation tools or the /etc/rc shell script to start Infoprint Server daemons automatically during system initialization. For more information, see z/OS Infoprint Server Customization.

Starting Infoprint Server with the aopstart command

Format
aopstart

Description
The aopstart command starts Infoprint Server daemons. If a daemon is already started, aopstart does not start that daemon again.

The aopstart command always starts daemons aopd, aopsdbd, aophinvd, and aoplogd. The aopstart command also starts the optional daemons specified in the start-daemons attribute in the Infoprint Server configuration file.

Result: After you enter the aopstart command, you see one or more messages. Some messages might be written only in the console log. The messages can include:
AOP075I Daemon daemon was started successfully.
AOP076E Start of daemon daemon failed.
AOP077I Daemon daemon is already started.
AOP137E Required Infoprint Server daemon daemon is not running.
Stop all daemons and restart.

Usage notes
1. The aopstart command does not restart a daemon that is running. To restart a daemon, first use the aopstop command to stop the daemon, and then enter the aopstart command.
2. Before you use the aopstart command, your installation might need to customize the aopstart EXEC. For information, see z/OS Infoprint Server Customization.
3. To use the aopstart command, you must either (1) be a member of the RACF® APOPER group or (2) have a UID of 0. You can use the z/OS UNIX su command to switch to an effective UID of 0 if you have access to the BPX.SUPERUSER profile in the RACF FACILITY class.
4. Start the z/OS SNMP agent (osnmpd) before you start the Infoprint Server SNMP subagent daemon (aopsnmpd). For information about how to start osnmpd, see z/OS Communications Server: IP Configuration Reference.
5. Make sure that TCP/IP has finished initialization before you start the LPD (aolpdp), the IPP Server daemon (aopippdxx), the IP PrintWay extended mode daemons (aopoutd and aopwsmd), or the z/OS SNMP agent. You do not have to start TCP/IP to start other daemons.
6. Start the Printer Inventory Manager daemons before you start IP PrintWay basic mode or a NetSpool task. Also, start the Printer Inventory Manager daemons before you start PSF if PSF uses the Printer Inventory.

7. Before you start Infoprint Server daemons, you might need to increase the maximum size of memory that is available. This table shows the minimum storage required by Infoprint Server daemons:

<table>
<thead>
<tr>
<th>Daemon</th>
<th>Minimum MB</th>
</tr>
</thead>
<tbody>
<tr>
<td>PostScript to AFP and PDF to AFP transform</td>
<td>42 MB (256 MB is recommended)</td>
</tr>
<tr>
<td>IPP Server</td>
<td>200 MB</td>
</tr>
</tbody>
</table>

To make sure that sufficient memory is available, either set the MAXASSIZE parameter in the BPXPRMxx member of SYS1.PARMLIB or enter the SETOMVS command from the console. For example, to set the maximum size to 256 MB, enter:

```
SETOMVS MAXASSIZE=268435456
```

For more information about setting the MAXASSIZE parameter in the BPXPRMxx member, see [z/OS Infoprint Server Customization](#).

The security administrator might have specified a maximum region size for your user ID in the RACF ASSIZEMAX parameter. The ASSIZEMAX parameter overrides the MAXASSIZE parameter.

If you start Infoprint Server daemons from the OMVS shell under TSO, the SIZE parameter on your TSO/E logon determines the amount of memory available. If you use data stream transforms, set SIZE=42000 or larger. IBM recommends that you set SIZE=256000 (or larger) so that you can transform large or complex data streams. If you start the IPP Server daemon, set SIZE=200000 (or larger).

8. From ISPF, you can use the TSO `oshell` or `omvs` command to run the `aopstart` command. On the ISPF Command Shell panel (ISPF option 6), type one of these commands:

   * `oshell aopstart`
   * `omvs aopstart`

   Then, on the OMVS command line, type `aopstart`

9. You can use the TSO `ishell` command to enter the `aopstart` command. You must, however, type the full path name of the `aopstart` command because the z/OS ISPF shell does not use environment variables set in the `/etc/profile` profile. For example, if the `aopstart` command is in the default directory, run this command:

   ```sh
   /usr/lpp/Printsrv/bin/aopstart
   ```

10. To request that Infoprint Server validate internal databases, set the AOPVALIDATEDB environment variable to any value (for example, AOPVALIDATEDB=1) either in the `aopstart` EXEC or in the environment. IBM recommends that you validate internal databases if Infoprint Server ended abnormally or if you specified the `force` option when you stopped Infoprint Server daemons. The AOPVALIDATEDB environment variable applies only when the Printer Inventory Manager daemons start. When you specify the AOPVALIDATEDB environment variable, Infoprint Server takes a few extra minutes to start.

11. The `aopstart` command can end with abend EC6 (reason code FFFF) or abend 33E. These abends do not indicate an error. Your installation can suppress these abends in the IEASLP00 member of SYS1.PARMLIB.
Environment variables

Infoprint Server daemons use these variables set in the environment or in the aopstart EXEC:

**AOPTRACEBYTES**  
The maximum size of a trace file.

**AOPTRACEMAXFILES**  
The number of trace files to produce.

**AOPTRACEON**  
Turns tracing on.

**AOPTRACEON_DATA, AOPTRACEON_FILTER, AOPTRACEON_MSGLOG**  
The type of data to trace.

**AOPVALIDATEDB**  
Causes Infoprint Server to check internal databases for validity before starting.

**LANG**  
The language used for messages.

**LC_ALL**  
The locale used to format date and time information in common log messages.

**LC_CTYPE**  
The locale used to determine the code page for validating attributes.

**LC_TIME**  
The locale used to format date and time information in common log messages.

**TZ**  
The time zone displayed in common log messages.

Infoprint Server daemons use these variables set in the aopstart EXEC:

**_BPX_SHAREAS**  
Causes the spawn() callable service to create some Infoprint Server subtasks in the parent’s address space.

**_BPX_UNLIMITED_OUTPUT**  
Lets Infoprint Server daemons write an unlimited amount of data to the JES spool without ending abnormally.

**_BPXK_SETIBMOPT_TRANSPORT**  
The TCP/IP job name associated with the TCP/IP stack you want to use.

**AOP_APPLID**  
The VTAM application program ID that IP PrintWay extended mode uses to communicate with VTAM-controlled printers.

**AOP_ALLOW_ALL_CHARACTERS_IN_LINE_DATA**  
Controls how line data is detected.

**AOP_BLANK_TRUNCATION_CLASSES**  
List of output classes for which IP PrintWay extended mode should truncate blank characters at the end of lines.

**AOP_IGNORE_DCF_ROUTING_ERRORS**  
Controls IP PrintWay extended mode routing.

**AOP_MAIL_DO_NOT_ADD_SUFFIX**  
Controls suffixes that are appended to e-mail documents.

**AOP_MAIL_PRESERVE_SUFFIXES**  
Preserves suffixes of e-mail documents.
AOP_MAIL_USE_FIRST_ADDRESS
Determines the e-mail addresses that IP PrintWay extended mode uses when print jobs contain more than one document.

AOP_MAXTHREADTASKS
The MAXTHREADTASKS limit for these Infoprint Server daemons: aophinvd, aopippdxp, aoplpd, aopnetd, aopoutd, outsdbd, aopssid, aopsubd, and aopwsmd.

AOP_SAP2AFP_RESOURCES
Directory that contains all of the SAP to AFP transform resources.

AOP_SELECT_WORK_FROM_HOLD_QUEUE
Controls whether IP PrintWay extended mode selects new held output groups from the JES spool.

AOP_SUPPRESS_POST_UNIX_FILTER_FORMATTING
Suppresses IP PrintWay extended mode formatting for data that a UNIX filter formats.

AOPCONF
Names the Infoprint Server configuration file. The file named in this variable takes precedence over configuration file /etc/Printsrv/aopd.conf.

AOPHINVD_MAXTHREADTASKS
The MAXTHREADTASKS limit for daemon aophinvd.

AOPIPPD_MAXTHREADTASKS
The MAXTHREADTASKS limit for daemon aopippdxp.

AOPLPD_MAXTHREADTASKS
The MAXTHREADTASKS limit for daemon aoplpd.

AOPMAILER
The full path name of the z/OS UNIX sendmail command.

AOPMAILER_OPTIONS
Options for the z/OS UNIX sendmail command.

AOPMSG_CONF
Names the Infoprint Server message configuration file. The file named in this variable takes precedence over configuration file /etc/Printsrv/aopmsg.conf.

AOPNETD_MAXTHREADTASKS
The MAXTHREADTASKS limit for daemon aopnetd.

AOPNETWORKED_USER_FIXED_JOBID
Determines the job ID for output data sets that NetSpool creates.

AOPNETWORKED_USER_UNALTERED_JOBID
Determines the job ID of output data sets that NetSpool creates.

AOPOUTD_MAXTHREADTASKS
The MAXTHREADTASKS limit for daemon aopoutd.

AOPRESUBMITUSER
Lets the job submitter’s z/OS user ID be used for RACF authorization checks during the resubmit for filtering function.

AOPRXF_CONF
Names the remote transform configuration file. The file named in this variable takes precedence over configuration file /etc/Printsrv/aoprxf.conf.
AOPSAPD_CONF
Names the SAP Callback daemon configuration file. The file named in this variable takes precedence over configuration file /etc/Printsrv/aopsapd.conf.

AOPSDBD_MAXTHREADTASKS
The MAXTHREADTASKS limit for daemon aopsd.

AOPSSID_MAXTHREADTASKS
The MAXTHREADTASKS limit for daemon aopssid.

AOPSUBD_MAXTHREADTASKS
The MAXTHREADTASKS limit for daemon aopsubd.

AOPTRACEDIR
Names the directory where trace files are to be written. The directory named in this variable takes precedence over directory /var/Printsrv/trace.

AOPWSMD_MAXTHREADTASKS
The MAXTHREADTASKS limit for daemon aopwsmd.

AOPXFD_CONF
Names the transform configuration file. The file named in this variable takes precedence over configuration file /etc/Printsrv/aopxfd.conf.

CLASSPATH
Lists the directories where files that the Infoprint Server IPP Server uses are located.

JAVA_HOME
Lists the directory where Java™ files that the Infoprint Server IPP Server uses are located.

LIBPATH
The path used to locate dynamic link libraries (DLL), including DLLs for Infoprint Server and SAP remote function calls.

NLSPATH
Lists the directory where the Infoprint Server message catalogs are located.

PATH
Lists the directory where Infoprint Server daemons are located.

STEPLIB
Names libraries that are not in the system LNKLST, including the IP PrintWay extended mode exit library, the FCB image library (SYS1.IMAGELIB), and language environment and C++ run-time libraries.

Files

/etc/Printsrv/aopd.conf
The default Infoprint Server configuration file. This file is required. The file named in the AOPCONF environment variable takes precedence over this file.

/etc/Printsrv/aopmsg.conf
The default message configuration file. The file named in the AOPMSG_CONF environment variable takes precedence over this file.

/etc/Printsrv/aopxf.conf
The default remote configuration file. This file is required if you use InfoPrint Transform Manager for Linux. The file named in the AOPRXF_CONF environment variable takes precedence over this file.

/etc/Printsrv/aopsapd.conf
The default SAP Callback daemon configuration file. This file is required if
the SAP Callback daemon receives a print request from SAP R/3. The file named in the AOPSAPD_CONF environment variable takes precedence over this file.

/etc/Printsrv/aopxfd.conf
The default Transform Manager configuration file. This file is required if you start the Transform Manager daemon. The file named in the AOPXFD_CONF environment variable takes precedence over this file.

Exit values

0 Successful completion.

>0 An error prevented one or more daemons from being started.

Related information
For more information about the AOPOPER group, environment variables, configuration files, and the aopstart EXEC, see z/OS Infoprint Server Customization.

Stopping Infoprint Server with the aopstop command

Format
aopstop [-d daemon]... [now] [force]

Description
The aopstop command stops all Infoprint Server daemons or only the specified daemons. Unless you specify the now or the force option, the daemons stop after current activity completes.

Result: After you enter the aopstop command, you see one or more messages. Some messages might be written only in the console log. The messages can include:
AOP044I Shutdown complete. (program:daemon)
AOP078W Daemon daemon is not running.
AOP079I A shutdown of daemon daemon has been initiated.
AOP134E The stop of daemon daemon failed.
AOP135I An abrupt shutdown of daemon daemon has been initiated.
AOP136I A destructive shutdown of daemon daemon has been initiated.

Options

-d daemon
Specifies the daemon to stop. If you omit this option, all active daemons are stopped, including the Printer Inventory Manager daemons (aopd, aophinvd, aoplogd, and aopsdbd). You can specify one of these values:

ippd Stops the Internet Printing Protocol daemon, aopippdxp.
lpd Stops the line printer daemon, aoplpd.
netd Stops the NetSpool daemon, aopnetd.
outd Stops the IP PrintWay extended mode daemons, aopoutd and aopwsmd. When you start IP PrintWay again, any IP PrintWay printers that were
stopped return to the started state, and any
printers that were redirected to other printers are
no longer redirected.

**snmp**

Stops the SNMP subagent daemon, **aopsnmpd**.

**ssid**

Stops the Infoprint Central daemon, **aopssid**.

**subd**

Stops the Print Interface subsystem daemon,
**aospitald**.

**xfd**

Stops the Transform Manager daemon, **aopxfd**.

**now**

Stops the daemons immediately. If work is in progress, incorrect
output or data loss might result. If this option is not specified, the
daemons stop after current activity completes.

**force**

Stops the daemons immediately using a “destructive” shutdown. If
work is in progress, incorrect output or data loss might result. For
daemons that manage a database, such as **aopd**, **aophinvd**, or
**aopssdbd**, the database might be corrupted. If this option is not
specified, the daemons stop after current activity completes.

**Notes:**

1. Use this command with extreme caution.
2. Before you use this command, use the **export** command to
   backup the Printer Inventory (if Infoprint Server is running).
3. After you stop daemons using this option, specify the
   AOPVALIDATEDB environment variable to validate internal
databases when you start Infoprint Server daemons again. You
   can specify AOPVALIDATEDB=1 either in the **aopstart** EXEC or
   in the environment. If databases are corrupted, you might need
to restore the Printer Inventory and the search databases.

**Usage notes**

1. To use the **aopstop** command, you must either (1) be a member of the RACF
   AOPOPER group or (2) have a UID of 0. You can use the z/OS UNIX **su**
   command to switch to an effective UID of 0 if you have access to the
   BPX.SUPERUSER profile in the RACF FACILITY class.
2. To stop all Infoprint Server daemons, enter the **aopstop** command without
   specifying any daemon names.
3. Before you stop all daemons, stop other programs that are using the Printer
   Inventory, such as NetSpool, IP PrintWay basic mode, and PSF.
4. Before you stop Infoprint Server, back up the Printer Inventory if you have
   made changes to it since the last backup. For information about how to back
   up the Printer Inventory, see [z/OS Infoprint Server Customization](#).
5. The aopstop command can end with abend EC6 (reason code FFFF) or abend
   33E. These abends do not indicate an error. You can suppress these abends in
   the IEASLP00 member of SYS1.PARMLIB.

**Examples**

To stop all active daemons (including the Printer Inventory Manager daemons)
after current activity ends, use this command. The Print Interface component of
Infoprint Server stops accepting new print requests and completes all work in
progress before shutting down.

`aopstop`
To stop the Transform Manager and line printer daemons, use this command:

```
aopstop -d xfd -d lpd
```

To stop all daemons immediately, use one of these commands. Documents that are being processed might be lost.

```
aopstop now
aopstop force
```

**Environment variables**

**AOPCONF**
Names the Infoprint Server configuration file. The file named in this variable takes precedence over configuration file `/etc/Printsrv/aopd.conf`.

**LANG**
The language used for messages.

**LIBPATH**
The path used to locate dynamic link libraries (DLL).

**NLSPATH**
The directory where the Infoprint Server message catalogs are located.

**File**

```
/etc/Printsrv/aopd.conf
```
The default Infoprint Server configuration file. This file is required. The file named in the AOPCONF environment variable takes precedence over this file.

**Exit values**

- 0  Stopping of the daemons was successfully initiated.
- >0 An error occurred that prevented stopping the daemons.

**Related information**

For more information about the AOPOPER group, environment variables, and configuration files, see [z/OS Infoprint Server Customization](#).

### Starting Infoprint Server with the AOPSTART JCL procedure

The AOPSTART procedure starts Infoprint Server daemons. If a daemon is already started, AOPSTART does not start that daemon again.

The AOPSTART procedure always starts daemons `aopd`, `aopstdb`, `aophinvd`, and `aoplogd`. The AOPSTART procedure also starts the optional daemons specified in the `start-daemons` attribute in the Infoprint Server configuration file.

To start Infoprint Server daemons with the AOPSTART JCL procedure, enter this MVS START command:

```
START AOPSTART
```

After you run the AOPSTART procedure, you see one or more messages in the STDOUT or STDERR data set, or in the console log. The messages can include:
AOP075I Daemon daemon was started successfully.
AOP076E Start of daemon daemon failed.
AOP077I Daemon daemon is already started.
AOP137E Required Infoprint Server daemon daemon is not running.
    Stop all daemons and restart.

Guidelines:
1. Before you run the AOPSTART procedure, your installation might need to
customize the aopstart EXEC and the AOPSTART procedure. For information,
see z/OS Infoprint Server Customization.
2. Start the z/OS SNMP agent (osnmpd) before you start the Infoprint Server
SNMP subagent daemon (aopsnmpd). For information about how to start
osnmpd, see z/OS Communications Server: IP Configuration Reference.
3. Make sure that TCP/IP has finished initialization before you start the LPD
(aoplpd), the IPP server daemon (aopippdxp), the IP PrintWay extended mode
daemons (aopoutd and aopwsmd), or the z/OS SNMP agent. You do not have
to start TCP/IP to start other daemons.
4. Start the Printer Inventory Manager daemons before you start IP PrintWay basic
mode or the NetSpool task. Also, start the Printer Inventory Manager daemons
before you start PSF if PSF uses the Printer Inventory.
5. To request that Infoprint Server validate internal databases, set the
AOPVALIDATEDB environment variable to any value (for example,
AOPVALIDATEDB=1) either in the aopstart EXEC or the AOPSTART STDENV
data set. IBM recommends that you validate internal databases if Infoprint
Server ended abnormally or if you specified the force option when you
stopped Infoprint Server daemons. The AOPVALIDATEDB environment
variable applies only when the Printer Inventory Manager daemons start. When
you specify the AOPVALIDATEDB environment variable, Infoprint Server takes
a few extra minutes to start.
6. The AOPSTART procedure can end with abend EC6 (reason code FFFF) or
abend 33E. These abends do not indicate an error. Your installation can
suppress these abends in the IEASLP00 member of SYS1.PARMLIB.

Stopping Infoprint Server with the AOPSTOP JCL procedure

The AOPSTOP procedure stops all Infoprint Server daemons or only the specified
daemons.

After you run the AOPSTOP procedure, you see one or more messages in the
STDOUT or STDERR data set, or in the console log. The messages can include:
AOP044I Shutdown complete. (program:daemon)
AOP078W Daemon daemon is not running.
AOP079I A shutdown of daemon daemon has been initiated.
AOP135I An abrupt shutdown of daemon daemon has been initiated.
AOP136I A destructive shutdown of daemon daemon has been initiated.

To stop Infoprint Server daemons with the AOPSTOP JCL procedure, enter this
MVS START command:
START AOPSTOP,[OPTIONS='-d daemon... [now] [force]' ]

-d daemon Specifies the daemon to stop. If you omit this option, all active
daemons are stopped, including the Printer Inventory Manager
daemons (aopd, aophinvd, aoplogd, and aopsdbd). You can
specify one of these values:
ippd  Stops the Internet Printing Protocol daemon, aopippd.

lpd  Stops the line printer daemon, aoplpd.

netd  Stops the NetSpool daemon, aopnetd.

outd  Stops the IP PrintWay extended mode daemons, aopoutd and aopwsmd. When you start IP PrintWay again, any IP PrintWay printers that were stopped return to the started state, and any printers that were redirected to other printers are no longer redirected.

snmpd  Stops the SNMP subagent daemon, aopsnmpd.

ssid  Stops the Infoprint Central daemon, aopssid.

subd  Stops the Print Interface subsystem daemon, aopsubd.

xfd  Stops the Infoprint Server Transform Manager daemon, aopxfd.

now  Stops the daemons immediately. If work is in progress, incorrect output or data loss might result. If this option is not specified, the daemons stop after current activity completes.

force  Stops the daemons immediately using a “destructive” shutdown. If work is in progress, incorrect output or data loss might result. For daemons that manage a database, such as aopd, aophinvd, or aopsdbd, the database might be corrupted. If this option is not specified, the daemons stop after current activity completes.

Notes:
1. Use this command with extreme caution.
2. Before you use this command, use the export command to backup the Printer Inventory (if Infoprint Server is running).
3. After you stop daemons using this option, specify the AOPVALIDATEDB environment variable to validate internal databases when you start Infoprint Server daemons again. You can specify AOPVALIDATEDB=1 either in the aopstart EXEC or in the AOPSTART STDENV data set. If databases are corrupted, you might need to restore the Printer Inventory and the search databases.

Examples:
1. To stop all daemons after current activity ends, enter this MVS START command. The Print Interface component of Infoprint Server stops accepting new print requests and completes all work in progress before shutting down.
   START AOPSTOP

2. To stop the Infoprint Server Transform Manager and line printer daemons, enter this MVS START command:
   START AOPSTOP, OPTIONS=’-d xfd -d lpd’

3. To stop all daemons immediately, enter this MVS START command. Documents that are being processed might be lost.
   START AOPSTOP, OPTIONS=’now’
4. To stop all daemons immediately using a “destructive” shutdown, enter this MVS START command. Documents that are being processed might be lost. For daemons that manage a database, such as **aopd**, **aophinvd**, or **aopsdbd**, the database might be corrupted. Use this command with extreme caution.

```
START AOPSTOP,OPTIONS='force'
```

**Guidelines:**

1. Before you run the AOPSTOP procedure, your installation might need to customize it. For information, see [*z/OS Infoprint Server Customization*](#).

2. To stop all Infoprint Server daemons, run the AOPSTOP procedure without specifying any daemon names.

3. Before you stop all daemons, stop other programs that are using the Printer Inventory, such as NetSpool, IP PrintWay basic mode, and PSF.

4. Before you stop Infoprint Server, back up the Printer Inventory if you have made changes to it since the last backup. For information about how to back up the Printer Inventory, see [*z/OS Infoprint Server Customization*](#).

5. The AOPSTOP procedure can end with abend EC6 (reason code FFFF) or abend 33E. These abends do not indicate an error. You can suppress these abends in the IEASLP00 member of SYS1.PARMLIB.
Chapter 3. Starting and stopping the NetSpool task and NetSpool LUs

These topics describe how to start and stop the NetSpool task and how to control NetSpool printer logical units (LUs) from the system console:
- Starting the NetSpool task
- Entering NetSpool commands
- Stopping the NetSpool task
- Starting NetSpool printer LUs
- Stopping NetSpool printer LUs
- Displaying the status of NetSpool printer LUs

Tip: You can start, stop, and display the status of NetSpool LUs from Infoprint Central. For more information, see Chapter 7, “Using Infoprint Central,” on page 43. Also, see the Infoprint Central online help system.

Starting the NetSpool task

Each NetSpool started task runs in its own system address space and processes data sets for different classes of NetSpool printer LUs. When a NetSpool task starts, it attempts to start any printer LUs defined in the Printer Inventory and assigned to one of the started LU classes specified in the NetSpool startup procedure. If the administrator defines a new printer LU in the Printer Inventory after you start the NetSpool task, NetSpool automatically starts that printer LU if it is in one of the started LU classes.

Before you begin:
- Make sure that the Printer Inventory Manager and NetSpool have been customized. See Chapter 7, “Using Infoprint Central,” on page 43. Also, see the Infoprint Central online help system.
- Start the Printer Inventory Manager daemon (aopd) and the NetSpool daemon (aopnetd). See Chapter 2, “Starting and stopping Infoprint Server daemons,” on page 5.

These administrative tasks can be done before or after you start the NetSpool task:
- Define NetSpool printer LUs in the Printer Inventory. See Chapter 13, “Planning printer and printer pool definitions for NetSpool,” on page 111.
- Define NetSpool printer LUs to VTAM. See Chapter 17, “Defining NetSpool printer LUs to VTAM,” on page 239.

Steps to start the NetSpool task:
1. Make sure that VTAM is started, and then activate any printer LUs defined in the Printer Inventory in the LU classes NetSpool will process. Use the VTAM VARY ACT command to activate the printer LUs.
   If NetSpool cannot start a printer LU because the printer LU is inactive in VTAM or because it is started by another NetSpool started task, NetSpool starts the printer LU automatically when the printer LU becomes available.

2. Run the NetSpool startup procedure. Use this MVS START command:

   START procedure_name[,JOBNAME=jobname]
For example, if the NetSpool startup procedure is a member named APIJPJCL in the SYS1.PROCLIB library, enter this command:

```
START APIJPJCL
```

(Optional) You can specify a jobname for each NetSpool task that you start. A jobname lets you easily distinguish between different NetSpool started tasks. To specify a jobname of NETSPOOL, enter this command:

```
START APIJPJCL,JOBNAME=NETSPOOL
```

---

**Result:** After you start NetSpool, use either (1) Infoprint Central or (2) the NetSpool DISPLAY SELECTED command (described on page 23), to display the status of the printer LUs that NetSpool started or attempted to start. However, you cannot use Infoprint Central to display LU status if your installation starts more than one NetSpool task.

---

### Entering NetSpool commands

To control NetSpool printer LUs, you can use the MVS MODIFY command to direct NetSpool commands to NetSpool. You can also use the MVS STOP command to stop a NetSpool started task.

The MVS MODIFY and STOP commands use the jobname and identifier fields to direct the command to the appropriate NetSpool task. If only one NetSpool task is started on a system, or if you specified a different jobname for each started task the JOBNAME parameter of the START command, specify only the jobname field in the command. However, if you started multiple NetSpool tasks with the same jobname, use the identifier field to distinguish between them. For more information about how to specify the jobname and identifier for your installation, see [z/OS MVS System Commands](#).

The format of the MODIFY command is:

```
Syntax

{F | MODIFY} jobname[,id],NetSpool_command
```

- **F | MODIFY**
  - The MODIFY command name. You can enter either F or MODIFY.

- **jobname**
  - The job name of the NetSpool startup procedure. This can be the member name (for example, APIJPJCL) or the name you specified on the JOBNAME parameter of the START command.

- **id**
  - A number that identifies the NetSpool startup procedure to which you want the NetSpool command directed. If only one NetSpool startup procedure is running on a system, or you specified different job names in the JOBNAME parameter on the START command, you do not need to specify this field. However, if you started more than one NetSpool task using the same NetSpool startup procedure, and you did not specify the JOBNAME parameter on the START command, you must specify the identifier to distinguish among them.

- **NetSpool_command**
  - The NetSpool command, for example, LUNAME=LUPRT001,ADD. The next sections describe NetSpool commands.
Stopping the NetSpool task

You can enter one of several NetSpool operator commands to stop a NetSpool started task, depending on how quickly you want to stop NetSpool. You can stop NetSpool:
- After all VTAM sessions end normally.
- Immediately, after NetSpool ends all VTAM sessions.
- Immediately, without ending VTAM sessions. Use this method only if other methods fail.

The VTAM HALT command also can cause sessions with NetSpool printer LUs to end or can stop the NetSpool task.

Tip: To stop NetSpool processing, you do not need to stop the NetSpool daemon (aopnetd). When you stop the NetSpool task, NetSpool processing ends. You can restart the NetSpool task without restarting the NetSpool daemon.

Stopping NetSpool after current sessions end normally

Use the QUIT command to stop the NetSpool started task after all current sessions end normally. The QUIT command prevents new sessions from starting. Each current session ends only when the VTAM application that established the session ends it. Thus, a long delay might occur before NetSpool stops and returns to the operating system.

The format of the QUIT command is:

```plaintext
Syntax
F jobname[.id],QUIT
```

Stopping NetSpool immediately

Use the QUIT FORCE command to stop the NetSpool started task after ending all current sessions immediately. Because NetSpool ends all current sessions immediately, some output data sets might be incomplete. NetSpool creates data sets with all data received.

The format of the QUIT FORCE command is:

```plaintext
Syntax
F jobname[.id],QUIT FORCE
```

Stopping NetSpool abnormally

Use the KILL or MVS STOP command to stop the NetSpool started task immediately, without ending any VTAM sessions or creating output data sets. Data already sent to NetSpool is lost.

Attention: Use the KILL and STOP commands only when a hang condition prevents completion of a QUIT FORCE command.

The format of the KILL command is:
Using VTAM HALT commands

When you enter a VTAM HALT command, NetSpool does one of these actions, depending on the type of HALT command you entered:

- **Standard HALT**
  The HALT command causes all VTAM sessions to end normally. New sessions are not allowed to start. No data is lost. NetSpool creates output data sets with all received data. NetSpool places all started printer LUs in the WAITING state, periodically (every 60 seconds) attempting to restart the printers.

- **HALT QUICK**
  The HALT QUICK command causes all VTAM sessions to end immediately. New sessions are not allowed to start. No data is lost. NetSpool creates output data sets with all received data. NetSpool places all started printer LUs in the WAITING state, periodically (every 60 seconds) attempting to restart the printers.

- **HALT CANCEL**
  The HALT CANCEL command causes all VTAM sessions to end immediately. New sessions are not allowed to start. No data is lost. NetSpool creates output data sets with all received data. The NetSpool started task stops, returning to the operating system.

Starting NetSpool printer LUs

When you start NetSpool, the NetSpool printer LUs that are assigned to the LU classes specified on the EXEC statement in the NetSpool startup procedure are started. After NetSpool is started, you can use either (1) Infoprint Central or (2) the VTAM VARY ACT and LUNAME ADD commands to start an LU. You might want to start an LU that is assigned to a NetSpool LU class that has not been started, or to restart an LU that you stopped.

This section describes the VTAM VARY ACT and LUNAME ADD commands. The Infoprint Central action to start a NetSpool LU is equivalent to entering both the VTAM VARY ACT and LUNAME ADD commands. For information about how to use Infoprint Central, see the Infoprint Central online help system.

**Limitation:** You cannot use Infoprint Central to start, stop, or display the status of NetSpool LUs if you start more than one NetSpool task. However, you can use Infoprint Central to do other functions.

**Tips:**
• If you specify a printer LU name in a printer definition after NetSpool is started, NetSpool automatically tries to start the LU if it is assigned to one of the LU classes that NetSpool has already started. This means that you do not need to start the LU with the NetSpool ADD command. However, you must still activate it in VTAM using either Infoprint Central or the VARY ACT command.

• After NetSpool has started, if you want to start all printers in another LU class, you can start another NetSpool task and specify the LU class on the EXEC statement. This eliminates the need to enter the LUNAME ADD command numerous times to start many printer LUs. However, if you start more than one NetSpool task, you cannot use Infoprint Central to work with NetSpool LUs.

Before you begin: The LU to be started must be defined in a printer definition in the Printer Inventory and also must be defined to VTAM with an APPL statement. For more information about APPL statements, see “Creating APPL statements for NetSpool printer LUs” on page 240.

Steps to start an LU with the VTAM VARY and LUNAME ADD commands:

1. If the printer LU is not active in VTAM, activate it using the VTAM VARY ACT command.

2. Add the printer LU to NetSpool, using the LUNAME ADD command shown below.

The format of the LUNAME ADD command is:

```
Syntax

F jobname[,id],LUNAME=lu-name,ADD
```

*lu-name* Specifies the name of the printer LU. The name must match the LU name in a printer definition in the Printer Inventory.

If NetSpool cannot start a printer LU because it is not active in VTAM or because it has been started in another NetSpool started task, NetSpool starts the printer LU automatically at a later time, when the printer LU becomes available. If you display printer LUs using the DISPLAY command or Infoprint Central, the printer LU will be in the WAITING state.

Example: In this example, printer LU LUPRT003 is varied active in VTAM and then is added to NetSpool.

```
VARY NET,ACT,ID=LUPRT003
F jobname$id,LUNAME=LUPRT003,ADD
```

**Stopping NetSpool printer LUs**

While NetSpool is running, you can use (1) Infoprint Central, (2) the LUNAME PURGE command, or (3) the VTAM VARY INACT and LUNAME DEL commands to deactivate the VTAM session with a printer and to stop NetSpool from processing any more print requests for the printer LU.

This section describes the VTAM VARY INACT, LUNAME DEL, and LUNAME PURGE commands. The Infoprint Central action to stop a NetSpool LU is
equivalent to entering the LUNAME PURGE command. For information about how to use Infoprint Central, see the Infoprint Central online help system.

Infoprint Central and the LUNAME PURGE command provide a fast way to stop a printer LU because the VTAM session ends immediately and no more data is sent to the printer LU. The printer LU finishes processing data it has already received so no data is lost. The LUNAME DEL command lets you stop a printer LU after the VTAM session has ended normally.

Limitation: You cannot use Infoprint Central to start, stop, or display the status of NetSpool LUs if you start more than one NetSpool task. However, you can use Infoprint Central to do other functions.

Tip: If you remove a printer LU name from a printer definition after NetSpool is started, NetSpool automatically stops the printer LU after the VTAM application ends the session. Therefore, you do not need to use stop the printer LU in this case.

Steps to stop an LU with the VTAM VARY and LUNAME DEL commands:
1. If the printer is started, deactivate the printer LU in VTAM, using the VTAM VARY INACT command. The type of VARY command you choose depends on how quickly you want the VTAM session to end. In either case, NetSpool creates an output data set with all data received. Therefore, no data is lost.
   • Specify the TYPE=IMMED option to end the VTAM session immediately.
   • Specify no TYPE option to wait until the VTAM application sending the data ends the session normally. A long delay might occur until the session ends.
     When you deactivate the printer LU in VTAM, the printer is placed in the WAITING state, meaning that NetSpool automatically restarts the printer LU when you reactivate the printer LU in VTAM.
     Tip: If a printer LU is already in the WAITING state because NetSpool could not start it, you do not need to first deactivate the printer in VTAM.

2. Delete the printer LU from NetSpool using the LUNAME DEL command shown below. This command frees resources for the printer LU and prevents NetSpool from restarting it when you reactivate the printer LU using VTAM.
   After you enter the LUNAME DEL command, the printer LU will be in a PENDING CLOSE state until NetSpool has created an output data set with data received prior to the LUNAME DEL command.
   Tip: Wait for the printer to become inactive in VTAM before you enter this command.

The format of the LUNAME DEL command is:

```
Syntax

F jname[jid], LUNAME=lu-name, DEL
```

`lu-name` Specifies the name of the printer LU. The name must match the LU name in a printer definition in the Printer Inventory.
Examples:

- In this example, printer LU LUPRT003 is deactivated in VTAM after the VTAM session for printer LU LUPRT003 ends immediately. The LUNAME DEL command, entered after the printer is inactive in VTAM, causes NetSpool to delete LUPRT003 from its list of selected printers LUs.

  ```
  VARY NET,INACT,ID=LUPRT003,TYPE=IMMED
  F jobname.id,LUNAME=LUPRT003,DEL
  ```

- In this example, NetSpool deletes printer LU LUPRT003 from its list of selected printers. Use the LUNAME DEL command without preceding it with a VARY INACT command only when the printer LU has not been successfully started. That is, the printer LU is in the WAITING state.

  ```
  F jobname.id,LUNAME=LUPRT003,DEL
  ```

Stopping an LU with the LUNAME PURGE command:

The LUNAME PURGE command deactivates the printer LU in VTAM immediately and closes the printer LU, deleting it from NetSpool's list of selected printers. NetSpool creates an output data set with any data received from VTAM before you enter the LUNAME PURGE command. However, the VTAM session is ended as soon as the command is entered, and the printer LU does not receive any new data from VTAM.

**Tip:** The LUNAME PURGE command is useful when, because of a significant error with the printer LU, you want processing to stop immediately for that printer LU and you do not want to allow any more data to be sent to it.

The format of the LUNAME PURGE command is:

```
Syntax
F jobname.id,LUNAME=lu-name,PURGE
```

`lu-name` Specifies the name of the printer LU. The name must match the LU name in a printer definition in the Printer Inventory.

Example: In this example, the VTAM session with printer LU LUPRT003 ends immediately. LUPRT003 is in a PENDING CLOSE state while NetSpool creates an output data set for any data it has received. NetSpool deletes LUPRT003 from its list of selected printers.

  ```
  F jobname.id,LUNAME=LUPRT003,PURGE
  ```

Displaying the status of NetSpool printer LUs

Use either (1) Infoprint Central or (2) the DISPLAY command to display the status of printer LUs.

**Limitation:** You cannot use Infoprint Central to start, stop, or display the status of NetSpool LUs if you start more than one NetSpool task. However, you can use Infoprint Central to do other functions.

The DISPLAY command returns these states:

- STARTED
NetSpool selected this printer LU for processing. The printer LU is either in a session with a VTAM application or is ready to accept a request from a VTAM application to establish a session.

- **WAITING**
  NetSpool selected the printer LU for processing, but has been unable to start the printer LU because it is not available. NetSpool periodically (every 60 seconds) attempts to start the printer, automatically starting it when it becomes available. You do not receive a message on the console when NetSpool automatically starts a printer LU at a later time.
  Because NetSpool periodically attempts to start printer LUs in the WAITING state, you might want to either start or stop a printer LU that is in the WAITING state.
  - To start a printer LU that is not active in VTAM, activate the printer LU with the VTAM VARY ACT command. When the printer becomes active, NetSpool automatically starts the printer LU.
  - To stop a printer LU, enter the LUNAME DEL command. Because NetSpool has not successfully started the printer LU, you do not need to first vary the printer inactive in VTAM.
  - To start a printer LU that is started by another NetSpool task, first stop the printer in the other NetSpool started task, using the VTAM VARY INACT command and the LUNAME DEL command. Then, activate the printer LU in VTAM. This NetSpool task automatically starts it.

- **PENDING CLOSE**
  NetSpool selected this printer LU for stopping because you entered the LUNAME DEL or LUNAME PURGE command. NetSpool will stop the printer LU after NetSpool creates an output data set with all data received before the LUNAME DEL or LUNAME PURGE command was entered.
  After the printer LU stops, it no longer is displayed when you enter the DISPLAY command for this NetSpool started task. At that point, you can restart the printer LU by activating the printer LU with the VTAM VARY ACT command and then adding the printer LU to NetSpool using the LUNAME ADD command.

**Tip:** The status displayed is the status for this NetSpool started task only. For example, a printer LU might not display as STARTED, WAITING, or PENDING CLOSE, but it might be started in another NetSpool task.

The format of the DISPLAY command is:

```
Syntax
F jobname.id,DISPLAY {LUNAME=luname | SELECTED | STARTED | WAITING | TRACE}
```

**LUNAME=luname**
Requests that NetSpool display the status for the printer LU. You see a message like one of these:
- `luname` IS NOT SELECTED.
- `luname` IS STARTED SESSION=ACTIVE PRINTERNAME=MYPRTNER LUTYPE=1 PLU=IMS001 EOFRULE=EB.
- `luname` IS WAITING.
- `luname` IS PENDING CLOSE.
SELECTED Requests that NetSpool display the printer LUs that are selected for processing. The status of the printers is STARTED, WAITING, or PENDING CLOSE. The minimum abbreviation allowed is SEL.

STARTED Requests that NetSpool display all printer LUs in the STARTED state. The minimum abbreviation allowed is STA.

WAITING Requests that NetSpool display all printer LUs in the WAITING state. The minimum abbreviation allowed is WAI.

TRACE Requests that NetSpool display all printer LUs that are being traced and whether internal tracing is active. For more information about tracing printer LUs, see z/OS Infoprint Server Messages and Diagnosis. The minimum abbreviation allowed is TRA.

Additional information for STARTED status

When you use the DISPLAY command with LUNAME, SELECTED, or STARTED, you see additional information that can help you diagnose problems with NetSpool LUs, VTAM definitions, and VTAM application programs. The information can include:

- SESSION=\textit{status}
  The indicator of whether the VTAM session with NetSpool is currently established (ACTIVE) or not established (INACTIVE). The session status can help you diagnose problems when you are not sure if a primary logical unit (PLU) has established a session with the NetSpool printer LU.

- PRINTERNAME=\textit{printer-definition-name} or POOLNAME=\textit{printer-pool-definition-name}
  The name of the printer definition or printer pool definition for this LU. The printer definition name can help you diagnose problems when you need to determine which printer definition contains the NetSpool items associated with the LU, such as end-of-file rules and formatting options.

- LUTYPE=\textit{lu-type}
  The type of LU (0, 1, or 3). For active sessions, you see the current LU type. For inactive sessions, you see the LU type of the previous session. If a session has not been established, you do not see this information. The LU type can help you diagnose problems when you see a NetSpool data stream message or when you are trying to change the page format. NetSpool does not control page formatting for 3270 data streams (LU0 and LU3) or when \texttt{netspool-formatting=none}.

- PLU=\textit{plu-name}
  The name of the primary logical unit. For active sessions, you see the current PLU name. For inactive sessions, you see the PLU name of the previous session. If a session has not been established, you do not see this information. The PLU name can help you diagnose problems when more than one VTAM application prints on the LU and a print request is in error.

- EOFRULE=\textit{rule}
  The End of File rule that NetSpool is using (End-of-bracket (EB), End-of-chain (EC), End-of-session (ES), String, or Timer). The EOF rule can help you diagnose problems when jobs do not close on the spool or when print requests are separated into several jobs.

Example: In this example, NetSpool lists the status of all printer LUs selected for processing.

\texttt{F jobname.id,DISPLAY SELECTED}
This is sample output from the DISPLAY command:

API1008I Display of SELECTED LUs.
API1002I LUPRT002 — LU IS STARTED SESSION=ACTIVE PRINTERNAME=MYPRINTER
         LUTYPE=1 PLU=IMS001 EOFRULE=EB.
API1005I LUPRT000 — LU IS PENDING CLOSE.
API1002I LUPRT001 — LU IS STARTED SESSION=INACTIVE PRINTERNAME=YOURPRINTER
         LUTYPE=0 PLU=IMS002 EOFRULE=TIMER.
API1003I LUPRT003 — LU IS WAITING.
Chapter 4. Starting and stopping IP PrintWay FSAs (basic mode)

These topics describe how to start and stop IP PrintWay basic mode functional subsystem applications (FSAs). These topics do not apply to IP PrintWay extended mode.

Related information: For more information about the JES2 and JES3 commands, see one of these:
- z/OS JES2 Commands
- z/OS JES3 Commands

For more information about the MVS commands, see z/OS MVS System Commands.

Starting an IP PrintWay functional subsystem (basic mode)

IP PrintWay basic mode operates as a JES functional subsystem (FSS), an extension of JES that runs in its own system address space. Before you start an IP PrintWay functional subsystem (FSS) and the functional subsystem applications (FSAs) under its control, your installation must:
- Customize the Printer Inventory Manager.
- Define an IP PrintWay FSS and one or more FSAs under control of the FSS to JES.
- Customize IP PrintWay and create a cataloged start procedure for each FSS.
- Create an FSS definition for some or all IP PrintWay FSSs in the Printer Inventory.
- Create an FSA definition for some or all IP PrintWay FSAs in the Printer Inventory.

These tasks are described in z/OS Infoprint Server Customization.

IP PrintWay uses the configuration information specified in the FSS and FSA definitions when the FSS and each FSA starts. FSS and FSA definitions are optional. If an FSS or FSA definition does not exist in the Printer Inventory, IP PrintWay uses default configuration information.

After these tasks are done, you can enter commands at the operator console to start each IP PrintWay FSA. You do not need to enter a command to start the FSS because JES starts the FSS automatically when you start the first FSA under control of that FSS.

Notes:
1. If you change either the IP PrintWay startup JCL procedure or the IP PrintWay FSS definition after IP PrintWay is already started, you must stop and restart the IP PrintWay FSS to pick up the changes.
2. If you change the IP PrintWay FSA definition after IP PrintWay is already started, you must stop and restart the IP PrintWay FSA.
3. You do not need to stop and restart IP PrintWay FSAs if you restart TCP/IP. IP PrintWay automatically reestablishes connection with TCP/IP.

If an FSA is defined with the START=YES parameter on the JES2 PRTnnnnn statement, JES2 automatically starts the FSA when you bring up the z/OS system. JES3 does not support the automatic start option.
To start an IP PrintWay basic mode FSA:

1. Make sure that TCP/IP is started on the z/OS system.

2. Make sure that the Printer Inventory Manager daemon is started. See Chapter 2, “Starting and stopping Infoprint Server daemons,” on page 5.

3. Verify that the printers and print servers are online or started. You can start the printers and print servers after you start the IP PrintWay FSA. However, they should be started before the FSA attempts to transmit data to the printer or server. Otherwise, a TCP/IP error occurs.

4. Start the IP PrintWay FSA and the FSS by entering this JES2 or JES3 start command:
   JES2: $Sfsa_name [,fsa_name ... ]
   JES3: *CALL WTR,OUT=fsa_name

   Replace fsa_name with one of these:
   - In JES2, the name of the JES PRTnnnn statement. For example: PRT0001.
   - In JES3, the name in the JNAME parameter of the JES DEVICE statement.

   Note: If your installation has created an FSA definition for the IP PrintWay FSA, make sure that the name in the FSA definition matches the name you specify to JES when you start the FSA. If the names do not match, IP PrintWay does not use the information in the FSA definition when the FSA starts.

Stops an IP PrintWay functional subsystem (basic mode)

To stop an IP PrintWay basic mode functional subsystem (FSS), you should first stop all FSAs under its control.

Stopping an FSA (basic mode)

Use these JES2 or JES3 commands to stop an IP PrintWay FSA. The FSA stops after transmitting the current data set and data sets already selected for transmission.

JES2: $Pfsa_name [,fsa_name ... ]
JES3: *VARY,fsa_name [,fsa_name ... ],OFFLINE
      *CANCEL,fsa_name

Replace fsa_name with one of these:
- In JES2, the name of the JES PRTnnnn statement. For example, PRT123.
- In JES3, the name in the JNAME parameter of the JES DEVICE statement.

The *VARY command makes the FSA unavailable for transmitting data sets but lets the current data set finish. The *CANCEL command stops the FSA.

Note: IP PrintWay does not support the JES2 Cancel command ($C).
Processing of data sets retained on JES spool or waiting to be retried (basic mode)

When you stop an FSA, IP PrintWay releases to JES all data sets that have been retained after successful or unsuccessful transmission to the printer and all data sets that are waiting to be retried. These data sets can be processed by another IP PrintWay FSA or can be reselected by the same IP PrintWay FSA when the FSA is restarted.

IP PrintWay saves routing, retry, and retention information when it releases a data set to JES. When IP PrintWay reselects a data set that has already been processed, IP PrintWay uses the saved information to resume processing at the correct point. IP PrintWay retransmits the data set if the retry limit has not yet been reached and deletes the data set from the JES spool if the retention time has expired.

After an IP PrintWay FSA stops and releases data sets to JES, you can use JES commands and other spool management products (such as SDSF) to modify the output class, form name, and destination of the released data sets. IP PrintWay, however, does not use the new class, form name, or destination to locate a new printer definition. Instead, IP PrintWay uses the saved routing information.

Tip: After IP PrintWay releases a data set to JES, IP PrintWay ignores any changes you make to the host name, IP address, URL, LU name, print queue name, port number, logmode, retry and retention parameters, and name of Inventory components that contain print options.

Stopping an FSS (basic mode)

Before stopping an FSS, you must stop all FSAs under its control. If the FSS was configured with the AUTOSTOP=YES option on the JES2 FSS(fss_name) statement, JES2 stops the FSS automatically after you have stopped all FSAs. In a JES3 environment, JES automatically stops the FSS after you stop all FSAs under its control.

If JES does not automatically stop the FSS, use this MVS operator command to stop the FSS after stopping all FSAs under its control:

C fss_name

Replace fss_name with one of these:
- In JES2, the name on the JES FSS(fss_name) statement
- In JES3, the name in FSSNAME parameter of the JES FSSDEF statement

Ending an FSA (basic mode)

If you are not able to stop an FSA with the commands described in “Stopping an FSA (basic mode)” on page 28, in both JES2 and JES3, you can use the MODIFY command with the FORCE parameter. The syntax of this command is:

```
{MODIFY | F} fss_name,FORCE,fsa_name
```

**Syntax**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fss_name</td>
<td>Specifies the name of the FSS that manages the FSA. The fss_name parameter must match the FSSNAME parameter of the JES FSSDEF statement for the FSS.</td>
</tr>
<tr>
<td>FORCE</td>
<td>Specifies that the FSA is to be stopped.</td>
</tr>
</tbody>
</table>
fsa_name Specifies the FSA to be stopped.

**Tip:** IP PrintWay writes message ANFM027I when the FORCE parameter is processed. If the FSA is tracing to an external trace data set when the FORCE parameter is used, an abend might occur when the FSS address space ends.

If the MODIFY command is unsuccessful on JES3 systems, enter this JES3 command:

*FAIL,fso_name
Chapter 5. Using the IP PrintWay transmission queue (basic mode)

These topics apply only to IP PrintWay basic mode. IP PrintWay extended mode does not use the same transmission queue as IP PrintWay basic mode. If you run IP PrintWay extended mode, use Infoprint Central, JES commands and other spool management products (such as SDSF) to manage print jobs that IP PrintWay has selected from the JES spool. IBM recommends that you use Infoprint Central because it lets you do more actions on IP PrintWay print jobs and printers. See Chapter 7, “Using Infoprint Central,” on page 43.

The IP PrintWay basic mode transmission queue contains an entry for each data set that IP PrintWay basic mode has selected from the JES spool to process. Each entry contains the status of the transmission of the data set, routing information, and transmission options.

After IP PrintWay basic mode selects a data set from the JES spool for transmission, you cannot use JES commands and other spool management products (such as SDSF) to manage the data set. You must use Infoprint Server ISPF panels to monitor, reroute, retransmit, and delete data sets that IP PrintWay has selected.

IP PrintWay initially creates a queue entry for each data set to be transmitted. IP PrintWay retains the queue entry until either (1) IP PrintWay deletes the data set from the JES spool or (2) the IP PrintWay FSA processing the data set ends normally or abnormally and releases the data sets it is processing back to JES so that another IP PrintWay FSA can process them.

Under usual circumstances, you do not need to maintain the IP PrintWay transmission queue because IP PrintWay retains queue entries and deletes queue entries automatically. IP PrintWay retains and deletes entries based on retry and retention parameters specified either in the printer definition or in the JCL for each data set:

• If the transmission of a data set is successful, IP PrintWay retains the queue entry until the retention period specified for successful transmissions has expired and then automatically deletes the queue entry.

• If the transmission of a data set fails (the transmission is still unsuccessful after being retried the requested number of times), IP PrintWay retains the queue entry until the retention period specified for failed transmissions has expired and then automatically deletes the queue entry.

If all IP PrintWay FSAs stop processing, the transmission-queue should be empty. If any entries do remain, delete the entries or reallocate the data set before restarting IP PrintWay. If you reallocate the data set, you must also reinitialize it, as described in z/OS Infoprint Server Customization.

If your installation has used RACF or a similar product to protect the IP PrintWay transmission-queue data set, you might not be authorized to do some or all of these functions. If, for example, you have read-only access to the IP PrintWay transmission-queue data set, you are allowed to list and browse entries but not hold, reset, modify, or delete them. The Infoprint Server ISPF panels show only those functions you are allowed to do.
Note: Do not use VSAM editing functions to change any records in the IP PrintWay transmission-queue data set.

Starting an Infoprint Server ISPF session

To maintain the IP PrintWay transmission queue using ISPF panels, you must first start an Infoprint Server ISPF session. For information, see “Starting the ISPF session and configuring the panels” on page 243. Online help is available for each panel, input field, and message. To obtain help, press the HELP function key.

Listing transmission-queue entries (basic mode)

You must display a list of transmission-queue entries before you can do other functions, such as browsing or modifying an individual entry. You can either list all transmission-queue entries, or you can select the entries you want to list.

Listing all transmission-queue entries (basic mode)

To display a list of all entries on the IP PrintWay transmission queue:

1. On the Infoprint Server: Printer Inventory Manager panel, select 5 PrintWay Queue and press Enter.

2. On the IP PrintWay Transmission Queue Selection panel:
   a. Change the name of the transmission-queue data set, if necessary. The name of the transmission-queue data set represents the data set that IP PrintWay uses when displaying and updating entries. During an ISPF session, you can work with multiple transmission-queue data sets. For example, if your installation has defined multiple IP PrintWay FSSs, you might need to access the transmission-queue data set for each FSS. To change the name of the data set during your ISPF session, change the name on the IP PrintWay Transmission Queue Selection panel.
      If you do not change the name of this data set, IP PrintWay uses name ANF.QUEUE.
   b. Leave all other selection fields blank.
   c. Press Enter to display the IP PrintWay Transmission Queue panel.

3. On the IP PrintWay Transmission Queue panel:
   a. Press Enter at any time to obtain a current list.
   b. Press the END function key to exit the list.

Listing selected transmission-queue entries (basic mode)

You can select entries based on one or more of these characteristics of queue entries:
- Printer definition name
- Class, form, and destination name
- Job name
- Date the data set arrived on the IP PrintWay transmission queue
- Time the data set arrived on the IP PrintWay transmission queue
- Status of the transmission
- Port number of the socket
- Name of the print queue
To display a list of selected queue entries:

1. On the Infoprint Server: Printer Inventory Manager panel, select **PrintWay Queue** and press Enter.

2. On the IP PrintWay Transmission Queue Selection panel:
   a. Change the name of the transmission-queue data set, if necessary. If your installation has defined multiple transmission-queue data sets, use this panel several times to list entries in all transmission-queue data sets.
   b. Type values in one or more fields to specify selection criteria. To be listed, transmission-queue entries must meet *all* of the criteria you specify. Leave blank any fields that you do not want IP PrintWay to consider in selecting entries.
      
      You can use an asterisk (*) in these ways:
      - By itself to mean any value
      - At the start of a string (*ABC matches values ending with ABC)
      - At the end of a string (ABC* matches values starting with ABC)
      - As a part of the date or time field, for example: */03/* or 9:*:*

      **Tip:** You cannot use an asterisk as a wild card in the **Port Number** field.
      
      If you enter a value in the **Print Queue/Logmode** or **Host Name/IP Address/URL/LUName/e-mail** field, use the same lowercase and uppercase characters that are specified in the transmission-queue entry. Although these fields can contain up to 255 characters, this panel only lets you enter 185 characters. If necessary, use the asterisk (*) to select longer names. The **Host Name/IP Address/URL/LUName/e-mail** field contains only the first 255 characters of the e-mail address.
   c. Press Enter.

3. On the IP PrintWay Transmission Queue panel:
   a. A hyphen (-) in front of the name in the **Route Name** field indicates that the entry represents a single data set. The data set grouping specified in the printer definition is either **None** or **Job**. An asterisk (*) in front of the name indicates that the entry represents one or more data sets that belong to a concatenation. The data set grouping specified in the printer definition is **Concatenate Job**. For more information about grouping data sets, see "Transmitting multiple data sets in a JES output group" on page 198.
   b. Press Enter at any time to obtain a current list.
   c. Press the END function key to exit the list.

---

**Browsing a transmission-queue entry (basic mode)**

When you browse an entry on the IP PrintWay transmission queue, you can view fields, but you cannot change any of them. If a field in an entry is blank when you browse it, it means that IP PrintWay uses a default value for the field.
When the name in the **Route Name** field is preceded by an asterisk, the data displayed is from the first data set of the concatenation.

To browse the entry:

1. List the entry or entries that you want to browse, as described in "Listing transmission-queue entries (basic mode)" on page 32.

2. On the IP PrintWay Transmission Queue panel, type B in the **Action** column in front of the entries you want to browse, and press Enter.

3. On the IP PrintWay Transmission Queue Entry panel, press the END function key when you want to exit the panel.

---

**Holding a transmission-queue entry (basic mode)**

To prevent IP PrintWay from transmitting or automatically deleting a data set on the IP PrintWay transmission queue, you can hold the queue entry. However, you **cannot** hold the queue entry for a data set that IP PrintWay is currently transmitting to its destination.

When you hold an entry, IP PrintWay retains the data set on the JES spool and changes the status to H (hold). When an entry is in the hold status (H), you can delete, modify, or reset it.

You can hold an entry for an individual data set, all entries for a selected list of data sets, or all entries with a certain name on a selected list. When you hold an entry whose name in the **Route Name** field is preceded by an asterisk, all data sets in the concatenation are held.

To restore a queue entry to its original status, hold the entry again. IP PrintWay restores the original status of any entry that is already in the hold status.

---

**Holding a queue entry (basic mode)**

To hold one or more individual queue entries:

1. List the entry or entries that you want to hold, as described in "Listing transmission-queue entries (basic mode)" on page 32.

2. On the IP PrintWay Transmission Queue panel, type H in the **Action** column in front of the entries you want to hold, and press Enter.

---

**Holding all transmission-queue entries in a list (basic mode)**

You can hold a list of transmission-queue entries, selected based on criteria such as printer definition name, status, or address of the printer. You can also hold only those entries in the list that have a specified route name. The route name is displayed in the **Route Name** field and contains either the printer definition name or the CLASS, FORM, and DEST values specified in the printer definition.

To hold a list of queue entries:
1. List the entries that you want to hold, as described in “Listing transmission-queue entries (basic mode)” on page 32.

2. On the IP PrintWay Transmission Queue panel, enter one of these on the command line:
   a. HOLD to hold all entries in the list
   b. HOLD routename to hold all entries in the list with the specified name in the Route Name field

3. To exit the panel, press the END function key.

---

**Resetting a transmission-queue entry (basic mode)**

To retransmit a data set on the IP PrintWay transmission queue, you can reset its queue entry. However, you cannot reset the queue entry for a data set that IP PrintWay is currently transmitting to its destination.

When you reset a queue entry, IP PrintWay retransmits the data set as soon as possible as if this were the first transmission attempt. Before you reset a queue entry, you can modify the entry and change routing information, formatting options, and translation options. For information, see “Modifying a transmission-queue entry (basic mode)” on page 36.

You can reset an entry for one data set or you can reset entries for a list of data sets. When you reset an entry whose name in the Route Name field is preceded by an asterisk, all data sets in the concatenation are reset.

When you reset an entry, IP PrintWay automatically changes these fields:
- The Transmission Status field is set to Z (queued for first attempt).
- The Next Activity field is set to the current date and time.
- The Retries field is set to 0.

---

**Resetting a queue entry (basic mode)**

To reset one or more queue entries:

1. List the entry or entries that you want to reset, as described in “Listing transmission-queue entries (basic mode)” on page 32.

2. On the IP PrintWay Transmission Queue panel:
   a. If you want to change routing or options information in the entry before resetting it, type E in the Action column in front of the entries you want to edit and press Enter. Edit the entries and then press the END function key.
   b. Type R in the Action column in front of the entries you want to reset, and press Enter.

---

**Resetting all queue entries in a list (basic mode)**

You can reset an entire list of queue entries, selected based on criteria such as printer definition name, status, or address of the printer. You can also reset only those data sets in the list that have a specified route name. The route name is
displayed in the **Route Name** field and contains either the printer definition name or the CLASS, FORM, and DEST values specified in the printer definition.

To reset a list of queue entries:

1. List the entries that you want to reset, as described in “Listing transmission-queue entries (basic mode)” on page 32.

2. On the IP PrintWay Transmission Queue panel, enter one of these on the command line:
   - `RESET` to reset all entries in the list
   - `RESET routename` to reset all entries in the list with the specified name in the **Route Name** field

3. To exit the panel, press the END function key.

---

**Modifying a transmission-queue entry (basic mode)**

You can edit fields in a transmission-queue entry only if IP PrintWay is not currently transmitting the data set to its destination. That is, the status of the entry cannot be A (active). When you edit a field, the change takes effect immediately. If, for example, you change the address of the printer, IP PrintWay uses the new address when it next transmits the data set.

When you modify an entry whose name in the **Route Name** field is preceded by an asterisk, the asterisk indicates that the entry contains data for the first data set of the concatenation. Except for LPR options, changes you make to this entry affect all data sets in the concatenation. For example, if you change the retry time for an entry, the retry time is changed for all the data sets in the concatenation because all the data sets are sent together. Because IP PrintWay allows different LPR options for individual data sets of a concatenation, changes you make to the LPR options field apply only to the *first* data set of the concatenation.

**Attention:** While you are editing a queue entry, IP PrintWay does *not* transmit the data set or any other data sets scheduled for transmission to the same address. Therefore, make your changes and press the END function key as quickly as possible. If you take longer than 12 minutes, IP PrintWay proceeds with transmission of data sets to the destination.

You can do these tasks by modifying a queue entry:
- Reroute a data set to a different print queue.
- Retain the data sets on the JES spool for a shorter or longer time.
- Expedite or delay the next retry attempt.
- Increase or decrease the number of retry attempts.
- Change the maximum document size and response timeout.
- Change formatting options for the next transmission of the data set.
- Change translation options for the next transmission of the data set.

These tasks are explained more fully below.

To modify an entry:

1. List the entries to modify, as described in “Listing transmission-queue entries (basic mode)” on page 32.
2. On the IP PrintWay Transmission Queue panel, type E in the Action column in front of the entries you want to edit, and press Enter.

3. On the IP PrintWay Transmission Queue Entry panel:
   a. Edit the fields as necessary. Press Enter to validate the fields.
   b. To save the queue entry, but maintain the panel on the screen, enter SAVE on the command line. You can now continue editing the entry:
      • To save the options entry and exit the panel, press the END function key.
      • To exit the panel without saving your changes, enter CANCEL on the command line.

---

Rerouting a data set (basic mode)

To reroute a data set to another destination, change the routing information in these fields:

- If the transmission protocol is LPR, specify the Host/IP Address/URL/LUName and Print Queue/Logmode fields.
- If the transmission protocol is SOCKET, specify the Host/IP Address/URL/LUName and Port Number fields.
- If the transmission protocol is IPP, specify the Host/IP Address/URL/LUName field.
- If the transmission protocol is VTAM, specify the Host/IP Address/URL/LUName and Print Queue/Logmode fields.
- If the transmission protocol is e-mail, specify the Host/IP Address/URL/LUName/e-mail field.

If the status of the queue entry is S (succeeded), F (failed), or H (entry held), you must reset the entry after you change the routing information. Resetting the entry causes IP PrintWay to retransmit the data set. For information, see “Resetting a transmission-queue entry (basic mode)” on page 35.

If the status of the queue entry is Z (queued for first attempt), or R (queued for retry), do not reset the entry after you change the routing information.

---

Changing retention periods (basic mode)

To retain a queue entry with a status of Z (queued for first attempt) or R (queued for retry) for a longer or shorter time, change the Retain Time: Success or Retain Time: Failure fields. Type FOREVER in the Retain Time field if you want IP PrintWay to retain the queue entry forever.

To retain a queue entry with a status of S (succeeded) or F (failed) for a longer or shorter time, change the date and time in the Next Activity field. Type NEVER in the Next Activity Date and Next Activity Time fields if you want IP PrintWay to retain the queue entry forever.

---

Changing the time between retries (basic mode)

To increase or decrease the time between retries of a queue entry with a status of Z (queued for first attempt) or R (queued for retry), change the time in the Retry: Time field. The new retry time takes effect after the next transmission.
To retransmit the data set immediately, reset the queue entry, as described in "Resetting a transmission-queue entry (basic mode)" on page 35.

Changing the retry limit (basic mode)
To increase or decrease the retry limit for a queue entry with a status of Z (queued for first attempt) or R (queued for retry), change the retry limit in the Retries field. To stop retry attempts, change the retry limit in the Retries field to 0.

To retry a failed transmission (status F), increase the retry limit in the Retries field. Also, change the date and time in the Next Activity field to the time you want for the next retry attempt.

Tip: You can also retry a failed transmission by resetting the queue entry, as described in "Resetting a transmission-queue entry (basic mode)" on page 35.

Changing the maximum document size and response timeout value (basic mode)
To increase or decrease the maximum number of bytes that IP PrintWay can transmit to the printer, specify the number of bytes in the Maximum document size field. This field does not apply when the VTAM protocol is used. IP PrintWay uses the new size when it retransmits the data set.

To increase or decrease the number of seconds that IP PrintWay waits for a response from the printer, change the value in the Response timeout field. This field does not apply when the e-mail protocol is used. IP PrintWay uses the new value when it retransmits the data set.

If the status of the queue entry is S (succeeded), F (failed), or H (entry held), you must reset the queue entry after you change the values. Resetting the entry causes IP PrintWay to retransmit the data set. For information, see "Resetting a transmission-queue entry (basic mode)" on page 35.

If the status of the queue entry is Z (queued for first attempt), or R (queued for retry), do not reset the entry after you change the values.

Changing formatting options (basic mode)
To change the formatting options and formatting rules of a data set, select Change Formatting Options and press Enter. Edit the fields in the Formatting Options Entry panel. IP PrintWay uses the new formatting options and formatting rules when it retransmits the data set.

If the status of the queue entry is S (succeeded), F (failed), or H (entry held), you must reset the queue entry after you change the formatting options and rules. Resetting the entry causes IP PrintWay to retransmit the data set. For information, see "Resetting a transmission-queue entry (basic mode)" on page 35.

If the status of the queue entry is Z (queued for first attempt), or R (queued for retry), do not reset the entry after you change the formatting options and rules.

Changing translation options (basic mode)
To change the translation options of a data set, select Change Translation Options and press Enter. Edit the fields in the translation Options Entry panel. IP PrintWay uses the new translation options when it retransmits the data set.
If the status of the queue entry is S (succeeded), F (failed), or H (entry held), you must reset the queue entry after you change the translation options. Resetting the entry causes IP PrintWay to retransmit the data set. For information, see “Resetting a transmission-queue entry (basic mode)” on page 35.

If the status of the queue entry is Z (queued for first attempt), or R (queued for retry), do not reset the entry after you change the translation options.

Deleting a transmission-queue entry (basic mode)

Under usual circumstances, you do not need to delete queue entries. IP PrintWay automatically deletes a transmission-queue entry after retrying an unsuccessful transmission the specified number of times and after the retain time specified for the data set, if any, has expired.

Under some circumstances, you might need to delete a specific queue entry. For example, if the RETAINF or RETAINS JCL parameter or the printer definition specifies a retention time of FOREVER, you need to delete the queue entry manually.

To delete a queue entry:

1. List the entries you want to delete, as described in “Listing transmission-queue entries (basic mode)” on page 32.

2. On the IP PrintWay Transmission Queue panel, type D in the Action column in front of the queue entries you want to delete, and press Enter.

3. On the Delete Confirmation panel, press Enter to delete the entry. Press the END function key to cancel the delete request.

When you delete a transmission-queue entry, IP PrintWay also removes the data set from the JES spool.

Querying the status of a print queue (basic mode)

If a data set did not successfully print and a data-set entry still remains on the transmission queue, you might want to query the status of the printer's queue. You can query the status of the printer's queue only if IP PrintWay used the LPR protocol to transmit the data set to the printer.

To query the status of the printer's queue:

1. List entries for the printer you want to query, as described in “Listing transmission-queue entries (basic mode)” on page 32.

2. On the IP PrintWay Transmission Queue panel, type S (for short queue status) or L (for long queue status) in the Action column in front of the queue entry for the data set, and press Enter.

Results:
• If IP PrintWay was able to establish a connection with the printer:

  Queue State for
  PASS
  On remote host:
    9.99.176.81

  2 entries
  0 - port busy. No info

• If IP PrintWay was not able to establish a connection with the printer:

  CONNECT ERROR
Chapter 6. Starting sendmail

If you use IP PrintWay to send print output to e-mail destinations, start z/OS UNIX sendmail if you want to:

- Send output to sendmail alias names
- Receive sendmail messages, for example messages about bounced e-mails

If neither of these conditions apply, you do not need to start sendmail.

If you start sendmail, start it as a daemon so that you can receive messages. Use the `-bd` option to start sendmail as a daemon. Use the `-q` option to specify how often sendmail is to look in its queue to process pending mail.

**Example:** These commands switch to an effective UID of 0 and start sendmail as a daemon that processes pending mail every minute:

```bash
su
/usr/sbin/sendmail -bd -q1m &
```

To use the `su` command, you must be permitted to the BPX.SUPERUSER profile in the FACILITY class in RACF.

**Tip:** To start sendmail automatically, you can put the `sendmail` command in the `/etc/rc` file.

**Related information:**

For information about how to customize sendmail, see [z/OS Infoprint Server Customization](#).
Chapter 7. Using Infoprint Central

Infoprint Central is a print management application that runs on the Web. It is primarily used by help desk operators. However, other authorized users and job submitters can also use Infoprint Central. These topics give you an overview of how you can use Infoprint Central and describes these tasks:

<table>
<thead>
<tr>
<th>Task</th>
<th>See page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Customizing your Web browser</td>
<td>50</td>
</tr>
<tr>
<td>Logging on to Infoprint Central from the Web</td>
<td>51</td>
</tr>
</tbody>
</table>

Tips:
- If you run IP PrintWay extended mode, use Infoprint Central because it lets you work with IP PrintWay extended mode printers. It also lets you work with output data sets that IP PrintWay extended mode is currently processing, and it displays the status of output data sets, including whether IP PrintWay has retained them.
- If you run IP PrintWay basic mode, you cannot use Infoprint Central to work with jobs submitted to IP PrintWay basic mode or work with IP PrintWay printers. However, you can use Infoprint Central to do other functions.

With Infoprint Central you can do these actions (images shown are from Infoprint Central):

**Work with print jobs:** You can find and work with output groups (called print jobs) that are on the JES spool. Plus, you can see more information about print jobs that Infoprint Server processes. For example, you can see whether an Infoprint Server print job completed successfully and where it printed – even if the print job is no longer on the JES spool.

You can use search criteria such as job name and owner to find print jobs. After you find a print job, you can delete, hold, release, move, and change the priority of the print job. And, you can see all messages from Infoprint Server for that one print job without having to search through message logs.

**Tips:**
- A print job is typically one output data set. However, a print job can consist of several output data sets submitted together in the same batch job. In JES2, a print job is called an output group.
- Infoprint Central does not display some print jobs. See “Limitations”.

**Work with printers:** You can find and work with printers that are defined in the Printer Inventory – including AFP printers controlled by PSF (called PSF printers), and printers to which IP PrintWay can send print jobs (called IP PrintWay printers).

You can also work with PSF AFP Download Plus senders as if they were PSF printers. An AFP Download Plus sender sends print jobs to a receiver on another system for printing, e-mailing, or faxing.

You can use search criteria such as printer name and location to find printers. After you find a printer, you can see its status, the printer’s job queue, and view other properties of the printer. For example, you can see whether the
printer is processing, idle, or offline, and you can see the level of paper and
toner. You can also do these printer actions:

- PSF printers: Start, stop, interrupt, pause (JES2 only), ping, repeat, space,
turn online, turn offline, and reset. Also, you can change forms and other
job-selection criteria, and you can link to the Web pages of some printers. If
the PSF printer is an AFP Download Plus sender, you can do a limited set of
PSF printer actions.

- IP PrintWay printers: Start, stop, redirect, restore, ping, turn online, turn
offline, and reset. Also, you can see all the messages from Infoprint Server
for that one printer, and you can link to the Web pages of some printers.

Tips:

- Some status information and printer actions (ping, turn online, turn offline,
reset, display Web page) are available only for TCP/IP-attached printers.

- If multiple printer definitions in the Printer Inventory have the same printer
IP address (or host name), Infoprint Central displays only one IP PrintWay
printer. However, if the printer definitions have different queue names or
port numbers, Infoprint Central displays a separate IP PrintWay printer for
each queue name or port number.

Work with NetSpool logical units: You can work with any NetSpool
logical units (LUs) that are defined to NetSpool in the Printer Inventory and
also defined to VTAM.

You can find LUs by name. After you find a NetSpool LU, you can start and
stop it. When you start an LU, that LU is started in both Infoprint Server and
VTAM. Likewise, when you stop an LU, that LU is stopped in both Infoprint
Server and VTAM. You can also display information about the current VTAM
session established with a NetSpool LU.

Display printer definitions: You can display the properties of any printer
definition in the Printer Inventory. You can use search criteria, such as the
printer definition name and the printer's location, to find printer definitions.
This can help you find the name of a printer in your area.

Check system status: You can see the status of all Infoprint Server
daemons and tasks. This can help you determine the cause of a printing
problem. You can also start and stop IP PrintWay job selection rules to change
which print jobs IP PrintWay processes.

Auditing Infoprint Central actions: Infoprint Central writes a message to the
Infoprint Server common message log each time someone selects an Infoprint
Central action. To find out who used Infoprint Central to do actions, select the
View log action for Infoprint Server print jobs, JES print jobs, IP PrintWay printers,
PSF printers, and NetSpool LUs.

Limitations:

- You can only work with objects to which your security administrator has given
you RACF authorization. For information about the authorization required to
work with different objects, see [z/OS Infoprint Server Customization].

- You can only work with printers to which either PSF or IP PrintWay extended
mode can print.
• You cannot work with NetSpool LUs if more than one NetSpool task is running. Instead, you must use NetSpool commands and VTAM commands as described in Chapter 3, “Starting and stopping the NetSpool task and NetSpool LUs,” on page 17.
• Infoprint Central does not display these types of print jobs because they are numerous and users typically do not print them:
  – TSU print jobs
  – Held print jobs with only documents that have these DD names: JESJCL, JESMSGLG, JESYSMSG, SYSPRINT, and SYSTSPRT
  – Print jobs with job name BPXAS
• Infoprint Central does not display print jobs that were sent to a JES spool on a different system.

Infoprint Central actions

Infoprint Central lets you do the actions listed in the following tables. For a complete description of each action, see the online help for Infoprint Central. The images shown are from Infoprint Central.

Table 5. Infoprint Central actions for Infoprint Server print jobs

<table>
<thead>
<tr>
<th>Infoprint Central action</th>
<th>Brief description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change priority</td>
<td>Change the priority of print jobs.</td>
</tr>
<tr>
<td>Delete</td>
<td>Delete print jobs.</td>
</tr>
<tr>
<td>Hold</td>
<td>Hold print jobs.</td>
</tr>
<tr>
<td>Move</td>
<td>Move print jobs to another printer.</td>
</tr>
<tr>
<td>Release</td>
<td>Release print jobs for processing.</td>
</tr>
<tr>
<td>View log</td>
<td>View messages for print jobs.</td>
</tr>
<tr>
<td>View properties</td>
<td>View all properties of print jobs.</td>
</tr>
</tbody>
</table>

Table 6. Infoprint Central actions for JES print jobs

<table>
<thead>
<tr>
<th>Infoprint Central action</th>
<th>Brief description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change priority</td>
<td>Change priority of print jobs.</td>
</tr>
<tr>
<td>Delete</td>
<td>Delete print jobs.</td>
</tr>
</tbody>
</table>
Table 6. Infoprint Central actions for JES print jobs (continued)

<table>
<thead>
<tr>
<th>Infoprint Central action</th>
<th>Brief description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hold</td>
<td>Hold print jobs.</td>
</tr>
<tr>
<td>Release</td>
<td>Release print jobs for processing.</td>
</tr>
<tr>
<td>View log</td>
<td>View messages for print jobs.</td>
</tr>
<tr>
<td>View properties</td>
<td>View all properties of print jobs.</td>
</tr>
</tbody>
</table>

Table 7. Infoprint Central actions for IP PrintWay printers

<table>
<thead>
<tr>
<th>Infoprint Central action</th>
<th>Brief description</th>

<td>Delete print jobs</td>
<td>D (Delete) action on IP PrintWay Transmission Queue panel</td>
</tr>
</tbody>
</table>

Customizing your Web browser

Infoprint Central supports these Web browsers:
- Microsoft® Internet Explorer 6.0 (or a higher level)
- Netscape Navigator 7.0 (or a higher level)
- IBM Home Page Reader 4.0 (or a higher level).

These are the required and recommended Internet settings for your browser.

Required settings:
- Enable JavaScripts.
- Enable style sheets.

Recommended settings:
- Set your browser to always retrieve the latest pages from the Web so that the Infoprint Central refresh function works correctly:
- If you use Microsoft Internet Explorer, change the setting for temporary Internet files to check for newer versions of stored pages on every visit to a page. Do not use the Microsoft default setting, which is to check for newer versions of stored pages automatically.
- If you use Netscape Navigator, compare documents in the cache to documents on the network every time.

• Do not block or disable all cookies. Infoprint Central stores cookies on your system to save your search values.
• If you use Microsoft Internet Explorer, do not disable the meta refresh security option. Infoprint Central uses the meta refresh function to display your search results automatically. If you use Netscape Navigator, no action is required because Netscape always enables the meta refresh function.

Tip: Depending on your Web browser, you might not be able to customize some of these settings.

---

### Logging on to Infoprint Central from the Web

To start Infoprint Central, enter a URL in the browser:

- For the English version:
  

  If the HTTP Server uses Secure Sockets Layer (SSL):
  

- For the Japanese version:
  

  If the HTTP Server uses Secure Sockets Layer (SSL):
  

hostname
  
  The address of the z/OS system where the HTTP Server is running.

port
  
  The port where the HTTP Server receives requests. If the HTTP Server receives requests at the default port, you can omit the port number. The default port number depends on whether you have customized the HTTP Server to use Secure sockets layer (SSL):
  
  • The SSL default port is 443.
  • Otherwise, the default port is 80.

Example: If the HTTP Server receives requests at the default port, you can enter:

or

Tip: When you log on to Infoprint Central, you can log on to only one z/OS system. You can see all the print jobs, printer queues, and Infoprint Server messages for that one z/OS system only. Therefore, if you configure IP PrintWay extended mode to print on the same printers from different z/OS systems, you must open separate instances of your Web browser so that you can see all print jobs on a printer’s queue and all messages from IP PrintWay about a printer.
Chapter 8. Working with output data sets on the JES spool using JES commands and SDSF

This section describes how to use JES commands and the JES2 System Display and Search Facility (SDSF) to work with output data sets that Infoprint Server processes. This section describes these tasks:

<table>
<thead>
<tr>
<th>Task</th>
<th>See page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Locating output data sets allocated by Infoprint Server</td>
<td>33</td>
</tr>
<tr>
<td>Using JES commands and SDSF to work with output data sets</td>
<td>34</td>
</tr>
</tbody>
</table>

**Locating output data sets allocated by Infoprint Server**

These fields displayed by the JES2 System Display and Search Facility (SDSF), or a comparable product, help you locate data sets that Infoprint Server has allocated on the JES spool. The information that SDSF displays in each field depends on how the print request was submitted.

<table>
<thead>
<tr>
<th>If the print request was submitted in this way:</th>
<th>The contents of these SDSF fields are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job name</td>
<td>Job ID</td>
</tr>
<tr>
<td><strong>z/OS UNIX lp command</strong></td>
<td>User ID of the job submitter</td>
</tr>
<tr>
<td><strong>AOPPRINT JCL procedure</strong></td>
<td>Job name</td>
</tr>
<tr>
<td><strong>Batch job using a DD JCL statement</strong></td>
<td>Job name</td>
</tr>
<tr>
<td><strong>Print command or application on a remote system</strong></td>
<td>Name of the job submitter on the remote system</td>
</tr>
<tr>
<td><strong>VTAM application (such as a CICS and IMS application)</strong></td>
<td>Owner name from the printer definition or print data, or the member name of the NetSpool startup procedure</td>
</tr>
</tbody>
</table>
If the print request was submitted in this way:

<table>
<thead>
<tr>
<th>Job name</th>
<th>Job ID</th>
<th>Owner</th>
<th>Last qualifier of data set name</th>
</tr>
</thead>
</table>

1. The job submitter or VTAM application can specify a job name in the **sysout-job-name** job attribute. If specified, this job name is used instead.

2. The Infoprint Server job ID starts with the 2-character prefix that is defined in the Infoprint Server configuration file, **aopd.conf**. The default prefix is **PS**. The job submitter or VTAM application can specify a job ID in the **sysout-job-id** job attribute. If specified, this job ID is used instead. The **lp** command returns this job ID to the job submitter.

3. A # in the data set name indicates that JES does not allow the character in this field. For example, if the file to be printed is **myfile.print**, this field contains **le#print**.

4. Infoprint Server allocates the data set on the JES spool when (1) the job submitter uses the Print Interface subsystem and (2) IP PrintWay basic mode sends data sets to the Print Interface LPD, a situation that can occur when the **resubmit for filtering** option is selected in the printer definition.

5. A ? in the data set name indicates that the DSNAME parameter was not specified.

6. Print commands include the **lpr**, **enq**, **lp**, and **print** commands. Job submitters can also print from a remote system using SAP R/3 or a standard Windows print submission method.

7. If the document was submitted with an **lpr** command, this is the user ID specified in the P control code in the LPD control file. If the user ID is unknown, the job name might contain **UNKNOWN** or **ANONYMOU**. A # in the name indicates that the name contains a character that JES does not allow.

**Tips:**

- JES commands might return a different job ID from the job ID that SDSF displays. JES commands display the z/OS job ID that z/OS assigns to the data set. If the Print Interface subsystem allocated the data set on the JES spool, the JES commands return the same job ID as SDSF displays.

- The fully qualified data set name might not contain the same values as SDSF displays. For example, the job ID in the fully qualified data set name is always a job ID assigned by z/OS to the data set. The job ID in the data set name matches the job ID displayed by SDSF only for data sets that NetSpool allocates on the JES spool.

- If Print Interface or NetSpool has already converted EBCDIC data to ASCII, using approximately 32K byte records, you might not be able to use your standard tools to view the data on the spool.

- When a user requests more than 255 copies of the same data set, multiple output groups for the data set are created on the JES spool. Each output group has the same user ID and job ID. To delete the data set, you must individually delete all output groups for the same data set.

**Using JES commands and SDSF to work with output data sets**

You can use JES and SDSF commands to do these actions on output data sets, depending on whether you run IP PrintWay extended mode or basic mode:

**IP PrintWay extended mode:** If IP PrintWay extended mode is not currently processing a data set, you can delete, hold, and release it. And, you can change its attributes, such as its priority, DEST, CLASS, and FORMS values. You can do these actions on data sets that IP PrintWay has not yet processed, is waiting to retry, or has retained on the JES spool after completion. You cannot do these actions on data sets that IP PrintWay extended mode is processing. Infoprint Central, however, lets you work with data sets that IP PrintWay extended mode is processing. See Chapter 7, “Using Infoprint Central,” on page 43.
These considerations apply when you run IP PrintWay extended mode:

- If you hold a retained data set, the data set remains held until you release or delete it. IP PrintWay does not delete it automatically when the retain time expires.
- If you hold a data set between retries, the next data set prints on the printer. If you subsequently release the held data set, it prints as soon as the printer is available, after any print jobs with a higher priority. IP PrintWay does not wait for the retry interval to expire.
- If you release a retained data set, it prints as soon as the printer is available, after any print jobs with a higher priority. Notice that you can release retained data sets even though they are not held.
- If you release a data set between retries, it prints as soon as the printer is available. IP PrintWay does not wait for the retry interval to expire. Notice that you can release data sets while IP PrintWay is waiting for the retry interval to expire, even though they are not held.
- If you change attributes of any data set, IP PrintWay uses the new attributes when it prints the data set again. If the data set is retained or between retries, the data set prints as soon as the printer is available. (See “Limitation”.)

**IP PrintWay basic mode:** If IP PrintWay basic mode has not selected a data set for processing, you can delete, hold, and release it. And, you can change its attributes, such as its DEST, CLASS, and FORMS values. However, you cannot delete, hold, or release data sets that IP PrintWay is waiting to retry or data sets that IP PrintWay has retained on the JES spool. The Infoprint Server ISPF panels, however, let you work with data sets that IP PrintWay basic mode is retrying or has retained on the JES spool. See Chapter 5, “Using the IP PrintWay transmission queue (basic mode),” on page 31.

These considerations apply when you run IP PrintWay basic mode:

1. If you change attributes of a data set, IP PrintWay uses the new attributes when it prints the data set. (See “Limitation”.)
2. If IP PrintWay stops, which causes it to release data sets to JES, you cannot change the host name or IP address, print-queue name, component name, retry time, retry limit, or retention times of the data sets. IP PrintWay ignores any changes you make to these values.

**Limitation:** If a print request selects an IP PrintWay printer by specifying the name of its printer definition, you cannot use JES commands or SDSF to move the data set to an alternate IP PrintWay printer by changing the DEST, CLASS, and FORMS values of the output data set. This is because Infoprint Server uses the printer name, if specified, to select a printer. All print requests submitted through Print Interface or NetSpool select the printer by specifying the name of its printer definition. Also, the printer name can be specified in the FSSDATA and SUBSYS JCL parameters.

However, if you run IP PrintWay extended mode, you can use Infoprint Central to move a data set to an alternate IP PrintWay printer even though the print request has selected the IP PrintWay printer by specifying the name of its printer definition. For more information, see the Infoprint Central online help system.
Chapter 9. Viewing messages

This section describes how you can view messages from:
- Infoprint Server common message log
- IP PrintWay basic mode
- NetSpool
- Data transforms
- z/OS UNIX sendmail

Viewing messages in the common message log

The common message log lets you see messages from most Infoprint Server components and from PSF for z/OS (PSF) in one place. The log can contain messages from:
- All components of Infoprint Server except for IP PrintWay basic mode
  IP PrintWay extended mode writes its messages only to the common message log. Other components (such as NetSpool and Print Interface), also write messages to other locations (such as the NetSpool message-log data set and the system console log).
- Some transform products
  For information about whether a transform writes messages to the common message log, see the documentation for the transform.
- PSF for z/OS (PSF)
  PSF V4R4 (or later) can write messages for print jobs and printers to the common message log.

The administrator can customize the common message log to specify how many days worth of messages to keep. The default is that no messages are kept unless you start the Infoprint Central daemon (aopssid). If aopssid starts, the default is 1 day’s worth of messages. For information about how to customize the common message log, see the description of the log-retention attribute in the Infoprint Server configuration file (aopd.conf), in z/OS Infoprint Server Customization.

Infoprint Central lets authorized users view messages in the common message log for selected print jobs and printers. In addition, Infoprint Server administrators can use the aoplogu command to select messages in a particular time range and copy them to a file or view them on the terminal.

You can enter the aoplogu command on the z/OS UNIX command line, or you can submit a batch job that runs the aoplogu command. Infoprint Server provides sample job AOPLOGUS in SYS1.SAMPLIB that runs the aoplog command. You must edit sample job AOPLOGUS before submitting it.

aoplogu command

Format

\textbf{aoplogu \{-b \ \textit{time}\} \{-e \ \textit{time}\}}

or

\textbf{aoplogu \{-l \ \textit{time}\}}

The format of \textit{time} is one of these:
The `aoplogu` command lets administrators view messages in the common message log. You can specify that you want to view:

- All the messages.
- The messages in a range of times. For example, the messages from 6 May 2004 to 10 May 2004, or the messages beginning on 6 May 2004.
- The most recent messages for a length of time. For example, the messages for the last day or for the last two minutes.

**Results:** The results are written to standard output (stdout).

**Options**

- `-b` The beginning time of the range of messages that you want to view. The default is the oldest message that is available in the common message log.
- `-e` The ending time of the range of messages that you want to view. The default is the most recent message that is available in the common message log.
- `-l` The most recent messages for the length of time that you specify.

**Usage notes**

1. To use the `aoplogu` command, you must be defined to RACF as a z/OS UNIX user and be connected to the RACF AOPADMIN group. For more information, see [z/OS Infoprint Server Customization](#).
2. When you specify the `-b` or `-e` option, the defaults for the year, month, day, and hour are the current year, month, day, and hour.
3. When you specify the `-b` or `-e` option, you can enter 1 - 4 digits for the year. For example, 4, 04, and 2004 all mean the year 2004.
4. You can enter any value for the units of time, beginning with 0. For example, you can enter 25 for the hour or 61 for the minute.
5. The time is inclusive. For example, `aoplogu -b 0 -e 0` includes all messages that occurred in the first minute of the current hour.

**Examples**

To view all the messages, use this command:

```
aoplogu
```

To view all the messages from 6 May 2004 to 10 May 2004, use this command:

```
aoplogu -b 2004:05:06:0:0 -e 2004:05:10:0:0
```

To view all the messages for the last day, use this command:

```
aoplogu -l 1:0:0
```

To view all the messages for the last two minutes, use this command:
To view all the messages for the last day plus the last three hours and to put them in a file called mymessages, use this command:

```
aoplogu -l 1:3:0 > mymessages
```

**Environment variables**

**AOPCONF**
Names the Infoprint Server configuration file. The file named in this variable takes precedence over configuration file `/etc/Printsrv/aopd.conf`.

**LANG**
The language used for messages.

**LC_ALL**
The locale used to format date and time information in common log messages.

**LC_TIME**
The locale used to format date and time information in common log messages.

**LIBPATH**
The path used to locate dynamic link libraries (DLL).

**NLSPATH**
The directory where the Infoprint Server message catalogs are located.

**TZ**
The time zone displayed in common log messages.

**File**

`/etc/Printsrv/aopd.conf`
The default Infoprint Server configuration file. This file is optional. The file named in the AOPCONF environment variable takes precedence over this file.

**Exit values**

<table>
<thead>
<tr>
<th>Exit Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Successful completion.</td>
</tr>
<tr>
<td>&gt;0</td>
<td>An error prevented the messages from being displayed.</td>
</tr>
</tbody>
</table>

**Format of messages in the common message log**

The `aoplogu` command displays messages in the common message log in this format:

```
date time priority:level user:id [job:id] [filename:name] [dsn:name] [output_device:name] [job_selection_rule:name] [fsa:name] [luname:name] [jes_jobname:name] [program:name] msg:message
```

For example:

```
12/19/10 17:04:13 (UTC-7) priority:info user:OMVSID job:PS000469 
output_device:lpr://myprinter.xyz.com/RAW program:aopoutd  
msg:AOP3613I The print job was completed successfully.
```

**Field**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>The date the message was written.</td>
</tr>
</tbody>
</table>
| dsn   | The fully qualified data set name that JES assigns. The document name is the last qualifier. A pound sign (#) in the document name replaces any character that JES does not allow in a document name. For example, if the

Chapter 9. Viewing messages
last 8 characters of the document name are file.lwp, this field contains FILE#LWP. This field might not contain the system ID, which is the first qualifier in a fully qualified data set name.

**filename**
The name of the file to be printed. Blanks are converted to an underscore (_).

**fsa**
The name of the JES functional subsystem application (FSA) for the PSF printer.

**jes_jobname**
The job name, or the name of the job submitter or owner:
- For a batch job, the name of the job that created the print job.
- For print requests submitted from remote systems (such as Windows), the first 8 characters of the logon name used on the remote system. A pound sign (#) in the name replaces a character (such as a period) that z/OS does not allow in the job name.
- For print requests submitted from VTAM applications (such as CICS or IMS), the owner name in the data stream, the default owner in the printer definition, or the name of the NetSpool startup procedure.

**job**
The job ID.
- A job ID with a PS prefix indicates that either Print Interface or NetSpool created the output data set on the JES spool. (Your installation can specify a different job prefix in the Infoprint Server configuration file.)
- A job ID with a JOB, STC, or TSU prefix indicates that either JES or the Print Interface subsystem created the output data set on the JES spool.
- Job submitters can specify the **sysout-job-id** job attribute to override the job ID.

**job_selection_rule**
The name of an IP PrintWay job selection rule that IP PrintWay extended mode used to select the print job from the JES spool for processing.

**luname**
The NetSpool logical unit (LU) name for the printer.

**msg**
The message number and text.

**output_device**
An identifier of the IP PrintWay extended mode printer where the print job printed or is scheduled to print, in one of these formats:

- **direct_sockets://hostname:port**
  The hostname and port number of the IP PrintWay printer.
- **lpr://hostname/queue**
  The hostname and print queue name of the IP PrintWay printer.
- **mailto:**
  An indication that the output data set is to be sent to an e-mail destination.
- **vtam://luname**
  The VTAM logical unit (LU) name of the IP PrintWay printer.

**uri**
The Uniform Resource Identifier (URI) of the Internet Printing Protocol (IPP) server running in the printer. Examples are:

- ipp://myprinter.xyz.com

**fsa_name**
The name of the JES functional subsystem application (FSA) for the PSF printer.

**priority**
The severity of the message:

**action**
A terminating situation occurred.
error An error occurred.
info This is an information message.
severe A severe error occurred.
warning A warning situation occurred.

program
The name of the Infoprint Server daemon, command, or program that
issued the message:
aopd The Printer Inventory Manager daemon.
aopd.JESStatusDaemon
  The Printer Inventory Manager status daemon.
aopd.JESScavenger
  The Printer Inventory Manager scavenger daemon.
aophinvd The Historical Inventory daemon. It maintains information
  about Infoprint Server print jobs that are not on the JES
  spool.
aopipdpdxp The IPP Server daemon. It processes print requests from
  remote clients that use the Internet Printing Protocol (IPP).
aoplogd The log daemon. It manages the Infoprint Server common
  message log.
aoplpd The line printer daemon (LPD). It processes print requests
  from remote clients that use the TCP/IP line printer
  requester (LPR) protocol.
aopnetd The NetSpool daemon. Together with the NetSpool started
  task, it processes print requests from VTAM applications
  such as CICS and IMS.
aopoutd An IP PrintWay extended mode daemon. It sends output to
  remote printers in the TCP/IP network and to e-mail
  destinations.
aopsapd The SAP callback daemon. It handles callback notification
  for the SAP Output Management System (OMS).
aopsxdbd The search data base daemon. It manages the Printer
  Inventory search data base that Infoprint Central uses.
aopsnmpd The SNMP subagent daemon. It provides printer status
  information for PSF-controlled printers to the z/OS SNMP
  agent for viewing with an SNMP manager.
aopssid The Infoprint Central daemon. It communicates with JES.
aopsubd The Print Interface subsystem daemon. It processes output
  data sets that specify the Print Interface subsystem on the
  SUBSYS parameter of the DD statement.
aopwsmd An IP PrintWay extended mode daemon. It uses the IP
  PrintWay job selection rules in the Printer Inventory to
  select output data sets from the JES spool.
aopxfd The Infoprint Server Transform Manager daemon. It
  manages other transform daemons, which transform data
  from one format to another.
cancel The cancel command.
InfoprintCentral Infoprint Central
lp The Ip command.
PSF_z/OS PSF for z/OS

NetSpool started task
The name of the NetSpool started task. Together with the
NetSpool daemon, it processes print requests from VTAM
applications such as CICS and IMS.

other values The name of an Infoprint Server program.
time  The time that Infoprint Server wrote the message, followed by the time zone. For information about time zones, see z/OS UNIX System Services Command Reference.

user  The z/OS user ID or the name of the user who submitted the print job, the z/OS user ID of the user who did the Infoprint Central action on the print job, or the z/OS user ID of the user who started the Infoprint Server daemons.

---

**Viewing IP PrintWay basic mode messages**

IP PrintWay basic mode writes a message to the IP PrintWay message-log data set when it receives a data set from JES, when IP PrintWay successfully or unsuccessfully transmits the data set to the target printer or e-mail destination, and when IP PrintWay releases the data set to JES. Also, IP PrintWay writes other messages to this data set, and IP PrintWay installation exits can write messages to this data set.

The messages wrap around to the beginning when the data set becomes full. The timestamp preceding each message indicates when IP PrintWay wrote the message. IP PrintWay writes a string containing equal signs, ========, at the end of the last message written.

Your installation can write an IP PrintWay Message exit to suppress unwanted messages from the message-log data set. For more information, see z/OS Infoprint Server Customization.

To view the messages:

1. Start an Infoprint Server ISPF session.
   - For information about how to start an Infoprint Server ISPF session, see “Starting the ISPF session and configuring the panels” on page 243.

2. On the main Infoprint Server ISPF panel, select: 7 Configure.
   - Make sure that the Message log field contains the name of the IP PrintWay message log used by the IP PrintWay functional subsystem (FSS). This name must match the data set name specified in the IP PrintWay startup procedure.

3. On the main Infoprint Server ISPF panel, select: 6 PrintWay Message.

4. To find the latest message, press the REFRESH function key on the Infoprint Server ISPF panels, or search for a string of equal signs.

---

**Viewing NetSpool messages**

NetSpool writes messages to several locations:

- NetSpool writes all messages to the operator console.
- NetSpool writes most messages, with the exception of messages written at initialization and termination, to the Infoprint Server common message log if it is enabled. For information about how to enable the common message log, see
NetSpool writes some messages, with the exception of messages written at initialization and termination and job-related messages, to the NetSpool message log data set if it is specified in the NetSpool startup procedure. You can view messages in this data set by browsing it.

### Viewing transform messages

If you use transforms, you can find messages in these locations:

- **Common message log:** Some transforms write messages in the Infoprint Server common message log. These messages are related to errors in the transform or transform configuration. For information, see the documentation for the transform.

- **Transform stderr file:** Messages in this file are related to errors in the transform or transform configuration. For information about how to find the transform stderr file, see [z/OS Infoprint Server Messages and Diagnosis](#).

  **Tip:** The transform stderr files are deleted when you restart the Infoprint Server Transform Manager.

- **Printed output:** Some transforms write messages related to errors in the input data stream on a separate page at the end of the transformed output.

### Viewing z/OS UNIX sendmail messages

When IP PrintWay transmits output to an e-mail destination, it uses the z/OS UNIX sendmail facility. Sendmail returns an error message when it cannot deliver an e-mail:

- If the target e-mail address is for a **local** system, the sendmail error message is recorded in the IP PrintWay message log (basic mode) or the common message log (extended mode).

- If the target e-mail address is for a **remote** system, no error message is recorded in the IP PrintWay message log (basic mode) or common message log (extended mode). Sendmail instead sends a message about the failed delivery to one of these users:
  - If the e-mail address was specified in a sendmail alias, sendmail notifies the owner of the alias.
  - If the e-mail address was specified directly in the printer definition, or if no owner is specified for the alias, sendmail notifies the user associated with the IP PrintWay startup procedure. This user ID is AOPSTC if your installation used the user ID suggested in [z/OS Infoprint Server Customization](#).

You might need to wait several days before sendmail returns an error message to you about an e-mail that could not be delivered to a remote system. How long you need to wait depends in part on how long it takes the remote system to notify sendmail that an e-mail is not deliverable and in part on how your installation has customized sendmail. For more information about customizing sendmail timeout values, see [z/OS Infoprint Server Customization](#).

To receive messages from sendmail, run the z/OS UNIX **mail** or **mailx** command. For information about these commands, see [z/OS UNIX System Services Command Reference](#).
Part 2. Administration

Chapter 10. Administration roadmap

Chapter 11. Planning the Printer Inventory

Planning printer definitions
- Selecting the type of printer definition
- Determining how many printer definitions to create
  - One printer definition for one actual printer
  - Several printer definitions for one actual printer
- Specification attributes in a printer definition
  - Allocation section
  - Processing section
  - NetSpool options section
  - NetSpool end-of-file section
  - IP PrintWay options section
  - Protocol section
- Including components in printer definitions
  - Example of components for IP PrintWay printer definitions
  - Example of components for PSF printer definitions
- Planning printer pool definitions
- Planning FSS definitions
- IP PrintWay basic mode FSS definitions
- PSF FSS definitions
- Planning FSA definitions
- IP PrintWay basic mode FSA definitions
- PSF FSA definitions
- Planning job selection rules

Chapter 12. Planning printer definitions for Print Interface

Specifying JES allocation parameters
- Procedure for specifying attributes
- Example
- Validating that documents can print as requested
  - Data formats
  - Procedure for specifying attributes
  - Example
- Using the aopfiltr.so filter
  - Procedure for specifying attributes
  - Example
- Using the LPD compatibility filter
  - Filter options
  - Procedure for specifying attributes
  - Example
- Using an installation-provided filter
  - Procedure for specifying attributes
  - Example
- Converting data from EBCDIC to ASCII or ASCII to EBCDIC
  - Procedure for specifying attributes

Chapter 13. Planning printer and printer pool definitions for NetSpool

Specifying the NetSpool printer LU name
- Procedure for specifying attributes
- Grouping NetSpool printer LUs into LU classes
- Procedure for specifying attributes
- Specifying JES allocation parameters
  - Procedure for specifying attributes
  - Example
- Converting SCS and 3270 data streams to line data streams
  - Procedure for specifying attributes
  - Examples
- Converting SCS and 3270 data streams to PCL data streams
  - Procedure for specifying attributes
  - Examples
- Selecting no data stream conversion
  - Procedure for specifying attributes
  - Example
- Specifying a default user ID and job attribute prefix
  - Procedure for specifying attributes
  - Example
- Selecting a font
  - Procedure for specifying attributes
  - Example
- Specifying how NetSpool determines end-of-file
  - End-of-file rules
  - Procedure for specifying attributes
  - Example
- Broadcasting data using multiple printer definitions
  - Procedure for specifying attributes
  - Example
- Validating that documents can print as requested
  - Procedure for specifying attributes
  - Example
- Using an installation-provided filter
  - Procedure for specifying attributes
  - Example
- Converting output bin and input tray names to numbers for an AFP printer
  - Procedure for specifying attributes
  - Example
  - Using the Print Interface subsystem
  - Procedure for specifying attributes
  - Example
  - Example 1. A PSF printer definition
  - Example 2. An IP PrintWay printer definition
- Creating the Infoprint Server default printer definition
  - Procedure for specifying the name of the default printer definition
  - Example

Chapter 11. Planning the Printer Inventory

These topics contain information to help you plan your Printer Inventory. The Printer Inventory consists of UNIX files (such as z/FS files) that contain information about your printing environment.

In this information, PSF refers to PSF for z/OS and to the AFP Download Plus feature of PSF.

The Printer Inventory can contain these types of objects, called definitions:

**Printer definitions**
Describe the printers in your system. IP PrintWay, PSF, or JES can control the printers.

Printer definitions can also:
- Describe an e-mail destination. The destination can be one e-mail address or a list of e-mail addresses.
- Include other Printer Inventory objects called components. Components let you use one object to specify information that is common to several printer definitions.

**Printer pool definitions**
Describe groups of printer definitions that you want to broadcast data to (applies only to NetSpool). Only VTAM applications can print to a printer pool definition.

**FSS definitions**
Describe the IP PrintWay basic mode and PSF functional subsystems (FSSs) that the system programmer has defined to your JES system.

**FSA definitions**
Describe the IP PrintWay basic mode and PSF functional subsystem applications (FSAs) that the system programmer has defined to your JES system.

**Job selection rules**
Describe the rules that IP PrintWay extended mode uses to determine which print jobs to select from the JES spool to print.

Table 14 summarizes the types of objects you can create in the Printer Inventory and indicates when the definitions are required. Required definitions are required by all installations. Optional definitions are required only if the condition is met. See the page reference for more information about the definition.

</tbody>
</table>

1. In some cases you can support more than one printer with the same printer definition. For more information, see "One printer definition for several actual printers" on page 78.
2. You must create FSS and FSA definitions for PSF if you configure PSF to use the Printer Inventory. For information about how to configure PSF to use the Printer Inventory, see:
   - PSF for z/OS: Customization
   - PSF for z/OS: AFP Download Plus

To create and manage Printer Inventory definitions, you can use one of these methods or a combination of these methods:

- **Infoprint Server ISPF panels**: The ISPF panels let you add, list, browse, copy, edit, and delete definitions. For information about how to use the ISPF panels, see Chapter 18, “Using ISPF panels to manage the Printer Inventory,” on page 243.

- **Printer Inventory Definition Utility (PIDU)**: The PIDU program lets you create, display, list, modify, rename, delete, export, and dump definitions. You might find the PIDU program convenient for creating a large number of definitions at one time or for making the same change to many definitions. For information about how to run the PIDU program, see Chapter 19, “Using the PIDU program to manage the Printer Inventory,” on page 263.

- **Infoprint Server Migration program**: The migration program can create PSF FSS and FSA definitions in the Printer Inventory from information in your PSF startup procedures and JES definitions. The migration program can also help you migrate to Infoprint Server from the NetSpool and IP PrintWay features of PSF. It creates printer definitions from information currently in your NetSpool print-characteristics data set, IP PrintWay routing data set, and IP PrintWay options data set.

### Planning printer definitions

A printer definition contains information about one or more printers or e-mail destinations. The printer can be a local printer or remote printer in your TCP/IP network, or it can be a printer defined to VTAM.

A printer definition contains these general types of information:

- Information that Print Interface and NetSpool use to allocate data sets on the JES spool.
  For example, the JES output class (CLASS), the destination name (DEST), the forms name (FORMS), and the form definition name for all data sets submitted to the printer definition.
• Information that IP PrintWay uses to transmit data sets from the JES spool to the printer or the e-mail destination.
  For example, the IP address of the printer or the e-mail addresses of the e-mail recipients.

Users, who can be job submitters or applications, submit print jobs to a printer by specifying the name of the printer definition or, in some cases, the CLASS, DEST, and FORMS values for the printer definition. The name of a printer definition is case-sensitive and can contain up to 17 printable characters.

Before you create printer definitions, you should understand these topics:
• The types of printer definitions you can create
• How many printer definitions you need to create for each actual printer
• The printer attributes that you can specify in the printer definitions
• How to use components to help you manage large numbers of printer definitions

**Selecting the type of printer definition**

One of the first decisions to make when you plan the Printer Inventory is the type of printer definition to create for each printer or e-mail destination. The type indicates the program that sends data from the JES spool to the printer. The types of printer definitions you can create are:

- **IP PrintWay**
  Select this type for TCP/IP-attached, non-AFP printers, and for VTAM-controlled printers, for AFP printers controlled by InfoPrint Manager for AIX or Windows, and for e-mail destinations. Also select this type when you print on a printer that is TCP/IP-attached to a different z/OS system running another instance of Infoprint Server.
  When you use the Infoprint Server ISPF panels to select the printer definition type, you also must select the transmission protocol that IP PrintWay is to use to transmit data to the printer. You can select the LPR, direct sockets, Internet Printing Protocol (IPP), VTAM, or e-mail protocol. For information about how to determine which protocol to select, see Chapter 14, “Planning printer definitions for IP PrintWay,” on page 141.

- **PSF**
  Select this type for AFP printers that PSF or a comparable product controls. AFP printers can be locally-attached, SNA-attached, or TCP/IP-attached.

- **General**
  Select this type for printers that do not fall into the other two categories. For example, select General for line printers that JES controls.

This is the ISPF screen you use to select the type of printer:
Tip: Select the type of definition carefully because Infoprint Server processing differs according to the selected type. For example, if the printer definition type is PSF, Print Interface converts text data to line data before placing it on the JES spool. Also, if the printer definition type is IP PrintWay, the Infoprint Server ISPF panels let you specify information specific to IP PrintWay, such as the IP address of the printer.

Determining how many printer definitions to create

You can create:

- One printer definition to represent each actual printer or e-mail destination.
- One printer definition to represent several actual printers or e-mail destinations.
- Several printer definitions to represent one actual printer or e-mail destination.

One printer definition for one actual printer

This is the most common configuration for all types of printer definitions. In this configuration, you create one printer definition for each print queue or printer and for each e-mail destination. This configuration lets job submitters direct output to a specific printer or e-mail destination.

Note that you can use the same printer definition to process different types of data. For example, you can use the same printer definition for printing data submitted by VTAM applications, data submitted by workstation applications, and data submitted from TSO.

Each printer definition can be associated with only one NetSpool printer LU name. Therefore, if your installation needs to print on the same actual printer using different printer LU names, you need to create more than one printer definition for the same printer.

To work in this configuration, the JES work-selection criteria for each PSF functional subsystem application (FSA) must be unique. For example, one FSA could be defined to JES with work-selection criterion of destination BLDG5, while the other printer FSA could be defined with work-selection criterion of destination BLDG6. For information about specifying JES work-selection criteria, see z/OS JES2 Initialization and Tuning Guide or z/OS JES3 Initialization and Tuning Guide.

One printer definition for several actual printers

If you want to minimize the number of printer definitions you create in the Printer Inventory, you can create one printer definition for several actual printers or e-mail destinations in these situations:

- If job submitters can specify the address of an IP PrintWay printer or the addresses of e-mail recipients on either the OUTPUT JCL statement or in Infoprint Server job attributes, you can create one printer definition for all printers or e-mail destinations that share the same characteristics. This is because job submitters can print to one printer definition, but direct the output data set to a specific printer or e-mail address by using a JCL parameter or job attribute. For more information, see “Selecting the LPR protocol” on page 147, “Selecting the direct sockets protocol” on page 151, and “Selecting the e-mail protocol” on page 160.

- If job submitters use the Print Interface subsystem to submit print requests to PSF printers, you can create one printer definition for printers that share the same characteristics. This is because job submitters can print to one printer definition, but direct the output data set to a specific PSF printer by specifying
that printer's work-selection criteria (for example, the printer's CLASS and DEST values) on the OUTPUT JCL statement. For more information, see "Using the Print Interface subsystem" on page 103.

- If your installation has several PSF or JES printers that share the same JES work-selection criteria, you need to create only one printer definition for all the printers. For example, if there are several similar PSF printers in building 5, you could specify the same JES work-selection criterion (for example, destination BLDG5) in the JES FSA definitions for all printers in building 5. This lets JES balance the workload among the printers in building 5. Job submitters can submit all output data sets to the same printer definition and let JES direct the output data set to the printer that becomes available first.

For information about how to specify JES work-selection criteria, see z/OS JES2 Initialization and Tuning Guide or z/OS JES3 Initialization and Tuning Guide.

Guideline: Create at least one printer definition for each printer so that all job submission methods can be used to print on a printer, including those job submission methods that do not permit the specification of the JES output class, destination name, or IP address. For example, the lp command does not let you specify the JES output class or destination name. And, when the IP PrintWay basic mode resubmit for filtering option is used, the printer's IP address cannot be specified on the OUTPUT JCL statement.

Several printer definitions for one actual printer
You might need to create more than one printer definition for the same actual printer or print queue in these situations:

- To print documents with different requirements on the same actual printer or print queue. For example, to print documents on a PSF printer with different overlays. You would create two printer definitions for the actual printer. In one printer definition, specify the name of one overlay. In the other printer definition, specify the name of the other overlay.

As an alternative, job submitters who use the lp command or an OUTPUT JCL statement can specify the name of the overlay during job submission. However, not all job-submission methods allow specification of job attributes such as an overlay name.

- To print VTAM application data on the same actual printer with different requirements. For example, to print on the same printer with different NetSpool end-of-file rules, you would create two printer definitions with two different NetSpool printer LU names.

- To print ASCII or formatted data (such as PCL data) and EBCDIC data to the same IP PrintWay print queue from the local z/OS system using an OUTPUT JCL statement to submit the print job. For information, see "Printing data without formatting (basic mode)" on page 222.

Specifying attributes in a printer definition
The characteristics of a printer and print jobs that you specify in a printer definition are called printer attributes. When you use ISPF panels to create or edit printer definitions, you specify printer attributes as values in panel fields. If you use the Printer Inventory Definition Utility to create or edit printer definitions, you specify printer attributes as keyword and value pairs. Although you can specify many attributes in a printer definition, you do not need to specify all of them because Infoprint Server and JES supply default values for many of the attributes.

Some attributes are used by all components of Infoprint Server. However, other attributes are used only by one component of Infoprint Server. Therefore,
depending on which components of Infoprint Server you plan to use in your installation, you might not need to specify all of the attributes. For example, if you do not plan to use NetSpool to print VTAM application data, you do not need to specify attributes that only NetSpool uses. The online help for each panel field describes which components use the field.

Most of the attributes that you can specify in a printer definition are divided into logical groups called sections. The sections of a printer definition are: Allocation, Processing, NetSpool Options, NetSpool End-of-File, IP PrintWay Options, and Protocol. Figure 1 shows the different types of printer definitions and the sections that each type contains.

</tr>
</tbody>
</table>

Figure 1. Sections of printer definitions

Appendix B, “ISPF panels,” on page 455 shows the panels that you use to specify attributes in a printer definition.

**Allocation section**
The Allocation section contains attributes that tell NetSpool and Print Interface how to allocate output data sets on the JES spool. For example, in this section you can specify the output class, destination name, or job priority.

Each attribute in the Allocation section corresponds to a parameter that you can specify on an OUTPUT JCL statement. For a table that shows all field names in the Allocation section and the corresponding OUTPUT parameters, see “Allocation attributes and corresponding OUTPUT or DD statement parameters” on page 443. Because each field corresponds to an OUTPUT parameter, if you need more information about any of the attributes in this section, see z/OS MVS JCL Reference.

Some print-submission methods let the user specify the same attributes that you can specify in the Allocation section. In this case, the attribute specified during job submission overrides the attribute in the printer definition. For example, if the lp command contains the **form-definition** attribute, Print Interface allocates the job on the JES spool with the form definition name on the lp command.

“ISPF panel for the Allocation section or component” on page 457 shows the panel that you use to specify attributes in the Allocation section of a printer definition.

**Processing section**
The Processing section contains attributes that tell NetSpool, Print Interface, and IP PrintWay how to process data. For example, in this section you can specify attributes that control the page-formatting done by NetSpool and IP PrintWay and attributes that control data transforms done by Print Interface.

The Processing section also contains attributes that Print Interface and IP PrintWay use to determine whether the document can print on the printer. These are called **validation attributes**. If the document cannot print on the printer, Print Interface
rejects the print request, and IP PrintWay places the job on the system hold queue.
For example, you can specify the types of data formats that the printer supports or
the maximum size job that can print.

“ISPF panel for the Processing section or component” on page 458 shows the panel
that you use to specify attributes in the Processing section of a printer definition.

**NetSpool options section**
The NetSpool Options section contains attributes that tell NetSpool how to convert
the input data stream before writing the data to the JES spool. NetSpool can
convert the input data stream to either a line or PCL data stream. Or, you can
request that NetSpool write the input data stream without change to the JES spool.
“ISPF panel for the NetSpool Options section or component” on page 460 shows
the panel that you use to specify attributes in the NetSpool Options section of a
printer definition.

**NetSpool end-of-file section**
The NetSpool End-of-File section contains attributes that tell NetSpool when to
close the output data set on the JES spool so that the data can be printed. “ISPF
panel for the NetSpool End-of-File section or component” on page 461 shows the
panels that you use to specify attributes in the NetSpool End-of-File section of a
printer definition.

**IP PrintWay options section**
The IP PrintWay Options section contains attributes that tell IP PrintWay such
things as how long to retain data sets on the JES spool after transmission to the
remote system, how often to retry unsuccessful transmissions, or which exits to call
while processing data. “ISPF panel for the IP PrintWay Options section or
component” on page 462 shows the panel that you use to specify attributes in the
IP PrintWay Options section of a printer definition.

**Protocol section**
The Protocol section contains attributes that tell IP PrintWay which transmission
protocol to use to transmit data sets to the remote system: line printer requester
(LPR), direct-sockets printing, Internet Printing Protocol (IPP), VTAM, or e-mail.
This section also contains attributes that are specific to the type of transmission
protocol you select. For example, in this section you can specify LPR options such
as whether you want the LPD on the remote system to print a banner page.

The Protocol section also contains the name of the RACF profile that controls who
can work with a printer using Infoprint Central for the Web. The RACF profile
applies only if you run IP PrintWay extended mode.

“ISPF panels for the Protocol section or component” on page 463 shows the panels
that you use to specify attributes in the Protocol section of a printer definition.

**Including components in printer definitions**
Because a Printer Inventory might contain hundreds or thousands of printer
definitions, changing information in many printer definitions can be
time-consuming. Therefore, you might want to create additional objects in the
Printer Inventory called *components* and include them in printer definitions.
Consider creating components when several printer definitions share the same
attributes. To use components:
1. Specify the shared attributes in a component, instead of specifying the same
   attributes in many printer definitions.
2. Include the component in all printer definitions to which those attributes apply.

When you change the attributes in a component, all printer definitions that include that component pick up the new attributes.

Creating components is optional. Some printer definitions in the Printer Inventory might include components, while other printer definitions might not. Whether or not you use components, you can use the Printer Inventory Definition Utility (PIDU) to make changes to many printer definitions at one time. For information about PIDU, see Chapter 19, “Using the PIDU program to manage the Printer Inventory,” on page 263.

When you create components, you do not need to specify every attribute in that component. Instead, you might want to specify some attributes in the printer definitions. For example, the Protocol component contains an attribute that defines the IP address of the remote printer. Because the IP address is usually unique for each remote printer, you could omit the IP address from the component and instead specify it in the printer definition.

When you include components in a printer definition, you can override some of the attributes specified in the components by specifying a different value in the printer definition itself. For example, if one printer definition requires a longer retention time on the JES spool, you can override the attribute that specifies the retention time in the printer definition itself. You do not need to create a new component. Notice, however, that if you override an attribute in a printer definition, when you change the same attribute in the component, the printer definition does not pick up the new attribute.

You can create these types of components (one type for each section of a printer definition): Allocation, Processing, NetSpool Options, NetSpool End-of-File, IP PrintWay Options, and Protocol.

**Tip:** Another reason to create components is so that job submitters who use JCL can override printer attributes specified in the printer definition. Job submitters can specify a component name in the PRTOPTNS parameter of the OUTPUT JCL statement. The printer attributes specified in components with that name override the printer attributes specified in the printer definition. For more information, see “Creating components for the PRTOPTNS JCL parameter” on page 209.

**Example of components for IP PrintWay printer definitions**

Figure 2 on page 83 shows an example of components that you can include in IP PrintWay printer definitions. After the figure is a description of the components.
1. **Allocation component:** Both IP PrintWay printer definitions shown include the same Allocation component. In this component, you could specify the work-selection criteria defined for the IP PrintWay FSA (basic mode) or in the IP PrintWay job selection rule (extended mode). For example, if IP PrintWay selects jobs in output class P, specify class P in this component.

   You might need to specify some allocation attributes in the printer definitions themselves. For example, if job submitters need to select these printer definitions using the CLASS, DEST, or FORMS parameters on an OUTPUT JCL statement, the value for the DEST or FORMS attribute must be unique for each printer definition. Because this value is unique, do not specify it in the component. Instead, specify the DEST or FORMS value in the printer definition itself. For more information, see "Using DEST, CLASS, and FORMS to select a printer definition" on page 174.

2. **Processing component:** Both IP PrintWay printer definitions include the same Processing component. In this component, you could specify the data formats that the printer’s print queues can accept. For example: line data, text data, and PCL data. You could also specify whether you want the printer’s LPD to print a page header.

3. **NetSpool End-of-File components:** Each IP PrintWay printer definition includes a different NetSpool End-of-File component. In these components, you could specify different end-of-file rules for NetSpool to use.

   Only printer definitions that are configured for use with NetSpool need to include a NetSpool End-of-File component. However, you can include a NetSpool End-of-File component even if NetSpool is not configured.

4. **IP PrintWay Options component:** Both IP PrintWay printer definitions include the same IP PrintWay Options component. In this component, you could specify a retry time and a retention time for unsuccessfully transmitted data sets. You could also specify the name of an IP PrintWay exit program.
5. **Protocol components**: Each IP PrintWay printer definition includes a different Protocol component. In the first Protocol component, you could specify attributes for the LPR protocol, while in the second Protocol component, you could specify attributes for the VTAM protocol.

Because the IP address (for the LPR and direct sockets protocols), the URL (for the IPP protocol), the logical unit name (for the VTAM protocol), and the e-mail addresses are typically unique, do not specify these values in the component. Instead, specify the IP address, URL, logical unit name, and e-mail addresses in each printer definition that includes the component.

**Tip**: Neither printer definition in this example includes a NetSpool Options component.

**Example of components for PSF printer definitions**

Figure 3 shows an example of components you can include in PSF printer definitions. After the figure is a description of each component and printer definition.

You can include the same components in different types of printer definitions. For example, IP PrintWay and PSF printer definitions can share the NetSpool End-of-File components, if the same NetSpool end-of-file rule is appropriate.

*Components not shown: Allocation and NetSpool Options

**Figure 3. Components for a PSF printer definition**

1. **Processing component**: Both PSF printer definitions include the same Processing component. In this component, you could specify the data formats that the PSF printers support and the data transforms that you want to use.

2. **NetSpool End-of-File component**: Each PSF printer definition includes a different NetSpool End-of-File component. In these components, you might specify different end-of-file rules for NetSpool to use.

   Only printer definitions that are configured for use with NetSpool need to include a NetSpool End-of-File component. However, you can include a NetSpool End-of-File component even if NetSpool is not configured.

**Notes**:  
1. Neither printer definition in this example includes an Allocation component because each PSF printer FSA in this example has unique work-selection
criteria, which means that Print Interface and NetSpool must allocate data sets on the JES spool with different allocation values. Therefore, the allocation values are specified in the printer definitions themselves.

2. Neither printer definition in this example includes a NetSpool Options component.

Planning printer pool definitions

Printer pool definitions let you broadcast data to more than one printer at a time. Each printer pool definition defines the group of printer definitions to which you want to broadcast data.

Only NetSpool supports broadcasting. Therefore, only VTAM applications can print to a printer pool definition. NetSpool uses the attributes specified in the Allocation section of each printer definition to create output data sets on the JES spool, one output data set for each printer definition.

Figure 4 shows the relationship between a printer pool definition and printer definitions.

![Diagram of Printer Pool Definition](image)

Figure 4. Relationship between printer pool definition and printer definitions

The printer pool definition specifies the NetSpool printer LU name (LUDEPT01 in this example) and lists the printer definitions in the broadcast group (Printer 1 and Printer 2). The printer definitions are standard printer definitions. That is, they could be used for printing directly from clients, including VTAM applications.

"ISPF panel for a printer pool definition" on page 466 shows the panel that you use to specify attributes in a printer pool definition. For more information about how to create a printer pool definition, see "Broadcasting data using multiple printer definitions" on page 134.

Planning FSS definitions

An FSS definition contains information about a JES functional subsystem (FSS). You can define these types of FSS definitions:

- IP PrintWay basic mode FSS definitions. IP PrintWay can use the information in this definition when the FSS starts.
- PSF FSS definitions. PSF can use the information in this definition when the FSS starts.

You can use the Infoprint Server ISPF panels to create and manage FSS definitions. "ISPF panel for an IP PrintWay FSS definition" on page 467 shows the panel that you use to create an FSS definition. For information about how to use the ISPF...
panels, see "Managing FSS definitions" on page 257. You can also use the Printer Inventory Definition Utility (PIDU) to create FSS definitions. For information, see Chapter 19, "Using the PIDU program to manage the Printer Inventory,” on page 263.

Note: You must also define each IP PrintWay basic mode and PSF FSS to JES. The FSS definition in the Printer Inventory does not replace the JES definition.

**IP PrintWay basic mode FSS definitions**

In an IP PrintWay basic mode FSS definition you can specify configuration information that applies to all functional subsystem applications (FSAs) in the IP PrintWay FSS. You can define one IP PrintWay FSS definition for each FSS that your installation has defined to JES.

In the FSS definition you can specify this information:

- The name of the TCP/IP startup procedure
- The language IP PrintWay basic mode uses for messages
- The type of tracing to start for each FSA and the size of tracing tables
- The number of hiperspace blocks each FSA can use
- Whether IP PrintWay basic mode is to use the standard TCP/IP translation table to convert data from EBCDIC to ASCII
- The default document code page that IP PrintWay basic mode uses when it converts data from an EBCDIC code page to the printer's code page
- The VTAM ID of the application program that IP PrintWay basic mode uses to transmit data to a VTAM-controlled printer

Creating IP PrintWay FSS definitions is optional unless your installation plans to print on VTAM-controlled printers. If your installation plans to print on VTAM-controlled printers, you must specify the ID of the application program you defined to VTAM for IP PrintWay. If an IP PrintWay FSS definition is not created when IP PrintWay starts, IP PrintWay uses default values for the other attributes you can specify in an FSS definition.

If you create an FSS definition after the FSS has started or if you change any information in the FSS definition, you must restart the IP PrintWay FSS to pick up the changes.

**Tip:** [z/OS Infoprint Server Customization] and the ISPF help panels contain more information about the values you can specify in an IP PrintWay FSS definition.

**PSF FSS definitions**

In a PSF FSS definition you can specify configuration information that applies to all PSF functional subsystem applications (FSAs) in the FSS (functional subsystem). You must create one FSS definition for each FSS that your installation has defined to JES.

If you want PSF to use configuration information specified in an FSS definition, you must customize PSF to use the Printer Inventory. If PSF uses the Printer Inventory, an FSS definition must exist in the Printer Inventory.
If you create an FSS definition after the PSF FSS is started or if you change any information that PSF uses in the FSS definition, you must restart the PSF FSS to pick up the changes.

**Tip:** For complete information about the fields and values you can specify in a PSF FSS definition, see:

- *PSF for z/OS: Customization*
- *PSF for z/OS: AFP Download Plus*
- *PSF for z/OS: Customization* also tells you how to use a migration program to create PSF FSS definitions.

### Planning FSA definitions

An FSA definition contains information about functional subsystem applications (FSAs) defined to JES. You can define these types of FSA definitions:

- IP PrintWay basic mode FSA definition. IP PrintWay uses the information in this definition when the FSA starts.
- PSF FSA definition. PSF uses the information in this definition when the FSA starts.

You can use the Infoprint Server ISPF panels to create and manage FSA definitions. The ISPF panel for an IP PrintWay FSA definition” on page 467 shows the panel that you use to create an FSA definition. For information about how to use the ISPF panels, see “Managing FSA definitions” on page 259. You can also use the Printer Inventory Definition Utility (PIDU) to create FSS definitions. For information, see Chapter 19, “Using the PIDU program to manage the Printer Inventory,” on page 263.

**Note:** You must also define each IP PrintWay basic mode and PSF FSA to JES. The FSA definition in the Printer Inventory does not replace the JES definition.

### IP PrintWay basic mode FSA definitions

You can create one IP PrintWay basic mode FSA definition for each IP PrintWay FSA that your installation has defined to JES. In each IP PrintWay FSA definition you can specify the type of tracing to start for the FSA.

Creating IP PrintWay FSA definitions is optional. If an IP PrintWay FSA definition has not been created for an FSA, IP PrintWay uses the tracing value specified in the FSS definition.

If you create an FSA definition after the FSA is started or if you change the FSA definition, you must restart the IP PrintWay FSA to use the changed values. However, you do not need to restart the FSS and any other IP PrintWay FSA.

**Tip:** *z/OS Infoprint Server Customization* and the ISPF help panels contain information about values you can specify in an IP PrintWay FSA definition.

### PSF FSA definitions

You can create one PSF FSA definition for each PSF FSA that your installation has defined to JES. In each PSF FSA definition you can specify configuration information that applies to that FSA.
If you want PSF to use configuration information specified in FSA definitions, you must customize PSF to use the Printer Inventory. If PSF uses the Printer Inventory, an FSA definition must exist in the Printer Inventory for each PSF FSA in the FSS.

If you create an FSA definition after the PSF FSA is started or if you change any information in the FSA definition, you must restart the PSF FSA to pick up the changes. However, you do not need to restart the PSF FSS.

If you create an FSA definition for a PSF printer, you can use Infoprint Central to control it.

Tip: For complete information about the fields and values you can specify in a PSF FSA definition, see:
- PSF for z/OS: Customization
- PSF for z/OS: AFP Download Plus

PSF for z/OS: Customization also tells you how to use a migration program to create PSF FSA definitions.

Planning job selection rules

IP PrintWay extended mode uses the job selection rules to determine which print jobs to select from the JES spool for printing. You must create at least one job selection rule for IP PrintWay to select print jobs. The attributes of the print job must match all of the values in a rule to be selected.

You can use the Infoprint Server ISPF panels to create and manage job selection rules. "ISPF panel for an IP PrintWay job selection rule" on page 467 shows the panel that you use to create a job selection rule. For information about how to use the ISPF panels, see “Managing job selection rules” on page 261. You can also use the Printer Inventory Definition Utility (PIDU) to create job selection rules. For information, see Chapter 19, “Using the PIDU program to manage the Printer Inventory,” on page 263.

For detailed information about how to set up and use job selection rules, see z/OS Infoprint Server Customization.
Chapter 12. Planning printer definitions for Print Interface

Before using Print Interface to allocate output data sets on the JES spool, you must specify the attributes that Print Interface uses in the printer definitions. If a printer definition does not already exist for a printer, you must create one. If a printer definition already exists, edit it and specify the attributes that Print Interface uses.

Once you have specified the attributes that Print Interface uses, users can use one of several different methods to submit print jobs to Print Interface. For example: the `lp` command, the AOPPRINT JCL procedure, an `lpr` command, the Server Message Block (SMB) protocol from a Windows system, the Infoprint Port Monitor for Windows, or the Print Interface subsystem. The attributes you specify in a printer definition are the same regardless of the method users might use to submit print jobs.

Table 46 on page 446 summarizes the attributes that Print Interface uses and indicates whether each attribute is required or optional. You can use the Infoprint Server ISPF panels or the Printer Inventory Definition Utility (PIDU) to specify these attributes.

These topics describe how to specify printer attributes to do these tasks:

<table>
<thead>

<td>109</td>
</tr>
</tbody>
</table>

Note: For detailed information about each attribute (including the values you can specify, restrictions, and examples), use the online help for each field on the ISPF panels.

Specifying JES allocation parameters

You can specify attributes in the Allocation section of the printer definition to tell Print Interface how to allocate output data sets on the JES spool. For example, you can specify the JES output class and destination name.

Some job submission methods let job submitters specify Infoprint Server job attributes, which override the attributes you specify in this section. When the Print Interface subsystem is used, parameters specified on the DD and OUTPUT JCL statements override the values specified in this section.
Each attribute in the Allocation section of a printer definition corresponds to a parameter on a DD or OUTPUT JCL statement. “Allocation attributes and corresponding OUTPUT or DD statement parameters” on page 443 lists fields in the Allocation section and the corresponding JCL parameters. For a full explanation of each JCL parameter, see z/OS MVS JCL Reference. Also, the ISPF online help for each field summarizes the meaning of each field.

NetSpool also uses these attributes in the Allocation section to allocate data sets on the JES spool. In most cases, the same attributes are suitable for both NetSpool and Print Interface. To specify unique attributes for Print Interface and NetSpool, you must create two separate printer definitions for the printer: one for print requests submitted to Print Interface and another for print requests submitted to NetSpool.

As an alternative to specifying attributes in the Allocation section, job submitters can specify Infoprint Server job attributes and application programmers can embed job attributes in the VTAM application data sent to NetSpool. For information about how to specify job attributes, see z/OS Infoprint Server User's Guide.

Procedure for specifying attributes

On the Allocation panel, specify:

- **Spool allocation values** heading: The fields under this heading correspond to the OUTPUT JCL parameters that JES uses to direct output data sets from the JES spool to IP PrintWay, PSF, or another JES functional subsystem application (FSA):
  - In a PSF printer definition, specify the JES work-selection criteria for the PSF printer FSA. For example, if the JES work-selection criteria are class E and destination BLDG5, specify E in the CLASS field and BLDG5 in the DEST field.
  - In an IP PrintWay basic mode printer definition, specify the JES work-selection criteria defined for the IP PrintWay basic mode FSA. For example, if the work-selection criterion is class P, specify P in the CLASS field.
  - In an IP PrintWay extended mode printer definition, specify the job-selection criteria defined in the IP PrintWay extended mode job selection rule. For example, if the job-selection criterion is class P, specify P in the CLASS field.

JES work-selection criteria are defined in the JES3 DEVICE statement and the JES2 PRTnnn statement.

- Specify other fields that the PSF, IP PrintWay, transforms, and JES use.

**Tip:** If you need to specify the same allocation attributes in more than one printer definition, specify the attributes in an Allocation component. Then, include that component in each printer definition to which the component applies.

**Example**

This ISPF panel shows how to specify an output class and destination in the Allocation section of a PSF printer definition.
**Result:** Print Interface allocates output data sets in JES output class E and with destination name BLDG5. The PSF printer (FSA) defined to JES with work-selection criteria of class E and destination BLDG5 selects the output data set for printing.
Validating that documents can print as requested

Before accepting a print request, Print Interface can validate that the document can print as requested. For example, Print Interface can verify that the printer supports the data format of the input document. If Print Interface determines that a document cannot print, Print Interface rejects the print request with a message and does not allocate a data set on the JES spool.

Table 15 lists the fields in a printer definition that Print Interface uses to validate that the print request can print on the selected printer. The third column in the table indicates the job attribute or JCL parameter that the job submitter specifies to request a print function.

<table>
<thead>
<tr>
<th>Field name</th>
<th>Meaning</th>
<th>Job attribute and JCL parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data format</td>
<td>Input data formats the printer supports. For more information, see “Data formats.”</td>
<td>document-format job attribute</td>
</tr>
<tr>
<td>Duplexes supported</td>
<td>Duplexing supported by the printer (simplex, duplex, and tumble)</td>
<td>duplex job attribute DUPLEX JCL parameter</td>
</tr>
<tr>
<td>Forms supported</td>
<td>Forms names allowed</td>
<td>forms job attribute FORMS JCL parameter</td>
</tr>
<tr>
<td>Maximum copies</td>
<td>Maximum number of copies allowed</td>
<td>copies job attribute COPIES JCL parameter</td>
</tr>
<tr>
<td>Maximum document size</td>
<td>Maximum size of document (in bytes) allowed. This number does not include copies.</td>
<td>None. Print Interface determines the document size.</td>
</tr>
<tr>
<td>Print-error reporting supported</td>
<td>Types of error-reporting supported by the printer (invalid-character and print-positioning errors)</td>
<td>print-error-reporting job attribute DATACK JCL parameter</td>
</tr>
</tbody>
</table>

Notes:
1. Print Interface does not inspect options specified in the form definition used to print the job during validation. For example, if the form definition specifies five copies, Print Interface does not use this copy count to determine whether the print request exceeds the copy limit.
2. Print Interface validates the JCL parameters if (1) the Print Interface subsystem is used or (2) the IP PrintWay basic mode resubmit for filtering option is used.

Data formats

In the Data format field, select all input data formats that the printer supports. Also select all input data formats that can be transformed into a supported data format by the associated filter.

Print Interface automatically determines the type of data format in each input document unless the job submitter specifies the data format in the document-format job attribute. If Print Interface cannot determine the input data format, the default is other.

Guidelines:
1. In a PSF printer definition, select line data, text, and MO:DCA-P. PSF accepts line data and MO:DCA-P formats. Print Interface automatically transforms text data into line data when the printer definition is a PSF printer definition.

   If you have installed a transform product, you can also select other data formats. For information, see Chapter 15, “Planning printer definitions for transforms,” on page 225.

   **Tip:** If your installation has installed PSF for z/OS, you can select the XML data format without specifying a filter because PSF can process XML files using a page definition.

2. In an IP PrintWay printer definition, select the data formats accepted by the printer.

   If the printer accepts text data, select line data as well as text because Print Interface automatically converts line data to text data.

   If you install a transform product, you can also select other data formats. For information, see Chapter 15, “Planning printer definitions for transforms,” on page 225.

3. Select other as one of the supported data formats only if you want Print Interface to send documents with an unknown data format to the printer, or for the Xerox data format. By default, the other data format is selected, so be sure to deselect it unless the printer can accept data formats other than those Print Interface can automatically detect.

Table 16 explains the types of input data formats that you can select. You can select more than one type of data format.

<table>
<thead>
<tr>
<th>Data format</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>JPEG</td>
<td>Joint Photographic Experts Group file format (JFIF).</td>

<tr>
<td>XML</td>
<td>The Extensible Markup Language.</td>
</tr>
<tr>
<td>Other</td>
<td>All data formats that do not fall into one of the above categories, such as the Xerox data format. This is the default data format when Infoprint Server cannot determine the data format.</td>
</tr>
</tbody>
</table>

**Procedure for specifying attributes**

On the Processing panel, specify the fields listed in Table 15 on page 92.
Tip: When you leave the default settings on the Processing panel, Print Interface does not validate print requests.

Example
This ISPF panel shows how to specify the valid data formats, duplexing options, and print-error reporting options. Only a portion of the panel is shown.

Result: Print Interface rejects any print request that contains these data formats or print options:

- A data format of PostScript, PCL, PDF, SAP, TIFF, JPEG, or an unknown data format.
- The duplex=yes or duplex=tumble job attribute.
- The DUPLEX=NORMAL or DUPLEX=TUMBLE parameter on the OUTPUT JCL statement.

Using the aopfiltr.so filter
For each type of data format that Print Interface supports, you can specify the name of an associated filter. A filter is a program that can inspect and modify data before Print Interface writes the data to an output data set on the JES spool. When you specify the name of an filter for a supported data format in a printer definition, Print Interface automatically calls that filter before writing data to the JES spool.

Infoprint Server provides filter aopfiltr.so, which prepares text data for printing on ASCII printers. This filter converts ASCII line-feed controls that are not preceded by carriage-return controls to carriage-return and line-feed controls (X'0D0A'). The X'0D0A' control is suitable for most ASCII printers.

Guidelines:
- Specify filter aopfiltr.so for the text data format in all IP PrintWay printer definitions except when you select the VTAM protocol or the e-mail protocol.
Do not specify filter **aopfiltr.so** in a PSF printer definition.

### Procedure for specifying attributes

On the Processing panel of an IP PrintWay printer definition, specify:

- **Data format** field: Select the **Text** data format.
- **Filter** field: Specify the name of the **aopfiltr.so** filter. Type the absolute pathname if the filter is *not* in a directory named in the LIBPATH environment variable.
- **Resubmit for filtering** field: Do *not* select this field if the only filter you specify in the printer definition is **aopfiltr.so**. For more information about this field, see "Resubmitting documents to Print Interface for filtering (basic mode)" on page 217. Selecting this field can adversely impact system performance. This field applies only to IP PrintWay basic mode. IP PrintWay extended mode ignores it.

**Tip:** When you use the Infoprint Server ISPF panels to create an IP PrintWay printer definition, filter **aopfiltr.so** is automatically displayed in the **Filter** field on the Processing panel of an IP PrintWay printer definition when you select the LPR, direct sockets, IPP, or e-mail protocol.

### Example

This ISPF panel shows how to specify the **aopfiltr.so** filter that Infoprint Server provides in the Processing section of an IP PrintWay printer definition. Only a portion of the ISPF panel is shown.

```

### Using the LPD compatibility filter

For each type of data format that Print Interface supports, you can specify the name of an associated filter. A **filter** is a program that can modify data before Print Interface writes the data to an output data set on the JES spool. When you specify the name of a filter for a supported data format in a printer definition, Print Interface automatically calls that filter before writing data to the JES spool.
Infoprint Server provides the LPD compatibility filter, `lpd_compat.so`, which formats text data and line data in a similar way to the z/OS TCP/IP LPD and creates line data. This filter is suitable for use with the line data and text data formats for printers that accept line data.

The LPD compatibility filter, `lpd_compat.so`, provides support for some LPD command codes and parameters that the Print Interface LPD does not otherwise support. (LPD command codes and parameters are specified in the LPD control file sent by the LPR with each document to be printed.) This filter also lets you specify the `-f`, `-l`, and `-w` filter options, which correspond to the FILTER, LINECOUNT, and WIDTH parameters of the TCP/IP LPR command.

Table 17 summarizes the LPD command codes supported by the Print Interface LPD, with and without the LPD compatibility filter. For a full description of the LPD command codes, see RFC 1179.

1. The z/OS TCP/IP LPR command lets you specify these parameters as part of the job name: DEST, FOR, FORM, IDENTIFIER, LINECOUNT, OTHER, PASS, and PRIORITY. Print Interface does not support these parameters.
2. JES does not permit the Print Interface LPD to allocate data sets on the JES spool with the owner's name. Therefore, to make the owner name visible on the JES spool, the Print Interface LPD makes the owner name the job name except when IP PrintWay submits the data set to the Print Interface LPD. In this case, the Print Interface LPD keeps the original job name so that the operator can use the original job name to find the data set on the spool.
3. Print Interface automatically detects the data format of the input data stream and ignores the format specification in the command code. For example, Print Interface detects a PostScript data stream even if the o command code is not specified.
4. Without the compatibility filter, command codes f and l are equivalent. Print Interface leaves all ASCII control characters in the output data stream.
5. If an unsupported command code is specified in the LPD control file, the command code is ignored and no error is reported.
6. The Print Interface LPD, with or without the compatibility filter, does not support these functions that you can specify with the z/OS TCP/IP LPR command:
   - Carriage control specification
   - Top margin
7. The Print Interface LPD, with or without the compatibility filter, can print multiple copies of the same file when the LPD control file contains multiple lowercase command codes followed by the name of the same print file. (The Print Interface LPD always prints at least one copy of a file, even if no lowercase command code is specified in the LPD control file.)

Guidelines:
- If you want the functions that filter lpd_compat.so provides, specify it for the Text and Line data data formats in PSF printer definitions, General printer definitions, and in IP PrintWay printer definitions when you select the VTAM protocol.
- Do not specify filter lpd_compat.so in IP PrintWay printer definitions except when you select the VTAM protocol.
**Filter options**

As an option, when you specify the `lpd_compat.so` filter, you can also specify a filter code, a maximum line count, and a maximum line width in the printer definition. You specify these values in filter options. Job submitters can specify the same filter options in the Infoprint Server `filter-options` job attribute.

The `lpd_compat.so` filter accepts these options:

- `%filter-options`  
  Causes options specified in the `filter-options` job attribute (specified, for example, on the `lp` command) to be passed to the transform.

  You can type the `%filter-options` option in any position relative to the other filter options. If you specify filter options to the right of `%filter-options`, those options override the same options specified in the `filter-options` job attribute.

- `-f filter`  
  Specifies the type of filter processing. This option is used only if the `f`, `l`, `p`, and `r` command codes are not specified in the LPD control file. The default value is `f`. Valid values are:

<table>
<thead>
<tr>
<th>Filter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>f</code></td>
<td>Paginate the data, but do not add a heading. Truncate lines that exceed the maximum width. Discard any ASCII control characters except CR, FF, LF, BS, NL, VT, and HT.</td>
</tr>
<tr>
<td><code>l</code></td>
<td>Do not paginate the data or add a heading. Pass through all control characters.</td>
</tr>
<tr>
<td><code>p</code></td>
<td>Paginate the data, adding a heading to each page. The heading includes the date and time that Infoprint Server received the data, the title, and the page number. The title is the name of file as specified by the N (name) command code in the LPD control file, unless the T (title) command code is specified. After a page of text, a new page is started with a new page number. Truncate lines that exceed the maximum width.</td>
</tr>
<tr>
<td><code>r</code></td>
<td>Interpret the first column of each input line as a FORTRAN (ANSI) carriage control. Blank, &quot;1&quot;, &quot;0&quot;, &quot;+&quot; and &quot;,&quot; carriage controls are supported. Truncate lines that exceed the maximum width.</td>
</tr>
</tbody>
</table>

The filter values correspond to the values allowed on the `FILTER` parameter of the z/OS TCP/IP LPR command.

- `-l length`  
  Specifies the maximum number of lines to include on a page. This value applies only to filters `f` and `p`. The default value is 60 lines. To prevent Print Interface from inserting page breaks, specify 0.

  This option corresponds to the `LINECOUNT` subparameter of the z/OS TCP/IP LPR command and also to the `PAGESIZE` parameter of the z/OS TCP/IP SERVICE statement.

- `-w width`  
  Specifies the maximum number of columns to allow on a line. Lines longer than the number specified (except for the title line) are truncated. The number specified does not include the carriage control character at the beginning of each line. This value applies only to filters `f`, `p`, and `r`. It is...
used only if the W (width) command code is not specified in the LPD control file. The default action is that lines are not truncated.

This option corresponds to the WIDTH parameter of the TCP/IP LPR command and to the LINESIZE parameter of the TCP/IP SERVICE statement.

Procedure for specifying attributes

On the Processing panel of a printer definition, specify:

- **Data format** field: Select the data format to which the filter applies. For filter `lpd_compat.so`, select *Line data* and *Text*.

- **Filter** field: Specify `lpd_compat.so`. Type the absolute pathname if the filter is not in a directory named in the LIBPATH environment variable.

- **Resubmit for filtering** field: Do not select this field if the only filter you specify in the printer definition is `lpd_compat.so`. For more information about this field, see “Resubmitting documents to Print Interface for filtering (basic mode)” on page 217. Selecting this field can adversely impact system performance. This field applies only to IP PrintWay basic mode. IP PrintWay extended mode ignores it.

Example

This ISPF panel shows how to specify the `lpd_compat.so` filter that Infoprint Server provides in the Processing section of a PSF printer definition. Only a portion of the ISPF panel is shown.

```
  Processing
  
  Printer definition name . myprinter
  :
  :
  
  Supported Data Formats and Associated Filters:
  Data format: Filter:

  / Line data  lpd_compat.so -w 72 %filter-options (extend)
  _ MO:OCA-P __________________________________________________ (extend)
  _ PostScript __________________________________________________ (extend)
  _ Text  lpd_compat.so -w 72 %filter-options (extend)
  _ PCL __________________________________________________ (extend)
  _ PDF __________________________________________________ (extend)
  _ SAP __________________________________________________ (extend)
  _ XML __________________________________________________ (extend)
  _ TIFF __________________________________________________ (extend)
  _ JPEG __________________________________________________ (extend)
  _ Other _____________________________________________ (extend)
    
  _ Resubmit for filtering
    
  :
```

The filter options mean:

- The `%filter-options` option causes the filter to use any filter options that a job submitter specifies in the `filter-options` job attribute. For example, on an `lp` command.

- The `-w` option causes the filter to truncate lines that exceed 72 printable characters.

Because the `-w` option is specified to the left of `%filter-options`, a `-w` option specified in the `filter-options` job attribute overrides this value.
To print an MVS data set with a header on each page and a maximum width of 80 characters, a user could specify the `filter-options` job attribute on this `lp` command:

```
lp -d myprinter -o "filter-options='-f p -w 80'" "MYDATA"
```

### Using an installation-provided filter

For each type of data format (line-data, MO:DCA-P, PostScript, text, PCL, PDF, SAP, XML, and other), you can specify the name of an associated filter. A filter is a program that can inspect and modify data. When you specify the name of a filter for a supported data format in a printer definition, the filter is called when the data format is detected. Print Interface can call the associated filter (a filter is called only once for each data set) before it writes the data to an output data set on the JES spool.

Your installation can write its own filter program, either a DLL filter or a UNIX filter. For information about how to write a filter, see [z/OS Infoprint Server Customization](#).

### Procedure for specifying attributes

On the Processing panel, specify:

- **Data format** field: Select the data format of the input document that your filter applies to.
- **Filter** field: Specify the name of the filter followed by the options that you want to provide as command line arguments to the filter.
  - If the filter is a DLL filter, type the absolute pathname unless the filter is in a directory named in the LIBPATH environment variable.
  - If the filter is a UNIX filter, type `spawn` before the filter name. Type the absolute pathname of the filter unless the filter is in a directory named in the PATH environment variable.

### Example

This ISPF panel shows how to specify a UNIX filter written by your installation for line data. Only a portion of the ISPF panel is shown.

```
<table>
<thead>
<tr>
<th>Data format:</th>
<th>Filter:</th>
</tr>
</thead>
<tbody>
<tr>
<td>/ Line data</td>
<td>spawn /usr/mylib/my_unix_filter -a option operand (extend)</td>
</tr>
<tr>
<td>/ MD:DCAP</td>
<td>(extend)</td>
</tr>
<tr>
<td>/ PostScript</td>
<td>(extend)</td>
</tr>
<tr>
<td>/ Text</td>
<td>(extend)</td>
</tr>
<tr>
<td>/ PCL</td>
<td>(extend)</td>
</tr>
<tr>
<td>/ PDF</td>
<td>(extend)</td>
</tr>
<tr>
<td>/ SAP</td>
<td>(extend)</td>
</tr>
<tr>
<td>/ XML</td>
<td>(extend)</td>
</tr>
<tr>
<td>/ TIFF</td>
<td>(extend)</td>
</tr>
<tr>
<td>/ JPEG</td>
<td>(extend)</td>
</tr>
<tr>
<td>/ Other</td>
<td>(extend)</td>
</tr>
</tbody>
</table>
```

If the input data stream contains line data, Print Interface calls the `my_unix_filter` filter to transform line data. The option and operand that follow the filter name are passed to the filter.
Converting data from EBCDIC to ASCII or ASCII to EBCDIC

Print Interface can convert data from EBCDIC to ASCII or from ASCII to EBCDIC before writing text data to the JES spool. Print Interface automatically detects these types of formatted data and does not convert the data: JPEG, MO:DCA-P (also called AFP), PCL, PDF, PostScript, SAP, TIFF, and XML.

Print Interface uses the iconv utility provided with z/OS to convert text data between EBCDIC and ASCII code pages. You can specify the document and printer code pages that Print Interface uses as the source and target code pages. For more information about the iconv utility, see z/OS XL C/C++ Programming Guide.

If a filter is specified in the printer definition, Print Interface converts data from one code page to another before calling the filter.

Procedure for specifying attributes

On the Processing panel, specify:

- **Document code page** field: Leave this field blank, or specify the code page used to create documents submitted to this printer definition. In most cases, you should leave this field blank. If the field is blank, Print Interface determines the appropriate code page:
  - If the print request was submitted from the local z/OS system (with, for example, the lp command or the AOPPRINT procedure), Print Interface uses the document code page for the z/OS locale. This is usually an EBCDIC code page.
  - If the print request was submitted from a remote system, Print Interface uses the ASCII code page defined in the Infoprint Server configuration file or the default ASCII code page, ISO8859-1. For information about the configuration file, see z/OS Infoprint Server Customization.

Tip: To print ASCII documents from the local z/OS system, specify an ASCII code page (for example, IBM-850) in this field or ask the job submitter to specify the ASCII code page in the **document-codepage** job attribute.

- **Printer code page** field: Specify the code page the printer uses to print the job. In an IP PrintWay printer definition, specify the name of an ASCII code page (such as IBM-850). In a PSF printer definition, specify the name of an EBCDIC code page (such as IBM-037). If you use ISPF panels to create printer definition, the ASCII or EBCDIC code page specified in the Infoprint Server configuration file is displayed in this field.

Tip: If this field is blank, Print Interface does not convert data from one code page to another.

Tips:
1. You can specify any code pages supported by z/OS. For code page names, see z/OS XL C/C++ Programming Guide.
2. If you specify a custom code page, make sure that conversion tables exist to convert between these code page:
   - The code pages in the Document code page and Printer code page fields.
   - The code page for the z/OS locale and the custom code page. The locale is set in the LC_CTYPE environment variable and in the Language field of the Infoprint Server ISPF Configuration panel.
3. You do not need to specify code page attributes in the printer definition unless you need to change either the document or printer code page. If you use the Infoprint Server ISPF panels to create printer definitions, by default, the printer code page field already contains the name of either an EBCDIC or ASCII code page, depending on the printer. In an IP PrintWay printer definition, the default code page is the ASCII code page specified in the Infoprint Server configuration file. In a PSF or General printer definition, the default code page is the EBCDIC code page specified in the Infoprint Server configuration file.

Mapping output bin and input tray names to numbers for an AFP printer

The input tray is the tray on the printer that serves as the paper source. The output bin is a bin on the printer where printed jobs are delivered. The input-tray and output-bin job attributes let users specify a tray name, such as 3-hole and a bin name, such as staple.

If you define input tray or output bin names in a printer definition, a job submitter or VTAM application can use those names in the input-tray or output-bin job attribute. If you do not define any tray or bin names, Print Interface and NetSpool ignore the input-tray or output-bin job attribute. If, however, you define some tray or bin names, Print Interface and NetSpool reject a print request that specifies an undefined tray or bin name in the job attribute.

When you define input tray names, you must map the names to the numbers that an AFP printer uses for paper-source identification. When you define output bin names, you must map the names to the bin numbers that an AFP printer uses for output-bin identification. For tray and bin numbers that the printer uses, see your printer documentation.

Tip: Whether or not you define input tray or output bin names in a printer definition, a job submitter can specify the tray and bin number directly using the input-tray-number and output-bin-number job attributes or the INTRAY and OUTBIN JCL parameters. The job submitter can specify any tray and bin numbers. You do not need to specify the numbers in the printer definition.

Procedure for specifying attributes

On the Processing panel, specify:

- **Input tray name** and **Number** fields: Specify a name and the tray number used by the AFP printer.
- **Output bin name** and **Number** fields: Specify a name and the bin number used by the printer.

Example

This ISPF panel shows how to map input tray names and output bin names to numbers in the Processing section of a PSF printer definition. Only a portion of the ISPF panel is shown.
If a user specifies the `input-tray=envelope` job attribute, Print Interface and NetSpool allocate the output data set on the JES spool with tray number 65. If the printer is an AFP printer, PSF uses tray number 65 when communicating with the printer.

If a user specifies the `output-bin=staple` attribute on the `lp` command, Print Interface and NetSpool allocate the output data set with bin number 4. If the printer is an AFP printer, PSF uses bin number 4 when communicating with the printer.

### Using the Print Interface subsystem

A z/OS job submitter can specify the `SUBSYS` parameter on the DD JCL statement to request that the Print Interface subsystem process output data created by the batch application. `SUBSYS` subparameters are:

- Name of the Print Interface subsystem
- Name of the printer definition to use
- Infoprint Server job attributes

The job submitter can also specify other parameters on the DD and `OUTPUT` JCL statements that the Print Interface subsystem supports.

The Print Interface subsystem transforms data from one format to another (if transforms are requested in the printer definition) and allocates a `sysout` data set on the JES spool. The Print Interface subsystem can be used to print on any type of printer.

When you create a printer definition to be used with the Print Interface subsystem, you do not need to specify any special fields. Therefore, if you have already created a printer definition, no changes are required.

Typically, you create one printer definition for each printer. However, when creating printer definitions to be used just with the Print Interface subsystem, you can simplify administration by creating only one printer definition for all printers that share the same attributes. If you create one printer definition for printing to several printers, the job submitter must specify the JCL parameters that are required to direct the output to the desired printer:

- If you create one PSF printer definition for all printers controlled by PSF, the job submitter must specify the JCL parameters that correspond to the JES work-selection criteria for that printer. For example, the output class and destination name.

**Example:** This example shows the DD and `OUTPUT` statements that can be used to direct output to a specific PSF printer using a printer definition named `anyafpprinter`. 
• If you create one IP PrintWay printer definition for all printers that use the LPR protocol, the job submitter must specify the printer’s IP address and print queue name.

Example: This example shows the DD and OUTPUT statements that can be used to direct output to a specific printer using a printer definition named anypsprinter:

```plaintext
//JOB2  JOB ...
//STEP1  EXEC PGM=USERA
//OUTDS1 OUTPUT DEST='IP:PRINTER1.XYZ.COM',PRTQUEUE='queue'
//DD1    DD SUBSYS=(AOP1,'anypsprinter'),OUTPUT=(*.OUTDS1)
```

• If you create one IP PrintWay printer definition for all printers that use the direct sockets protocol, the job submitter must specify the printer’s IP address and port number on the OUTPUT JCL statement.

Example: This example shows the DD and OUTPUT statements that can be used to direct output to a specific printer using a printer definition named anynetprinter:

```plaintext
//JOB2  JOB ...
//STEP1  EXEC PGM=USERA
//OUTDS1 OUTPUT DEST='IP:PRINTER2.XYZ.COM',PORTNO='2501'
//DD1    DD SUBSYS=(AOP1,'anynetprinter'),OUTPUT=(*.OUTDS1)
```

Guideline: Create one printer definition for each printer so that users can use all job submission methods to print on the printer, including those job submission methods that do not permit the job submitter to specify the JES output class, destination name, or IP address. For example, the `lp` command does not let you specify the JES output class or destination name. And, when the IP PrintWay basic mode `resubmit for filtering` option is used, the printer’s IP address cannot be specified on the OUTPUT JCL statement.

When the Print Interface subsystem is used, JES always assigns each data set to a separate JES output group. This is true even if the data set would otherwise be in the same JES output group as other data sets in the job step. Therefore, if the printer is controlled by IP PrintWay, these results occur:

• Data sets in the same job step might not print together or might not print in the original order.
• Data sets in the same job step are always sent in separate e-mails.
• If you currently add a separator page before the first data set in a JES output group, that separator page now prints before each data set.

Related task: Create a default Infoprint Server printer definition, as described in “Creating the Infoprint Server default printer definition” on page 109.

Procedure for specifying attributes

When you create a printer definition to be used with the Print Interface subsystem, the fields in these sections of the printer definition have special considerations:

• Main section:
  - **Printer definition name** field: To use the Print Interface subsystem, the job submitter must specify the printer definition name in either the SUBSYS or FSSDATA JCL parameter. This name is case-sensitive. Therefore, the job submitter must enter it exactly as you specify it in the printer definition.
- **Use DEST, CLASS, and FORMS for IP PrintWay printer selection** field: The Print Interface subsystem ignores this field. The job submitter must specify the name of the printer definition. If none is specified, the Infoprint Server default printer definition is used. For information, see “Creating the Infoprint Server default printer definition” on page 109.

- **Allocation** section: The job submitter can specify JCL parameters and job attributes that correspond to all of the attributes in this section of the printer definition. Therefore, these attributes are not required. The JCL parameters and job attributes specified during job submission override the attributes specified in the printer definition.

  **Guideline:** Even though the job submitter can specify these same attributes in JCL parameters, specify default values for required JCL parameters, for example:

  - In a PSF printer definition, if the JES output class and destination name are JES work-selection criteria for the printer, specify the CLASS and DEST fields. If you do, the job submitter can omit the CLASS and DEST parameters on the OUTPUT JCL statement.
  - In an IP PrintWay printer definition, if the JES output class is the JES work-selection criteria for IP PrintWay, specify the CLASS field. If you do, the job submitter can omit the CLASS parameter on the OUTPUT JCL statement.

- **Processing** section:

  - **Filter** field: Specify transform filters. For information, see Chapter 15, “Planning printer definitions for transforms,” on page 225.
  - **Resubmit for filtering** field: IP PrintWay ignores this field because the Print Interface subsystem has already transformed the data.

    **Guideline:** If you run IP PrintWay basic mode, select this field so that IP PrintWay can transform data sets.

  - **Maximum document size** field: If the transformed data written to the sysout data set exceeds the number of bytes specified in this field, the Print Interface subsystem does not allocate any data sets in the job step and returns a JCL error.

  - **Maximum copies** and **xxxx-supported** fields: The Print Interface subsystem validates that values in the corresponding JCL parameters and job attributes are supported. If not, the Print Interface subsystem does not allocate any data sets in the job step and returns a JCL error. For more information, see “Validating that documents can print as requested” on page 92.

- **NetSpool Options** section: NetSpool does not use the Print Interface subsystem. Therefore, the Print Interface subsystem ignores attributes specified in this section.

- **NetSpool End-of-File** section: NetSpool does not use the Print Interface subsystem. Therefore, the Print Interface subsystem ignores attributes specified in this section.

- **IP PrintWay Options** section: The **Dataset grouping** field does not apply because JES assigns each data set to a different JES output group.

- **Protocol** section: You must fill in the required fields. However, the **DEST=IP:, PRTQUEUE, and PORTNO** parameters on the OUTPUT JCL statement override the printer's IP address, print queue name, and port number.

---

**Example 1. A PSF printer definition**

These ISPF panels show a printer definition that can be used for printing to a PSF-controlled printer using the Print Interface subsystem. Only a portion of some ISPF panels are shown.

| **Maximum document size** | ________ |
| **Maximum copies** | _____ |
| **Forms supported** | ________ ________ ________ ________ ________ |
| **Duplex supported** | / Simplex / Duplex / Tumble |
| **Print-error reporting supported** | / Character / Position |

**Result:** A job submitter can use these JCL statements to print a PostScript document on this printer:

```
//JOB1 JOB ...
//STEP1 EXEC PGM=USERA
//OUTDS1 OUTPUT FORMDEF=MYFDEF,USERLIB=MYLIB
//DD1 DD SUBSYS=(AOP1,'myafpprinter','filter-options="-a io1"'),
// DSNNAME=&&MYDATA,OUTPUT=*.OUTDS1
```

1. The Print Interface subsystem accepts line data, AFP data, PCL data, PostScript data, PDF data, SAP data, and XML data. It calls the associated transform if a
filter is specified. It passes any transform options, such as the -a option, that were specified in the filter-options attribute in the SUBSYS JCL parameter to the transform.

2. The Print Interface subsystem allocates a sysout data set on the JES spool with output class F, destination name PRT003, and data set name MYDATA. JES defaults apply for other output parameters that are not specified in the JCL or in the Allocation section of the printer definition. For example, the JES default form name is used.

3. The Print Interface subsystem writes the transformed data to the sysout data set.

4. The PSF printer that prints data sets in class F with destination name PRT003 selects the data set from the JES spool and prints it, using form definition F1MYFDEF in library MYLIB to format the data.

Example 2. An IP PrintWay printer definition
These ISPF panels show a printer definition that can be used for printing to an IP PrintWay-controlled printer that accepts PCL data using the Print Interface subsystem. Only a portion of some ISPF panels are shown.
Result: A job submitter can use these JCL statements to print AFP data to the printer:

```
//JOB1 JOB ...
//STEP1 EXEC PGM=USERA
//OUTDS1 OUTPUT FORMDEF=MYFDEF,USERLIB=MYLIB
//DD1 DD SUBSYS=(AOP1,'mypclprinter'),DSNAME=&MYDATA,
//      OUTPUT=*.OUTDS1
```

1. The Print Interface subsystem accepts text data, line data, AFP data, or PCL data and calls the associated transform. The AFP to PCL transform uses form definition F1MYFDEF in library MYLIB to format the data.

2. The subsystem allocates a sysout data set on the JES spool in JES output class P with data set name MYDATA. JES defaults are used for output parameters that are not specified in the JCL or in the Allocation section of the printer definition.

3. If IP PrintWay is customized to select data sets in output class P, IP PrintWay selects the data set from the JES spool and sends the data to the printer whose address is specified in printer definition mypclprinter.
Creating the Infoprint Server default printer definition

The default Infoprint Server printer definition is used in these situations:

- **lp command**: When the job submitter does not specify a printer definition on the lp command and the PRINTER and LPDEST environment variables are not set
- **Print Interface subsystem**: When the printer definition is omitted in the SUBSYS parameter on the DD JCL statement and the FSSDATA parameter is not specified on the OUTPUT JCL statement

You can use any printer definition that you have already created as the default printer definition. However, you must specify the name of the default printer definition on the Infoprint Server Configuration panel. By default, the name of the default printer definition is `lp1`.

**Procedure for specifying the name of the default printer definition**

To specify the name of the default printer definition:

1. On the Infoprint Server: Printer Inventory Manager panel, select 7 Configure.
2. On the Configuration panel, specify the name in the Default printer field.

**Example**

This ISPF panel shows how to specify the name of the default printer definition.

```
Configuration

Printer Inventory:
  Configuration file: /etc/Printsrv/aopd.conf
  NLS path: /usr/lpp/Printsrv/En_US/%N
  Language: En_US
  Default printer: default-printer

Results:
- The lp command uses the printer definition named default-printer if the job submitter does not specify a printer definition name and the PRINTER and LPDEST variables are not set.
- The Print Interface subsystem uses the printer definition named default-printer if the job submitter does not specify a printer definition name.
```
Chapter 13. Planning printer and printer pool definitions for NetSpool

Before you can use NetSpool to print VTAM application data, you must specify fields (attributes) that NetSpool uses in the printer definition. Table 47 on page 448 summarizes the attributes that NetSpool uses and indicates whether each attribute is required or optional. If a printer definition does not already exist for the printer or e-mail destination, you must create one. If a printer definition already exists, edit it and specify the attributes that NetSpool uses.

You can configure printer definitions for use by NetSpool before or after starting the NetSpool program. If NetSpool is already started, NetSpool automatically starts the printer LU when you save the printer definition, provided that the printer LU is assigned to one of the LU classes that NetSpool has started. If the printer LU is not active in VTAM, NetSpool automatically starts it when the printer LU becomes active.

If you change printer attributes in an existing printer definition while a VTAM session with the printer LU is active, in most cases NetSpool uses the changed values when it allocates the next output data set on the JES spool. However, changes to the LU class and end-of-file rules are related to the VTAM session and do not take effect with the next data set. For information, see “Grouping NetSpool printer LUs into LU classes” on page 112 and “Specifying how NetSpool determines end-of-file” on page 130.

In addition to configuring the printer definition for use by NetSpool, you must also define the NetSpool printer LU name to VTAM. If NetSpool is already started, define the printer LU to VTAM before configuring the printer definition, because NetSpool attempts to start the printer LU as soon as the printer definition is saved in the Printer Inventory. For information, see Chapter 17, “Defining NetSpool printer LUs to VTAM,” on page 239.

These topics describe how to specify printer attributes required to do these tasks:

Mapping output bin and input tray names to numbers for an AFP printer | 138

**Note:** For detailed information about each attribute (including the values you can specify, restrictions, and examples), use the online help for each field on the ISPF panels.

### Specifying the NetSpool printer LU name

In each printer definition, you must specify the NetSpool printer logical unit (LU) name that you want to associate with the printer. NetSpool uses this name to establish a session with VTAM applications. This name is the VTAM secondary LU (SLU) name and must match the name in the ACB parameter of the APPL statement. For information about how to select NetSpool printer LU names and how to create APPL statements, see Chapter 17, "Defining NetSpool printer LUs to VTAM," on page 239.

Each printer LU name in the Printer Inventory must be unique. That is, you cannot specify the same LU name in more than one printer definition. If you need to associate more than one NetSpool printer LU name with the same printer, you must create additional printer definitions for that printer. These printer definitions can be identical except for the printer definition name and the NetSpool LU name.

If the printer LU name is in one of the LU classes that NetSpool has started, NetSpool automatically attempts to start a VTAM session with the printer. If the printer LU is not yet active in VTAM, NetSpool automatically starts the printer when the printer LU becomes active. If the printer LU name is not in one of the started LU classes, the operator must use the NetSpool ADD command to add it. For information, see "Starting NetSpool printer LUs" on page 20.

IBM recommends that you do not change the LU name in a printer definition while a VTAM session with the printer is active.

### Procedure for specifying attributes

To specify the NetSpool printer LU name, specify this attribute on the first ISPF panel displayed for the printer definition:

- **LU Name** field: Specify the LU name.

"Main ISPF panel for an IP PrintWay printer definition" on page 455 shows the ISPF panel that you use to specify LU name. Use the online help for the ISPF panel and the help for each field on the panel for more information.

### Grouping NetSpool printer LUs into LU classes

NetSpool lets you group NetSpool printer LUs into *logical-unit classes*. A class is identified by a number from 1 to 64.

You might want to group logical printers into classes for these reasons:

- To start classes of logical printers at different times. For example, you might want to process requests for one class of printers during the day and process requests for another class of printers during the night.
To spread processing of different classes of logical printers over different address spaces. You might want to do this if you have a large number of logical printers.

The NetSpool startup procedure identifies which LU classes NetSpool is to start. After NetSpool is started, the operator can dynamically start and stop individual logical printers that are in different classes from those specified when NetSpool was started. For information about the NetSpool startup procedure, see [Infoprint Server Customization](#). For information about how to start printers in other classes, see Chapter 3, “Starting and stopping the NetSpool task and NetSpool LUs,” on page 17.

Each NetSpool printer LU can belong to one or more LU classes. If you assign a printer LU to more than one class, NetSpool starts that printer LU when you start any one of the classes. For example, if you assign a printer LU to classes 1 and 2, NetSpool starts the printer LU if either class 1 or class 2 is specified in the NetSpool startup procedure.

Grouping NetSpool LUs into classes is optional. If you do not specify an LU class, NetSpool assigns the printer LU to class 1. When you start NetSpool, start class 1 and NetSpool starts all printer LUs defined in the Printer Inventory.

You can change the LU class for a printer definition. If you change the LU class after NetSpool has started the printer LU, NetSpool takes these actions:

- If the new LU class is one of the classes that NetSpool has started, NetSpool automatically attempts to start the printer LU.
- If the new LU class is not in one of the started LU classes, NetSpool stops the printer LU after the VTAM application ends the session.

### Procedure for specifying attributes

On the first ISPF panel for the printer definition, specify:

- **LU Classes** field: Specify one or more LU classes, each class represented by a number (1 – 64).

  > “Main ISPF panel for an IP PrintWay printer definition” on page 455 shows the ISPF panel that you use to specify LU classes.

### Specifying JES allocation parameters

You must specify attributes in the Allocation section of a printer definition to tell NetSpool how to allocate output data sets on the JES spool. For example, you can specify the JES output class or destination name.

Each attribute in the Allocation section of a printer definition corresponds to a parameter that you can specify on an OUTPUT JCL statement. [Allocation attributes and corresponding OUTPUT or DD statement parameters](#) lists fields in the Allocation section and the corresponding OUTPUT JCL parameters. For a full explanation of each JCL parameter, see [z/OS MVS JCL Reference](#). The ISPF online help for each field summarizes the meaning of each field.

Some of the attributes apply only if the printer is a PSF printer or the printer definition specifies a transform. For information about the fields that apply when you use a transform, see the documentation for the transform.
Print Interface also uses the attributes in the Allocation section to allocate data sets on the JES spool. In most cases, the same attributes are suitable for both NetSpool and Print Interface. If you need to specify unique attributes for NetSpool, you must create two separate printer definitions for the same printer.

Procedure for specifying attributes

On the Allocation panel, specify:

- **Spool allocation values** heading: The fields under this heading correspond to the OUTPUT JCL parameters that JES can use to direct output data sets from the JES spool to IP PrintWay, a PSF printer, or another JES functional subsystem application (FSA):
  - In a PSF printer definition, specify the JES work-selection criteria defined for the PSF printer FSA. For example, if the JES work-selection criteria are class E and destination BLDG5, specify E in the CLASS field and BLDG5 in the DEST field.
  - In an IP PrintWay basic mode printer definition, specify the JES work-selection criteria defined for the IP PrintWay basic mode FSA. For example, if the work-selection criterion is class P, specify P in the CLASS field.
  - In an IP PrintWay extended mode printer definition, specify the job-selection criteria defined in the IP PrintWay extended mode job selection rule. For example, if the job-selection criterion is class P, specify P in the CLASS field.

  **Tip:** JES work-selection criteria are defined in the JES3 DEVICE statement and the JES2 PRTnnnnn statement.

- Specify other fields that transforms, PSF, or IP PrintWay use:
  - If your installation uses the transforms, specify fields that the transforms use. For information about these fields, see the documentation for the transform.
  - In an IP PrintWay printer definition, specify fields that IP PrintWay uses. For information about these fields, see “Specifying allocation parameters for IP PrintWay” on page 179.
  - In a PSF printer definition, specify fields that correspond to the JCL parameters that PSF uses. For information about these JCL parameters, see PSF for z/OS: User’s Guide.

  **Tip:** If you need to specify the same allocation attributes in more than one printer definition, specify the attributes in an Allocation component. Then, include that component in each printer definition to which the component applies.

**Example**

This ISPF panel shows how to specify an output class and destination in the Allocation section of a printer definition.
NetSpool allocates output data sets in JES output class E and with destination name BLDG5. The FSA defined to JES with work-selection criteria of class E and destination BLDG5 selects the output data set for printing.
Converting SCS and 3270 data streams to line data streams

In each printer definition, you can select a NetSpool formatting option. The formatting option controls how NetSpool formats the data streams created by your VTAM applications. You can select one of these formatting options:

- Convert to line (default)
- Convert to PCL
- None

To convert data streams to line data or to PCL format, a separate transform product is not required.

This section describes the Convert to line formatting option. When you select the Convert to line option, NetSpool converts SCS data streams (on VTAM LU type 1 sessions) and 3270 data streams (on VTAM LU type 0 and type 3 sessions) to line data streams.

You can select the Convert to line option for a wide range of printers, including:

- Line printers controlled by JES
  Line printers that natively accept line data streams.
- AFP printers controlled by PSF
  AFP printers do not natively accept line data streams. However, PSF can convert line data streams to Intelligent Printer Data Streams (IPDS™), which AFP printers accept.
- Network printers controlled by IP PrintWay
  Network printers do not natively accept line data streams. However, IP PrintWay can convert line data streams to ASCII text data streams, which most network printers accept. If you install the separately priced AFP to PCL, AFP to PDF, or AFP to PostScript transform, NetSpool can convert line data streams to PCL, PDF, or PostScript data streams.

**Tip:** The NetSpool Convert to PCL formatting option is also suitable for most network printers. When NetSpool converts input data streams to PCL data streams, it can support more of the formatting options in the original data streams, such as print density and line density, than when it converts to line data streams.

When you select the Convert to line option, NetSpool converts the printable data, SCS controls, and 3270 controls in the input data stream to line data with ANSI carriage-control characters. Carriage-control characters control line spacing and skipping operations. NetSpool supports most of the SCS and 3270 controls in the input data stream that are associated with printing. However, NetSpool ignores those SCS and 3270 controls for which no equivalent support exists in line data. NetSpool writes the line data to the JES spool in variable-length, blocked records, with a maximum record size of 4092 bytes.

To fill in the fields in the printer definition that are related to NetSpool formatting, you should understand these functions that NetSpool provides when you select the Convert to line option:

- **Page formatting:** NetSpool formats data into lines and pages before writing it to the JES spool. The page formatting is different for SCS and 3270 input data streams.
- **SCS data streams:** NetSpool uses the SCS Set Horizontal Format (SHF) and SCS Set Vertical Format (SVF) controls in the input data stream to format data into
lines and pages. The SHF and SVF controls specify page-formatting values such as line length, page length, margins, and tabs. The SHF and SVF controls take effect immediately and remain in effect until either the next SHF or SVF control or until NetSpool establishes another VTAM session with the printer.

If the SCS data stream does not contain SHF and SVF controls, NetSpool uses default values. In each printer definition, you can specify the default values that NetSpool is to use for the line length, page length, margins, and tabs.

3270 data streams: NetSpool uses the 3270 Write Control Characters (WCCs) in the input data stream to format data into lines and pages. To change page-formatting values for 3270 data, the application programmer must change the WCCs generated by the VTAM application that creates the 3270 data. NetSpool does not use the SCS default page-formatting values specified in the printer definition when it formats 3270 data.

- **DBCS support:** NetSpool supports these SCS and 3270 controls and orders, which identify double-byte character set (DBCS) strings:
  - Shift Out and Shift In
  - Set Attribute, with the Character Set attribute

In addition, NetSpool supports these 3270 orders, which identify DBCS strings:
  - Start Field Extended with the Character Set attribute
  - Modify Field with the Character Set attribute

In place of these controls and orders, NetSpool inserts Shift Out and Shift In line-data controls where necessary in the line-data output. When you print DBCS data on printers controlled by PSF, you must select the PSF **SOSI2** option to prevent printing unwanted blanks.

For tables that describe how NetSpool converts SCS and 3270 data streams to line data streams, see [z/OS Infoprint Server Customization](#).

**Procedure for specifying attributes**

To convert SCS and 3270 data streams to line data streams:

1. On the NetSpool Options panel, select the **Convert to line** formatting option.

2. (Optional) On the Processing panel, specify these default page-formatting values, which NetSpool uses for input SCS data streams only:
   - **Line length** field: Specify the maximum number of columns on each line. This is the default value for the SCS maximum presentation position (MPP) value. Allowed values are 1-255. The default value is 80.
   - **Page length** field: Specify the maximum number of lines per page. This is the default value for the SCS maximum presentation line (MPL) value. Allowed values are 1-255. The default value is 1, which means that NetSpool does not control the number of lines that are placed on a page. The VTAM application controls the number of lines per page.
   - **Margins: Left** field: Specify the column number at which you want data to start on each line. This is the default value for the SCS left margin (LM) value. Allowed values are 1-255. The default value is 1.
   - **Margins: Right** field: Specify the column number at which you want data to end on each line. This is the default value for the SCS right margin (RM) value. Allowed values are 1-255. The default value is 80.
   - **Margins: Top** field: Specify the line number of the first line on each page. This is the default value for the SCS top margin (TM) value. Allowed values are 1-255. The default value is 1.
• **Margins: Bottom** field: Specify the line number of the last line of data on each page. This is the default value for the SCS bottom margin (BM) value. Allowed values are 1-255. The default value is 1 (no bottom margin).

If you specify a value of 1, NetSpool does not insert form feeds when the input data stream spaces past the bottom margin. However, NetSpool does insert form feeds when an explicit form feed or a Select Vertical Channel command occurs in the input data.

• **Tabs: Horizontal** field: Specify horizontal tabs. This is the default value for the SCS horizontal tab (HT) value. Allowed values are 0-255. The default is no horizontal tabs. The input data stream can add additional tab positions but cannot remove default tabs set in this field.

NetSpool always sets the first tab to the left margin value. Therefore, do not specify it. NetSpool ignores a value of 0. In this example, NetSpool sets horizontal tabs at columns 6, 15, 50, 75, and 100.

```
SCS Conversion:
Margins: Top .. ___ Bottom .. ___ Left .. 6 Right .. ___
Tabs: Vertical .. ___ ___ ___ ___ ___ (extend)
       Horizontal . 15 50 75 100 ___ (extend)
```

• **Tabs: Vertical** field: Specify vertical tabs. This is the default value for the SCS vertical tab (VT) value. Allowed values are 0-255. The default is no vertical tabs.

NetSpool always sets the first tab to the top margin value. Therefore, do not specify it. NetSpool ignores a tab value of 0. NetSpool uses the first eleven tabs as line numbers for Select Vertical Channel 2 through 12. In this example, NetSpool sets:
- Vertical tabs at lines 6, 20, 40, and 50
- Vertical channels are set: CH01=6, CH02=20, CH04=40, CH05=50

These vertical channels are *not* set: CH03, CH06 through CH12.

```
SCS Conversion:
Margins: Top .. 6  0  40  50 ___ (extend)
Tabs: Vertical .. 20 ___ ___ ___ ___ (extend)
```

3. **(Optional)** If you want to send the data in PDF format in an e-mail, specify the AFP to PDF transform in the **Filter** field.

4. If the printer is controlled by PSF and you print DBCS output, on the **Allocation** panel, specify:

   • **PRMODE** field: Specify **SOSI2**.
   • **Character sets** field: Specify a single-byte font and a double-byte font.

**Tip:** If you need to specify the same fields in more than one printer definition, specify the fields in components. Then, include those components in each printer definition to which the components apply.

**Examples**

These examples show how to fill in the ISPF panels to convert SCS and 3270 input data streams to line data streams.
Example 1. Converting SCS data streams to line data streams: This ISPF panel shows how to request that NetSpool convert input data streams from VTAM applications to line data streams.

```
NetSpool Options

Printer definition name . myprinter

Formatting . . . . 2  1. None  2. Convert to line  3. Convert to PCL
   Record size . .
   RECFM . . . . . 1. VB  2. VBA  3. VBM
```

This ISPF panel shows how to specify default page-formatting values for SCS data streams.

```
Processing

SCS Conversion:
   Margins: Top . .6  Bottom .61  Left . .3  Right .75
   Line length . .80
   Page length . .80
   Tabs: Vertical . .
   Horizontal . .5  10  15  20  . (extend)
```

Example 2. Converting 3270 data streams to line data streams: This ISPF panel shows how to request that NetSpool convert input data streams from your VTAM applications to line data streams.

```
NetSpool Options

Printer definition name . myprinter

Formatting . . . . 2  1. None  2. Convert to line  3. Convert to PCL
   Record size . .
   RECFM . . . . . 1. VB  2. VBA  3. VBM
```

Converting SCS and 3270 data streams to PCL data streams

In each printer definition, you can select a NetSpool formatting option. The formatting option controls how NetSpool formats the data streams created by your VTAM applications. You can select one of these formatting options:

- Convert to line (default)
- Convert to PCL
- None

To convert data streams to line data or to PCL format, a separate transform product is not required.

This section describes the Convert to PCL formatting option. When you select the Convert to PCL option, NetSpool converts SCS data streams (on VTAM LU type 1 sessions) and 3270 data streams (on VTAM LU type 0 or type 3 sessions) to Printer Control Language (PCL) 5 data streams.
You can select **Convert to PCL** for printers controlled by IP PrintWay that accept PCL data streams. When you select this option, IP PrintWay automatically transmits PCL data streams created by NetSpool to the printer without additional page formatting.

Most printers that accept PCL data streams can also accept text data streams. Therefore, for these printers you can select either the NetSpool **Convert to PCL** or the **Convert to line** formatting option. The **Convert to PCL** option provides these additional functions:

- For SCS data streams, NetSpool can support this additional print control functions in the input data stream, thereby providing better print fidelity:
  - Line-density and print-density
  - Page orientation
  - Paper-source and output-bin
  - Job-separation
  - Duplex

  When you select the **Convert to line** option, NetSpool cannot fulfill these requests in the input data stream due to limitations in line data.

- For SCS data streams, NetSpool can automatically change the orientation of the page between portrait and landscape on a page by page basis. NetSpool can also reduce print output, if necessary, to make the data fit on the line or page.

- For both SCS and 3270 data streams, NetSpool lets you specify the line density, print density, and page orientation for each printer in the printer definition. This means that you do not need to set these values at the printer's control panel or specify the PCL commands in the IP PrintWay **Document header** field.

The **Convert to PCL** option is *not* suitable, however, in these printing situations. Therefore, in these situations, instead select the **Convert to line** option:

- The printer is controlled by JES or PSF. JES and PSF do not accept PCL data.
- Your VTAM applications generate DBCS data. NetSpool cannot support DBCS data when you select the **Convert to PCL** option.
- You want to use a form definition and page definition to format your data and print it on a PCL printer. In this case, select the NetSpool **Convert to line** option and also use the AFP to PCL transform to convert line data streams created by NetSpool to PCL data streams.

When you select the **Convert to PCL** option, NetSpool converts EBCDIC data, SCS controls, and 3270 controls in the input data stream to ASCII data and PCL commands. NetSpool supports most of the SCS and 3270 controls in the input data stream that are associated with printing. NetSpool ignores those SCS and 3270 controls for which no equivalent PCL commands exist. NetSpool writes PCL data streams to the JES spool in variable-length, blocked format, with a maximum record size of 32752 bytes.

To fill in the fields in the printer definition that are related to NetSpool formatting, you should understand these functions that NetSpool provides when you select the **Convert to PCL** option:

- **EBCDIC to ASCII conversion**: NetSpool converts data from EBCDIC to ASCII before writing it to the JES spool. To convert data to ASCII, NetSpool converts data from an EBCDIC code page (also called the *document code page*) to an ASCII code page (also called the *printer code page*) using the IBM iconv utility. For most printing situations, the default document and printer code pages that NetSpool uses are suitable. However, in each printer definition, you can specify different document and printer code pages.
• **Page formatting:** NetSpool formats data into lines and pages before writing it to the JES spool. The page formatting is different for SCS and 3270 input data streams.

**SCS data streams:** NetSpool uses SCS Set Horizontal Format (SHF) and SCS Set Vertical Format (SVF) controls to format data into lines and pages. The SHF and SVF controls specify page-formatting values such as line length, page length, margins, and tabs. The SHF and SVF controls take effect immediately and remain in effect until either the next SHF or SVF control or until NetSpool starts writing a new output data set to the JES spool.

If the SCS data stream does *not* contain SHF and SVF controls, NetSpool uses default values. In each printer definition, you can specify the default values that NetSpool is to use for the line length, page length, margins, and tabs.

**3270 data streams:** NetSpool uses page-formatting values in the 3270 Write Control Characters (WCCs) in the 3270 data stream to format data into lines and pages. To change page-formatting values for 3270 data, the application programmer must change the WCCs generated by the VTAM application that creates the 3270 data. For 3270 data streams, NetSpool does *not* use any of the default page-formatting values for line length, page length, margins, and tabs that you specify in the printer definition.

• **Print density, line density, and page orientation:** NetSpool can generate PCL commands to set the print density (characters per inch), line density (lines per inch), and page orientation (portrait or landscape). NetSpool processing differs for SCS and 3270 data streams.

  – **SCS data streams:** NetSpool converts the SCS Set Print Density (SPD) and SCS Set Line Density (SLD) controls in the input data stream to corresponding PCL commands. In each printer definition, you can specify the default print density and line density that NetSpool is to use when the SCS data stream does not contain SPD and SLD controls. The SCS data stream does not contain orientation controls. However, in each printer definition, you can specify the page orientation that NetSpool is to use. Also, you can request that NetSpool automatically determine the appropriate orientation of each page, as described below.

  – **3270 data streams:** 3270 data streams do *not* contain print density, line density, and page orientation information. In each printer definition, you can specify the print density, line density, and page orientation that NetSpool is to use.

For both SCS and 3270 data streams, if you do not specify density or orientation values in the printer definition, the values set at the printer’s control panel are used unless the density and orientation are specified in another location. Density and orientation can be specified in several places. If they are specified in more than one place, the *first* value in this list is used. For example, a value specified in the SCS data stream overrides all other values.

1. SCS controls that occur in the input SCS data stream, including any PCL commands and SCS controls added by the NetSpool Transparent Data exit
2. PCL commands or SCS controls added by the NetSpool Beginning of File exit
3. Density and orientation values you specify in the printer definition under the **NetSpool PCL Conversion** heading
4. PCL commands you specify in the IP PrintWay **Document header** field in the printer definition
5. PCL commands added by the IP PrintWay Begin Data Set exit
6. The default value set at the printer’s control panel

• **Automatic page orientation (SCS data streams only):**
When you select the automatic page orientation option in the printer definition, NetSpool automatically determines the appropriate orientation (portrait or landscape) of each page based on the line length and page length of that page. If necessary, NetSpool reduces the size of the print (the font size) and increases the line density so that data fit on a line.

NetSpool uses the line and page lengths specified in SCS controls and in the **Print density**, **Line density**, **Line length**, and **Page length** fields to determine the appropriate page orientation for each page. If the line length is greater than the page length, NetSpool sets the orientation to landscape. Otherwise, it sets the orientation to portrait. When NetSpool sets the orientation to landscape, if the **Line length** field (or the MPP in the SCS SHF control) is greater than 106, NetSpool sets the print density to 15 characters per inch and the line density to 8 lines per inch.

For more information, see:
- [z/OS Infoprint Server User’s Guide](#) for tables that describe how NetSpool converts SCS and 3270 data streams to PCL data streams
- [z/OS Infoprint Server Customization](#) for information about NetSpool exits

### Procedure for specifying attributes

To request that NetSpool convert SCS and 3270 data streams to PCL data streams:

1. On the NetSpool Options panel, select the **Convert to PCL** formatting option.

2. (Optional) On the Processing panel, specify code pages for EBCDIC to ASCII conversion:
   - **Document code page** field: Leave this field blank or specify the name of an EBCDIC code page supported by IBM. If you leave this field blank, the default code page is the EBCDIC code page specified in the Infoprint Server configuration file, `aopd.conf`. If no code page is specified in the configuration file, NetSpool uses code page IBM-1047.
   - **Printer code page** field: Specify the name of an ASCII code page that is supported by IBM. The ISPF panels automatically display the ASCII code page that is specified in the Infoprint Server configuration file, `aopd.conf`. If no code page is specified in the printer definition, NetSpool uses code page IBM-850.

### Guidelines:

a. For most printing situations, you do **not** need to modify the code pages in the printer definition. The initial values in the printer definition are generally suitable.

b. If you plan to use this printer definition with Print Interface as well as with NetSpool, leave the **Document code page** field blank and specify a code page in the **Printer code page** field. For information about how Print Interface uses these fields, see “Converting data from EBCDIC to ASCII or ASCII to EBCDIC” on page 101.

c. You can specify any code pages supported by IBM. For valid code page names, see [z/OS XL C/C++ Programming Guide](#).

d. If you specify a custom code page, make sure that conversion tables exist to convert between these code pages:
   - The code pages in the **Document code page** and **Printer code page** fields.
   - The code page for the z/OS locale and the custom code page.
For information about how to create conversion tables, see information about code set conversion utilities in z/OS XL C/C++ Programming Guide.

3. (Optional) On the Processing panel, specify these default page-formatting values, which NetSpool uses for input SCS data streams only:

- **Line length** field: Specify the maximum number of columns on each line. This is the default value for the SCS maximum presentation position (MPP) value. Allowed values are 1-255. The default value is 80.

- **Page length** field: Specify the maximum number of lines per page. This is the default value for the SCS maximum presentation line (MPL) value. Allowed values are 1-255. The default value is 1, which means that NetSpool does not control the number of lines that are placed on a page. The VTAM application controls the number of lines per page.

- **Margins: Left** field: Specify the column number at which you want data to start on each line. This is the default value for the SCS left margin (LM) value. Allowed values are 1-255. The default value is 1.

- **Margins: Right** field: Specify the column number at which you want data to end on each line. This is the default value for the SCS right margin (RM) value. Allowed values are 1-255. The default value is 80.

- **Margins: Top** field: Specify the line number of the first line on each page. This is the default value for the SCS top margin (TM) value. Allowed values are 1-255. The default value is 1.

- **Margins: Bottom** field: Specify the line number of the last line of data on each page. This is the default value for the SCS bottom margin (BM) value. Allowed values are 1-255. The default value is 1 (no bottom margin). If you specify a value of 1, NetSpool does not insert form feeds when the input data stream spaces past the bottom margin. However, NetSpool does insert form feeds when an explicit form feed or a Select Vertical Channel command occurs in the input data.

- **Tabs: Horizontal** field: Specify horizontal tabs. This is the default value for the SCS horizontal tab (HT) value. Allowed values are 0-255. The default is no horizontal tabs. The input data stream can add additional tab positions but cannot remove default tabs set in this field.

NetSpool always sets the first tab to the left margin value. Therefore, do not specify it. NetSpool ignores a value of 0. In this example, NetSpool sets horizontal tabs at columns 6, 15, 50, 75, and 100.

<table>
<thead>
<tr>
<th>SCS Conversion:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Margins:</strong> Top . . . .</td>
</tr>
<tr>
<td><strong>Bottom . . . .</strong></td>
</tr>
<tr>
<td>Left . . 6</td>
</tr>
<tr>
<td>Right . .</td>
</tr>
<tr>
<td><strong>Tabs: Vertical . . . .</strong></td>
</tr>
<tr>
<td><strong>Horizontal . 15 50 75 100</strong> (extend)</td>
</tr>
</tbody>
</table>

- **Tabs: Vertical** field: Specify vertical tabs. This is the default value for the SCS vertical tab (VT) value. Allowed values are 0-255. The default is no vertical tabs.

NetSpool always sets the first tab to the top margin value. Therefore, do not specify it. NetSpool ignores a tab value of 0. NetSpool uses the first eleven tabs as line numbers for Select Vertical Channel 2 through 12. In this example, NetSpool sets:
- Vertical tabs at lines 6, 20, 40, and 50
- Vertical channels are set: CH01=6, CH02=20, CH04=40, CH05=50

These vertical channels are not set: CH03, CH06 through CH12.
4. (Optional) On the Processing panel, specify these PCL conversion values:

- **Print density** field: Specify the number of characters per inch. Valid values are 1-255. The default is the PCL Pitch command or Horizontal Motion Index command specified in the Document header field or, if none is specified, the value set on the printer's control panel.

- **Line density** field: Specify the number of lines per inch. Valid values are 1-72. The default is the PCL Line Spacing command or Vertical Motion Index command specified in the Document header field or, if none is specified, the value set on the printer's control panel.

- **Orientation** field: Select one of these options. **None** is the default.
  - **None**: NetSpool does not specify the PCL page orientation. The PCL Logical Page Orientation command specified in the IP PrintWay Document header field or the orientation set at the printer is used.
  - **Portrait**: Lines are printed parallel to the paper's short edge.
  - **Landscape**: Lines are printed parallel to the paper's long edge.

- **SCS automatic page orientation** field: Select this field if you want NetSpool to automatically determine the orientation (portrait or landscape) of each page. NetSpool ignores this field for 3270 data streams.

  **Guideline**: If you select this field, also specify values in the Print density, Line density, Line length, and Page length fields.

5. On the IP PrintWay Options panel:

- Select any IP PrintWay formatting option, because IP PrintWay ignores the IP PrintWay **Formatting** field if NetSpool has already converted data to PCL.

- (Optional) Specify PCL commands in the Document header and Document trailer fields.

  **Guidelines**:
  a. You might want to select a font in the Document header field. For more information, see “Selecting a font” on page 128.
  b. If you specify PCL commands in the Document header field, (1) specify PCL and PJL reset commands before any other PCL commands in the Document header field and also (2) specify PCL and PJL reset commands in the Document trailer field. This is because NetSpool does not reset the printer to its original status when you specify your own PCL commands in the Document header field.

Specify these PCL 5 commands to reset the printer to its original status:

```plaintext
Document header . . <ESC>%-12345X<ESC>E (extend)
/ Translate document header
Document trailer . . <ESC>E<ESC>%-12345X (extend)
/ Translate document trailer
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ESC&gt;%-12345X</td>
<td>Resets the printer and enters PJL mode.</td>
</tr>
</tbody>
</table>
<ESC>E

Resets the printer.

You can also choose to leave the Document header field and Document trailer fields blank. If you leave these fields blank, NetSpool automatically generates the necessary PCL commands to reset the printer to its original status both before and after each data set.

**Tip:** If you need to specify the same fields in more than one printer definition, specify the fields in components. Then, include those components in each printer definition to which the components apply.

**Examples**

These examples show how to fill in the ISPF panels for SCS and 3270 input data streams.

**Example 1. Converting SCS data streams to PCL data streams:** This ISPF panel shows how to request that NetSpool convert the input data stream to PCL format.

```

---

Chapter 13. Planning printer and printer pool definitions for NetSpool 125
Selecting no data stream conversion

In each printer definition, you can select a NetSpool formatting option. The formatting option controls how NetSpool formats the data streams created by your VTAM applications. You can select one of these formatting options:

- Convert to line (default)
- Convert to PCL
- None

This section describes the None formatting option. When you select the None option, NetSpool does not inspect or convert the input data streams. Instead, NetSpool writes input data streams unchanged to the JES spool.

You can select the None option when your VTAM applications create output data that the printer can accept without change. For example, if you have VTAM applications that generate ASCII PCL or PostScript data.

When you select the None option, NetSpool writes data to the JES spool in variable-length, blocked records, with a maximum record size of 32752. You can select a different record format and change the maximum record size in the printer definition.

When you select the None option, NetSpool does not call any exits.

Procedure for specifying attributes

To request that NetSpool not convert the input data stream:

1. On the NetSpool Options panel, specify these fields:
   - Formatting field: Select the None option.
• **Maximum record size** field: (Optional) Specify the maximum size of the variable-length records. Allowed values are 1-32752. The default value is 32752.

• **RECFM** field: Select one of these record formats:
  – VB: variable blocked (default)
  – VBA: variable blocked with ANSI carriage controls
  – VBM: variable blocked with machine carriage controls

2. If the printer is controlled by IP PrintWay, on the IP PrintWay Options panel, specify:

  • **Formatting** field: Select None if you do not want IP PrintWay to convert data to ASCII or do any page formatting.

**Tip:** If you need to specify the same fields in more than one printer definition, specify the fields in components. Then, include those components in each printer definition to which the components apply.

**Example**
This ISPF panel shows how to request no NetSpool formatting and also specify the record size and record format of the output data set.

<table>
<thead>
<tr>
<th>NetSpool Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Formatting . . . 1 1 None 2 Convert to line 3 Convert to PCL</td>
</tr>
<tr>
<td>Record size ... MD</td>
</tr>
<tr>
<td>RECFM . . . 1 1 VB 2 VBA 3 VBM</td>
</tr>
<tr>
<td>Default owner . . .</td>
</tr>
<tr>
<td>Embedded attributes prefix . . .</td>
</tr>
</tbody>
</table>

**Specifying a default user ID and job attribute prefix**

To specify the default owner of printed output, or to identify job attributes embedded in print data, you can specify these fields in each printer definition:

• **Default owner:**
  The default Infoprint Server job owner for the associated LU if the print data does not specify an owner. The job owner is used for output data sets created for this NetSpool LU. In addition:
  – The Infoprint Server job owner can help you find jobs using Infoprint Central.
  – The job owner in this field is also used as the JES job name if no other owner or job name is specified in the print data.
  – The job owner specified in this field is not used as the JES job owner. The JES job owner is always the ID of the user who started the Infoprint Server daemons.

  If this field is blank, the default job owner is the ID of the user who started the NetSpool daemon **aopnetd**.

• **Embedded attributes prefix:**
  The prefix that identifies job attributes embedded in the print data. For information about how to embed job attributes in VTAM application print data, see [z/OS Infoprint Server User’s Guide](#). NetSpool uses the embedded job attributes when it allocates an output data set on the spool.
If this field is blank, NetSpool does not use job attributes specified in the print data. If this field contains a value, print jobs that do not contain embedded job attributes are not affected.

**Tip:** Do not use embedded job attributes if you specify the Timer end-of-file rule. Results can be unpredictable.

### Procedure for specifying attributes

On the NetSpool Options panel, specify these fields:

- **Default owner** field: Specify a combination of 1-8 letters (a-z, A-Z), numbers (0-9), and special characters (# $ @). The first character cannot be a number. Blanks and other special characters are not allowed. Lowercase letters are converted to uppercase.

- **Embedded attributes prefix** field: Enter either character data or hexadecimal data:
  - To enter character data, enter 1-12 letters, numbers, or special characters. Character data is case-sensitive.
  - To enter hexadecimal data, enter 1-12 bytes of data. Enclose the data in single quotation marks, prefixed with the letter x.

**Example**

This ISPF panel shows how to specify a default owner and an embedded attribute prefix.

![NetSpool Options panel](image)

**Selecting a font**

NetSpool assumes a fixed-pitch font when it formats data. Therefore, you should use a fixed-pitch font to print the data so you can maintain the correct alignment of characters. If you select the **Convert to PCL** formatting option, you should use a fixed-pitch, scalable font to print the data.

If the printer's default font is not suitable, you can specify a font using one of these methods. The method you use depends on whether the printer is controlled by IP PrintWay or PSF:

- **Printers that PSF controls:** Name the font in the **Character sets** field on the Allocation panel of the printer definition.

- **Printers that IP PrintWay controls:** You can specify a font in one of these places:
  - Specify PCL commands to select the font in the IP PrintWay **Document header** field in the printer definition. IP PrintWay sends the PCL commands in this field to the printer. Therefore, this font is used to print all data sets transmitted to the printer, not only data sets created by NetSpool.
  - Specify PCL commands to select the font in the NetSpool Beginning of File exit. This font is used to print all data sets created by NetSpool.
Name the font in the **Character sets** field on the Allocation panel of the printer definition. Use this method if you (1) use the AFP to PCL or AFP to PostScript transform or (2) print to a remote system running PSF, such as InfoPrint Manager for AIX or Windows. Otherwise, the font you specify in this field is ignored.

**Guidelines:**
1. If a fixed-pitch font is not suitable for all of your print jobs, you could set up more than one printer definition for the same printer. Then, specify a fixed-pitch font in the printer definition that NetSpool uses.
2. If you are using PSF printers, consider specifying the **chars** attribute in embedded job attributes.
3. PCL commands in the NetSpool Beginning of File exit override PCL commands in the **Document header** field.
4. If you use the AFP to PCL or the AFP to PostScript transform, do **not** specify a PCL command in the NetSpool Beginning of File exit because the AFP to PCL and AFP to PostScript transforms cannot interpret PCL commands.
5. If you select the **SCS automatic page orientation** field, specify the size of the font in the **Line density** and **Print density** fields instead of in a PCL command so that NetSpool can accurately determine the appropriate page orientation. This is because NetSpool cannot detect the size of a font specified in a PCL command or in the **Character sets** field.

**Procedure for specifying attributes**

To fill in ISPF panels to specify a fixed-pitch font:

- If the printer is controlled by PSF, name the font in the **Character sets** field on the Allocation panel.
- If the printer is controlled by IP PrintWay, and IP PrintWay uses the AFP to PCL transform or the AFP to PostScript transform for line data, name the font in the **Character sets** field on the Allocation panel.
- If the printer is controlled by IP PrintWay, and IP PrintWay does not use a transform for line data, specify PCL commands to select the font in the **Document header** field on the IP PrintWay Options panel. Also, be sure to reset the printer to its original state in the **Document trailer** field.

**Tip:** If you need to specify the same fields in more than one printer definition, specify the fields in components. Then, include those components in each printer definition to which the components apply.

**Examples**

**Example 1. Specifying a fixed-pitch font for a printer controlled by PSF:** This example shows how to fill in the ISPF panels to specify a fixed-pitch font for a printer controlled by PSF. Also, use this example if the printer definition is controlled by IP PrintWay and IP PrintWay uses the AFP to PCL or the AFP to PostScript transform.
In this example, PSF, the AFP to PCL transform, and the AFP to PostScript transform use the Gothic Text Latin1, fixed-pitch, font. The pitch is 10 characters per inch.

**Example 2. Specifying a fixed-pitch font for a printer controlled by IP PrintWay:** This example shows how to fill in the ISPF panels to specify PCL commands to select a fixed-pitch font to print the data and then reset the printer to its default settings.

```
IP PrintWay Options

Document header ..<ESC>%-12345X<ESC>E<ESC>(8U<esc>(s0p10h0s3b4102T(extend)
  /Translate document header
Document trailer ..<ESC>E<ESC>%-12345X(extend)
  /Translate document trailer
```

The PCL commands in the **Document header** field reset the printer to its default settings and then select the fixed-pitch Letter Gothic font. The PCL commands shown mean:

<table>
<thead>
<tr>
<th>Command</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ESC&gt;%-12345X</td>
<td>Reset the printer and enter PJL mode.</td>
</tr>
<tr>
<td>&lt;ESC&gt;E</td>
<td>Reset the printer.</td>
</tr>
<tr>
<td>&lt;ESC&gt;(8U</td>
<td>Select the Roman-8 symbol set.</td>
</tr>
<tr>
<td>&lt;ESC&gt;(s0p10h0s3b4102T</td>
<td>Set fixed spacing (0p), 10 characters per inch (10h), upright style (0s), bold weight (3b), and Letter Gothic typeface (4102T).</td>
</tr>
</tbody>
</table>

**Notes:**
1. The last letter of each command is a capital letter to denote the end of the command.
2. When you select the NetSpool **Convert to PCL** formatting option, the value in the **Print density** field overrides the number of characters per inch set in the **Document header** field.

---

**Specifying how NetSpool determines end-of-file**

To guarantee that data that belongs together actually gets printed in the correct order, NetSpool writes data that belongs together to a single output data set on the JES spool. For printing in the SNA network, the concept of a data set is not needed because an application starting a session with a printer gains exclusive control of that printer for the duration of the session. In contrast, when printing in a JES
environment, the sending application is not guaranteed exclusive control of the
printer. Between two successive data sets from one application, data sets from
other applications might print. If the first attempt to print a data set fails, and a
later retry succeeds, two successive data sets from the same application could even
be printed in reverse order.

To create an output data set, NetSpool must determine where one data set should
end and the next one should begin. You specify the rules that NetSpool uses to
make this determination. You can specify different rules for different combinations
of VTAM primary logical unit (PLU) names and LU types. The PLU name
identifies the VTAM application that sends data to NetSpool.

The rules generally use information found in the input data stream to determine
when to end the current output data set. VTAM request unit (RU) chaining
information can be used, a string in the input data stream can be used, or even a
timer can be used. Work with the application programmers in your installation to
determine the appropriate end-of-file rules for each printer definition.

Note: If you edit end-of-file rules in a printer definition while VTAM sessions with
the printer LU are active, you must restart the active sessions from your
VTAM application, such as CICS and IMS, to pick up the changes.

End-of-file rules

Print data for a logical printer is received as a stream of VTAM request units
(RUs). The SNA architecture defines two groupings of RUs that are of interest:
• A chain consists of one or more RUs.
• A bracket consists of all of the RUs in one or more related chains.

From an SNA-theory point of view, the use of brackets is the most logical way to
determine data-set boundaries. Using this technique, a request marked BB (Begin
Bracket) indicates the start of a new data set, and the end of a chain marked EB
(End Bracket) marks the end of the data set. This is the default end-of-file rule that
NetSpool uses unless you change it. It is called the end-of-bracket rule.

The end-of-bracket rule works with both CICS and IMS LU type 1 sessions, with
CICS LU type 3 sessions, and with other applications able to control the use of the
BB and EB bracket bits. However, for some applications, the end-of-bracket rule
does not work well, as indicated by these examples:
1. In a CICS application with an LU type 0 session:
   • BB is sent on the session's first request.
   • No EB is sent at the end of the transaction.
   • Result: The output for the entire session is treated as one data set, causing a
     potentially long delay in printing.
2. In an IMS application with a non-SNA 3270 printer:
   • Each line of output is sent as a separate chain marked BB, EB.
   • Result: Each line is treated as a separate data set, causing unnecessary
     overhead and increasing the chances of data sets from other applications
     intruding.

NetSpool lets you specify five end-of-file rules. NetSpool uses only one of these
rules for any one session:
• **End-of-bracket (default):** NetSpool ends the data set when the RU chain is marked EB (End Bracket) and starts a new data set when a request unit (RU) is marked BB (Begin Bracket).

• **End-of-session:** NetSpool ends the data set at the end of the VTAM session for this printer definition.

• **End-of-chain:** NetSpool ends the data set at the end of a chain.

• **String:** NetSpool ends the data set when the last RU in a chain contains a specified string of data. You can also specify whether NetSpool is to keep or delete the specified string of data in the output data set.

• **Timer:** NetSpool ends the data set when the time interval specified in either the Timeout idle interval field or the Busy interval field expires and NetSpool has received the last RU in the chain.

  The Timer idle interval field specifies the amount of time NetSpool waits for input data before printing the data already received. If NetSpool does not receive any input data during this time and a reasonable stopping point has been reached (end of an RU chain), NetSpool closes the output data set so it can be printed.

  The Busy interval field specifies the amount of time for which NetSpool receives data without printing it. After this time interval expires, NetSpool closes the output data set when a reasonable stopping point is reached (end of an RU chain and the top of a new page).

  Use the timer method only when none of the other end-of-file rules makes sense because:
  - The use of timers to detect data-set boundaries is an inexact method. Tuning is required to choose the best timer values, and even then the results are inexact.
  - Under each of the other end-of-file rules, exact data-set boundaries can be determined directly from the received print data requests.

These rules apply when you select the Timer option:

  - Specify this option only for LU types 0 and 3.
  - Do not select this option when you select the None formatting option or when you use the Embedded attributes prefix field on the NetSpool Options panel.

### Delete form-feed option

When you specify an end-of-file rule, you can also specify whether you want NetSpool to delete form-feed controls that occur in the input data stream before writing the output data set on the JES spool. Deleting form-feed controls lets you remove blank pages that might print before or after the data. You can specify which form-feed controls NetSpool is to delete:

- **Leading form-feed controls:** NetSpool deletes the form-feed control at the beginning of the output data set.

- **Trailing form-feed controls:** NetSpool deletes the form-feed control at the end of the output data set.

- **Both leading and trailing form-feed controls:** NetSpool deletes the form-feed control both at the beginning and the end of the output data set.

These considerations apply when you delete trailing form-feed controls:

- For LU type 1 sessions, the form-feed control in the last RU is deleted. If the end-of-session rule is selected, form-feed controls at the end of a data set are not deleted.
For LU types 0 and 3 sessions, the form-feed control in the page built by the last RU chain is deleted. However, for LU type 3, if the end-of-bracket rule is selected and the RU that ends the bracket is a null single element chain, the form-feed control from the prior chain is deleted.

**Procedure for specifying attributes**

You only need to specify an end-of-file rule and a form-feed option if the defaults are not suitable. By default, NetSpool uses the end-of-bracket rule to determine end of file and does not delete any form-feed controls.

In the NetSpool End-of-File section of the printer definition, you can specify either default rules or specific rules for different primary logical unit (PLU) names:

- A default rule can apply either to all LU types (LU type 0, LU type 1, and LU type 3) or to a specific LU type. NetSpool uses a default rule only if you do not specify another rule for the PLU name and LU type being processed.

- A rule for a specific PLU name or PLU name pattern can apply either to all LU types (LU type 0, LU type 1, and LU type 3) or to a specific LU type. The order in which you type the PLU names on the ISPF panel can be important because NetSpool uses the first rule that applies to the PLU name and LU type being processed.

A PLU pattern must contain these characters:
- At least one letter or number.
- Either asterisks (*) or question marks (?) but not both:
  - An asterisk represents any number of characters at the start or end of a PLU name. Do not type an asterisk in the middle of a pattern.
  - A question mark represents exactly one character. Type a question mark anywhere in the pattern.

For example, these are valid name patterns: IMS*, ??XYZ???

Although you can specify more than one end-of-file rule in the NetSpool End-of-File section, NetSpool uses only one rule for each VTAM session.

**Tip:** If the same end-of-file rules and form-feed options are used by more than one NetSpool printer LU, specify the attributes in an NetSpool End-of-File component. Then, include that component in the printer definitions for the NetSpool printer LUs to which the rules apply.

**Example**

These two ISPF panels show how to specify an end-of-file rule in the NetSpool End-of-File section of a printer definition.

On the NetSpool End-of-File Rules panel, you must indicate whether you want to specify a default end-of-file rule or an end-of-file rule for a specific PLU name or PLU name pattern. In this example, a PLU name pattern, IMS*, is specified. This means that NetSpool uses the end-of-file rule that you specify on the next panel for all PLU names that start with IMS. Because option 5 is selected, the end-of-file rule that you specify on the next panel applies to all LU types with the PLU name pattern, including types 0, 1, and 3.
The NetSpool End of File Rule panel is displayed when you press the Enter key on the first panel. On this panel you must select the end-of-file rule. In this example, these options are selected:

- **String** option: When NetSpool finds X'FF' in the input data stream, NetSpool ends the data set on the JES spool and starts a new one.
- **Keep** option: NetSpool writes X'FF' to the output data set.
- **Delete form feed** option 1: NetSpool does not delete any form-feed controls in the output data set.

### Broadcasting data using multiple printer definitions

NetSpool lets users broadcast the same data to multiple printers or e-mail destinations at the same time. NetSpool formats the data one time and allocates separate output data sets on the JES spool for each printer or e-mail destination.

To broadcast data, you must create three types of objects in the Printer Inventory:

1. A printer definition for each destination. The destination can be a printer or an e-mail address list. If you have already created a printer definition for the destination, you do not need to create a new one.

2. A NetSpool End-of-File component that contains the end-of-file rules that NetSpool should use. If you want to use the default end-of-file rule (end-of-bracket), you do not need to create a component.

3. A printer pool definition. In this definition, specify the printer LU name that VTAM applications use as the secondary LU name when printing to this pool of printers or e-mail destinations. Also select these:
   - The printer definitions that you created in step 1.
   - (Optional) The NetSpool End-of-File component that you created in step 2.
   - (Optional) The default owner of printed output.
   - (Optional) The identifier for job attributes embedded in print data.
The printer definition that you list first in the printer pool definition must specify the attributes that NetSpool uses to format data. NetSpool formats the data only once and writes the same data in each data set it allocates on the JES spool.

**Procedure for specifying attributes**

In the printer definitions that you plan to list in the printer pool definition, specify:

- **NetSpool LU name** field: Specify this field only if your VTAM applications need to print directly to this printer definition. Leave this field blank if you want to list this printer in the printer pool definition. Instead, specify the secondary LU name that your VTAM applications use in the **LU name** field in the printer pool definition.

- On the Allocation panel, specify the fields required to allocate output data sets on the JES spool. For more information, see “Specifying JES allocation parameters” on page 113.

In one of the printer definitions, specify these attributes if the default values are not appropriate. List this printer definition first in the printer pool definition.

- On the Processing panel:
  - All fields under the **SCS Conversion** heading.
  - All fields under the **NetSpool PCL Conversion** heading.

- On the NetSpool Options panel: All fields. The **Default owner** and the **Embedded attributes prefix** fields are optional (for more information, see “Specifying a default user ID and job attribute prefix” on page 127).

- On the Allocation panel: **SEGMENT** field and **HOLD** field. NetSpool uses these fields only in the first printer definition listed in the printer pool definition.

In the printer pool definition on the Printer Pool panel, specify these fields:

- **Pool name**: Specify a name for the printer pool definition. This name can be the same as the NetSpool printer LU name.

- **LU name**: Specify the NetSpool printer LU name. For more information, see “Specifying the NetSpool printer LU name” on page 112.

- **Description**: (Optional) Specify a description to help you manage your printer pool definitions.

- **LU classes**: Specify the LU classes for the printer LU name if the default is not appropriate. For more information, see “Grouping NetSpool printer LUs into LU classes” on page 112.

- **NetSpool end-of-file component**: Specify the name of a component if the default end-of-file rule is not appropriate. For more information, see “Specifying how NetSpool determines end-of-file” on page 130.

- **Default owner**: (Optional) Specify the default owner of printed output. For more information, see “Specifying a default user ID and job attribute prefix” on page 127.

- **Embedded attributes prefix**: (Optional) Specify the identifier for job attributes embedded in print data. For more information, see “Specifying a default user ID and job attribute prefix” on page 127.

- **Printer definition names**: Select the printer definitions to which you want to broadcast data from a list that you can display. (Place your cursor on this field and press Enter.)

**Tip**: First select the printer definition in which you specified the attributes that you want NetSpool to use when formatting the data.
Example
This ISPF panel shows how to create a printer pool definition.

```
Printer Pool

Pool name . . ludept01
LU name . . LDEPT01
Description . ATT department 001 printers (extend)
LU classes . . z . . . . . . 41 (extend)
NetSpool end-of-file component . . eof1 (list)
Default owner . . . . . . . . . . . . smith
Embedded attributes prefix . . <<ibmjobattr

Printer definition names . . printer1 printer2 (list)

```

When a VTAM application prints to LU name LDEPT01, NetSpool uses the end-of-file rules specified in NetSpool end-of-file component named `eof1` and the formats the input data stream using attributes specified in printer definition `printer1`. NetSpool uses the attributes in the Allocation sections of printer definitions named `printer1` and `printer2` to create two output data sets on the JES spool.

Validating that documents can print as requested

Before accepting a print request, NetSpool can validate that the data can print as requested on the printer. If NetSpool determines that a document cannot print, NetSpool rejects the print request with a message and does not allocate a data set on the JES spool.

Table 18 lists the fields in a printer definition that NetSpool uses to validate that the print request can print on the printer. The third column in the table indicates the job attribute that the VTAM application can specify in the embedded job attributes to request a print function.

Table 18. Printer definition fields used for validation in NetSpool

<table>

<tr>
<td><strong>Maximum document size</strong></td>
<td>Maximum size of document (in bytes) allowed. This number does not include copies.</td>
<td>None. NetSpool determines the document size.</td>
</tr>
<tr>
<td><strong>Print-error reporting supported</strong></td>
<td>Types of error-reporting supported by the printer (invalid-character and print-positioning errors)</td>
<td><code>print-error-reporting</code></td>
</tr>
</tbody>
</table>
**Procedure for specifying attributes**

On the Processing panel, specify the fields listed in Table 18 on page 136. In the Data format field, be sure to select these data formats, depending on the option you select in the Formatting field on the NetSpool Options panel:

- If you select the Convert to line option, select Line data.
- If you select the Convert to PCL option, select PCL.
- If you select the None option, select Other.

**Tip:** Select all data formats for no data stream validation. (This is the default.)

**Example**

This ISPF panel shows how to specify the valid data formats for a printer that can print PostScript, text, and PCL data. Notice that Line data is selected even though the printer does not accept line data. You must select Line data because the NetSpool Convert to line option is selected in the Formatting field. IP PrintWay automatically converts line data to text data before sending it to the printer. Only a portion of the panel is shown.

```
Processing...
Data format: Filter:
/ Line data ___________________________________________________ (extend)
  MO:DCA-P ___________________________________________________ (extend)
/ PostScript ___________________________________________________ (extend)
/ Text ___________________________________________________ (extend)
/ PCL ___________________________________________________ (extend)
  PDF ___________________________________________________ (extend)
  SAP ___________________________________________________ (extend)
  XML ___________________________________________________ (extend)
  TIFF ___________________________________________________ (extend)
  JPEG ___________________________________________________ (extend)
  Other ___________________________________________________ (extend)

_ Resubmit for filtering

Maximum copies..... _____
Forms supported.... ________ ________ ________ _________ _________ (more)

Duplex supported. . . / Simplex / Duplex / Tumble
Print-error reporting supported . / Character / Position

Chapter 13. Planning printer and printer pool definitions for NetSPOOL
```
only once for each data set) after it converts the input SCS or 3270 data to either line or PCL data, and before it writes the data to an output data set on the JES spool.

Your installation can write its own filter program, either a DLL filter or a UNIX filter. For information about how to write a filter, see z/OS Infoprint Server Customization.

**Procedure for specifying attributes**

On the Processing panel, specify:

- **Data format** field: Select the data format of the input document that your filter applies to.
- **Filter** field: Specify the name of the filter followed by the options that you want to provide as command line arguments to the filter.
  - If the filter is a DLL filter, type the absolute pathname unless the filter is in a directory named in the LIBPATH environment variable.
  - If the filter is a UNIX filter, type `spawn` before the filter name. Type the absolute pathname of the filter unless the filter is in a directory named in the PATH environment variable.

**Example**

This ISPF panel shows how to specify a UNIX filter written by your installation for line data. Only a portion of the ISPF panel is shown.

```
Processing
Data format: Filter:
/ Line data spawn /usr/mylib/my_unix_filter -a option operand (extend)
    MD:BCA-P __________________________________________________ (extend)
    PostScript __________________________________________________ (extend)
    Text __________________________________________________ (extend)
    PCL __________________________________________________ (extend)
    PDF __________________________________________________ (extend)
    SAP __________________________________________________ (extend)
    XML __________________________________________________ (extend)
    TIFF __________________________________________________ (extend)
    JPEG __________________________________________________ (extend)
    Other __________________________________________________ (extend)
```

If the input data stream contains line data, NetSpool calls the `my_unix_filter` filter to transform line data. The option and operand that follow the filter name are passed to the filter.

**Mapping output bin and input tray names to numbers for an AFP printer**

The *input tray* is the tray on the printer that serves as the paper source. The *output bin* is a bin on the printer where printed jobs are delivered. The *input-tray* and *output-bin* job attributes let users specify a tray name, such as *3-hole* and a bin name, such as *staple*.

If you define input tray or output bin names in a printer definition, a job submitter or VTAM application can use those names in the *input-tray* or *output-bin* job attribute. If you do not define *any* tray or bin names, Print Interface and NetSpool
ignore the input-tray or output-bin job attribute. If, however, you define some tray or bin names, Print Interface and NetSpool reject a print request that specifies an undefined tray or bin name in the job attribute.

When you define input tray names, you must map the names to the numbers that an AFP printer uses for paper-source identification. When you define output bin names, you must map the names to the bin numbers that an AFP printer uses for output-bin identification. For tray and bin numbers that the printer uses, see your printer documentation.

Tip: Whether or not you define input tray or output bin names in a printer definition, a job submitter can specify the tray and bin number directly using the input-tray-number and output-bin-number job attributes or the INTRAY and OUTBIN JCL parameters. The job submitter can specify any tray and bin numbers. You do not need to specify the numbers in the printer definition.

Procedure for specifying attributes

On the Processing panel, specify:

- **Input tray name** and **Number** fields: Specify a name and the tray number used by the AFP printer.
- **Output bin name** and **Number** fields: Specify a name and the bin number used by the printer.

Example

This ISPF panel shows how to map input tray names and output bin names to numbers in the Processing section of a PSF printer definition. Only a portion of the ISPF panel is shown.

<table>
<thead>
<tr>
<th>Processing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input tray name: Number: Output bin name: Number:</td>
</tr>
<tr>
<td>top 1 staple 4</td>
</tr>
<tr>
<td>bottom 2 side 2</td>
</tr>
<tr>
<td>envelope 65 top 1</td>
</tr>
<tr>
<td>manual 100</td>
</tr>
<tr>
<td>3-hole 3</td>
</tr>
</tbody>
</table>

If a user specifies the input-tray=envelope job attribute, Print Interface and NetSpool allocate the output data set on the JES spool with tray number 65. If the printer is an AFP printer, PSF uses tray number 65 when communicating with the printer.

If a user specifies the output-bin=staple attribute on the lp command, Print Interface and NetSpool allocate the output data set with bin number 4. If the printer is an AFP printer, PSF uses bin number 4 when communicating with the printer.
Chapter 14. Planning printer definitions for IP PrintWay

Before using IP PrintWay to send print output to remote printers and e-mail destinations, you must create printer definitions. Typically, you should create one printer definition for each printer and one for each e-mail destination. In the printer definition, you specify the printer’s address or the recipients’ e-mail addresses. However, depending on the job submission method used and the type of printer, job submitters can sometimes specify a printer’s address or e-mail addresses during job submission in job attributes and JCL parameters. If so, you might be able to create one printer definition for a group of printers that share the same attributes, and another printer definition for all e-mail destinations.

Guideline: Create at least one printer definition for each printer for these reasons:

- Some job submission methods (for example, the LPR command) do not support specification of job attributes or JCL parameters.
- Job submitters cannot specify the printer’s address if the printer uses the IPP or VTAM protocol.
- Infoprint Central cannot display information about idle IP PrintWay printers when a printer definition does not exist for that printer.

In the printer definition, you also can specify attributes that IP PrintWay uses to format data in the output data set and transmit data sets to the printer. Table 48 on page 450 summarizes the printer attributes that IP PrintWay uses and indicates whether the attributes are required or optional.

After you create printer definitions and specify attributes used by IP PrintWay, job submitters can print from batch applications using JCL. However, before job submitters can print from VTAM applications using NetSpool or from local and remote systems using Print Interface, you might need to specify additional attributes in the printer definition. For information about these attributes, see Chapter 13, “Planning printer and printer pool definitions for NetSpool,” on page 111 and Chapter 12, “Planning printer definitions for Print Interface,” on page 89.

You can create and edit IP PrintWay printer definitions before starting IP PrintWay or while IP PrintWay is running. If you create or edit a printer definition while IP PrintWay is running, IP PrintWay uses the new attributes the next time IP PrintWay selects a data set from the JES spool that uses the printer definition. IP PrintWay extended mode also uses the new attributes the next time it retries printing a data set that failed to print.

IP PrintWay basic mode and IP PrintWay extended mode use the same printer definitions. However, when you move from IP PrintWay basic mode to IP PrintWay extended mode, you might need to make some changes. For information, see “Comparing printer definitions for IP PrintWay basic mode and extended mode” on page 143.

These topics describe how to specify printer attributes in the printer definition to do these tasks. Some of the tasks apply only to the indicated IP PrintWay transmission protocol. Notice that some tasks apply only to IP PrintWay extended mode or IP PrintWay basic mode. The title of each task indicates, in parenthesis, to which mode the task applies. If no mode is indicated in the title, the task applies to both modes.

### Comparing printer definitions for IP PrintWay basic mode and extended mode

IP PrintWay basic mode and extended mode can use the same printer definitions. However, some fields in printer definitions apply only to IP PrintWay basic mode, and some fields apply only to IP PrintWay extended mode.

Most installations do not need to change printer definitions when they migrate from IP PrintWay basic mode to IP PrintWay extended mode. However, you should review this section to see if changes are required.

#### IP PrintWay extended mode fields

Table 19 on page 144 lists the fields in printer definitions (and the corresponding printer attributes) that apply only to IP PrintWay extended mode. IP PrintWay basic mode ignores these fields. Table 19 on page 144 describes the changes you might want to make in printer definitions when you migrate to extended mode.
<table>
<thead>
<tr>
<th>ISPF panel field (attribute)</th>
<th>Description</th>
<th>Change required to printer definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic dataset grouping (automatic-dataset-grouping)</td>
<td>If this field is selected, IP PrintWay extended mode transmits all the data sets in the same JES output group to a printer in one transmission, or sends the data sets in the same e-mail. This is an efficient method of transmitting data sets to a printer. However, it might not be suitable for some older printers. This field, if selected, overrides the option selected in the Dataset grouping field. For more information, see &quot;Transmitting multiple data sets in a JES output group&quot; on page 198.</td>
<td>Select this field for more efficient printing if your printer supports it.</td>
</tr>
<tr>
<td>Embedded headers (mail-embedded-headers)</td>
<td>If this field is selected, IP PrintWay extended mode examines line-data documents for an e-mail header. If a header is found, it sends the e-mail to the recipients in the header.</td>
<td>Select this field for more efficient printing if your printer supports it.</td>
</tr>
<tr>
<td>Form feed (form-feed)</td>
<td>This field specifies the form-feed controls to add to text data to indicate the start of a new page.</td>
<td>Specify this field if the printer or print server requires form-feed characters other than X'0D0C' (carriage-return and form-feed controls).</td>
</tr>
<tr>
<td>Inline message (mail-inline-message)</td>
<td>This field specifies an optional message that IP PrintWay extended mode includes in the beginning of each e-mail.</td>
<td>Specify the message text if you want to include a standard greeting or introductory paragraph.</td>
</tr>
<tr>
<td>Inline text and line data (mail-inline-text)</td>
<td>If this field is selected, IP PrintWay extended mode includes text and line-data documents inline in the body of the e-mail instead of in attachments.</td>
<td>Specify this field if you want text and line data included inline in the e-mail.</td>
</tr>
<tr>
<td>Operator security profile (operator-security-profile)</td>
<td>This field contains the name of a RACF profile that your security administrator defines. The RACF profile controls who can display information about and do actions on the printer using Infoprint Central. For more information, see &quot;Setting up operator security for the printer (extended mode)&quot; on page 177.</td>
<td>Specify the name of the RACF profile for the printer if you use Infoprint Central.</td>
</tr>
<tr>
<td>Record pages printed for accounting (page-accounting)</td>
<td>If this field is selected, IP PrintWay extended mode records the number of printed pages in the SMF type 6 record. For more information, see &quot;Tracking the number of printed pages (extended mode)&quot; on page 187.</td>
<td>Select this field for more accurate accounting information. The printer must support PJL and the direct sockets printing protocol.</td>
</tr>
<tr>
<td>Restart printing after last successful page (page-restart)</td>
<td>If this field is selected, IP PrintWay extended mode tells the printer to restart printing after the last page that the printer reported printed successfully. For more information, see &quot;Tracking the number of printed pages (extended mode)&quot; on page 187.</td>
<td>Select this field to save paper and printing costs when IP PrintWay retries printing. The printer must support PJL and the direct sockets printing protocol.</td>
</tr>
</tbody>
</table>
### IP PrintWay basic mode fields

Table 20 lists the fields (and corresponding attributes) that apply only to IP PrintWay basic mode. IP PrintWay extended mode ignores these fields. Table 20 describes the changes you might need to make in printer definitions that specify these fields when you migrate to extended mode.

**Tip:** To find all printer definitions that contain an attribute you want to change, use the Printer Inventory Definition Utility (PIDU) program. See "list—list names of objects" on page 288.

#### Table 20. Printer definition fields that apply only to IP PrintWay basic mode

<tr>
<td>Formatting (printway-formatting)</td>
<td>IP PrintWay extended mode ignores these formatting options:  * None: IP PrintWay detects the data format and only formats data sets that contain line data.  * Use FCB: IP PrintWay uses the FCB if one is specified in the FCB JCL parameter.</td>
<td>None.</td>
</tr>
<tr>
<td>PostScript header (printway-postscript)</td>
<td>IP PrintWay extended mode ignores this field and does not add any PostScript headers.</td>
<td>If a printer definition currently specifies these options:  * Landscape or Always landscape: Specify printer commands for landscape printing in the Document header field. See &quot;Specifying printer commands for landscape printing&quot; on page 202.  * Add: Specify the AFP to PostScript transform in the Filter field.</td>
</tr>
<tr>
<td>Resubmit for filtering (resubmit-for-filtering)</td>
<td>IP PrintWay extended mode ignores this field because it transforms data streams by calling the transforms directly, without resubmitting the data sets to Print Interface.</td>
<td>None.</td>
</tr>
</tbody>
</table>

### IP PrintWay basic mode and extended mode fields

Table 21 on page 146 lists the fields (and corresponding attributes) that IP PrintWay basic mode and extended mode support in different ways. Table 21 on page 146 describes the changes you might need to make in printer definitions that specify these fields when you migrate to extended mode.
Tip: To find all printer definitions that contain an attribute you want to change, use the Printer Inventory Definition Utility (PIDU) program. See “list—list names of objects” on page 288.

Table 21. Printer definition fields that have special considerations for IP PrintWay extended mode

<table>
<thead>
<tr>
<th>ISPF panel field (attribute)</th>
<th>Description</th>
<th>Action required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data format (document-formats-supported)</td>
<td>This field lets you specify the types of data formats that the printer accepts or that can be transformed to a format the printer accepts. IP PrintWay extended mode validates that the format of the input data stream is one of the supported types. This field also applies to IP PrintWay basic mode, but only when the Resubmit for filtering option is selected. For more information, see “Validating that data sets can print as requested” on page 204.</td>
<td>Select all the data formats that IP PrintWay should accept.</td>
</tr>
<tr>
<td>Duplex supported (duplexes-supported)</td>
<td>This field specifies whether the printer can print in duplex. IP PrintWay extended mode validates that the printer supports the duplexing option specified in the DUPLEX parameter on the OUTPUT JCL statement. This field also applies to IP PrintWay basic mode, but only when the Resubmit for filtering option is selected. For more information, see “Validating that data sets can print as requested” on page 204.</td>
<td>Select all the duplex options that IP PrintWay should accept.</td>
</tr>
<tr>
<td>Line termination (line-termination)</td>
<td>The default line-termination controls for IP PrintWay extended mode are different from those in basic mode. The defaults, in EBCDIC, are: IP PrintWay basic mode: • LPR, direct sockets, IPP: X’25’ (line-feed) • VTAM, e-mail: X’0D15’ (carriage-return, new-line) IP PrintWay extended mode: • LPR (ASCII printer code page), direct sockets, IPP: X’0D15’ • LPR (EBCDIC printer code page): X’0D25’ • VTAM, e-mail: X’0D15’ In addition, IP PrintWay extended mode uses the printer code page (Printer code page field) to translate the line-termination controls from EBCDIC to ASCII, while IP PrintWay basic mode uses a hard-coded translate table. If the Line termination field contains 0025 or 25 and the Printer code page field contains ISO8859-1, leave the Line termination field blank so that IP PrintWay extended mode uses the default value. This is because code page ISO8859-1 translates EBCDIC X’25’ to ASCII X’85’, which can cause data to not print correctly.</td>
<td></td>
</tr>
</tbody>
</table>
## Selecting the LPR protocol

In an IP PrintWay printer definition, you can select the transmission protocol that IP PrintWay uses to transmit output data sets from the JES spool to the printer, print server, or e-mail destination. IP PrintWay supports these transmission protocols: LPR, direct sockets, IPP, VTAM, and e-mail.

Select the IP PrintWay LPR protocol if you want IP PrintWay to transmit data sets to the printer or print server using the TCP/IP LPR protocol defined by RFC 1179. When IP PrintWay uses this protocol, an LPD that adheres to RFC 1179 must be running in the remote printer or print server.

When you select the LPR protocol, IP PrintWay transmits data to the LPD at the IP address (or host name) and print queue name that you specify in the printer definition. A job submitter can override the IP address and print queue name specified in the printer definition by specifying the IP address on the OUTPUT JCL statement or in an Infoprint Server job attribute.

Because some job submitters can specify the printer’s IP address, you can create one printer definition for several printers that share the same attributes. To use this printer definition, the job submitter must specify the name of the printer definition, the printer’s IP address and the printer’s print queue name on the OUTPUT JCL statement or in Infoprint Server job attributes. If the job submitter does not specify the name of the printer definition on an OUTPUT JCL statement, IP PrintWay uses printer attributes specified in the default IP PrintWay printer definition described...
in “Creating an IP PrintWay default printer definition” on page 207. For more information about job submission, see z/OS Infoprint Server User’s Guide.

When you select the LPR protocol, IP PrintWay also transmits a control file for each data set to the LPD. In the printer definition, you can specify whether you want IP PrintWay to transmit the control file before or after the data set. IP PrintWay converts some attributes that you specify in the printer definition to control codes in this control file. In addition, in the printer definition, you can specify any other control codes that the LPD accepts.

By default, IP PrintWay prints multiple copies of a data set by transmitting the data set to the printer multiple times. Some LPDs, however, can print multiple copies when IP PrintWay transmits the data set to the printer only one time. If your printer supports printing multiple copies of the same data set, you can select the Optimize copies option in the printer definition to improve performance. To determine if your printer supports printing multiple copies of the same data set, select the Optimize copies field and submit a print request with multiple copies. If your printer prints only one copy, deselect this option.

Related customization tasks: These IP PrintWay customization tasks are related to the LPR protocol. For information about how to do these tasks and other customization tasks related to the LPR protocol, see z/OS Infoprint Server Customization.

- Customize the TCP/IP component of z/OS Communications Server.
- IP PrintWay extended mode writes temporary data sets to the /var/Printsrv/printway directory. If necessary, increase the amount of space available to this directory.
- IP PrintWay basic mode writes temporary files to hiperspace. If necessary, increase the amount of available hiperspace in the IP PrintWay FSS definition.

Procedure for specifying attributes

1. On the Choose a Definition Type and Protocol panel, select IP PrintWay LPR. If you copy a printer definition, select an IP PrintWay printer definition that uses the LPR protocol.

2. On the LPR Protocol panel, specify these fields:
   - **IP address**: Specify the host name or dotted decimal address of the printer or print server. If another printer definition refers to this printer, use the same uppercase and lowercase letters when you type the host name.
     
     Rule: You can specify the IP address in dotted-decimal format. If the printer or print server has an IPv6 address, you must specify its host name instead of its colon-hexadecimal format address.
     
     Tip: If you run IP PrintWay extended mode and specify a host name, define the host name in the Domain Name Server (DNS) before you save the printer definition. If you create the DNS entry after you save the printer definition, Infoprint Central cannot display the printer for this printer definition until someone submits a print job to the printer definition or until you modify an attribute in the printer definition.
   - **Print queue name**: Specify the name of the print queue in the printer or print server. To determine the correct queue name, see the documentation for the network interface card, the printer, or the print server.
     
     Tip: Some common queue names are:
TEXT and RAW are queue names used for some Ricoh printers, most HP printers, and most Lexmark printers. Specify the RAW queue for formatted text data, PCL data, and PostScript data.

TEXT and PASS are queue names used for some Ricoh printers. Specify the PASS queue for formatted text data, PCL data, and PostScript data.

Formatted text data must contain a carriage return and line feed controls at the end of each line. If you specify RAW or PASS and you run IP PrintWay basic mode, also specify 0025 in the Line termination field. This causes IP PrintWay basic mode to add carriage return and line feed controls at the end of each line. IP PrintWay extended mode adds carriage return and either line feed or new line controls at the end of each line by default.

- **Mode**: Select one of these options:
  - **Control file first**: IP PrintWay transmits the control file before the data file. Not all LPDs support this mode. However, this mode lets some LPDs print data as it is received and print larger files.
  - **Control file last**: IP PrintWay transmits the control file after the data file. All LPDs that adhere to RFC 1179 support this mode (default).
  - **Stream**: IP PrintWay transmits the control file before the data file. The remote LPD must support the RECEIVE CONTROL FILE FIRST and RECEIVE DATA FILE WITH UNSPECIFIED LENGTH commands. Select this mode for IBM network stations.
  - **Remote PSF**: IP PrintWay transmits files to InfoPrint Manager. For more information about this option, see "Printing with InfoPrint Manager for AIX or Windows" on page 206.

- **Optimize copies**: Select this field if the printer’s LPD can print multiple copies of the same data set.

- **Restrict ports**: Select this field to restrict the z/OS ports that IP PrintWay uses to the range of 721 to 731. Select this option if the printer’s LPD requires that IP PrintWay restrict itself to ports in this range. When you do not select the Restrict Ports field, IP PrintWay can use any free port. This increases the probability of finding an available port.

- **Print banner page, Banner class, Banner job name, Filename, Indent, Owner, Print function, Title, and Width**: (Optional) Specify values that IP PrintWay transmits to the printer in the LPD control file. For a description of these fields and the default values, see the ISPF online help panels.

  **Tip**: Although IP PrintWay transmits these values to the LPD, the LPD might not support them. For example, the LPD might not support printing a banner page or indenting data.

- **User options**: (Optional) Specify control codes that are supported by the LPD. IP PrintWay adds these control codes to the end of the LPD control file.

3. On the IP PrintWay Options panel, specify these fields:

- **Automatic dataset grouping (extended mode) or Dataset grouping**: Select how you want IP PrintWay to transmit data sets that are in the same JES output group. For information, see "Transmitting multiple data sets in a JES output group" on page 198.

  **Tip**: When you run IP PrintWay extended mode, select the Automatic dataset grouping (extended mode) field. Automatic data set grouping is the most efficient method of transmitting data sets to the printer. Also, it makes sure that data sets in the same output group print together.
Document header or Document trailer: You might need to specify a command to force the printer to start each copy on a new sheet of paper. For more information, see “Sending commands to the printer” on page 200.

Example
These ISPF panels show how to specify the LPR protocol in a printer definition.

Tip: This example shows only some of the ISPF panels that comprise a printer definition. For a complete printer definition that is suitable for the LPR protocol, see Appendix D, “Sample IP PrintWay printer definitions,” on page 481.

The Choose a Definition Type and Protocol panel lets you select the protocol type when you use the Add function to create a printer definition.

```
Option ===> 1
Type        Protocol
1 IP PrintWay LPR
2 IP PrintWay direct sockets
3 IP PrintWay IPP
4 IP PrintWay VTAM
5 IP PrintWay e-mail
6 PSF
7 General
```

To display this LPR Protocol panel, press Enter on the Custom values field for the Protocol section on the main panel for the printer definition.

```
LPR Protocol
Printer definition name . myprinter
Operator security profile
Printer IP address . printer1.boulder (extend)
Print queue name . RAW (extend)
LPR Processing Options:
   Mode . . . . . . . . 2 1. Control file first 2. Control file last
   Optimize copies
   Restrict ports
   Print banner page
   Banner class . Department 001, Building 003
   Banner job name
   Filename . . . . . . . . . . . . . . . . . . . . (extend)
   Indent . . . . . . . . . . . . . . . . . . . .
   Owner . . . . . . . . . . . . . . . . . . . .
   Print function . .
   Title . . . . . . . . . . . . . . . . . . . . (extend)
   Width . . . . . . . . . . . . . . . . . . . .
   User options . . . . . . . . . . . . . . . . . . (extend)
```

Results:
- IP PrintWay uses the LPR protocol to transmit data sets to print queue text at IP address printer1.boulder. Because the Restrict ports field is not selected, IP PrintWay lets TCP/IP select any available port on the z/OS system to transmit data.
Because **Control file last** is selected in the **Mode** field, IP PrintWay transmits the control file to the LPD after the data file.

IP PrintWay also transmits the text specified in the **Banner class** field to the LPD in the control file for printing on a banner page, a page that prints before the data set. However, the banner prints only if the LPD can print banner pages.

To display this IP PrintWay Options panel, press Enter on the **Custom values** field for the IP PrintWay Options section on the main panel for the printer definition:

```
IP PrintWay Options
Printer definition name . myprinter
 ;
 / Automatic dataset grouping (extended mode)
 Dataset grouping... 3 1. None 2. Job 3. Concatenate job
 ;
```

**Result:** IP PrintWay sends all data sets in the same JES output group to the printer in the same transmission:

- IP PrintWay extended mode uses the **Automatic dataset grouping** field. IP PrintWay extended mode uses the **Dataset grouping** field only if the **Automatic dataset grouping** field is not selected.
- IP PrintWay basic mode uses the **Concatenate job** option of the **Dataset grouping** field.

### Selecting the direct sockets protocol

In an IP PrintWay printer definition, you can select the transmission protocol that IP PrintWay uses to transmit output data sets from the JES spool to the printer, print server, or e-mail destination. IP PrintWay supports these transmission protocols: LPR, direct sockets, IPP, VTAM, and e-mail.

Select the IP PrintWay direct sockets protocol if you want IP PrintWay to use the TCP/IP direct sockets printing protocol to transmit data sets directly to a designated port on a printer or print server. When you select this protocol, the printer or print server must support direct sockets printing.

**Tips:**

- Some printers support the direct sockets printing protocol as well as other protocols, such as the LPR protocol. For large data sets, the direct sockets printing protocol can provide better performance. However, you might want to select the LPR protocol to take advantage of the formatting options that IP PrintWay can specify in the LPD control file. For example, printing a banner page.
- When you select the direct sockets protocol, IP PrintWay extended mode can record the number of printed pages in the SMF type 6 record and can restart printing after the last page that printed successfully. For information, see “Tracking the number of printed pages (extended mode)” on page 187.

When you select the direct sockets protocol, IP PrintWay transmits data to the printer or print server at the IP address (or host name) and port number that you specify in the printer definition. A job submitter can override the IP address and
port number specified in the printer definition by specifying the IP address in the
DEST=IP: parameter and the port number in the PORTNO parameter on the
OUTPUT JCL statement.

Because the job submitter can override the IP address and port number, you can
create one printer definition for several printers that share the same attributes. To
use this printer definition, the job submitter must specify the name of the printer
definition, the IP address, and the port number on the OUTPUT JCL statement. If
the job submitter does not specify the name of the printer definition on the
OUTPUT JCL statement, IP PrintWay uses printer attributes specified in the default
IP PrintWay printer definition described in "Creating an IP PrintWay default
printer definition" on page 207. For more information about job submission, see
z/OS Infoprint Server User’s Guide.

IP PrintWay prints multiple copies by transmitting the data set to the printer the
requested number of times. This is because the direct sockets printing protocol
cannot print multiple copies of a single data set.

**Related customization tasks:** These IP PrintWay customization tasks are related
to the direct sockets protocol. For information about how to do these tasks and other
customization tasks related to the direct sockets protocol, see z/OS Infoprint Server
Customization.

- Customize the TCP/IP component of z/OS Communications Server.
- When more than one copy is requested, IP PrintWay extended mode writes
temporary files to the /var/Printsrv/printway directory. If necessary, increase the
  amount of space available to this directory.
- When you specify a value in the Maximum document size field, or select the
  Delete form feed option, IP PrintWay basic mode writes temporary files to
  hiperspace. If necessary, increase the amount of available hiperspace in the IP
  PrintWay FSS definition.

**Procedure for specifying attributes**

1. Add a new printer definition. On the Choose a Definition Type and Protocol
   panel, select IP PrintWay direct sockets. If you copy a printer definition, select
   an IP PrintWay printer definition that uses the direct sockets protocol.

2. On the Direct Sockets Protocol panel, specify these fields:
   - **IP address:** Specify the host name or dotted decimal address of the printer
     or print server. If another printer definition refers to this printer, use the
     same uppercase and lowercase letters when you type the host name.
     **Rule:** You can specify the IP address in dotted-decimal format. If the printer
     or print server has an IPv6 address, you must specify its host name instead
     of its colon-hexadecimal format address.
     **Tip:** If you run IP PrintWay extended mode and specify a host name, define
     the host name in the Domain Name Server (DNS) before you save the
     printer definition. If you create the DNS entry after you save the printer
     definition, Infoprint Central cannot display the printer for this printer
     definition until someone submits a print job to the printer definition or until
     you modify an attribute in the printer definition.
   - **Port number:** Specify the port number at which the printer or print server
     supports printing. To determine the correct port number, see the
     documentation for the network interface card or printer.
**Tip:** Some common port numbers are:
- Port 9100, which is used by some Ricoh printers, most HP printers, and most Lexmark printers.
- Port 2501, which is used by some Ricoh printers.

- (Optional) **Record pages printed for accounting:** IP PrintWay extended mode records the number of printed pages in the SMF type 6 record. For more information, see “Tracking the number of printed pages (extended mode)” on page 187.
- (Optional) **Restart printing after last successful page:** IP PrintWay extended mode restarts printing after the last page in the print job that printed successfully. For more information, see “Tracking the number of printed pages (extended mode)” on page 187.

---

**Example**

These ISPF panels show how to specify the direct sockets protocol in a printer definition.

When you use the Add function to create a new printer definition, the Choose a Definition Type and Protocol panel lets you select the protocol type.

```plaintext
Choose a Definition Type and Protocol

Option ==> 2
Type       Protocol
1 IP PrintWay LPR
2 IP PrintWay direct sockets
3 IP PrintWay IPP
4 IP PrintWay VTAM
5 IP PrintWay e-mail
6 PSF
7 General
```

To display this Direct Sockets Protocol panel, press Enter on the **Custom values** field for the Protocol section on the main panel for the printer definition.

```plaintext
Direct Sockets Protocol

Printer definition name . myprinter
Operator security profile

Printer IP address . 99.999.123.456 (extend)
Port number . . . . 2501

Printer Job Language (PJL) options:
  _ Record pages printed for accounting
  _ Restart printing after last successful page
```

**Result:** IP PrintWay uses the direct sockets protocol to transmit data sets to port number 2501 at IP address 99.999.123.456. IP PrintWay transmits only a data file, without a control file.
Selecting the IPP protocol

In an IP PrintWay printer definition, you can select the transmission protocol that IP PrintWay uses to transmit output data sets from the JES spool to the printer, print server, or e-mail destination. IP PrintWay supports these transmission protocols: LPR, direct sockets, IPP, VTAM, and e-mail.

Select the IP PrintWay IPP (Internet Printing Protocol) protocol if you want IP PrintWay to transmit data sets over the Internet to the printer. When you select the IPP protocol, an IPP server must be running in the remote printer or host system.

IP PrintWay transmits the print data stream to the IPP server at the URL that you specify in the printer definition. A job submitter cannot override the URL when submitting a print job. This means that you must create one printer definition for each printer.

Along with the data, IP PrintWay also transmits a control file containing these IPP job attributes:
- copies
- document-name
- job-name
- requesting-user-name
- sides

The IPP server running in the printer or print server processes the IPP job attributes that IP PrintWay sends with each print request. The IPP server ignores any IPP job attributes that it does not support. For example, some IPP servers do not support the copies and sides attributes, so the output might not print as requested. If the IPP server ignores one or more of the IPP job attributes for a print job, a message in the IP PrintWay message log indicates which job attributes were ignored.

Limitations: When you select the IPP protocol, IP PrintWay does not support:
- Concatenate job option of the Dataset grouping field
- Automatic dataset grouping field

Related customization tasks: These IP PrintWay customization tasks are related to the IPP protocol. For information about how to do these tasks and other customization tasks related to the IPP protocol, see z/OS Infoprint Server Customization.
- If you did not install Infoprint Server files in default directories, specify the directories in the STDENV data set in the IP PrintWay startup procedure.
- Customize the TCP/IP component of z/OS Communications Server.
- When more than one copy is requested, IP PrintWay extended mode writes temporary files to the /var/Printsrv/printway directory. If necessary, increase the amount of space available to this directory.
- When you specify a value in the Maximum document size field or select the Delete form feed option, IP PrintWay basic mode writes temporary files to hiperspace. If necessary, increase the amount of available hiperspace in the IP PrintWay FSS definition.
Procedure for specifying attributes

1. Add a new printer definition. On the Choose a Definition Type and Protocol panel, select IP PrintWay IPP. If you copy a printer definition, select an IP PrintWay printer definition that uses the IPP protocol.

2. On the IPP Protocol panel, specify these fields:
   - **URL**: Specify the uniform resource locator (URL) of the IPP server. Consult your IPP printer or IPP print server documentation for the format of the URL to use. The format of the URL depends on the implementation of the IPP printer or print server and varies among printer manufacturers.

Example
These ISPF panels show how to specify the IPP protocol in a printer definition.

When you use the Add function to create a printer definition, the Choose a Definition Type and Protocol panel lets you select the protocol type.

<table>
<thead>
<tr>
<th>Option</th>
<th>Type</th>
<th>Protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>IP PrintWay</td>
<td>LPR</td>
</tr>
<tr>
<td>2</td>
<td>IP PrintWay</td>
<td>direct sockets</td>
</tr>
<tr>
<td>3</td>
<td>IP PrintWay</td>
<td>IPP</td>
</tr>
<tr>
<td>4</td>
<td>IP PrintWay</td>
<td>VTAM</td>
</tr>
<tr>
<td>5</td>
<td>IP PrintWay</td>
<td>e-mail</td>
</tr>
<tr>
<td>6</td>
<td>PSF</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>General</td>
<td></td>
</tr>
</tbody>
</table>

To display this IPP Protocol panel, press Enter on the Custom values field for the Protocol section on the main panel for the printer definition.

**Result**: IP PrintWay uses the IPP protocol to transmit data sets to an IPP server at URL http://myprinter.xyz.com:631.

Selecting the VTAM protocol

In an IP PrintWay printer definition, you can select the transmission protocol that IP PrintWay uses to transmit output data sets from the JES spool to the printer, print server, or e-mail destination. IP PrintWay supports these transmission protocols: LPR, direct sockets, IPP, VTAM, and e-mail.

Select the IP PrintWay VTAM protocol if you want IP PrintWay to transmit data sets to a VTAM-controlled printer. The printer must be defined to VTAM as LU type 0, 1, or 3.
IP PrintWay transmits data sets to the VTAM LU name that you specify in the printer definition. A job submitter cannot specify the LU name of the printer when submitting a print job. Therefore, you must create a printer definition for each VTAM-controlled printer.

Depending on the VTAM LU type, IP PrintWay can convert line data to either the SNA Character String (SCS) or the Data Stream Compatible/Data Stream Extended (DSC/DSE) data stream. This tables summarizes the supported LU types and data streams:

<table>
<thead>
<tr>
<th>LU type</th>
<th>Data stream</th>
</tr>
</thead>
<tbody>
<tr>
<td>LU type 0</td>
<td>DSC/DSE</td>
</tr>
<tr>
<td>LU type 1</td>
<td>SCS</td>
</tr>
<tr>
<td>LU type 3</td>
<td>DSC/DSE</td>
</tr>
</tbody>
</table>

IP PrintWay can also transmit data sets to VTAM-controlled printers without changing the data. This support means that you can print data that is already in the format required by your VTAM-controlled printers. For example, you can print PCL data to VTAM-controlled printers that accept PCL data. As an option, IP PrintWay can transmit the unchanged data as transparent data. This support lets you transmit data through an SNA gateway that requires that data be preceded by transparent data controls. Typically, the SNA gateway removes the transparent data controls before transmitting the data to the printer. For each printer, you can specify the transparent data character that the SNA gateway expects in the transparent data controls. IP PrintWay does not transmit these types of data as transparent data:

- Printer commands specified in the Document header and Document trailer fields
- Data added by the IP PrintWay Begin Data Set and End Data Set exits

**Limitations:** When you select the VTAM protocol, IP PrintWay does not support:

- Double-byte character set (DBCS) data
- Printing more than one copy of a data set (IP PrintWay basic mode)
- For LU1 devices, String Control Byte compression (SCB) or compaction
- Dataset grouping and Automatic dataset grouping fields
- Translate only option of the Formatting field

**Related customization tasks:** These IP PrintWay customization tasks are related to the VTAM protocol. For information about how to do these tasks and other customization tasks related to the VTAM protocol, see [z/OS Infoprint Server Customization](#).

- Install Infoprint Coaxial Printer Support V2 for z/OS (5655-N62). For installation instructions, see the Program Directory for the product.
- Create a VTAM APPL definition for IP PrintWay (extended mode), or create a VTAM APPL definition for each IP PrintWay FSS (basic mode).

**Creating VTAM resource definitions for VTAM-controlled printers**

You must create these VTAM resource definitions in addition to the VTAM APPL definition for the IP PrintWay FSS:

- A VTAM logon mode entry definition for each device type. See “VTAM logon mode definitions” on page 157.
A VTAM resource definition for each printer. See "VTAM resource definitions for printers."

VTAM cross-domain definitions. These definitions might be required if the VTAM printer resource definitions are owned by another VTAM domain.

For complete information about how to create these VTAM resource definitions, see z/OS Communications Server: SNA Resource Definition Reference.

**VTAM logon mode definitions**

A VTAM logon mode definition defines the VTAM session parameters. IP PrintWay does not require any special parameters in the VTAM logon mode definition. Therefore, you can use any existing LU0, LU1, and LU3 logon mode definition that is suitable for the type of printer attachment used by the printer. In a VTAM cross-domain system, the logon mode definition must be available to the VTAM domain that owns the printer logical unit.

Entries supplied by IBM in the default logon mode table, ISTINCLM, that would be suitable are:

```
**********************************************************************
* * DSILGMOD LOGMODE TABLE FOR BSC, LOCAL, SDLC 3275, 3277, 3278, 3279 *
* MODEL 2 OR 12, 24 X 80 SCREEN. MAY BE USED TO RUN *
  * MODELS 3, 4, 5, 2C OR 3C AS MODEL 2 *
* ALSO FOR 3284, 3286, 3287, 3288, 3289 PRINTERS *
* THROUGH A 3271, 3272, 3274, 3275, OR 3276 CONTROLLER *
* *
**********************************************************************
DSILGMOD MDEENT LOGMODE=DSILGMOD,FMPROF=X'02',TSPROF=X'02', *
PRIPROT=X'71',SECPROT=X'40',COMPROT=X'2000', *
RUSIZES=X'0000',PSERVIC=X'0000000000000000000000000200',* 
APPNCS=#CONNECT

APPNCS=#CONNECT
```

**VTAM resource definitions for printers**

A VTAM resource definition is required for each printer. Some sample VTAM resource definitions are:

* Non-SNA, LTYPE=0
  
P001 LOCAL CUADDR=nnn,TERM=nnnn, DLOGMOD=DSILGMOD
  
* SNA, LTYPE=1
  
P002 LU LOCADDR=nnn, DLOGMOD=SCS

* SNA, LTYPE=3
  
P003 LU LOCADDR=nnn, DLOGMOD=DSC4K
Tip: The DLOGMOD parameter names an entry in the VTAM logmode table. You can also specify the logmode entry name in the Printer logmode field of the printer definition.

Procedure for specifying attributes

1. Add a printer definition. On the Choose a Definition Type and Protocol panel, select IP PrintWay VTAM. When you select the VTAM protocol, a value that is suitable for the VTAM protocol is automatically displayed in this field:
   - **Printer code page**: The EBCDIC code page specified in the Infoprint Server configuration file, `aopd.conf`, is displayed. For information about how to edit this file, see [z/OS Infoprint Server Customization](#)

   Instead of adding a new printer definition, you can either copy or change the protocol in an existing printer definition:
   - If you copy a printer definition, select an IP PrintWay printer definition that uses the VTAM protocol.
   - If you change the protocol type of an existing printer definition using the `X` function on the List Printer Definition panel, also edit this field on the Processing panel:
     - **Printer code page**: Specify an EBCDIC code page (such as IBM-1047) because most VTAM-controlled printers expect EBCDIC data.

2. On the VTAM Protocol panel, specify these fields:
   - **Printer LU name**: Specify the VTAM network name of the printer. This name must match the name of the VTAM resource definition. For example, the name of the VTAM LU statement or the VTAM LOCAL statement. This field is required.
   - **Printer logmode**: (Optional) Specify the name of an entry in the VTAM logon mode table. The default is the name specified in the DLOGMOD parameter of the VTAM resource definition statement for the printer.
   - **Checkpoint pages**: (Optional) Specify the number of pages (0 - 25) between data-set checkpoints. IP PrintWay requests a definitive response from the printer after the specified number of pages. If a printer error or printer intervention situation occurs, IP PrintWay resends all pages that were sent after the last definitive response from the printer. This makes sure that no data is lost. However, duplicate pages, up to the specified checkpoint number, might be printed.

   If a printer error or intervention situation persists after IP PrintWay resends pages from the last data-set checkpoint, IP PrintWay resends all data from the beginning if retries are requested. In this case, more duplicate pages might be printed.

   A value of 0 means that IP PrintWay takes no checkpoints. If an error occurs, IP PrintWay retransmits the entire data set if you have requested retries for the printer.

   If you request frequent checkpoints, printer performance might be adversely affected. If you request less frequent checkpoints, more duplicate pages might be printed. The default value is 5 pages.
   - **Send as transparent data**: (Optional) Select this field to send data to the printer as transparent data. IP PrintWay precedes transparent data with a transparent data control that contains a 1-byte transparent data character and a 1-byte length field.
Tip: When you select the Send as transparent data field, IP PrintWay always processes data as if the IP PrintWay None formatting option were selected. Therefore, if you select this field, it is not necessary to also select the None option on the IP PrintWay Options panel.

3. (Optional) On the Processing panel and the IP PrintWay Options panel, specify these fields that control how IP PrintWay formats data for the printer:
   - **Transparent data char**: (Optional) If you select the Send as transparent data field, specify the transparent data character that you want IP PrintWay to use in the transparent data control. The default character is X’35’.
   - If you do not select the Send as transparent data field, see “SCS page-formating attributes” on page 212 and “Using an FCB to format data” on page 196 for information about the fields that control how IP PrintWay creates SCS and DSC/3270 data streams.

Example

These ISPF panels show how to specify the VTAM protocol in a printer definition.

Tip: This example shows only some of the ISPF panels that comprise a printer definition. For a complete printer definition that is suitable for the VTAM protocol, see Appendix D, “Sample IP PrintWay printer definitions,” on page 481.

Use the Add function to create a printer definition. On the Choose a Definition Type and Protocol panel, select the protocol type:

```
Choose a Definition Type and Protocol
Option ===> 4
Type === Protocol
1 IP PrintWay LPR
2 IP PrintWay direct sockets
3 IP PrintWay IPP
4 IP PrintWay VTAM
5 IP PrintWay e-mail
6 PSF
7 General
```

To display this VTAM Protocol panel, press Enter on the Custom values field for the Protocol section on the main panel of the printer definition.

```
VTAM Protocol
Printer definition name . myprinter
Operator security profile

Printer LU name. . . P002

VTAM Processing Options:
  Printer logmode... SCS
  Checkpoint pages .. 5
  _ Send as transparent data

Results:
  - IP PrintWay uses the VTAM protocol to transmit data sets to the printer with VTAM LU name P002.
```
• IP PrintWay uses the VTAM logon-mode entry named SCS and requests a definitive response from the printer every 5 pages.

Selecting the e-mail protocol

In an IP PrintWay printer definition, you can select the transmission protocol that IP PrintWay uses to transmit output data sets from the JES spool to the printer, print server, or e-mail destination. IP PrintWay supports these transmission protocols: LPR, direct sockets, IPP, VTAM, and e-mail.

Select the IP PrintWay e-mail protocol if you want IP PrintWay to transmit data sets to one or more e-mail addresses over the Internet using the z/OS UNIX sendmail function that z/OS Communications Server provides.

IP PrintWay transmits e-mails to the e-mail addresses that you specify in the printer definition. Some job submitters can override the e-mail addresses during job submission. You can set up just one printer definition for the e-mail protocol because the job submitter can specify the e-mail addresses. You must specify a default e-mail address in this printer definition.

IP PrintWay provides these functions when you select the e-mail protocol:
• IP PrintWay can send an output data set to one or more primary and secondary e-mail addresses at the same time.
• You can specify e-mail addresses or the name of an alias that is defined to sendmail. Sendmail expands alias names into one or more real e-mail addresses. For information about how to define aliases, see “Defining aliases to z/OS UNIX sendmail” on page 164.
• You can specify the e-mail address or alias name that recipients of the e-mail can reply to.
• IP PrintWay basic mode sends all documents as e-mail attachments. IP PrintWay extended mode can include text and line-data documents inline in the body of an e-mail. To request this function, select the Inline text and line data field in the printer definition.
• IP PrintWay can send data sets that are in the same JES output group in the same e-mail. To request this function, select the Concatenate job option in the Dataset grouping field or the Automatic dataset grouping (extended mode) field.
• IP PrintWay can transform the input data from one format to another before creating the attachment. For example, if your installation has installed an AFP to PDF transform, you can transform line-data or AFP data to PDF format. For information about how to request a transform, see Chapter 15, “Planning printer definitions for transforms,” on page 225.
• Depending on the method used to submit jobs, some job submitters can customize the subject of the e-mail. For those situations in which the job submitter cannot specify a subject, you can specify a default subject line in the printer definition. For example, when you print VTAM application data (such as CICS data) through NetSpool, the job submitter cannot customize the subject line unless the VTAM application embeds the title-text job attribute in the print data.
• When you print VTAM application data (such as CICS data) through NetSpool, you can print data and also send it to a set of e-mail addresses at the same time. To do this, create a printer pool definition and in the pool definition list the printer definition that specifies the e-mail addresses and also the printer
definition for the printer itself. For more information, see "Broadcasting data using multiple printer definitions" on page 134.

- IP PrintWay extended mode can send e-mails to the recipients specified in an e-mail header in line-data documents. To select this function, select the Embedded headers field. For the format of the e-mail header, see z/OS Infoprint Server User’s Guide.

- IP PrintWay extended mode can include a message in the beginning of e-mails. To select this function, specify the Inline message field.

Table 22 shows how IP PrintWay constructs an e-mail.

<table>
<thead>
<tr>

</tr>
<tr>
<td>3. If NetSpool processes the print request, the text specified in the <strong>sysout-dataset-name</strong> job attribute, or the LU name of the VTAM application that submitted the print request (primary LU)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4. If the print job is submitted with JCL, the last qualifier of the data set name on the JES spool, or the job name</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IP PrintWay attaches a suffix to the file name that designates the document format. (See Note 2 below.)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Notes:
1. In these situations, Infoprint Server generates the job name. In all other cases, the job name is the name of the batch job.
   - If NetSpool processes the print request, the job name is the name specified in the **sysout-job-name** job attribute, the owner name specified in the **owner** job attribute or in the printer definition, or the member name of the NetSpool startup procedure.
   - If Print Interface, except for the subsystem, processes the print request, the job name is the name specified in the **sysout-job-name** job attribute or the user ID of the person who submitted the print request.
2. Considerations for the name of the file attachment:
• A # in the file name means that the original file name contains a character that JES does not allow in a data set name. For example, if the original file name is myfile.print, this field contains le#print.

• These suffixes designate the document format:

<table>
<thead>
<tr>
<th>Suffix</th>
<th>Document format</th>
</tr>
</thead>
<tbody>
<tr>
<td>afp</td>
<td>Advanced Function Presentation (also known as MO:DCA-P)</td>
</tr>
<tr>
<td>jpg</td>

</tr>
<tr>
<td>octet-stream</td>
<td>Unrecognized format</td>
</tr>
</tbody>
</table>

• Tip: The system administrator can set these environment variables to control the suffixes that IP PrintWay appends to the file names:
  – AOP_MAIL_PRESERVE_SUFFIXES
  – AOP_MAIL_DO_NOT_ADD_SUFFIX

For information about these environment variables, see z/OS Infoprint Server Customization.

3. IP PrintWay uses the values in a document e-mail header only if the Embedded headers field is selected in the printer definition or the mail-embedded-headers job attribute is specified.

Limitations:
• In some situations, the sender field of the e-mail does not contain the e-mail address of the individual who sent the e-mail. Therefore, job submitters should specify the reply address in the mail-reply-address attribute. If job submitters cannot specify attributes, you can specify the reply address in the Reply address field in the printer definition.

• In these cases, the recipient should not reply to the sender:
  – If NetSpool processed the print request and no owner is specified in either the owner job attribute or in the printer definition, the sender is the ID of the user who started the Infoprint Server daemons and the domain is the domain of the system on which sendmail is running.
  – If Print Interface processed the print request and the job was submitted from a remote system, the sender is the name of the user on the remote system. However, the domain name is the domain of the system on which sendmail is running, so in most cases, this would not be a valid z/OS e-mail address.

• IP PrintWay cannot always determine whether an e-mail was successfully sent to a recipient. This is because sendmail does not report an error to IP PrintWay when mail could not be delivered to an e-mail address on a remote system. In this case, sendmail returns the undeliverable e-mail to owner of the sendmail alias. If the e-mail address is specified directly in the printer definition, or if no alias owner is defined, sendmail returns undeliverable e-mail to the user ID associated with the IP PrintWay startup procedure (basic mode) or the ID of the user who started the Infoprint Server daemons. For more information about sendmail messages, see “Viewing z/OS UNIX sendmail messages” on page 63.

• IP PrintWay ignores the number of requested copies and always sends only one data set to an e-mail address.
• IP PrintWay cannot add PostScript headers to data sets with line data. If you want to e-mail line data as a PostScript document, use the AFP to PostScript transform to convert line data to PostScript format.

**Related customization tasks:** These IP PrintWay customization tasks are related to the e-mail protocol. For information about how to do these tasks and other customization tasks related to the e-mail protocol, see [z/OS Infoprint Server Customization](#).

- Configure the z/OS UNIX sendmail component of z/OS Communications Server.
- If you did not install Infoprint Server files and z/OS UNIX sendmail in default directories, specify the directories in the AOPMAILER environment variable.
- Customize the TCP/IP component of z/OS Communications Server.
- When you specify a value in the Maximum document size field or select the Delete form feed option, IP PrintWay basic mode writes temporary files to hiperspace. If necessary, increase the amount of available hiperspace in the IP PrintWay FSS definition.

**Defining aliases to z/OS UNIX sendmail**

You can define an alias name to sendmail to represent one or more real e-mail addresses. Sendmail expands alias names into e-mail addresses when it sends an e-mail. After you define an alias to sendmail, you can specify the alias name in a printer definition. You might want to define an alias for a mailing list that you need to specify in more than one printer definition or that is longer than the number of characters you can specify in a printer definition.

This is a summary of the steps you need to do to define an alias to sendmail. For more complete information, see [z/OS Communications Server: IP Configuration Guide](#).

1. In the sendmail aliases file, `/etc/mail/aliases`, specify the alias name and either the real e-mail addresses or the name of a file in which you specify the real addresses. To edit the aliases file, you must have an effective UID of 0.

   ```
   _________________________________________________________
   2. Run the sendmail `newaliases` command so that sendmail recognizes the new aliases.
   _________________________________________________________
   
   3. (Optional) Create a file in which you specify the real e-mail addresses for the alias. This file must be readable by everyone but writeable only by the owner. All directories in its path must be readable by everyone, executable by everyone, and writeable only by the owner.
   _________________________________________________________
   
   For example, to define two aliases, dept123 and dept456:
   
   1. Switch to an effective UID of 0:
   ```
   su
   ```
   
   To use the z/OS UNIX `su` command, you must be permitted to the BPX.SUPERUSER profile in the FACILITY class in RACF.
   
   Then, edit the sendmail aliases file using your preferred editor, for example:
   ```
   oedit /etc/mail/aliases
   ```
Add these lines to define the e-mail addresses for alias dept123 and the name of a file that contains the e-mail addresses for alias dept456:

```
# Define an alias and the list of addresses.
depth123: user1@xyz.com, user2@xyz.com, user3@xyz.com
# Define an alias and the file that contains the list.
depth456: "include:/u/myuserid/dept456.list"
```

2. Update sendmail so that it recognizes the new aliases:

```
/usr/sbin/newaliases
```

3. Create file `/u/myuserid/dept456.list` using your preferred editor, for example:

```
oedit /u/myuserid/dept456.list
```

In this file, specify the e-mail addresses for alias DEPT456:

```
user1@xyz.com, user2@xyz.com, user3@xyz.com, user4@xyz.com, user5@xyz.com
```

Change the permissions of the file:

```
chmod 755 /u/myuserid/dept456.list
```

Change the permissions of the directory:

```
chmod 755 /u/myuserid
```

For more information about the z/OS UNIX commands used in this example, see [z/OS UNIX System Services Command Reference](#).

### Viewing e-mail attachments

This table summarizes how e-mail recipients can view e-mail attachments created by IP PrintWay.

The mail servers on AIX systems and on most UNIX systems, including z/OS UNIX, let users view data that is in text format. Other data formats such as PDF or PostScript cannot be viewed.

<table>
<thead>
<tr>
<th>Data Format</th>
<th>Viewer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Any text editor such as Windows Notepad.</td>
</tr>
<tr>
<td>AFP</td>
<td>The AFP Viewer plug-in for Windows, which you can download from the Web: <a href="http://www.ibm.com">www.ibm.com</a> Search for “AFP Viewer”.</td>
</tr>
<tr>
<td>PDF</td>
<td>The Adobe Acrobat Reader, which you can download from the Adobe Web site. To view PDF data created by the AFP to PDF transform, you might need to customize Acrobat Reader.</td>
</tr>
<tr>
<td>PostScript</td>
<td>Ghostview, which you can download from the Ghostview Web site.</td>
</tr>
</tbody>
</table>

### Procedure for specifying attributes

You can either create a new printer definition for an e-mail destination or modify an existing printer definition for a printer.

**Creating a new e-mail printer definition**

Do these steps to create a new printer definition for an e-mail destination. These steps describe fields that have special considerations for the e-mail protocol. You might also need to specify other fields in the printer definition to use all the functions that Infoprint Server provides.
1. Use the Infoprint Server ISPF panels to add a new printer definition. On the Choose a Definition Type and Protocol panel, select **IP PrintWay e-mail**.

2. On the E-mail Protocol panel, specify the **To addresses** field and any of these other fields:
   - **To addresses**: The e-mail addresses or alias names of the recipients of the e-mail. You can specify 1-32 e-mail addresses (to add more entries, put your cursor on “more” and press Enter). Each e-mail address can be 1-60 characters. An address that the job submitter specifies overrides this value.
   - **CC addresses**: The e-mail addresses or alias names of the “copy (cc)” recipients of the e-mail. A cc means that other recipients of the e-mail can see the cc recipient listed. You can specify 1-32 e-mail addresses (to add more entries, put your cursor on “more” and press Enter). Each e-mail address can be 1-60 characters. An address that the job submitter specifies overrides this value.
   - **BCC addresses**: The e-mail addresses or alias names of the “blind copy (bcc)” recipients of the e-mail. A bcc means that other recipients of the e-mail do not see the bcc recipient listed. You can specify 1-32 e-mail addresses (to add more entries, put your cursor on “more” and press Enter). Each e-mail address can be 1-60 characters. An address that the job submitter specifies overrides this value.
   - **From name**: The descriptive name or other identifier of the sender of the e-mail. You can specify one name. It can be 1-60 characters, including blanks. IP PrintWay always includes `userid@domainname` to identify the sender. The user ID of the job submitter is `userid`. The domain name where Infoprint Server is running is `domainname`. For example: `JOHN@SYSTEM1`.
   - **Reply address**: The e-mail address or alias name that recipients of the e-mail can reply to. You can specify one e-mail address. It can be 1-60 characters. An address that the job submitter specifies overrides this value. If you do not specify this field, most e-mail programs use the sender's e-mail address, which is `userid@domainname`. The user ID of the job submitter is `userid`. The domain name where Infoprint Server is running is `domainname`.
   - **Embedded headers**: If any line-data documents contain e-mail headers, select the **Embedded headers** field. When this field is selected, IP PrintWay looks for an e-mail header in each document with line-data format. If a header is found, IP PrintWay sends the e-mail to the recipients specified in the header. If no line-data documents contain e-mail headers, deselect this field for improved performance.
   - **Inline text and line data**: Select this field if you want to include text data and line-data inline in the body of the e-mail instead of in attachments.
   - **Inline message**: Specify an optional message to include in the beginning of each e-mail.

Each e-mail address or alias name should be in this format:

```
username@domainname
```

- **username**: The name of the recipient or the name of an alias defined to sendmail.
- **@domainname**: The domain name of the target system. If you omit `@domainname`, the domain name of the system on which sendmail is running is used. If you specify an alias, omit `@domainname`. 

---

166  z/OS V1R13.0 Infoprint Server Operation and Administration
3. On the Allocation panel, specify these fields:
   - **Spool allocation values**: Specify either the job-selection values that are specified in the IP PrintWay job selection rule (extended mode) or the work-selection values specified in the JES FSA definition (basic mode). For example, if the job-selection value for IP PrintWay is class E, specify E in the CLASS field.
   - **Title**: (Optional) Specify a default subject for the e-mail. You can specify up to 60 characters, including blanks and any other printable characters. A job submitter can override this value.
     If you run IP PrintWay basic mode, this field applies only to documents that NetSpool or Print Interface processes.

4. On the Processing panel, specify these fields:
   - **Filter**: (Optional) Specify any transforms you want to use. For example, you might want to specify the AFP to PDF transform for the Line data and MO:DCA-P data formats to create PDF documents. If you run IP PrintWay basic mode and specify a transform, also select the **Resubmit for filtering** option.
   - **Printer code page**: Specify one of these code pages:
     - Any ASCII code page: IP PrintWay converts EBCDIC data from the document code page (default is IBM-1047) to the specified ASCII code page.
     - EBCDIC code page IBM-1047: Sendmail converts EBCDIC data from code page IBM-1047 to the ASCII code page configured for sendmail.
   **Tips**:
     - The only EBCDIC code page you should specify is IBM-1047. This is because sendmail can only convert data from code page IBM-1047 to an ASCII code page.
     - If the code page for the locale on the z/OS system where Infoprint Server is running is not IBM-1047, specify an ASCII code page instead of an EBCDIC code page.
     - Specify a code page that the iconv utility supports, or specify a custom ASCII code page. For code page names that iconv supports, see z/OS XL C/C++ Programming Guide.
     - If you specify a custom code page, make sure that conversion tables exist to convert between the custom code page and these code pages:
       - The code page in the **Document code page** field
       - The code page for the z/OS locale

5. On the NetSpool Options panel, if your installation prints from VTAM applications such as CICS and IMS, select the **Convert to line** formatting option. NetSpool can transform line data to PDF data if you specify the AFP to PDF transform on the Processing panel. Or, IP PrintWay can convert the line data to text data. Both PDF and text data can be viewed in an e-mail attachment. Do not select the **Convert to PCL** formatting option because PCL data cannot be easily viewed.
6. On the IP PrintWay Options panel:
   - Select how you want IP PrintWay to handle data sets that are in the same JES output group. Select one of these values in the Dataset grouping field:
     - **Concatenate job**: Each data set is sent in the same e-mail to the address specified for the first data set in the output group.
     - **None** or **Job**: Each data set is sent in a separate e-mail. IP PrintWay extended mode sends each e-mail to the address specified for the first data set in the output group unless the AOP_MAIL_USE_FIRST_ADDRESS = NO environment is set. If AOP_MAIL_USE_FIRST_ADDRESS=NO, IP PrintWay extended mode sends each e-mail to the address or addresses specified for the data set in the e-mail header, in a job attribute, or in a JCL parameter.
   - **Tips:**
     - **IP PrintWay extended mode**: The **Automatic dataset grouping** field provides the same function as the **Concatenate job** option.
     - These fields apply only for data sets that JES assigns to the same output group. For example, when Print Interface and NetSpool allocate data sets on the JES spool, JES assigns each data set to a separate output group. For more information, see “Transmitting multiple data sets in a JES output group” on page 198.
     - Leave the **Retry time** and **Retry limit** fields blank. Retries are not recommended for the e-mail protocol. For more information about these fields, see “Handling unsuccessful data transmissions” on page 180.

---

**Modifying a printer definition**

To modify a printer definition that currently represents a printer to send data to an e-mail destination instead:

1. Use the Infoprint Server ISPF panels to list the printer definition you want to modify. On the List Printer Definition panel, use the X function. On the Choose a Definition Type and Protocol panel, select **IP PrintWay e-mail**.

2. On the E-mail Protocol panel, specify the **To addresses** field and any of these other fields:
   - **To addresses**: The e-mail addresses or alias names of the recipients of the e-mail. You can specify 1-32 e-mail addresses (to add more entries, put your cursor on “more” and press Enter). Each e-mail address can be 1-60 characters. An address that the job submitter specifies overrides this value.
   - **CC addresses**: The e-mail addresses or alias names of the “copy (cc)” recipients of the e-mail. A cc means that other recipients of the e-mail can see the cc recipient listed. You can specify 1-32 e-mail addresses (to add more entries, put your cursor on “more” and press Enter). Each e-mail address can be 1-60 characters. An address that the job submitter specifies overrides this value.
   - **BCC addresses**: The e-mail addresses or alias names of the “blind copy (bcc)” recipients of the e-mail. A bcc means that other recipients of the e-mail do not see the bcc recipient listed. You can specify 1-32 e-mail addresses (to add more entries, put your cursor on “more” and press Enter). Each e-mail address can be 1-60 characters. An address that the job submitter specifies overrides this value.
• **From name:** The descriptive name or other identifier of the sender of the e-mail. You can specify one name. It can be 1-60 characters, including blanks. IP PrintWay always includes `userid@domainname` to identify the sender. The user ID of the job submitter is `userid`. The domain name where Infoprint Server is running is `domainname`. For example: `JOHN@SYSTEM1`.

• **Reply address:** The e-mail address or alias name that recipients of the e-mail can reply to. You can specify one e-mail address. It can be 1-60 characters. An address that the job submitter specifies overrides this value. If you do not specify this field, most e-mail programs use the sender's e-mail address, which is `userid@domainname`. The user ID of the job submitter is `userid`. The domain name where Infoprint Server is running is `domainname`.

• **Embedded headers:** If any line-data documents contain e-mail headers, select the **Embedded headers** field. When this field is selected, IP PrintWay looks for an e-mail header in each document with line-data format. If a header is found, IP PrintWay sends the e-mail to the recipients specified in the header. If no line-data documents contain e-mail headers, deselect this field for improved performance.

• **Inline text and line data:** Select this field if you want to include text documents and line-data documents inline in the body of the e-mail instead of in attachments.

• **Inline message:** Specify an optional message to include in the beginning of each e-mail.

Each e-mail address or alias name should be in this format:

`username[@domainname]`

`username`

The name of the recipient or the name of an alias defined to sendmail.

`@domainname`

The domain name of the target system. If you omit `@domainname`, the domain name of the system on which sendmail is running is used. If you specify an alias, omit `@domainname`.

3. On the Allocation panel, specify these fields:

• **Spool allocation values:** Change these fields to specify either the job-selection values that are specified in the IP PrintWay job selection rule (extended mode) or the work-selection values specified in the JES FSA definition (basic mode). For example, if the job-selection value for IP PrintWay is class E, specify E in the **CLASS** field. If the printer definition currently represents an IP PrintWay-controlled printer, no changes are required.

• **Title:** (Optional) Specify a default subject for the e-mail. You can specify up to 60 characters, including blanks and any other printable characters. A title specified by the job submitter overrides this value. If you run IP PrintWay basic mode, this field applies only to documents that NetSpool or Print Interface processes.

4. On the Processing panel, specify these fields:

• **Printer code page:** Specify an ASCII code page or EBCDIC code page IBM-1047.

• **Print page header:** Deselect this field if you do not want a page header on each page of the e-mail attachment.
PostScript header: Remove any selected options so that IP PrintWay does not attempt to add a PostScript header.

Filter: (Optional) Specify transforms. For example, you might want to specify the AFP to PDF transform for the Line data and MO:DCA-P data formats to create PDF documents. If you run IP PrintWay basic mode and specify a transform, also select the Resubmit for filtering option.

Remove filter lpd_compat.so if it is specified for the Text data format.

5. On the NetSpool Options panel, if your installation prints from VTAM applications such as CICS and IMS, select the Convert to line formatting option. NetSpool can transform line data to PDF data if you specify the AFP to PDF transform on the Processing panel. Or, IP PrintWay can convert the line data to text data. Both PDF and text data can be viewed in an e-mail attachment. Do not select the Convert to PCL formatting option because PCL data cannot be easily viewed.

6. On the IP PrintWay Options panel:

   - Select how you want IP PrintWay to handle data sets that are in the same JES output group. Select one of these values in the Dataset grouping field:
     - Concatenate job: Each data in sent in the same e-mail to the address specified for the first data set in the output group.
     - None or Job: Each data set is sent in a separate e-mail. IP PrintWay extended mode sends each e-mail to the address specified for the first data set in the output group unless the AOP_MAIL_USE_FIRST_ADDRESS=NO environment is set. If AOP_MAIL_USE_FIRST_ADDRESS=NO, IP PrintWay extended mode sends each e-mail to the address or addresses specified for the data set in the e-mail header, in a job attribute, or in a JCL parameter.

   Tips:
   - IP PrintWay extended mode: The Automatic dataset grouping field provides the same function as the Concatenate job option.
   - These fields apply only for data sets that JES assigns to the same output group. For example, when Print Interface and NetSpool allocate data sets on the JES spool, JES assigns each data set to a separate output group. For more information, see “Transmitting multiple data sets in a JES output group” on page 198.

   • Blank out any values specified in the Retry time and Retry limit fields. Retries are not recommended for the e-mail protocol. For more information about these fields, see “Handling unsuccessful data transmissions” on page 180.

   • Blank out any values specified in the Document header and Document trailer fields. Printer commands might be displayed as unrecognizable text when the e-mail attachment is viewed.

Testing the printer definition
To verify that you have typed the e-mail addresses correctly in the printer definition and in the sendmail alias file, submit a job from the local system with the Ip command. For example, if your printer definition is named deptmail, enter this command on the z/OS UNIX command line:

lp -d deptmail myfile
Results:

1. IP PrintWay writes a message to indicate that sendmail successfully accepted the e-mail request. Sendmail verifies that alias names and recipient names for users on the local system are correctly specified. However, an error might occur later when sendmail attempts to send an e-mail to a remote system.

2. If e-mails were sent successfully to the remote systems, you should receive no sendmail error messages. To check for sendmail error messages:
   a. If you specified an owner for a sendmail alias name, see if any mail is returned to the owner's user ID.
   b. See if any mail is returned to the user associated with the IP PrintWay startup procedure. Sendmail returns error messages to this user ID if no other owner is specified for a sendmail alias name or if the e-mail address is specified directly in the printer definition. This user ID is AOPSTC if your installation used the user ID that is suggested in z/OS Infoprint Server Customization.

To check for mail, run the z/OS UNIX mail or mailx command. For more information about this command, see z/OS UNIX System Services Command Reference.

You might need to wait several days before sendmail returns a message to you when it cannot send an e-mail to a remote system. How long you need to wait depends in part on how long it takes the remote system to notify sendmail that an e-mail is undeliverable and in part on how your installation has customized sendmail. For more information about customizing sendmail timeout values, see z/OS Infoprint Server Customization.

Example

These ISPF panels show how to create a printer definition named deptmail, select the e-mail protocol, and fill in fields that are specific to the e-mail protocol.

Tip: This example shows only some of the ISPF panels and fields that comprise a printer definition. For a complete printer definition that is suitable for the e-mail protocol, see Appendix D, “Sample IP PrintWay printer definitions,” on page 481.

Use the Add function of the Infoprint Server ISPF panels to create a printer definition. On the Choose a Definition Type and Protocol panel, select the e-mail protocol:

```
Choose a Definition Type and Protocol
Option ===> 5
Type    Protocol
1 IP PrintWay LPR
2 IP PrintWay direct sockets
3 IP PrintWay IPP
4 IP PrintWay VTAM
5 IP PrintWay e-mail
6 PSF
7 General
```

To display this E-mail Protocol panel, press Enter on the Custom values field for the Protocol section on the main panel for the printer definition:
E-mail Protocol

Printer definition name . deptmail

To addresses . . toname@xyz.com,dept123,dept456 (more)
CC addresses . . copyname@xyz.com (more)
BCC addresses . . (more)
From name . . John Q. Sender
Reply address . johnsender@xyz.com

IP PrintWay extended mode
  Embedded headers
  - Inline text and line data
  Inline message . Greetings:<LF><LF>The sales report is attached.<LF> (extend)

Results:

- E-mails are sent to: toname@xyz.com and the addresses represented by aliases dept123 and dept456.
- A copy of the e-mail is sent to: copyname@xyz.com.
- The e-mail includes this description of the sender: John Q. Sender.
- Most e-mail programs that recipients use send replies back to this address: johnsender@xyz.com.
- All documents are sent as attachments.
- The text in the Inline message field is included in the beginning of each e-mail.

To display this Allocation panel, press Enter on the Custom values field for the Allocation section on the main panel for the printer definition:

Allocation

Printer definition name . deptmail

...:

Values for Separator Pages:
  Address . _____________________________________________________ (extend)
  Building . _____________________________________________________
  Department . _____________________________________________________
  Name . _____________________________________________________
  Room . _____________________________________________________
  Title . . Annual Report for XYZ Corporation

Result: For data sets that IP PrintWay extended mode, NetSpool, or Print Interface processes, the e-mail subject is Annual Report for XYZ Corporation unless the job submitter specifies another title.

To display this IP PrintWay Options panel, press Enter on the Custom values field for the IP PrintWay Options section on the main panel for the printer definition:
Specifying a printer definition name, description, and location

You must assign each printer definition a name, which job submitters can use to print to IP PrintWay printers. In addition, you can specify a description of the printer and the printer's location. Although the description and location are optional, they can help users find printers and printer definitions.

**Printer definition name:** A job submitter can specify the printer definition name in the FSSDATA JCL parameter, the SUBSYS JCL parameter, in the -d parameter of the `ip` command, and as the print queue name in the `lpr` command. For more information about how to specify the printer definition name, see Chapter 14. Planning printer definitions for IP PrintWay.

Follow these guidelines:

- Select a name that is unique for all printer definitions and printer pool definitions in the Printer Inventory.
- The name is case-sensitive. If job submitters use the incorrect case, Infoprint Server cannot find the printer definition and reports an error. To avoid errors, use all lowercase or all uppercase letters.
- Batch job submitters can specify the DEST, CLASS, and FORMS parameters instead of the printer definition name on the OUTPUT JCL statement to direct output to IP PrintWay printers. Therefore, consider specifying the DEST value as the printer definition name. For more information, see “Using DEST, CLASS, and FORMS to select a printer definition” on page 174.
- Infoprint Central users can specify the printer definition name to find printers, print jobs, and printer definitions. Users can specify the exact name or only the first few characters of the name. Therefore, you might want to use a naming pattern that lets users find multiple printers and printer definitions more easily.

**Description:** The description is used for information purposes only. For example, you could specify the model number of the printer in the Description field. However, it is also a search criterion on the Infoprint Server ISPF panels. The description is case-sensitive. Therefore, to make searching easier, consider using all lowercase or uppercase letters.

**Location:** The location is used for information purposes only. For example, the information in the Location field could help Infoprint Central users direct service personnel to the printer if it requires service. However, it is also a search criterion on the Infoprint Server ISPF panels and in Infoprint Central. Follow these guidelines:
• The location is case-sensitive. Infoprint Central can do case-sensitive or case-insensitive searches. However, ISPF panels only do case-sensitive searches. Therefore, to make searching easier, consider using all lowercase or uppercase letters.

• Infoprint Central users can specify the exact location information or only the first few characters of the location. Therefore, use a format that lets users find printers and printer definitions more easily. For example, if you use this format, Infoprint Central users can find all printers in the (1) city, (2) city/building, or (3) city/building/office:
  Location. . . mycity/mybuilding/myoffice

• If more than one printer definition exists for the same IP PrintWay printer, specify the same location in all printer definitions so that Infoprint Central can find the printer.

  Tip: To see if more than one printer definition exists for a printer, on the Select Printer Definitions ISPF panel, specify the host name or dotted decimal address of the printer in the IP address field. A list of all printer definitions for the printer is returned.

Procedure for specifying attributes

On the IP PrintWay Printer Definition panel, specify these fields:

• **Printer definition name**: Specify a 1–17 character name, including any letters, numbers, or special characters except for blanks.

• **Description**: Specify a 1–256 character description, including any letters, numbers, special characters, and blanks.

• **Location**: Specify a 1–256 character location, including any letters, numbers, special characters, and blanks.

Example

This ISPF screen shows how to specify the name of the printer definition, a description of the printer, and the printer's location.

<table>
<thead>
<tr>
<th>IP PrintWay Printer Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Printer definition name . myprinter</td>
</tr>
<tr>
<td>Description . INFOPRINT 1312 (extend)</td>
</tr>
<tr>
<td>Location. . . DENVER/BD03/A1-03 (extend)</td>
</tr>
</tbody>
</table>

Using DEST, CLASS, and FORMS to select a printer definition

A z/OS job submitter can specify the printer definition that IP PrintWay is to use on the DD or OUTPUT JCL statement in one of these JCL parameters:

• **FSSDATA parameter**: The job submitter can specify the name of the printer definition in the printer subparameter of the FSSDATA parameter on the OUTPUT JCL statement. The name of the printer definition is case-sensitive and must exactly match the name in the Printer Inventory.

  Tip: Job submitters can specify the FSSDATA parameter with IP PrintWay basic mode and IP PrintWay extended mode, even though IP PrintWay extended mode is not implemented as a JES functional subsystem (FSS).

• **SUBSYS parameter**: When using the Print Interface subsystem, the job submitter must specify the name of the printer definition in the second subparameter of
the SUBSYS parameter on the DD statement. The destination, class, and form name are not used to select the printer definition.

- **DEST, CLASS, and FORMS parameters**: The job submitter can specify values that match the ones specified in the DEST, CLASS, and FORMS fields of the printer definition except when the Print Interface subsystem is used. The job submitter can specify the destination, class, and form name on either the DD or OUTPUT JCL statement. If the job submitter does not specify a value for the DEST, CLASS, or FORMS parameters, the default value assigned by JES must match the corresponding value, if any, specified in the printer definition.

To enable printer selection with the DEST, CLASS, and FORMS JCL parameters, you must select the **Use DEST, CLASS, and FORMS for IP PrintWay printer selection** option. You must also specify a unique combination of DEST, CLASS, and FORMS values in each printer definition in which you select this option. You do not need to specify all three DEST, CLASS, and FORMS values in each printer definition.

To select a printer definition, the job submitter specifies the same DEST, CLASS, and FORMS values on the OUTPUT JCL statement that you specified in the printer definition. For example, if you create the printer definitions shown in this table:

<table>
<thead>
<tr>
<th>Printer definition name</th>
<th>DEST field</th>
<th>CLASS field</th>
<th>FORMS field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dept#4</td>
<td>D004</td>
<td>P</td>
<td>Not specified</td>
</tr>
<tr>
<td>Dept#5</td>
<td>D005</td>
<td>P</td>
<td>Not specified</td>
</tr>
<tr>
<td>Manager#5</td>
<td>D005</td>
<td>P</td>
<td>MANAGER</td>
</tr>
</tbody>
</table>

Then, to select one of these printer definitions, the job submitter can specify these parameters on the OUTPUT JCL statement:

- To select Dept#4 printer, specify one of these OUTPUT statements:
  - //OUT1 OUTPUT DEST=D004,CLASS=P
    The FORMS parameter can contain any value.
  - //OUT2 OUTPUT FSSDATA='printer=Dept#4'

- To select Dept#5 printer, specify one of these OUTPUT statements:
  - //OUT3 OUTPUT DEST=D005,CLASS=P
    The FORMS parameter can contain any value except for MANAGER.
  - //OUT4 OUTPUT FSSDATA='printer=Dept#5'

- To select Manager#5 printer, specify one of these OUTPUT statements:
  - //OUT5 OUTPUT DEST=D005,CLASS=P,FORMS=MANAGER
  - //OUT6 OUTPUT FSSDATA='printer=Manager#5'

**Hierarchy of printer selection**

If the OUTPUT JCL statement specifies DEST, CLASS, and FORMS values that match more than one printer definition, IP PrintWay selects the printer definition with the best match, using this hierarchy:

1. The printer definition with matching DEST, CLASS, and FORMS values.
2. The printer definition with matching DEST and CLASS values, but with no matching FORMS value.
3. The printer definition with matching DEST and FORMS values, but with no matching CLASS value.
4. The printer definition with matching CLASS and FORMS values, but with no matching DEST value.
5. The printer definition with matching DEST value, but with no matching CLASS and FORMS values.
6. The printer definition with matching CLASS value, but with no matching DEST and FORMS values.
7. The printer definition with matching FORMS value, but with no matching DEST and CLASS values.

This example illustrates the hierarchy of printer selection that IP PrintWay uses. If you create the printer definitions shown in this table:

<table>
<thead>
<tr>
<th>Printer definition name</th>
<th>DEST field</th>
<th>CLASS field</th>
<th>FORMS field</th>
</tr>
</thead>
<tbody>
<tr>
<td>MyDefault</td>
<td>Not specified</td>
<td>P</td>
<td>Not specified</td>
</tr>
<tr>
<td>Dept#5</td>
<td>D005</td>
<td>P</td>
<td>Not specified</td>
</tr>
<tr>
<td>Manager#5</td>
<td>D005</td>
<td>P</td>
<td>MANAGER</td>
</tr>
</tbody>
</table>

IP PrintWay selects printer definitions:
- If the OUTPUT JCL statement specifies CLASS=P (with any value for DEST except D005 and any value for FORMS except MANAGER), IP PrintWay selects printer definition MyDefault. The MyDefault printer definition is the only printer definition that matches these JCL values.
- If the OUTPUT JCL statement specifies DEST=D005 and CLASS=P (with any value for FORMS except MANAGER), IP PrintWay selects printer definition Dept#5. IP PrintWay uses the selection hierarchy to select printer definition Dept#5 instead of MyDefault, which also matches the JCL values.
- If the OUTPUT JCL statement specifies DEST=D005, CLASS=P, and FORMS=MANAGER, IP PrintWay selects printer definition Manager#5. IP PrintWay uses the selection hierarchy to select printer definition Manager#5 instead of MyDefault or Dept#5, which also match the JCL values.

**Procedure for specifying attributes**

To enable printer selection with the DEST, CLASS, or FORMS JCL parameters, specify these attributes in the printer definition:

1. On the first ISPF panel for the printer definition, specify this field:
   - **Use DEST, CLASS, and FORMS for IP PrintWay printer selection**: Select this field.

2. On the Allocation panel, specify these fields:
   - **CLASS**: Specify a class. Leave this field blank if you do not want IP PrintWay to match the value in the CLASS JCL parameter.
   - **DEST**: Specify a destination. Leave this field blank if you want do not want IP PrintWay to match the value in the DEST JCL parameter.
   - **FORMS**: Specify a forms name. Leave this field blank if you do not want IP PrintWay to match the value in the FORMS JCL parameter.

The values in the DEST, CLASS, and FORMS fields, together, must be unique in each printer definition in which the **Use DEST, CLASS, and FORMS for IP PrintWay printer selection** option is selected. For example, if you specify DEST PRT5 and CLASS P in one printer definition, you **cannot** specify DEST PRT5 and CLASS P in another printer definition.
Example

This ISPF panel shows how to request that IP PrintWay use the DEST, CLASS, and FORMS JCL parameters to select this printer definition.

```
Add IP PrintWay Printer Definition

Printer definition name . myprinter
Description . _______________________________________________________ (extend)
Location . . _______________________________________________________ (extend)

Section Component name Custom values

BURST . . . 1. Yes 2. No
HOLD . . . . 1. Yes 2. No
OUTDISP . . 1. Purge (without printing) 2. Leave

```

Setting up operator security for the printer (extended mode)

If your security administrator created a RACF profile to control who can use Infoprint Central to display information about and do actions on the printer, specify the name of this RACF profile in the printer definition. If you specify the name of a RACF profile, only Infoprint Central users permitted to the profile can display information about and do actions on this printer. If you do not specify the name of a RACF profile, or if the profile name is not defined to RACF, any Infoprint Central user can display information about and do actions on the printer.

This task does not apply when you use IP PrintWay basic mode because Infoprint Central for the Web lets users work only with printers controlled by IP PrintWay extended mode, not basic mode.
Rule: If more than one printer definition exists for an IP PrintWay printer, specify the same RACF profile in all printer definitions for the printer. To find all the printer definitions for a printer that uses either the LPR or direct sockets protocol, on the Select Printer Definitions ISPF panel, specify the host name or dotted decimal address of the printer in the IP address field.

Tips:
1. You can specify the name of the profile before it is defined to RACF. If you specify a profile name that is not defined to RACF, Infoprint Central proceeds as if the user has the required access to the profile.
2. If the same RACF profile applies to a group of IP PrintWay and PSF printers, specify the same profile name in the IP PrintWay printer definitions and PSF FSA definitions for all the printers in the group.
3. To specify the same operator security profile in a group of IP PrintWay printer definitions, create a Protocol component with the name of the RACF profile, and include that Protocol component in the printer definitions for all the printers in the group. Creating a component makes it easier to change the name of the RACF profile if necessary.
4. You can use the Infoprint Server ISPF panels or the Printer Inventory Definition Utility (PIDU) to specify the RACF profile name. If you want to specify the same RACF profile in many IP PrintWay printer definitions, it is easier to use the PIDU program. See "Example 2. Using PIDU to specify the profile name."

Related information: For information about how to define RACF profiles in the PRINTSRV class to protect IP PrintWay printers, see z/OS Infoprint Server Customization.

Procedure for specifying attributes
On the LPR Protocol panel, the Direct Sockets Protocol panel, or the IPP Protocol panel, specify this field:

- **Operator security profile:** Specify the name of the RACF resource profile in the PRINTSRV class.

Example 1. Using ISPF panels to specify the profile name
This ISPF screen shows how to specify the name of the RACF profile in a printer definition that uses the LPR protocol.

Example 2. Using PIDU to specify the profile name
These commands show how to specify the name of the same RACF profile in all IP PrintWay printer definitions that do not already contain a profile name.
1. Enter these commands as one command on the z/OS UNIX command line:

```
pidu -qc "list printer where printer-type=ip-printway and operator-security-profile=null;" | awk '{print "modify printer " $1 " operator-security-profile = \"PRINTERS.DENVER\";"} > /tmp/defs
```
The list command lists the names of all IP PrintWay printer definitions with no value in the operator-security-profile attribute. These names are piped to the awk program, which writes modify commands to modify the printer definitions to file /tmp/defs.

2. Inspect the /tmp/defs file to make sure the modify commands are acceptable.
3. Enter this command to update the Printer Inventory:

   pidu < /tmp/defs

Specifying allocation parameters for IP PrintWay

This section describes the fields in the Allocation section of a printer definition that you might need to set if you use IP PrintWay. Values in the Allocation section apply to these documents:

- All documents that Print Interface and NetSpool allocate on the JES spool
- All documents that IP PrintWay extended mode processes

Job attributes and JCL parameters override values specified in the Allocation section of the printer definition. For example, the title-text job attribute and the TITLE JCL parameter override the value specified in the Title field on the Allocation panel.

Also, IP PrintWay uses the CLASS, DEST, and FORMS fields on the Allocation panel to select the printer definition to use. For information, see “Using DEST, CLASS, and FORMS to select a printer definition” on page 174.

Procedure for specifying attributes

On the Allocation panel, specify these fields:

- **Spool allocation values** heading: Specify the JES job-selection values for IP PrintWay:
  - If you run IP PrintWay extended mode, specify the same job-selection values that are specified in the IP PrintWay job selection rule. For example, if the job selection rule specifies class P, specify P in the CLASS field.
  - If you run IP PrintWay basic mode, specify the same work-selection values that are specified in the JES definition for the IP PrintWay FSA. For example, if the JES definition specifies class P and destination PRT001, specify P in the CLASS field and PRT001 in the DEST field.

Also, specify:

- **FCB**: Specify the name of the forms control buffer (FCB) you want IP PrintWay to use. For information, see “Using an FCB to format data” on page 196.

- **CLASS, DEST, and FORMS**: Specify the class, destination, and forms IP PrintWay uses to select this printer definition. For information, see “Using DEST, CLASS, and FORMS to select a printer definition” on page 174.

- **Values for separator pages** heading:
  - **Address, Building, Department, Name, Room, Title**: Specify the values that IP PrintWay exits (for example, the Begin Data Set) can print on separator pages. For information about IP PrintWay exits, see “z/OS Infoprint Server Customization.”
  - **Title**: Specify the subject line for e-mails (e-mail protocol), or the title passed to LPDs (LPR protocol). You can specify up to 60 characters, including blanks and any other printable characters.

- **Other values** heading:
- **Notify**: Specify up to four user IDs that IP PrintWay notifies when a data set has been successfully or unsuccessfully transmitted, or when IP PrintWay deletes the data set from the JES spool.

- **Copies**: Specify the number of copies to be printed. Allowed values are 1 to 32640. The default value is 1.

  **Guidelines:**
  - VTAM protocol: This field does not apply when you run IP PrintWay basic mode. Only one copy prints.
  - E-mail protocol: This field does not apply. Only one copy is sent.
  - IPP protocol: Some IPP printers do not support the **copies** IPP job attribute. In this case, only one copy prints.
  - LPR protocol: If only one copy prints, deselect the **Optimize copies** field.
  - If a copy does not start on a separate page, specify printer commands to start a new page. For information, see “Specifying printer commands to print on a new sheet of paper” on page 202.
  - This field does not apply to output data sets that z/OS batch jobs create because JES sets a default of one copy.

- **Duplex**: Specify the type of duplexing.

  **Guidelines:**
  - LPR, direct-sockets, VTAM, e-mail protocols: This field does not apply.
  - IPP Protocol: The IPP server must support the **sides** IPP job attribute. If it does not, the printer's default is used.

---

**Handling unsuccessful data transmissions**

IP PrintWay can retry unsuccessful data transmissions to a printer. Typically, a data transmission is unsuccessful because one of these types of errors has occurred:

- **Connection error**
  
  IP PrintWay cannot connect to the printer in the time period specified in the printer definition. This type of error occurs before IP PrintWay sends any data to the printer. It can occur if the printer is powered off or a network problem exists.

- **Response error**
  
  The printer reports an error, or IP PrintWay does not receive a response from the printer in the time period specified in the printer definition. This type of error occurs when IP PrintWay sends data to the printer. It can occur because the printer is offline or the printer requires operator intervention. For example, the printer might be out of paper, or it might have a paper jam. Or, it can occur because the printer takes a long time to respond.

If an error (such as a connection or response error) occurs, you can request that IP PrintWay retry the operation.

- After a connection error, IP PrintWay tries to connect to the printer again.
- After a response error, IP PrintWay resends data to the printer from the beginning of the print job.

When the printer becomes ready after a response error, the printer prints any data that IP PrintWay sent before the response error and is still in the printer's buffer. Then it prints data that IP PrintWay resent.

If you run IP PrintWay extended mode and use the direct sockets protocol, you can direct IP PrintWay to tell the printer where to restart printing after a response error. IP PrintWay can tell the printer to restart printing from the last...
page that the printer indicated printed successfully or from the beginning of the print job. For information, see “Tracking the number of printed pages (extended mode)” on page 187.

**Tip:** Whenever IP PrintWay resends data, the printer might print duplicate pages. To prevent duplicate pages, consider specifying a high response timeout value especially if you run IP PrintWay extended mode. See the description of the **Response timeout** field in “Setting timeout values.”

If an error persists after IP PrintWay completes the retries, or if no retries are requested, IP PrintWay can retain the failed print job on the JES spool so that the operator can release the print job to print after the problem is corrected. For information, see ”Retaining data sets on the JES spool” on page 185.

### Setting timeout values

To change the default timeout values, set these fields in the printer definition:

- **Connection timeout:** The maximum amount of time that IP PrintWay waits while attempting to connect to the printer. If the printer is turned on and the network is operational, IP PrintWay connects to the printer in a few seconds. However, if the printer is powered off, IP PrintWay waits for the connection timeout period.
  
  While waiting to connect to the printer:
  - The IP PrintWay basic mode FSA cannot process any other print jobs.
  - However, other IP PrintWay basic mode FSAs can process other print jobs.
  - IP PrintWay extended mode can process other print jobs.

  **Guidelines:**
  - The default value of 30 seconds is suitable for most printers.
  - Do not specify a low connection timeout value because IP PrintWay might not be able to connect to the printer in the specified time due to network traffic.
  - Increase the connection timeout value if IP PrintWay reports a timeout error when the printer is turned on. (IP PrintWay writes a message with TCP/IP ERRNO of 60).
  - IP PrintWay basic mode: Do not specify a high connection timeout value because the IP PrintWay basic mode FSA cannot process any other print jobs during this period.

- **Response timeout:** The maximum amount of time that IP PrintWay waits for a response from a printer after sending data to it. When the response timeout value expires, IP PrintWay either resends data (if retries are requested) or fails the print job.

  If a printer is ready and its buffer is not full, most printers respond to IP PrintWay immediately. However, if a printer requires operator intervention (for example, the printer is out of paper), most printers do not respond until the printer becomes ready. In addition, if you select one of the PJL options in the printer definition (see ”Tracking the number of printed pages (extended mode)” on page 187), most printers do not respond until the printer finishes printing the document.

  While waiting for a response from the printer:
  - The IP PrintWay basic mode FSA cannot process any other print jobs.
  - However, other IP PrintWay basic mode FSAs can process other print jobs.
  - IP PrintWay extended mode can process other print jobs.
The default response timeout value is 10 minutes. The maximum value you can specify is 31 days, which is the maximum time that TCP/IP allows IP PrintWay to wait for a response.

**Guidelines:**

- Do not set the response timeout value too low, especially if you print large documents on printers that have small buffers or that print slowly. For example, a response timeout value of 30 seconds might cause IP PrintWay to retry the transmission before the printer has finished printing its buffer.

- A high response timeout value gives an operator more time to correct a problem before IP PrintWay resends data to the printer (if retries are requested) or fails the print job. For example, you might want to specify a response timeout value of 3 days if your printers are unattended over a long weekend.

- **IP PrintWay extended mode:** If you select one of the PJL options in the printer definition (see “Tracking the number of printed pages (extended mode)” on page 187), most printers respond only after the printer has finished printing the document. Therefore, the response timeout value should be long enough to allow the largest documents to finish printing.

- **IP PrintWay extended mode:** A high response timeout value does not affect printing to other printers. However, if you specify a high response timeout value for many printers, IP PrintWay can exceed the maximum number of MVS tasks that IP PrintWay extended mode (aopoutd daemon) can have active at one time. This can happen if IP PrintWay waits for responses from many printers at the same time.

If you see this message, which indicates that you are close to exceeding the maximum number of MVS tasks, ask your system administrator to increase the maximum number of MVS tasks in the APOUTD_MAXTHREADTASKS environment variable (for example, you might increase the number to 250):

```
BPXI040I PROCESS LIMIT MAXTHREADTASKS HAS REACHED 85% OF ITS CURRENT CAPACITY OF 200 FOR PID=nnnnnn IN JOB APOOUTD.
```

For information about the APOUTD_MAXTHREADTASKS environment variable, see [z/OS Infoprint Server Customization](https://www.ibm.com/support/knowledgecenter/en/SSM47K_1.6.0/infoprint_server/zosinfoprintservercustomization.html).

**Tip:** The LIMMSG statement in the BPXPRMxx member of SYS1.PARMLIB controls whether z/OS UNIX® issues message BPXI040I. The default is that z/OS UNIX does not issue BPXI040I messages. You can change the LIMMSG value dynamically using the SETOMVS command.

- **IP PrintWay basic mode:** If you want to specify a high response timeout value, ask your system administrator to define an IP PrintWay FSA to JES that selects print jobs for this one printer only. If an IP PrintWay FSA selects print jobs for several printers, when one printer with a high response timeout value does not respond for a long time, printing to the other printers can be delayed until the operator corrects the problem and the printer becomes ready.

- **E-mail protocol:** IP PrintWay ignores this field.

- **VTAM protocol:** If the printer is waiting for intervention, Infoprint Central cannot delete a print job until the printer responds or the response timeout value expires. Therefore, if you set a high response timeout value, the operator might not be able to delete the current print job in a timely manner.

### Setting retry values

To request retries, set these fields in the printer definition:
• **Retry limit:** The number of times that IP PrintWay retries a connection or data transmission. By default, IP PrintWay does not do any retries.

If you request at least 1 retry, IP PrintWay automatically retries the transmission one time immediately after the transmission fails. This automatic retry is in addition to the retries you request. The automatic retry permits the print job to be transmitted when a transmission problem is short-lived. For example, after receiving a print job, some printers do not become ready to receive another print job for one or two seconds.

The RETRYL parameter on an OUTPUT JCL statement overrides this value.

**Guidelines:**

- Specify a retry limit greater than 0 because some printer errors are short-lived.
- When you send data to an e-mail destination, do not request retries. This is because errors that z/OS UNIX sendmail reports to IP PrintWay are typically not short-lived and because IP PrintWay would resend e-mails to the entire list of e-mail addresses, not just to the e-mail address in error.

• **Retry time:** The amount of time between each retry. By default, IP PrintWay retries immediately.

Between retries, IP PrintWay basic mode and extended mode continue to select and process other print jobs from the JES spool and transmit them to other printers and print queues. To maintain the correct order of transmission, however, IP PrintWay does not attempt to transmit other print jobs to this printer until it has completed all retries.

The RETRYT parameter on an OUTPUT JCL statement overrides this value.

This table shows how IP PrintWay retries transmissions when you specify different retry limits and retry times in the printer definition:

<table>
<thead>
<tr>
<th>Retry limit</th>
<th>Retry time</th>
<th>IP PrintWay action</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 or blank</td>
<td>Any value</td>
<td>IP PrintWay does not retry the transmission.</td>
</tr>
<tr>
<td>&gt;0</td>
<td>0 or blank</td>
<td>IP PrintWay retries the transmission automatically one time right after the original transmission fails. Then IP PrintWay retries for the specified number of times at the specified interval. If retry time is blank, IP PrintWay retries approximately every second.</td>
</tr>
</tbody>
</table>

**Procedure for specifying attributes**

On the IP PrintWay Options panel, specify these fields:

• **Connection timeout:** Specify the maximum number of seconds that IP PrintWay is to wait for TCP/IP or VTAM to connect to the printer. Allowed values are 5 - 180. The default value is 30 seconds.

• **Response timeout:** Specify the maximum number of seconds that IP PrintWay is to wait for a response from the printer before attempting any retries. Allowed values are 0 - 2678400. The maximum value is 2678400 seconds (31 days). The default value is 600 seconds (10 minutes).

• **Retry limit:** Specify the number of retries you want IP PrintWay to attempt. Allowed values are 0 – 32767.

• **Retry time:** Specify the time IP PrintWay is to wait between each retry. Allowed values are 0 seconds – 9999 hours, 59 minutes and 59 seconds.
Example 1. Setting timeout and retry values (basic mode)

This ISPF panel shows how to specify timeout and retry values that are suitable for IP PrintWay basic mode. Only a portion of the ISPF panel is shown.

<table>
<thead>
<tr>
<th>IP PrintWay Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retry time.. 0000:10:00</td>
</tr>
<tr>
<td>Retry limit..... 3</td>
</tr>
<tr>
<td>Connection timeout .. 30</td>
</tr>
<tr>
<td>Response timeout ... 60</td>
</tr>
</tbody>
</table>

Results:
1. IP PrintWay attempts to connect to the printer. If the connection is not established in 30 seconds (connection timeout), IP PrintWay attempts to connect again immediately (automatic retry).
2. After 10 minutes (retry time), IP PrintWay attempts to connect to the printer again. IP PrintWay retries the connection 3 times (retry limit). The maximum number of connection attempts is 5 (original + automatic + retry limit).
3. After IP PrintWay connects to the printer, it sends the print job to the printer. It waits up to 60 seconds (response timeout) for a response from the printer.
4. If the printer does not respond in 60 seconds, IP PrintWay waits up to 10 minutes (retry time) for a response. If the printer becomes ready during the 10 minutes, IP PrintWay resumes sending the print job to the printer.
5. After the 10 minutes, IP PrintWay resends the print job to the printer up to 3 times (retry limit) and waits up to 10 minutes each time for a response.
6. If the transmission is unsuccessful after all retries, IP PrintWay retains the print job on the JES spool if retention is requested. Otherwise, it deletes the print job from the JES spool.

In this example:
- The maximum time that IP PrintWay basic mode waits to connect to the printer is:
  30 seconds + 30 seconds + 3(10 minutes + 30 seconds) = 32 minutes, 30 seconds
- The maximum time that IP PrintWay basic mode waits for a response from the printer is:
  60 seconds + 3(10 minutes + 60 seconds) = 34 minutes

Example 2. Setting timeout and retry values (extended mode)

This ISPF panel shows how to specify timeout and retry values that are suitable for IP PrintWay extended mode. Only a portion of the ISPF panels are shown.
Results:
1. IP PrintWay attempts to connect to the printer. If the connection is not established in 30 seconds (connection timeout), IP PrintWay attempts to connect again immediately (automatic retry).
2. After 10 minutes (retry time), IP PrintWay attempts to connect to the printer again. IP PrintWay retries the connection 3 times (retry limit). The maximum number of connection attempts is 5 (original + automatic + retry limit).
3. When the connection is established, IP PrintWay sends the print job to the printer. It waits up to 259200 seconds (response timeout of 3 days) for a response from the printer.
4. If the printer does not respond in 259200 seconds, IP PrintWay waits for 10 minutes (retry time). If the printer becomes ready during the 10 minutes, IP PrintWay resumes sending the print job to the printer.
5. After the 10 minutes, IP PrintWay resends the print job to the printer up to 3 times (retry limit) and waits up to 10 minutes each time for a response.
6. If the transmission is unsuccessful after all retries, IP PrintWay retains the print job on the JES spool if retention is requested. Otherwise, it deletes the print job from the JES spool.

In this example:
- The maximum time that IP PrintWay extended mode waits to connect to the printer is:
  30 seconds + 30 seconds + 3(10 minutes + 30 seconds) = 32 minutes, 30 seconds
- The maximum time that IP PrintWay extended mode waits for a response from the printer is:
  259200 seconds + 3(10 minutes + 259200 seconds) = 10 days, 30 minutes

Retaining data sets on the JES spool

IP PrintWay can retain data sets on the JES spool for a specified period of time after the data sets have completed processing. Although retaining data sets on the JES spool uses spool space, it lets you retransmit data sets that have not printed correctly or have not been successfully sent to the e-mail destination. When the retention period for data sets expires, IP PrintWay deletes them from the JES spool.

When IP PrintWay retains data sets on the JES spool:
- If you run IP PrintWay basic mode, retained data sets remain selected by IP PrintWay.
- If you run IP PrintWay extended mode, all retained data sets are released to JES. They are either in the held state (JES2) or in the keep state (JES3).
The operator can work with retained data sets:

- If you run IP PrintWay basic mode, the operator can use the Infoprint Server ISPF panels to move data sets to different printers, reset them, hold them, or delete them. For information, see Chapter 5, “Using the IP PrintWay transmission queue (basic mode),” on page 31.

  If the operator resets a data set, IP PrintWay basic mode restarts printing it from the beginning of the data set.

  If the operator holds a data set, the data set is held until the operator resets or deletes the data set. IP PrintWay basic mode does not delete it automatically when its retention period expires.

- If you run IP PrintWay extended mode, the operator can use Infoprint Central or JES commands to move print jobs to different printers, release them, hold them, or delete them. For information, see Chapter 7, “Using Infoprint Central,” on page 43 and “Using JES commands and SDSF to work with output data sets” on page 54. (In some cases, you must use Infoprint Central, instead of JES commands, to move print jobs to different printers.)

  If the operator releases a print job, IP PrintWay extended mode restarts printing either from the beginning of the first data set in the print job or after the last page that printed successfully. For more information, see “Tracking the number of printed pages (extended mode)” on page 187.

  If the operator holds a print job, all data sets in that print job are held until the operator releases or deletes the print job. IP PrintWay extended mode does not delete the print job automatically when its retain time expires.

You can specify these fields in the printer definition to control retention:

- **Retention period: Successful:** The period of time IP PrintWay retains all data sets that have been successfully transmitted.

- **Retention period: Failure:** The period of time IP PrintWay retains all data sets that were not successfully transmitted after all requested retries have been attempted. If a failed data set is part of a JES output group (print job), IP PrintWay retains all data sets in the print job.

**Guidelines:**

- IP PrintWay basic mode: Do not retain successful data sets, and retain failed data sets for as short a time as possible because a system abend (abend code 878) can occur when an IP PrintWay FSS retains a very high number of data sets on the JES spool. Or, migrate to IP PrintWay extended mode.

- IP PrintWay extended mode: You can specify longer retention times because a system abend does not occur when you retain a large number of data sets on the JES spool.

IP PrintWay considers a print job to be **successful** when IP PrintWay finishes processing the print job without error. Table 25 on page 187 summarizes when IP PrintWay considers a print job to be successful for each transmission protocol.
Table 25. IP PrintWay successful print jobs

<table>
<thead>
<tr>
<th>For this protocol:</th>
<th>IP PrintWay considers print jobs successful when:</th>
</tr>
</thead>
</table>
| Direct sockets    | • A PJL option is selected: The printer finishes printing all documents in the print job.  
• A PJL option is not selected: The printer or print server receives all documents in the print job. However, printing might fail later.  
For information about PJL options, see “Tracking the number of printed pages (extended mode).” |
| E-mail            | z/OS UNIX sendmail accepts the mail request. However, transmission of the mail to remote recipients might fail later. |
| IPP, LPR, VTAM    | The printer or print server receives all documents in the print job. However, printing might fail later. |

Procedure for specifying attributes

On the IP PrintWay Options panel, specify these fields:

- **Retention period: Successful**: Specify the amount of time IP PrintWay is to retain successfully transmitted data sets. Specify a time period from 0 seconds to 9999 hours, 59 minutes and 59 seconds.

- **Retention period: Failure**: Specify the amount of time IP PrintWay is to retain data sets whose transmission failed. Specify a time period from 0 seconds to 9999 hours, 59 minutes and 59 seconds.

To request that IP PrintWay retain data sets on the JES spool forever, specify FOREVER in either field. In this case, however, the operator must delete data sets from the JES spool when they are no longer required.

Example

This ISPF panel shows how to specify a retention period for data sets whose transmission fails. Only a portion of the ISPF panel is shown.

```
IP PrintWay Options
:
:
Retention period:
    Successful . .  __________ Failure . . 0024:00:00
:
```

Result: IP PrintWay retains data sets that could not be transmitted on the JES spool for 24 hours.

Tracking the number of printed pages (extended mode)

IP PrintWay extended mode can track the number of pages that print on printers that support Hewlett Packard (HP) Printer Job Language (PJL). This function is available only for printers that use the direct-sockets printing protocol.

To track the number of printed pages, select one or both of these PJL options in the printer definition:
• **Record pages printed for accounting**: If this option is selected, IP PrintWay records the number of printed pages in the SMF type 6 record, in field SMF6PGE. This provides you with more accurate accounting information.

• **Restart printing after last successful page**: If this option is selected, IP PrintWay tells the printer to restart printing after the last page that the printer reported printed successfully. This option reduces the number of duplicate pages that print, especially when large documents are printed. This option applies when IP PrintWay restarts printing after an error occurs and when the operator releases a retained print job that has partially printed.

  If this option is not selected, IP PrintWay restarts printing from the beginning of the print job.

When you select either of these PJL options, IP PrintWay provides these additional functions:

• When the operator cancels a print job from the printer console, IP PrintWay detects that the print job has been canceled and does not retry the transmission.

• IP PrintWay waits until print jobs have finished printed before considering them successful and deleting them from the JES spool. If a failure occurs during printing, IP PrintWay retains the failed print jobs on the JES spool (if retention is requested).

• IP PrintWay writes a message with the number of pages that printed in the print job. The number of pages is the same as the number in the SMF type 6 record. The operator can use Infoprint Central to view this message in the log for the Infoprint Server print job.

**Tip:** If you select one of the PJL options, you might need to increase the response timeout value (**Response timeout** field) in the printer definition. This is because most printers respond only after the document finishes printing. Therefore, the response timeout value should be long enough to allow the largest documents to finish printing. For more information, see “Handling unsuccessful data transmissions” on page 180.

**Performance:** If you select one of the PJL options:

• Printer throughput can be slower in these situations:
  - You print more than one copy of a document.
  - You print multiple documents in one print job.

  The affect on printer throughput can vary for different printers.

• Printer throughput is not affected when you print one document at a time. That is, it takes the same amount of time to print the same one document. However, IP PrintWay writes its completion message (AOP3613I The print job was completed successfully) at a later time:
  - If you select a PJL option, IP PrintWay writes this message when the printer indicates it has finished printing the document.
  - If you do not select a PJL option, IP PrintWay writes this message when the printer indicates it has received the document in its buffer.

**Job name:** The job name that IP PrintWay extended mode sends to the PJL printer has this format:

\[ AOP dsname copy timestamp \]

**AOP**

Indicates that IP PrintWay sent the file to the printer.
The z/OS JES sysout data set name of the file. Usually this name includes system name, user ID, job name, job ID, data set ID, and the short data set name (or ?).

copy
The number of the copy. For example, 1 means the first copy.

timestamp
Date and time in the country locale. The timestamp is truncated if the full job name would exceed the 80 characters allowed in a PJL job name.

Sample job names are:
AOP SYS1.USER1.MYJOB.STC18767.D0000103.TEST 1 08/27/10 12:39:37 PM
AOP SYS1.USER2.MYJOB.JOB18869.D0000101.? 1 08/27/10 12:44:33 PM

Printing scenarios
These scenarios describe various situations and indicate how many pages print and the page count that IP PrintWay records in the SMF type 6 record. The number of pages that print and the SMF page count depend on where IP PrintWay extended mode tells the printer to restart printing.

IP PrintWay does not resend a print job to the printer
IP PrintWay sends a 200 page print job to the printer. The printer prints without error. If the printer runs out of paper or has a paper jam while it is printing, the printer operator fixes the problem before the IP PrintWay response timeout value expires. Table 26 shows how many pages print and the page count in the SMF type 6 record (field SMF6PGE).

<table>
<thead>
<tr>
<th>When printing restarts at this point</th>
<th>Total pages printed</th>
<th>Page count in SMF record</th>
</tr>
</thead>
<tbody>
<tr>
<td>After last successful page</td>
<td>200</td>
<td>200</td>
</tr>
<tr>
<td>Beginning of print job</td>
<td>200</td>
<td>200</td>
</tr>
</tbody>
</table>

IP PrintWay resends a print job to the printer
IP PrintWay sends a 200 page print job to the printer. After printing 175 pages, the printer runs out of paper. The printer has 25 pages stored in its buffer that have not printed yet. The IP PrintWay response timeout value expires before the operator adds paper. IP PrintWay resends the print job to the printer and tells the printer where to restart printing. Table 27 shows how many pages print and the page count in the SMF type 6 record (field SMF6PGE).

<table>
<thead>
<tr>
<th>When printing restarts at this point</th>
<th>Pages printed before retry</th>
<th>Pages printed when printer is ready</th>
<th>Total pages printed</th>
<th>Page count in SMF record</th>
</tr>
</thead>
<tbody>
<tr>
<td>After last successful page</td>
<td>1 - 175</td>
<td>176 - 200 (in buffer)</td>
<td>225</td>
<td>200</td>
</tr>
<tr>
<td>Beginning of print job</td>
<td>1 - 175</td>
<td>176 - 200 (in buffer)</td>
<td>400</td>
<td>375</td>
</tr>
</tbody>
</table>

IP PrintWay resends a failed print job to the printer
IP PrintWay sends a 200 page print job to the printer. After printing 175 pages, the printer runs out of paper. The printer has 25 pages stored in its buffer that have
IP PrintWay finishes all retries before the printer becomes ready. IP PrintWay retains the print job on the spool. When the operator releases the print job, IP PrintWay resends the print job and tells the printer where to restart printing. Table 28 shows how many pages print and the page count in the SMF type 6 record (field SMF6PGE).

<table>
<thead>
<tr>
<th>When printing restarts at this point</th>
<th>Pages printed before failure</th>
<th>Pages printed when printer is ready</th>
<th>Pages printed when operator releases job</th>
<th>Total pages printed</th>
<th>Page count in SMF record</th>
</tr>
</thead>
</table>
| After last successful page            | 1 - 175                      | 176 - 200 (in buffer)              | 176 - 200                                | 225                 | • 175 in record for failed print  
• 200 in record for successful print  
(See Note.) |
| Beginning of print job                | 1 - 175                      | 176 - 200 (in buffer)              | 1 - 200                                  | 400                 | 375                      |

**Note:** IP PrintWay writes two SMF records for each document. It writes one record when it retains the print job on the JES spool, and it writes another record when it prints the print job again. The SMF6DCI field in each record indicates whether the document finished printing.

**Requirements**

The requirements are:

- The printer must support the direct sockets printing protocol.
- The printer must support these PJL commands as described in HP documentation:
  - `USTATUS DEVICE`
  - `USTATUS JOB`
  - `USTATUS PAGE`
  If the printer does not support these PJL commands, IP PrintWay extended mode writes a warning or error message to the common message log.
- Documents must not already contain a PJL JOB command. If a document contains a PJL JOB command, IP PrintWay extended mode writes an error message to the common message log (AOP3859E) and does not process the print job.

**Tips:**

- To determine whether a printer supports PJL, contact the printer manufacturer. However, some printers that support PJL do not support PJL commands as described in HP documentation. To determine whether a printer supports PJL, select a PJL option in the printer definition and submit a print job. Look in the Infoprint Server common message log for one of these messages:
  - AOP3858E The printer requires intervention or does not support PJL.
  - AOP3856E The printer does not support the PJL USTATUS JOB command.
  - AOP3854W The printer does not support the PJL USTATUS PAGE command.
  - AOP3855W The printer does not support the PJL USTATUS DEVICE command.
  - AOP3857W The printer does not return information after each page prints.

You can use Infoprint Central to look for these messages in the log for the Infoprint Server print job.

See also “Limitations” for a list of printers that do not support the PJL commands.
If you use an AFP to PCL or the AFP to PostScript transform, customize the transform to not add PJL commands. For information, see the documentation for the transform.

For information about how to change the protocol of an existing printer definition to the direct sockets protocol, see “Changing the type of a printer definition or the IP PrintWay protocol type” on page 290.

Limitations

The limitations are:

• If the operator holds or moves a print job that is printing, when the operator releases the print job, IP PrintWay tells the printer to start printing from the beginning of the print job.

• If the operator stops IP PrintWay while some print jobs are printing, when you start IP PrintWay, IP PrintWay tells the printer to starts printing from the beginning of the print jobs.

• If a network problem occurs while the printer is printing a print job, IP PrintWay might not be able to determine the number of pages that have printed. Therefore, additional duplicate pages might be printed.

• The PJL enhancements are not fully supported if IP PrintWay runs on multiple systems in a sysplex. This is because if an error occurs after some pages have printed, and IP PrintWay retries the print job on another system in the sysplex, IP PrintWay cannot determine how many pages have already printed. In this situation, IP PrintWay tells the printer to start printing from the beginning of the print job, and the page count in the SMF type 6 record includes only the pages that printed during the last retry.

• These older printers, and printers that use the same controller, support the PJL commands but do not return correct page information for each document. Therefore, the page count in the SMF type 6 record will be inaccurate, and some pages might not print if IP PrintWay resends data after an error. IP PrintWay does not write a warning or error message when a PJL option is selected for these printers.
  – InfoPrint 21
  – InfoPrint 70
  – InfoPrint 70 Plus
  – InfoPrint 2060ES
  – InfoPrint 2075ES
  – InfoPrint 2085
  – InfoPrint 2090ES
  – InfoPrint 2105
  – InfoPrint 2105ES

Procedure for specifying attributes

On the Direct Sockets Printing Protocol panel, specify these fields:

• **Record pages printed for accounting:** IP PrintWay extended mode records the number of printed pages in the SMF type 6 record.

• **Restart printing after last successful page:** IP PrintWay extended mode restarts printing after an error from the last page in the print job that printed successfully.
Example
This ISPF panel shows how to select both PJL options. The printer in this example supports the direct-sockets printing protocol. Only a portion of the ISPF panel is shown.

Direct Sockets Protocol

Printer Job Language (PJL) options:
/ Record pages printed for accounting
7 Restart printing after last successful page

Converting between EBCDIC and ASCII (extended mode)

This section applies to IP PrintWay extended mode. If you run IP PrintWay basic mode, see “Converting between EBCDIC and ASCII (basic mode)” on page 214.

IP PrintWay extended mode can convert line and text data from EBCDIC to ASCII, or from ASCII to EBCDIC, before transmitting data sets to the printer. You specify in the printer definition whether you want IP PrintWay to convert data.

Tip: IP PrintWay does not convert data between EBCDIC and ASCII if Print Interface has allocated the data set on the JES spool or if NetSpool has converted the data stream to any format other than line data. In these cases, Print Interface or NetSpool has already converted data to the printer code page.

IP PrintWay extended mode uses the iconv utility to convert data between EBCDIC and ASCII. The iconv utility converts data from one code page to another, from the code page used to create the document to the code page used by the printer. For more information about the iconv utility, see z/OS XL C/C++ Programming Guide. Print Interface and NetSpool also use iconv to convert data from EBCDIC to ASCII.

Procedure for specifying attributes
To use the iconv utility to convert data from the document code page to the printer code page:

- On the Processing panel of the printer definition, specify these fields:
  - **Document code page**: Leave this field blank or specify the name of an EBCDIC code page supported by IBM. If you leave this field blank, the default code page is the EBCDIC code page specified in the Infoprint Server configuration file, aopd.conf. If no code page is specified in the configuration file, IP PrintWay extended mode uses code page IBM-1047.
  - **Printer code page**: Specify the name of either an ASCII code page (such as ISO8859-1) or an EBCDIC code page (such as IBM-1047) that is supported by IBM. For code page names, see z/OS XL C/C++ Programming Guide. If you leave this field blank, IP PrintWay uses a default code page that is appropriate for the protocol:
    - E-mail protocol: IBM-1047 (an EBCDIC code page)
    - LPR, direct sockets, or IPP protocol: IBM-850 (an ASCII code page)
    - VTAM: IBM-1047 (an EBCDIC code page)
If you use the ISPF panels to create an IP PrintWay printer definition, the default ASCII or EBCDIC code page specified in the Infoprint Server configuration file is initially displayed in the printer definition:
- E-mail protocol: Default EBCDIC code page
- LPR, direct sockets, or IPP protocol: Default ASCII code page
- VTAM protocol: Default EBCDIC code page

**Guidelines:**
- For most printing situations, you do not need to modify the code pages in the printer definition. The initial values in the printer definition are generally suitable. However, when you create a printer definition for the e-mail protocol, if the code page that is initially displayed in the **Printer code page** field is not IBM-1047, you must specify a suitable ASCII code page instead. For more information, see "Creating a new e-mail printer definition" on page 165.
- If you plan to use this printer definition with Print Interface as well as with IP PrintWay, leave the **Document code page** field blank and specify a code page in the **Printer code page** field. For information about how Print Interface uses these fields, see "Converting data from EBCDIC to ASCII or ASCII to EBCDIC" on page 101.
- You can specify any code pages supported by IBM. For valid code page names, see [z/OS XL C/C++ Programming Guide].
- If you specify a custom code page, make sure that conversion tables exist to convert between these code pages:
  - The code pages in the **Document code page** and **Printer code page** field.
  - The code page for the z/OS locale and the custom code page.
For information about how to create conversion tables, see information about code set conversion utilities in [z/OS XL C/C++ Programming Guide].

### Converting line data to a text data stream

IP PrintWay automatically converts line data into text data *except* in these situations:
- Print Interface already formatted line data into text data.
- You specify a filter in the **Filter** field for the **Line data** format.
- You select the **Remote PSF** option in the **Mode** field.
- You select the VTAM protocol.
- IP PrintWay basic mode: You select the **None** option in the **Formatting** field.
- IP PrintWay extended mode: IP PrintWay detects that the data set does not contain line data.

You can specify these fields in the printer definition to control how IP PrintWay converts line data into text data:
- **Carriage control type**: An indication of whether to use the carriage-control characters that are present in the data set to format data. By default, IP PrintWay automatically determines whether a data set contains carriage controls and uses carriage controls if they are present.
  
  **Tip**: For most printing applications, do not select any value in this field. The IP PrintWay default is suitable for most applications, regardless of whether carriage controls are present or not.
• **Delete form feed:** An indication of whether to delete form-feed controls from the beginning and end of data sets. By default, IP PrintWay does not delete any form-feed controls.

  **Tip:** You might need to delete form-feed controls if your applications insert form-feed controls that result in blank pages being printed at the beginning or end of data sets.

• **Form feed:** The form-feed controls, specified in EBCDIC, that the printer or print server requires. IP PrintWay extended mode converts the form-feed controls to ASCII and adds them to text data to indicate the start of a new page. The default form-feed controls are: `X'0D0C'` (carriage-return and form-feed). IP PrintWay basic mode ignores this field.

• **Line termination:** The line-termination controls, specified in EBCDIC, that the printer or print server requires. IP PrintWay converts the line-termination controls to ASCII and adds them to text data to indicate the end of a line. The default line-termination controls are:
  
  - IP PrintWay basic mode:
    - LPR, direct sockets, IPP, and e-mail protocols: `X'25'` (line-feed)
    - VTAM protocol: `X'0D15'` (carriage-return and new-line)
  
  - IP PrintWay extended mode:
    - LPR (with an ASCII printer code page), direct sockets, IPP, and e-mail protocols: `X'0D15'` (carriage-return and new-line)
    - LPR protocol (with an EBCDIC printer code page): `X'0D25'` (carriage-return and line-feed)
    - VTAM protocol: `X'0D15'` (carriage-return and new-line)

  **Tips:**
  
  - IP PrintWay extended mode: If the **Printer code page** field contains ISO8859-1, leave the **Line termination** field blank. If you need to specify 25 or 0D25, specify a printer code page that translates EBCDIC X'25' to ASCII X'0A', such as code page IBM-850.
  
  - IP PrintWay basic mode: Consider specifying 0D25 in the **Line termination** field. This value is more suitable for many ASCII printers than the IP PrintWay default line-termination control of X'25'.

• **Omit line termination at EOF:** An indication of whether to omit the line-termination controls that IP PrintWay adds at the end of each document that contains ANSI carriage controls. IP PrintWay does not add any line-termination controls at the end of documents for the IPP, VTAM, and e-mail protocols, so this field does not apply to these protocols.

  **Tips:**
  
  - Some printers require line-termination controls at the end of documents so data for the next document starts printing at the beginning of the line.
  
  - Line-termination controls added at the end of documents can cause a printing problem when an application adds transparent data to the end of a document.

• **Transparent data char:** The transparent-data control used in the input data. IP PrintWay transmits data after the transparent-data control without converting it from EBCDIC to ASCII. However, IP PrintWay does not transmit the transparent data control and the 1-byte length field after the control. The default transparent data control is `X'35'`.

IP PrintWay uses the ANSI or machine carriage controls in the input data stream to format data. IP PrintWay supports the print no space, space 1 line, space 2 lines, and space 3 lines carriage controls. If FCB processing is enabled, IP PrintWay also
supports skip-to-channel carriage controls. For more information about how to enable FCB processing in the printer definition, see “Using an FCB to format data” on page 196.

For data sets without carriage controls, you can specify these fields in the printer definition to control how IP PrintWay formats data into pages:

- **Pagination**: An indication of whether IP PrintWay formats line data without carriage controls into pages. By default, pagination is selected.
- **Margins: Top** and **Margins: Bottom**: Number of blank lines to leave in the top and bottom margins. The default is no margins.
- **Page height**: Number of lines to print on a page. The default is 58 lines.
- **Print page header**: An indication of whether to insert a header at the top of each page. The 3-line header contains the fully qualified data set name and a page number, followed by two blank lines.

**Procedure for specifying attributes**

To format data, specify these attributes in the printer definition.

- On the Processing panel, specify these fields:
  - **Pagination**
  - **Margins: Top** and **Margins: Bottom**
  - **Page height**
  - **Print page header**
- On the IP PrintWay Options panel, specify these fields:
  - **Formatting** (basic mode)
  - **Line termination**
  - **Transparent data char**
  - **Form feed** (extended mode)
  - **Delete form feed**
  - **Omit line termination at EOF**

**Example**

These ISPF panels show how to specify formatting options for IP PrintWay. The fields shown on the Processing panel apply only for data sets that do not contain carriage-control characters. Only a portion of the panel is shown.

```
Processing...

IP PrintWay Line-to-Text Conversion:
/ Pagination
    Margins: Top . . 5   Bottom . . 5
Page height . . 65
/ Print page header
```

Using an FCB to format data

IP PrintWay can use a forms control buffer (FCB) to format line data when IP PrintWay creates a text, SCS, or DSC data stream:

- IP PrintWay extended mode uses an FCB if an FCB is specified.
- IP PrintWay basic mode uses an FCB if an FCB is specified and you select the Use FCB option in the printer definition.

An FCB can be specified in several locations. If an FCB is specified in more than one location, IP PrintWay uses this hierarchy for selecting the FCB:
1. The FCB specified in the FCB parameter of the OUTPUT JCL statement or in the forms-control-buffer job attribute.
2. The FCB specified in the Forms control buffer field of the printer definition (on the Allocation panel).
   IP PrintWay uses the FCB specified in the printer definition when one of these conditions is met:
   - IP PrintWay extended mode processes the data set
   - NetSpool allocates the data set on the JES spool
   - Print Interface allocates the data set on the JES spool and the VTAM protocol is selected
3. The FCB defined to JES as the default FCB (IP PrintWay basic mode only).

The specified FCB must reside in the SYS1.IMAGELIB library. IP PrintWay prefixes the specified FCB name when it searches for the FCB in SYS1.IMAGELIB, depending on the transmission protocol selected in the printer definition:

- For the VTAM protocol, IP PrintWay prefixes the FCB name with FCB2 to create the member name. If the FCB cannot be located with the FCB2 prefix, the FCB request is ignored and default values are used. The default values are skip-to-channel 1 line 1.
- For other protocols, IP PrintWay prefixes the FCB name with FCB4 to create the member name. If this member is not found in SYS1.IMAGELIB, PrintWay uses prefix FCB2, and if it is not found, PrintWay uses prefix FCB3. If no members are found, IP PrintWay writes a message stating that the member does not exist in SYS1.IMAGELIB, and it retains the data set if retention is requested for failed data sets.
If the input data stream contains carriage controls, IP PrintWay honors skip-to-channel carriage controls in the input data, in addition to carriage controls for print no space, space 1 line, space 2 lines, and space 3 lines. If the input data does not contain carriage controls, IP PrintWay either ignores the FCB or reports an error, depending on the transmission protocol selected in the printer definition:

• For the VTAM protocol, IP PrintWay does not use the FCB.
• For other protocols, IP PrintWay reports an error.

Table 29 summarizes the FCB functions that IP PrintWay supports. IP PrintWay supports different FCB functions depending on the type of output data stream that IP PrintWay creates. For example, the DSC/DSE data stream does not support specification of the number of lines per inch.

Table 29. FCB functions supported by IP PrintWay

<table>
<thead>
<tr>
<th>FCB function</th>
<th>Output data stream</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Text1</td>
</tr>
<tr>
<td>Number of lines per page</td>
<td>Yes</td>
</tr>
<tr>
<td>Number of lines per inch</td>
<td>No</td>
</tr>
<tr>
<td>Channel codes</td>
<td>Yes</td>
</tr>
<tr>
<td>Left margin (indexing)</td>
<td>No</td>
</tr>
<tr>
<td>Skip a line</td>
<td>Yes</td>
</tr>
</tbody>
</table>

1. IP PrintWay can create a text data stream when you select the LPR, direct sockets, IPP, or e-mail protocol.
2. IP PrintWay can create an output SCS or DSC/DSE data stream when you select the VTAM protocol.

Tip: IP PrintWay does not format data sets that Print Interface allocates on the JES spool unless the VTAM protocol is selected.

JES3 notes for IP PrintWay basic mode:
1. JES3 passes the FCB parameter specified on an OUTPUT JCL statement to IP PrintWay basic mode only if FCB is specified as a JES3 work-selection criterion for the PrintWay basic mode FSA.
2. JES3 provides a default FCB to IP PrintWay basic mode unless you specify the PDEFAULT=FCB parameter in the JES initialization statement for the IP PrintWay basic mode FSA.
3. For information about how to configure JES3 initialization statements for IP PrintWay basic mode, see z/OS Infoprint Server Customization.

Procedure for specifying attributes
To format data sets using an FCB, specify these fields in the printer definition:
• (Basic mode) On the IP PrintWay Options panel, specify this field:
  – Formatting: Select Use FCB.

When you select Use FCB in the Formatting field, IP PrintWay basic mode uses the FCB only if an FCB is specified for the data set. If no FCB is specified, IP PrintWay does standard formatting. Therefore, you can select Use FCB even if some data sets do not use an FCB. In a JES3 environment, however, you might want to configure the IP PrintWay basic mode FSA so that JES3 does not pass a default FCB name to IP PrintWay.
IP PrintWay extended mode ignores this field. It always uses the FCB if one is specified for a data set.

- (Optional) On the Allocation panel, specify the name of a default FCB in the FCB field.

**Example**
This ISPF panel shows how to request that IP PrintWay basic mode use the FCB, if one is specified, to format the data. Only a portion of the ISPF panel is shown.

```
IP PrintWay Options
...
Basic Mode Formatting:
...
  Formatting:... 4 1. None       2. Standard
               3. Translate only 4. Use FCB
```

### Transmitting multiple data sets in a JES output group

IP PrintWay lets you control how it transmits data sets that are in the same JES output group to a printer or to an e-mail destination. You can request that IP PrintWay transmit each data set individually in a separate transmission or e-mail, or together in one transmission or e-mail. Transmitting data sets in the same transmission makes sure that data sets from other print requests do not print between the data sets in the JES output group.

A JES output group consists of output data sets created in the same batch job that have the same OUTPUT JCL parameters, such as the same CLASS, DEST, FORMS, and TITLE parameters. For more information about how JES places output data sets into output groups, see [z/OS JES2 Initialization and Tuning Guide](https://www.ibm.com) or [z/OS JES3 Initialization and Tuning Guide](https://www.ibm.com).

You can specify these fields and options in the printer definition to control the transmission of data sets in the same JES output group:

**Automatic dataset grouping (extended mode) field**
Select this field if you want IP PrintWay extended mode to transmit all the data sets to a printer in the same transmission or send all the data sets in the same e-mail (each data set is a separate attachment). This is an efficient method of transmitting data sets that makes sure the data sets print together. Most printers start printing each data set on a new sheet of paper.

If more than one copy is requested, data sets print in the order IP PrintWay receives them from JES. For example, if you request 2 copies of data set A and 3 copies of data set B, data sets print in this order: data set A, data set A, data set B, data set B, data set B.

**Tips:**
- Some older printers do not support this type of transmission. These printers might not start each data set on a new sheet of paper, or they might print an extra blank page between data sets. If this case, you can (1) specify a printer command to start a new sheet in the Document Header field or (2) deselect this option and select the Job option or the Concatenate job option in the Dataset grouping field instead.
- IP PrintWay basic mode ignores this field and instead uses the option selected in the Dataset grouping field.
• If you select this field, IP PrintWay extended mode ignores the option selected in the Dataset grouping field.

Concatenate job option – Dataset grouping field
Select this option if you want IP PrintWay to combine all the data sets into a single transmission called a **concatenation** and transmit them to a printer in the same transmission or send all the data sets in the same e-mail (each data set is a separate attachment). This is an efficient method of transmitting data that makes sure the data sets print together. IP PrintWay inserts form feeds between data sets so that, in most cases, each data set starts printing on a new page.

If more than one copy is requested, the data sets print in the order in which IP PrintWay concatenated them. However, the number of copies requested for the first data set applies to all data sets. For example, if you print 2 copies of data set A and 3 copies of data set B, 2 copies of each data set print in this order: data set A, data set B, data set A, data set B.

**Tips:**
• Some printers might start printing data sets on the back side of a sheet in duplex mode. In this case, you can (1) select the **Automatic dataset grouping (extended mode)** field, (2) select the **Job** option, or (3) specify a printer command to start a new sheet in the Document header field.
• IP PrintWay basic mode: If you select the **Resubmit for filtering** field, data sets might start printing on the same page as the previous data set in the concatenation. Also, when you select the **Resubmit for filtering** field, all the data sets in the output group must have the same type of carriage controls and the same data format.
• If you print copies, do not select this option because the correct number of copies might not print. The number of copies requested for the first data set in the concatenation applies to all data sets in the concatenation. The number of copies requested for the second and subsequent data sets is ignored.

Job option – Dataset grouping field
Select this option if you want IP PrintWay to transmit the data sets to a printer as individual data sets as soon as each data set is ready to print, or send each data set in a separate e-mail. This method makes it likely that data sets in the same JES output group print together. However, data sets from other print requests might print between the data sets. Each data set starts printing on the front side of a sheet of paper.

If you print to a print server, each data set arrives and is stored as a separate file at the print server. Therefore, the data sets can be individually managed on the remote print spool.

If more than one copy is requested, the data sets print in the order that IP PrintWay receives them from JES. For example, when you print 2 copies of data set A and 3 copies of data set B, data sets print in this order: data set A, data set A, data set B, data set B, data set B.

None option – Dataset grouping field
Select this option if you want IP PrintWay basic mode to transmit the data sets to a printer as individual data sets as soon as each data set is ready to print, or send each data set in a separate e-mail.

If more than one copy is requested, the data sets print in the order that IP PrintWay receives them from JES. For example, when you print 2 copies of data set A and 3 copies of data set B, data sets print in this order: data set A, data set A, data set B, data set B, data set B.
Tip: This option does not apply to IP PrintWay extended mode. If you select it, IP PrintWay extended mode uses the Job option instead.

Limitations:
- If Print Interface or NetSpool allocates a data set on the JES spool, JES places each data set in a separate output group even when the job submitter submits multiple data sets with the same ip command or in the same job step using the Print Interface subsystem. Therefore, IP PrintWay cannot group data sets. The Automatic dataset grouping and Dataset grouping fields do not apply.
- When it uses the VTAM protocol, IP PrintWay always transmits each data set in a separate transmission. The Automatic dataset grouping and Dataset grouping fields do not apply.
- When it uses the IPP protocol, IP PrintWay supports only the Job and None options in the Dataset grouping field. The Automatic dataset grouping field does not apply.

Procedure for specifying attributes
To specify how IP PrintWay transmits data sets in the same JES output group, specify one of these fields on the IP PrintWay Options panel:

- Automatic dataset grouping (extended mode)
- Dataset grouping: Select None, Job, or Concatenate job. The default is Job.

Example
This ISPF panel shows how to request that IP PrintWay transmit all the data sets in the same JES output group to the printer in the same transmission or send the data sets in the same e-mail:
- IP PrintWay extended mode uses the Automatic dataset grouping field.
- IP PrintWay basic mode uses the Dataset grouping field.

Only a portion of the ISPF panel is shown.

```
IP PrintWay Options
...
/ Automatic dataset grouping (extended mode)
Dataset grouping...1. None 2. Job 3. Concatenate job
...
```

Sending commands to the printer
In the printer definition, you can specify printer commands that IP PrintWay sends to the printer. Printer commands are sometimes called printer setup strings. You can specify printer commands in these fields:

- **Document header**: IP PrintWay sends the printer commands specified in this field to the printer at the beginning of each document. For example, you could specify PCL commands to select a font or request landscape printing.
- **Document trailer**: IP PrintWay sends the printer commands specified in this field to the printer at the end of each document. For example, you could specify a PCL command to reset the printer to its default state.

IP PrintWay sends the document header to the printer after it sends any separator page that the Begin Data Set exit adds, and it sends the document trailer before it sends any separator page that the End Data Set exit adds. The order is:
For example, if you specify commands for landscape printing in the **Document header** field, the separator page that the Begin Data Set exit adds does not print in the landscape orientation. To print the separator page in the landscape orientation, the Begin Data Set exit must add printer commands for landscape printing before the separator page data.

You can also specify a document header and document trailer in the IP PrintWay Begin Data Set exit (in the ANFUEXT control block). The document header and document trailer the exit specifies in the ANFUEXT control block override the document header and trailer specified in the printer definition. The Begin Data Set exit lets you specify a different document header and trailer for each document. For information about the Begin Data Set exit, see [z/OS Infoprint Server Customization](https://www.ibm.com/support/docview.wss?uid=swg21414837).

You can specify printer commands in either EBCDIC or ASCII representation, and you can request that IP PrintWay convert the printer commands to the printer’s code page (either an EBCDIC or ASCII code page) before transmitting them to the printer. For example, if the printer accepts ASCII data, you can enter the printer commands in EBCDIC in the printer definition and request that IP PrintWay convert them to ASCII before transmission. For information about how IP PrintWay converts data between EBCDIC and ASCII, see “Converting between EBCDIC and ASCII (extended mode)” on page 192.

When you enter data in EBCDIC in the printer definition, you can use these special values, which IP PrintWay converts to the indicated EBCDIC hexadecimal values. If you use these special values, use EBCDIC representation for the rest of the printer commands as well:

<table>
<thead>
<tr>
<th>Value</th>
<th>Hex (EBCDIC)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;FF&gt;</td>
<td>0C</td>
<td>Form feed</td>
</tr>
<tr>
<td>&lt;CR&gt;</td>
<td>0D</td>
<td>Carriage return</td>
</tr>
<tr>
<td>&lt;LF&gt;</td>
<td>25</td>
<td>Line feed</td>
</tr>
<tr>
<td>&lt;ESC&gt;</td>
<td>27</td>
<td>Escape</td>
</tr>
<tr>
<td>&lt;SP&gt;</td>
<td>40</td>
<td>Space</td>
</tr>
</tbody>
</table>

**Tip:** To print the euro on a euro-capable printer, you might need to load the 9N symbol set into the printer. You can select the 9N symbol set on the printer panel, or you can specify this PCL command in the **Document header** field to load the 9N symbol set: "ESC>(9N"

### Specifying SCS controls for VTAM-controlled printers

When you print on VTAM-controlled SCS printers, you can specify SCS controls in the **Document header** and **Document trailer** fields. For example, if your printer supports the Page Presentation Media (PPM) control, you can specify the PPM control in the **Document header** field to adjust the paper drawer, duplex option, and other media-related characteristics. In the **Document trailer** field, you can reset...
the printer to its original state. Consult the documentation for your printer to determine which SCS controls your printer supports.

IP PrintWay automatically generates SCS controls in the SCS data stream that it sends to the printer. Therefore, if you specify these same controls in the Document header field, the printer ignores them. The SCS controls that IP PrintWay generates in the SCS data stream are:

- SLD (Set Line Density)
- SPD (Set Print Density)
- SHF (Set Horizontal Format)
- SVF (Set Vertical Format)

Although you cannot specify the SHF and SVF controls in the Document header field, you can specify the SHF maximum presentation position (MPP) and the SVF maximum page length (MPL) in the printer definition. For more information, see “SCS page-formatting attributes” on page 212.

### Specifying printer commands to print on a new sheet of paper

In these cases, you might need to specify printer commands to print data sets on new sheets of paper:

- When you print multiple copies, some printers print the next copy on the back side of the sheet of paper, or even on the same side as the previous copy.
  
  To determine if your printer prints each copy on a new sheet of paper, print multiple copies of a data set that is less than one page in length.

- When you select the direct sockets protocol and print multiple data sets in the same output group, sometimes the second and subsequent data sets in the output group print on the back side of the sheet of paper, or even on the same side as the previous data set. This can occur when you select the Concatenate job option in the Dataset grouping field.

To force printing on a new sheet of paper, specify one of these printer commands, depending on the type of data typically printed on the printer. For most printers, specify the command in the Document trailer field. However, for other printers, you might need to specify the printer command in the Document header field or in both fields:

- For PostScript data streams, specify the PJL Universal Exit Language (UEL) command:
  
  \(<ESC>%-12345X\)

- For non-PostScript data streams, specify the PCL Select Front command:
  
  \(<ESC>\&a1G\)

**Notes:**

1. Some printers that accept PCL commands might not accept the PJL UEL command.
2. Do not specify these commands for VTAM-controlled printers.

### Specifying printer commands for landscape printing

To print documents in the landscape orientation on a printer that can print PCL data, specify these printer commands in the Document header field:

\(<ESC>E<ESC>&12A<ESC>&110<ESC>&1BD<ESC>&11E<ESC>&166F<ESC>(s12H\)

<table>
<thead>
<tr>
<th>Command</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(&lt;ESC&gt;E)</td>
<td>Reset the printer</td>
</tr>
</tbody>
</table>
<ESC>(&l2A Set paper size to letter (the “l” is a lowercase L)
<ESC>(&l1O Set orientation to landscape (the “O” is a capital letter O)
<ESC>(&l8D Set lines per inch to 8
<ESC>(&l1E Set top margin to 1 line
<ESC>(&l66F Set number of print lines to 66
<ESC>(s12H Set font pitch to 12 characters per inch

Procedure for specifying attributes

On the IP PrintWay Options panel, specify these fields:

- **Document header**: Specify printer commands to be sent to the printer at the beginning of each data set and each copy of a data set.

- **Translate document header**: Select this field if the value needs to be converted to the code page the printer accepts. For example, select this field if the Document header field is in EBCDIC representation and the printer accepts ASCII data.

- **Document trailer**: Specify printer commands to be sent to the printer at the end of each data set and each copy of a data set.

- **Translate document trailer**: Select this field if the value needs to be converted to the code page the printer accepts. For example, select this field if the Document trailer field is in EBCDIC representation and the printer accepts ASCII data.

**Tip**: If you need to specify the same printer commands in more than one printer definition, specify them in an IP PrintWay Options component. Then, include that component in each printer definition to which the values apply.

**Example**

This ISPF panel shows how to specify PCL commands in a document header and trailer for a PCL printer. Only a portion of the ISPF panel is shown.

```
IP PrintWay Options

Document header . . <ESC>E<ESC>&l2A<ESC>&l1O<ESC>&l8D<ESC>&l1E<ESC>&l66F<ESC>(s12H

/ Translate document header
Document trailer . . <ESC>E
/ Translate document trailer

Tip: Place your cursor on Extend and press Enter to enter the entire document header value.
```

**Result**: IP PrintWay sends the instructions in the Document header field to the printer. The PCL commands in the Document header field mean:
### Command Meaning

- `<ESC>E` Reset the printer
- `<ESC>&l2A` Set paper size to letter (the “l” is a lowercase L)
- `<ESC>&l1O` Set orientation to landscape (the “O” is a capital letter O)
- `<ESC>&l8D` Set lines per inch to 8
- `<ESC>&l1E` Set top margin to 1 line
- `<ESC>&l66F` Set number of print lines to 66
- `<ESC>(s12H` Set font pitch to 12 characters per inch

The `<ESC>E` in the **Document trailer** field resets the printer.

The **Translate document header** and **Translate document trailer** fields are selected so that IP PrintWay translates the data from EBCDIC to ASCII before transmission to the printer.

### Validating that data sets can print as requested

Before transmitting a data set to the printer, IP PrintWay uses information you provide in the printer definition to validate that the data set can print as requested on the printer. For example, IP PrintWay can validate that the data set does not exceed a size limit. You might want to specify limits because the printer itself has certain limitations, such as a small buffer that cannot receive large data sets, or you might want to specify limits for other reasons, such as you want to prevent job submitters from printing large data sets on slow printers.

Table 30 lists the fields in a printer definition that IP PrintWay uses to validate that a data set can print on the printer. The third column in the table indicates the JCL parameter that the job submitter specifies to request the print function, and the fourth column indicates the action IP PrintWay takes if the validation fails.

**Table 30. Printer definition fields used for validation in IP PrintWay**

<table>
<thead>
<tr>
<th>Field name</th>
<th>Meaning</th>
<th>JCL parameter</th>
<th>IP PrintWay action if validation fails</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data format</td>
<td>Input data formats the printer supports. For more information, see “Data formats” on page 92</td>
<td>None</td>
<td>IP PrintWay does not transmit the data set to the printer.</td>
</tr>
<tr>
<td>Duplexes supported</td>
<td>Duplexing supported by the printer (simplex, duplex, and tumble)</td>
<td>DUPLEX</td>
<td>IP PrintWay does not transmit the data set to the printer.</td>
</tr>
<tr>
<td>Field name</td>
<td>Meaning</td>
<td>JCL parameter</td>
<td>IP PrintWay action if validation fails</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------</td>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Maximum</td>
<td>Maximum size (in bytes) allowed for all data sets</td>
<td>None. IP PrintWay determines the document size.</td>
<td>If the output group contains only one data set, or if IP PrintWay is transmitting the data sets in a concatenation, IP PrintWay does not transmit any documents in the output group to the printer. Otherwise, IP PrintWay sends documents to the printer until the maximum size is reached and then does not transmit any more data sets in the output group.5</td>
</tr>
<tr>
<td>copies 3</td>
<td>Maximum number of copies allowed.</td>
<td>COPIES</td>
<td>IP PrintWay transmits the number of copies allowed.</td>
</tr>
</tbody>
</table>

Notes:
1. IP PrintWay basic mode does not validate the data format.
2. If you select the VTAM protocol in the printer definition, IP PrintWay does not limit the size of data sets that can print.
3. IP PrintWay ignores the Maximum copies field if the protocol does not support copies. For example, the e-mail protocol and the VTAM protocol (IP PrintWay basic mode) do not support copies.
4. The number of copies specified in the form definition is not included when the number of copies or the size of a data set is calculated.
5. IP PrintWay retains the failed data sets on the JES spool if a retention period for failed transmissions is specified.

Print Interface and NetSpool also use these fields to validate that print requests can print as requested. If Print Interface or NetSpool determine that a data set cannot print, no output data set is allocated on the JES spool.

**Procedure for specifying attributes**

(Optional) On the Processing panel, specify these fields:

- **Data format**: (extended mode) Specify all the input data formats that the printer supports. Select all fields if you do not want IP PrintWay to validate the input data format.
- **Duplexes supported**: Select all the types of duplexing the printer supports. Select all options if you do not want IP PrintWay to validate duplexing.
- **Maximum document size**: Specify the maximum number of bytes in a print job to send to the printer. Allowed values are 1 - 2147483646. Leave this field blank if you do not want IP PrintWay to limit the size.
• **Maximum copies**: Specify the maximum number of copies of the same data set that can be printed. Allowed values are 1 - 32640. Leave this field blank if you do not want IP PrintWay to limit the number of copies.

**Example**

This ISPF panel shows how to specify the data formats the printer accepts, and also limit the document size and number of copies. Only a portion of the ISPF panel is shown.

---

**Printing with InfoPrint Manager for AIX or Windows**

IP PrintWay can use the LPR protocol to transmit data sets to Ricoh InfoPrint Manager for AIX or InfoPrint Manager for Windows. When processing a file for InfoPrint Manager, IP PrintWay does not convert data to ASCII and does not format the input data. However, IP PrintWay adds a record length field to each record as required by InfoPrint Manager.

In addition, IP PrintWay sends AFP options, such as the name of the form definition, to InfoPrint Manager in the LPD control file. IP PrintWay prefixes each option with -o, as required by InfoPrint Manager. For a list of the -o options that IP PrintWay creates in the LPD control file, see *Appendix C, “InfoPrint Manager options,”* on page 477.

To create -o options, IP PrintWay uses values specified in DD and OUTPUT JCL statements or in Infoprint Server job attributes. For example, if the job submitter specifies the FORMDEF parameter on the OUTPUT JCL statement, IP PrintWay creates the -of option in the LPD control file. For some JCL parameters, such as the CLASS and FORMS parameters, JES provides default values.

You can specify one additional -o option in the User options field, which IP PrintWay adds to the LPD control file. To specify more than one option, you must use the Printer Inventory Definition Utility (PIDU) and specify the server-user-options attribute. For more information, see *“server-user-options”* on page 435.
Tip: The -o options that IP PrintWay creates using values specified in the DD and OUTPUT JCL parameters override the same -o options specified in the User options field (or server-user-options attribute).

Procedure for specifying attributes
On the Protocol panel, specify these fields:

- **Mode**: Select the Remote PSF option.
- **IP address**: Specify the host name or dotted decimal address of the system where InfoPrint Manager is running.
  
  You can specify the IP address in dotted-decimal format. If the system running InfoPrint Manager has an IPv6 address, you must specify its host name instead of its colon-hexadecimal format address.
- **Print queue name**: Specify the name of the remote print queue.
- **User options**: (Optional) Specify one additional option for InfoPrint Manager.

(Optional) On the Allocation panel, you can specify these fields. IP PrintWay transmits these values to InfoPrint Manager if no other value is specified during job submission. If you run IP PrintWay basic mode, the values on the Allocation panel apply only to documents that Print Interface or NetSpool processes.

- **Spool allocation values**:
  - CLASS
  - DEST
  - FORMS
  - FCB
  - PRMODE
  - UCS
- **Resource related values**:
  - Form definition
  - Character sets
  - Input tray
  - Output bin
  - Page definition
  - Image shift
- **Error reporting values**: Print error reporting
- **Other values**:
  - Copies
  - Duplex
  - Table reference characters

Tip: When you select the Remote PSF option, IP PrintWay basic mode ignores the Formatting field in the IP PrintWay section. IP PrintWay basic mode processes data sets as if you had selected the None formatting option.

Creating an IP PrintWay default printer definition
If a job submitter specifies the printer IP address on an OUTPUT JCL statement (in the DEST=IP: parameter), but does not specify a printer definition name in the FSSDATA parameter, IP PrintWay can use values specified in its default printer definition. The name of the IP PrintWay default printer definition is DFLTENTRY.
In the IP PrintWay default printer definition, you can specify default values that IP PrintWay uses if any of these OUTPUT JCL parameters are not specified on the OUTPUT JCL statement:
- RETAINF and RETAINS
- RETRYL and RETRYT
- PRTOPTNS

Infoprint Server creates a default printer definition if one does not already exist. If you want to use different default values, you can edit the default printer definition.

The default printer definition that Infoprint Server creates specifies these default values:

<table>
<thead>
<tr>
<th>JCL Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RETAINS</td>
<td>0; IP PrintWay does not retain data sets on the JES spool after transmission is successful.</td>
</tr>
<tr>
<td>RETAINF</td>
<td>0; IP PrintWay does not retain data sets on the JES spool after transmission fails.</td>
</tr>
<tr>
<td>RETRYL</td>
<td>0; IP PrintWay does not retry unsuccessful transmissions.</td>
</tr>
<tr>
<td>RETRYT</td>
<td>0; IP PrintWay does not wait between each retry.</td>
</tr>
<tr>
<td>PRTOPTNS</td>
<td>IP PrintWay uses default values for all printer definition fields. For information about default values, see the ISPF field help.</td>
</tr>
</tbody>
</table>

**Procedure for specifying attributes**

In the IP PrintWay default printer definition, you can specify any attributes that apply to IP PrintWay. These attributes have special considerations:

1. On the main ISPF panel for the printer definition, specify these fields:
   - **Printer definition name**: The name must be DFLTNTRY (uppercase).
   - **Use DEST, CLASS, and FORMS for IP PrintWay printer selection**: Do not select this field.

2. On the Processing panel:
   - Do not select the **Resubmit for filtering** field. If you select this field, IP PrintWay basic mode ignores the IP address that the job submitter specifies in the DEST=IP: parameter of the OUTPUT JCL statement and transmits the data set to the IP address specified in the printer definition. The Resubmit for filtering field does not apply to IP PrintWay extended mode.

3. On the Protocol panel:
   - **Printer IP address, Print queue name, Port number**: Leave these fields blank because IP PrintWay always uses the IP address and print-queue name or port number specified on the OUTPUT JCL statement. IP PrintWay uses either the LPR or direct sockets protocol, depending on which JCL parameters are specified on the OUTPUT JCL statement. IP PrintWay uses the LPR protocol if the PRTQUEUE parameter is specified, and uses the direct sockets protocol if the PORTNO parameter is specified.
Creating components for the PRTOPTNS JCL parameter

In the PRTOPTNS parameter of the OUTPUT JCL statement, a job submitter can
specify the name of a set of components that contain IP PrintWay printing options.
IP PrintWay uses the printing options in these components instead of the options
that are specified in the printer definition that IP PrintWay uses to print the data
set.

You need to create components for use with the PRTOPTNS JCL parameter only if
job submitters want to print with different printing options from those specified in
the printer definition. One situation where users might want to specify different
printing options is when you have not created a printer definition for the printer
and IP PrintWay uses options in the default printer definition. (IP PrintWay uses
options in the default printer definition when the job submitter specifies the
DEST=IP: JCL parameter and omits the FSSDATA=printer JCL parameter.)

You can specify IP PrintWay options in three types of components:
• Processing
• IP PrintWay Options
• Protocol

When the job submitter names a set of components in the PRTOPTNS JCL
parameter, IP PrintWay uses only a subset of all the options that might be specified
in the named components. IP PrintWay ignores the other options in the
components. “Procedure for specifying attributes” identifies the fields that contain
the options that IP PrintWay uses from the components.

Procedure for specifying attributes

Rules:
• Use the same name for the Processing, IP PrintWay Options, and Protocol
  components.
• Because the PRTOPTNS parameter lets a job submitter specify a maximum of 16
  characters, limit the component name to 16 characters.
• Create at least one Processing, IP PrintWay Options, or Protocol component. If a
  component does not exist, IP PrintWay uses default values for the printing
  options in the missing component.

To create a set of components for the PRTOPTNS parameter:

1. In the Processing component, specify any of these fields (leave a field blank if
   you want IP PrintWay to use the default value):
   • Double-byte translation table
   • Margins: Top and Margins: Bottom
   • Maximum document size
   • Page height
   • Pagination
   • Print page header
   • SOSI mode
   • Translation data set qualifier

2. In the IP PrintWay Options component, specify any of these fields (leave a
   field blank if you want IP PrintWay to use the default value):
   • Automatic dataset grouping
   • Carriage control type
3. In the Protocol component, specify any of these fields (leave a field blank if you want IP PrintWay to use the default value):
   - Banner class
   - Filename
   - Indent
   - Mode
   - Owner
   - Print banner page
   - Print function
   - Record pages printed for accounting
   - Restart printing after last successful page
   - Restrict ports
   - Title
   - User Options
   - Width

**Tip:** If you specify a value for any field that is not in this list, IP PrintWay ignores the value and, instead, uses the value in the printer definition.

**Example**

Assume that you have created a Processing component, an IP PrintWay Options component, and a Protocol component named **PWoptions**. To use IP PrintWay options in these components, the job submitter can specify the PRTOPTNS parameter in an OUTPUT JCL statement, as shown:

```jcl
//OUT1 OUTPUT PRTOPTNS='PWoptions' ...
```

The component name is case-sensitive. Therefore, if the name contains special characters or lowercase characters, the job submitter must enclose the name in quotation marks.

**Using an installation-provided filter**

For each type of data format, you can specify the name of an associated filter. A **filter** is a program that can inspect and modify data. When you specify the name of a filter for a supported data format in a printer definition, the filter is called when the data format is detected. IP PrintWay can call the associated filter (a filter is called only once for each data set):

- IP PrintWay extended mode calls the filter before it transmits the data set to the printer.
IP PrintWay basic mode uses the filter only if you also select the **Resubmit for filtering** field. IP PrintWay basic mode resubmits the data to Print Interface, which calls the associated filter program.

Your installation can write its own filter program, either a DLL filter or a UNIX filter. For information about how to write a filter, see **z/OS Infoprint Server Customization**.

**Procedure for specifying attributes**

On the Processing panel, specify:

- **Data format** field: Select the data format of the input document that your filter applies to.
- **Filter** field: Specify the name of the filter followed by the options that you want to provide as command line arguments to the filter.
  - If the filter is a DLL filter, type the absolute pathname unless the filter is in a directory named in the LIBPATH environment variable.
  - If the filter is a UNIX filter, type `spawn` before the filter name. Type the absolute pathname of the filter unless the filter is in a directory named in the PATH environment variable.
- **Resubmit for filtering** field: Select this field if you run IP PrintWay basic mode. For more information about this field, see “Resubmitting documents to Print Interface for filtering (basic mode)” on page 217. Selecting this field can adversely impact system performance.

**Example**

This ISPF panel shows how to specify a UNIX filter written by your installation for line data. Only a portion of the ISPF panel is shown.

```
  Processing
  
  Data format: Filter:
  / Line data spawn /usr/mylib/my_unix_filter -a option operand (extend)
    MO:DCA-P __________________________________________________ (extend)
    PostScript __________________________________________________ (extend)
    Text __________________________________________________ (extend)
    PCL __________________________________________________ (extend)
    PDF __________________________________________________ (extend)
    SAP __________________________________________________ (extend)
    XML __________________________________________________ (extend)
    TIFF __________________________________________________ (extend)
    JPEG __________________________________________________ (extend)
    Other __________________________________________________ (extend)
  / Resubmit for filtering
  ...
```

If the input data stream contains line data, IP PrintWay calls the `my_unix_filter` filter to transform line data. The option and operand that follow the filter name are passed to the filter.

**Converting line data to an SCS or DSC/DSE data stream (basic mode)**

When you select the VTAM protocol in the printer definition, IP PrintWay basic mode automatically converts line data into either SCS or DSC/DSE format except when **None** is selected in the IP PrintWay basic mode **Formatting** field.
IP PrintWay uses the ANSI or machine carriage controls in the input data stream to format data. IP PrintWay supports the print no space, space 1 line, space 2 lines, and space 3 lines carriage controls. If FCB processing is enabled, IP PrintWay also supports skip-to-channel 1-9, A, B and C (1-12) carriage controls. For more information about how to enable FCB processing in the printer definition, see “Using an FCB to format data” on page 196.

**SCS page-formatting attributes**

You can specify SCS page-formatting attributes in the printer definition. You can specify top and bottom margins, left and right margins, the maximum line length, and the maximum page length. The left margin and maximum page length specified in the printer definition are used only if the FCB does not specify other values. These SCS page-formatting attributes are used to generate the SCS Set Horizontal Format (SHF) and Set Vertical Format (SVF) commands.

You cannot set the line density (lines per inch) or the print density (characters per inch) in the printer definition. IP PrintWay sets the line density to the lines per inch specified in the FCB. If FCB processing is not enabled or if no FCB is present, IP PrintWay uses 6 lines per inch. IP PrintWay sets the print density based on the table reference characters (TRCs) in the input data stream, as shown in Table 31. If no TRCs are present, IP PrintWay uses the character density set on the printer's panel.

<table>
<thead>
<tr>
<th>Table reference character</th>
<th>Print density characters per inch (CPI)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>10 CPI</td>
</tr>
<tr>
<td>1</td>
<td>12 CPI</td>
</tr>
<tr>
<td>2</td>
<td>15 CPI</td>
</tr>
<tr>
<td>3</td>
<td>16.6 or 17.1 CPI (depends on printer)</td>
</tr>
</tbody>
</table>

IP PrintWay does not support SCS controls, such as the X'35' transparent data control, that are embedded in line data. The transparent data control and any other unrecognized characters are converted to blank characters.

**Procedure for specifying attributes**

1. (Optional) On the Processing panel of the printer definition for an SCS printer, specify these fields, which are displayed under the SCS Conversion heading:
   • **Margins: Top**: The number of the first line of data on a page. The default is no top margin.
   • **Margins: Bottom**: The number of the line at which the bottom margin starts on a page. The default is no bottom margin.
   • **Margins: Left**: The column number at which the left margin starts on a page. If FCB processing is enabled and the FCB specifies a left margin, the FCB value is used instead. The default is column 1.
   • **Margins: Right**: The column number at which the right margin starts on a page. The default is no right margin.
   • **Line length**: The number of columns to place on one line, including the left and right margins. This value is the SHF Maximum Presentation Position (MPP). The default is the printer default set on the printer panel.
• **Page length**: The number of lines to place on a page, including the top and bottom margins. This value is the SVF Maximum Page Length (MPL). If FCB processing is enabled and the FCB specifies a page size, the FCB value is used instead. The default is the printer default set on the printer panel.

2. (Optional) On the IP PrintWay Options panel, specify these fields:

- **Formatting**: Select either the **Standard** or **Use FCB** option. The default is **Standard**. The **Translate-only** option is equivalent to the **Standard** option for the VTAM protocol.
- **Line termination**: Specify the line-termination controls (in EBCDIC) required by the printer. The default is the carriage-return and new-line (CRNL) controls, 0D15 in EBCDIC.
- **Delete form feed**: Specify whether you want IP PrintWay to delete form-feed controls from the beginning and end of data sets. Consider deleting form-feed controls if your applications insert form-feed controls that result in blank pages printed at the beginning or end of data sets. By default, IP PrintWay does not delete any form-feed controls.

Other fields under the **Formatting** heading do not apply when you select the VTAM protocol.

---

**Example**

These ISPF panels show how to specify formatting values. The values on the Processing panel apply only when IP PrintWay converts line data into SCS format. Only a portion of the ISPF panels are shown.

```
Processing

SCS Conversion:
  Margins: Top . . . 6  Bottom . . 6  Left . . . 11  Right . . . 71
  Line length . . . 64  Page length . . . 64
  Tabs: Vertical . . .  --- --- --- --- (extend)
  Horizontal . .  --- --- --- --- (extend)
```

**Results:**

- 66 lines are printed on a page. The top and bottom margins contain 5 blank lines. The left and right margins contain 10 blank spaces. However, if the FCB for the data set specifies a left margin and page size value, the FCB values are used instead of the left margin and page length value shown in this example.
- IP PrintWay does not use the **Tabs** fields shown on the Processing panel. Only NetSpool uses these fields when converting SCS data streams to line data streams or PCL data streams.
Results: IP PrintWay:
• Adds 0D15 (CRNL) to the end of each line. This is the default.
• Deletes any trailing form feed controls.
• Uses the FCB if one is provided to format the data.

Converting between EBCDIC and ASCII (basic mode)

This section applies to IP PrintWay basic mode. If you run IP PrintWay extended mode, see “Converting between EBCDIC and ASCII (extended mode)” on page 192.

IP PrintWay basic mode can convert line and text data from EBCDIC to ASCII or from ASCII to EBCDIC before transmitting a data set to the remote printer. You specify in the printer definition whether you want IP PrintWay basic mode to convert data and also the conversion method you want IP PrintWay basic mode to use.

Tip: IP PrintWay basic mode does not convert data between EBCDIC and ASCII if Print Interface has allocated the data set on the JES spool or if NetSpool has converted the data stream to any format other than line data. In these cases, Print Interface or NetSpool has already converted data to the printer code page.

IP PrintWay basic mode can use one of these methods to convert data between EBCDIC and ASCII:
• The iconv utility (default method)
  The iconv utility converts data from one code page to another, from the code page used to create the document to the code page used by the printer. For more information about the iconv utility, see z/OS XL C/C++ Programming Guide. Print Interface and NetSpool also uses iconv to convert data from EBCDIC to ASCII. IBM recommends using this method because you can specify attributes in the printer definition that are suitable for both Print Interface and IP PrintWay. By default, IP PrintWay uses this method.
• TCP/IP translation tables
  For compatibility with previous releases, you can request that IP PrintWay use either the standard TCP/IP translation table supplied by IBM or a customized TCP/IP translate table created using the CONVXLAT program. For information
about using translation tables and the CONVXLAT program, see z/OS Communications Server: IP Configuration Reference.

Notes:
1. IBM does not recommend using TCP/IP translation tables because if you specify the attributes required for IP PrintWay to use the TCP/IP translation tables, you must create a separate printer definition if you want to use Print Interface to print on the same printer.
2. When you select the VTAM protocol, do not use the standard TCP/IP translation table because the standard translation table converts data from EBCDIC to ASCII.
3. When you select the VTAM protocol, IP PrintWay does not support DBCS translation tables.

Procedure for specifying attributes
The procedure you use depends on how you want IP PrintWay to convert data between EBCDIC and ASCII.

Using iconv to convert data between code pages
To use the iconv utility to convert data from the document code page to the printer code page:

- In the IP PrintWay FSS definition, specify the source code page in the Document code page field. If no code page is specified, the default is IBM-1047.
- In the IP PrintWay Options section of the printer definition, select Standard, Use FCB, or Translate only in the Formatting field. Standard is the default.
- On the Processing panel of the printer definition, specify these fields:
  - **Document code page**: Leave this field blank. IP PrintWay uses the document code page you specified in the FSS definition.
  - **Printer code page**: Specify the name of either an ASCII code page (such as ISO8859-1) or an EBCDIC code page (such as IBM-1047) that is supported by IBM. For code page names, see z/OS XL C/C++ Programming Guide.

If you leave this field blank, the default action depends on the protocol selected in the printer definition:
- VTAM or e-mail protocol: IP PrintWay does not convert data from one code page to another.
- LPR, direct sockets, or IPP protocol: IP PrintWay uses IBM-850 as the printer code page.

If you use the ISPF panels to create an IP PrintWay printer definition, the panel, by default, displays either the default ASCII or the default EBCDIC code page that is specified in the Infoprint Server configuration file, depending on the protocol selected in the printer definition:
- VTAM or e-mail protocol: The EBCDIC code page is displayed.
- LPR, direct sockets, or IPP protocol: The ASCII code page is displayed.

- Leave the **Translation data set qualifier** field blank.
- Leave the **Double-byte translate table** fields blank.

Using the standard TCP/IP translation table
To use the standard TCP/IP translation table to convert from EBCDIC to ASCII:

- In the IP PrintWay FSS definition, select the **Old-style translation** field. You do not need to select this field if you select a double-byte option in the **Double-byte translate table** field.
• On the IP PrintWay Options panel of the printer definition, in the **Formatting** field: Select **Standard**, **Use FCB**, or **Translate only**. **Standard** is the default.

• On the Processing panel, specify these fields:
  - **Document code page**: Leave this field blank.
  - **Printer code page**: Leave this field blank.

  **Tip**: When you leave this field blank, Print Interface does not translate data from one code page to another, for example from EBCDIC to ASCII. Therefore, your output might not print correctly. If you have a problem printing documents using Print Interface, create a second printer definition for this printer, and specify a printer code page or use the default ASCII code page that is displayed in this field when you use the ISPF panels to create an IP PrintWay printer definition.

  - **Translation data set qualifier**: Leave this field blank.
  - **Double-byte translate table**: To print DBCS data, select a double-byte option.

**Using a customized or a DBCS TCP/IP translation table**

To use a customized TCP/IP translation table or a DBCS TCP/IP translation table to convert data between EBCDIC and ASCII:

• On the IP PrintWay Options panel in the **Formatting** field: Select either **Standard**, **Use FCB**, or **Translate only** option. **Standard** is the default.

• On the Processing panel, specify these fields:
  - **Printer code page**: Leave this field blank.

  **Tip**: When you leave this field blank, Print Interface does not translate data from one code page to another, for example from EBCDIC to ASCII. Therefore, your output might not print correctly. If you have a problem printing documents using Print Interface, create a second printer definition for this printer, and specify a printer code page or use the default ASCII code page that is displayed in this field when you use the ISPF panels to create an IP PrintWay printer definition.

  - **Translation data set qualifier**: Specify the name of the table.
  - **Double-byte translate table**: To print DBCS data, select a double-byte option.

**Search order for TCP/IP translation tables**

IP PrintWay uses this search order to find a customized TCP/IP translation table:

1. `xlate_name.language_name`
2. `tcpip_hlq.xlate_name.language_name`
3. `tcpip_hlq.STANDARD.language_name`

   * `xlate_name`: The name in the **Translation data set qualifier** field
   * `tcpip_hlq`: The TCP/IP high-level qualifier, TCPIP by default
   * `language_name`: For single-byte data streams, `language_name` is TCPXLBIN. For double-byte data stream, `language_name` depends on the value selected in the **Double-byte translate table** field. For example, if you specify the SCHINESE option, `language_name` is TCPSCBIN.

IP PrintWay uses this search order to find a standard TCP/IP translation table:

1. `tcpip_hlq.LPR.language_name`
2. `tcpip_hlq.STANDARD.language_name`

   * `tcpip_hlq`: Specifies the TCP/IP high-level qualifier, TCPIP by default.
   * `language_name`: For single-byte data streams, `language_name` is TCPXLBIN. For
double-byte data stream, \textit{language\_name} depends on the value selected in the \textbf{Double-byte translate table} field. For example, if you specify the \texttt{SCHINESE} option, \textit{language\_name} is TCPSCBIN.

### Resubmitting documents to Print Interface for filtering (basic mode)

The IP PrintWay basic mode \textit{resubmit for filtering} option lets you transform data in any output data set that IP PrintWay selects from the JES spool. For example, this option lets you use these AFP data transforms which IBM transform products provide:

- The AFP to PCL transform, which lets you print AFP and line-data documents to PCL printers
- The AFP to PostScript transform, which lets you print AFP and line-data documents to PostScript printers
- The AFP to PDF transform, which lets you create PDF output for viewing and printing from a workstation

IP PrintWay extended mode transforms data without resubmitting data sets to Print Interface, so the \textit{resubmit for filtering} option does not apply. IP PrintWay extended mode ignores the \textit{Resubmit for filtering} field if it is selected.

Figure 5 shows the processing that occurs when you select the \textbf{Resubmit for filtering} field in a printer definition.

![Figure 5](image-url)

Figure 5. Processing when resubmit for filtering option is selected

1. IP PrintWay basic mode selects a data set from the JES spool. It selects the printer definition to use based on the parameters specified on the \texttt{OUTPUT JCL} statement. (The job submitter can specify either the \texttt{FSSDATA} parameter or the
DEST, CLASS, and FORMS parameters to select the printer definition.) IP PrintWay detects that the data set has not already been processed by Print Interface.

2. Because the **Resubmit for filtering** field is selected in the printer definition, IP PrintWay basic mode transmits the data set and its JCL parameters to Print Interface.

3. Print Interface validates that the printer supports the data format and the print options requested in the JCL parameters. Print Interface calls the transform filter (if any) associated with the input data format and writes the transformed data to a second output data set on the JES spool.

4. IP PrintWay basic mode selects the second output data set from the JES spool. If Print Interface has called a data transform, IP PrintWay transmits the data, unchanged, to the printer. Otherwise, IP PrintWay does the formatting specified in the printer definition.

5. IP PrintWay transmits the data to the remote printer.

Steps 2, 3, and 4 are done only when the **Resubmit for filtering** field is selected.

**Note:** The processing shown in Figure 5 on page 217 results in two data sets allocated on the JES spool. Therefore, do not select this option unless necessary because system performance can be adversely affected.

These considerations apply when IP PrintWay basic mode resubmits a data set to Print Interface for filtering:

- IP PrintWay writes *two* accounting records for the same data, one for the first data set transmitted to Print Interface (see step 2) and another for the second data set transmitted to the printer (see step 5). Your system programmer can write an IP PrintWay SMF exit routine to suppress one of the SMF records. For more information about the SMF accounting record, see Chapter 20, “Using accounting information in SMF type 6 records,” on page 439.

- IP PrintWay retains *both* data sets on the JES spool if you specify a retention period in the **Retention period** fields. Retention periods specified at job submission (for example, on an OUTPUT JCL statement) apply only to the first data set allocated on the JES spool.

- The Print Interface LPD must listen at port 515.

- Job submitters cannot specify the printer’s IP address, print queue name, or port number on the OUTPUT JCL statement or in an Infoprint Server job attribute. IP PrintWay ignores these values if specified at job submission and, instead, uses the values in the printer definition.

- Do not select the **Resubmit for filtering** field in the IP PrintWay default printer definition.

- JES always assigns each data set that Print Interface allocates on the JES spool to a separate JES output group. This is true even if the data set was originally in the same JES output group as other data sets when IP PrintWay first selected it from the JES spool. Therefore, when you select the **Resubmit for filtering** field, IP PrintWay cannot transmit data sets in the original JES output group together to the printer or send them in the same e-mail. These results occur:
  - Data sets in the same original JES output group might not print together or might not print in the original order, even if the **Job** or **Concatenate job** option is selected in the **Dataset grouping** field. This result is especially likely if your installation has customized the Infoprint Server Transform Manager so that it can transform more than one data set at the same time. When you
transform more than one data set at the same time, small data sets are transformed more quickly and then IP PrintWay can transmit them to the printer before larger data sets.

- Data sets in the same original JES output group are always sent in separate e-mails, even if the Concatenate job option is selected in the Dataset grouping field.
- If your installation adds a separator page only before the first data set in a JES output group, that separator page prints before each data set.

- The second sysout data set, which Print Interface allocates on the JES spool, contains the same job name, job ID, and last qualifier of the data set name as the original sysout data set on the JES spool. Therefore, the operator can use these values to find the job submitter’s data set on the JES spool.

For information about how to write IP PrintWay exit routines and configure the Print Interface LPD, see z/OS Infoprint Server Customization.

Procedure for specifying attributes

On the Processing panel, specify these fields:

- **Resubmit for filtering**: Select this field to enable the IP PrintWay basic mode transform function.

- **Data Format** and **Filter**:
  - Select the data format and specify the associated filter program to transform the data.
  - (Optional) Specify other fields used by the filters. For information about the fields to specify, see Chapter 15, “Planning printer definitions for transforms,” on page 225.

- **Validation fields**: (Optional) Specify fields that Print Interface uses to validate the print request, such as the Duplex supported field. For information about these fields, see “Validating that documents can print as requested” on page 92. By default, Print Interface does not do validation.

On the Allocation panel, specify the JES allocation parameters that Print Interface uses when it allocates data sets on the JES spool after filtering. For information about these fields, see “Specifying JES allocation parameters” on page 89. For example, be sure to specify values for the JES work-selection parameters, such as CLASS, that IP PrintWay uses to select data sets from the JES spool. (For more information about JES work-selection parameters, see z/OS Infoprint Server Customization.) In some cases, the values the job submitter specified on the OUTPUT JCL statement override the corresponding values you specify in the Allocation panel. Table 32 shows the OUTPUT JCL statement parameters that override the values on the Allocation panel.

<table>

</tbody>
</table>

1. If the CHARS parameter is not specified, the value in the UCS JCL parameter is used.
2. The COPIES parameter can also be specified on the DD JCL statement.
3. The form name can also be specified in the SYSOUT parameter on the DD statement.
4. If PAGEDEF parameter is not specified, the value in the FCB JCL parameter is used.

Example
This ISPF panel shows how to request that all line data and AFP data be transformed to PCL data using the afpxpcl.dll filter. Only a portion of the ISPF panel is shown.

```
Processing
...
Supported data formats and associated filters:
Data Format: Filter:
/ Line data  afpxpcl.dll (extend)
/ MO:DCA-P afpxpcl.dll (extend)
/ Postscript afpxpcl.dll (extend)
/ Text aopfiltr.so (extend)
/ PCL (extend)
/ PDF (extend)
/ SAP (extend)
/ XML (extend)
/ TIFF (extend)
/ JPEG (extend)
/ Other (extend)
/ Resubmit for filtering
...
Maximum document size . __________
Maximum copies..... _____
Forms supported . . . / Simplex / Duplex / Tumble
Duplex supported. . . / Simplex / Duplex / Tumble
Print-error reporting supported . / Character / Position
...
```

This ISPF panel shows how to specify the JES allocation values that Print Interface uses when it allocates the data set on the JES spool.
**Result:** Print Interface allocates data sets on the JES spool with CLASS=E and DEST=BLDG5. Print Interface uses the FORMS value specified by the job submitter on the OUTPUT JCL statement instead of std, which is specified in the FORMS field. For information about other JCL values that override values specified on this panel, see Table 32 on page 219.
Printing data without formatting (basic mode)

If you run IP PrintWay basic mode and your batch applications create output that contains ASCII text data, PCL data, PDF data, or AFP data, you must request in the printer definition that IP PrintWay basic mode transmit the data sets to the printer or e-mail destination without formatting the data. To do this, select the IP PrintWay none formatting option in the printer definition.

Tip: IP PrintWay extended mode detects the data stream and automatically sends data other than line data to the printer without formatting.

In some situations, even though IP PrintWay basic mode does not format the data, it might be necessary to translate the data stream to either ASCII or EBCDIC, depending on the requirements of the destination. In this situation, select the Translate only formatting option in the printer definition.

Select the IP PrintWay basic mode none formatting option when your batch applications create:
- ASCII text, PCL, or PDF data to be printed on an ASCII printer
- AFP, PCL, or PDF data to be sent to an e-mail destination
- PCL data to be printed on a VTAM-controlled PCL printer

Select the IP PrintWay basic mode Translate only formatting option when your batch applications create:
- ASCII text data to be mailed to an e-mail destination

In these situations, IP PrintWay can automatically determine that it should transmit the data stream unchanged to the printer. Therefore, in these cases, it ignores the IP PrintWay formatting option selected in the printer definition and automatically processes data sets as if the none formatting option were selected:
- The data stream contains a PostScript header.
- Print Interface converted the data stream to a format suitable for its destination.
- The Remote PSF option is selected on the LPR Protocol panel.
- NetSpool converted the data stream to a PCL data stream (the Convert to PCL option is selected on the NetSpool Options panel).
- The data is to be sent to a VTAM-controlled printer as transparent data (the Send as transparent field is selected on the VTAM Protocol panel).

Procedure for specifying attributes

On the IP PrintWay Options panel, specify these fields:
- **Formatting**: Select None or Translate only.
  
  When you select the None or Translate only formatting option, IP PrintWay ignores these fields:
  - Processing panel: All fields under the IP PrintWay Line-to-Text Conversion and SCS Conversion headings
  - IP PrintWay Options panel: All fields under the Formatting and Basic Mode Formatting headings (except for the Formatting field)
  - (Optional) Specify other fields such as Document header and Document trailer.

Example

This ISPF panel shows how to request that IP PrintWay not translate or format data. Only a portion of the ISPF panel is shown.
**Formatting for PostScript landscape orientation (basic mode)**

IP PrintWay basic mode can format non-PostScript data sets in the landscape orientation for printing on a PostScript printer. To request landscape orientation, you can select a landscape option in the **PostScript header** field.

IP PrintWay extended mode ignores the **PostScript header** field. For information about how to print in landscape orientation when you run IP PrintWay extended mode, see “Specifying printer commands for landscape printing” on page 202.

**Note:** IP PrintWay does not format data if Print Interface has allocated the data set on the JES spool or if NetSpool has converted the data stream to any format other than line data. In these cases, Print Interface or NetSpool formats the data. Therefore, the **PostScript header** field does not apply to these data sets.

If you select one of the landscape options in the **PostScript header** field, IP PrintWay basic mode sends this PostScript program to the printer before sending data. This program intercepts the data, formats it, and prints it. This PostScript program does not work if the data to be printed is already PostScript data.

```
614 25 translate 90 rotate .88 .76 scale
/n 1 def
/fs 10 def
/ls 11.2 def
/ld ls 2 mul def
/lt ls 3 mul def
/t 740 fs sub def
/y t def /ff t def /os 20 def
/s 512 string def
/Courier-Bold findfont
/fs scalefont setfont
/p {n {copypage} repeat erasurepage} def
/i (%stdin) (r) file def
//c i read not {p stop} if def
/c 26 eq {p stop} if
/x 20 def
/y c 43 eq {y/x os def}
{/c 32 eq {y ls sub}
{/c 48 eq {y ld sub}
{/c 45 eq {y lt sub}
{/c 49 eq {ff} {y} ifelse
/ff 0 def
/y 65 le {p/y t def} if x y moveto
/os i s readline not {p stop} if dup show
/length 0 eq {20} {20.72} ifelse def } loop
```

**Limitations:**
If you select a landscape option, do not use the same printer definition to print PostScript data sets from a batch application. If you do, an error occurs.

Do not select a landscape option when you select the e-mail protocol.

If you select a landscape option, do not specify printer commands in the Document header and Document trailer fields.

**Procedure for specifying attributes**

On the IP PrintWay Options panel, specify these fields:

- **Formatting**: Select the **Standard** option.
- **PostScript header**: Select the **Landscape** option.
Chapter 15. Planning printer definitions for transforms

Infoprint Server can work with these IBM transform products:

- IBM Print Transform from AFP to PCL for Infoprint Server for z/OS (5655-TF2)
- IBM Print Transform from AFP to PDF for Infoprint Server for z/OS (5655-TF1)
- IBM Print Transform from AFP to PostScript for Infoprint Server for z/OS (5655-TF3)
- IBM Infoprint Transforms to AFP for z/OS (5655-N60)
- IBM Infoprint XT Extender for z/OS (5655-J65)

Infoprint Server can work with these IBM transform products, but they are no longer orderable:

- IBM Infoprint Transform for AFP to HP PCL for z/OS (5655-P19)
- IBM Infoprint Transform for AFP to Adobe PDF for z/OS (5655-P20)
- IBM Infoprint Transform for AFP to Adobe PostScript for z/OS (5655-P21)

Infoprint Server can work with these Ricoh products:
- InfoPrint Transform Manager for Linux
- InfoPrint Manager for AIX
- InfoPrint Manager for Windows

The topics in this section describe how to direct Infoprint Server to automatically call an Infoprint transform before writing documents to the JES spool or sending them to the printer.

Using transform filters

To transform data automatically, you specify a transform filter in the printer definition. A transform filter is a program that transforms the input data to another data format.

You can specify a different filter for each input data format that Infoprint Server supports: line data, JPEG, MO:DCA-P, PCL, PDF, PostScript, SAP, TIFF, XML, text, and other. After Infoprint Server detects the input data format of a document, it calls the transform filter that you associated with that data format.

Table 33 lists the transform products and the name of the transform filters that you can specify in the printer definition.

<table>
<thead>
<tr>
<th>Transform product</th>
<th>Transform</th>
<th>Transform filter</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBM Print Transform from AFP to PCL for Infoprint Server for z/OS</td>
<td>AFP to PCL</td>
<td>afpxpcl.dll</td>
</tr>
<tr>
<td>IBM Print Transform from AFP to PDF for Infoprint Server for z/OS</td>
<td>AFP to PDF</td>
<td>afpxpdf.dll</td>
</tr>
<tr>
<td>IBM Print Transform from AFP to PostScript for Infoprint Server for z/OS</td>
<td>AFP to PostScript</td>
<td>afpxps.dll</td>
</tr>
</tbody>
</table>
Table 33. Infoprint transforms and filter names (continued)

<table>
<thead>
<tr>
<th>Transform product</th>
<th>Transform</th>
<th>Transform filter</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBM Infoprint Transform for AFP to HP PCL for z/OS</td>
<td>AFP to PCL</td>
<td>afp2pcl.dll</td>
</tr>
<tr>
<td>IBM Infoprint Transform for AFP to Adobe PDF for z/OS</td>
<td>AFP to PDF</td>
<td>afp2pdf.dll</td>
</tr>
<tr>
<td>IBM Infoprint Transform for AFP to Adobe PostScript for z/OS</td>
<td>AFP to PostScript</td>
<td>afp2ps.dll</td>
</tr>
<tr>
<td>IBM Infoprint Transforms to AFP for z/OS</td>
<td>PCL to AFP</td>
<td>pcl2afp.dll</td>
</tr>
<tr>
<td></td>
<td>PDF to AFP</td>
<td>ps2afp.dll</td>
</tr>
<tr>
<td></td>
<td>PostScript to AFP</td>
<td></td>
</tr>
<tr>
<td></td>
<td>SAP to AFP</td>
<td>sap2afp.dll</td>
</tr>
<tr>
<td>IBM Infoprint XT Extender for z/OS</td>
<td>Xerox to AFP</td>
<td>x2afp.dll</td>
</tr>
<tr>
<td>InfoPrint Transform Manager for Linux</td>
<td>All transforms</td>
<td>aoprf.so</td>
</tr>
<tr>
<td>InfoPrint Manager for AIX</td>
<td>PCL to AFP</td>
<td>aoprf.dll</td>
</tr>
<tr>
<td>InfoPrint Manager for Windows</td>
<td>PDF to AFP</td>
<td></td>
</tr>
<tr>
<td></td>
<td>PostScript to AFP</td>
<td></td>
</tr>
</tbody>
</table>

Notes:
1. The ps2afp.dll filter transforms both PDF and PostScript data to AFP format.
2. Infoprint Server provides filters aoprf.so and aoprf.dll. Transform products provide the other transform filters.

A filter can accept options, which control processing of the transform. Table 34 summarizes the options that you can specify for each transform filter.

Table 34. Transform filter options

<table>
<thead>
<tr>
<th>Filter</th>
<th>Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>aoprf.so</td>
<td>[%filter-options] [%xf-options] [-xf &quot;transformattributes&quot;]... [option ...]</td>
</tr>
<tr>
<td>All other filters</td>
<td>[%filter-options] [option ...]</td>
</tr>
</tbody>
</table>

Filter options for the aoprf.dll filter

You can specify these filter options for the aoprf.dll filter:

%filter-options

Causes any options that a job submitter specified in the filter-options job attribute to be passed directly to the transform.

You can type %filter-options in any position relative to other filter options. If you specify any options to the right of %filter-options, those options override the same options that were specified in the filter-options job attribute, with the exception of any options that are cumulative.

-a imagetype

The type of AFP data stream image that the transform generates for each page in the PCL, PostScript, or PDF file. Valid values are:
fs45  IOCA color FS45 images. Specify this value for color printers such as the InfoPrint Color 1454 or 1464 printer. Specify this value only for the PostScript and PDF data formats.

im1  IM1 image. This type of image is not compressed.

io1  IOCA image. This type of image is not compressed.

io1-g4  Compressed Image Object Content Architecture (IOCA) image in Modified Telecommunication Standardization Sector (TSS) T.6 G4 Facsimile Coding Scheme (G4 MMR) format. This is the recommended output type because it takes up less space on the hard disk, and it prints faster.

Tips:
1. Some older AFP printers do not support printing with an image type of io1-g4. For these printers, specify an image type of io1-mmr because it is the compressed image type supported by these printers. This image type results in faster printing than uncompressed image types.
2. TSS was formerly the International Telegraph and Telephone Consultative Committee (CCITT).

io1-mmr  Compressed IOCA image in Modified Modified Read (MMR) format.

-l length  This option is passed directly to the InfoPrint Manager transform daemon. For the values you can specify, see the ps2afp or pcl2afp command description in InfoPrint Manager: Reference.

-P  The TCP/IP port number on the AIX or Windows system at which the transform daemon is receiving data. Consult the AIX or Windows administrator for the correct value to specify. If you omit this option, the default port for the type of input data is used. Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>8251</td>
<td>The default port number for the PostScript and PDF data formats.</td>
</tr>
<tr>
<td>8253</td>
<td>The default port number for the PCL data format.</td>
</tr>
<tr>
<td>924 - nnnn</td>
<td>Any valid port number greater than or equal to 924 at which the transform daemon is receiving data.</td>
</tr>
</tbody>
</table>

-p pagerange  This option is passed directly to the InfoPrint Manager transform daemon. For the values you can specify, see the ps2afp or pcl2afp command description in InfoPrint Manager: Reference.

-q transformattributes  When you select the FS45 image output (~a fs45), you can specify these transform attributes and values. For a detailed description of these attributes and values, see InfoPrint Manager: Reference.

color-profile={euroscale | none | swop}  Specifies the color profile that the transform is to use. The default value is none. You can also specify these synonyms:

<table>
<thead>
<tr>
<th>Value</th>
<th>Synonym:</th>
</tr>
</thead>
</table>

euroscale Euroscale
swop SWOP

color-rendering-intent={relative | perceptual}
Specifies how the transform is to process shades that the color printer
cannot reproduce exactly. The default value is relative.

color-toner-saver={ no | yes}
Specifies whether the transform is to reduce the amount of color toner
used by the printer. The default value is no. You can also specify these
synonyms:

<table>
<thead>
<tr>
<th>Value</th>
<th>Synonym:</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>false</td>
</tr>
<tr>
<td>yes</td>
<td>true</td>
</tr>
</tbody>
</table>

presentation-object-container-extraction-mode={ignore | inline}
Specifies how the transform generates presentation object container
resources in the output stream. The default value is ignore.

Rules:
• Specify attributes in this format: attribute=value.
• If you specify more than one attribute, separate the attributes with a
  space.
• Do not abbreviate the attribute names and values.
• Use the exact uppercase and lowercase letters for the attribute and
  values.
• If the -q value contains spaces, enclose the entire value in single or
double quotation marks.
• You can specify the -q option multiple times. If you specify the same
  attribute multiple times, the last value specified for the attribute is used.

-r resolution
This option is passed directly to the InfoPrint Manager transform daemon.
For the values you can specify, see the ps2afp or pcl2afp command
description in InfoPrint Manager: Reference.

-t outputtype
Determines the type of output to generate.
Valid values are:

document
Printable document. This is the default value.

overlay
Graphic image that can be printed on each page of a printable
document.

pagesegment
Graphic image that can be embedded in a printable document.

Tip: When you generate overlays or page segments from
multiple-page documents, the user might want to use the -g
or -p option to select pages. Otherwise, one overlay or page
segment is created for each page of the input file.

-w width
This option is passed directly to the InfoPrint Manager transform daemon.
For the values you can specify, see the `ps2afp` or `pcl2afp` command description in *InfoPrint Manager: Reference*.

-x xoffset
This option is passed directly to the InfoPrint Manager transform daemon. For the values you can specify, see the *ps2afp* or *pcl2afp* command description in *InfoPrint Manager: Reference*.

-y yoffset
This option is passed directly to the InfoPrint Manager transform daemon. For the values you can specify, see the *ps2afp* or *pcl2afp* command description in *InfoPrint Manager: Reference*.

-xf ipaddress
The host name or dotted decimal address of the AIX or Windows system on which the transform daemon is running. This is a required option. For example, 9.99.9.23 or AIX4.

You can specify the IP address in the dotted-decimal format. If the AIX or Windows system has an IPv6 address, you must specify its host name instead of its colon-hexadecimal format address.

Tip: InfoPrint Manager transforms, by default, create 32K records. To limit the maximum AFP record length to 8K bytes, the InfoPrint Manager administrator must add this statement to the InfoPrint Manager configuration file for the transform (for example, configuration file `ps2afpd.cfg`):

```
pragma=AFPDSRECORDLENGTH=8000
```

Filter options for the aoprfxf.so filter

You can specify these filter options for the *aoprfxf.so* filter:

-xf "transformattributes"
In this option, you can specify one or more of these transform attributes:

- fail-on-datastream-error=yes | no
- output-format=pdf | modca-p
- trailer-error-page=yes | no
- transform-id=transform_ID

For a description of these transform attributes see [z/OS Infoprint Server User’s Guide](#)
Rules:

• Specify attributes in this format: attribute=value.
• If you specify more than one attribute, separate the attributes with a space.
• You can abbreviate the attribute names and values.
• Use the exact uppercase and lowercase letters for the attribute and values.
• If the -xf value contains any spaces, enclose the entire value in single or double quotation marks.
• You can specify the -xf option multiple times. If you specify the same attribute multiple times, the last value specified for the attribute is used.

Examples:

aoprxf.so -xf "fail-on-datastream-error = yes"
aoprxf.so -xf "fail-on-datastream-error=yes trailer-error-page=no"
aoprxf.so -xf fail-on-datastream-error=yes -xf trailer-error-page=no

Tip:

Infoprint Server does not check the syntax of these options. It passes them directly to the transform.

Filter options for other transform filters

You can specify these filter options for transform filters pcl2afp.dll, ps2afp.dll, sap2afp.dll, afp2pcl.dll, afp2ps.dll, afpxpcl.dll, afpxps.dll, afpxpdf.dll, and x2afp.dll.

%filter-options

Causes any options that a job submitter specified in the filter-options job attribute to be passed directly to the transform.

You can type %filter-options in any position relative to other filter options. If you specify transform options to the right of %filter-options, those options override the same options that were specified in the filter-options.
job attribute, with the exception of any options that are cumulative. If an option is cumulative, the transform applies all occurrences of the option.

**option** Any option that the transform accepts. Separate multiple options with a space. For information about the transform options, see:

- [IBM Print Transforms from AFP for Infoprint Server for z/OS](#)
- [IBM Infoprint Transforms from AFP for z/OS](#)
- [IBM Infoprint Transforms to AFP for z/OS](#)
- [IBM Infoprint XT Extender for z/OS](#)

Tip: Infoprint Server does not check the syntax of these options. It passes them directly to the transform.

**Procedure for specifying attributes**

On the Processing panel, specify these fields:

- **Data format** field: Select the format of the input document to which the filter applies.
- **Filter** field: Specify the name of the filter followed by any filter options. Type the absolute pathname if the filter is not in a directory named in the LIBPATH environment variable specified in the `aopstart` EXEC and the `/etc/profile` file.
- **Resubmit for filtering** field: Select this field if you run IP PrintWay basic mode and want to transform documents submitted from batch applications. This field does not apply to IP PrintWay extended mode. For more information about this field, see "Resubmitting documents to Print Interface for filtering (basic mode)" on page 217.

**Tips:**

1. If you plan to specify the same filters in several printer definitions, consider creating a Processing component. Then include the Processing component in each printer definition. For example, you could create one Processing component for all PSF printer definitions. In that component, specify the transforms that convert data to AFP format.

2. If you specify a filter in a component, you **must** erase (space over) any filters that are specified in the Processing section of the printer definition itself. If any filters are specified in the printer definition itself, the filters specified in the component are not used.

**Example 1. Specifying the aoprfx.so filter for transforms to AFP**

This ISPF panel shows how to specify the aoprfx.so filter to use transforms to AFP that InfoPrint Transform Manager for Linux provides. Only a portion of the Processing panel is shown.
Supported data formats and associated filters:

Data format: Filter:

<table>
<thead>
<tr>
<th>Data format</th>
<th>Filter</th>
</tr>
</thead>
<tbody>
<tr>
<td>/ Line data</td>
<td>(extend)</td>
</tr>
<tr>
<td>MO:DCA-P</td>
<td>(extend)</td>
</tr>
<tr>
<td>PostScript</td>
<td>aprxf.so -a FS45 -l 297m -w 210m -r 240 %filter-options %xf-options (extend)</td>
</tr>
<tr>
<td>Text</td>
<td>(extend)</td>
</tr>
<tr>
<td>PCL</td>
<td>aprxf.so -a IO1_G4 -l 297m -w 210m -r 240 %filter-options (extend)</td>
</tr>
<tr>
<td>PDF</td>
<td>aprxf.so -a FS45 -l 297m -w 210m -r 240 %filter-options (extend)</td>
</tr>
<tr>
<td>SAP</td>
<td>(extend)</td>
</tr>
<tr>
<td>XML</td>
<td>(extend)</td>
</tr>
<tr>
<td>TIFF</td>
<td>aprxf.so -a FS45 -l 297m -w 210m -r 240 %filter-options %xf-options (extend)</td>
</tr>
<tr>
<td>JPEG</td>
<td>aprxf.so -a FS45 -l 297m -w 210m -r 240 %filter-options %xf-options (extend)</td>
</tr>
<tr>
<td>Other</td>
<td>(extend)</td>
</tr>
</tbody>
</table>

- Resubmit for filtering

**Tip:** To enter more characters than can fit on the line, move the cursor to “extend” and press Enter. On the Extended Field panel, type all the characters. Do not end a line that continues to the next line with a blank character. Be sure to press Enter and check your text before you exit the Extended Field panel.

---

**Explanation of fields:**

- The selected data formats are suitable for AFP printers that PSF controls:
  - **Line data**, **MO:DCA-P**, and **XML** are selected because PSF can accept these data formats. No filter is required.
  - **Text** is selected because Infoprint Server automatically converts text data into line data when the printer definition is a PSF printer definition. No filter is required.
  - **PostScript**, **PCL**, **PDF**, **TIFF**, and **JPEG** are selected because InfoPrint Transform Manager for Linux transforms can transform these data formats to AFP format.

- The **-a**, **-l**, **-r**, and **-w** options are passed directly to InfoPrint Transform Manager for Linux.

- **%filter-options** causes the transforms to use any transform options that the job submitter specifies in the **filter-options** job attribute. Because **%filter-options** is specified to the right of the transform options (**-a**, **-l**, **-r**, **-w**), the job submitter can override these transform options.

- **%xf-options** causes the transforms to use any transform attributes, such as **trailer-error-page**, that the job submitter specifies in the **xf-options** job attribute.

- **Resubmit for filtering** is not selected because this field does not apply to a PSF printer definition. However, you should select this field in an IP PrintWay printer definition if you run IP PrintWay basic mode.
Example 2. Specifying the aoprxf.so filter for the AFP to PDF transform

This ISPF panel shows how to specify the aoprxf.so filter to use the AFP to PDF transform that InfoPrint Transform Manager for Linux provides. Only a portion of the Processing panel is shown.

Tip: To enter more characters than can fit on the line, move the cursor to “extend” and press Enter. On the Extended Field panel, type all the characters. Do not end a line that continues to the next line with a blank character. Be sure to press Enter and check your text before you exit the Extended Field panel.

Explanation of fields:

- The selected data formats are suitable for a printer or e-mail destination that accepts PDF format:
  - **MO:DCA-P** is selected because the AFP to PDF transform can transform MO:DCA-P data to PDF format. The AFP to PDF transform that InfoPrint Transform Manager for Linux provides cannot transform line data; therefore, the **Line data** format is not selected.
  - **PDF** is selected. No filter is specified because documents in PDF format do not need to be transformed.
- **%filter-options** causes the transform to use any transform options that the job submitter specifies in the **filter-options** job attribute.
- **%xf-options** causes the transform to use any transform attributes that the job submitter specifies in the **xf-options** job attribute.
- The **-xf** option specifies PDF as the output format. This option is required to use the AFP to PDF transform.
Example 3. Specifying the aoprform.dll filter

This ISPF panel shows how to specify the aoprform.dll transform filter to use transforms that InfoPrint Transform Manager for AIX or Windows provides. Only a portion of the Processing panel is shown.

```
Supported Data Formats and Associated Filters:
Data format: Filter:
/ Line data ______________________________________________________ (extend)
/ MO:DCA-P ______________________________________________________ (extend)
/ PostScript aoprform.dll %filter-options -r 300 sys4 (extend)
/ Text ______________________________________________________ (extend)
/ PCL aoprform.dll %filter-options -r 300 sys4 (extend)
/ PDF aoprform.dll %filter-options -r 300 sys4 (extend)
/ SAP ______________________________________________________ (extend)
/ XML ______________________________________________________ (extend)
/ TIFF ______________________________________________________ (extend)
/ JPEG ______________________________________________________ (extend)
/ Other ______________________________________________________ (extend)
```

Explanation of fields:

- The selected data formats are suitable for AFP printers that PSF controls:
  - **Line data**, **MO:DCA-P**, and **XML** are selected because PSF can accept these data formats. No filter is required.
  - **Text** is selected because Infoprint Server automatically converts text data into line data when the printer definition is a PSF printer definition. No filter is required.
  - **PostScript**, **PCL**, and **PDF** are selected because InfoPrint Manager transforms can transform these data formats to AFP format.
- **%filter-options** causes the transforms to use any options that the job submitter specifies in the **filter-options** job attribute. Because **%filter-options** is specified to the left of the **-r** transform option, the job submitter cannot override this option.
- The **-r** option specifies the resolution of the output. This option is passed to the InfoPrint Manager transform daemon.
- **sys4** causes the aoprform.dll filter to pass the data to be transformed to the system with host name sys4.
- **Resubmit for filtering** is not selected because this field does not apply to a PSF printer definition. However, you should select this field in an IP PrintWay printer definition if you run IP PrintWay basic mode.
Chapter 16. Planning PSF FSS and FSA definitions

PSF FSS and FSA definitions in the Printer Inventory contain configuration information that PSF for z/OS or the AFP Download plus feature of PSF can use. In addition, PSF FSA definitions contain information that Infoprint Central uses.

Tip: In Infoprint Central, a “PSF printer” can refer to an AFP printer or to an AFP Download Plus sender.

You can create these definitions in the Printer Inventory:

• An FSS definition for each PSF functional subsystem (FSS)
• An FSA definition for each PSF functional subsystem application (FSA)

You must create PSF FSS and FSA definitions in these cases:

• You want to specify PSF configuration information in the Printer Inventory
• You want to use Infoprint Central to work with PSF printers

These topics describe how to specify information in PSF FSA definitions that Infoprint Central uses. For information about how to specify PSF configuration information, see:

• PSF for z/OS: Customization
• PSF for z/OS: AFP Download Plus

Tip: If you want to submit print requests through Print Interface or NetSpool, you must also create printer definitions in the Printer Inventory. If you do not plan to submit print jobs using Print Interface or NetSpool, it is not necessary to create printer definitions.

Specifying the FSA name, description, and location

You must specify the FSA name. In addition, you can specify a description and a location for the PSF printer or AFP Download Plus receiver.

FSA name: The FSA name must match the FSA name in the JES initialization statement.

Description: The description is a search criterion on the Infoprint Server ISPF panels. To make searching easier, consider using all lowercase or uppercase letters because the ISPF panels can only do case-sensitive searches.

Location: The location is a search criterion on the Infoprint Server ISPF panels and in Infoprint Central. The location can also help Infoprint Central users direct service personnel to the printer if it requires service. Follow these guidelines:

• Infoprint Central can do case-sensitive or case-insensitive searches. However, ISPF panels only do case-sensitive searches. Therefore, to make searching easier, consider using all lowercase or uppercase letters.
• Infoprint Central users can specify location information to find a PSF printer. They can specify either the exact location information or the first few characters of the location. Therefore, use a format that lets users find printers more easily. For example, if you use this format, Infoprint Central users can find all printers in the (1) city, (2) city/building, or (3) city/building/office:
Procedure for specifying attributes

On the PSF FSA panel, specify these fields:

- **FSA name**: Specify the same FSA name as specified in the JES initialization statement for the FSA.
- **Description**: Specify a 1 – 256 character description, including any letters, numbers, special characters, and blanks.
- **Location**: Specify a 1 – 256 character location, including any letters, numbers, special characters, and blanks.

**Example**
This ISPF screen shows how to specify the FSA name, a description of the printer, and the printer’s location.

![PSF FSA, TCP/IP](image)

**Setting up operator security for the printer**

If your security administrator created a RACF profile to control who is authorized to use Infoprint Central to display information about and do actions on the PSF printer, specify the name of this RACF profile in the FSA definition.

**Tips:**
1. You can specify the name of the profile before it is defined to RACF. If you specify a profile name that is not defined to RACF, Infoprint Central proceeds as if the user has the required access to the profile.
2. If the same RACF profile applies to a group of IP PrintWay and PSF printers, specify the same profile name in the PSF FSA definitions and IP PrintWay printer definitions for all the printers in the group.
3. You can use the Infoprint Server ISPF panels or the Printer Inventory Definition Utility (PIDU) to specify the RACF profile name. If you want to specify the same RACF profile in many PSF FSA printer definitions, it is easier to use the PIDU program. See “Example 2. Using PIDU to specify the profile name” on page 237.

**Related information:** For information about how to define RACF profiles in the PRINTSRV class to protect PSF printers, see [z/OS Infoprint Server Customization](#).
Example 2. Using PIDU to specify the profile name
This example shows how to specify the name of a RACF profile in all PSF FSA definitions for TCP/IP-attached printers that do not already have a profile.

1. Enter these commands as one command on the z/OS UNIX command line:

   ```
   pidu -qc "list fsa where fsa-type=psf-tcpip and operator-security-profile=null;" | awk '{print "modify fsa " $1 " operator-security-profile="PRINTERS.DENVER";"}' > /tmp/defs
   ```

   The `list` command lists the names of all PSF FSA definitions for TCP/IP-attached printers with no value in the `operator-security-profile` attribute. These names are piped to the `awk` program, which writes `modify` commands to modify the `operator-security-profile` attribute.

2. Inspect the `/tmp/defs` file to make sure the `modify` commands are acceptable.

3. Enter this command to update the Printer Inventory:

   ```
   pidu < /tmp/defs
   ```
Chapter 17. Defining NetSpool printer LUs to VTAM

To define a NetSpool printer LU to VTAM, do these tasks:

- Select NetSpool printer LU names.
- Create VTAM APPL statements for each NetSpool LU name.
- Define resources in VTAM applications.

In addition to defining the NetSpool LU names to VTAM, you must specify the NetSpool LU names in the printer definitions for the target printers. In the printer definitions, you also specify other printer attributes used by NetSpool. For information, see Chapter 13, “Planning printer and printer pool definitions for NetSpool,” on page 111.

Selecting NetSpool printer LU names

Each installation determines how many NetSpool printer logical units (LUs) to define. A sample configuration might be to define one NetSpool printer LU to replace each SNA-network printer in your installation. Alternatively, you could define a greater or fewer number of NetSpool logical printers than you have SNA-network printers.

Each NetSpool printer LU is identified with an 1 to 8 character alphanumeric name. You specify this LU name in the printer definitions and in the application-program LU name you use to define the NetSpool printer LU to VTAM.

When you name logical printers, you can do one of these without changing the primary LU (PLU) resource definitions of your VTAM applications:

- Assign NetSpool logical-printer names that are the same as the printer names currently defined in the resource definitions of the VTAM applications. For example, if the printer LU name used by a VTAM application is IMSPR001, the NetSpool LU name could be IMSPR001.
- Assign NetSpool logical-printer names that are different from the printer names used by the VTAM application. You might want to do this to make the NetSpool LU names more meaningful to your operators. For example, if the printer LU name used by your VTAM application is IMSPR001, the NetSpool LU name could be LUPRT001.

You map the old and new names to each other in the VTAM APPL statements that define the logical printers to VTAM, as described in the ACBNAME parameter in Creating APPL statements for NetSpool printer LUs” on page 240.

In either of these two cases, because only one set of VTAM definitions with the same names can be known to VTAM at a time, you must do one of these:

- Remove the VTAM LU statements for the SNA-network printers.
- Deactivate the major node containing the VTAM LU statements before activating the logical-printer LUs with the same name.

This means that other VTAM applications cannot communicate with the SNA-network printers at the same time NetSpool is running.

Note: If other VTAM applications still need to communicate with the SNA-network printers at the same time NetSpool is running, you must assign new PLU names in the resource definitions of the VTAM applications.
using NetSpool. Use the new printer names as the NetSpool logical-printer names and also as the application-program LU names when you define the logical printers to VTAM.

**Naming considerations for IMS/CICS users of telnet**

In IMS or CICS subsystems, applications receive communication services from terminal-management functions of subsystems. Thus, the IMS programmer thinks of a device as an LTERM, and the CICS programmer thinks of a device as a TCTTE entry.

Many IMS and CICS applications have algorithms that derive LTERM or TCTTE names for printers by doing some hashing technique on the input LTERM or TCTTE names. If NetSpool is used with Telnet, this creates problems because Telnet assigns the input LU name (and thereby the LTERM or TCTTE name) arbitrarily from a pool of LU names. If this type of algorithm is in use in your installation, and you are using Telnet, IBM recommends that you use the IP-LU mapping feature of Telnet. This feature enables you to specify the input LU name rather than having it randomly selected from a pool. This would, in turn, permit the application to select the LU name for the printer. See the LUMAP statement described in [z/OS Communications Server: IP Configuration Reference](#).

**Creating APPL statements for NetSpool printer LUs**

NetSpool runs as a VTAM application program, maintaining separate LU-LU sessions for each NetSpool printer LU. Each LU-LU session is between:

- A primary LU, which is the VTAM application that initiates the VTAM session and sends print requests
- A secondary LU, which is the NetSpool printer LU

You must create a VTAM APPL definition statement in the SYS1.VTAMLST data set for each NetSpool printer LU. Create the APPL statement in a new or existing application major node definition. Figure 6 shows two sample APPL statements under a major node named NETSPOOL.

```plaintext
NETSPOOL VBUILD TYPE=APPL *
  LUPRT001 APPL MODETAB=ISTINCLM,DLOGMOD=S3270,EAS=1,SESSLIM=YES
  IMSPR002 APPL ACBNAME=LUPRT002,MODETAB=ISTINCLM,DLOGMOD=SCS,EAS=1,SESSLIM=YES
```

*Figure 6. Sample APPL statements for NetSpool LUs*

The parameters on the APPL statement are:

- **statement-name**
  Specifies the secondary LU name used by VTAM applications to establish a VTAM session. If this name does not match the NetSpool LU name specified in the printer definition, the ACBNAME parameter must match the LU name in the printer definition. Specify one to eight alphanumeric characters. In this example, the names are: LUPRT001 and IMSPR002.

- **ACBNAME=lu-name**
  Specifies the NetSpool LU name. This name must match the LU name specified in the printer definition.

  This parameter is optional. If you omit it, the default is the name specified as the `statement-name`. 
If the LU name in the printer definition matches the statement-name, IBM recommends that you omit the ACBNAME parameter and let it default, as shown in the first APPL statement in Figure 6 on page 240.

If the LU name in the printer definition does not match the name in statement-name, which is the secondary LU name, you must specify the same LU name as in the printer definition in this parameter, as shown in the second APPL statement in Figure 6 on page 240.

MODETAB=table-name
Specifies the name of a VTAM logon mode table to be used to associate each logon mode entry-name with a set of session parameters. If not specified, the default name is ISTINCLM.

DLOGMOD=entry-name
Specifies the name of an entry in the VTAM logon mode table that contains session parameters to be used when the primary LU does not provide other parameters. If this entry is used to establish the session parameters, this entry must specify correct LU type, FM profile, and TS profile parameters, as shown in Table 35 on page 242. If not specified, the default is the first entry in the VTAM logon mode table specified in the MODETAB parameter.

Note: The entry-name must be in the VTAM logon mode table named in the MODETAB parameter or in the default table named ISTINCLM.

EAS=1
Specifies the number of active sessions for this printer. Always specify 1.

SESSLIM=YES
Specify YES to allow VTAM to queue pending sessions for the secondary LU, if the secondary LU already has an active session with another primary LU.

PARSESS=NO
Specifies that multiple sessions are not allowed. PARSESS=NO is the default, so it is not shown in the example.

Note: Do not code any APPC-related keywords.

For more information about the APPL statement, see z/OS Communications Server: SNA Resource Definition Reference.

If the APPL statement name or the ACBNAME name is the same as the LU name of an SNA-network printer, either remove the LU definitions for the SNA-network printers or deactivate the major node containing those LU statements.

---

**Defining resources for VTAM applications**

The resource definitions for your VTAM applications, such as CICS or IMS, must comply with these requirements:

- A printer defined in the resource definition must contain a network name that matches the APPL statement name.
- The session parameters (BIND parameters) established for the printer must be valid, as shown in Table 35 on page 242
If you are using CICS, you must specify QUERY=NO on the TYPETERM macro for the printers.

For information about defining resources, see the IMS or CICS information related to resource definitions.

### Specifying correct BIND parameters

The VTAM BIND request that the VTAM application, the primary LU, sends to establish a session with a NetSpool printer LU, the secondary LU, must result in correct BIND parameters. That is:

- The LU type must be consistent with the type of print data to be sent during the session.
- The FM Profile and TS Profile values must be valid for that LU type.
- The presentation space must not exceed the maximum size.

Table 35 shows the valid combinations of the BIND parameters.

<table>
<thead>
<tr>
<th>Data type</th>
<th>LU type</th>
<th>FM profile</th>
<th>TS profile</th>
<th>Presentation space</th>
</tr>
</thead>
<tbody>
<tr>
<td>3270 data</td>
<td>LU 0</td>
<td>2</td>
<td>2</td>
<td>Maximum is 16384 bytes</td>
</tr>
<tr>
<td>3270 data</td>
<td>LU 3</td>
<td>3</td>
<td>3</td>
<td>Maximum is 16384 bytes</td>
</tr>
<tr>
<td>SNA character</td>
<td>LU 1</td>
<td>3 or 4</td>
<td>3 or 4</td>
<td></td>
</tr>
<tr>
<td>string (SCS) data</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

VTAM applications that establish sessions with NetSpool printer LUs can either use the BIND parameters in the logon mode table entry referred to in the APPL statement for the NetSpool printer LU, or the applications can override the BIND parameters, using their own resource definitions. In either case, the BIND parameters must be correct.

In most cases, CICS and IMS subsystems override the BIND parameters associated with the NetSpool printer LU with BIND parameters that are consistent with the type of data in the print requests. However, in one case, when an IMS application sends a BIND request, and the NetSpool printer LU logical printer is defined in IMS as a non-SNA 3270 device, IMS uses the BIND parameters specified for the NetSpool printer LU, without any changes. Therefore, in this instance, the BIND parameters for the NetSpool printer LU must be correct for a 3270 data stream, as shown in Table 35.
Chapter 18. Using ISPF panels to manage the Printer Inventory

These topics describe how to use Infoprint Server ISPF panels to manage entries in the Printer Inventory. You can use ISPF panels to add, list, browse, copy, edit, and delete printer definitions, components, printer pool definitions, FSA definitions, FSS definitions, and job selection rules.

You can also use the Printer Inventory Definition Utility (PIDU) to manage entries in the Printer Inventory. The PIDU program can be useful for creating a large number of entries in the Printer Inventory. Also, you can use the PIDU program to create a backup copy of the Printer Inventory (see the export command). For information, see Chapter 19, “Using the PIDU program to manage the Printer Inventory,” on page 263.

For examples of some of the Infoprint Server ISPF panels, see Appendix B, “ISPF panels,” on page 455.

When the Printer Inventory Manager is started, it creates the Printer Inventory files if they do not already exist in directory /var/Printsrv or in the directory specified in the base-directory statement of the Infoprint Server configuration file aopd.conf. To view the Printer Inventory files, use either the Infoprint Server ISPF panels or the PIDU program.

Starting the ISPF session and configuring the panels

Before using the Infoprint Server ISPF panels, Infoprint Server must be started. The Printer Inventory Manager daemon, aopd, must be active. For more information, see “Starting Infoprint Server with the aopstart command” on page 6.

You must have authority to the AOP.ADMINISTRATOR profile in the RACF PRINTSRV class:
- READ access is required to browse objects in the Printer Inventory.
- UPDATE access is required to add or edit objects in the Printer Inventory.

If the AOP.ADMINISTRATOR profile does not exist, READ access to the AOPADMIN profile in the RACF FACILITY class is required to do any actions. For more information about how to establish security for the Printer Inventory, see z/OS Infoprint Server Customization.

Displaying Infoprint Server panels in Japanese

The ISPF panels are available in English and Japanese. To view Japanese panels:
- Define the code page to your 3270 emulator as IBM-939.
- When you start ISPF, enter: ISPF Japanese.
- Define the terminal type as 3270KN on the ISPF Settings panel.

Customizing CUA attributes for ISPF fields

Before you start using the Infoprint Server panels, you might want to customize your CUA (common user access) settings for ISPF fields. When you customize CUA settings, values that are specified in components can be displayed in a different color from other values on the panels. This lets you quickly distinguish
between values that are specified in components and custom values (that is, values specified in a printer definition itself) on those ISPF panels that display both types of values.

To customize your ISPF CUA settings:
1. On the ISPF Settings panel, select Colors from the action bar and then select CUA attributes.

2. Change an attribute, such as color, for Choice Entry fields so that it is different from the attribute for Normal Entry fields. Values from components are displayed with the attributes selected for Choice Entry fields, while other values are displayed with the attributes selected for the Normal Entry fields.

Displaying the main Infoprint Server panel
To display the main Infoprint Server panel:
1. On the ISPF Primary panel, select the OS/390® System option.

2. On the z/OS System Programmer Primary Option panel, select the Infoprint Server option. The first panel is called the Infoprint Server: Printer Inventory Manager panel. If the z/OS System Programmer Primary Option panel does not contain the Infoprint Server option, ask your system programmer to customize your ISPF environment, as described in z/OS Infoprint Server Customization.

3. Before you use the panels for the first time, check the panel configuration. On the Infoprint Server: Printer Inventory Manager panel, select 7 Configure and press Enter.

4. On the Configuration panel, fill in the fields to configure your panels. Your system programmer can change the default values that appear on this panel in file AOPINIT, as described in z/OS Infoprint Server Customization. Use the ISPF online help for information about each field. To save the new settings and exit the panel, press the END function key.

Defining an Infoprint Server default printer definition
You can specify the name of a printer definition to be used as the default printer by the lp and lpstat commands and by the Print Interface subsystem. The default name is lp1.

The PRINTER and LPDEST environment variables override the default printer definition name for the lp command.

To specify a default printer definition:
1. On the Infoprint Server: Printer Inventory Manager panel, select 7 Configure and press Enter.
2. On the Configuration panel, fill in the **Default printer** field and press the END function key.

3. Add a printer definition with that name. For information, see “Adding a printer definition.”

---

**Managing printer definitions**

This section describes how to use the Infoprint Server ISPF panels to manage printer definitions. For information about how to specify attributes in a printer definition for the components of Infoprint Server that you plan to use, see:

- Chapter 12, “Planning printer definitions for Print Interface,” on page 89
- Chapter 13, “Planning printer and printer pool definitions for NetSpool,” on page 111
- Chapter 14, “Planning printer definitions for IP PrintWay,” on page 141
- Chapter 15, “Planning printer definitions for transforms,” on page 225

**Adding a printer definition**

You can add a printer definition as described in this section.

**Tip:** It is more efficient to add a printer definition by copying an existing printer definition of the same type. For information, see “Copying a printer definition” on page 248.

To add a printer definition:

1. On the Infoprint Server: Printer Inventory Manager panel, select **1 Add** and press Enter.

2. On the Choose a Definition Type and Protocol panel, select the type of printer definition and press Enter. Types are: IP PrintWay, PSF, and General. If the type is IP PrintWay, also select the type of transmission protocol (LPR, direct sockets, IPP, VTAM, or e-mail). Depending on selected type and protocol, different ISPF panels are displayed. For information about the types of printer definitions, see “Selecting the type of printer definition” on page 77.

3. On the IP PrintWay Printer Definition panel, the PSF Printer Definition panel, or the General Printer Definition panel:

   a. Fill in the printer definition name and other fields on this panel. To display online help information about how to use components and how to specify custom values, place the cursor on the command line and press the HELP function key. To display help information about each field, place the cursor on the input area of the field and press the HELP function key.

   To fill in the fields for each section of the printer definition (for example, the Allocation section), you can do one of these:

   - Select a component that contains the attributes you want. To do this, place the cursor on the **Component Name** field for the section and press Enter. On the Component List panel, select the component name from the list and press Enter. If a component doesn’t exist, create the component on the Component List panel.
Note: Before you can save a printer definition that includes a component, all included components must exist in the Printer Inventory.

- Fill in the fields in each section directly in this printer definition. To do this, place the cursor on the **Custom Values** field for the section and press Enter. On the next panel, fill in the fields and press the END function key to return to the Printer Definition panel. The fields you fill in are not saved in the inventory until you press the END function key from the Printer Definition panel.

- Select a component, but also specify some fields directly in the printer definition. To do this, first select a component and then place the cursor on the **Custom Values** field and press Enter. On the next panel, the values specified in the component are displayed in blue. If you specify a different value for a field, this value overrides the value in the component.

For a list of the required and optional fields for NetSpool, IP PrintWay, and Print Interface, see table Appendix A, “Printer attribute tables,” on page 443.

From this panel, you can also create and manage all of the components for the different sections of the printer definition. To do this, place the cursor on the **Component Name** field for the section and press Enter. For more information, see “Managing components” on page 251.

b. If you want to validate the fields before you save the printer definition, press Enter.

c. To save the new definition but keep the panel on the screen, type SAVE on the command line and press Enter.

tip: Type SAVE on the command line to easily add more than one printer definition of the same type.

d. To save the new definition and exit the panel, press the END function key.

---

### Adding multiple printer definitions

To add more than one printer definition of the same type (IP PrintWay, PSF, or General) at the same time:

1. Follow the instructions described in “Adding a printer definition” on page 245 or “Copying a printer definition” on page 248, and fill in the fields for the first printer definition.

2. To save the printer definition, type SAVE on the command line and press Enter. The printer definition panel remains on your screen. You can type SAVE from any of the printer definition panels.

3. Fill in the fields for the second printer definition. Specify a new printer definition name and change any other values.

**Tip:** You do not need to return to the main printer definition panel to change the name of the printer definition. Specify the new name in the **Printer definition name** field that is displayed at the top of each printer definition panel.
4. Type SAVE on the command line to save the second printer definition, and repeat these steps.

Tip: You can also use the Printer Inventory Definition Utility (PIDU) program to add many printer definitions at one time. First use the ISPF panels to create one printer definition of the desired type and protocol. Then use the PIDU export command to generate a PIDU create command for that printer definition. Replicate and edit the create command to create other printer definitions. For detailed information and examples, see Chapter 19, “Using the PIDU program to manage the Printer Inventory,” on page 263.

Listing printer definitions

You must display a list of printer definitions before you can browse, copy, edit, delete, or change the type of a printer definition. You can list all printer definitions, or you can select the printer definitions you want to list.

Listing all printer definitions

To display a list of all printer definitions:

1. On the Infoprint Server: Printer Inventory Manager panel, select 2 List and press Enter.

2. On the Printer Definition List panel, you can type one of the actions to do the other functions described in this section. Press the END function key to exit the list. Press Enter at any time to obtain a current list.

Listing selected printer definitions

You can select printer definitions based on one or more of these criteria. Printer definitions are listed if they meet all of the criteria you specify.

- Name of the printer definition
- Type of printer definition: IP PrintWay, PSF, or General
- Type of data formats the printer supports
- Location of the printer
- Destination associated with the printer definition
- Class associated with the printer definition
- Forms name associated with the printer definition
- Destination node associated with the printer definition
- Logical unit name for the printer definition
- Host name or IP address of the printer

To display a list of selected printer definitions:

1. On the Infoprint Server: Printer Inventory Manager panel, select 3 Select and press Enter.

2. On the Select Printer Definitions panel, type values in one or more fields to specify selection criteria and press Enter. The online help for each field tells you how to use an * or ? to represent one or more variable characters.
3. On the Printer Definition List panel, you can type an action in front of one or more printer definitions and press Enter. Press Enter at any time to obtain a current list.

4. Press the END function key to exit the list.

Tip: To list all printer definitions that use a particular component, see “Listing printer definitions that include a component” on page 252.

Browsing a printer definition

When you browse a printer definition, you can view fields but you cannot change any of them. To browse the printer definition:

1. List the printer definition that you want to browse, as described in “Listing printer definitions” on page 247.

2. On the Printer Definition List panel, type B in the A column in front of the printer definition you want to browse and press Enter.

3. On the Printer Definition panel:
   a. To view a component that is named in the printer definition, place the cursor on the component name and press Enter.
   b. To view all of the attributes for this printer definition, including the attributes specified in the component (if one is named in the Component Name field), place the cursor on the Custom Values field and press Enter.
   c. To return to the Printer Definition List panel, press the END function key.

Copying a printer definition

To add a new printer definition, you can copy an existing definition and modify fields in the definition as necessary. To make sure that the correct fields are displayed on the ISPF panels, be sure to copy the same type of printer definition (IP PrintWay, PSF, or General) as the one you want to add. If the printer definition is an IP PrintWay printer definition, also be sure to copy a printer definition that uses the same protocol (LPR, direct sockets, IPP, VTAM, or e-mail) as the one you want to add.

When you copy a printer definition, you can change any field. However, you must change the Printer Name field.

To copy a printer definition:

1. List the printer definition you want to copy, as described in “Listing printer definitions” on page 247.

2. On the Printer Definition List panel, type C in the A column in front of the printer definition you want to copy and press Enter.

3. On the Printer Definition panel:
a. Change the **Printer Name** field and any other field. To validate the fields, press Enter.

b. To save the new printer definition, but maintain the panel on the screen, type `SAVE` on the command line and press Enter. You can now add additional printer definitions. To save the new definition and return to the Printer Definition List panel, press the END function key.

**Tip:** Type `SAVE` on the command line to easily add more than one printer definition of the same type.

c. To save the new definition and exit the panel, press the END function key.

---

**Editing a printer definition**

When you edit a printer definition, you can edit any field. Changes you make generally take effect for the next data set that NetSpool and Print Interface allocate on the JES spool and the next data set that IP PrintWay selects from the JES spool. Changes you make to a printer definition do not affect data sets in the process of being allocated on the JES spool or data sets retained on the JES spool after successful or failed transmission.

Changes to the NetSpool end-of-file rules and NetSpool LU class, however, are related to the VTAM session and do not take effect for the next data set allocated on the JES spool. For information about when changes to these fields take effect, see “Specifying how NetSpool determines end-of-file” on page 130 and “Grouping NetSpool printer LUs into LU classes” on page 112.

If you change the name of a printer definition, the name is automatically changed in any printer pool definition that lists the printer definition.

**Tip:** To change the protocol type in an IP PrintWay printer definition, see “Changing the type of a printer definition or the IP PrintWay protocol type” on page 250.

To edit a printer definition:

1. List the printer definition you want to edit, as described in “Listing printer definitions” on page 247.

2. On the Printer Definition List panel, type **E** in the **A** column in front of the printer definition whose fields you want to edit, and press Enter.

3. On the Printer Definition panel:
   a. Change any field on the panels. To validate the fields, press Enter.
   b. To save the printer definition but maintain the panel on the screen, type `SAVE` on the command line and press Enter. To save the printer definition and return to the Printer Definition List panel, press the END function key.
Deleting a printer definition

When you delete a printer definition, the printer definition is removed from the Printer Inventory. If a printer pool definition contains the printer definition, the printer definition is automatically removed from the printer pool definition. To delete a printer definition:

1. List the printer definition you want to delete, as described in "Listing printer definitions" on page 247.

2. On the Printer Definition List panel, type D in the A column in front of the printer definition you want to delete and press Enter.

3. On the Confirm Delete panel, press Enter to delete the printer definition. Press the END function key to cancel the delete request.

Changing the type of a printer definition or the IP PrintWay protocol type

Do these steps to change the type of the printer definition or to change the type of protocol that IP PrintWay uses to transmit data to the printer. The printer definition types are: IP PrintWay, PSF, or General. The IP PrintWay protocol types are: LPR, direct sockets, IPP, VTAM, and e-mail.

1. List the printer definition you want to change, as described in "Listing printer definitions" on page 247.

2. On the Printer Definition List panel, type X in the A column in front of the printer definition you want to change and press Enter.

3. On the Choose a Definition Type and Protocol panel, select the printer definition type and the protocol type. Press Enter.

4. If you selected an IP PrintWay type, the Protocol panel is displayed. On the Protocol panel, specify the required fields for the type of protocol and save the printer definition.
   Before you save the printer definition, make sure that these fields are correct on the Processing panel:
   • **Printer code page**: For the LPR, direct sockets, and IPP protocols, specify an ASCII code page. For the VTAM and e-mail protocols, specify an EBCDIC code page.
   • **Filter field for the Text data format**: For the LPR, direct sockets, and IPP protocols, specify either the *aopfiltr.so* or *lpd_compat.so* filter. For the VTAM and e-mail protocols, do not specify either of these filters.

5. If you selected either PSF or General type, the Printer Definition List panel is displayed. If you need to edit any fields in the printer definition, type E in the A column in front of the printer definition. If you changed the type from IP PrintWay to either PSF or General, make sure that these fields are correct on the Processing panel:
• **Printer code page**: Specify an EBCDIC code page.
• **Filter field for the Text data format**: Do not specify the `aopfилтр.so` filter.

---

**Testing a printer definition**

The ISPF panels check the validity of many of the values you specify in the fields of a printer definition. However, to check the validity of all fields (for example, to verify the IP address of the remote printer) print a file to the printer named in the printer definition. If IP PrintWay finds an error, it sends a message to the IP PrintWay message log. If NetSpool finds an error, it sends a message to the NetSpool message log if one exists.

If you have configured data transforms, print data of each format to the printer definition.

---

**Managing components**

This section describes how to use Infoprint Server ISPF panels to manage components. A component contains attributes that are common to several printer definitions. You can define one or more components for each section of a printer definition, such as the Allocation section and the Processing section. For more information about components and when you might want to create them, see "Including components in printer definitions" on page 81.

For information about how to customize your ISPF settings so that values that you specify in components are displayed in different colors on ISPF panels, see "Customizing CUA attributes for ISPF fields" on page 243.

---

**Listing components**

You must obtain a list of components before you can add, copy, edit, rename, or delete a component. To obtain a list of components:

1. Add, edit, or copy any printer definition, as described in "Adding a printer definition" on page 245, "Copying a printer definition" on page 248 or "Editing a printer definition" on page 249.

2. On the Printer Definition panel:
   a. If you are adding a printer definition, specify a printer definition name.
   b. Place the cursor on the **Component Name** field for one section of the printer definition, for example, the Allocation section, and press Enter.

3. The Component List panel displays all of the components for the section. On this panel, you can type an action in the **A** column to do the other functions described in this section. Press the END function key to return to the Printer Definition panel.

4. Type CANCEL on the command line of the Printer Definition panel, unless you want to add, edit, or copy the printer definition.
Adding a component

You can add a component of a printer definition as described in this section.

Tip: It is more efficient to add a component by copying an existing component of the same type. For information, see "Copying a component" on page 253.

To add a component:
1. List the components for the section of the printer definition, for example, the Allocation section, as described in "Listing components" on page 251.
2. On the Component List panel, type `add` on the command line and press Enter.
3. On the next panel:
   a. Type a component name in the **Component name** field. The components for the same section must have unique names. However, components for different sections can have the same name. For example, an Allocation component and a Processing component can have the same name.
   b. Specify any other attributes. You can leave blank the fields that you want to specify in the printer definitions that include this component. In the printer definitions that include the component, you can override any attributes specified in the component and you can specify attributes that are left blank in the component. To validate the fields, press Enter.
   c. To save the new component but keep the panel on the screen, type `SAVE` on the command line and press Enter. To save the new component and return to the Component List panel, press the END function key.
   Tip: Type `SAVE` on the command line to easily add more than one component of the same type.
   d. To save the new component and exit the panel, press the END function key.

Listing printer definitions that include a component

To list the printer definitions that include a particular component:
1. List the components for the section of the printer definition, as described in "Listing components" on page 251.
2. On the Component List panel, type `P` in the A column in front of the component name and press Enter.
3. The Printer Definition List panel displays a list of printer definitions that include the component. On this panel, you can add, edit, browse, copy, those printer definitions. Press the END function key to return to the Component List panel.
**Browsing a component**

When you browse a component, you can view fields but you cannot change any of them. To browse any component:

1. List the components for the section of the printer definition as described in "Listing components" on page 251.

2. On the Component List panel, type B in the Action column next to the components you want to browse and press Enter.

3. The next panel displays the component. Press the END function key to return to the Component List panel.

**Copying a component**

You can add a new component by copying an existing component to a new component and changing the name and any other fields. Because the components for each section of a printer definition, for example the Allocation section, contain different fields, be sure to copy the correct type of component.

To copy a component:

1. List the components for the section of the printer definition as described in "Listing components" on page 251.

2. On the Component List panel, type C in the Action column in front of the component you want to copy and press Enter.

3. On the next panel:
   a. Change the **Component Name** field and any other field. To validate the fields, press Enter.
   b. To save the new component, but keep the panel on the screen, type SAVE on the command line and press Enter. To save the new definition and return to the Component List panel, press the END function key.

   **Tip:** Type SAVE on the command line to easily add more than one component of the same type.
   c. To save the new component and exit the panel, press the END function key.

**Editing a component**

When you edit a component, you can edit any field. The changes you make take effect for all printer definitions that include that component. Therefore, before editing a component, you might want to list the printer definitions that include the component.

If you change the name of a component, the component name is automatically changed in all printer definitions and printer pool definitions that include that component.
To edit a component:

1. List the components for the section of the printer definition as described in “Listing components” on page 251.

2. On the Component List panel, type E in the A column in front of the components you want to edit and press Enter.

3. On the next panel:
   a. Change any field on the panels. To validate the fields, press Enter.
   b. To save the component, but keep the panel on the screen, typeSAVE on the command line and press Enter. To save the component and return to the Component List panel, press the END function key.
   c. To save the component and exit the panel, press the END function key.

Renaming a component

To rename a component and also change the component name in all printer definitions and printer pool definitions that include the component:

1. List the components for the section of the printer definition as described in “Listing components” on page 251.

2. On the Component List panel, type R in the A column in front of the component you want to rename and press Enter.

3. On the Enter the New Component Name panel, type the new name and press Enter. Press the END function key to cancel the rename request.

Deleting a component

You can delete a component only if no printer definitions or printer pool definitions include that component. You can use the procedure described in “Listing printer definitions that include a component” on page 252 to determine whether any printer definition include the component to be deleted.

To delete a component:

1. List components as described in “Listing components” on page 251.

2. On the Component List panel, type D in the A column in front of the components you want to delete and press Enter.

3. On the Confirm Delete panel, press Enter to delete the component, or press the END function key to cancel the delete request.
Managing printer pool definitions

This section describes how to use the Infoprint Server ISPF panels to manage printer pool definitions. A printer pool definition is used by NetSpool to broadcast data to several printer definitions. For more information about printer pool definitions and when you might want to create them, see “Planning printer pool definitions” on page 85.

Adding a printer pool definition

You can add a printer pool definition as described in this section.

Before you add a printer pool definition, create the printer definitions for the printers in the pool, if necessary.

To add a printer pool definition:

1. On the Infoprint Server: Printer Inventory Manager panel, select 4 Other Definitions and press Enter.

2. On the FSA, FSS, Pool, and Job Selection Rule Management panel, select 7 Add and press Enter.

3. On the Printer Pool panel:
   a. To display online help information about how to use the panel, place the cursor on the command line and press the HELP function key. To display help information about each field, place the cursor on the input area of each field and press the HELP function key.
   b. Fill in the LU name field and the Printer definition names fields. To select printer definitions one at a time from a list, place the cursor on the word list and press Enter.

      If a printer definition does not exist, you can create it from the list panel.

      Before you can save a printer pool definition, all printer definitions listed in the printer pool definition must exist in the Printer Inventory.

      The order in which printer definition names are listed is significant.

      NetSpool uses formatting attributes in the printer definition that you list first.

   c. Other fields on the Printer Pool panel are optional. For more information about which fields to specify in printer pool definitions, see “Broadcasting data using multiple printer definitions” on page 134.
   d. To validate the fields before you save the printer pool definition, press Enter.
   e. To save the new definition but keep the panel on the screen, type SAVE on the command line and press Enter.
   f. To save the new definition and exit the panel, press the END function key.

Listing printer pool definitions

You must display a list of printer pool definitions before you can browse, copy, edit, or delete a printer pool definition. You can list all printer pool definitions, or you can select the printer pool definitions you want to list.
Listing all printer pool definitions
To display a list of all printer pool definitions:
1. On the Infoprint Server: Printer Inventory Manager panel, select 4 Other Definitions and press Enter.

2. On the FSA, FSS, Pool, and Job Selection Rule Management panel, select 8 List and press Enter.

3. On the Pool List panel, you can type one of the actions to do the other functions described in this section. Press the END function key to exit the list. Press Enter at any time to obtain a current list.

Listing selected printer pool definitions
You can select printer pool definitions based on one or more of these criteria. Printer pool definitions are listed if they meet all of the criteria you specify.
• Name of the printer pool definition
• NetSpool logical-unit (LU) name
• Description of the printer pool definition
• LU class
• NetSpool End-of-File component name
• Names of printer definitions in the pool

To display a list of selected printer pool definitions:
1. On the Infoprint Server: Printer Inventory Manager panel, select 4 Other Definitions and press Enter.

2. On the FSA, FSS, Pool, and Job Selection Rule Management panel, select 9 Select and press Enter.

3. On the Select Pool panel, type values in one or more fields to specify selection criteria and press Enter. The online help for each field tells you how to use an * or ? to represent one or more variable characters.

4. On the Pool List panel, you can type an action in front of one or more printer definitions and press Enter. Press Enter at any time to obtain a current list.

5. Press the END function key to exit the list.

Browsing, copying, editing, and deleting a printer pool definition
To browse, copy, edit, or delete the printer pool definition:
1. List the printer definition that you want to work with, as described in “Listing printer pool definitions” on page 255.
2. On the Pool List panel, type B, C, E, or D in the A column in front of the printer pool definition you want to work with and press Enter.

3. To return to the Pool List panel, press the END function key.

Managing FSS definitions

This section describes how to use the Infoprint Server ISPF panels to manage FSS (functional subsystem) definitions. For more information about FSS definitions and when you might want to create them, see “Planning FSS definitions” on page 85.

Adding an FSS definition

You can add an FSS definition as described in this section.

Tip: It is more efficient to add an FSS definition by copying an existing FSS definition of the same type. For information, see “Browsing, copying, editing, and deleting an FSS definition” on page 258.

To add an FSS definition:

1. On the Infoprint Server: Printer Inventory Manager panel, select 4 Other Definitions and press Enter.

2. On the FSA, FSS, Pool, and Job Selection Rule Management panel, select 4 Add.

3. On the Choose an FSS type to add panel, select the type of FSS definition and press Enter. Types are: IP PrintWay and PSF. Depending on the type you select, different ISPF panels are displayed.

4. On the IP PrintWay FSS panel or the PSF FSS panel:
   a. Fill in the FSS name and other fields on this panel. The FSS name must match the name of the FSS as defined to JES. To display online help information, place the cursor on the command line and press the HELP function key. To display help information about each field, place the cursor on the input area of the field and press the HELP function key.
   b. To validate the fields before you save the FSS definition, press Enter.
   c. To save the new definition but keep the panel on the screen, type SAVE on the command line and press Enter.

      Tip: Type SAVE on the command line to easily add more than one FSS definition of the same type.

   d. To save the new definition and exit the panel, press the END function key.

Tip: If you have already created some FSS definitions, you can add a new FSS definition by typing A in the A column on the FSS Definition List panel. For more information, see “Listing FSS definitions” on page 258.
Listing FSS definitions
You must display a list of FSS definitions before you can browse, copy, edit, or delete an FSS definition. You can list all FSS definitions, or you can select the FSS definitions you want to list.

Listing all FSS definitions
To display a list of all FSS definitions:
1. On the Infoprint Server: Printer Inventory Manager panel, select 4 Other Definitions and press Enter.

2. On the FSA, FSS, Pool, and Job Selection Rule Management panel, select 5 List and press Enter.

3. On the FSS List panel, you can type one of the actions to do the other functions described in this section. Press the END function key to exit the list. Press Enter at any time to obtain a current list.

Listing selected FSS definitions
You can select FSS definitions to list based on one or more of these criteria. FSS definitions are listed if they meet all of the criteria you specify.
- FSS name
- Description of the FSS definition
- Type of FSS definition: IP PrintWay or PSF

To display a list of selected FSS definitions:
1. On the Infoprint Server: Printer Inventory Manager panel, select 4 Other Definitions and press Enter.

2. On the FSA, FSS, Pool, and Job Selection Rule Management panel, select 6 Select and press Enter.

3. On the FSS Select panel, type values in one or more fields to specify selection criteria and press Enter. The online help for each field tells you how to use an * or ? to represent one or more variable characters.

4. On the FSS List panel, you can type an action in front of one or more printer definitions and press Enter. Press Enter at any time to obtain a current list.

5. Press the END function key to exit the list.

Browsing, copying, editing, and deleting an FSS definition
To browse, copy, edit, or delete a FSS definition:
1. List the FSS definition that you want to work with, as described in "Listing FSS definitions."
2. On the FSS List panel, type B, C, E, or D in the A column in front of the FSS definition you want to work with and press Enter.

3. To return to the FSS List panel, press the END function key.

Managing FSA definitions

This section describes how to use the Infoprint Server ISPF panels to manage FSA (functional subsystem application) definitions. For more information about FSA definitions and when you might want to create them, see “Planning FSA definitions” on page 87.

Adding an FSA definition

You can add an FSA definition as described in this section.

Tip: It is more efficient to add an FSA definition by copying an existing FSA definition of the same type. For information, see “Browsing, copying, editing, and deleting an FSA definition” on page 260.

To add an FSA definition:

1. On the Infoprint Server: Printer Inventory Manager panel, select 4 Other Definitions and press Enter.

2. On the FSA, FSS, Pool, and Job Selection Rule Management panel, select 1 Add.

3. On the Choose an FSA type to add panel, select the type of FSA definition and press Enter. Types are: IP PrintWay, PSF channel, PSF SNA, PSF TCP/IP, and AFP Download Plus. Depending on the type you select, different ISPF panels are displayed.

4. On the IP PrintWay FSA panel or the PSF FSA panel:
   a. Fill in the FSA name and other fields on this panel. The FSA name must match the name of the FSA as defined to JES. To display online help information, place the cursor on the command line and press the HELP function key. To display help information about each field, place the cursor on the input area of the field and press the HELP function key.
   b. To validate the fields before you save the FSA definition, press Enter.
   c. To save the new definition but keep the panel on the screen, type SAVE on the command line and press Enter.

   Tip: Type SAVE on the command line to easily add more than one FSA definition of the same type.

   d. To save the new definition and exit the panel, press the END function key.

Tip: If you have already created some FSA definitions, you can add a new FSA definition by typing A in the A column on the FSA Definition List panel. For more information, see “Listing FSA definitions” on page 260.
Listing FSA definitions
You must display a list of FSA definitions before you can browse, copy, edit, or delete an FSA definition. You can list all FSA definitions, or you can select the FSA definitions you want to list.

Listing all FSA definitions
To display a list of all FSA definitions:
1. On the Infoprint Server: Printer Inventory Manager panel, select 4 Other Definitions and press Enter.

2. On the FSA, FSS, Pool, and Job Selection Rule Management panel, select 2 List and press Enter.

3. On the FSA List panel, you can type one of the actions to do the other functions described in this section. Press the END function key to exit the list. Press Enter at any time to obtain a current list.

Listing selected FSA definitions
You can select FSA definitions to list based on one or more of these criteria. FSA definitions are listed if they meet all of the criteria you specify.
- FSA name
- Description of the FSA definition
- Type of FSA definition: IP PrintWay, PSF channel, PSF SNA, PSF TCP/IP, or PSF AFP Download Plus.

To display a list of selected FSA definitions:
1. On the Infoprint Server: Printer Inventory Manager panel, select 4 Other Definitions and press Enter.

2. On the FSA, FSS, Pool, and Job Selection Rule Management panel, select 3 Select and press Enter.

3. On the FSA Select panel, type values in one or more fields to specify selection criteria and press Enter. The online help for each field tells you how to use an * or ? to represent one or more variable characters.

4. On the FSA List panel, you can type an action in front of one or more printer definitions and press Enter. Press Enter at any time to obtain a current list.

5. Press the END function key to exit the list.

Browsing, copying, editing, and deleting an FSA definition
To browse, copy, edit, or delete a FSA definition:
1. List the FSA definition that you want to work with, as described in “Listing FSS definitions” on page 258.

2. On the FSA List panel, type B, C, E, or D in the A column in front of the FSA definition you want to work with and press Enter.

3. To return to the FSA List panel, press the END function key.

Note: When you edit values in an FSA definition, you need to restart the IP PrintWay FSA or PSF printer for your changes to take effect.

Managing job selection rules

This section describes how to use the Infoprint Server ISPF panels to manage job selection rules. Job selection rules apply only to IP PrintWay extended mode.

For detailed information about how to set up and use job selection rules, see z/OS Infoprint Server Customization.

Adding a job selection rule

You can add a job selection rule as described in this section.

Tip: It is more efficient to add a job selection rule by copying an existing job selection rule. For information, see “Browsing, copying, editing, and deleting a job selection rule” on page 262.

To add a job selection rule:

1. On the Infoprint Server: Printer Inventory Manager panel, select 4 Other Definitions and press Enter.

2. On the FSA, FSS, Pool, and Job Selection Rule Management panel, select 10 Add.

3. On the Job Selection Rule panel:
   a. Fill in the Rule name and other fields on this panel. To display online help information, place the cursor on the command line and press the HELP function key. To display help information about each field, place the cursor on the input area of the field and press the HELP function key.
   b. To validate the fields before you save the job selection rule, press Enter.
   c. To save the new job selection rule but keep the panel on the screen, type SAVE on the command line and press Enter.
   d. To save the new job selection rule and exit the panel, press the END function key.

Tip: Type SAVE on the command line to easily add more than one job selection rule.
Tip: If you have already created some job selection rules, you can add a new job selection rule by typing A in the A column on the Job Selection Rule List panel. For more information, see “Listing job selection rules.”

Listing job selection rules

You must display a list of job selection rules before you can browse, copy, edit, or delete a job selection rule.

To display a list of all job selection rules:
1. On the Infoprint Server: Printer Inventory Manager panel, select 4 Other Definitions and press Enter.
2. On the FSA, FSS, Pool, and Job Selection Rule Management panel, select 11 List and press Enter.
3. On the Job Selection Rule List panel, you can type one of the actions to do the other functions described in this section. Press the END function key to exit the list. Press Enter at any time to obtain a current list.

Browsing, copying, editing, and deleting a job selection rule

To browse, copy, edit, or delete a job selection rule:
1. List the job selection rule that you want to work with, as described in “Listing job selection rules.”
2. On the Job Selection Rule List panel, type B, C, E, or D in the A column in front of the job selection rule you want to work with and press Enter.
3. To return to the Job Selection Rule List panel, press the END function key.
Chapter 19. Using the PIDU program to manage the Printer Inventory

These topics describe how to use the Printer Inventory Definition Utility (PIDU) program to manage objects in the Printer Inventory. Inventory objects include printer definitions, printer pool definitions, components, FSS definitions, FSA definitions, and job selection rules.

The PIDU program is useful for creating and editing many objects at the same time. Also, it lets you do some functions that you cannot do with Infoprint Server ISPF panels. For example, you can export or dump objects in the Printer Inventory to a file, and you can do more powerful searches of the Printer Inventory.

Before you start:
- Ask your operator to start the Printer Inventory Manager daemon aopd.
- Ask your security administrator for the required authorization. You must (1) have a UID of 0 or be a member of the AOPADMIN group and (2) have access to the AOP.ADMINISTRATOR resource profile in the RACF PRINTSRV class:
  - READ access is required to display, dump, export, or list objects in the Printer Inventory
  - UPDATE access is required to create, delete, force-create, modify, or rename objects in the Printer Inventory

If the AOP.ADMINISTRATOR profile does not exist in the PRINTSRV class, READ access to the AOPADMIN profile in the FACILITY class is required to do any functions.

Running the PIDU program

You can run the PIDU program in two ways:
- From the z/OS UNIX shell using the pidu command. See "Running the PIDU program using the pidu command."
- As a batch job. See "Running the PIDU program as a batch job" on page 266.

Running the PIDU program using the pidu command

Format
pidu [-qv] [-c "command; ..."]... [filename]...

Description
The pidu command lets you specify one or more of the PIDU commands shown in Table 36 on page 268 to manage objects in the Printer Inventory. You can specify PIDU commands in the -c option or in a file. The pidu command writes a report of errors to standard error (stderr) and writes informational messages and command output to standard output (stdout).

Options
- -c 'command; ...'
- -c "command; ..."

Specifies one or more PIDU commands. Enclose the commands in single or double quotation marks, and end each statement with a
semicolon. If a command contains a value that requires single quotation marks, such as a hexadecimal value, enclose the commands in double quotation marks. You can repeat the -c option.

If you do not specify the -c option or the name of a file, pidu reads the commands from standard input (stdin), which can be either keyboard data or output from another command.

You can specify these PIDU commands:
* create
* delete
* display
* display-fully
* dump
* export
* force-create
* list
* modify
* rename

For detailed information about these commands, see “PIDU commands” on page 268.

-q  Suppresses informational messages that the pidu command writes to stdout.

-v  Writes the name of the Printer Inventory to stderr. Also provides additional informational messages.

Operands

filename  The name of a UNIX file or sequential MVS data set that contains the commands. You can repeat this option.

If the data set is an MVS data set, specify // before the file name. If you specify a fully-qualified data set name, also enclose the data set name in single quotation marks and specify a backslash before each single quotation mark. For example, if the output file is named USERID.MYFILE, enter:

//’USERID.MYFILE’

If you want your TSO user ID prefixed to the data set name, specify:

//MYFILE

To specify commands from stdin, omit the file name and the -c option.

Usage notes

- You can specify PIDU commands interactively from your keyboard. For an example, see “Entering PIDU commands interactively” on page 265.
- When you specify PIDU commands in a UNIX file (such as a z/FS file) or an MVS data set:
  - Start comments with a pound sign (#).
  - Include blank lines if desired.
  - You can specify the PIDU command names, attribute names, and attribute values on separate lines.
In a UNIX file, an attribute value can span lines provided that all lines other than the last line end with a backslash. Be sure that no blank characters are present after the backslash. For example:

```
attribute1 = 'A very, very, very long \
value'
```

In an MVS data set, the entire attribute value must be on one line. To specify a very long attribute value, allocate a data set that has a logical record length of 255 (LRECL=255) and a variable blocked record format (RECFM=VB). Then specify the entire value on one line. For example:

```
attribute1 = 'A very, very, very long value'
```

Examples -- pidu

**Entering PIDU commands interactively:** To enter one or more PIDU commands interactively from your keyboard:

1. On the z/OS UNIX command line, type `pidu` and press Enter.

   _______________________________________________________

2. Type a PIDU command and press Enter. For example, to create a printer definition, type:

   ```
   create printer lp1 description="Default printer"
   location="Printer room" printer-type=ip-printway dcf-routing=yes
   destination=LPI printer-ip-address=printer1.boulder luname=LUPRT001
   lu-classes=[2] include-allocation=printway
   include-processing = pcl_printer include-printway-options=pcl_land_l7cpi
   include-netspool-eof-rules=bracket include-netspool-options=pcl
   include-protocol=lpr_options ;
   ```

   For an explanation of this ```create``` command, see "Creating an IP PrintWay printer definition for a PCL printer with LPR protocol" on page 275.

   _______________________________________________________

3. After the command is processed, type another command and press Enter. For example, to display the attributes of the printer definition just created, enter:

   ```
   display printer lp1;
   ```

   _______________________________________________________

4. After the command is processed, use **Ctrl-D** or type **exit** to end the `pidu` command.

   _______________________________________________________

**Specifying PIDU commands on the command line:** To specify two PIDU list commands with the `-c` option, enter:

```
pidu -c "list printer; list printer-pool;"
```

**Specifying PIDU commands in a file:** To specify a UNIX file named `pidu.commands` that contains PIDU commands, enter:

```
pidu pidu.commands
```

To specify a fully-qualified MVS data set named `MARY.PIDU.CMDS`, enter:

```
pidu //\'MARY.PIDU.CMDS\'
```

To prefix your TSO user ID to the data set name, enter:

```
pidu //PIDU.CMDS
```
File *pidu.commands* (or data set PIDU.CMDS) contains the PIDU commands. For example:

```sh
create printer lp1 description="Default printer"
location="Printer room" printer-type=ip-printway dcf-routing = yes destination=LP1
printer-ip-address=printer1.boulder luname = LUPRT001 lu-classes={ 2 }
include-allocation=printway include-processing=pcl_printer
include-printway-options=pcl_land_17cpi include-netspool-options=pcl
include-netspool-eof-rules=bracket include-protocol=lpr_options
list printer; # List all printer definitions
```

**Specifying PIDU commands with hexadecimal values:** To specify a PIDU create command containing the line-termination attribute, enter:

```
pidu -c "create printer lp2 line-termination=X'0D25';"
```

**Environment variables**

- **AOPCONF**: Names the Infoprint Server configuration file. The file named in this variable takes precedence over the user-specific configuration file ($HOME/.aopconf) and the system default configuration file (/etc/Printsrv/aopd.conf).

- **LIBPATH**: The path used to locate dynamic link libraries (DLL).

- **NLSPATH**: Lists the directory where the Infoprint Server message catalogs are located.

- **PATH**: Lists the directory where the Infoprint Server executables are located.

**Files**

- **$HOME/.aopconf**: Contains the user-specific Infoprint Server configuration file. This file takes precedence over /etc/Printsrv/aopd.conf.

- **/etc/Printsrv/aopd.conf**: The default Infoprint Server configuration file. This file is optional.

**Exit values**

- **0**: The PIDU commands were done successfully.

- **>0**: An error occurred that prevented one or more PIDU commands from being done successfully.

**Running the PIDU program as a batch job**

You can run the PIDU program as a batch job from TSO by using the AOPBATCH or BPXBATCH program. This section describes how to use the AOPBATCH program because the AOPBATCH program sets default environment variables that the PIDU program requires.

**Using AOPBATCH to run the PIDU program**

You can invoke AOPBATCH in JCL with this EXEC statement:

```sh
//stepname EXEC PGM=AOPBATCH,PARM='pidu [-v] [-q]
```

- **-q**: Suppresses informational messages that the *pidu* command writes to the output data set named in the STDOUT DD statement.

- **-v**: Writes the name of the Printer Inventory to the output data set named in the STDERR DD statement. Also provides additional informational messages.

You can specify these DD statements:
STDENV Specifies environment variables used by the PIDU program. You can specify the environment variables either in-stream or in a UNIX file or MVS data set. For the environment variables used by the PIDU program, see “Environment variables” on page 266. When you use AOPBATCH, you need to specify the PATH, LIBPATH, and NLSPATH environment variables only if your installation did not install Infoprint Server files in the default directories. Specify the AOPCONF environment variable if the Infoprint Server configuration file is not in /etc/Printsrv/aopd.conf or in $HOME/aopconf. Specify the environment variables in the format variable = value.

STDERR Specifies a SYSOUT data set, a UNIX file, or an MVS data set. The PIDU program writes error messages to this file or data set.

STDIN Specifies PIDU commands in-stream or names a UNIX file or MVS data set that contains the commands.

Tip: If any attribute value is greater than 80 characters, you cannot specify the PIDU commands in-stream because an attribute value cannot span lines and the SYSIN DD * statement lets you specify a maximum of 80 characters on one line. Instead, specify the PIDU commands in an MVS data set that has a logical record length (LRECL) of 255 and a variable blocked (VB) blocksize (BLKSIZE).

STDOUT Specifies a SYSOUT data set, a UNIX file, or an MVS data set. The PIDU program writes its output and informational messages to this file or data set.

IBM provides sample JCL in the AOPPIDU member of SYS1.SAMPLIB for running the PIDU program using the AOPBATCH utility. Figure 7 shows member AOPPIDU.

```
//AOPPIDU JOB ,'pidu'
//*
//PIDU EXEC PGM=AOPBATCH,PARM='pidu'
//*
//STDIN DD DSN=hlq.INVDEFS,DISP=SHR
//*
//STDOUT DD SYSOUT**
//STDERR DD SYSOUT**
//*
// STDENV may point to a dataset containing environment variables.
// Builtin values will work for the default installation.
// STDENV DD DSN=environment,DISP=SHR
```

Figure 7. Sample JCL for running the PIDU program as a batch job — SYS1.SAMPLIB(AOPPIDU)

Example: This example lists all printer definitions and printer pool definitions, and specifies environment variables in-stream in the JCL:

```
//AOPPIDU JOB ...
//PIDU EXEC PGM=AOPBATCH,PARM='pidu'
//STDIN DD *
list printer;
list printer-pool;
/*
//STDOUT DD SYSOUT**
//STDERR DD SYSOUT**
//STDENV DD *
```
Tip: If your installation installed Infoprint Server files in default directories, you can omit the STDENV DD statement.

**Using BPXBATCH to run the PIDU program**

If you use the BPXBATCH utility program to run the `pidu` command, you must always set the PATH, LIBPATH, and NLSPATH environment variables, even if your installation installed Infoprint Server files in default locations. Specify the AOPCONF environment variable if the Infoprint Server configuration file is not in `/etc/Printsrv/aopd.conf` or in `$HOME/.aopconf`. For information about these environment variables, see “Environment variables” on page 266.

For information about the BPXBATCH utility program, see z/OS UNIX System Services Command Reference.

**PIDU commands**

As input to the PIDU program, you must specify one or more PIDU commands. Table 36 summarizes the PIDU commands, the function of each command, and where to find more information about the command.

<table>
<thead>
<tr>
<th>PIDU command</th>
<th>Function of command</th>
<th>See page</th>
</tr>
</thead>
<tbody>
<tr>
<td>create</td>
<td>Create a new object.</td>
<td>270</td>
</tr>
<tr>
<td>delete</td>
<td>Delete an object.</td>
<td>283</td>
</tr>
<tr>
<td>display</td>
<td>Display the attributes of an object.</td>
<td>284</td>
</tr>
<tr>
<td>display-fully</td>
<td>Display the attributes of a printer definition plus the attributes of any components that the printer definition includes.</td>
<td>285</td>
</tr>
<tr>
<td>dump</td>
<td>Dump all objects.</td>
<td>283</td>
</tr>
<tr>
<td>export</td>
<td>Generate <code>create</code> commands for all objects or only objects that meet certain criteria.</td>
<td>286</td>
</tr>
<tr>
<td>force-create</td>
<td>Create an object and replace an object of the same name and in the same object class if it exists.</td>
<td>270</td>
</tr>
<tr>
<td>list</td>
<td>List all objects or only objects that meet certain criteria.</td>
<td>288</td>
</tr>
<tr>
<td>modify</td>
<td>Modify attributes of an object.</td>
<td>289</td>
</tr>
<tr>
<td>rename</td>
<td>Rename an object.</td>
<td>291</td>
</tr>
</tbody>
</table>

Tip: To abbreviate command names, use enough characters to make the command name unique. For example, you can abbreviate `display` as `di`.

**PIDU object classes**

Most PIDU commands require that you identify the object class of the object in the Printer Inventory that you want to work with. Table 37 on page 269 summarizes how the PIDU program classifies objects in the Printer Inventory.
Table 37. Classes of objects used by the PIDU program

<table>
<thead>
<tr>
<th>Object class</th>
<th>Description of object</th>
</tr>
</thead>
<tbody>
<tr>
<td>allocation</td>
<td>An Allocation component</td>
</tr>
<tr>
<td>fsa</td>
<td>An FSA definition</td>
</tr>
<tr>
<td>job-selection-rule</td>
<td>A job selection definition</td>
</tr>
<tr>
<td>netspool eof-rules</td>
<td>A NetSpool End-of-File component</td>
</tr>
<tr>
<td>netspool-options</td>
<td>A NetSpool Options component</td>
</tr>
<tr>
<td>printer</td>
<td>A printer definition</td>
</tr>
<tr>
<td>printer-pool</td>
<td>A printer pool definition</td>
</tr>
<tr>
<td>printway-fss</td>
<td>An FSS definition for an IP PrintWay functional subsystem</td>
</tr>
<tr>
<td>printway-options</td>
<td>An IP PrintWay Options component</td>

<tr>
<td>processing</td>
<td>A Processing component</td>
</tr>
<tr>
<td>protocol</td>
<td>A Protocol component</td>
</tr>
<tr>
<td>psf-fss</td>
<td>An FSS definition for a PSF functional subsystem</td>
</tr>
</tbody>
</table>

Where predicate

Two of the PIDU commands, export and list, let you construct a where predicate to select the objects you want to export or list. In the where predicate, you can specify one or more conditions.

The where predicate has this format:

\[\text{where} \ \text{condition} \ [\text{and} \mid \text{or} \ \text{condition}]...\]

A condition has this format:

\[\text{[not]} \ \text{attribute} \ \text{operator} \ \text{value}\]

- **not** Indicates that the evaluation of the condition is to be reversed.
- **attribute** Specifies the name of a single-valued attribute that is valid for the object class. Note that multi-valued attributes are not supported.
  
  You can specify any attribute that is valid for the object class. You can also specify the attribute name to limit definitions by name.
  
  For a list of the valid attributes, see "Attribute listing" on page 293.
  
  - **operator** Specifies one of the operators shown in Table 38 on page 270
  
  - **value** Specifies the value of the attribute. All values are case-sensitive.
    
    Therefore, be sure to type the same uppercase and lowercase letters as are stored in the Printer Inventory. The special value null means that an attribute is not specified.
    
    If you use the match operator, you must specify a regular expression as defined in “Regular Expressions” in z/OS UNIX System Services Command Reference.
    
    If the value contains special characters (such as \* \{} \} > ), enclose the value in quotation marks.
Table 38 summarizes the operators that you can use when you construct a condition. Some operators are valid only for certain types of attribute values, as indicated in the table. For example, you can use the match operator only for attributes that accept strings values.

Table 38. Operators for attributes

<table>
<thead>
<tr>
<th>Operator</th>
<th>Operation</th>
<th>String values</th>
<th>Fixed values</th>
<th>Integer values</th>
</tr>
</thead>
<tbody>
<tr>
<td>=</td>
<td>Equal</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>!=</td>
<td>Not equal</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>&gt;</td>
<td>Match a value greater than the specified value</td>
<td>Yes&lt;sup&gt;1&lt;/sup&gt;</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>&lt;</td>
<td>Match a value less than the specified value</td>
<td>Yes&lt;sup&gt;1&lt;/sup&gt;</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>&lt;=</td>
<td>Match a value less than or equal to the specified value</td>
<td>Yes&lt;sup&gt;1&lt;/sup&gt;</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>&gt;=</td>
<td>Match a value greater than or equal to the specified value</td>
<td>Yes&lt;sup&gt;1&lt;/sup&gt;</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>match</td>
<td>Match the specified regular expression</td>
<td>Yes&lt;sup&gt;1&lt;/sup&gt;</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

1. A string value is evaluated using binary collation.

To specify an expression with multiple conditions, separate the conditions with one of these operators:

- **and**: The expression is true only if both conditions are true.
- **or**: The expression is true if either condition is true.

Multiple conditions are evaluated using an order of precedence, with **and** conditions evaluated before **or** conditions. You can override the order by using parentheses. Expressions in parentheses are evaluated first.

**Tip**: For examples of the *where* predicate, see:

- "export—export objects to a file" on page 286
- "list—list names of objects" on page 288

### create and force-create—create an object

**Format**

create objectclass name [attribute = value]... ;

force-create objectclass name [attribute = value]... ;

**Description**

The create command creates an object in the Printer Inventory. The object must not already exist in the Printer Inventory.

The force-create command does the same function as the create command except that if an object of the same name and in the same object class exists, it is replaced.
create and force-create

**Operands**

*objectclass*  
The class of the object that you want to create. For a list of the valid object classes, see Table 37 on page 269.

*name*  
A name to identify the object. Objects in the same object class cannot have the same name. Also, a printer pool definition (printer-pool object class) cannot have the same name as a printer definition (printer object class).

When you create a printer definition, printer-pool definition, job selection rule, or component, specify any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ # @ . = /). Blank characters are not allowed. In an IP PrintWay printer definition, use name DFTNTRY to designate the IP PrintWay default printer definition. The name is case-sensitive.

When you create an FSS or FSA definition, this name must match the name used to define the FSA or FSS to JES. Specify a valid combination of 1-8 letters, numbers, and national characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. Lowercase letters are converted to uppercase.

If the name contains special characters, enclose the name in single or double quotation marks.

*attribute = value*  
One or more attributes and values. Separate attributes with spaces. For the valid attributes for each object class, see "Attribute listing" on page 293.

**Usage notes**

- A printer definition can include one or more components. For example, a printer definition can include one Allocation component and one Processing component. When a printer definition includes a component, the attributes specified for the component apply to the printer definition as well. To include a component, use the `include-object` attributes, such as `include-allocation` and `include-processing`.
- When you create a printer definition and include components, you can override any attribute that is specified in a component. To do this, specify the same attribute on the `create` statement for the printer definition. The attribute you specify on the `create` statement applies only to the printer definition. The value of the attribute in the component is not changed.

**Tip:** If an attribute is specified in a printer definition, and you later change the value for that attribute in an included component, the value in the printer definition remains unchanged.

- You must create components *before* you create any printer definitions that include these components.
- You must create printer definitions *before* you create any printer pool definitions that list these printer definitions.
- To help you specify a valid `create` statement, first use the ISPF panels to create the object in the Printer Inventory and then use the PIDU `display` or `export` command to list the attributes for the object.
- If you repeat the same attribute in a `create` statement, the PIDU program uses the last specification.
Examples -- create and force-create
You can find additional examples of PIDU commands in the file /usr/lpp/Printsrv/samples/sample.pidl

All of these examples also apply to the force-create command.

Creating an allocation component: This example creates an Allocation component named printway. This Allocation component might be included in all printer definitions for printers to be managed by the same IP PrintWay basic mode FSA.

```
pidu -c 'create allocation printway
description="JES allocation values for IP PrintWay"
output-class=K ;'
```

The attributes set in this component are:
- **description**: This attribute describes the component.
- **output-class**: This attribute specifies the output class that is the JES work-selection criterion for the IP PrintWay basic mode FSA. In this example, the output class is K. NetSpool and Print Interface will allocate output data sets on the JES spool in class K.

Creating a processing component for PCL printers: This example creates a Processing component named pcl_printer that contains attributes suitable for printers that can print PCL files:

```
pidu -c 'create processing pcl_printer
description = "Generic PCL options"
printer-codepage = ISO8859-1
document-formats-supported = [ text pcl modca-p line-data ]
filters = { text -> aopfiltr.so modca-p -> "afpxpcl.dll -c us"
            line-data -> "afpxpcl.dll -c us" }
pcl-print-density = 10
pcl-line-density = 6 ;'
```

The attributes set in this component are:
- **description**: This attribute describes the component.
- **printer-codepage**: This attribute specifies ASCII code page ISO8859-1. Specify an ASCII code page so that Print Interface converts EBCDIC data to ASCII before writing data to the JES spool. NetSpool also converts data to this code page when the netspool-formatting=convert-to-pcl attribute is specified in the printer definition.
- **document-formats-supported**: This attribute specifies that the printer accepts text, PCL, MO:DCA-P, and line data. The printer accepts MOD:CA-P and line data because a transform is associated with this data format in the filters attribute.
- **filters**: This attribute requests that Print Interface use these filters:
  - `aopfiltr.so` filter for text data. IBM recommends that you specify this filter for text data. The `aopfiltr.so` filter is provided with Infoprint Server. For information about this filter, see "Using the aopfiltr.so filter" on page 94.
  - `afpxpcl.dll` filter for MO:DCA-P (AFP) data and line data. This filter transforms AFP and line data to PCL data.
- **pcl-print-density**: This attribute specifies the number of characters per inch to be printed on a line. NetSpool uses this value when the netspool-formatting=convert-to-pcl attribute is also specified in the printer definition.
- **pcl-line-density**: This attribute specifies the number of lines per inch to be printed on a page. NetSpool uses this value when the netspool-formatting=convert-to-pcl attribute is also specified in the printer definition.
Creating a processing component for AFP printers: This example creates a Processing component named afp_printer that contains attributes suitable for printing on AFP printers:

\[ \text{pidu -c 'create processing afp_printer} \]
\[ \text{description = "AFP options"} \]
\[ \text{printer-codepage = IBM-1047} \]
\[ \text{document-formats-supported = \{ modca-p line-data text pcl postscript pdf\}} \]
\[ \text{filters = \{ pcl -> "pcl2afp.dll %filter-options"} \]
\[ \text{postscript -> "ps2afp.dll %filter-options"} \]
\[ \text{pdf -> "ps2afp.dll %filter-options"\} ; '} \]

The attributes set in this component are:
- **description**: This attribute describes the component.
- **printer-codepage**: This attribute specifies EBCDIC code page IBM-1047. Specify an EBCDIC code page so that Print Interface converts ASCII data to EBCDIC before writing data to the JES spool.
- **document-formats-supported**: This attribute specifies that the printer accepts MO:DCA-P, line data, text, PCL, PostScript, and PDF data.
- **filters**: This attribute requests that Infoprint Server use the pcl2afp.dll filter to transform PCL data to AFP format (MO:DCA-P) and the ps2afp.dll filter to transform both PostScript and PDF data to AFP format.

Creating an IP PrintWay options component: This example creates an IP PrintWay Options component named pcl_land_17cpi that contains attributes suitable for printing in the landscape orientation on PCL printers and for retaining data sets on the JES spool that IP PrintWay cannot transmit to the remote printer.

\[ \text{pidu -c 'create printway-options pcl_land_17cpi} \]
\[ \text{description = "PCL landscape 17 cpi"} \]
\[ \text{retry-limit = 5} \]
\[ \text{retry-time = 5:00} \]
\[ \text{failure-retention-period = forever} \]
\[ \text{document-header = "<esc>E<esc>&l10<esc>(s17H"} \]
\[ \text{document-trailer = "<esc>E" ; '} \]

The attributes set in this component are:
- **description**: This attribute describes the component.
- **retry-limit**: This attribute specifies that IP PrintWay is to retry unsuccessful transmissions up to 5 times before considering the transmission to have failed.
- **retry-time**: This attribute specifies that IP PrintWay is to retry unsuccessful transmissions every 5 minutes. IP PrintWay also automatically retries an unsuccessful transmission right after the first transmission fails.
- **failure-retention-period**: This attribute specifies that IP PrintWay retain the output data set on the JES spool if the transmission fails.
- **document-header**: This attribute specifies printer commands for printing in the landscape direction. IP PrintWay translates the instructions to ASCII and transmits them to the printer before the data.
- **document-trailer**: This attribute specifies printer commands to reset the printer to its original state. IP PrintWay translates the instructions to ASCII and transmits them to the printer after the data.

Creating a NetSpool options component for PCL printers: This example creates a NetSpool Options component named pcl. The attributes in this component request that NetSpool convert data to PCL before writing it to the JES spool.
create and force-create

pidu -c 'create netspool-options pcl
   description = "Convert to PCL"
   netspool-formatting = convert-to-pcl ;'

The attributes set in this component are:

- **description**: This attribute describes the component.
- **netspool-formatting**: This attribute requests that NetSpool convert data to PCL before writing it to the JES spool.

Creating a NetSpool options component to print binary data: This example creates a NetSpool Options component named binary. The attributes in this component request that NetSpool not convert or format data before writing it to the JES spool.

```sh
pidu -c 'create netspool-options binary
description = "No formatting; 80 byte records"
netspool-formatting = none
maximum-record-size = 80
recfm = vba ;'
```

The attributes set in this component are:

- **description**: This attribute describes the component.
- **netspool-formatting**: This attribute specifies that NetSpool not format data before writing it to the JES spool.
- **maximum-record-size**: This attribute specifies that NetSpool write a maximum record size of 80 bytes.
- **recfm**: This attribute specifies that NetSpool use a record format of VBA.

Creating a NetSpool end-of-file component: This example creates a NetSpool End-of-File component named bracket. The attributes in this component tell NetSpool to use the end-of-bracket rule to determine when to close the output data set on the JES spool, and also request that NetSpool delete form feed controls that occur at the end of the output data set.

```sh
pidu -c 'create netspool-eof-rules bracket
description="Bracket rule; delete trailing form feeds"
eof-rules=
  default={ all -> {eof-method=end-bracket delete-form-feed=trailing} }
} ;'
```

The attributes set in this component are:

- **description**: This attribute describes the component.
- **eof-rules**: This attribute specifies the start of the end-of-file rules.
- **default**: This attribute defines default end-of-file rules that apply to all LU types.
- **eof-method**: This attribute requests that NetSpool use the end-of-bracket rule.
- **delete-form-feed**: This attribute requests that NetSpool delete form feed controls at the end of the output data set.

Creating a protocol component for LPR protocol: This example creates a Protocol component named lpr_options that contains attributes suitable for transmitting data sets using IP PrintWay and the LPR to LPD protocol.

```sh
pidu -c 'create protocol lpr_options
description = "LPR to PASS queue"
protocol-type = lpr
print-queue-name = PASS ;'
```

The attributes set in this component are:
**create and force-create**

- **description**: This attribute describes the component.
- **protocol-type**: This attribute requests the LPR to LPD protocol.
- **print-queue-name**: This attribute specifies the name of the PASS print queue on the target printer.

Creating an IP PrintWay printer definition for a PCL printer with LPR protocol:

This example creates a printer definition named `lp1` for a printer managed by IP PrintWay. IP PrintWay uses the LPR to LPD TCP/IP protocol to transmit data to the remote printer or print server.

```plaintext
pidu -c 'create printer lp1
description = "Default printer"
location = "Printer room"
printer-type = ip-printway
dcf-routing = yes
destination = LP1
printer-ip-address = printer1.boulder
lu-name = LUPRT001
lu-classes = { 2 }
default-owner = smith
embedded-attributes-prefix = "<<ibmjobattr"
operator-security-profile = "DENVER.001"
include-allocation = printway
include-processing = pcl_printer
include-printway-options = pcl_land_17cpi
include-netspool-options = pcl
include-netspool-eof-rules = bracket
include-protocol = lpr_options ;'
```

Users can access this printer definition in these ways:

- **Local and remote can users use `lp1` as the name of the destination, print queue, or printer definition.**
- **IPP clients can use one of these URIs:**
  - `ipp://host/servlet/IPPServlet/lp1`
  - `http://host:631/servlet/IPPServlet/lp1`

  The host name or IP address of the z/OS system is `host`.

- **JCL users can specify either (1) FSSDATA='printer=lp1' or (2) CLASS=K and DEST=LP1 on an OUTPUT JCL statement. JCL users can also use the AOPPRINT procedure, specifying `lp1` as the printer name.**
- **VTAM applications use NetSpool printer LU name LUPRT001.**

The attributes set in this printer definition are:

- **description**: This attribute describes the printer definition.
- **location**: This attribute describes the location of the printer.
- **printer-type**: This attribute specifies that IP PrintWay manages the printer.
- **dcf-routing**: This attribute specifies that users can select this printer using the DEST, CLASS and FORMS parameters on an OUTPUT JCL statement. In this example, the DEST value is specified in the destination attribute, the CLASS value is specified in the included Allocation component named printway, and the FORMS value is not specified.
- **destination**: This attribute specifies that Print Interface and NetSpool allocate output data sets on the JES spool with a DEST value of LP1. Because dcf-routing=yes, IP PrintWay selects this printer definition when the OUTPUT JCL statement contains a DEST value of LP1 and a CLASS value of K.
- **printer-ip-address**: This attribute specifies the IP address of the remote printer or print system.
create and force-create

- **luname**: This attribute specifies the NetSpool printer LU name.
- **lu-classes**: This attribute assigns the NetSpool printer LU name to LU class 2.
- **default-owner**: This attribute specifies the default Infoprint Server job owner for data sets that NetSpool spools for the associated logical unit (LU) if embedded job attributes in the print data do not specify an owner.
- **embedded-attributes-prefix**: This attribute specifies, for data sets that NetSpool spools, the prefix that identifies job attributes embedded in the print data.
- **operator-security-profile**: This attribute controls who can work with this printer using Infoprint Central.
- **include-object**: These attributes include components in the printer definition. All attributes specified in the named components apply to this printer definition. You must create components **printway**, **pcl_printer**, **pcl_land_17cpi**, **pcl**, **bracket**, and **lpr_options**.

Creating an IP PrintWay printer definition for a PCL printer with IPP protocol:

This example creates a printer definition named **lab_printer** for a remote printer to which IP PrintWay transmits data. IP PrintWay uses Internet Printing Protocol (IPP) to transmit data to an IPP server running on the remote printer or print server.

```bash
pidu -c 'create printer lab_printer
description = "IPP printer in 004 lab"
location = "Lab printer room - building 004"
printer-type = ip-printway
dcf-routing = yes
destination = LAB
luname = LUPRT003
lu-classes = { 2 }
default-owner = smith
operator-security-profile = "DENVER.001"
protocol-type = ipp
printer-uri = "ipp://myprinter.xyz.com"
include-allocation = printway
include-processing = pcl_printer
include-printway-options = pcl_land_17cpi
include-netspool-options = pcl
include-netspool-eof-rules = bracket ; '
```

Users can access this printer definition in these ways:
- Local and remote users can use **lab_printer** as the name of the destination, print queue, or printer definition.
- IPP clients can use one of these URIs:
  - `ipp://host/servlet/IPPServlet/lab_printer`
  - `http://host:631/servlet/IPPServlet/lab_printer`

The host name or IP address of the z/OS system is **host**.

- JCL users can specify either (1) `FSSDATA='printer=lab_printer'` or (2) `CLASS=K and DEST=LAB` on an OUTPUT JCL statement. JCL users can also use the AOPPRINT procedure, specifying **lab_printer** as the printer name.
- VTAM applications use NetSpool printer LU name LUPRT003.

The attributes set in this printer definition are:
- **description**: This attribute describes the printer definition.
- **location**: This attribute describes the location of the printer.
- **printer-type**: This attribute specifies that IP PrintWay manages the printer.
• **dcf-routing**: This attribute specifies that users can select this printer using the DEST, CLASS, and FORMS parameters on an OUTPUT JCL statement. In this example, the DEST value is specified in the **destination** attribute, the CLASS value is specified in the Allocation component named printway, and the FORMS value is not specified.

• **destination**: This attribute specifies that NetSpool and Print Interface allocate output data sets on the JES spool with a DEST value of LAB. Because **dcf-routing=yes**, IP PrintWay selects this printer definition when the OUTPUT JCL statement contains a DEST value of LAB and a CLASS value of K.

• **luname**: This attribute specifies the NetSpool printer LU name.

• **lu-classes**: This attribute assigns the NetSpool printer LU name to LU class 2.

• **default-owner**: This attribute specifies the default Infoprint Server job owner for data sets that NetSpool spools for the associated logical unit (LU) if embedded job attributes in the print data do not specify an owner.

• **embedded-attributes-prefix**: This attribute specifies, for data sets that NetSpool spools, the prefix that identifies job attributes embedded in the print data.

• **operator-security-profile**: This attribute controls who can work with this printer using Infoprint Central.

• **protocol-type**: This attribute requests that IP PrintWay use Internet Printing Protocol (IPP) to transmit data to the printer.

• **printer-uri**: This attribute specifies the Uniform Resource Identifier (URI) of the remote printer.

• **include-object**: These attributes include components in the printer definition. All attributes specified in the named components apply to this printer definition. The named components were created in previous examples.

Creating an IP PrintWay printer definition for an SCS printer with VTAM protocol: This example creates a printer definition named *scs_printer* for a remote printer to which IP PrintWay transmits data. IP PrintWay uses VTAM to transmit data to the SCS printer.

```
pidu -c 'create printer scs_printer
    description = "SCS printer"
    location = "Building 005"
    printer-type = ip-printway
    printer-codepage = IBM-1047
    dcf-routing = yes
    destination = scsprt
    operator-security-profile = "DENVER.001"
    protocol-type = vtam
    printer-luname = p001
    printer-logmode = scs
    vtam-checkpoint-pages = 10
    printway-formatting = use-fcb
    scs-top-margin = 6
    scs-bottom-margin = 62
    scs-left-margin = 11
    scs-right-margin = 71
    scs-maximum-line-length = 80
    scs-maximum-page-length = 66
    include-allocation = printway ; '
```

Users can access this printer definition in these ways:

• Local and remote users can use **scs_printer** as the name of the destination, print queue, or printer definition.

• IPP clients can use one of these URIs:
  - ipp://host/servlet/IPPServlet/scs_printer
The host name or IP address of the z/OS system on which Infoprint Server is running is host.

- JCL users can specify either (1) FSSDATA='printer=scs_printer' or (2) CLASS=K and DEST=SCSPRT on an OUTPUT JCL statement. JCL users can also use the AOPPRINT procedure, specifying scs_printer as the printer name.

The attributes set in this printer definition are:

- **description**: This attribute describes the printer definition.
- **location**: This attribute describes the location of the printer.
- **printer-codepage**: This attribute specifies EBCDIC code page IBM-1047. Specify an EBCDIC code page so that Print Interface and IP PrintWay convert ASCII data to EBCDIC. Most SCS printers accept EBCDIC data.
- **printer-type**: This attribute specifies that IP PrintWay manages the printer.
- **dcf-routing**: This attribute specifies that users can use the DEST, CLASS, and FORMS parameters on an OUTPUT JCL statement to select this printer definition. In this example, the DEST value is specified in the destination attribute, the CLASS value is specified in the Allocation component named printway, and the FORMS value is not specified.
- **destination**: This attribute specifies that Print Interface allocate output data sets on the JES spool with a DEST value of SCSPRT. Because the dcf-routing=yes attribute is specified, IP PrintWay uses this printer definition for all data sets on the JES spool with a DEST value of SCSPRT and a CLASS value of K.
- **operator-security-profile**: This attribute controls who can work with this printer using Infoprint Central.
- **protocol-type**: This attribute requests that IP PrintWay use VTAM to transmit data to the printer.
- **printer-luname**: This attribute specifies the name of the remote SCS printer as defined to VTAM.
- **vtam-checkpoint-pages**: This attribute specifies that IP PrintWay will request a definitive response from the printer every 10 pages.
- **printway-formatting**: This attribute specifies that the FCB, if specified, is used to create the SCS data stream.
- **scs-xxxx**: These attributes specify formatting values.
- **include-allocation**: This attribute includes the previously defined allocation component named printway. See “Creating an allocation component” on page 272.

**Creating an IP PrintWay printer definition for the e-mail protocol**: This example creates a printer definition named deptmail and selects the e-mail protocol:

```
pidu -c 'create printer deptmail
description = "E-mail destination"
location = "Departments 01 and 02"
printer-type = ip-printway
printer-codepage = IBM-1047
dcf-routing = yes
destination = DEPTMAIL
protocol-type = email
title-text = "My default e-mail title"
mail-bcc-addresses = ("user2@xyz.com" dept01list)
mail-cc-addresses = ("user3@xyz.com" dept02list)
mail-from-name = "John Q. Sender"
mail-reply-address = ("mysecretary@xyz.com")
mail-to-addresses = ("user1@xyz.com" dept03list)
```
create and force-create

```luname = DEPTMAIL
lu-classes={ 1 }
default-owner = smith
embedded-attributes-prefix = "<<ibmjobattr"
printway-formatting = use-fcb
print-page-header = no
dataset-grouping = concatenate-job
include-allocation = printway ;`

Users can access this printer definition in these ways:
- Local and remote users can use deptmail as the name of the destination, print queue, or printer definition.
- IPP clients can use one of these URIs:
  – ipp://host/servlet/IPPServlet/deptmail
  – http://host:631/servlet/IPPServlet/deptmail

The host name or IP address of the z/OS system is host.
- JCL users can specify either (1) FSSDATA=’printer=deptmail’ or (2) CLASS=K and DEST=DEPTMAIL on an OUTPUT JCL statement. Users of the AOPPRINT procedure specify deptmail as the printer name.

The attributes set in this printer definition are:
- **description**: This attribute describes the printer definition.
- **location**: This attribute describes the e-mail destination.
- **printer-type**: This attribute specifies IP PrintWay.
- **printer-codepage**: This attribute specifies EBCDIC code page IBM-1047. Specify an EBCDIC code page so that Print Interface and IP PrintWay convert ASCII text data to EBCDIC.
- **dcf-routing**: This attribute specifies that job submitters can use the DEST, CLASS, and FORMS parameters on an OUTPUT JCL statement to select this printer definition. In this example, the DEST value is specified in the destination attribute, the CLASS value is specified in the Allocation component named printway, and the FORMS value is not specified.
- **destination**: This attribute specifies that Print Interface and NetSpool allocate output data sets on the JES spool with a DEST value of DEPTMAIL. Because the dcf-routing=yes attribute is specified, IP PrintWay uses this printer definition for all data sets on the JES spool with a DEST value of DEPTMAIL and a CLASS value of K.
- **protocol-type**: This attribute requests that IP PrintWay use the e-mail protocol.
- **title-text**: This attribute specifies a default subject for e-mails.
- **mail-bcc-addresses**: This attribute specifies the e-mail addresses of the “blind copy (bcc)” recipients of the e-mail. A bcc means that other recipients of the e-mail do not see the bcc recipient listed. One e-mail address and one z/OS UNIX sendmail alias name are specified.
- **mail-cc-addresses**: This attribute specifies the e-mail addresses of the “copy (cc)” recipients of the e-mail. A cc means that other recipients of the e-mail can see the cc recipient listed. One e-mail address and one z/OS UNIX sendmail alias name are specified.
- **mail-from-name**: This attribute specifies the descriptive name or other identifier of the sender of the e-mail.
- **mail-reply-address**: This attribute specifies the e-mail address that recipients of the e-mail can reply to. If this attribute is omitted, most e-mail programs use the
sender's e-mail address. The default is userid@domainname. The user ID of the job submitter is userid. The domain name where Infoprint Server is running is domainname.

- **mail-to-addresses**: This attribute specifies the e-mail addresses of the recipients of the e-mail. One e-mail address and one z/OS UNIX sendmail alias name are specified.
- **luname**: This attribute specifies the NetSpool printer LU name.
- **lu-classes**: This attribute assigns the NetSpool printer LU name to LU class 1.
- **default-owner**: This attribute specifies the default Infoprint Server job owner for data sets that NetSpool spoolls for the associated logical unit (LU) if embedded job attributes in the print data do not specify an owner.
- **embedded-attributes-prefix**: This attribute specifies, for data sets that NetSpool spoolls, the prefix that identifies job attributes embedded in the print data.
- **printway-formatting**: This attribute specifies IP PrintWay use the FCB, if one is specified, to format line data.
- **print-page-header**: This attribute causes IP PrintWay not to add a page header when it formats line data.
- **dataset-grouping**: This attribute requests that data sets that are in the same JES output group be sent as attachments in the same e-mail.
- **include-allocation**: This attribute includes the previously defined Allocation component named printway. See “Creating an allocation component” on page 272.

**Creating a PSF printer definition**: This example creates a printer definition named prt2 for an AFP printer controlled by PSF:

```
pidu -c 'create printer prt2
description = "Dept 002 printer"
location = "Building 002 printer room"
printer-type = psf-mvs
destination = DEPT002
output-class = J
luname = LUPRT002
lu-classes = { 2 }
default-owner = smith
embedded-attributes-prefix = "<<ibmjobattr"
include-processing = afp_printer
include-netspool-eof-rules = bracket ; '
```

Users can access this printer definition in these ways:
- Local and remote users can use prt2 as the name of the destination, print queue, or printer definition.
- IPP clients can use one of these URLs:
  - ipp://host/servlet/IPPServlet/prt2
  - http://host:631/servlet/IPPServlet/prt2

  The host name or IP address of the z/OS system is host.
- JCL users can use the AOPPRINT procedure to access this printer definition, specifying prt2 as the printer name. For information about the AOPPRINT procedure, see *z/OS Infoprint Server User’s Guide*.
- VTAM applications can use NetSpool printer LU name LUPRT002.

The attributes set in this printer definition are:
- **description**: This attribute describes the printer definition.
- **location**: This attribute describes the location of the printer.
• **printer-type**: This attribute specifies that PSF manages the printer.
• **output-class**: This attribute specifies the output class that is the JES work-selection criterion for the PSF printer FSA. In this example, the output class is J. NetSpool and Print Interface will allocate output data sets on the JES spool in class J.
• **luname**: This attribute specifies the NetSpool printer LU name.
• **lu-classes**: This attribute assigns the NetSpool printer LU name to LU class 2.
• **default-owner**: This attribute specifies the default Infoprint Server job owner for data sets that NetSpool spools for the associated logical unit (LU) if embedded job attributes in the print data do not specify an owner.
• **embedded-attributes-prefix**: This attribute specifies, for data sets that NetSpool spools, the prefix that identifies job attributes embedded in the print data.
• **include-object**: These attributes include components in the printer definition. All attributes specified in the named components apply to this printer definition. The named components were created in previous examples.

**Creating a general printer definition**: This example creates a printer definition named fred for a printer that is not controlled by IP PrintWay or by PSF:

```
pidu -c 'create printer fred
description = "Fred Jones"
location = "Office A-11"
printer-type = general
general-spooling-mode = line
destination = FRED ;'
```

Users can access this printer definition in these ways:
• Local and remote users use **fred** as the name of the destination, print queue, or printer definition.
• IPP clients use one of these URIs:
  – ipp://host/servlet/IPPServlet/fred
  – http://host:631/servlet/IPPServlet/fred

The host name or IP address of the z/OS system is **host**.
• JCL users can use the AOPPRINT procedure to access this printer definition, specifying **fred** as the printer name. For information about the AOPPRINT procedure, see [z/OS Infoprint Server User’s Guide](#).

**Tip**: This example does not specify the **luname** attribute. Therefore, VTAM applications cannot print to this printer definition.

The attributes set in this printer definition are:
• **description**: This attribute describes the printer definition.
• **location**: This attribute describes the location of the printer.
• **printer-type**: This attribute specifies General.
• **general-spooling-mode**: This attribute tells Print Interface to write data to the output data set on the JES spool in record format.
• **destination**: This attribute specifies the destination name that is the JES work-selection criterion for the printer. NetSpool and Print Interface allocate output data sets on the JES spool with destination name FRED.

**Creating a printer pool definition**: This example creates a printer pool definition named DEPT004. NetSpool creates a separate output data set on the JES spool for each printer definition in the printer pool definition.
To print to printer definitions p1, p2, and p3, VTAM applications use NetSpool printer LU name LU4.

```
pidu -c 'create printer-pool DEPT004
  description = "All printers in dept 004"
  luname = LU4
  lu-classes = { 1 2 }
  default-owner = smith
  embedded-attributes-prefix = "<<ibmjobattr"
  include-netspool-eof-rules = bracket
  printer-names = { p1 p2 p3 } ;'
```

The attributes set in this printer definition are:

- **description**: This attribute describes the printer definition.
- **luname**: This attribute specifies the NetSpool printer LU name LU4.
- **lu-classes**: This attribute assigns the NetSpool printer LU to LU classes 1 and 2.
- **default-owner**: This attribute specifies the default Infoprint Server job owner for data sets that NetSpool spools for the associated logical unit (LU) if embedded job attributes in the print data do not specify an owner.
- **embedded-attributes-prefix**: This attribute specifies, for data sets that NetSpool spools, the prefix that identifies job attributes embedded in the print data.
- **include-netspool-eof-rules**: This attribute includes the NetSpool End-of-File Rules component named bracket. You must also create this component.
- **printer-names**: This attribute lists the names of the printer definitions in the pool. You must create printer definitions named p1, p2, and p3.

**Creating an IP PrintWay FSS definition**: This example creates an FSS definition for an IP PrintWay functional subsystem (FSS) named PRINTWAY. The name of this definition (PRINTWAY) must match the name used to define the FSS to JES. An IP PrintWay FSS definition is optional. Create one only if you want to change the default values that IP PrintWay uses.

```
pidu -c 'create printway-fss PRINTWAY
  trace-mode = internal ;'
```

The **trace-mode** attribute turns internal tracing on for the IP PrintWay FSS and all functional subsystem applications (FSAs) in this FSS.

**Creating an IP PrintWay FSA definition**: This example creates an FSA definition for an IP PrintWay functional subsystem application (FSA) named PRT123. The name of the FSA definition (PRT123) must match the name used to define the FSA to JES. An IP PrintWay FSA definition is optional. Create one only if you want to change default values that IP PrintWay uses.

```
pidu -c 'create fsa PRT123
  fsa-type = ip-printway
  trace-mode = full ;'
```

The attributes set in this printer definition are:

- **fsa-type**: This attribute tells the ISPF panels to display this definition as an IP PrintWay FSA definition.
- **trace-mode**: This attribute requests a full trace for this FSA.

**Creating a PSF FSS definition**: This example creates an FSS definition for a PSF functional subsystem (FSS) named PSFFSS. Your system programmer must also define an FSS named PSFFSS to JES.

```
pidu -c 'create psf-fss PSFFSS
  tcpip-job-name = TCPIP ;'
```
Creating a PSF FSA definition: This example creates an FSA definition for a PSF functional subsystem application (FSA) named PRT3. Your system programmer must also define an FSA named PRT3 to JES.

```
pidu -c 'create fsa PRT3
  fsa-type = psf-tcpip
  form-definition = A10110
  location = "Bldg 3"
  operator-security-profile = "DENVER.001"
  page-definition = A08682
  printer-ip-address = 9.99.12.33 ;'
```

The attributes set in this printer definition are:
- **fsa-type**: This attribute tells the ISPF panels to display this definition as a PSF FSA definition for a TCP/IP-connected printer.
- **form-definition**: This attribute names the default form definition for the printer.
- **location**: This attribute describes the location of the printer.
- **operator-security-profile**: This attribute controls who can work with this printer using Infoprint Central.
- **page-definition**: This attribute names the default page definition for the printer.
- **printer-ip-address**: This attribute identifies the IP address of the target printer.

Creating a job selection rule: This example creates a job selection rule named Class-N. IP PrintWay extended mode uses the job selection rules to determine which print jobs to select from the JES spool for printing. You must create at least one job selection rule for IP PrintWay to select print jobs. You can create as many job selection rules as you need. The attributes of the print job must match all of the values in a rule to be selected.

```
pidu -c 'create job-selection-rule Class-N
  job-selection-status = enabled
  output-class-list = {N}
  description = "Select overnight print jobs in Class N" ;'
```

The attributes set in this job selection rule are:
- **job-selection-status**: This attribute specifies that IP PrintWay uses the job selection rule to determine which print jobs to select from the JES spool for printing.
- **output-class-list**: This attribute specifies that IP PrintWay selects only print jobs in the specified JES output class.
- **description**: This attribute describes the job selection rule.

**delete**—delete an object

**Format**
```
delete objectclass name ;
```

**Description**
The **delete** command deletes an object from the Printer Inventory.

**Operands**
- **objectclass**: The class of the object that you want to delete. For a list of the valid object classes, see Table 37 on page 269.
- **name**: The name of the object. Names are case-sensitive, so be sure to use
delete

the correct uppercase and lowercase letters. Enclose the name in single or double quotation marks if the name contains special characters.

Usage notes

- You cannot delete a component that is included in one or more printer definitions. You must first modify the printer definitions to remove the component names. You can use the PIDU list command to list all printer definitions that include a component and the PIDU modify command to modify the printer definitions.
- If you delete a printer definition that is listed in a printer pool definition, that printer definition is removed from the list of printers in the printer pool definition.

Examples -- delete

Deleting a component: This example deletes the NetSpool Options component named binary. This example also shows the list command that you should use before you delete the component to make sure that no printer definitions include that component.

```bash
pidu -c 'list printer where include-netspool-options=binary ;'
pidu -c 'delete netspool-options binary ;'
```

Deleting an FSA definition: This example deletes the FSA definition named FSA1:

```bash
pidu -c 'delete fsa FSA1 ;'
```

display—show attributes of an object

Format

```bash
display objectclass name ;
```

Description

The display command lists the attributes for one object in the Printer Inventory. This command writes the attributes to stdout. The attributes are displayed in the format required by the create command.

Operands

- objectclass The class of the object that you want to display. For a list of the valid object classes, see Table 37 on page 269.
- name The name of the object. Names are case-sensitive, so be sure to use the correct uppercase and lowercase letters. Enclose the name in single or double quotation marks if the name contains special characters.

Usage notes

- The display command does not list attributes that are specified in any components that are included in a printer definition. If a printer definition includes components, use the display-fully command.
- The display command might not list attributes that you have set to default values. This is because, to save space in the Printer Inventory, the Infoprint Server ISPF panels do not generally store attributes with default values.
Examples -- display

Displaying a printer definition:  This example displays attributes for the lp1 printer definition. It does not display attributes for the components that are included in the lp1 printer definition.

    pidu -c 'display printer lp1 ;'

Displaying an FSA definition:  This example displays attributes for the FSA1 FSA definition:

    pidu -c 'display fsa FSA1 ;'

display-fully—show attributes of a printer definition plus included components

Format

display-fully printer name ;

Description

The display-fully command lists the attributes for a printer definition in the Printer Inventory plus the attributes of any components that the printer definition includes, such as an Allocation component or a Processing component. This command writes the attributes to stdout.

Operands

printer  The class of the object that you want to display. The only valid object class is printer.

name  The name of the printer definition. Names are case-sensitive, so be sure to use the correct uppercase and lowercase letters. Enclose the name in single or double quotation marks if the name contains special characters.

Usage notes

• If the same attribute is defined in a printer definition and a component, the value in the printer definition overrides the value in the component.

• The display-fully command might not list attributes that are set to default values. This is because, to save space in the Printer Inventory, the Infoprint Server ISPF panels do not generally store attributes with default values.

Examples -- display-fully

Displaying all attributes for a printer definition and its components:  This example displays all attributes for the lp1 printer definition. It also displays all attributes for the components that are included in the lp1 printer definition.

    pidu -c 'display-fully printer lp1 ;'

dump—dump the Printer Inventory to a file

Format

dump filename ;

Description

The dump command writes the contents of the Printer Inventory to the named file. Your IBM service representative might ask you to use the dump command to assist IBM in diagnosing problems in the Printer Inventory.
dump

Operands

filename The name of the output file, which can be a UNIX file or an MVS data set. The output file does not need to exist. However, if the file already exists, the contents are overwriten.

If the data set is an MVS data set, specify // before the file name. If you specify a fully-qualified data set name, also enclose the data set name in single quotation marks and specify a backslash before each single quotation mark. For example, if the output file is named USERID.MYFILE, enter:

//`USERID.MYFILE`

If you want your TSO user ID prefixed to the data set name, specify:

//MYFILE

Usage notes

- If you allocate an MVS data set for the output file, IBM recommends that you use RECFM=VB and LRECL=8192. However, other values might be suitable as well.
- To write the contents of the Printer Inventory to a file in a more readable format, or to back up the Printer Inventory, use the export command.

Examples -- dump

This example writes the contents of the Printer Inventory to file named inventory.dump:

pidu -c 'dump inventory.dump ; '

This example writes the contents of the Printer Inventory to an MVS data set named USER1.INVENT.DUMP:

pidu -c "dump //`USER1.INVENT.DUMP`" ; "

export—export objects to a file

Format

export filename [objectclass [where condition [and | or condition]...]]

Description

The export command exports all objects that an administrator can create in the Printer Inventory, or only those objects that meet specified conditions. The export command does not export print job information that is stored in the Printer Inventory.

You can use the export command to back up the Printer Inventory. Also, the statements in the output file can be used as input to the PIDU program on another z/OS system.

The export command writes a create statement for each exported object to an output file. The output file does not need to exist. However, if the file already exists, the file is replaced.

Tip: Use the export command to back up the Printer Inventory. Do not use ordinary copy commands to create a backup copy of the Printer Inventory while Infoprint Server is running because the copy might contain inconsistent data. For
more information about how to schedule regular backups of the Printer Inventory and how to restore the Printer Inventory, see [z/OS Infoprint Server Customization](#).

**Operands**

`filename`  
The name of the output file, which can be a UNIX file or an MVS data set.

If the data set is an MVS data set, specify `/` before the file name. If you specify a fully-qualified data set name, also enclose the data set name in single quotation marks and specify a backslash before each single quotation mark. For example, if the output data set is named `USERID.MYFILE`, enter:

```
/\'USERID.MYFILE\'
```

If you want your TSO user ID prefixed to the data set name, specify:

```
/\MYFILE
```

`objectclass`  
The class of the objects that you want to export. For a list of the valid object classes, see [Table 37 on page 269](#). If you omit this operand, all objects are exported.

`where condition [and | or condition]...`

One or more conditions, which can limit the objects that are exported. Only objects that are in the specified object class and that meet the conditions are exported. If you omit the `where` predicate, all objects in the specified object class are exported.

For information about how to specify conditions, see [“Where predicate” on page 269](#).

**Usage notes**

- If you allocate an MVS data set for the output file, IBM recommends that you use `RECFM=VB` and `LRECL=8192`. However, other values might be suitable as well.
- The `export` command might not export attributes that you have set to default values. This is because, to save space in the Printer Inventory, the Infoprint Server ISPF panels do not generally store attributes with default values.

**Examples -- export**

**Exporting all objects in the Printer Inventory:**

- This example exports all objects in the Printer Inventory to UNIX file `inventory.export`:

  ```
  pidu -c 'export inventory.export ; '
  ```

- This example exports all objects in the Printer Inventory to MVS data set `USER1.INVENT.EXPORT`:

  ```
  pidu -c "export //\'USER1.INVENT.EXPORT\' ; "
  ```

**Exporting all or selected printer definitions:**

- This example exports all printer definitions in the Printer Inventory to UNIX file `printers.export`:

  ```
  pidu -c 'export printers.export printer ; '
  ```

- This example exports all printer definitions that contain attribute `output-class = K`, either in the printer definition or in an included component, to file `classk.export`:
Exporting selected FSA definitions: This example exports selected FSA definitions in the Printer Inventory to UNIX file psffsa.export. The where predicate specifies that only FSA definitions used by PSF be exported.

```
pi -c 'export classk.export printer where output-class=K ; '
```

list—list names of objects

Format

```
list objectclass [where condition [and|or condition]... ] ;
```

Description

The list command lists the names of all objects in a specified object class or only objects that meet certain criteria.

Operands

- **objectclass**: The class of the objects that you want to list. For a list of the valid object classes, see Table 37 on page 269.

- **where condition [and|or condition]...**: Conditions that can limit the objects that are listed. Only objects that meet the conditions are listed. If you omit the where predicate, all objects in the specified object class are listed.

Usage notes

You can use the list command in combination with the modify command to list all or selected objects in an object class and then modify one or more attributes. For an example, see "Listing and modifying printer definitions" on page 291.

Examples -- list

Listing printer definitions:

- This example lists all IP PrintWay printer definitions:
  ```
  pi -c 'list printer where printer-type=ip-printway ; '
  ```

- This example lists all PSF printer definitions:
  ```
  pi -c 'list printer where printer-type=psf-mvs ; '
  ```

- This example lists printer definitions that include the Protocol component named lpr_options:
  ```
  pi -c 'list printer where include-protocol=lpr_options ; '
  ```

- This example lists printer definitions that specify an LU name in the luname attribute. That is, the value of the luname attribute is not a null value.
  ```
  pi -c 'list printer where not luname=null ; '
  ```

- This example lists IP PrintWay printer definitions that do not include a Protocol component. That is, the value of the include-protocol attribute is a null value.
  ```
  pi -c 'list printer where printer-type=ip-printway and include-protocol=null;' 
  ```

- This example lists printer definitions whose names start with **prt**:
  ```
  pi -c 'list printer where name match "^prt" ; '
  ```

- This example lists printer definitions that contain attribute **output-class=K** either in the printer definition or in an included component:
modify—change attributes of an object

Format

modify objectclass name [attribute = value]... ;

Description

The modify command modifies attributes for an object in the Printer Inventory. The object must already exist in the Printer Inventory.

Changes you make to attributes for a printer definition or component generally take effect for the next data set that NetSpool and Print Interface allocate on the JES spool and the next data set that IP PrintWay selects from the JES spool. Changes to NetSpool end-of-file rules or to the NetSpool LU class (attribute lu-classes), however, are related to the VTAM session and do not take effect for the next data set allocated on the JES spool. For information about when changes to these fields take effect, see "Specifying how NetSpool determines end-of-file" on page 130 and "Grouping NetSpool printer LUs into LU classes" on page 112.

Changes you make to a printer definition or component do not affect data sets that IP PrintWay has retained on the JES spool after successful or failed transmission.

Changes you make to attributes for an FSA definition take effect only when you restart the IP PrintWay or PSF FSA. Changes you make to attributes for an FSS definition take effect when you restart the FSS.
modify

Operands

**objectclass**
The class of the object that you want to modify. For a list of the valid object classes, see Table 37 on page 269.

**name**
The name of the object. Names are case-sensitive, so be sure to use the correct uppercase and lowercase letters. Enclose the name in single or double quotation marks if the name contains special characters.

**attribute = value**
One or more attributes and values. Separate attributes with spaces. For the valid attributes for each object class, see “Attribute listing” on page 293.

Usage notes

- To remove an attribute, type `null` as the value for the attribute. For a description of the `null` value, see “Default values” on page 292.
- If you modify an attribute in a component, the modified attribute applies to all printer definitions that include the component unless the attribute is also specified for the printer definition itself. In this case, the printer definition retains its attribute value.
- If you repeat the same attribute in a `modify` statement, the PIDU program uses the last specification.
- You can use the `list` command with the `modify` command to modify all or selected objects in an object class. For an example, see “Listing and modifying printer definitions” on page 291.

Examples -- modify

**Modifying an allocation component:** This example modifies the Allocation component named printway. The modified attribute (`output-class`) applies to all printer definitions that include this component unless the `output-class` attribute is specified for the printer definition itself.

```
pidu -c 'modify allocation printway output-class=L ;'
```

**Modifying a printer definition:** This example changes the protocol used by IP PrintWay in the printer definition named lab_printer. (For the `create` statement for this printer definition, see “Creating an IP PrintWay printer definition for a PCL printer with IPP protocol” on page 276.)

```
pidu -c 'modify printer lab_printer
    protocol-type = lpr
    printer-uri = null
    printer-ip-address = printer2.boulder
    print-queue-name = TEXT ;'
```

The attributes modified in this printer definition are:

- **protocol-type**: The new protocol is the LPR protocol.
- **printer-uri**: This attribute is removed because the URI is not used for the LPR protocol.
- **printer-ip-address**: This attribute specifies the host name of the remote printer. It is required for the LPR protocol.
- **print-queue-name**: This attribute specifies the print queue name on the remote printer. It is required for the LPR protocol.
Listing and modifying printer definitions: This example, entered as one command on the z/OS UNIX command line, lists selected printer definitions and changes an attribute in those printer definitions. This example uses these PIDU commands and the awk command:

1. The PIDU list command lists the names of all printer definitions with output-class=K.

2. These names are input to the awk program, which writes PIDU modify commands to modify the output-class attribute. For information about the awk program, see z/OS UNIX System Services Command Reference.

3. The output from the awk program is input to the pidu command:

```
pidu -qc "list printer where output-class = K ; " |
awk '{ print "modify printer " $1 " output-class = "B";" }' |
pidu
```

rename—rename an object

Format
rename objectclass name newname ;

Description
The rename command renames an object in the Printer Inventory.

If you rename a component, this command automatically renames the component in all printer definitions that include the component. If you rename a printer definition, this command automatically renames the printer definitions in all printer pool definitions that list the printer definition.

Operands
objectclass The class of the object that you want to rename. For a list of the valid object classes, see Table 37 on page 269.

name The name of the object. Names are case-sensitive, so be sure to use the correct uppercase and lowercase letters. Enclose the name in single or double quotation marks if the name contains special characters.

newname The new name to identify the object. This name must be a unique name for the class of object in the Printer Inventory.

When you create a printer definition, printer-pool definition, job selection rule, or component, specify any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ # @ . - = /). Blank characters are not allowed. In an IP PrintWay printer definition, use name DFLTNTRY to designate the IP PrintWay default printer definition. The name is case-sensitive.

When you create an FSS or FSA definition, this name must match the name used to define the FSA or FSS to JES. Specify a valid combination of 1-8 letters, numbers, and special characters (# $ @). The first character cannot be numeric. Lowercase letters are converted to uppercase.

If the name contains special characters, enclose the name in single or double quotation marks.
Example -- rename
This example renames the printer definition named lab_printer to new name jim:

```
pidu -c 'rename printer lab_printer jim ; '
```

## Attribute characteristics
This section describes these characteristics of the attributes that you can specify in PIDU commands:
- Valid abbreviations for attribute names and values
- Default values for attributes
- Single-valued and multi-valued attributes
- Types of values: integers, strings, and fixed values

## Abbreviations
The attributes listed in this section show attribute names and values in their complete form. Often, you can abbreviate attribute names and values by using the first letter of each word in the name or value. For example, you can use the abbreviation `d-f-s` for the `document-formats-supported` attribute. You can use `po` for the `postscript` value, and specify the attribute and value pair as `d-f-s={po}`.

Sometimes specifying only the first letter in each word is ambiguous. For example, `c` might stand for `class` or `copies`. Here, specify enough of the name so that it is unique, as in `cl` or `co`. If the values are ambiguous, the PIDU program rejects the command with an error message.

## Default values
When you create an object and omit an attribute, no value is assigned to that attribute in the Printer Inventory. For attributes that have no value, Infoprint Server takes a default action, which is described in the heading “Default value”.

If you do specify a value for an attribute and later want to remove the attribute so that Infoprint Server does the default action, use the `modify` command and specify `null` as the attribute value.

For example, to remove the value for the `notify` attribute, you could specify:

```
notify = null
```

## Single-valued and multi-valued attributes
Specify attributes in this format, with or without spaces on either side of the equal sign:

```
attribute=value
attribute = value
```

Attributes can be either single-valued or multi-valued.

**Single-valued attributes:** Single-valued attributes accept only one value. For single-valued attributes, the syntax is:

```
attribute = value
attribute = "value with spaces"
```

**Multi-valued attributes:** Multi-valued attributes accept one or more values separated with spaces and enclosed in braces. Multi-valued attributes can contain a list of values or a value-map.

- A list assigns one or more values to the attribute. The syntax is:
Attributes

attribute = {value1 value2 value3}
For example: printer-names={printer1 printer2 printer3}

• A value-map assigns one value to another. The syntax is:
  attribute = {value1 -> value2 value3 -> value4}
  For example: filters={pcl -> pcl2afp.dll pdf -> pdf2afp.dll}

Types of values

You can specify these types of values:
• Integer values
• String values
• Fixed values, also known as enumerated values

Integer values
Some attributes accept integer values. You can specify integer values in either
decimal or hexadecimal format. Begin a hexadecimal value with 0 (zero) followed
by the letter x. After the 0x, type any number (0-9) or a letter (A-F or a-f).
Lowercase letters are equivalent to uppercase letters. The display command always
displays the decimal equivalent of hexadecimal values.

For example, these integer values are equivalent:
dump-code = 0x09600c00
dump-code = 157289480

String values
Some attributes accept a string of printable characters. Enclose a string value in
double or single quotation marks if it includes blanks or special characters (such as
#, (, ), or $). For example:
description = "My printer"

Most string values are stored in the Printer Inventory with the same uppercase and
lowercase letters that you type when you specify the value. However, in some
cases, lowercase letters are converted to uppercase letters. For example, the value
you enter for the output-class attribute is converted to uppercase because JES
accepts only uppercase letters for the JES output class.

Fixed values (enumerated values)
Some attributes accept one or more keywords as values. These keywords are called
fixed values. The pidu command calls these values enumerated values. Fixed values
are case-sensitive. Always use lowercase characters when typing fixed values. For
example, you can specify these fixed values for the printer-type attribute:

  printer-type=ip-printway
  printer-type=psf-mvs
  printer-type=general

Attribute listing

This section describes the attributes that you can use when you create or modify
objects in the Printer Inventory. The attributes for each object class are listed
alphabetically in the section for that object class. Table 39 on page 294 summarizes
the object classes and where you can find the list of valid attributes for that object
class.
### Attributes

### Attributes for the allocation object class

This section lists the attributes that are valid when you create Allocation components, which are in object class `allocation`. These attributes are also valid for the `printer` object class.

#### Required attributes

No attributes are required. However, if you plan to use Print Interface or NetSpool, you must specify the attributes that correspond to the JES work-selection criteria defined for the program (PSF or IP PrintWay) that you want to process the output data sets from the JES spool.

#### address-text

This multi-valued, list attribute specifies the address that is printed on the separator pages for a data set.

**ISPF field name:** Address

**Allowed values:** You can enter 1–4 values. Each value is a combination of 1–60 letters (a–z, A–Z), numbers (0–9), blanks, and special characters (such as: @ $ # , * - /). If a value contains blanks or special characters, enclose it in double quotation marks. If you specify more than one value, separate the values by spaces and enclose the list of values in braces. For example:

```
address-text={"6300 Diagonal Hwy." "Boulder, CO" 80301}
```
allocation and printer

This example uses three values, corresponding to three address lines.

**Default value:** None.

**Usage guidelines:**
- Whether the text specified by this attribute is printed depends on how the system administrator configures the separator sheet.
- IP PrintWay sends this attribute to the remote printer if the value of the `lpr-mode` attribute is `to-remote-psf`.
- This attribute is equivalent to the ADDRESS parameter of the OUTPUT JCL statement.

**afp-parameters**
This **single-valued** attribute specifies the name of a data set that contains AFP Download Plus parameters. If the data set is a partitioned data set, also specify the name of the member that contains the parameters, as shown in the example.

**ISPF field name:** AFP parameters

**Allowed values:** A valid data set name, with an optional member name. For example:
- `USER.AFPPARMS`
- `USER.PDS(AFPPARMS)`

**Default value:** None.

**Usage guidelines:**
- The data set must exist and be cataloged.
- This attribute is equivalent to the AFPPARMS parameter of the OUTPUT JCL statement.
- For more information about AFP Download Plus, see [PSF for z/OS: AFP Download Plus](#).

**building-text**
This **single-valued** attribute specifies the building location that is printed on the separator pages for a data set.

**ISPF field name:** Building

**Allowed values:** You can enter a combination of 1–60 letters (a–z, A–Z), numbers (0–9), blanks, and special characters (such as: @ $ # , * - /). If the value contains blanks or special characters, enclose it in double quotation marks. For example:
- `building-text="Building 003"`

**Default value:** No default value.

**Usage guidelines:**
- Whether the text specified by this attribute is printed depends on how the system administrator configures the separator sheet.
- IP PrintWay sends this attribute to the remote printer if the value of the `lpr-mode` attribute is `to-remote-psf`.
- This attribute is equivalent to the BUILDING parameter of the OUTPUT JCL statement.
burster-trimmer-stacker
This single-valued attribute indicates whether forms printed on a printer equipped with a burster-trimmer-stacker are left in continuous fanfold or are separated, trimmed, and stacked in single sheets.

ISPF field name: BURST

Allowed values: You can enter one of these fixed values:
yes The forms are burst, trimmed, and stacked.
no The forms are left in continuous fanfold.

Default value: The installation default determines if the forms are burst, trimmed, and stacked.

Usage guidelines:
• This attribute does not apply to IP PrintWay printer definitions.
• This attribute is equivalent to the BURST parameter of the OUTPUT and DD JCL statements.

chars
This multi-valued, list attribute specifies the names of the coded fonts that are used to print a data set on a printer.

ISPF field name: Character sets

Allowed values: You can enter 1–4 coded font names. Each name is a combination of 1–4 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). Blanks and other special characters are not allowed. If a value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

For valid coded font names, see IBM AFP Fonts: Font Summary for AFP Font Collection. Omit the X0 or XZ prefix from the coded font name.

If you specify more than one value, separate the values by spaces and enclose the list of values in braces. For example:
chars={60DB 60D8}

Default value: The font specified in the page definition is used. If the page definition does not specify a font:
• The transforms use the default font in the transform configuration file. If no font is specified, the transforms use font X060D9.
• PSF uses its default font.

Usage guidelines:
• This attribute applies to documents printed on an AFP printer.
• Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
• Some coded fonts have 6-character names, not counting the prefix. For the 4-character alternate coded font name, see IBM AFP Fonts: Font Summary for AFP Font Collection.
• PSF and the transforms use this attribute only if the page definition used to print the job does not specify fonts. If you specify fonts with this attribute and
the page definition also specifies fonts, PSF and the transforms use the fonts that are named in the page definition. PSF, however, uses the font in this attribute if the default page definition is used.

- If you specify more than one coded font with the `chars` attribute, the job must contain either shift-out-shift-in (SOSI) codes or table reference characters (TRCs) to use coded fonts other than the first one. IBM recommends that you do not mix SOSI codes and TRCs.
  - If the job contains TRCs, you must specify the `table-reference-characters` attribute value as `true`. PSF and the transforms use the TRC characters to select the corresponding coded font specified with the `chars` attribute.
  - If the job contains SOSI codes, PSF and the transforms use the first coded font specified with the `chars` attribute as the single-byte font and the second coded font as the double-byte font.

For more information about using multiple coded fonts, see `AFP: Programming Guide and Line Data Reference` and `PSF for z/OS: User’s Guide`.

- IP PrintWay sends this attribute to the remote printer if the value of the `lpr-mode` attribute is `to-remote-psf`.
- This attribute is equivalent to the `CHARS` parameter of the OUTPUT and DD JCL statements.

**checkpoint-pages**

This single-valued attribute specifies the number of pages you want between checkpoints that PSF takes while processing a data set.

**ISPF field name:** Checkpoint pages

**Allowed values:** You can enter an integer from 1 to 32767.

**Default value:** JES uses your system default. If no system default exists, PSF does not record checkpoints.

**Usage guidelines:**

- If you specify a value for this attribute and for `checkpoint-seconds`, JES determines which value to use.
- This attribute does not apply to IP PrintWay printer definitions.
- This attribute is equivalent to the `CKPTPAGE` parameter of the OUTPUT JCL statement.

**checkpoint-seconds**

This single-valued attribute specifies the number of seconds you want between checkpoints that PSF takes while processing a data set.

**ISPF field name:** Checkpoint seconds

**Allowed values:** You can enter an integer from 1 to 32767.

**Default value:** JES uses your system default. If no system default exists, PSF does not record checkpoints.

**Usage guidelines:**

- If you specify a value for this attribute and for `checkpoint-pages`, JES determines which value to use.
- This attribute does not apply to IP PrintWay printer definitions.
allocation and printer

- This attribute is equivalent to the CKPTSEC parameter of the OUTPUT JCL statement.

**color-map**

This *single-valued* attribute specifies the name of the object container for the color mapping table resource that PSF uses to print a data set containing color translation information. This attribute is only used when sending output to a printer that supports color mapping table resources.

**ISPF field name:** Color map

**Allowed values:** You can enter a combination of 1–8 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If the value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

**Default value:** If a color map is not specified for the data set or for the printer, PSF uses an internal color mapping table.

**Usage guidelines:**
- This attribute does not apply to IP PrintWay printer definitions.
- This attribute is equivalent to the COLORMAP parameter of the OUTPUT JCL statement.
- IBM recommends a prefix of M1 for color mapping table resources.

**com-setup-member**

This *single-valued* attribute specifies the name of the object container for the microfilm setup resource that PSF uses to print data on a microfilm device. This attribute is only used when sending output to a microfilm device.

**ISPF field name:** Com setup member

**Allowed values:** You can enter a combination of 1–8 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If the value contains special characters, enclose it in double quotation marks.

**Default value:** No default value.

**Usage guidelines:**
- IBM recommends a prefix of H1 for microfilm setup resources.
- This attribute does not apply to IP PrintWay printer definitions.
- This attribute is equivalent to the COMSETUP parameter of the OUTPUT JCL statement.

**copies**

This *single-valued* attribute specifies the number of collated copies you want to print.

**ISPF field name:** Copies

**Allowed values:** You can enter an integer from 1 to 32640.

**Default value:** 1
allocation and printer

Usage guidelines:
- This attribute does not apply to the e-mail protocol. Only one copy is sent.
- If you run IP PrintWay basic mode, this attribute does not apply to the VTAM protocol. Only one copy prints.
- Some Internet Printing Protocol (IPP) printers do not support the copies IPP job attribute. In this case, only one copy prints.
- PSF sends the entire document to the printer the specified number of times.
- PSF ignores this attribute if you specify one or more values for the copy-group attribute.
- This attribute is similar to the COPIES parameter of the OUTPUT and DD JCL statements.

**copy-group**
This multi-valued, list attribute specifies the number of copies of each page of the data set you want printed consecutively before the next page is printed. You can enter 1–8 copy groups. The data set is sent to the printer once for each copy group. The total number of copies equals the sum of the copy groups.

**ISPF field name:** Copy group

**Allowed values:** You can enter 1–8 integers, each from 1 to 255. If you specify more than one value, separate the values by spaces and enclose the list of values in braces.

Example:
```
copy-group={1 3 2}
```

When a data set containing three pages is printed:
- Copy group 1 prints one copy of each page.
- Copy group 2 prints three copies of each page.
- Copy group 3 prints two copies of each page.

**Default value:** No default values.

**Usage guidelines:**
- Each individual copy group or the sum of all copy groups cannot be greater than 255.
- When a copy group is specified, the copies attribute is ignored.
- This attribute does not apply to IP PrintWay printer definitions.
- This attribute is similar to the COPIES parameter of the OUTPUT and DD JCL statements.

**department-text**
This single-valued attribute specifies the department identifier that is printed on the separator pages for a data set.

**ISPF field name:** Department

**Allowed values:** You can enter a combination of 1–60 letters (a–z, A–Z), numbers (0–9), blanks, and special characters (such as: @ $ # , * - /). If the value contains blanks or special characters, enclose it in double quotation marks. For example:
```
department-text="Payroll Dept."
```

**Default value:** No default value.
**Usage guidelines:**

- Whether the text specified by this attribute is printed depends on how the system administrator configures the separator sheet.
- IP PrintWay sends this attribute to the remote printer if the value of the `lpr-mode` attribute is `to-remote-psf`.
- This attribute is equivalent to the DEPT parameter of the OUTPUT JCL statement.

**description**

This single-valued attribute describes the printer definition. This attribute is not required. However, the description can help users select a printer.

**ISPF field name:** Description

**Allowed values:** You can enter a combination of 1–256 letters (a–z, A–Z), numbers (0–9), blanks, and special characters (such as # $ @ ! = / -). If the value contains blanks or special characters, enclose it in double quotation marks. For example: description="4019 LaserPrinter PS39"

**Default value:** No default value.

**destination**

This single-valued attribute specifies a destination name for output data sets.

**ISPF field name:** DEST

**Allowed values:** You can enter a combination of 1–8 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If the value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

**Default value:** JES determines the value.

**Usage guidelines:**

- If you also specify the `jes-node` attribute, it becomes part of the DEST parameter for allocation: DEST=`jes-node.dest`.
- When you specify `dcf-routing =yes`, IP PrintWay uses this value, if specified, for printer selection. For more information, see the `dcf-routing` attribute in “Attributes for the printer object class” on page 371.
- This attribute is equivalent to the DEST parameter of the OUTPUT JCL statement.

**duplex**

This single-valued attribute indicates whether printing is done on both sides of the sheet and if so, how.

**ISPF field name:** Duplex

**Allowed values:** You can enter one of these fixed values:

- **no** Prints on the front side of the paper only.
- **yes** Prints on both sides of the paper so the top edge of side 1 is the top edge of side 2.
**tumble**

Prints on both sides of the paper but tumbles the print so the top edge of side 1 is the bottom edge of side 2.

**Default value:** The value in the form definition or the internal copy group is used.

**Usage guidelines:**
- This attribute applies to documents printed on an AFP printer.
- Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
- If IP PrintWay transmits the data set to a remote printer, the document is printed on both sides only if the line printer daemon (LPD) or the IPP server for the target printer supports duplex printing.
- IP PrintWay sends this attribute to the remote printer if `lpr-mode=to-remote-psf`.
- This attribute is equivalent to the DUPLEX parameter of the OUTPUT JCL statement.

**error-disposition**

This **single-valued** attribute indicates the disposition of a data set when PSF terminates the data set because an error occurs during printing.

**ISPF field name:** Error disposition

**Allowed values:** You can enter one of these fixed values:
- `default` Take the standard PSF action.
- `hold` Hold the data set on the JES spool until it is released by the system operator.
- `quit` Release the data set to JES. JES handles the data set based on the value of the `normal-output-disposition` attribute.

**Default value:** default

**Usage guidelines:**
- This attribute does not apply to IP PrintWay printer definitions.
- This attribute is equivalent to the PRTERRO parameter of the OUTPUT JCL statement.

**flash-count**

This **single-valued** attribute specifies the number of copies on which the forms flash (specified by the `flash-name` attribute) is to be printed, beginning with the first copy printed. A forms flash is a 3800 printer hardware frame that prints a photographic negative on selected forms.

**ISPF field name:** FLASH count

**Allowed values:** You can enter an integer from 0 to 255.

**Default value:** 255

**Usage guidelines:** This attribute is similar to the FLASH parameter of the OUTPUT and DD JCL statements.
**flash-name**

This **single-valued** attribute specifies the name of the forms flash used to print a data set. A *forms flash* is a 3800 printer hardware frame that prints a photographic negative on selected forms. PSF ignores this attribute for all printers but the 3800 printer. The number specified by the **flash-count** attribute determines how many copies of the data set are printed with the forms flash.

**ISPF field name:** FLASH name

**Allowed values:** You can enter a combination of 1–4 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). Blanks and other special characters are not allowed. If the value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

**Default value:** No default value.

**Usage guidelines:** This attribute is similar to the FLASH parameter of the OUTPUT and DD JCL statements.

**form-definition**

This **single-valued** attribute specifies the name of the form definition that defines how a data set is printed.

**ISPF field name:** Form definition

**Allowed values:** You can enter a combination of 1–8 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). Blanks and other special characters are not allowed. If the value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

You can specify the form definition name with or without the F1 prefix. However, if the name of the form definition, without the F1 prefix, starts with F1, specify the full name. For example, F1F1USER.

**Default value:** PSF and the transforms use the first inline form definition. If none exists:

- PSF uses the installation-defined default form definition.
- The transforms use the default form definition in the transform configuration file, `aopxfd.conf`. If a default form definition is not specified in the file, the transforms use F1CP0110.

**Usage guidelines:**

- This attribute applies to documents printed on an AFP printer.
- Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
- To correctly print documents that contain an inline form definition when using the AFP Printer Driver for Windows, do not specify a value for this attribute.
- If the job submitter specifies a form definition, it overrides the form definition in this attribute.
- IP PrintWay sends this attribute to the remote printer if the value of the **lpr-mode** attribute is **to-remote-psf**.
- This attribute is equivalent to the FORMDEF parameter of the OUTPUT JCL statement.
forms
This single-valued attribute specifies the name of the form on which data sets are printed.

ISPF field name: FORMS

Allowed values: You can enter a combination of 1–8 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). Blanks and other special characters are not allowed. If the value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

Default value: JES determines the default value.

Usage guidelines:
- If the job submitter specifies a form name, it overrides the form name in this attribute.
- When you specify dcf-routing = yes, IP PrintWay uses this value, if specified, for printer selection. For more information, see the dcf-routing attribute in "Attributes for the printer object class" on page 371.
- This attribute is equivalent to the FORMS parameter of the OUTPUT JCL statement.

forms-control-buffer
This single-valued attribute specifies the name of the forms control buffer (FCB) a printer uses to control the vertical format when printing a data set.

ISPF field name: FCB

Allowed values: You can enter a combination of 1–4 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). Blanks and other special characters are not allowed. If the value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

Default value: JES determines the default value.

Usage guidelines:
- IP PrintWay basic mode: If this is an IP PrintWay printer definition, also specify printway-formatting=use-fcb so that IP PrintWay basic mode uses the forms control buffer.
- This attribute is equivalent to the FCB parameter of the OUTPUT and DD JCL statements.

group-identifier
This single-valued attribute specifies the name that JES assigns to the output group for the data set. JES always assigns each data set that NetSpool and Print Interface allocate on the JES spool to a separate JES output group even though you specify a name in this attribute.

ISPF field name: GROUPID

Allowed values: You can enter a combination of 1–8 letters (a–z, A–Z) or numbers (0–9). Blanks and special characters are not allowed. If the value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

Default value: No default value.
**Usage guidelines:** This attribute is equivalent to the GROUPID parameter of the OUTPUT JCL statement.

**hold**
This single-valued attribute indicates the disposition of output data sets that Print Interface or NetSpool allocates on the JES spool.

**ISPF field name:** HOLD

**Allowed values:** You can enter one of these fixed values:

- **yes** or **true** Hold the data set until it is released by the system operator. Then print the data set and purge it.
- **no** or **false** In JES2, use the value specified in the normal-output-disposition attribute. In JES3, print the data set and then purge it.

**Default value:** The JES default is **no**.

**Usage guidelines:** This attribute is equivalent to the HOLD parameter of the DD JCL statement.

**input-tray-number**
This single-valued attribute specifies a number that identifies the paper source used to print a data set. To determine the tray numbers that your printer supports, see its documentation.

**ISPF field name:** Input tray

**Allowed values:** You can enter an integer from 1 to 255.

**Default value:** The default is the number in the form definition or the printer's default paper source.

**Usage guidelines:**
- This attribute applies to documents printed on an AFP printer.
- Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
- The transforms map this tray number to the tray number of the PCL or PostScript printer, using tray-mapping values specified in the transform configuration file, `aopxfd.conf`.
- IP PrintWay sends this attribute to the remote printer if the value of the `lpr-mode` attribute is `to-remote-psf`.
- The input tray that a job submitter specifies overrides this attribute.
- This attribute is equivalent to the INTRAY parameter of the OUTPUT JCL statement.

**jes-form-length**
This single-valued attribute indicates the paper length in inches or centimeters. This field is used to change the paper length of the physical paper at the printer without reconfiguring the printer. The value must contain at least one digit and an abbreviation for inches or centimeters.

**ISPF field name:** JES form length

**Allowed values:** You can enter a value in the format `nn.mmuu`.
allocation and printer

nn A number from 0 to 99. You must specify at least one digit to the left of the decimal point.

mmm A number from 0 to 999. The decimal point and the digits after it are optional.

uu One of these fixed values:

- in Inches
- cm Centimeters

Examples:

- jes-form-length=9.5in
- jes-form-length=12.345cm
- jes-form-length=2in
- jes-form-length=0.5cm

Default value: JES uses the printer’s default paper length.

Usage guidelines: This attribute is equivalent to the FORMLEN parameter of the OUTPUT JCL statement.

jes-maximum-line-count

This single-valued attribute specifies the maximum number of lines printed on each output page.

ISPF field name: LINECT

Allowed values: You can enter an integer from 0 to 255.

Default value: JES determines the default.

Usage guidelines: This attribute is equivalent to the LINECT parameter of the OUTPUT JCL statement.

jes-node

This single-valued attribute specifies the name of the destination node to which JES sends the data sets. This node is used with the value of the destination attribute as part of the JCL DEST parameter: DEST=jesnode.dest.

ISPF field name: JES node

Allowed values: You can enter a combination of 1–8 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). Blanks and other special characters are not allowed. If the value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

Default value: JES uses the node from which the job was submitted.

Usage guidelines: This attribute is similar to the DEST=nodename.name parameter of the OUTPUT JCL statement.

jes-priority

This single-valued attribute specifies a number that determines the order in which a data set is placed in the print queue. A data set with a higher number has a higher priority and is printed sooner.

ISPF field name: PRTY
**allocation and printer**

**jes-threshold**
This **single-valued** attribute specifies a number that indicates the maximum size allowed for a data set to print it as one unit of work. The size is calculated as the number of records in a data set multiplied by the number of copies requested. When this size exceeds the jes-threshold value, the data set is printed as two units of work.

**ISPF field name: THRESHLD**

**Allowed values:** You can enter an integer from 1 to 99999999.

**Default value:** JES uses the installation default specified at initialization.

**Usage guidelines:** This attribute is equivalent to the THRESHLD parameter of the OUTPUT JCL statement.

**jes-writer**
This **single-valued** attribute specifies the name of an external writer that processes the data sets. An external writer is an IBM- or installation-written program.

**ISPF field name: WRITER**

**Allowed values:** You can enter a combination of 1–8 letters (a–z, A–Z), numbers (0–9) and special characters (# $ @). Blanks and other special characters are not allowed. If the value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

**Default value:** No default value.

**Usage guidelines:** This attribute is equivalent to the WRITER parameter of the OUTPUT JCL statement.

**label-data-pages**
This **single-valued** attribute indicates whether the security label is printed on each page of printed output. The security label represents a security level and categories defined to RACF. The security label is determined by the SECLABEL parameter of the JOB JCL statement.

**ISPF field name: Label data pages**

**Allowed values:** You can enter one of these fixed values:

- **yes** The security label determined by SECLABEL is printed.
- **no** The security label is not printed.

**Default value:** PSF sets the default based on whether PSFMPL is active.
allocation and printer

Usage guidelines:
- This attribute does not apply to IP PrintWay printer definitions.
- This attribute is equivalent to the DPAGELBL parameter of the OUTPUT JCL statement.

name
This single-valued attribute specifies the name of the component.

Note: This is a non-settable attribute. Do not specify the name attribute on the PIDU create, force-create, or modify command. Instead, specify the name as an operand on the command. However, you can specify the name attribute when you construct a condition for the where predicate on the list and export commands.

ISPF field name: Component Name

Allowed values: Any combination of 1–17 letters (a–z, A–Z), numbers (0–9), and special characters (such as $@ # = /). Blank characters are not allowed. If the value contains special characters, enclose it in double quotation marks.

Default value: None.

name-text
This single-valued attribute specifies the requestor name that is printed on the separator pages for a data set.

ISPF field name: Name

Allowed values: You can enter a combination of 1–60 letters (a–z, A–Z), numbers (0–9), blanks, and special characters (such as: @ $ # , * / ). If the value contains blanks or special characters, enclose it in double quotation marks. For example:
name-text="R. Roper"

Default value: No default value.

Usage guidelines:
- Whether the text specified by this attribute is printed depends on how the system administrator configures the separator sheet.
- IP PrintWay sends this attribute to the remote printer if the value of the lpr-mode attribute is to-remote-psf.
- This attribute is equivalent to the NAME parameter of the OUTPUT JCL statement.

normal-output-disposition
This single-valued attribute indicates the normal output disposition of sysout data sets that Print Interface or NetSpool allocate on the JES spool.

ISPF field name: OUTDISP

Allowed values: You can enter one of these fixed values:
- write: Print the data set, then purge it.
- hold: Hold the data set until released, then print the data set and purge it.
- keep: Print the data set, then hold it until it is released.
**allocation and printer**

leave Hold the data set until released, then print the data set and hold it until it is released.

**purge** Delete the data set without printing (not recommended).

**Default value:** JES2 uses the installation default for normal disposition for the sysout class of the data set.

**Usage guidelines:**
- IP PrintWay ignores the `keep` and `leave` options. IP PrintWay always deletes data sets after printing them or sending them to an e-mail destination unless the job submitter or printer definition specifies a retention period. See “failure-retention-period” on page 389 and “successful-retention-period” on page 396.
- Do not select the `purge` option because JES deletes the data sets from the JES spool before they are printed.
- This attribute is similar to the OUTDISP parameter of the OUTPUT JCL statement.
- This attribute applies only to JES2. JES3 ignores it.
- JES2 ignores this attribute if `hold=yes`.

**notify**
This multi-valued, list attribute specifies the user IDs you want notified when the print jobs are completed. The notification sent to the specified user IDs indicates whether the print job completed successfully.

**ISPF field name:** NOTIFY... at node

**Allowed values:** You can enter 1–4 values in the format `node.userid`:
- `node` The node associated with the user ID. Specify from 1–8 alphanumeric or national ($, #, @) characters. Lowercase letters are converted to uppercase. If you do not specify a node, the node from which the job was submitted is used.
- `userid` The user ID. Specify from 1–8 alphanumeric or national ($, #, @) characters. The first character must be alphabetic or national. Lowercase letters are converted to uppercase.

If you specify more than one value, separate the values by spaces and enclose the list of values in braces. For example:

```plaintext
notify={boulder.martha charlie}
```

**Default value:** If you do not specify at least one user ID, no notification is sent. If you specify a user ID without a node, the node from which the job was submitted is used.

**Usage guidelines:**
- This attribute is equivalent to the NOTIFY parameter of the OUTPUT JCL statement.

**output-bin-number**
This single-valued attribute identifies the output bin a printer uses. To determine the bin numbers that your printer supports, see its documentation.

**ISPF field name:** Output bin
allowed values: You can enter an integer from 1 to 65535.

default value: The default is the output bin number in the form definition or the printer's default output bin.

usage guidelines:
- This attribute applies to documents printed on an AFP printer.
- Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
- IP PrintWay sends this attribute to the remote printer if the value of the lpr-mode attribute is to-remote-psf.
- The output bin that a job submitter specifies overrides this attribute.
- This attribute is equivalent to the OUTBIN parameter of the OUTPUT JCL statement.

output-class
This single-valued attribute specifies a JES output class for output data sets.

ISPf field name: CLASS

allowed values: You can enter a letter (a–z, A–Z) or number (0–9). Special characters are not allowed. Lowercase letters are converted to uppercase.

default value: JES determines the default value.

usage guidelines:
- When you specify dcf-routing = yes, IP PrintWay uses this value, if specified, for printer selection. For more information, see the dcf-routing attribute in “Attributes for the printer object class” on page 371.
- This attribute is equivalent to the CLASS parameter of the OUTPUT JCL statement.

overlay-back
This single-valued attribute specifies the name of the predefined data (lines, shading, text, boxes, or logos) that PSF and the transforms print on the back side of a page when the data set is duplexed.

ISPf field name: Overlay back

allowed values: You can enter a combination of 1–8 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If the value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

default value: No default value.

usage guidelines:
- This attribute applies to documents printed on an AFP printer.
- Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
- IP PrintWay sends this attribute to the remote printer if the value of the lpr-mode attribute is to-remote-psf.
- This overlay prints in addition to any overlay that the form definition specifies.
• If the job submitter specifies a back overlay, it overrides this overlay.
• This attribute is equivalent to the OVERLAYB parameter of the OUTPUT JCL statement.
• IBM recommends a prefix of O1 for overlay resources.

**overlay-front**
This *single-valued* attribute specifies the name of the predefined data (lines, shading, text, boxes, or logos) that PSF and transforms print on the front side of a page.

**ISPF field name:** Overlay front

**Allowed values:** You can enter a combination of 1–8 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If the value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

**Default value:** No default value.

**Usage guidelines:**
• This attribute applies to documents printed on an AFP printer.
• Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
• IP PrintWay sends this attribute to the remote printer if the value of the lpr-mode attribute is to-remote-psf.
• This overlay prints in addition to any overlay that the form definition specifies.
• If the job submitter specifies a front overlay, it overrides this overlay.
• This attribute is equivalent to the OVERLAYF parameter of the OUTPUT JCL statement.
• IBM recommends a prefix of O1 for overlay resources.

**page-definition**
This *single-valued* attribute specifies the name of the page definition that defines how a data set is printed.

**ISPF field name:** Page definition

**Allowed values:** You can enter a combination of 1–8 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). Blanks and other special characters are not allowed. If the value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

You can specify the page definition name with or without the P1 prefix. However, if the name of the page definition, without the P1 prefix, starts with P1, specify the full name. For example, P1P1USER.

**Default value:** PSF and the transforms use the first inline page definition. If none exists:
• PSF uses the installation-defined default page definition.
• The transforms use the default page definition in the transform configuration file, aopxfd.conf. If a default page definition is not specified in the file, the transforms use P1P08682.
Usage guidelines:
- This attribute applies to documents printed on an AFP printer.
- Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
- IP PrintWay sends this attribute to the remote printer if the value of the \texttt{lpr-mode} attribute is \texttt{to-remote-psf}.
- If the job submitter specifies a page definition, it overrides the page definition in this attribute.
- This attribute is equivalent to the PAGEDEF parameter of the OUTPUT JCL statement.

\textbf{print-error-messages}
This \textbf{single-valued} attribute indicates whether all message groups generated in the processing of a data set are printed or saved in a file:
- If PSF prints the data set on the z/OS system, the messages are printed at the end of the data set.
- If PSF sends the data set to an AFP Download Plus receiver to print on another system, PSF saves the messages in a file on the z/OS system.

\textbf{ISPF field name: Print error messages}

\textbf{Allowed values:} You can enter one of these fixed values:
\begin{itemize}
  \item \texttt{yes} \quad PSF prints or saves all error messages until an error occurs that ends processing.
  \item \texttt{no} \quad PSF does not print or save error messages unless an error occurs that ends processing. If that happens, only the message group describing the last error is printed or saved.
\end{itemize}

\textbf{Default value:} The default value for the PSF printer or for the AFP Download Plus sender.

\textbf{Usage guidelines:}
- This attribute does not apply to IP PrintWay printer definitions.
- This attribute is similar to the PIMSG parameter of the OUTPUT JCL statement.

\textbf{print-error-messages-maximum}
This \textbf{single-valued} attribute specifies the maximum number of message groups that PSF generates when the value of the \texttt{print-error-messages} attribute is \texttt{yes}.
When the maximum number is reached, PSF stops processing the data set and deletes it from the JES spool.

\textbf{ISPF field name: Maximum messages}

\textbf{Allowed values:} You can enter an integer from 0 to 999. A value of 0 means the data set is processed until it completes or an error occurs that ends processing of the data set.

\textbf{Default value:} 16

\textbf{Usage guidelines:}
- This attribute does not apply to IP PrintWay printer definitions.
- This attribute is similar to the PIMSG parameter of the OUTPUT JCL statement.
allocation and printer

print-error-reporting
This single-valued attribute indicates whether the printer reports character and position errors. Character errors are caused by trying to use a code point that is not assigned to a character in a font. Position errors are caused by trying to print outside the printable area.

ISPF field name: Print error reporting

Allowed values: You can enter one of these fixed values:

none Do not report any character or position errors.
all Report all character and position errors.
character Report only character errors.
position Report only position errors.

Default value: none

Usage guidelines:
• If you enter all, character, or position, it must be one of the values of the print-error-reporting-supported attribute of the Processing component of the printer definition.
• Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
• This attribute is similar to the DATACK parameter of the OUTPUT JCL statement.

process-mode
This single-valued attribute specifies the processing mode for printing a data set.

ISPF field name: PRMODE

Allowed values: You can enter a combination of 1–8 letters (a–z, A–Z) or numbers (0–9). Blanks and special characters are not allowed. These fixed values have special meaning:

LINE The data set is scheduled to a line-mode printer.
PAGE The data set is scheduled to a page-mode printer.
SOSI1 In a line-mode data set containing both single-byte and double-byte characters, PSF converts each shift-out, shift-in code to a blank and a Set Coded Font Local text control.
SOSI2 In a line-mode data set containing both single-byte and double-byte characters, PSF converts each shift-out, shift-in code to a Set Coded Font Local text control.
SOSI3 In a line-mode data set containing both single-byte and double-byte characters, PSF converts each shift-in code to a Set Coded Font Local text control and two blanks. It converts each shift-out code to a Set Coded Font Local text control.
SOSI4 When double-byte character set (DBCS) text is converted from ASCII to EBCDIC, PSF skips each shift-out, shift-in code and does not count the code when calculating offsets for the print data set.

Default value: JES determines the default.
Usage guidelines:

- This attribute applies to documents printed on an AFP printer.
- Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
- IP PrintWay sends this attribute to the remote printer if the value of the `lpr-mode` attribute is `to-remote-psf`.
- For the shift-out, shift-in process to work correctly, either the `chars` attribute or the page definition used to print the job must specify two coded fonts. The first must be a single-byte font, and the second must be a double-byte font.
- If the job submitter specifies a shift-in/shift-out value, it overrides this attribute.
- IBM recommends that you do not mix SOSI codes and TRCs in the same job.
- This attribute is equivalent to the `PRMODE` parameter of the `OUTPUT JCL` statement.

resolution

This `single-valued` attribute indicates the resolution at which the output was formatted. PSF uses this value to choose the correct resolution system library that has previously been defined by the system programmer.

ISPF field name: Resolution

Allowed values: You can enter one of these fixed values:

240  The data set was formatted with resources at 240 pels per inch.
300  The data set was formatted with resources at 300 pels per inch.

Default value: The system default library is used.

Usage guidelines: This attribute does not apply to IP PrintWay printer definitions.

resource-directories

This `multi-valued, list` attribute specifies the directories that contain TrueType and OpenType fonts that PSF uses to process data sets. PSF searches these directories before searching system-defined resource directories. PSF searches the directories in the order that you specify them.

ISPF field name: Resource directories

Allowed values: You can enter 1–8 valid directory names. Each directory name can be up to 255 characters. The first character must be a slash. If the value contains special characters other than slashes or periods, enclose it in double quotation marks.

If you specify more than one value, separate the values by spaces and enclose the list of values in braces. For example:

resource-directories={/u/myserid/truetype /u/myuserid/opentype}

Default value: PSF determines the resource directories.

Usage guidelines:

- If the job submitter specifies resource directories, those directories override this attribute.
allocation and printer

- PSF must be enabled for Unicode. If a PSF FSS definition exists, the `unicode-enabled` attribute must be specified. See "unicode-enabled" on page 438.
- This attribute is equivalent to the USERPATH parameter of the OUTPUT JCL statement.

**resource-library**

This **multi-valued**, list attribute specifies the names of user libraries that contain the AFP resources PSF and the AFP to PCL, AFP to PDF, or AFP to PostScript transform use to process data sets. The specified libraries are searched before any other resource libraries defined to PSF or to the transforms. The resources contained in the libraries include fonts, page segments, overlays, page definitions, and form definitions. For PSF to search the specified libraries for page definitions or form definitions, you or the job submitter must specify a value for the `page-definition` or `form-definition` attribute.

**ISPF field name:** Resource library

**Allowed values:** You can enter 1–8 valid library names. If the value contains special characters other than periods, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

If you specify more than one value, separate the values by spaces and enclose the list of values in braces. For example:

```
resource-library={font.library overlay.library}
```

**Default value:** None.

**Usage guidelines:**
- All resource libraries must exist and be cataloged.
- The job submitter must be authorized to read the libraries.
- This attribute applies to documents printed on an AFP printer.
- Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
- IP PrintWay sends this attribute to the remote printer if the value of the `lpr-mode` attribute is `to-remote-psf`.
- If the job submitter specifies a user library, it overrides this attribute.
- This attribute is equivalent to the USERLIB parameter of the OUTPUT JCL statement.

**restrict-printable-area**

This **single-valued** attribute indicates whether an area on each page of printed output is reserved for the security label. When an area is reserved for a security label, the printed output is shifted on each page. You cannot print data in the reserved area.

**ISPF field name:** Restrict printable area

**Allowed values:** You can enter one of these fixed values:

- **yes** An area on each page is reserved for the security label.
- **no** An area is not reserved for the security label.

**Default value:** PSF sets the default based on whether PSFMPL is active.
Usage guidelines:
- This attribute does not apply to IP PrintWay printer definitions.
- This attribute is equivalent to the SYSAREA parameter of the OUTPUT JCL statement.

**room-text**
This single-valued attribute specifies the room name that is printed on the separator pages for a data set.

**ISPF field name:** Room

**Allowed values:** You can enter a combination of 1–60 letters (a–z, A–Z), numbers (0–9), blanks, and special characters (such as: @ $ #, * - /). If the value contains blanks or special characters, enclose it in double quotation marks.

**Default value:** No default value.

Usage guidelines:
- Whether the text specified by this attribute is printed depends on how the system administrator configures the separator sheet.
- IP PrintWay sends this attribute to the remote printer if the value of the lpr-mode attribute is to-remote-psf.
- This attribute is equivalent to the ROOM parameter of the OUTPUT JCL statement.

**save-afp-statistics**
This single-valued attribute indicates whether you want PSF to generate an AFP Statistics (AFPSTATS) report. An AFPSTATS report gives you detailed information about the data set, such as where resources were found and what significant events happened.

**ISPF field name:** Save AFP statistics

**Allowed values:** You can enter one of these fixed values:

- **yes** An AFPSTATS report is generated.
- **no** An AFPSTATS report is not generated.

**Default value:** An AFPSTATS report is not generated.

Usage guidelines:
- This attribute is equivalent to the AFPSTATS parameter of the OUTPUT JCL statement.

**segment-pages**
This single-valued attribute specifies the maximum number of pages produced in a data set segment before it is sent for printing.

**ISPF field name:** SEGMENT

**Allowed values:** You can enter an integer from 1 to 99999. For example, a value of 100 means that each data segment contains 100 pages. If the data set produces 400 pages, four separate segments of 100 pages each are produced for printing.

**Default value:** No default value. The data set is not segmented.
**Usage guidelines:** This attribute is equivalent to the SEGMENT parameter of the DD JCL statement.

**table-reference-characters**

This single-valued attribute indicates whether data sets printed on this printer contain table-reference characters (TRCs). A TRC selects a font character set named by the **chars** attribute or the page definition used to print the job. A TRC is the first character of each line in the data set unless the first character is a carriage control character. In that case, the TRC is the second character.

**ISPF field name:** Table reference characters

**Allowed values:** You can enter one of these fixed values:

- **yes** or **true**  Data sets contain TRCs.
- **no** or **false**  Data sets do not contain TRCs.

**Default value:** no

**Usage guidelines:**

- This attribute applies to documents printed on an AFP printer.
- Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
- If the value of this attribute is **yes** and the page definition does not specify fonts, you must specify fonts with the **chars** attribute.
- If the data set contains TRCs and the value of this attribute is **no**, your printed output will not be correct. PSF and the transforms will interpret the TRCs as text characters.
- IBM recommends that you do not mix SOSI codes and TRCs in the same job.
- IP PrintWay sends this attribute to the remote printer if the value of the **lpr-mode** attribute is **to-remote-psf**.
- This attribute is equivalent to the TRC parameter of the OUTPUT JCL statement.

**title-text**

This single-valued attribute specifies the description of the output that can be printed on the separator pages for a data set. IP PrintWay also sends it to the printer's LPD for printing on a separator page generated by the printer's LPD. It also is the subject of e-mails when the job submitter does not specify another title.

**ISPF field name:** TITLE

**Allowed values:** You can enter a combination of 1–60 letters (a–z, A–Z), numbers (0–9), blanks, and special characters (such as: @ $ , * - /). If the value contains blanks or special characters, enclose it in double quotation marks. For example: title-text="Annual Report"

**Default value:** No default value.

**Usage guidelines:**

- Whether the text specified by this attribute is printed depends on how the administrator configures the separator sheet or how the LPD is implemented.
- IP PrintWay sends this attribute to the remote printer if the value of the **lpr-mode** attribute is **to-remote-psf**.
This attribute is equivalent to the TITLE parameter of the OUTPUT JCL statement.

**universal-character-set**
This single-valued attribute specifies a code for the universal character set (UCS) a printer uses to print data sets.

**ISPF field name:** UCS

**Allowed values:** You can enter a combination of 1–4 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). Blanks and other special characters are not allowed. If the value contains special characters, enclose it in double quotation marks. Lowercase letters are converted to uppercase.

**Default value:** JES determines the default.

**Usage guidelines:** This attribute is equivalent to the UCS parameter of the OUTPUT and DD JCL statements.

**userdata**
This multi-valued, list attribute specifies installation-defined information for the user.

**ISPF field name:** USERDATA

**Allowed values:** You can enter 1–16 values. Each value is a combination of 1–60 letters (a–z, A–Z), numbers (0–9), blanks, and special characters (such as: @ $ # , * - /). If a value contains blanks or special characters, enclose it in double quotation marks. If you specify more than one value, separate the values by spaces and enclose the list of values in braces. For example:

```
userdata={UserValue "LocalKey=Installation Data" "Installation Data"}
```

**Default value:** No default value.

**Usage guidelines:** This attribute is equivalent to the USERDATA parameter of the OUTPUT JCL statement.

**x-image-shift-back**
This single-valued attribute specifies a decimal number that indicates how much the logical page is shifted horizontally on the back side of each physical page.

**ISPF field name:** Image shift x-direction back

**Allowed values:** You can enter a number from 000.000 to 999.999, followed by the units. No blank spaces are allowed. These units are valid:

<table>
<thead>
<tr>
<th>Unit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>IN</td>
<td>Inches</td>
</tr>
<tr>
<td>CM</td>
<td>Centimeters</td>
</tr>
<tr>
<td>MM</td>
<td>Millimeters (default unit)</td>
</tr>
<tr>
<td>PELS</td>
<td>Picture elements (1/240 inch)</td>
</tr>
<tr>
<td>POINTS</td>
<td>Points (1/72 inch)</td>
</tr>
</tbody>
</table>

For example, you can enter these values:
**x-image-shift-back**

This single-valued attribute specifies a decimal number that indicates how much the logical page is shifted horizontally on the back side of each physical page.

**ISPF field name:** Image shift x-direction back

**Allowed values:** You can enter a number from 000.000 to 999.999, followed by the unit. For information about allowed units, see “x-image-shift-back” on page 328.

**Default value:** The default is the number in the form definition. The default unit is millimeters.

**Usage guidelines:**
- This attribute applies to documents printed on an AFP printer.
- Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
- IP PrintWay sends this attribute to the remote printer if the value of the lpr-mode attribute is to-remote-psf.
- The number that a job submitter specifies overrides this attribute.
- This attribute is similar to the OFFSETXB parameter of the OUTPUT JCL statement.

**y-image-shift-back**

This single-valued attribute specifies a decimal number that indicates how much the logical page is shifted vertically on the back side of each physical page.

**ISPF field name:** Image shift y-direction back

**Allowed values:** You can enter a number from 000.000 to 999.999, followed by the unit. For information about allowed units, see “x-image-shift-back” on page 328.

**Default value:** The default is the number in the form definition.

**Usage guidelines:**
- This attribute applies to documents printed on an AFP printer.
allocation and printer

- Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
- IP PrintWay sends this attribute to the remote printer if the value of the lpr-mode attribute is to-remote-psf.
- The number that a job submitter specifies overrides this attribute.
- This attribute is similar to the OFFSETYB parameter of the OUTPUT JCL statement.

**y-image-shift-front**

This **single-valued** attribute specifies a decimal number that indicates how much the logical page is shifted vertically on the front side of each physical page.

**ISPF field name:** Image shift y-direction front

**Allowed values:** You can enter a number from 000.000 to 999.999, followed by the unit. For information about allowed units, see “x-image-shift-back” on page 328.

**Default value:** The default is the number in the form definition. The default unit is millimeters.

**Usage guidelines:**
- This attribute applies to documents printed on an AFP printer.
- Products that transform AFP documents can support this attribute. For information, see the documentation for the transform.
- IP PrintWay sends this attribute to the remote printer if the value of the lpr-mode attribute is to-remote-psf.
- The number that a job submitter specifies overrides this attribute.
- This attribute is similar to the OFFSETYF parameter of the OUTPUT JCL statement.

### Attributes for the fsa object class

This topic lists attributes that are valid when you create FSA definitions, which are in object class **fsa**. You can create FSA definitions for PSF (or the AFP Download Plus feature of PSF) or IP PrintWay basic mode.

**Tip:** In this topic, **PSF** refers to PSF for z/OS, the AFP Download Plus feature of PSF, or IP PrintWay basic mode.

When you create an FSA definition for PSF, all attributes are valid. However, only a subset of the attributes apply for each type of FSA: PSF channel, PSF TCP/IP, PSF SNA, and PSF AFP Download Plus. For information about which attributes PSF uses, see:
- [PSF for z/OS: Customization](#)
- [PSF for z/OS: AFP Download Plus](#)

When you create an FSA definition for IP PrintWay basic mode, only these attributes are valid:
- **description**
- **fsa-type**
- **trace-mode**
**Required attributes**

For Infoprint Server to display the correct ISPF panel for an FSA definition, you must specify the **fsa-type** attribute. In addition, PSF requires these attributes:

- **applid** (when fsa-type=psf-sna)
- **form-definition**
- **luname** (when fsa-type=psf-sna)
- **page-definition**
- **printer-ip-address** (when fsa-type=psf-tcpip or fsa-type=afp-download-plus)

IP PrintWay does not require any attributes in an FSA definition.

**acknowledgement-level**

This **single-valued** attribute specifies whether PSF requests an acknowledgement every sheet or every page.

**ISPF field name:** Acknowledgement level

**Allowed values:** You can enter one of these fixed values:

- **page** An acknowledgement is requested for every page that is printed (default).
- **sheet** An acknowledgement is requested for every sheet that is printed.

**afpdp-dataset-grouping**

This **single-valued** attribute indicates whether output data sets in the same job are grouped together when sending them to the AFP Download Plus receiver.

**ISPF field name:** Data set grouping

**Allowed values:** You can enter one of these fixed values:

- **yes** PSF groups output data sets into jobs. The AFP Download Plus receiver prints the data sets in the same job in sequence with one set of separator pages for the job.
- **no** PSF does not group output data sets into jobs (default). The AFP Download Plus receiver treats each data set as a separate job.

**afpdp-working-directory**

This **single-valued** attribute specifies the name of the UNIX directory that AFP Download Plus uses as its working directory.

**ISPF field name:** Working directory

**Allowed values:** You can enter a directory name of up to 255 characters. PSF adds the beginning and ending forward slashes if they are missing from the directory name. If the value contains special characters other than slashes or periods, enclose the value in double quotation marks. This attribute is case-sensitive.

**Default value:** PSF uses directory */var/psf/.*

**Usage guidelines:** The directory must exist before you start AFP Download Plus.

**applid**

This **single-valued** attribute specifies the name of the VTAM application-program node for an FSA when PSF is printing to an SNA-attached printer in deferred-printing mode.
ISPF field name: Applid

Allowed values: You can enter a valid combination of 1–8 letters (a-z, A-Z), numbers (0–9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If a value contains special characters, enclose the value in quotation marks.

blank-compression
This single-valued attribute specifies whether PSF compresses blanks in line data. Blank compression is a data-compression function in PSF that reduces the amount of data sent through the attachment. PSF compresses blanks in line data that contains more than five contiguous blanks.

ISPF field name: Blank compression

Allowed values: You can enter one of these fixed values:

- yes PSF compresses blanks.
- no PSF does not compress blanks (default).

Usage guidelines: Blank compression for host-connected, channel-attached printers most likely does not improve data transmission.

capture-inline-resources
This single-valued attribute specifies whether PSF tells a connected DPF to capture and store inline resources.

ISPF field name: Capture inline resources

Allowed values: You can enter one of these fixed values:

- yes DPF captures inline resources.
- no DPF does not capture inline resources (default).

channel-buffer-count
This single-valued attribute specifies the number of 32 KB (32768 bytes) buffers that are needed for processing jobs on a channel-attached printer.

ISPF field name: Channel buffer count

Allowed values: You can enter an integer from 1 to 10000. This value is multiplied by 32 KB (32768 bytes) to determine the total amount of reserved storage.

chars
This multi-valued, list attribute specifies the names of the coded fonts that are used to print a data set on a printer.

ISPF field name: Character sets

Allowed values: You can enter 1–4 coded font names. Each name can be any combination of 1–4 letters (a-z, A-Z), numbers (0–9), and special characters (# $ @). Blanks and other special characters are not allowed. If a value contains special characters, enclose the value in quotation marks. Lowercase letters are converted to uppercase. For valid coded font names, see IBM AFP Fonts: Font Summary for AFP Font Collection.
If you specify more than one value, separate the values by spaces and enclose the list of values in braces. For example:
chars={GT12 GB12 G112}

**close-libraries-when-idle**
This single-valued attribute specifies whether PSF closes the resource libraries when there is no print activity for 60 seconds.

**ISPF field name:** Close libraries when idle

**Allowed values:** You can enter one of these fixed values:
- **yes** PSF closes resource libraries.
- **no** PSF does not close resource libraries (default).

**Usage guidelines:** Closing the resource libraries causes the operating system to free the fixed storage below the 16 MB line that is required for I/O to the resource libraries. However, this function adds the overhead of closing and reopening the libraries between print activity.

**color-map**
This single-valued attribute specifies the name of the object container for the color mapping table resource that PSF uses to print a data set containing color translation information. This attribute is only used when the printer supports color mapping table resources.

**ISPF field name:** Color map

**Allowed values:** You can enter a valid combination of 1–8 letters (a-z, A-Z), numbers (0–9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If a value contains special characters, enclose the value in quotation marks. Lowercase letters are converted to uppercase.

**Default value:** If a color map is not specified for the print job or printer, PSF uses an internal color mapping table.

**com-setup-member**
This single-valued attribute specifies the name of the object container for the microfilm setup resource that PSF uses to print data on a microfilm device. This attribute is only used when sending output to a microfilm device.

**ISPF field name:** Com setup member

**Allowed values:** You can enter a valid combination of 1–8 letters (a-z, A-Z), numbers (0–9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If a value contains special characters, enclose the value in quotation marks.

**compression**
This single-valued attribute indicates whether PSF compresses data before sending it to the AFP Download Plus receiver.

**ISPF field name:** Compression

**Allowed values:** You can enter one of these fixed values:
**lzw**  
PSF uses the LZW compression algorithm to compress data.

**none**  
PSF does not compress data (default).

**consolidate-im1-images**  
This *single-valued* attribute specifies whether PSF consolidates a multiple-celled IM1 image into a single Image Object Content Architecture (IOCA) image.

**ISPF field name: Consolidate IM1 images**

**Allowed values:** You can enter one of these fixed values:

- **yes**  
  PSF consolidates a multiple-celled IM1 image into a single IOCA image.

- **no**  
  PSF converts a multiple-celled IM1 image to multiple IOCA images (default).

**cse-check-fit**  
This *single-valued* attribute specifies how PSF checks the pages for cut-sheet emulation (CSE) mode.

**ISPF field name: Check CSE fit**

**Allowed values:** You can enter one of these fixed values:

- **no**  
  PSF does not check to see whether the page fits 2 up on the sheet (default).

- **first**  
  PSF only checks the first page printed for a new copy group to see if it fits 2 up on the sheet.

- **all**  
  PSF checks front side of all pages to see if they fit 2 up on the sheet.

**cse-orientation**  
This *single-valued* attribute specifies whether PSF generates portrait or landscape pages for printing in cut-sheet emulation (CSE) mode.

**ISPF field name: CSE orientation**

**Allowed values:** You can enter one of these fixed values:

- **portrait**  
  PSF generates portrait pages (default).

- **landscape**  
  PSF generates landscape pages.

**cse-preserve-page-position**  
This *single-valued* attribute indicates whether PSF preserves page placement when it repositions because of error recovery or an operator command. This attribute applies only when PSF is printing in cut-sheet emulation (CSE) mode.

If you specify **yes**, you must also specify **cse-sheet-eject=yes**.

**ISPF field name: CSE preserve page position**

**Allowed values:** You can enter one of these fixed values:

- **yes**  
  Page placement is preserved.

- **no**  
  Page placement is not preserved (default).
**cse-sheet-eject**
This **single-valued** attribute indicates whether PSF starts printing each data set and each copy of a data set on a new sheet of paper when PSF is printing in cut-sheet emulation (CSE) mode.

**ISPF field name:** CSE sheet eject

**Allowed values:** You can enter one of these fixed values:

- **yes** PSF starts printing on a new sheet. PSF also starts printing on a new sheet whenever it does offset stacking. For example, when the form definition requests separation for a new copy group.
- **no** PSF starts printing on the next sheet or, in N_UP printing, on the next front-side partition. The next front-side partition might occur on the same sheet. This is the default.

**default-process-mode**
This **single-valued** attribute specifies the default processing mode PSF uses to print data sets containing both single-byte and double-byte fonts.

**ISPF field name:** Default process mode

**Allowed values:** PSF ignores all values but these fixed values:

- **SOSI1** Each shift-out, shift-in code is converted to a blank and a Set Coded Font Local text control (default).
- **SOSI2** Each shift-out, shift-in code is converted to a Set Coded Font Local text control.
- **SOSI3** The shift-out code is converted to a Set Coded Font Local text control. The shift-in code is converted to a Set Coded Font Local text control and two blanks.
- **SOSI4** Each shift-out, shift-in code is skipped and not counted when calculating offsets for the print data set. SOSI4 is used when double-byte character set (DBCS) text is converted from ASCII to EBCDIC.

**description**
This **single-valued** attribute describes the FSA definition. The description can help you select an FSA definition from a list.

**ISPF field name:** Description

**Allowed values:** You can enter any combination of 1–256 letters (a-z, A-Z), numbers (0–9), blanks, and special characters (such as # $ @ ! = / -). If the value contains blanks or special characters, enclose the value in quotation marks.

**direct-download**
This **single-valued** attribute indicates whether PSF sends MO:DCA-P data directly to the AFP Download Plus receiver without first storing the data in a temporary file on the z/OS system.

**ISPF field name:** Direct download

**Allowed values:** You can enter one of these fixed values:

- **none** PSF does not send MO:DCA-P data directly to the AFP Download Plus receiver (default).
**Usage guidelines:**
- The `modca-p` value can improve performance.
- If `direct-download=modca-p`, the AFP Download Plus receiver must support the direct download method of receiving MO:DCA-P data.
- This attribute applies to PSF V4R4. Earlier releases ignore it.

**disconnect-action**
This single-valued attribute specifies the action that PSF takes when the time specified by the `printer-disconnect-interval` attribute expires and no output is available from JES. This attribute is only for SNA-attached and TCP/IP-attached printers.

**ISP field name:** Disconnect action

**Allowed values:** You can enter one of these fixed values:
- **stop** PSF stops the printer FSA, which can then be restarted only by an operator command.
- **redrive** PSF redrives the printer FSA according to the value specified by the `printer-management-mode` attribute (default).

**display-afdp-status**
This single-valued attribute specifies whether PSF displays the processing and transmission status of AFP Download Plus on the console.

**ISP field name:** Display status

**Allowed values:** You can enter one of these fixed values:
- **yes** PSF displays the status.
- **no** PSF does not display the status (default).

**Usage guidelines:** This attribute applies to PSF V4R4. Earlier releases ignore it.

**dump-code**
This single-valued attribute specifies a PSF reason code or a restartable abend reason code that causes a conditional dump of the PSF address space when the reason code occurs.

**ISP field name:** Dump: Code

**Allowed values:** You can enter an integer from 0 to 2147483647 or a 7–8 character hexadecimal value. A PSF reason code is an 8-character hexadecimal value. An abend reason code is a 7-character hexadecimal value. The first three characters are always ABD. When you enter a hexadecimal value (which is suggested), you can enter the hexadecimal characters only or the hexadecimal characters with a prefix of 0x. For example, enter the dump-code attribute in one of these ways:

```plaintext
dump-code=09600c00
dump-code=0x09600c00
dump-code=157289480
```
**dump-message-id**
This single-valued attribute specifies a PSF message that causes a conditional dump of the PSF address space when the message occurs.

**ISPF field name:** Dump: Message ID

**Allowed values:** You can enter a value in the format APS<nnn t>:

<nnn> Three to four digit message number

<tt> One of these type codes:

A Message requiring operator action

I Information message

**eject-to-front-facing**
This single-valued attribute specifies whether PSF is to tell your continuous-forms printer to do an eject to front facing before the job-header page, before the start of a new document, or both.

**ISPF field name:** Eject to front facing

**Allowed values:** You can enter one of these fixed values:

none Eject to front facing is not done (default).

job Eject to front facing is done before the job-header page.

document Eject to front facing is done between documents in a data set.

both Eject to front facing is done before the job-header page and between documents.

**end-sna-conversation**
This single-valued attribute specifies whether PSF ends the SNA LU1 conversation between print jobs while maintaining the SNA session with the printer when the NPRO timer expires or after no job is available for one minute and the last page printed has been stacked.

**ISPF field name:** End SNA conversation

**Allowed values:** You can enter one of these fixed values:

yes PSF ends the SNA LU1 conversation with the printer.

no PSF maintains the SNA LU1 conversation between print jobs (default).

**error-disposition-supported**
This single-valued attribute specifies whether PSF honors the error disposition requested for a data set when PSF ends a data set because an error occurs during processing.

**ISPF field name:** Error disposition supported

**Allowed values:** You can enter one of these fixed values:

yes PSF honors the requested error disposition.

no PSF does not honor the requested error disposition (default).
fsa

failure-action
This single-valued attribute specifies the PSF action after a printer failure, an SNA session failure, or a TCP/IP network failure.

ISPF field name: Failure action

Allowed values: You can enter one of these fixed values:
stop PSF must be restarted by an operator command.
connect PSF establishes a connection or waits for the printer (default).

form-definition
This single-valued attribute specifies the name of the default form definition that defines how a data set is printed. This attribute is required; however, if the job submitter specifies a form definition, it overrides the form definition in this attribute.

ISPF field name: Form definition

Allowed values: You can enter a valid combination of 1–8 letters (a–z, A–Z), numbers (0–9), and special characters (# $ @). Blanks and other special characters are not allowed. If a value contains special characters, enclose the value in quotation marks. Lowercase letters are converted to uppercase.

You can specify the form definition name with or without the F1 prefix. However, if the name of the form definition, without the F1 prefix, starts with F1, specify the full name. For example, F1F1USER.

fsa-trace-dsname
This single-valued attribute specifies the data set to which PSF directs an FSA trace when trace-mode=full, trace-mode=ipds, trace-mode=limit, or trace-mode=sync.

ISPF field name: FSA trace dsname

Allowed values: You can enter a valid data set name that is allocated before the PSF FSA is started.

fsa-type
This single-valued attribute specifies the type of FSA.

Allowed values: You can enter one of these fixed values:
afp-download-plus An FSA for the AFP Download Plus feature of PSF.
ip-printway An FSA for IP PrintWay basic mode.
psf-channel An FSA for a channel-attached printer controlled by PSF.
psf-sna An FSA for an SNA-attached printer controlled by PSF.
psf-tcip An FSA for a TCP/IP-attached printer controlled by PSF.

global-overlay
This single-valued attribute specifies the member name of a medium overlay that the printer places on every sheet of output, including separator pages and message pages.
**ISPF field name: Overlay**

**Allowed values:** You can enter a combination of 1–8 letters (a-z, A-Z), numbers (0–9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If a value contains special characters, enclose the value in quotation marks. Lowercase letters are converted to uppercase.

**goca-box-supported**

This single-valued attribute indicates whether the printer supports Graphics Object Content Architecture (GOCA) Box drawing orders.

**ISPF field name: GOCA Box orders**

**Allowed values:** You can enter one of these fixed values:

- **yes** The printer supports the orders.
- **no** The printer does not support the orders (default).

**Usage guidelines:** This attribute affects how line data is transformed to MO:DCA-P before it is sent to the AFP Download Plus receiver.

**goca-fractional-line-supported**

This single-valued attribute indicates whether the printer supports Graphics Object Content Architecture (GOCA) Set Fractional Line Width drawing orders.

**ISPF field name: GOCA Set Fractional Line Width orders**

**Allowed values:** You can enter one of these fixed values:

- **yes** The printer supports the orders.
- **no** The printer does not support the orders (default).

**Usage guidelines:** This attribute affects how line data is transformed to MO:DCA-P before it is sent to the AFP Download Plus receiver.

**goca-process-color-supported**

This single-valued attribute indicates whether the printer supports Graphics Object Content Architecture (GOCA) Set Process Color drawing orders.

**ISPF field name: GOCA Set Process Color orders**

**Allowed values:** You can enter one of these fixed values:

- **yes** The printer supports the orders.
- **no** The printer does not support the orders (default).

**Usage guidelines:** This attribute affects how line data is transformed to MO:DCA-P before it is sent to the AFP Download Plus receiver.

**highlight-communications-failure-message**

This single-valued attribute specifies whether PSF highlights the message that it writes to the z/OS console when a communications failure occurs with the printer (message APS6501A). Highlighting the communications failure message can help you detect a problem that requires attention because the message remains on the console until the operator deletes it. This attribute applies to TCP/IP-attached printers.
ISPF field name: Highlight communications failure message

Allowed values: You can enter one of these fixed values:

yes  PSF highlights the communications failure message.
no   PSF does not highlight the communications failure message (default).

image-output-format
This single-valued attribute indicates the format that PSF uses for all image data that it sends to the AFP Download Plus receiver.

ISPF field name: Image output format

Allowed values: You can enter one of these fixed values:

ioca  Image data is in uncompressed Image Object Content Architecture (IOCA) format (default).
unchanged  Image data is in the same format as in the input document.

Usage guidelines: This attribute affects how line data is transformed to MO:DCA-P before it is sent to the AFP Download Plus receiver.

inhibit-recovery
This single-valued attribute indicates whether PSF inhibits error recovery for a job so that data is only resent to the printer if it has not already printed.

ISPF field name: Inhibit recovery

Allowed values: You can enter one of these fixed values:

yes  Error recovery is inhibited and data is only resent if it has not printed.
no   Recovery is not inhibited and data is resent from the point of the error (default).

inline-bcoca-objects
This single-valued attribute indicates whether PSF includes Bar Code Object Content Architecture™ (BCOCA) objects inline with the documents it sends to the AFP Download Plus receiver.

ISPF field name: Bar code objects (BCOCA)

Allowed values: You can enter one of these fixed values:

yes  PSF includes BCOCA objects inline (default).
no   PSF does not include BCOCA objects inline.

inline-color-management-resources
This single-valued attribute indicates whether PSF includes color management resources (CMRs) inline with the documents it sends to the AFP Download Plus receiver.

ISPF field name: Color management resources

Allowed values: You can enter one of these fixed values:

all  PSF includes all CMRs that are on the sending system. If you
specify this value, transmission time is longer because CMRs can be quite large. Specify this value if the receiving system does not contain CMRs.

generic  PSF includes all generic CMRs and all CMRs that the data stream references. Specify this value if any documents use CMRs that are not on the receiving system. Device-specific CMRs must reside on the receiving system or in the printer. This value is the default.

none  PSF does not include any CMRs inline. Specify this value if the CMRs reside on the receiving system.

**inline-foca-objects**
This **single-valued** attribute indicates whether PSF includes Font Object Content Architecture (FOCA) objects inline with the documents it sends to the AFP Download Plus receiver.

**ISPF field name:** Font objects (FOCA)

**Allowed values:** You can enter one of these fixed values:

- **yes**  PSF includes FOCA objects inline (default).
- **no**  PSF does not include FOCA objects inline.

**inline-form-definitions**
This **single-valued** attribute indicates whether PSF includes form definitions inline with the documents it sends to the AFP Download Plus receiver.

**ISPF field name:** Form definitions

**Allowed values:** You can enter one of these fixed values:

- **yes**  PSF includes form definitions inline (default).
- **no**  PSF does not include form definitions inline.

**inline-goca-objects**
This **single-valued** attribute indicates whether PSF includes Graphics Object Content Architecture (GOCA) objects inline with the documents it sends to the AFP Download Plus receiver.

**ISPF field name:** Graphics objects (GOCA)

**Allowed values:** You can enter one of these fixed values:

- **yes**  PSF includes GOCA objects inline (default).
- **no**  PSF does not include GOCA objects inline.

**inline-ioca-objects**
This **single-valued** attribute indicates whether PSF includes Image Object Content Architecture (IOCA) objects inline with the documents it sends to the AFP Download Plus receiver.

**ISPF field name:** Image objects (IOCA)

**Allowed values:** You can enter one of these fixed values:

- **yes**  PSF includes IOCA objects inline (default).
- **no**  PSF does not include IOCA objects inline.
**inline-object-containers**
This **single-valued** attribute indicates whether PSF includes object containers inline with the documents it sends to the AFP Download Plus receiver.

**ISPF field name:** Object containers

**Allowed values:** You can enter one of these fixed values:
- **yes**  PSF includes object containers inline (default).
- **no**   PSF does not include object containers inline.

**inline-overlays**
This **single-valued** attribute indicates whether PSF includes overlays inline with the documents it sends to the AFP Download Plus receiver.

**ISPF field name:** Overlays

**Allowed values:** You can enter one of these fixed values:
- **yes**  PSF includes overlays inline (default).
- **no**   PSF does not include overlays inline.

**inline-page-segments**
This **single-valued** attribute indicates whether PSF includes page segments inline with the documents it sends to the AFP Download Plus receiver.

**ISPF field name:** Page segments

**Allowed values:** You can enter one of these fixed values:
- **yes**  PSF includes page segments inline (default).
- **no**   PSF does not include page segments inline.

**inline-ptoca-objects**
This **single-valued** attribute indicates whether PSF includes Presentation Text Object Content Architecture (PTOCA) objects inline with the documents it sends to the AFP Download Plus receiver.

**ISPF field name:** Presentation text objects (PTOCA)

**Allowed values:** You can enter one of these fixed values:
- **yes**  PSF includes PTOCA objects inline (default).
- **no**   PSF does not include PTOCA objects inline.

**Usage guidelines:** This attribute applies to PSF V4R4. Earlier releases ignore it.

**inline-truetype-fonts**
This **single-valued** attribute indicates whether PSF includes TrueType and OpenType fonts inline with the documents it sends to the AFP Download Plus receiver.

**ISPF field name:** TrueType fonts

**Allowed values:** You can enter one of these fixed values:
- **yes**  PSF includes TrueType and OpenType fonts inline (default).
PSF does not include TrueType and OpenType fonts inline.

**input-tray-substitutions**
This *multi-valued, value-map* attribute associates one input tray number with two substitute tray numbers: one tray number for jobs that print on a single side of the paper and another tray number for jobs that print on both sides of the paper.

**ISPF field name:** Input Tray Substitutions

**Allowed values:** One to four sets of values in the format: `input_tray -> {simplex_tray duplex_tray}`:

- **input_tray** An integer from 1-255 that identifies the tray specified for the job in the INTRAY JCL parameter, the `input-tray-number` job attribute, or the form definition PSF uses to print the job.
- **simplex_tray** An integer from 1-255 that identifies the tray PSF is to use for jobs printed on a single side of the paper.
- **duplex_tray** An integer from 1-255 that identifies the tray PSF is to use for jobs printed on both sides of the paper.

To determine the tray numbers for your printer, see the printer documentation.

Enclose the entire values in braces. For example:

```
input-tray-substitutions = { 1 ->{1 3} 2 -> {2 4} }
```

In this example:
- When the job submitter specifies tray 1, PSF uses tray 1 for jobs that print on a single side of the paper and tray 3 for jobs that print on both sides of the paper.
- When the job submitter specifies tray 2, PSF uses tray 2 for jobs that print on a single side of the paper and tray 4 for jobs that print on both sides of the paper.

**Default value:** PSF does not use substitute tray numbers.

**Usage guidelines:** Specify this attribute when the same side-sensitive or edge-sensitive paper is loaded in different trays in two different directions. That is, in one direction for printing on a single side of the paper and in another direction for printing on both sides of the paper.

**interrupt-message-page**
This *single-valued* attribute specifies whether the interrupt message page that PSF inserts in your printed output is printed.

**ISPF field name:** Interrupt message page

**Allowed values:** You can enter one of these fixed values:

- **print** An interrupt message page is printed (default).
- **suppress** An interrupt message page is not printed.

**interrupt-message-page-copies**
This *single-valued* attribute specifies the number of copies PSF produces of the interrupt message page when the mark-interrupt-message-page attribute is specified.

**ISPF field name:** Interrupt message page: Copies
**Allowed values:** You can enter an integer from 1 (default) to 10.

**ioca-replicate-trim-supported**

This *single-valued* attribute indicates whether the printer supports the Image Object Content Architecture (IOCA) Replicate and Trim function.

**ISPF field name:** IOCA replicate and trim function

**Allowed values:** You can enter one of these fixed values:

- **yes** The printer supports the function.
- **no** The printer does not support the function (default).

**Usage guidelines:** This attribute affects how line data is transformed to MO:DCA-P before it is sent to the AFP Download Plus receiver.

---

**issue-intervention-messages**

This *single-valued* attribute specifies whether PSF displays intervention messages on the z/OS system console. An intervention message means that a printer has a physical problem, such as a paper jam or an open paper tray. After an operator fixes the problem, the printer starts printing again. This attribute applies to SNA-attached and TCP/IP-attached printers.

**ISPF field name:** Issue intervention messages

**Allowed values:** You can enter one of these fixed values:

- **yes** Intervention messages are displayed.
- **no** Intervention messages are not displayed.

**Default value:** Intervention messages are not displayed.

---

**issue-setup-messages**

This *single-valued* attribute specifies the setup parameters for which JES should display setup messages on the z/OS system console when an SNA-attached or TCP/IP-attached printer is initialized and at the start of any job that specifies a change in a setup parameter from what is active for the printer.

**ISPF field name:** Issue setup messages

**Allowed values:** You can enter one of these fixed values:

- **none** Do not display setup messages (default).
- **burst** Display setup messages for the BURST setup parameter.
- **forms** Display setup messages for the FORMS setup parameter.
- **all** Display setup messages for both BURST and FORMS setup parameters.

---

**label-data-pages**

This *single-valued* attribute specifies whether the security label is printed on each page of printed output. The security label is determined by the SECLABEL parameter of the JOB JCL statement.

**ISPF field name:** Label data pages

**Allowed values:** You can enter one of these fixed values:

- **yes** The security label determined by SECLABEL is printed.
The security label is not printed.

**Default value:** If this attribute is not specified, PSF sets the value to *yes* if PSFMPL is active (default) or to *no* if PSFMPL is not active. For more information, see [PSF for z/OS: Security Guide](#).

**label-separator-pages**

This single-valued attribute specifies whether the security label is printed on a separator page. The security label is determined by the SECLABEL parameter of the JOB JCL statement.

**ISPF field name:** Label separator pages

**Allowed values:** You can enter one of these fixed values:

*yes*  The security label determined by SECLABEL is printed.

*no*   The security label is not printed.

**Default value:** If this attribute is not specified, PSF sets the value to *yes* if PSFMPL is active (default) or to *no* if PSFMPL is not active. For more information, see [PSF for z/OS: Security Guide](#).

**location**

This single-valued attribute lets you specify the location of the printer or the AFP Download Plus receiver. The location can help users find printers or AFP Download Plus receivers.

**ISPF field name:** Location

**Allowed values:** Any combination of 1–256 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as # $ @ ! = / -). If a value contains blanks or special characters, enclose the value in quotation marks.

**Default value:** None.

**Usage guidelines:** If you use the same format to specify the location in all FSA definitions (for example: Bldg 3/Col 2), users can find all printers or AFP Download Plus receivers with similar locations, such as all printers in building 3.

**logmode**

This single-valued attribute specifies the name of the VTAM logon-mode table entry, which defines the session parameters for an SNA-attached printer.

**ISPF field name:** Logmode

**Allowed values:** You can enter a valid combination of 1–8 letters (a-z, A-Z), numbers (0-9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If a value contains special characters, enclose the value in quotation marks. Lowercase letters are converted to uppercase.

**luname**

This single-valued attribute specifies the unique, logical-unit name of an SNA-attached printer.

**ISPF field name:** LU name
map-to-outline-fonts

This **single-valued** attribute specifies whether PSF maps fonts to outline fonts.

**ISPF field name:** Map to outline fonts

**Allowed values:** You can enter one of these fixed values:

- **yes**: PSF uses system and user mapping tables to map fonts to corresponding outline fonts.
- **no**: PSF does not map fonts to outline fonts (default).

**Usage guidelines:** Specify `map-to-outline-fonts=yes` if your printer supports outline fonts, you have existing applications that use raster fonts, and you want to use outline fonts without changing the applications.

mark-interrupt-message-page

This **single-valued** attribute specifies whether PSF marks the interrupt message page with form marks.

**ISPF field name:** Interrupt message page: Mark page

**Allowed values:** You can enter one of these fixed values:

- **yes**: PSF marks the interrupt message page with form marks.
- **no**: PSF does not mark the interrupt message page (default).

mcf-name

This **single-valued** attribute specifies how PSF builds the Map Coded Font (MCF) Format 2 structured field in the data it sends to the AFP Download Plus receiver.

**ISPF field name:** Map Coded Font (MCF) Format 2 Name

**Allowed values:** You can enter one of these fixed values:

- **coded-font**: PSF uses the name of the coded font to build the MCF structured field. Specify this value for documents that contain double-byte character set (DBCS) fonts.
- **codepage-character-set**: PSF uses the names of the code page and character set to build the MCF structured field (default).

**Usage guidelines:** This attribute affects how line data is transformed to MO:DCA-P before it is sent to the AFP Download Plus receiver.

message-count-before-dump

This **single-valued** attribute specifies the number of times the message specified by the `dump-message-id` attribute is sent before PSF produces a conditional dump.

**ISPF field name:** Dump: Count
Allowed values: You can enter an integer from 1 (default) to 99.

**name**
This *single-valued* attribute specifies the name of the FSA. This name must be a unique name in the Printer Inventory and it must match the name on the JES initialization statement.

*Note:* This is a *non-settable* attribute. Do not specify the name attribute on the PIDU create, force-create, or modify command. Instead, specify the name as an operand on the command. However, you can specify the name attribute when you construct a condition for the where predicate on the list and export commands.

**ISPF field name:** FSA name

Allowed values: None.

**no-response-action**
This *single-valued* attribute specifies what action PSF takes when the time specified by the response-timeout attribute expires and a response has not been received from the printer or from the AFP Download Plus receiver.

**ISPF field name:** No response action

Allowed values: You can enter one of these fixed values:

- **notify-jes** PSF notifies JES that an expected response was not received (default).
- **notify-user** PSF sends a message to the user ID specified by the no-response-notify attribute and to JES indicating that an expected response was not received.
- **notify-operator** PSF sends a message to the system operator and to JES indicating that an expected response was not received.
- **terminate** PSF stops the printer FSA or the AFP Download Plus FSA. The system operator must issue a command to restart the FSA. The active data set is restarted from the last checkpoint.

*Usage guidelines:* This attribute applies to AFP Download Plus V4R4. Earlier releases ignore it.

**no-response-notify**
This *single-valued* attribute specifies the user ID to which PSF sends a message when an expected response is not received from the printer or from the AFP Download Plus receiver before time expires. This attribute is used when no-response-action=notify-users.

**ISPF field name:** No response action: Notify

Allowed values: Specify the value in the format node:userid:

- **node** The node associated with the user ID. Specify from 1–8 alphanumeric or national ($, #, @) characters. Lowercase letters are converted to uppercase.
  
  The node is required.
userid

The user ID. Specify from 1–8 alphanumeric or national (\$, #, @) characters. The first character must be alphabetic or national. Lowercase letters are converted to uppercase.

Usage guidelines: This attribute applies to AFP Download Plus V4R4. Earlier releases ignore it.

offset-interrupt-message-page
This single-valued attribute specifies whether offset stacking is required for the interrupt message page.

ISPF field name: Interrupt message page: Offset page

Allowed values: You can enter one of these fixed values:

- yes The printed output is offset stacked, beginning at the interrupt message page.
- no No offset stacking is done for the interrupt message page (default).

offset-stacking
This single-valued attribute controls when PSF does offset stacking. You can use offset stacking to separate printed output on cut-sheet printers and on continuous-forms printers that support offset stacking.

ISPF field name: Offset stacking

Allowed values: You can enter one of these fixed values:

- dataset PSF does offset stacking at the start of a new data set or copy of a data set.
- job PSF does offset stacking at the start of a new job.
- none PSF does not do offset stacking.

Usage guidelines:
- This attribute lets you control offset stacking separately from copy marking. If you select a value in this attribute for a printer that supports offset stacking, the COPYMARK parameter (in the JES initialization statement) and the suppress-copy-marks attribute control only copy marking and not offset stacking.
- If you do not specify this attribute, the COPYMARK parameter and the suppress-copy-marks attribute control both copy marking and offset stacking.
- PSF uses the value in this attribute for all jobs unless you override the value in a PSF Exit 7 Begin Data Set (BDS) call.

oid-format-supported
This single-valued attribute indicates whether the printer supports the Object Identifier (OID) format for TrueType and OpenType fonts.

ISPF field name: Object identifier (OID) format

Allowed values: You can enter one of these fixed values:

- yes The printer supports the OID format.
- no The printer does not support the OID format (default).
Usage guidelines: This attribute affects how line data is transformed to MO:DCA-P before it is sent to the AFP Download Plus receiver.

**operator-security-profile**

This single-valued attribute specifies the name of the RACF resource profile in the PRINTSRV class that controls who can work with this PSF printer or AFP Download Plus sender using Infoprint Central.

**ISPF field name:** Operator security profile

**Allowed values:** A combination of letters, numbers, and special characters except for commas, semicolons, parentheses, and blanks. If the value contains special characters, enclose it in single or double quotation marks. Lowercase letters are converted to uppercase. Do not start names with AOP. For example:

```plaintext
operator-security-profile = "DENVER.001"
```

**Usage guidelines:**
- To authorize users to a group of printers, specify the same profile name in the PSF FSA definitions and IP PrintWay printer definitions for all the printers in the group.
- If you have defined profiles in the OPERCMDS class that protect operator commands, users must have the appropriate level of access to those profiles to work with the printer. This is true whether or not you specify a profile in this attribute.
- For information about the PRINTSRV class, see [z/OS Infoprint Server Customization](https://www.ibm.com/docs/en/infoprint-server).

**Default value:** None.

**override-3800-default-font**

This single-valued attribute specifies whether PSF tells the 3800 to replace the hardware default font with the first font in the current font list.

**ISPF field name:** 3800 compatibility: Override default font

**Allowed values:** You can enter one of these fixed values:

- **yes**  PSF lets the printer replace the hardware default font.
- **no**   The printer uses the hardware default font (default).

**page-accounting-supported**

This single-valued attribute indicates whether PSF sends information, such as the number of pages and sheets in a data set, to the AFP Download Plus receiver. The AFP Download Plus receiver can use the information to provide more accurate accounting information.

**ISPF field name:** Page accounting supported

**Allowed values:** You can enter one of these fixed values:

- **yes**  PSF sends accounting information to the AFP Download Plus receiver.
- **no**  PSF does not send accounting information (default).

**Usage guidelines:** Select this option if the AFP Download Plus receiver supports the `-opagecount` and `-osheetcount` parameters.
**page-definition**

This **single-valued** attribute specifies the name of the default page definition that defines how a data set is printed. This attribute is required; however, if the job submitter specifies a page definition, it overrides the page definition in this attribute.

**ISPF field name:** Page definition

**Allowed values:** You can enter a valid combination of 1–8 letters (a-z, A-Z), numbers (0–9), and special characters (# $ @). Blanks and other special characters are not allowed. If a value contains special characters, enclose the value in quotation marks. Lowercase letters are converted to uppercase.

You can specify the page definition name with or without the P1 prefix. However, if the name of the page definition, without the P1 prefix, starts with P1, specify the full name. For example, P1P1USER.

**paper-length**

This **single-valued** attribute specifies the length of the paper that is loaded in the printer. The 3800 Line-Mode Conversion and Line-Mode Migration functions in AFP Download Plus can use this value to format line data.

**ISPF field name:** Paper length

**Allowed values:** A value in the format **nnnn.mmmuu**:

- **nnnn** A number from 0 to 9999. You must specify at least one digit to the left of the decimal point.
- **mmm** A number from 0 to 999. The decimal point and the digits after it are optional.
- **uu** One of these fixed values:
  - **IN** Inches
  - **CM** Centimeters
  - **MM** Millimeters
  - **PELS** Picture elements (1/240 inch)
  - **POINTS** Points (1/72 inch)

The default is 14IN.

**Usage guidelines:**

- If you specify the unit as PELS or POINTS, specify the value as a whole number with no decimal point.
- This attribute applies to PSF V4R4. Earlier releases ignore it.

**paper-width**

This **single-valued** attribute specifies the width of the paper that is loaded in the printer. The 3800 Line-Mode Conversion and Line-Mode Migration functions in AFP Download Plus can use this value to format line data.

**ISPF field name:** Paper width

**Allowed values:** A value in the format **nnnn.mmmuu**:
A number from 0 to 9999. You must specify at least one digit to the left of the decimal point.

A number from 0 to 999. The decimal point and the digits after it are optional.

One of these fixed values:

- **IN**  Inches
- **CM**  Centimeters
- **MM**  Millimeters
- **PELS**  Picture elements (1/240 inch)
- **POINTS**  Points (1/72 inch)

The default is 13.2IN.

**Usage guidelines:**
- If you specify the unit as PELS or POINTS, specify the value as a whole number with no decimal point.
- This attribute applies to PSF V4R4. Earlier releases ignore it.

**port-number**

This **single-valued** attribute specifies the port number with which PSF is to establish a connection to a TCP/IP-attached printer or to an AFP Download Plus receiver. The value in this attribute must match the TCP/IP port number in the printer or the AFP Download Plus receiver.

**ISPF field name:** Port number

**Allowed values:** You can enter an integer from 1 to 65535. The default is 5001.

**print-error-messages**

This **single-valued** attribute specifies whether PSF should print error messages at the end of a data set. If `fsa-type=afp-download-plus`, PSF saves all messages in a file on the z/OS system instead of printing them.

**ISPF field name:** Print error messages

**Allowed values:** You can enter one of these fixed values:

- **yes**  PSF prints or saves error messages until an error occurs that ends processing (default).
- **no**   PSF does not print or save error messages unless an error occurs that ends processing. If that happens, only the message group describing the last error is printed or saved.

**print-error-messages-maximum**

This **single-valued** attribute specifies the maximum number of message groups that PSF generates when `print-error-messages=yes`. When the maximum number is reached, PSF stops processing the data set and deletes it from the JES spool.

**ISPF field name:** Print error messages: Maximum messages

**Allowed values:** You can enter an integer from 0 to 999. A value of 0 means the data set is processed until it completes or an error occurs that ends processing of the data set. The default is 16.
**print-error-reporting**
This single-valued attribute specifies whether the printer reports character and position errors to PSF. Character errors are caused by trying to use a code point that is not assigned to a character in a font. Position errors are caused by trying to print outside the printable area.

**ISPF field name:** Print error reporting

**Allowed values:** You can enter one of these fixed values:
- none: Do not report any character or position errors (default).
- all: Report all character and position errors.
- character: Report only character errors.
- position: Report only position errors.

**printer-acquire-interval**
This single-valued attribute specifies the number of seconds between the time PSF releases a printer and when PSF tries to acquire it again. This attribute is only used when **printer-release-mode=time**.

**ISPF field name:** Acquire interval

**Allowed values:** You can enter an integer from 0 (default) to 86400.

**printer-connect-interval**
This single-valued attribute specifies the number of seconds during which PSF attempts to connect to a printer or to an AFP Download Plus receiver. When the connect interval expires and the connection is not complete, PSF ends the FSA.

**ISPF field name:** Connect interval

**Allowed values:** You can enter an integer from 0 to 86400. 0 means PSF attempts to connect for an unlimited time.

**Default value:** For channel-attached and SNA-attached printers, if this attribute is not specified blank, PSF attempts to connect for an unlimited time. For TCP/IP-attached printers and for AFP Download Plus receivers, PSF attempts to connect for 600 seconds (10 minutes).

**printer-disconnect-interval**
This single-valued attribute specifies the number of seconds until PSF ends the session with an SNA-attached or TCP/IP-attached printer.

**ISPF field name:** Disconnect interval

**Allowed values:** You can enter an integer from 0 (default) to 86400.

**printer-ip-address**
This single-valued attribute specifies the Internet Protocol (IP) address or host name of the TCP/IP-attached printer or the AFP Download Plus receiver.

**ISPF field name:** Printer IP address

**Allowed values:** You can specify the IP address in dotted-decimal format (nnnn.nnnn.nnnn.nnnn) or you can specify the host name. Specify a valid
combination of 1–40 letters (a-z, A-Z), numbers (0–9), and special characters (such as # $ @ — = /). Blanks are not allowed. If the value contains special characters, enclose the value in quotation marks.

**printer-management-mode**
This *single-valued* attribute specifies how PSF controls an SNA-attached or TCP/IP-attached printer in deferred-printing mode.

**ISPF field name:** Management mode

**Allowed values:** You can enter one of these fixed values:
- **immediate** PSF starts a communication session with the printer immediately and then looks for output available on the JES spool.
- **dialin** PSF starts a session with the printer when the switched line is connected.
- **outavail** PSF starts a communication session with the printer only when output is available on the JES spool (default).

**printer-release-interval**
This *single-valued* attribute specifies the number of seconds after which PSF responds to a request to release a printer in the method specified by the **printer-release-mode** attribute.

**ISPF field name:** Release interval

**Allowed values:** You can enter an integer from 0 (default) to 86400.

**printer-release-mode**
This *single-valued* attribute specifies how PSF is to respond to a request to release the printer.

**ISPF field name:** Release mode

**Allowed values:** You can enter one of these fixed values:
- **idle** PSF releases the printer when a request to release has been received and the time specified by the **printer-release-interval** attribute has expired with no output on the spool for the printer.
- **time** PSF starts the timer for the release interval when a release request is received, even when there is more output on the spool.
- **none** PSF does not release the printer (default).

**prune-double-byte-fonts**
This *single-valued* attribute specifies whether PSF prunes double-byte raster fonts to reduce the amount of font data sent to the printer.

**ISPF field name:** Prune double-byte fonts

**Allowed values:** You can enter one of these fixed values:
- **yes** PSF prunes double-byte raster fonts (default).
- **no** PSF does not prune double-byte fonts.
prune-single-byte-fonts
This single-valued attribute specifies whether PSF prunes single-byte raster fonts to reduce the amount of font data sent to the printer.

ISPF field name: Prune single-byte fonts

Allowed values: You can enter one of these fixed values:
yes PSF prunes single-byte raster fonts (default).
no PSF does not prune single-byte fonts.

psf-send-default-character
This single-valued attribute specifies whether PSF passes the default character information to the printer by fully populating the outline single-byte code page.

ISPF field name: Send default character

Allowed values: You can enter one of these fixed values:
yes PSF passes the default character information to the printer.
no PSF does not pass the default character information to the printer (default).

recover-from-font-not-found
This single-valued attribute specifies whether PSF should make sure the outline font derived from the mapped font exists before proceeding.

ISPF field name: Recover from font not found

Allowed values: You can enter one of these fixed values:
yes PSF should do library queries to make sure the mapped font exists before loading it.
no PSF does not need to make sure that the mapped font exists (default).

Usage guidelines:
- Specify recover-from-font-not-found=yes if your printer supports outline fonts, you have requested that PSF map to outline fonts, and you do not want pages in your job ended because the outline font identified through the mapped font did not exist on the host.
- When you specify recover-from-font-not-found=yes, the performance of PSF is degraded because of additional library queries for every mapped font resource.

release-ds-when-repositioning
This single-valued attribute specifies whether PSF should release data sets to JES when PSF repositions.

ISPF field name: Release data set when repositioning

Allowed values: You can enter one of these fixed values:
yes PSF releases the data sets when repositioning. The data sets might be reselected in a different order.
no PSF retains data sets during repositioning (default).
**report-line-mode-conversion-paper-length-errors**

This **single-valued** attribute indicates whether the 3800 Line-Mode Conversion function in AFP Download Plus reports an error when the paper length in the FCB does not match the value in the **paper-length** attribute.

**ISPF field name:** Report Line-Mode Conversion paper length errors

**Allowed values:** You can enter one of these fixed values:

- **yes** The Line-Mode Conversion function reports an error. It puts the print job on the hold queue and issues message APS973I.
- **no** The Line-Mode Conversion function does not report an error. It uses the value in the **paper-length** attribute (default).

**Usage guidelines:** This attribute applies to PSF V4R4. Earlier releases ignore it.

**resolution**

This **single-valued** attribute specifies the resolution at which the output was formatted. PSF uses this value to choose the associated resolution system library that has previously been defined by the system programmer.

**ISPF field name:** Resolution

**Allowed values:** You can enter one of these fixed values:

- **240** The data was formatted with resources at 240 pels per inch.
- **300** The data was formatted with resources at 300 pels per inch.

**Default value:** PSF uses the default system library.

**Usage guidelines:** The resolution in this attribute is used for all jobs unless the Exit 7 BDSC call overrides it.

**response-timeout**

This **single-valued** attribute specifies maximum number of seconds PSF waits for a response from the printer or from the AFP Download Plus receiver.

**ISPF field name:** Response timeout

**Allowed values:** You can enter an integer from 0 (default) to 86400.

**Usage guidelines:** This attribute applies to AFP Download Plus V4R4. Earlier releases ignore it.

**restrict-printable-area**

This **single-valued** attribute specifies whether an area on each page of printed output is reserved for the security label.

**ISPF field name:** Restrict printable area

**Allowed values:** You can enter one of these fixed values:

- **yes** An area on each page is reserved for the security label.
- **no** An area is not reserved for the security label.
Default value: If this attribute is not specified, PSF sets the value to yes if PSFMPL is active (default) or to no if PSFMPL is not active. For more information, see "PSF for z/OS: Security Guide".

**retained-fonts**

This **single-valued** attribute specifies the maximum number of fonts that PSF retains in printer storage between print jobs.

**ISPF field name: Retained fonts**

**Allowed values:** You can enter a value from 0 to 32767. The default value depends on the type of printer and the amount of storage available in the printer.

**Usage guidelines:**
- When PSF retains fonts, PSF does not need to reload the same fonts for subsequent jobs. However, retaining fonts requires additional printer storage.
- This value overrides the reasonable resource loading value (RRLV) for fonts that you can specify in the PSF Exit 7 initialization call.
- For information about RRLVs, see "PSF for z/OS: Customization".

**retained-form-definitions**

This **single-valued** attribute specifies the maximum number of form definitions that PSF retains in virtual storage between print jobs.

**ISPF field name: Retained form definitions**

**Allowed values:** You can enter a value from 0 to 32767. The default value is 6.

**Usage guidelines:**
- When PSF retains form definitions, PSF does not need to reload the same form definitions for subsequent jobs. However, retaining form definitions requires additional virtual storage.
- This value overrides the reasonable resource loading value (RRLV) for form definitions that you can specify in the PSF Exit 7 initialization call.
- For information about RRLVs, see "PSF for z/OS: Customization".

**retained-object-containers**

This **single-valued** attribute specifies the maximum number of object containers that PSF retains in printer storage between print jobs.

**ISPF field name: Retained object containers**

**Allowed values:** You can enter a value from 0 to 32767.

**Default value:** The default value is 0 for 3800 and 3820 printers. The default value is 200 for all other printers.

**Usage guidelines:**
- When PSF retains object containers, PSF does not need to reload the same object containers for subsequent jobs. However, retaining object containers requires additional virtual storage.
- This value overrides the reasonable resource loading value (RRLV) for object containers that you can specify in the PSF Exit 7 initialization call.
- For information about RRLVs, see "PSF for z/OS: Customization".
**retained-page-definitions**
This **single-valued** attribute specifies the maximum number of page definitions that PSF retains in virtual storage between print jobs.

**ISPF field name:** Retained page definitions

**Allowed values:** You can enter a value from 0 to 32767. The default value is 6.

**Usage guidelines:**
- When PSF retains page definitions, PSF does not need to reload the same page definitions for subsequent jobs. However, retaining page definitions requires additional virtual storage.
- This value overrides the reasonable resource loading value (RRLV) for page definitions that you can specify in the PSF Exit 7 initialization call.
- For information about RRLVs, see [PSF for z/OS: Customization](#).

**retained-page-segments**
This **single-valued** attribute specifies the maximum number of page segments that PSF retains in printer storage between print jobs.

**ISPF field name:** Retained page segments

**Allowed values:** You can enter a value from 0 (default) to 32767.

**Usage guidelines:**
- When PSF retains page segments, PSF does not need to reload the same page segments for subsequent jobs. However, retaining page segments requires additional printer storage.
- This value overrides the reasonable resource loading value (RRLV) for page segments that you can specify in the PSF Exit 7 initialization call.
- For information about RRLVs, see [PSF for z/OS: Customization](#).

**secure-transmission**
This **single-valued** attribute indicates whether PSF encodes data before sending it to the AFP Download Plus receiver.

**ISPF field name:** Secure transmission

**Allowed values:** You can enter one of these fixed values:

- **yes** PSF encodes data (default).
- **no** PSF does not encode data.

**send-messages-on-failure**
This **single-valued** attribute indicates whether PSF sends all messages to the AFP Download Plus receiver when it cannot send an output data set because of an error or because the operator canceled processing of the data set. The receiver can print the messages to help diagnose errors detected on the sending system, such as data stream errors.

**ISPF field name:** Send messages on failure

**Allowed values:** You can enter one of these fixed values:

- **all** PSF sends all messages to the receiver in a message data set in MO:DCA-P format (default).
generic-only
   PSF sends a generic message in line data format to the receiver to indicate
   that the output data was not sent.

send-messages-to-sysout
This single-valued attribute specifies whether PSF sends a message data set to a
SYSOUT data set for redirection to another CLASS or DEST for viewing or
printing.

ISPF field name: Send msgs to SYSOUT

Allowed values: You can enter one of these fixed values:
yes  PSF sends the message data set to a SYSOUT data set.
no   PSF does not send the message data set to a SYSOUT data set.

send-separator-pages
This single-valued attribute indicates whether PSF sends the job and data set
separator pages for each output data set to the AFP Download Plus receiver.

ISPF field name: Send separator pages

Allowed values: You can enter one of these fixed values:
yes  PSF sends separator pages to the receiver.
no   PSF does not send separator pages to the receiver (default).

set-3800-dataset-header-origin
This single-valued attribute specifies whether PSF sets the data set header media
origin on continuous-forms printers to the top left corner.

ISPF field name: Set media origin to 3800 origin for: Data set header

Allowed values: You can enter one of these fixed values:
yes  PSF sets the data set header media origin to the top left corner.
no   PSF does not set the data set header media origin to the top left corner
   (default).

set-3800-dataset-origin
This single-valued attribute specifies whether PSF sets the data set media origin
on continuous-forms printers to the top left corner.

ISPF field name: Set media origin to 3800 origin for: Data set

Allowed values: You can enter one of these fixed values:
yes  PSF sets the data set media origin to the top left corner.
no   PSF does not set the data set media origin to the top left corner (default).

set-3800-job-header-origin
This single-valued attribute specifies whether PSF sets the job header media origin
on continuous-forms printers to the top left corner.

ISPF field name: Set media origin to 3800 origin for: Job header

Allowed values: You can enter one of these fixed values:
yes  PSF sets the job header media origin to the top left corner.
no   PSF does not set the job header media origin to the top left corner (default).

**set-3800-job-trailer-origin**
This single-valued attribute specifies whether PSF sets the job trailer media origin on continuous-forms printers to the top left corner.

**ISPF field name:** Set media origin to 3800 origin for: Job trailer

**Allowed values:** You can enter one of these fixed values:

- **yes** PSF sets the job trailer media origin to the top left corner.
- **no** PSF does not set the job trailer media origin to the top left corner (default).

**set-3800-messages-origin**
This single-valued attribute specifies whether PSF sets the message data set media origin on continuous-forms printers to the top left corner.

**ISPF field name:** Set media origin to 3800 origin for: Message data set

**Allowed values:** You can enter one of these fixed values:

- **yes** PSF sets the message data set media origin to the top left corner.
- **no** PSF does not set the message data set media origin to the top left corner (default).

**snmp-reporting**
This single-valued attribute specifies whether PSF supplies printer status information to the z/OS Simple Network Management Protocol (SNMP) agent.

**ISPF field name:** SNMP reporting

**Allowed values:** You can enter one of these fixed values:

- **yes** SNMP reporting is done (default when Infoprint Central is customized).
- **no** SNMP reporting is not done (default).

**suppress-copy-marks**
This single-valued attribute specifies whether PSF should not print copy marks or do offset stacking. This attribute overrides the COPYMARK parameter of the JES initialization statement for the printer.

**ISPF field name:** Suppress copy marks

**Allowed values:** You can enter one of these fixed values:

- **yes** Copy marks are not printed and offset stacking is not done.
- **no** Copy marks are printed and offset stacking is done if requested in the COPYMARK parameter (default).

**Usage guidelines:** If you specify `suppress-copy-marks=yes` and also specify any value in the `offset-stacking` attribute, PSF suppresses only the printing of copy marks, while the `offset-stacking` attribute controls when PSF does offset stacking.
**trace-mode**

This **single-valued** attribute specifies the type of tracing that is started during FSA initialization. If the FSA has already started, a new trace mode takes effect the next time the FSA starts.

**ISPF field name:** Trace mode

**Allowed values:** You can enter one of these fixed values:

- **none**
  - **PSF:** No tracing is started during PSF initialization.
  - **IP PrintWay:** The tracing mode in the IP PrintWay FSS definition is used for the FSA (default).

- **internal**
  - **PSF:** An internal trace is started (default).
  - **IP PrintWay:** Only internal tracing is started.

- **ipds**
  - **PSF:** An external trace containing only IPDS data is started. An internal trace is also started.
  - **IP PrintWay:** IP PrintWay ignores this value.

- **limit**
  - **PSF:** An external trace like the full trace is started. However, information in some data buffers is truncated. An internal trace is also started.
  - **IP PrintWay:** IP PrintWay ignores this value.

- **sync**
  - **not PSFONLYPSF:** An FSA SYNC external trace is started. An internal trace is also started.
  - **IP PrintWay:** IP PrintWay ignores this value.

- **no-printing**
  - **PSF:** PSF ignores this value and starts only an internal trace.
  - **IP PrintWay:** Internal and external tracing is started, without tracing of record processing. Input records and TCP/IP commands are not traced.

- **full**
  - **PSF and IP PrintWay:** An FSA full external trace is started. An internal trace is also started.

**Usage guidelines for IP PrintWay only:**

- If you specify **full** or **no-printing**, you must start a GTF trace before starting the FSA.
- You can use the MODIFY operator command to stop the trace or to start tracing after an FSA has started.
- You might not want to start a full trace during peak processor usage.

**trace-table-size**

This **single-valued** attribute specifies a number that indicates how many 4 KB pages of storage are allocated for the FSA trace table.

**ISPF field name:** Trace table size

**Allowed values:** You can enter an integer from 1 to 999. The default is 32.

**transmit-recovery-pages**

This **single-valued** attribute specifies how often PSF synchronizes with the AFP Download Plus receiver to determine if the transmitted data has been received.
and, if necessary, retransmit data from the recovery point. The recovery point is the last time that PSF successfully synchronized with the AFP Download receiver.

**ISPF field name: Recovery pages**

**Allowed values:** A value from 0 to 65535; the default is 1000. When 0 is specified, PSF does not synchronize the transmitted data with the receiver until the end of a file.

**Usage guidelines:** This attribute applies to PSF V4R4. Earlier releases ignore it.

**use-line-mode-migration-linect**

This single-valued attribute indicates whether the PSF Line-Mode Migration function uses the number of lines specified in the LINCT parameter when the LNECT value is smaller than the number of lines specified in the FCB.

**ISPF field name: Use Line-Mode Migration LINCT**

**Allowed values:** You can enter one of these fixed values:

- **yes** The Line-Mode Migration function uses the LNECT parameter.
- **no** The Line-Mode Migration function does not use the LNECT parameter. It uses the FCB value (default).

**Usage guidelines:**

- If the LNECT value is larger than the FCB value, the Line-Mode Migration function uses the FCB value whether or not this attribute is specified.
- This attribute applies to PSF V4R4. Earlier releases ignore it.

### Attributes for the job selection rule object class

This section lists attributes that are valid when you create job selection rules, which are in object class **job-selection-rule**. This class applies only to IP PrintWay extended mode.

IP PrintWay extended mode uses the job selection rules to determine which output data sets (also called print jobs) to select from the JES spool for printing. You must create at least one job selection rule for IP PrintWay to select print jobs. You can create as many job selection rules as you need. The attributes of the print job must match all of the values in a rule to be selected.

#### Required attributes

All attributes are optional. If you do not specify any attributes, IP PrintWay extended mode selects all output data sets.

**creator-userid**

This single-valued attribute specifies the user ID of the person who submitted the print job.

If you also specify another attribute that is used for selecting print jobs, the print jobs must match the values in all attributes to be selected. This attribute applies only to IP PrintWay extended mode.

Specify this attribute only to select print jobs that a z/OS user ID owns. Print jobs that a z/OS user ID owns are those submitted using JCL, the lp command, or the AOPPRINT JCL procedure. You cannot use this attribute to select other print jobs—for example, print jobs submitted from remote systems that Print Interface...
allocated on the JES spool or print jobs that NetSpool allocated on the JES spool. This is because the owner name associated with NetSpool and most Print Interface print jobs is stored separately from the user name that JES records for print jobs. IP PrintWay selects only print jobs that this user ID submitted.

**ISPF field name:** Creator

**Allowed values:** Any combination of 1-8 letters (a-z, A-Z), numbers (0-9), and certain special characters (# $ @ * ?). The first character cannot be a number. Blanks and other special characters are not allowed. You can enter one or more asterisks in any position in the ID to represent zero or more unknown characters. You can enter one or more question marks in any position in the ID to represent one unknown character. If the value contains special characters, enclose it in single or double quotation marks. Lowercase letters are converted to uppercase. For example:

```
creator-userid = "userid#1"
```

**Default value:** None.

**description**

This single-valued attribute specifies the description of a job selection rule. This attribute applies only to IP PrintWay extended mode.

**ISPF field name:** Description

**Allowed values:** Any combination of 1-256 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as # $ @ != / -). If the value contains blanks or special characters, enclose it in single or double quotation marks. For example:

```
description = "Select overnight print jobs in Class-N"
```

**Default value:** None.

**dest-ip-address**

This single-valued attribute specifies whether IP PrintWay selects print jobs that specify an IP address in the DEST=IP: parameter on the OUTPUT JCL statement.

If you also specify another attribute that is used for selecting print jobs, the print jobs must match the values in all attributes to be selected. This attribute applies only to IP PrintWay extended mode.

**Tip:** Print jobs that Infoprint Server creates on the JES spool do not specify an IP address.

**ISPF field name:** DEST IP address

**Allowed values:** You can enter one of these fixed values:

- **include** Select only print jobs that specify an IP address.
- **exclude** Do not select any print jobs that specify an IP address.
- **ignore** Select any print jobs, regardless of whether they specify an IP address (default).
**destination-pattern**

This **single-valued** attribute lets you specify that IP PrintWay selects only print jobs with this destination name.

If you also specify another attribute that is used for selecting print jobs, the print jobs must match the values in all attributes to be selected. This attribute applies only to IP PrintWay extended mode.

**ISPF field name**: DEST

**Allowed values**: Any combination of 1-8 letters (a-z, A-Z), numbers (0-9), and certain special characters (# $ @ * ?). Blanks and other special characters are not allowed. You can enter one or more asterisks in any position in the name to represent zero or more unknown characters. You can enter one or more question marks in any position in the name to represent one unknown character. If the value contains special characters, enclose it in single or double quotation marks. Lowercase letters are converted to uppercase. For example:

```destination-pattern = "B003*"```  

In JES2, R*, RM*, RMT*, U*, and N* do not match print jobs with a JES route code of remote, special local, local, anylocal, or NJE. Also, do not specify an asterisk for destinations that JES DESTID initialization statements define.

**Default value**: None.

**forms-list**

This **multi-valued, list** attribute lets you specify that IP PrintWay selects only print jobs with one of these form names.

If you also specify another attribute that is used for selecting print jobs, the print jobs must match the values in all attributes to be selected. This attribute applies only to IP PrintWay extended mode.

**ISPF field name**: FORMS

**Allowed values**: You can specify 1-8 forms names. Each forms name can be any combination of 1-8 letters (a-z, A-Z), numbers (0-9), and certain special characters (# $ @ * ?). Blanks and other special characters are not allowed. You can enter one or more asterisks in any position in the name to represent zero or more unknown characters. You can enter one or more question marks in any position in the name to represent one unknown character. If the value contains special characters, enclose it in single or double quotation marks. If you specify more than one forms name, separate them with spaces and enclose the list in braces. Lowercase letters are converted to uppercase. For example:

```forms-list = {ACCT4010 "ST*D"} ```

**Default value**: None.

**jes-writer-pattern**

This **single-valued** attribute specifies the external writer, which is an IBM- or installation-written program. IP PrintWay selects only print jobs with this writer name.
job selection rule

If you also specify another attribute that is used for selecting print jobs, the print jobs must match the values in all attributes to be selected. This attribute applies only to IP PrintWay extended mode.

**ISPF field name:** WRITER

**Allowed values:** Any combination of 1-8 letters (a-z, A-Z), numbers (0-9), and certain special characters (# $ @ * ?). Blanks and other special characters are not allowed. You can enter one or more asterisks in any position in the name to represent zero or more unknown characters. You can enter one or more question marks in any position in the name to represent one unknown character. If the value contains special characters, enclose it in single or double quotation marks. Lowercase letters are converted to uppercase. For example:

```
jes-writer-pattern = "EXTWTR*"
```

**Default value:** None.

**job-selection-status**

This **single-valued** attribute specifies whether IP PrintWay uses the job selection rule to determine which print jobs to select from the JES spool for printing. This attribute applies only to IP PrintWay extended mode.

**Allowed values:** You can enter one of these fixed values:

- **enabled** IP PrintWay uses the job selection rule (default).
- **disabled** IP PrintWay does not use the job selection rule.

**lower-page-limit**

This **single-valued** attribute specifies the lower limit for the total number of pages in all AFP documents (data sets) in a print job (output group). The total pages must be equal to or greater than the lower limit.

If you also specify another attribute that is used for selecting print jobs, the print jobs must match the values in all attributes to be selected. This attribute applies only to IP PrintWay extended mode.

**ISPF field name:** Page limit: Lower

**Allowed values:** A number from 0 to 2147483647.

**Default value:** None.

**Usage guidelines:**

- If you specify this attribute and do not specify the **upper-page-limit** attribute, the upper limit is 2147483647.
- If you do not specify this attribute and do not specify **upper-page-limit**, IP PrintWay extended mode does not select print jobs based on the number of pages.
- JES calculates the number of pages in a print job.
- If you run JES3 for V1R12 or V1R11, do not specify this attribute.

**lower-record-limit**

This **single-valued** attribute specifies the lower limit for the total number of records in all non-AFP documents (data sets) in a print job (output group). The total records must be equal to or greater than the lower limit.
job selection rule

If you also specify another attribute that is used for selecting print jobs, the print jobs must match the values in all attributes to be selected. This attribute applies only to IP PrintWay extended mode.

**ISPF field name:** Record limit: Lower

**Allowed values:** A number from 0 to 2147483647.

**Default value:** None.

**Usage guidelines:**
- If you specify this attribute and do not specify the `upper-record-limit` attribute, the upper limit is 2147483647.
- If you do not specify this attribute and do not specify `upper-record-limit`, IP PrintWay extended mode does not select print jobs based on the number of records.
- JES calculates the number of records in a print job.
- Depending on the program that creates the print job, a record is not always equivalent to one printed line. For example, Print Interface creates records that can contain up to 32K bytes of data.
- If you run JES3 for V1R12 or V1R11, do not specify this attribute.

**name**

This **single-valued** attribute specifies the name of a job selection rule. This attribute applies only to IP PrintWay extended mode.

**Note:** This is a non-settable attribute. Do not specify the `name` attribute on the PIDU `create`, `force-create`, or `modify` command. Instead, specify the name as an operand on the command. However, you can specify the `name` attribute when you construct a condition for the `where` predicate on the `list` and `export` commands.

**ISPF field name:** Rule name

**Allowed values:** Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as # $ @ ! = / -). Blanks are not allowed. If the value contains special characters, enclose it in single or double quotation marks. For example:

```
name = "Class-N"
```

**Default value:** None.

**operator-security-profile**

This **single-valued** attribute specifies the name of the RACF resource profile in the PRINTSRV class that controls who can work with this job selection rule using z/OS Infoprint Central for the Web. This attribute applies only to IP PrintWay extended mode.

**Tips:**
1. You can specify the same operator security profile in all job selection rules.
2. For information about the PRINTSRV class, see [z/OS Infoprint Server Customization](#).

**ISPF field name:** Operator security profile
job selection rule

**Allowed values:** A combination of letters, numbers, and special characters except for commas, semicolons, parentheses, and blanks. If the value contains special characters, enclose it in single or double quotation marks. Lowercase letters are converted to uppercase. Do not start names with AOP. For example:

```plaintext
operator-security-profile = "DENVER.001"
```

**Default value:** None.

**output-class-list**
This multi-valued, list attribute lets you specify that IP PrintWay selects only print jobs in one of these JES output classes.

If you also specify another attribute that is used for selecting print jobs, the print jobs must match the values in all attributes to be selected. This attribute applies only to IP PrintWay extended mode.

**ISPF field name:** CLASS

**Allowed values:** You can specify 1-36 output classes. Each output class can be a letter (a-z, A-Z) or a number (0-9). Blanks and special characters are not allowed. If you specify more than one output class, separate them with spaces and enclose the list in braces. For example:

```plaintext
output-class-list = {A J 8}
```

**Default value:** None.

**upper-page-limit**
This single-valued attribute specifies the upper limit for the total number of pages in all AFP documents (data sets) in a print job (output group). The total pages must be equal to or less than the upper limit.

If you also specify another attribute that is used for selecting print jobs, the print jobs must match the values in all attributes to be selected. This attribute applies only to IP PrintWay extended mode.

**ISPF field name:** Page limit: Upper

**Allowed values:** A number from 0 to 2147483647.

**Default value:** None.

**Usage guidelines:**
- If you specify this attribute and do not specify the `lower-page-limit` attribute, the lower limit is 0.
- If you do not specify this attribute and do not specify `lower-page-limit`, IP PrintWay extended mode does not select print jobs based on the number of pages.
- JES calculates the number of pages in a print job.
- If you run JES3 for V1R12 or V1R11, do not specify this attribute.

**upper-record-limit**
This single-valued attribute specifies the upper limit for the total number of records in all non-AFP documents (data sets) in a print job (output group). The total records must be equal to or less than the upper limit.
job selection rule

If you also specify another attribute that is used for selecting print jobs, the print jobs must match the values in all attributes to be selected. This attribute applies only to IP PrintWay extended mode.

ISPF field name: Record limit: Upper

Allowed values: A number from 0 to 2147483647.

Default value: None.

Usage guidelines:
- If you specify this attribute and do not specify the lower-record-limit attribute, the lower limit is 0.
- If you do not specify this attribute and do not specify lower-record-limit, IP PrintWay extended mode does not select print jobs based on the number of records.
- JES calculates the number of records in a print job.
- Depending on the program that creates the print job, a record is not always equivalent to one printed line. For example, Print Interface creates records that can contain up to 32K bytes of data.
- If you run JES3 for V1R12 or V1R11, do not specify this attribute.

Attributes for the netspool-eof-rules object class

This section lists two of the attributes that are valid when you create NetSpool End-of-File components, which are in object class netspool-eof-rules. These attributes are also valid for the printer object class.

Due to the complexity of the other attributes that are valid for the netspool-eof-rules object class, these attributes are not described here. IBM recommends that you use the Infoprint Server ISPF panels to specify end-of-file rules.

Required attributes

All attributes are optional.

description

This single-valued attribute specifies a description for the component. The description can help you select the correct component from a list.

ISPF field name: Description

Allowed values: Any combination of 1-256 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as # $ @ ! = / -). If the value contains blanks or special characters, enclose it in single or double quotation marks.

Default value: None.

name

This single-valued attribute specifies the name of the component.

Note: This is a non-settable attribute. Do not specify name on the PIDU create, force-create, or modify command. Instead, specify the name as an operand on the command. However, you can specify this attribute when you construct a condition for the where predicate on the list and export commands.
Attributes for the netspool-options object class

This section lists attributes that are valid when you create NetSpool Options components, which are in object class netspool-options. These attributes are also valid for the printer object class.

Required attributes

All attributes are optional.

default-owner

This single-valued attribute specifies the default Infoprint Server job owner for the associated logical unit (LU) if the print data does not specify an owner. The job owner is used for output data sets created for this NetSpool LU.

ISPF field name: Default owner

Allowed values: A combination of 1-8 letters (a-z, A-Z), numbers (0-9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If the value contains special characters, enclose it in single or double quotation marks. Lowercase letters are converted to uppercase.

Default value: NetSpool uses the ID of the user who started the Infoprint Server daemons as the default job owner.

Usage guidelines:

- The Infoprint Server job owner helps you find jobs using Infoprint Central.
- The job owner in this attribute is also used as the JES job name if no other owner or job name is specified in the print data.
- The job owner specified in this field is not used as the JES job owner. The JES job owner is always the ID of the user who started the Infoprint Server daemons.

description

This single-valued attribute specifies a description for the component. The description can help you select the correct component from a list.

ISPF field name: Description

Allowed values: Any combination of 1-256 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as # $ @ ! = / -). If the value contains blanks or special characters, enclose it in single or double quotation marks.

Default value: None.

eMBEDDED-ATTRIBUTES-PREFIX

This single-valued attribute specifies the prefix that identifies job attributes embedded in the print data. For information about how to embed job attributes in VTAM application print data, see z/OS Infoprint Server User’s Guide. NetSpool uses the embedded job attributes when it allocates an output data set on the spool.
netspool-options and printer

ISPF field name: Embedded attributes prefix

Allowed values: A 1-12 character string (1-12 bytes of data if specified in hexadecimal format). To enter a hexadecimal value, begin the value with the letter x and enclose the value in single or double quotation marks.

Example: embedded-attributes-prefix = "<<ibmjobattr"

Default value: None. If you do not specify this attribute, NetSpool does not use job attributes specified in the print data.

maximum-record-size

This single-valued attribute specifies the maximum record size for the variable-length records that NetSpool writes to the output data set when netspool-formatting=none.

ISPF field name: Maximum record size

Allowed values: An integer from 1 to 32752.

Default value: NetSpool uses 32752 as the maximum record size.

Usage guidelines:

- If the length of the data in the input Request Unit (RU) is less than this value, NetSpool writes one record.
- If the length of the data in the input RU is greater than this value, NetSpool writes multiple records.
- If netspool-formatting=convert-to-line (default) or netspool-formatting=convert-to-pcl, do not specify this attribute.

name

This single-valued attribute contains the name of the component.

Note: This is a non-settable attribute. Do not specify the name attribute on the PIDU create, force-create, or modify command. Instead, specify the name as an operand on the command. However, you can specify the name attribute when you construct a condition for the where predicate on the list and export commands.

ISPF field name: Component Name

Allowed values: Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ # @ . - = / ). Blank characters are not allowed.

Default value: None.

netspool-formatting

This single-valued attribute specifies the type of formatting that NetSpool does before writing the input data to an output data set on the JES spool.

ISPF field name: Formatting

Allowed values: You can enter one of these fixed values:

- none NetSpool writes the input data without change to the output data set. NetSpool uses values specified in these attributes:
  - maximum-record-size
**netspool-options and printer**

- **rcfm**
  NetSpool does not call any exits.

**convert-to-line**
NetSpool converts SNA character stream (SCS) and 3270 data streams into line data streams. As an option, specify these attributes in the `processing` object class, which NetSpool uses during conversion:

- **scs-bottom-margin**
- **scs-horizontal-tabs**
- **scs-left-margin**
- **scs-maximum-line-length**
- **scs-maximum-page-length**
- **scs-right-margin**
- **scs-top-margin**
- **scs-vertical-tabs**

*Synonym: standard*

**convert-to-pcl**
NetSpool converts SNA character stream (SCS) and 3270 data streams into PCL data streams. As an option, specify these attributes in the `processing` object class, which NetSpool uses during conversion:

- **pcl-line-density**
- **pcl-orientation**
- **pcl-print-density**
- **scs-automatic-page-orientation**
- **scs-bottom-margin**
- **scs-horizontal-tabs**
- **scs-left-margin**
- **scs-maximum-line-length**
- **scs-maximum-page-length**
- **scs-right-margin**
- **scs-top-margin**
- **scs-vertical-tabs**

*Default value: convert-to-line*

**Usage guidelines:** If you specify `netspool-formatting=none`, do not specify the `busy-interval` or `idle-interval` attributes.

**rcfm**
This *single-valued* attribute specifies the record format (RECFM) for the output data sets that NetSpool writes to the JES spool when `netspool-formatting=none`.

*ISPF field name:* Recfm

**Allowed values:** You can enter one of these fixed values:

- **vb** Variable length, blocked records
- **vba** Variable length, blocked records, with ANSI carriage control characters
- **vbm** Variable length, blocked records, with machine carriage control characters

*Default value:* NetSpool writes variable length, blocked records.
netspool-options and printer

Usage guidelines: If netspool-formatting=convert-to-line (default) or netspool-formatting=convert-to-pcl, do not specify this attribute. NetSpool ignores it if specified.

Attributes for the printer object class

This section lists the attributes that are valid when you create printer definitions, which are in object class printer. In addition to these attributes, you can also specify attributes that are valid for the object classes listed in Table 41. Some object classes listed in the table are valid only for certain printer types, as defined by the printer-type attribute.

Table 41. Object classes whose attributes are valid for printer object class

<table>
<thead>
<tr>
<th>Object class</th>
<th>Valid for printer type</th>
<th>See page</th>
</tr>
</thead>
<tbody>
<tr>
<td>allocation</td>
<td>All types</td>
<td>305</td>
</tr>
<tr>
<td>netspool-eof-rules</td>
<td>All types</td>
<td>367</td>
</tr>
<tr>
<td>netspool-options</td>
<td>All types</td>
<td>368</td>
</tr>
<tr>
<td>printway-options</td>
<td>general, ip-printway</td>
<td>384</td>
</tr>
<tr>
<td>processing</td>
<td>All types</td>
<td>398</td>
</tr>
<tr>
<td>protocol</td>
<td>ip-printway</td>
<td>418</td>
</tr>
</tbody>
</table>

Required attributes

For Infoprint Server to display the correct ISPF panels for a printer definition, you must specify the printer-type attribute.

NetSpool requires the luname attribute.

Also, see the list of attributes for the other object classes whose attributes are valid for the printer object class. Table 41 summarizes these object classes. These object classes identify other required attributes.

dcf-routing

This single-valued attribute specifies whether job submitters can use the DEST, CLASS, and FORMS JCL parameters to select this printer definition. For more information, see "Using DEST, CLASS, and FORMS to select a printer definition" on page 174.

ISPF field name: Use DEST, CLASS, and FORMS for IP PrintWay printer selection

Allowed values: You can enter one of these fixed values:

yes The DEST, CLASS, and FORMS parameters can be used to select this printer definition.

no The DEST, CLASS, and FORMS cannot be used to select this printer definition.

Default value: IP PrintWay does not let job submitters select this printer using the DEST, CLASS, and FORMS parameters.

Usage guidelines:

- This attribute applies only for IP PrintWay printer definitions (printer-type =ip-printway).
If you select yes, you must also specify a value for one or more of these attributes: output-class, destination, or forms. If you omit one of these attributes, IP PrintWay does not use the corresponding JCL parameter for printer selection. The values for the output-class, destination, and forms attributes must, together, be unique in all printer definitions with def-routing = yes. Set this attribute to yes if you are migrating IP PrintWay routing entries and want to continue to use DEST, CLASS, and FORMS as selection criteria. Regardless of the value of this attribute, a job submitter can specify a printer name on an OUTPUT JCL statement to select this printer definition (in the FSSDATA parameter).

description
This single-valued attribute specifies a description for the printer definition. The description can help users select a printer definition.

ISPF field name: Description

Allowed values: Any combination of 1-256 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as $ @ ! = / -). If the value contains blanks or special characters, enclose it in single or double quotation marks.

Default value: None.

general-spooling-mode
This single-valued attribute indicates how Print Interface writes the input data to the output data set on the JES spool when printer-type=general. Select a value that is suitable for the printer. spooling-mode is an alias for this attribute.

ISPF field name: Spooling mode

Allowed values: You can enter one of these fixed values:

- line: Print Interface writes the data in records. This value is suitable for JES and AFP printers.
- stream: Print Interface writes the data as a data stream, with control characters to indicate the end of lines. This value is suitable for ASCII printers.

Default value: line

Usage guidelines: This attribute applies only for General printer definitions (printer-type=general). It is ignored if printer-type=psf-mvs or printer-type=ip-printway.

include-allocation
This single-valued attribute specifies the name of the Allocation component to be included in this printer definition. An Allocation component is an object in object-class allocation.

ISPF field name: Component name

Allowed values: Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ # @ . = / -). Blanks are not allowed. If the value contains special characters, enclose it in single or double quotation marks.

Default value: No Allocation component is included in the printer definition.
Usage guidelines: All attributes specified in this component apply to the printer definition. To override an attribute from the component, specify the attribute on the create or modify command for the printer definition.

**include-netspool-eof-rules**
This single-valued attribute specifies the name of a NetSpool End-of-File component to be included in this printer definition. A NetSpool End-of-File component is an object in object-class `netspool-eof-rules`.

**ISPF field name:** Component name

**Allowed values:** Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ # @ . _ = /). Blanks are not allowed. If the value contains special characters, enclose it in single or double quotation marks.

**Default value:** No NetSpool End-of-File component is included in the printer definition.

**Usage guidelines:** All attributes specified in this component apply to the printer definition. To override an attribute from the component, specify the attribute on the create or modify command for the printer definition.

**include-netspool-options**
This single-valued attribute specifies the name of a NetSpool Options component to be included in this printer definition. A NetSpool Options component is an object in object-class `netspool-options`.

**ISPF field name:** Component name

**Allowed values:** Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ # @ . _ = /). Blanks are not allowed. If the value contains special characters, enclose it in single or double quotation marks.

**Default value:** No NetSpool Options component is included in the printer definition.

**Usage guidelines:** All attributes specified in this component apply to the printer definition. To override an attribute from the component, specify the attribute on the create or modify command for the printer definition.

**include-printway-options**
This single-valued attribute specifies the name of an IP PrintWay Options component to be included in this printer definition. An IP PrintWay Options component is an object in object-class `printway-options`.

**ISPF field name:** Component name

**Allowed values:** Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ # @ . _ = /). Blanks are not allowed. If the value contains special characters, enclose it in single or double quotation marks.

**Default value:** No IP PrintWay Options component is included in the printer definition.

**Usage guidelines:**
include-processing
This single-valued attribute specifies the name of a Processing component to be included in this printer definition. A Processing component is an object in object-class processing.

ISPF field name: Component name

Allowed values: Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ # @ . - = /). Blanks are not allowed. If the value contains special characters, enclose it in single or double quotation marks.

Default value: No Processing component is included in the printer definition.

Usage guidelines:
- All attributes specified in this component apply to the printer definition. To override an attribute from the component, specify the attribute on the create or modify command for the printer definition.

include-protocol
This single-valued attribute specifies the name of a Protocol component to be included in this printer definition. A Protocol component is an object in object-class protocol.

ISPF field name: Component name

Allowed values: Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ # @ . - = /). Blanks are not allowed. If the value contains special characters, enclose it in single or double quotation marks.

Default value: No Protocol component is included in the printer definition.

Usage guidelines:
- All attributes specified in this component apply to the printer definition. To override an attribute from the component, specify the attribute on the create or modify command for the printer definition.

location
This single-valued attribute lets you specify the location of the printer. The location can help users select and find printers.

ISPF field name: Location

Allowed values: Any combination of 1-256 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as # $ @ ! = / -). If a value contains blanks or special characters, enclose the value in quotation marks.

Default value: None.

Usage guidelines:
If you use the same format to specify the location in all printer definitions (for example: Bldg 3/Col 2), you can find all printer definitions with similar locations, such as all printers in Bldg 3.

If more than one printer definition exists for the same IP PrintWay printer, specify the same location in all printer definitions for the printer so Infoprint Central can find the printer.

**lu-classes**

This multi-valued, list attribute identifies from one to sixty-four logical-unit (LU) classes for this NetSpool LU. If you specify more than one class, the NetSpool LU is assigned to all of the specified classes.

**ISPF field name:** LU classes

**Allowed values:** An integer from 1 to 64. You can specify a list of up to 64 classes. If you specify more than one LU class, separate the LU classes by spaces and surround the list of LU classes with braces. For example:

```
lu-classes={1 4 64}
```

**Default value:** \{1\}

**Usage guidelines:** When NetSpool starts, it starts LUs according to LU class. Therefore, specify the same LU class for all NetSpool LUs that you want to start at the same time.

**luname**

This single-valued attribute specifies the logical unit (LU) name that NetSpool uses to identify this printer. This name must be a unique LU name in the Printer Inventory.

**ISPF field name:** NetSpool LU name

**Allowed values:** A combination of 1-8 letters (a-z, A-Z), numbers (0-9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If the value contains special characters, enclose it in single or double quotation marks. Lowercase letters are converted to uppercase.

**Default value:** None.

**Usage guidelines:**

- This attribute is required for NetSpool to start a session with this printer.
- The name must match the LU name specified in the ACBNAME field of the VTAM APPL definition statement.

**name**

This single-valued attribute specifies the name of the printer definition.

**Note:** This is a non-settable attribute. Do not specify the name attribute on the PIDU create, force-create, or modify command. Instead, specify the name as an operand on the command. However, you can specify the name attribute when you construct a condition for the where predicate on the list and export commands.

**ISPF field name:** Printer Definition Name
Allowed values: Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ # @ . = /). Blank characters are not allowed.

Default value: None.

**printer-type**
This single-valued attribute specifies the type of printer definition.

**ISPF field name:** None.

**Allowed values:** You can enter one of these fixed values:
- **general** A printer definition for printers that are neither IP PrintWay nor PSF types.
- **ip-printway** A printer definition for remote printers in your TCP/IP or SNA network to which IP PrintWay transmits data.
- **psf-mvs** A printer definition for AFP printers controlled by PSF.

**Default value:** The Infoprint Server ISPF panels display the printer definition as a General printer definition. Print Interface writes data to the output data set on the JES spool in records (`general-spooling-mode=line`).

**Attributes for the printer-pool object class**
This section lists attributes that are valid when you create printer pool definitions, which are in object class **printer-pool**.

**Required attributes**
NetSpool requires these attributes:
- **lu-classes**
- **luname**
- **printer-names**

All other attributes are optional.

**default-owner**
This single-valued attribute specifies the default Infoprint Server job owner for the associated logical unit (LU) if the print data does not specify an owner. The job owner is used for output data sets created for this NetSpool LU.

**ISPF field name:** Default owner

**Allowed values:** A combination of 1-8 letters (a-z, A-Z), numbers (0-9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If the value contains special characters, enclose it in single or double quotation marks. Lowercase letters are converted to uppercase.

**Default value:** NetSpool uses the ID of the user who started the Infoprint Server daemons as the default job owner.

**Usage guidelines:**
- The Infoprint Server job owner helps you find jobs using Infoprint Central.
- The job owner in this attribute is also used as the JES job name if no other owner or job name is specified in the print data.
The job owner specified in this field is not used as the JES job owner. The JES job owner is always the ID of the user who started the Infoprint Server daemons.

**description**
This single-valued attribute specifies a description for the printer definition. The description can help users select a printer definition.

**ISPF field name:** Description

**Allowed values:** Any combination of 1-256 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as # $ @ ! = / ). If the value contains blanks or special characters, enclose it in single or double quotation marks.

**Default value:** None.

**embedded-attributes-prefix**
This single-valued attribute specifies the prefix that identifies job attributes embedded in the print data. For information about how to embed job attributes in VTAM application print data, see [z/OS Infoprint Server User’s Guide](#). NetSpool uses the embedded job attributes when it allocates an output data set on the spool.

**ISPF field name:** Embedded attributes prefix

**Allowed values:** A 1-12 character string (1-12 bytes of data if specified in hexadecimal format). To enter a hexadecimal value, begin the value with the letter x and enclose the value in single or double quotation marks.

Example: embedded-attributes-prefix = "<<ibmjobattr"

**Default value:** None. If you do not specify this attribute, NetSpool does not use job attributes specified in the print data.

**include-netspool-eof-rules**
This single-valued attribute specifies the name of a NetSpool End-of-File component to be included in this printer pool definition. A NetSpool End-of-File component is an object in object-class netspool-eof-rules.

**ISPF field name:** NetSpool end-of-file component

**Allowed values:** Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ # @ . = / ). Blanks are not allowed. If the value contains special characters, enclose it in single or double quotation marks. Be sure to specify the correct uppercase and lowercase letters.

**Default value:** No NetSpool End-of-File component is included in the printer definition.

**Usage guidelines:** All attributes specified in this component apply to the printer pool definition.

**lu-classes**
This multi-valued, list attribute identifies from one to sixty-four logical-unit (LU) classes for this NetSpool LU. If you specify more than one class, the NetSpool LU is assigned to all of the specified classes.

**ISPF field name:** LU classes
**printer-pool**

**Allowed values:** A number from 1 to 64. You can specify a list of up to 64 classes. If you specify more than one LU class, separate the LU classes with spaces and enclose the list in braces. For example:

```
lu-classes={1 4 64}
```

**Default value:** None.

**Usage guidelines:**
- NetSpool requires this attribute.
- When NetSpool starts, it starts LUs according to LU class. Therefore, specify the same LU class for all NetSpool LUs that you want to start at the same time.

**luname**

This **single-valued** attribute specifies the logical unit (LU) name that NetSpool uses to identify this printer pool definition. This name must be a unique LU name in the Printer Inventory.

**ISPF field name:** LU name

**Allowed values:** A combination of 1-8 letters (a-z, A-Z), numbers (0-9), and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If the value contains special characters, enclose it in single or double quotation marks. Lowercase letters are converted to uppercase.

**Default value:** None.

**Usage guidelines:**
- NetSpool requires this attribute to start a session with this printer.
- This name must match the LU name specified in the ACBNAME field of the VTAM APPL definition statement.

**name**

This **single-valued** attribute specifies the name of the printer pool definition.

**Note:** This is a **non-settable** attribute. Do not specify the name attribute on the PIDU create, force-create, or modify command. Instead, specify the name as an operand on the command. However, you can specify the name attribute when you construct a condition for the where predicate on the list and export commands.

**ISPF field name:** Pool Name

**Allowed values:** Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ # @ . = /). Blank characters are not allowed.

**Default value:** None.

**printer-names**

This **multi-valued, list** attribute specifies the names of one or more printer definitions. The printer definitions must exist in the Printer Inventory. NetSpool creates an output data set on the JES spool for each printer definition.

**ISPF field name:** Printer definition names
**Allowed values:** A list of one or more printer definition names. Separate the names with spaces and enclose the list of names with braces. For example:

```
printer-names={name1 name2 name3}
```

**Default value:** None.

**Usage guidelines:**
- NetSpool requires this attribute.
- NetSpool uses these attributes defined for the first printer definition in the list. NetSpool ignores these attributes defined in subsequent printer definitions:
  - `netspool-formatting`, `maximum-record-size`, `recfm`
  - `scs-left-margin`, `scs-right-margin`, `scs-top-margin`, `scs-bottom-margin`
  - `scs-maximum-line-length`, `scs-maximum-page-length`
  - `horizontal-tab`, `vertical-tab`

### Attributes for the printway-fss object class

This section lists attributes that are valid when you create IP PrintWay FSS definitions, which are in object class `printway-fss`. FSS definitions do not apply to IP PrintWay extended mode.

**Required attributes**

All attributes are optional.

**applid**

This single-valued attribute specifies the application program ID that IP PrintWay uses to establish a VTAM session with a printer. This ID must match the name of an APPL statement defined to VTAM. This field is required if the VTAM protocol type is selected in any printer definition used by this IP PrintWay FSS.

**ISPF field name:** Applid

**Allowed values:** A valid combination of 1-8 letters, numbers, and national characters (# $ @). The first character cannot be numeric. Lowercase characters are converted to uppercase.

**Default value:** None.

**Usage guidelines:** You must install Coaxial Printer Support V2 for z/OS and define the APPL statement to VTAM before you specify this attribute and restart the IP PrintWay FSS. Otherwise, IP PrintWay abends.

**concatenation-separators**

This single-valued attribute controls when IP PrintWay sends records to the printer that the Begin Data Set exit or the End Data Set exit adds. This attribute applies only when the `dataset-grouping=concatenate-job` attribute is specified in the printer definition.

**ISPF field name:** None

**Allowed values:** You can enter one of these fixed values:

- `document` IP PrintWay sends the records that the Begin Data Set adds at the beginning of each document in the print job. It sends the records that the End Data Set adds at the end of each document in the print job. This lets
the exits add different records for each document in the same print job. For example, the exits might add records that contain different printer commands (such as PCL commands). However, if the exits add text for separator pages, extra separator pages can print before and after each copy of a document.

job
IP PrintWay sends the records that the Begin Data Set adds at the beginning of the first document in the print job. It sends the records that the End Data Set exit adds at the end of the last document in the print job. If the exit adds text for separator pages, extra separator pages do not print before and after each copy of a document.

Default value: job

Usage guidelines:
• Specify concatenation-separators=document only if the Begin Data Set exit or the End Data Set exit adds printer commands (such as PCL commands) in records and the exits add different printer commands for different documents within the same print job. You should recode these exits to specify the same printer commands in the document header and document trailer fields in the ANFUEXT control block in the Begin Data Set exit so that extra separator pages do not print. For information about how to specify printer commands in the Begin Data Set exit, see
  "z/OS Infoprint Server Customization"
• After you recode the Begin Data Set and End Data Set exits to specify printer commands in the document header and document trailer fields in the ANFUEXT control block, either remove this attribute or specify the concatenation-separators=job attribute.
• IP PrintWay extended mode always sends the records that the Begin Data Set exit adds at the beginning of the first document in the print job. It sends the records that the End Data Set exit adds at the end of the last document in the print job. This function is equivalent to the IP PrintWay basic mode function when you specify the concatenation-separators=job attribute.
• You cannot use the ISPF panels to specify this attribute. You must use the z/OS UNIX pidu command:
  – To create a new IP PrintWay FSS definition and specify this attribute, enter this command:
    pidu -c "create printway-fss fssname concatenation-separators=document;"
  – To modify an existing IP PrintWay FSS definition to specify this attribute, enter this command:
    pidu -c "modify printway-fss fssname concatenation-separators=document;"
  – To delete this attribute from the FSS definition, enter this command:
    pidu -c "modify printway-fss fssname concatenation-separators=null;"
In these examples, fssname is the name of the IP PrintWay FSS as defined to JES. For information about how to specify the name of the IP PrintWay FSS definition, see "z/OS Infoprint Server Customization"

default-document-codepage
This single-valued attribute specifies the name of a default EBCDIC code page to use as the source code page when IP PrintWay translates data from EBCDIC to ASCII.

ISPF field name: Document code page

Allowed values: A valid code page name. An example of a valid code page is:
**default-document-codepage** = IBM-037

**Default value**: IP PrintWay uses code page IBM-1047.

**Usage guidelines**:
- If the printer definition used to print the job contains a code page in the **document-code-page** attribute, that code page overrides this value.
- For code page names, see [z/OS XL C/C++ Programming Guide](#).
- If you change this value, you must restart the FSS to pick up the new value.

**description**
This **single-valued** attribute specifies a description for the FSA definition. The description can help you select the FSA definition from a list.

**ISPF field name**: Description

**Allowed values**: Any combination of 1-256 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as # $ @ != / -). If the value contains blanks or special characters, enclose it in single or double quotation marks.

**Default value**: None.

**maximum-hiperspace-blocks**
This **single-valued** attribute specifies the maximum number of 4 KB blocks that each functional subsystem application (FSA) in this FSS can use in hiperspace. The number you specify can affect system performance and also can limit the size of the data sets the FSA can process.

**ISPF field name**: Hiperspace™ blocks

**Allowed values**: An integer from 1 - 524288.

**Default value**: Each IP PrintWay FSA uses 8,000 4 KB blocks, which is 32 megabytes.

**Usage guidelines**:
- If a data set requires a larger amount of hiperspace, IP PrintWay records an error and retains the data set on the JES spool if a retention period is specified for failed transmissions in the **failure-retention-period** attribute for the printer definition used to process the data set.
- If you change this value, you must restart the FSS to pick up the new value.

**name**
This **single-valued** attribute specifies the name of the FSA definition.

**Note**: This is a *non-settable* attribute. Do *not* specify the **name** attribute on the PIDU **create**, **force-create**, or **modify** command. Instead, specify the name as an operand on the command. However, you can specify the **name** attribute when you construct a condition for the **where** predicate on the **list** and **export** commands.

**ISPF field name**: FSA Name

**Allowed values**: Any combination of 1-8 letters (A-Z), numbers (0-9), and national characters ($ # @ ). Blank characters are not allowed. The first character cannot be a number. Lowercase letters are converted to uppercase.
Default value: None.

**national-language**
This single-valued attribute specifies the language that IP PrintWay uses for messages.

**ISPF field name:** National language

**Allowed values:** You can enter one of these fixed values:
- **us-english**  IP PrintWay uses English message table ANFMTENU.
- **ja-japanese**  IP PrintWay uses Japanese message table ANFMTJPN.

**Default value:** Each IP PrintWay FSA uses English messages.

**Usage guidelines:** If you change this value, you must restart the FSS to pick up the new value.

**old-style-translation**
This single-valued attribute indicates whether IP PrintWay uses the standard TCP/IP translate table to convert data from EBCDIC to ASCII when no code pages or TCP/IP translation tables are specified in the printer definition. For more information, see “Usage Guidelines”.

**ISPF field name:** Old-style translation

**Allowed values:** You can enter one of these fixed values:
- **yes**  IP PrintWay uses the standard TCP/IP translate table, STANDARD.TCPXLBIN, to convert data if no code pages and translation tables are specified in the printer definition.
- **no**  IP PrintWay takes the default action. See “Default Value”.

**Default value:** IP PrintWay uses code pages and the iconv utility to convert data. The source code page is specified in the default-document-codepage attribute. The target code page is IBM-850.

**Usage guidelines:**
- IP PrintWay ignores this attribute under either of these conditions:
  - The printer definition specifies a code page in either the document-codepage or printer-codepage attribute. In this case, IP PrintWay uses the iconv utility and the specified code pages to convert data.
  - The printer definition specifies a TCP/IP translation table in the translation-dataset-qualifier or db-translate-table attributes. In this case, IP PrintWay uses the specified translate table instead.
- If you change this value, you must restart the FSS to pick up the new value.

**tcpip-job-name**
This single-valued attribute specifies the name of the TCP/IP startup procedure. If you have changed the name of the TCP/IP startup procedure, specify the new name in this attribute.

**ISPF field name:** TCP/IP job name

**Allowed values:** A valid job name. Lowercase letters are converted to uppercase.
Default value: If you do not specify this attribute, the IP PrintWay FSA uses the name specified in TCPIPJOBNAME statement in the tcphlq.TCPIP.DATA data set. If the TCPIPJOBNAME statement is not specified, IP PrintWay uses TCPIP as the name of the TCP/IP startup procedure. For more information, see z/OS Infoprint Server Customization.

Usage guidelines: If you change this value, you must restart the FSS to pick up the new value.

trace-mode
This single-valued attribute specifies the type of IP PrintWay tracing for the FSS, and the default tracing mode for all functional subsystem applications (FSAs) in the FSS. Tracing starts when the FSS and FSAs starts. The trace mode specified in each FSA definition overrides this tracing mode for that FSA.

ISPF field name: Trace mode

Allowed values: You can enter one of these fixed values:

- **full**: Full internal and external tracing.
- **internal**: Internal tracing only.
- **no-printing**: Internal and external tracing, without tracing of record processing. That is, IP PrintWay does not trace input records and TCP/IP commands.
- **none**: No tracing.

Default value: No tracing.

Usage guidelines:
- The **internal** trace mode can assist IBM in diagnosing problems. IBM recommends that you specify this tracing mode.
- If you specify **full** or **no-printing**, you must start a GTF trace before starting the FSS.
- You can use the MODIFY operator command to stop the trace or to start tracing after an FSS or FSA is started.
- Do not start a full trace during peak processor usage.
- You must restart the FSS to pick up a changed value.

trace-prompt
This single-valued attribute indicates whether the operator is prompted each time the FSS starts. If this option is selected, IP PrintWay sends message ANFM020A to the operator when the FSS starts. Prompting lets the operator start tracing all functional subsystem applications (FSAs) before the FSA starts processing any data sets.

ISPF field name: Trace prompt

Allowed values: You can enter one of these fixed values:

- **yes**: The operator is prompted when the FSS starts.
- **no**: The operator is not prompted.

Default value: The operator is not prompted.
Usage guidelines: If you change this value, you must restart the FSS to pick up the new value.

**trace-table-size**
This single-valued attribute specifies the number of 4 KB pages of storage to allocate for each internal functional subsystem application (FSA) trace table. The storage for the trace tables is allocated above the 16 MB line.

**ISPF field name: Trace table size**

**Allowed values:** An integer from 1 - 999.

**Default value:** IP PrintWay uses 32 (128 KB) as the trace table size.

**Usage guidelines:**
- Storage is allocated for the tables only when internal tracing is active.
- If you change this value, you must restart the FSS to pick up the new value.

**Attributes for the printway-options object class**
This section lists attributes that are valid when you create IP PrintWay Options components, which are in object class **printway-options**. These attributes are also valid for the **printer** object class.

**Required attributes**
All attributes are optional.

**automatic-dataset-grouping**
This single-valued attribute indicates whether IP PrintWay extended mode automatically groups data sets that are in the same JES output group. Automatic grouping means that IP PrintWay sends all the data sets to a printer in the same transmission, and sends all the data sets in the same e-mail.

**ISPF field name: Automatic dataset grouping**

**Allowed values:** You can enter one of these fixed values:

- yes IP PrintWay automatically groups data sets and ignores the dataset-grouping attribute.
- no IP PrintWay groups data sets according to the value selected in the dataset-grouping attribute.

**Default value:** IP PrintWay groups data sets according to the value selected in the dataset-grouping attribute.

**Usage guidelines:**
- IBM recommends specifying this attribute so that data sets print together, with each data set starting on a new sheet of paper. However, some printers do not support this type of transmission and do not start each data set on a new sheet. In this case, either specify a command to force a new sheet in the Document header field, or do not specify this attribute.
- This attribute does not apply when you select the IPP or VTAM protocol. For these protocols, IP PrintWay transmits each data set in a separate transmission.
- IP PrintWay basic mode ignores this attribute.
**begin-dataset-exit**

This **single-valued** attribute specifies the name of an IP PrintWay Begin Data Set exit routine. IP PrintWay calls this exit before processing any records in a data set. In this exit you can add one or more records to the beginning of the data set and you can change IP PrintWay options.

**ISPF field name: Begin dataset exit**

**Allowed values:** The name of your exit routine. You can enter a valid combination of 1-8 letters (a-z, A-Z), numbers (0-9), and national characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If a value contains national characters, enclose the value in quotation marks. Lowercase letters are converted to uppercase. For example:

```
begin-dataset-exit = ANFUXB01
```

**Default value:** IP PrintWay does not call an exit routine before each data set.

**Usage guidelines:** The exit routine must be in an APF-authorized library identified either in the STEPLIB statement in the IP PrintWay startup procedure (IP PrintWay basic mode), in the STEPLIB environment variable (IP PrintWay extended mode), or in a library concatenated to LNKLST.

**carriage-control-type**

This **single-valued** attribute indicates the type of carriage control characters in the data sets. Specify this attribute only if you want IP PrintWay to do special processing of carriage control characters.

**ISPF field name: Carriage control type**

**Allowed values:** You can enter one of these fixed values:

- **ansi:** Interpret the first character of each record as a carriage control character.
- **machine:** Interpret the first character of each record as a carriage control character.
- **none:** Do not interpret the first character of each record as a carriage control character. Specify this value if you want to print all carriage control characters as data.

**Default value:** IP PrintWay automatically determines the type of carriage controls in each data set.

**Usage guidelines:**
- Do not specify **ansi** or **machine** when printing PostScript data sets.
- IP PrintWay processing is currently the same for **ansi** and **machine**.
- IP PrintWay ignores this attribute under any of these conditions:
  - The data set was placed on the spool by Print Interface.
  - The **printway-formatting** attribute contains a value other than **standard**.
  - **protocol-type=vtpam**.
  - NetSpool converted the data to PCL format.

**connection-timeout**

This **single-valued** attribute specifies the maximum number of seconds that IP PrintWay waits for TCP/IP or SNA to return an error if it cannot connect to the
printer. If the connection timeout value expires before the connection can be established, IP PrintWay attempts to connect to the printer again if retries are requested.

**ISPF field name:** Connection timeout

**Allowed values:** An integer from 5 - 180.

**Default value:** IP PrintWay waits 30 seconds.

**Usage guidelines:**
- The default value of 30 seconds is suitable for most printers.
- Do not set the timeout value too low because IP PrintWay might not be able to connect to the printer in the specified number of seconds due to network traffic.
- If you run IP PrintWay basic mode, do not set the timeout value too high because the IP PrintWay FSA does not process or print any other data sets while it waits to connect to the printer.
- Specify a higher connection timeout value if the timeout value expires before IP PrintWay can connect to the printer when the printer is turned on. IP PrintWay writes an error message when the connection timeout value expires.
- IP PrintWay ignores this value when `protocol-type=email`.

**dataset-grouping**

This **single-valued** attribute indicates how IP PrintWay groups data sets that are in the same JES output group (job) when it sends them to a printer or e-mail destination.

**ISPF field name:** Dataset grouping

**Allowed values:** You can enter one of these fixed values:

- **concatenate-job**
  Sends data sets to a printer in the same transmission, and sends data sets as attachments in the same e-mail. Specify this value to make sure that data sets print together. However, some printers might start printing on the back side of the paper. In addition, the correct number of copies might not print. The number of copies requested for the first data set in the concatenation applies to all data sets in the concatenation. The number of copies requested for the second and subsequent data sets in the concatenation is ignored.

  This value does not apply when `protocol-type=ipp`.

- **job**
  Sends data sets to a printer at the same time but not in the same transmission, and sends data sets in separate e-mails. Specify this value if you want a high probability that data sets print together, but you want to avoid the printing problems that can occur if you select the `concatenate-job` option. You must specify either `dataset-grouping=concatenate-job` or `automatic-dataset-grouping=yes` (extended mode only) to make sure that data sets print together.

- **none**
  Sends each data set to a printer in a separate transmission as soon as the data set is processed, and sends data sets in separate e-mails. Specify this value to manage each data set separately on the remote system. This value does not apply to IP PrintWay extended mode, which instead uses the `job` value.
printway-options and printer

**Default value:** IP PrintWay sends data sets to a printer at the same time but not in the same transmission, and sends data sets in separate e-mails (job option).

**Usage guidelines:**

- **IP PrintWay extended mode:** The *automatic-dataset-grouping* attribute overrides this attribute.
- **IP PrintWay extended mode:** If you specify *dataset-grouping=no* or *dataset-grouping=job* (default), IP PrintWay extended mode sends each e-mail in the output group to the address specified for the first data set in the output group unless the AOP_USE_FIRST_ADDRESS=YES environment is set. If AOP_MAIL_USE_FIRST_ADDRESS=NO, IP PrintWay extended mode sends each e-mail to the address or addresses specified for the data set in the e-mail header, in a job attribute, or in a JCL parameter.
- This attribute does not apply when you select the VTAM protocol. For this protocol, IP PrintWay transmits each data set in a separate transmission.
- The *concatenate-job* value does not apply when you select the IPP protocol.
- This attribute does not apply to data sets that Print Interface and NetSpool allocate on the JES spool because JES assigns each data set to a separate output group. It also does not apply to print jobs that are resubmitted to Print Interface for filtering.
- Data sets in the same JES output group must share the same values for certain parameters on the OUTPUT JCL statement. Therefore, if users do not specify exactly the same values for certain OUTPUT parameters, JES assigns the output data sets to separate output groups. For information about how JES groups output data sets, see [z/OS JES2 Initialization and Tuning Guide](https://www.ibm.com/docs/en/z-os) or [z/OS JES3 Initialization and Tuning Guide](https://www.ibm.com/docs/en/z-os).

**delete-form-feed**

This single-valued attribute indicates the type of form-feed controls that IP PrintWay is to delete from data sets.

**ISPF field name:** Delete form feed

**Allowed values:** You can enter one of these fixed values:

- **none**
  - Do not delete any form-feed controls.
- **leading**
  - Delete form-feed controls at the beginning of each data set.
- **trailing**
  - Delete form-feed controls at the end of each data set.
- **both**
  - Delete form-feed controls at the beginning and end of each data set.

**Default value:** IP PrintWay does not delete form feeds.

**Usage guidelines:**

- This attribute lets you remove blank pages that are printed at the beginning or end of data sets.
- IP PrintWay ignores this attribute under any of these conditions:
  - For protocols other than VTAM, the data set was placed on the spool by Print Interface.
  - `printway-formatting=none`.
  - NetSpool converted the data to PCL format.
**printway-options and printer**

### description
This **single-valued** attribute specifies a description for the component. The description can help you select the correct component from a list.

**ISPF field name:** Description

**Allowed values:** Any combination of 1-256 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as # $ @ ! = / -). If the value contains blanks or special characters, enclose it in single or double quotation marks.

**Default value:** None.

### document-header
This **single-valued** attribute specifies printer-specific data that IP PrintWay includes at the beginning of the document and sends to the remote printer or print server. For example, you might specify printer commands to change the printer default font.

**ISPF field name:** Document header

**Allowed values:** A combination of 1-292 letters, numbers, blanks, and special characters. You can also specify these special values, which IP PrintWay converts to EBCDIC hex values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Hex (EBCDIC)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;FF&gt;</td>
<td>0C</td>
<td>Form feed</td>
</tr>
<tr>
<td>&lt;CR&gt;</td>
<td>0D</td>
<td>Carriage return</td>
</tr>
<tr>
<td>&lt;LF&gt;</td>
<td>25</td>
<td>Line feed</td>
</tr>
<tr>
<td>&lt;ESC&gt;</td>
<td>27</td>
<td>Escape</td>
</tr>
<tr>
<td>&lt;SP&gt;</td>
<td>40</td>
<td>Space</td>
</tr>
</tbody>
</table>

If you specify these special values, use EBCDIC representation for the rest of the value and specify **translate-document-header=yes** (default) if the printer accepts ASCII data. If the value contains blanks or special characters, enclose it in single or double quotation marks. For example:

```
document-header="<esc>E<esc>&l10<esc>(s17H"
```

To enter a value in hexadecimal format, prefix the value with the letter x and enclose the value in single quotation marks. For example, this example specifies the same value in ASCII representation, in hexadecimal format. Because the value is in ASCII, also specify **translate-document-header=no** if the printer accepts ASCII data. For example:

```
document-header=x'1B451B266C31301B2873313748'
```

**Default value:** IP PrintWay does not include any data at the beginning of a document.

### document-trailer
This **single-valued** attribute specifies printer-specific data that IP PrintWay includes at the end of the document and sends to the remote printer or print server. For example, if the **document-header** attribute modifies the printer configuration, you might specify this attribute to restore the default printer configuration.

**ISPF field name:** Document trailer
**printway-options and printer**

**Allowed values:** A combination of 1-292 letters, numbers, blanks, and special characters. You can also specify these special values, which IP PrintWay converts to EBCDIC hex values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Hex (EBCDIC)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;FF&gt;</code></td>
<td>0C</td>
<td>Form feed</td>
</tr>
<tr>
<td><code>&lt;CR&gt;</code></td>
<td>0D</td>
<td>Carriage return</td>
</tr>
<tr>
<td><code>&lt;LF&gt;</code></td>
<td>25</td>
<td>Line feed</td>
</tr>
<tr>
<td><code>&lt;ESC&gt;</code></td>
<td>27</td>
<td>Escape</td>
</tr>
<tr>
<td><code>&lt;SP&gt;</code></td>
<td>40</td>
<td>Space</td>
</tr>
</tbody>
</table>

If you specify these special values, use EBCDIC representation for the rest of the value and specify `translate-document-trailer=yes` (default) if the printer accepts ASCII data. If the value contains blanks or special characters, enclose it in single or double quotation marks.

For example:

`document-trailer="<esc>E"`

To enter a value in hexadecimal format, prefix the value with the letter x and enclose the value in single quotation marks. This example specifies the same value in ASCII representation, in hexadecimal format. Because the value is in ASCII, also specify `translate-document-trailer=no` if the printer accepts ASCII data. For example:

`document-trailer=x'1B45'`

**Default value:** IP PrintWay does not include any data at the end of a document.

**end-dataset-exit**

This single-valued attribute specifies the name of an IP PrintWay End Data Set exit routine. IP PrintWay calls the exit you specify after processing all records in a data set. In this exit you can add one or more records to the end of the data set. You can also inspect IP PrintWay options, but you cannot change them.

**ISPF field name:** End dataset exit

**Allowed values:** The name of your exit routine. You can enter a valid combination of 1-8 letters (a-z, A-Z), numbers (0-9), and national characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If a value contains national characters, enclose the value in quotation marks. Lowercase letters are converted to uppercase. For example:

`end-dataset-exit = ANFUXED1`

**Default value:** IP PrintWay does not call an exit routine after each data set.

**Usage guidelines:** The exit routine must be in an APF-authorized library identified either in the STEPLIB statement in the IP PrintWay startup procedure (IP PrintWay basic mode), in the STEPLIB environment variable (IP PrintWay extended mode), or in a library concatenated to LNKLST.

**failure-retention-period**

This single-valued attribute specifies the amount of time IP PrintWay retains data sets on the JES spool after all retry transmission attempts to the remote printer or print server have failed.
ISPF field name: Retention period: Failure

Allowed values: You can specify the fixed value FOREVER, or a time value in this format: hhh:mm:ss:

- **hhhh** indicates the hours (0000-9999)
- **mm** indicates the minutes (00-59)
- **ss** indicates the seconds (00-59)

FOREVER means retain data sets forever on the JES spool.

For example:

- `failure-retention-period = 12:15:10` (12 hours, 15 minutes, 10 seconds)
- `failure-retention-period = 5:12` (5 minutes, 12 seconds)
- `failure-retention-period = 5` (5 seconds)
- `failure-retention-period = FOREVER`

Default value: IP PrintWay does not retain data sets on the JES spool.

Usage guidelines:

- The job submitter can override this value.
- If you run IP PrintWay basic mode, specify as short a retention time as possible because a system abend (abend code 878) can occur when an IP PrintWay FSS retains a very high number of data sets on the JES spool.
- If you run IP PrintWay extended mode and specify either `page-accounting=yes` or `page-restart=yes`, IP PrintWay retains the data set if it does not finish printing successfully.

form-feed

This single-valued attribute specifies the form-feed controls that the printer or print server requires. When it converts line data to text format, IP PrintWay extended mode adds the form-feed controls to the data stream to indicate the start of a new page.

ISPF field name: Form feed

Allowed values: A 1-4 character string (2-8 characters if specified in hexadecimal format) that is the EBCDIC representation of the controls. To enter a hexadecimal value, begin the value with the letter x and enclose the value in single quotation marks.

If you also specify the delete-form-feed attribute, specify only these hexadecimal values:

- **X'0C'** (form-feed control)
- **X'0D'** (carriage-return control)
- **X'25'** (line-feed control) or **X'15'** (new-line control)
- **X'40'** (blank)

If you specify a different value, IP PrintWay might not delete all leading or trailing form-feed controls.

This example specifies the form-feed control:

```
form-feed=X'0C'
```

Default value: **X'0D0C'** (carriage-return and form-feed controls)

Usage guidelines:
printway-options and printer

- IP PrintWay basic mode ignores this field.
- IP PrintWay extended mode ignores this field for the VTAM protocol; it always uses the default form-feed controls.
- IP PrintWay extended mode converts the form-feed controls to the printer code page, typically an ASCII code page.

line-termination
This **single-valued** attribute specifies the end-of-line controls required by the printer. IP PrintWay translates the controls to ASCII, if necessary, and adds them to the end of each line.

**ISPF field name:** Line termination

**Allowed values:** A 1-4 character string (2-8 characters if specified in hexadecimal format) that is the EBCDIC representation of the end-of-line control that IP PrintWay adds at the end of a line. To enter a hexadecimal value, begin the value with the letter x and enclose the value in single quotation marks.

This example specifies the carriage-return (CR) and line-feed controls:
```plaintext
line-termination=X'0D25'
```

This example specifies a PIDU create command containing the line-termination attribute:
```plaintext
pidu -c "create printer lp2 line-termination=X'0D25';"
```

**Default value:** IP PrintWay basic mode:
- LPR, direct sockets, IPP, and e-mail protocols: X'25' (line-feed)
- VTAM protocol: X'0D15' (carriage-return and new-line)

IP PrintWay extended mode:
- LPR (with an ASCII printer code page), direct sockets, IPP, and e-mail protocols: X'0D15' (carriage-return and new-line)
- LPR protocol (with an EBCDIC printer code page): X'0D25' (carriage-return and line-feed)
- VTAM protocol: X'0D15' (carriage-return and new-line)

**Usage guidelines:**
- IP PrintWay extended mode: If you specify printer code page ISO8859-1 (**printer-codepage=ISO8859-1**), omit the **line-termination** attribute so that IP PrintWay uses the default value. However, if you need to specify a line-termination value of X'25' or X'0D25', also specify an ASCII printer code page that translates EBCDIC X'25' to ASCII X'0A', such as IBM-850.
- IP PrintWay basic mode: Consider specifying a line-termination value of X'0D25'. This value is more suitable for many ASCII printers than the IP PrintWay default line-termination control of X'25'.
- IP PrintWay basic mode ignores this attribute under any of these conditions:
  - For protocols other than VTAM, Print Interface allocated the data set on the JES spool.
  - **printway-formatting=none**.
  - NetSpool converted the data to PCL format.

**name**
This **single-valued** attribute specifies the name of the component.
### printway-options and printer

**Note:** This is a *non-settable* attribute. Do not specify the *name* attribute on the PIDU *create*, *force-create*, or *modify* command. Instead, specify the name as an operand on the command. However, you can specify the *name* attribute when you construct a condition for the *where* predicate on the *list* and *export* commands.

**ISPF field name:** Component Name

**Allowed values:** Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ @ . - /). Blank characters are not allowed.

**Default value:** None.

**omit-line-termination-at-eof**

This *single-valued* attribute indicates whether IP PrintWay is to omit the LF (line feed) control (or other control specified in the *line-termination* attribute) at the end of each document.

**ISPF field name:** Omit line termination at EOF

**Allowed values:** You can enter one of these fixed values:

- **yes** IP PrintWay omits the line termination control at the end of each document.
- **no** IP PrintWay includes the line termination control at the end of each document.

**Default value:** IP PrintWay includes the line termination control at the end of each document.

**Usage guidelines:**

- Specify *yes* if a line termination control at the end of a document causes printing problems. For example, printing problems can occur when applications add transparent data to the end of data.
- Specify *no* (default) if your printer requires a line termination control at the end of the document to print data in the next document correctly.
- IP PrintWay ignores this attribute under any of these conditions:
  - The data set was placed on the spool by Print Interface.
  - *printway-formatting=none*.
  - *protocol-type=email*.
  - *protocol-type=ipp*.
  - *protocol-type=vtam*.
  - NetSpool converted the data to PCL format.

**printway-formatting**

This *single-valued* attribute specifies the type of translation and formatting that IP PrintWay basic mode does before transmitting data sets to the remote system.

**ISPF field name:** Formatting

**Allowed values:** You can enter one of these fixed values:

- **none** IP PrintWay does not translate or format data. Select this value to print binary data, such as AFP or PCL data.
- **standard** IP PrintWay translates data to ASCII or EBCDIC, adds line-termination
controls, and formats data into pages. For the VTAM protocol, IP PrintWay converts line data to SCS or DSC/DSE format.

**translate-only**

IP PrintWay translates data to ASCII or EBCDIC and adds line-termination controls. However, it does not format data into pages. For the VTAM protocol, this option is equivalent to standard.

**use-fcb**

IP PrintWay takes the same action as for standard except that if an FCB is specified for the data set or as a JES default, IP PrintWay formats using the FCB.

Default value: IP PrintWay does standard processing except under the conditions described in “Usage guidelines.”

**Usage guidelines:**

- This attribute does not apply to IP PrintWay extended mode.
- Under these conditions, IP PrintWay uses the none value and ignores any other values:
  - vtam-send-as-transparent=yes.
  - to-remote-psf=yes.
  - NetSpool converted the data to PCL format.
  - For protocols other than VTAM, Print Interface processed the data set.

**printway-postscript**

This single-valued attribute specifies the type of PostScript header that IP PrintWay basic mode adds to the beginning of each data set.

**ISPF field name:** Formatting

**Allowed values:** You can enter one of these fixed values:

- add-header IP PrintWay adds PostScript header %!
- always-landscape IP PrintWay takes the same action as for landscape. However, IP PrintWay also adds the landscape header to data sets that already have a PostScript header.
- landscape IP PrintWay adds a PostScript header for printing in the landscape direction (lines parallel to the long edge of the paper) to data sets that do not already have PostScript headers.
- ignore-header IP PrintWay ignores the PostScript header on data sets and processes all data sets as non-PostScript data sets.

Default value: IP PrintWay does not add PostScript headers. However, IP PrintWay processes data sets that already contain a PostScript header ( %!) as PostScript data sets.

**Usage guidelines:**

- This attribute does not apply to IP PrintWay extended mode.
- If you specify landscape or always-landscape, also specify printway-formatting=standard (default).
- If you specify add, IP PrintWay ignores the printway-formatting attribute.
- Do not specify landscape if any data sets already have PostScript headers.
printway-options and printer

- IP PrintWay ignores this attribute under any of these conditions:
  - The data set was placed on the spool by Print Interface.
  - `printway-formatting=none`.
  - `protocol-type=vtam`.
  - NetSpool converted the data to PCL format.
- If `protocol-type=email`, do not specify this attribute.

record-exit

This single-valued attribute specifies the name of the IP PrintWay Record exit routine. IP PrintWay calls this exit for each record in a data set. In a Record exit you can add one or more records, replace a record, or delete a record. You can also inspect IP PrintWay options, but you cannot change them.

ISPF field name: Record exit

Allowed values: The name of your exit routine. You can enter a valid combination of 1-8 letters (a-z, A-Z), numbers (0-9), and national characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If a value contains national characters, enclose the value in quotation marks. Lowercase letters are converted to uppercase. For example:

```
record-exit = ANFUXRC1
```

Default value: IP PrintWay does not call an exit routine for each record in a data set.

Usage guidelines: The exit routine must be in an APF-authorized library identified either in the STEPLIB statement in the IP PrintWay startup procedure (IP PrintWay basic mode), in the STEPLIB environment variable (IP PrintWay extended mode), or in a library concatenated to LNKLST.

response-timeout

This single-valued attribute specifies the number of seconds that IP PrintWay waits for a response from the remote printer or print server before reporting an error. After an error occurs, IP PrintWay attempts to send the data again if retries are requested.

ISPF field name: Response timeout

Allowed values: An integer from 0 - 2678400.

Default value: IP PrintWay waits 600 seconds (10 minutes) for a response.

Usage guidelines:

- Do not set the response timeout value too low, especially if you print large documents on printers that have small buffers or that print slowly. For example, a response timeout value of 30 seconds might cause IP PrintWay to retry the transmission before the printer has finished printing its buffer.
- A high response timeout value gives an operator more time to correct a problem before IP PrintWay resends data to the printer (if retries are requested) or fails the print job. For example, you might want to specify a response timeout value of 3 days if your printers are unattended over a long weekend.
- IP PrintWay extended mode: If you select one of the PJL options in the printer definition (see "Tracking the number of printed pages (extended mode)" on page 187), most printers respond only after the printer has finished printing the document. Therefore, the response timeout value should be long enough to allow the largest documents to finish printing.
IP PrintWay extended mode: A high response timeout value does not affect printing to other printers. However, if you specify a high response timeout value for many printers, IP PrintWay can exceed the maximum number of MVS tasks that IP PrintWay extended mode (aopoutd daemon) can have active at one time. This can happen if IP PrintWay waits for responses from many printers at the same time.

If you see this message, which indicates that you are close to exceeding the maximum number of MVS tasks, ask your system administrator to increase the maximum number of MVS tasks in the AOPOUTD_MAXTHREADTASKS environment variable (for example, you might increase the number to 250):

BPX1040I PROCESS LIMIT MAXTHREADTASKS HAS REACHED 85% OF ITS CURRENT CAPACITY
OF 200 FOR PID=nnnnnn IN JOB AOPOUTD.

For information about the AOPOUTD_MAXTHREADTASKS environment variable, see z/OS Infoprint Server Customization.

IP PrintWay basic mode: If you want to specify a high response timeout value, ask your system administrator to define an IP PrintWay FSA to JES that selects print jobs for this one printer only. If an IP PrintWay FSA selects print jobs for several printers, when one printer with a high response timeout value does not respond for a long time, printing to the other printers can be delayed until the operator corrects the problem and the printer becomes ready.

E-mail protocol: IP PrintWay ignores this field.

VTAM protocol: If the printer is waiting for intervention, Infoprint Central cannot delete a print job until the printer responds or the response timeout value expires. Therefore, if you set a high response timeout value, the operator might not be able to delete the current print job in a timely manner.

retry-limit
This single-valued attribute specifies the number of times that IP PrintWay retries an unsuccessful transmission.

ISPF field name: Retry limit

Allowed values: An integer from 0 - 32767.

Default value: IP PrintWay does not retry the transmission.

Usage guidelines:
- For information about how the retry-time and retry-limit attributes work together, see [Handling unsuccessful data transmissions](#) on page 180.
- Retries are not recommended when you send output to an e-mail destination. Therefore, when protocol-type=email, do not specify the retry-limit and retry-time attributes.

retry-time
This single-valued attribute specifies the amount of time IP PrintWay waits between retries of a transmission. For example, when the retry time is 1 minute, IP PrintWay retries every minute, up to the number of retries in the retry-limit attribute.

ISPF field name: Retry time

Allowed values: A value in this time format: hhh:mm:ss:
**printway-options and printer**

`hhhh` indicates hours (0000-9999)
`mm` indicates minutes (00-59)
`ss` indicates seconds (00-59)

For example:
- `retry-time = 1:00:00` (1 hour, 0 minutes, 0 seconds)
- `retry-time = 5:30` (5 minutes, 30 seconds)
- `retry-time = 5` (5 seconds)

**Default value:** IP PrintWay does not wait between retries.

**Usage guidelines:**
- For information about how the `retry-time` and `retry-limit` attributes work together, see "Handling unsuccessful data transmissions" on page 180.
- Retries are not recommended when you send output to an e-mail destination. Therefore, when `protocol-type=email`, do not specify the `retry-limit` and `retry-time` attributes.

**successful-retention-period**
This **single-valued** attribute specifies the amount of time IP PrintWay retains data sets on the JES spool after successful transmission.

**ISPF field name:** Retention period: Successful

**Allowed values:** You can specify the fixed value FOREVER, or a time value in this format: `hhhh:mm:ss`:

`hhhh` indicates the hours (0000-9999)
`mm` indicates the minutes (00-59)
`ss` indicates the seconds (00-59)
FOREVER means retain data sets forever on the JES spool.

For example:
- `successful-retention-period = 12:15:10` (12 hours, 15 minutes, 10 seconds)
- `successful-retention-period = 5:12` (5 minutes, 12 seconds)
- `successful-retention-period = 5` (5 seconds)
- `successful-retention-period = FOREVER`

**Default value:** IP PrintWay does not retain data sets on the JES spool.

**Usage guidelines:**
- The job submitter can override this value.
- If you run IP PrintWay basic mode, do not retain successful data sets because a system abend (abend code 878) can occur when an FSS retains a very high number of data sets on the JES spool.
- If you run IP PrintWay extended mode and specify either `page-accounting=yes` or `page-restart=yes`, IP PrintWay makes sure that the data set has printed successfully before the transmission is considered successful.
- If `protocol-type=email`, the transmission is considered successful when z/OS UNIX sendmail accepts the e-mail request. The transmission to remote recipients might fail later.

**translate-document-header**
This **single-valued** attribute indicates whether IP PrintWay must translate the string in the `document-header` attribute to the code page required by the printer before sending it to the remote printer or print server.
ISPF field name: Translate document header

Allowed values: You can enter one of these fixed values:

yes IP PrintWay translates the document header to the code page required by the printer. Select this value if, for example, you specify a document header in EBCDIC representation and the printer accepts ASCII data.

no IP PrintWay does not translate the document header.

Default value: IP PrintWay translates the string to the code page required by the printer.

translate-document-trailer

This single-valued attribute indicates whether IP PrintWay must translate the string in the document-trailer attribute to the code page required by the printer before sending it to the remote printer or print server.

ISPF field name: Translate document trailer

Allowed values: You can enter one of these fixed values:

yes IP PrintWay translates the document trailer to the code page required by the printer. Select this value if, for example, you specify a document trailer in EBCDIC representation and the printer accepts ASCII data.

no IP PrintWay translates the document trailer to the code page required by the printer.

Default value: IP PrintWay translates the string to the code page required by the printer.

transparent-data-character

This single-valued attribute specifies the character that designates transparent data in the input or output data stream.

ISPF field name: Transparent data char

Allowed values: A 1-character string (1-2 characters if specified in hexadecimal format). To enter a hexadecimal value, begin the value with the letter x and enclose the value in single quotation marks.

This example specifies the transparent data character:

transparent-data-character=X'FB'

This example specifies a PIDU create command containing the transparent-data-character attribute:

pidu -c "create printer lp2 transparent-data-character=X'FB';"

Default value: IP PrintWay uses X'35' as the transparent data character.

Usage guidelines:

• For protocols other than VTAM, this character designates transparent data in the input data stream. IP PrintWay removes transparent data controls and does not translate the transparent data that follows the controls to ASCII.

• For the VTAM protocol, if vtam-send-as-transparent=yes, IP PrintWay uses this character to designate transparent data in the output data stream.
printway-options and printer

- IP PrintWay ignores this attribute under any of these conditions unless
  vtam-send-as-transparent=yes:
    - The data set was placed on the spool by Print Interface.
    - printway-formatting=none.
    - protocol-type=vtam.
    - NetSpool converted the data to PCL format.

Attributes for the processing object class

This section lists attributes that are valid when you create Processing components, which are in object class processing. These attributes are also valid for the printer object class.

Required attributes

No attributes are required. However, you might need to specify the printer-codepage attribute for some data formats to print correctly.

db-translate-table

This single-valued attribute specifies the name of the translation table IP PrintWay basic mode uses to convert double-byte character set (DBCS) data from EBCDIC to ASCII.

ISPF field name: Double-byte translate table

Allowed values: You can enter one of these fixed values, depending on the language:

<table>
<thead>
<tr>
<th>Language</th>
<th>Allowed values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chinese</td>
<td>big5, schinese, tchinese</td>
</tr>
<tr>
<td>Japanese</td>
<td>euckanji, ibmkanji, jis78kj-ascii, jis78kj-jisroman, jis83kj-ascii, jis83kj-jisroman, sjiskanji</td>
</tr>
<tr>
<td>Korean</td>
<td>hangeul, ksc5601</td>
</tr>
</tbody>
</table>

Default value: IP PrintWay uses code pages to convert data to ASCII.

Usage guidelines:

- This attribute does not apply to IP PrintWay extended mode.
- If either document-codepage or printer-codepage is specified, IP PrintWay uses the code pages to convert data and ignores this attribute.
- IP PrintWay transmits the data without converting it to ASCII when the value is ibmkanji.
- The binary table data sets that the translation tables come from are:
  - TCPCHBIN (big5, tchinese)
  - TCPCHBIN (hangeul, ksc5601)
  - TCPJKBIN (euckanji, jis78kj, jis83kj, sjiskanji)
  - TCPJKBIN (schinese)
- For jis78kj and jis83kj, IP PrintWay uses these shift-in escape sequences and ignores the value in the printway-sosi-mode attribute: ascii: ESC(B jisroman: ESC(J
- IP PrintWay ignores this attribute when protocol-type=vtam or protocol-type=e-mail.
processing and printer

description
This single-valued attribute specifies a description for the component. The description can help you select the correct component from a list.

ISPF field name: Description

Allowed values: Any combination of 1-256 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as # $ @ ! = / -). If the value contains blanks or special characters, enclose it in single or double quotation marks.

Default value: None.

document-codepage
This single-valued attribute specifies the code page used to create documents submitted to this printer definition. Infoprint Server uses this code page as the source when converting documents from ASCII to EBCDIC or from EBCDIC to ASCII.

ISPF field name: Document code page

Allowed values: A valid code page name. For example:
document-codepage = ISO8859-1

Default value: Print Interface determines the default. If the print request was submitted from:
- The local z/OS system, Print Interface uses the code page for the z/OS locale, usually an EBCDIC code page.
- A remote system, Print Interface uses the ASCII code page specified in the Infoprint Server configuration file, aopd.conf or, if not specified, code page ISO8859-1.

NetSpool uses the EBCDIC code page specified in the Infoprint Server configuration file, aopd.conf or, if not specified, code page IBM-1047.

IP PrintWay:
- Basic mode uses the code page in the default-document-codepage attribute in the printway-fss object class or, if not specified, the code page IBM-1047.
- Extended mode uses the EBCDIC code page specified in the Infoprint Server configuration file, aopd.conf, or, if not specified, code page IBM-1047.

Usage guidelines:
- In most cases, the default value is suitable. One exception is when you need to print ASCII documents submitted with the lp command. In this case, specify an ASCII code page either in this attribute or on the lp command.
- For code page names, see z/OS XL C/C++ Programming Guide.
- If you specify a custom code page, make sure that conversion tables exist to convert between these code pages:
  - The code pages in the document-codepage and printer-codepage attributes.
  - The code page for the z/OS locale and the custom code page.

For information about how to create conversion tables, see information about code set conversion utilities in z/OS XL C/C++ Programming Guide.
processing and printer

- IP PrintWay basic mode: If neither document-codepage nor printer-codepage is specified and old-style-translation=yes, IP PrintWay basic mode uses the standard TCP/IP translation table.
- NetSpool converts data between code pages only if netspool-formatting=convert-to-pcl in the netspool-options object class. Otherwise, NetSpool ignores this attribute.

document-formats-supported
This multi-valued, list attribute indicates which data formats a printer supports. Print Interface, NetSpool, and IP PrintWay extended mode reject a print job with a data format that is not supported.

ISPF field name: Data format

Allowed values: Enter one or more of these fixed values:

- **jpeg** Joint Photographic Experts Group file format (JFIF).
- **line-data** Character data. Data is stored in records and can have carriage-control and table-reference characters.
- **modca-p** Ricoh Mixed Object Document Content Architecture for Presentation.
- **pcl** Hewlett Packard Printer Control Language.
- **pdf** Adobe Portable Document Format.
- **postscript** Adobe PostScript.
- **sap** SAP output text format (OTF) or ABAP format.
- **text** Character data. Data can contain LF, CR, HT, VT, and FF control characters only.
- **tiff** Tagged image file format.
- **xml** Extensible Markup Language, which includes Extensible Stylesheet Language formatting objects (XSL-FO).
- **other** All data formats that are not one of the other types, such as the Xerox data format.

For example:

```plaintext
document-formats-supported = {line-data modca-p text};
```

Default value: Print Interface, NetSpool, and IP PrintWay extended mode accept all data formats in the print request.

Usage guidelines: In a PSF printer definition, specify line-data, modca-p, and text. You can also specify other data formats in this attribute. For example, if your installation uses a PCL to AFP transform, also specify pcl in this attribute.

duplexes-supported
This multi-valued, list attribute indicates whether the printer can print on one or two sides of the paper. Print Interface, NetSpool, and IP PrintWay extended mode reject a print job that requests an option in the duplex job attribute or the DUPLEX parameter of the OUTPUT JCL statement that the printer does not support.

ISPF field name: Duplexes supported

Allowed values: Enter one or more of these fixed values:
The printer can print on one side of the paper.

**no**

The printer can print on both sides of the paper so the top edge of side 1 is the top edge of side 2.

**yes**

The printer can print on both sides of the paper but tumbles the print so the top edge of side 1 is the bottom edge of side 2.

**tumble**

The printer in this example can print on one or two sides of the paper but cannot tumble the output:

duplexes-supported = {no yes};

**Default value:** If this attribute is not specified, Print Interface, NetSpool, and IP PrintWay extended mode accept all values in the **duplex** job attribute.

**Usage guidelines:** This attribute does not apply to duplexing requested in a form definition.

---

### fail-on-transform-error

This **single-valued** attribute indicates whether transforms fail when data stream errors or warnings occur. Warnings can indicate degraded output.

**ISPF field name:** Fail on error

**Allowed values:** Enter one of these fixed values:

**error**

The transform fails when an error occurs and does not create an output document. However, the transform continues if warnings occur.

**no**

The transform continues processing when a warning or error occurs and creates an output document.

**warning**

The transform fails when a warning or error occurs and does not create an output document.

**Default value:**

1. The value in the AOP_FAIL_ON_ERROR environment variable for the transform class.
2. **no**

**Usage guidelines:** For information about whether a transform supports this attribute, see the documentation for the transform.

---

### filters

This **multi-valued, value-map** attribute associates data formats with a filter program for the data format. Print Interface and NetSpool invoke the specified filter before writing data to the output data set. IP PrintWay extended mode invokes the specified filter before sending data to the printer. To filter batch jobs submitted directly to IP PrintWay basic mode, specify the **resubmit-for-filtering** attribute.

**ISPF field name:** Filters

**Allowed values:** One or more value pairs in the format: `dataformat -> filterpath [options]`:

**dataformat**

Specifies the format of the input data. Enter one of these fixed values:
processing and printer

- **jpeg**  
  Joint Photographic Experts Group file format (JFIF).

- **line-data**  
  Bytes map to characters. Data is stored in records with carriage-control and table-reference characters.

- **modca-p**  
  Ricoh Mixed Object Document Content Architecture for Presentation.

- **pcl**  
  Hewlett Packard Printer Control Language.

- **pdf**  
  Adobe Portable Document Format.

- **postscript**  
  Adobe PostScript.

- **sap**  
  SAP output text format (OTF) or ABAP format.

- **text**  
  Bytes map to characters. Only contains LF, CR, HT, VT, and FF control characters.

- **tiff**  
  Tagged image file format.

- **xml**  
  Extensible Markup Language, which includes Extensible Stylesheet Language formatting objects (XSL-FO).

- **other**  
  All data formats that are not one of the other types, such as the Xerox data format.

### filterpath [options]

Specifies the path name of the filter, followed by filter options. For information about:

- Filter **aopfiltr.so**, see "Using the aopfiltr.so filter" on page 94.
- Filter **lpd_compat.so**, see "Using the LPD compatibility filter" on page 95.
- Filters **aoprxf.so**, **aoprform.dll**, see Chapter 15, “Planning printer definitions for transforms,” on page 225.
- Filters that transform products provide, see the documentation for the transform product.

#### Rules:

- Specify the full path name unless the filter is in a directory named either in the LIBPATH (for DLL filters) or PATH (for UNIX filters) environment variable specified in the aopstart EXEC and in the /etc/profile file.
- For a UNIX filter, type **spawn** before the path name.
- If the path name contains special characters (such as /), or if you specify filter options, enclose the path name and options in single or double quotation marks.

You can specify one or more value pairs. Enclose the value pairs with braces. Some examples are:

```
filters = {text -> aopfiltr.so}
filters = {pcl -> "pcl2afp.dll %filter-options" pdf -> "ps2afp.dll %filter-options"}
filters = {text -> "spawn /usr/mylib/mfilter myoption1 myoption2"}
```

**Default value:** Infoprint Server does not use any filter.

### forms-supported

This multi-valued, list attribute specifies the names of the forms the printer supports. Print Interface and NetSpool reject a print job that requests a forms name in the **forms** attribute that the printer does not support.
**processing and printer**

**ISPF field name:** forms-supported

**Allowed values:** Any combination of 1 - 8 letters (a-z, A-Z), numbers (0-9), and special characters (# $ @). Blanks and other special characters are not allowed. Lowercase letters are converted to uppercase. If you specify more than one forms name, separate the forms names with spaces and enclose the list in braces. For example:

```
forms-supported = {STANDARD FORM0001}
```

**Default value:** Print Interface and NetSpool accept any forms name in the `forms` job attribute.

**Usage guidelines:** If forms is a JES work-selection criterion, specify the same form names that are defined to JES.

**input-tray-map**

This multi-valued, value-map attribute associates input tray names with input tray numbers. Infoprint Server can reject a print job that requests an input tray in the `input-tray` job attribute that the printer does not support.

**ISPF field name:** Input tray name

**Allowed values:** One or more value pairs in the format: `name -> number`:

- **name**
  A name that can be used by a job submitter in the `input-tray` job attribute. Specify from 1-16 letters, numbers, and special characters (such as # $ @ -). If the value contains blanks or special characters, enclose the value in single or double quotation marks.

- **number**
  An integer from 1 - 255 that identifies the paper source. To determine the tray numbers for your printer, see the printer documentation. These names are usually assigned to these numbers:

<table>
<thead>
<tr>
<th>Name</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>alternate or top</td>
<td>1</td>
</tr>
<tr>
<td>bottom</td>
<td>2</td>
</tr>
<tr>
<td>envelope</td>
<td>65</td>
</tr>
<tr>
<td>manual</td>
<td>100</td>
</tr>
</tbody>
</table>

Enclose the values with braces. For example:

```
input-tray-map = {top -> 1 bottom -> 2}
```

**Default value:** No tray names are associated with numbers. If a job submitter specifies the `input-tray` job attribute, it is ignored.

**maximum-copies**

This single-valued attribute specifies the maximum number of copies that Infoprint Server allows to be printed.

**ISPF field name:** Maximum copies

**Allowed values:** An integer from 1 - 32640.

**Default value:** No limit to the number of copies.

**Usage guidelines:**
The number of copies specified in a form definition or on a TCP/IP command, such as the LPR command, are not included in this value.

IP PrintWay ignores this attribute when `protocol-type=email` because only one copy is sent to the e-mail destination.

IP PrintWay basic mode ignores this attribute when `protocol-type=vtam` because only one copy is printed.

**maximum-document-size**

This single-valued attribute specifies the maximum number of bytes that Infoprint Server allows for all documents in a print job (output group), including copies for IP PrintWay basic mode. You can use this attribute to limit the size of documents that users can send to a printer.

**ISPF field name:** Maximum document size

**Allowed values:** An integer from 1 - 2147483646. Omit this attribute if you want no size limit.

**Default value:** Infoprint Server does not limit the size of print jobs.

**Usage guidelines:** IP PrintWay basic mode ignores this attribute when `protocol-type=vtam`.

**name**

This single-valued attribute specifies the name of the component.

**Note:** This is a non-settable attribute. Do not specify the name attribute on the PIDU create, force-create, or modify command. Instead, specify the name as an operand on the command. However, you can specify the name attribute when you construct a condition for the where predicate on the list and export commands.

**ISPF field name:** Component Name

**Allowed values:** Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ @ # - = /). Blank characters are not allowed.

**Default value:** None.

**output-bin-map**

This multi-valued, value-map attribute associates output bin names with output bin numbers. Infoprint Server can reject print jobs that request an output bin in the output-bin job attribute that the printer does not support.

**ISPF field name:** Output bin name

**Allowed values:** One or more value pairs in the format: name -> number:

| name | A name that can be used by a job submitter in the output-bin job attribute. Specify from 1-16 letters, numbers, and special characters (such as $ # @ ->). If the value contains blanks or special characters, enclose the value in single or double quotation marks. |

| number | An integer from 1 - 65535 that identifies the output bin on the printer. To determine the bin numbers for your printer, see the printer documentation. |
Enclose the values with braces. For example:

output-bin-map = {bottom -> 1 side -> 2}

Default value: No bin names are associated with numbers. If a job submitter specifies the `output-bin` job attribute, it is ignored.

**pcl-line-density**

This *single-valued* attribute specifies the number of lines per inch to be printed on a page when NetSpool converts SNA character string (SCS) and 3270 data streams to PCL data streams. NetSpool uses this value only when the SCS data stream does not specify the line density. NetSpool always uses this value for 3270 data streams.

**ISPF field name:** NetSpool PCL Conversion: Line density

**Allowed values:** An integer from 1 - 72.

**Default value:** The PCL Line Spacing or Vertical Motion Index command specified in the `document-header` attribute is used. If these commands are not specified, the line density set on the printer's control panel is used.

**Usage guidelines:**

- NetSpool uses this attribute only when `netspool-formatting=convert-to-pcl`. Otherwise, this attribute is ignored.
- If `scs-automatic-page-orientation=yes`, you should specify a value in this attribute.

**pcl-orientation**

This *single-valued* attribute specifies the orientation of each page when NetSpool converts SNA character string (SCS) and 3270 data streams to PCL data streams.

**ISPF field name:** NetSpool PCL Conversion: Orientation

**Allowed values:** You can enter one of these fixed values:

- **landscape** Lines print parallel to the paper's long edge.
- **none** NetSpool does not specify a page orientation in the PCL data stream. The PCL Logical Page Orientation command specified in the `document-header` attribute or, if not specified, the orientation set on the printer's control panel is used.
- **portrait** Lines print parallel to the paper's short edge.

**Default value:** NetSpool does not specify a page orientation in the PCL data stream. The PCL Logical Page Orientation command specified in the `document-header` attribute is used. If this command is not specified, the orientation set at the printer's control panel is used.

**Usage guidelines:**

- NetSpool uses this attribute only when `netspool-formatting=convert-to-pcl`. Otherwise, this attribute is ignored.
- If `scs-automatic-page-orientation=yes`, NetSpool can override the value in this attribute and change the orientation of a page.

**pcl-print-density**

This *single-valued* attribute specifies the number of characters per inch to be printed on a line when NetSpool converts SNA character string (SCS) and 3270
data streams to PCL data streams. NetSpool uses this value only when the SCS data stream does not specify the print density. NetSpool always uses this value for 3270 data streams.

**ISPF field name:** NetSpool PCL Conversion: Print density

**Allowed values:** An integer from 1 - 255.

**Default value:** The PCL Pitch or Horizontal Motion Index command specified in the document-header attribute is used. If these PCL commands are not specified, the print density set on the printer's control panel is used.

**Usage guidelines:**
- NetSpool uses this attribute only when netspool-formatting=convert-to-pcl. Otherwise, this attribute is ignored.
- If scs-automatic-page-orientation=yes, you should specify a value in this attribute.

**pdf-encryption-level**
This **single-valued** attribute specifies the level of encryption used to encrypt PDF documents. A high level of encryption provides enhanced security. However, some users might not be able to open PDF documents that use a high level of encryption.

**ISPF field name:** Encryption level

**Allowed values:** You can enter one of these fixed values:

- **bits40** A low level of encryption (a 40-bit encryption key) is used. Select this value if you e-mail PDF documents to countries that do not use 128-bit encryption, or for users with Adobe Acrobat Reader 3.0 - 4.x.

- **bits128** A high level of encryption (a 128-bit encryption key) is used. Select this value for sensitive PDF documents.

**Default value:** bits128

**Usage guidelines:**
- IBM AFP to PDF transforms support this attribute. For information, see the documentation for the transform.
- The job submitter can override this value.

**pdf-owner-identifier**
This **single-valued** attribute specifies the identifier of the owner of an encrypted PDF document. The owner identifier is associated with a password that is stored in a separate database. An owner password is required to restrict actions with the pdf-protect attribute.

**ISPF field name:** Owner identifier

**Allowed values:** You can enter a text string of 1 - 256 characters. You can enter any combination of letters, numbers, blanks, and special characters that the AFP to PDF transform's Password exit allows. This text string might be case-sensitive, depending on the Password exit. If the text string you specify contains blanks or special characters (such as @ $ & ( ) > < ", ", "/"), enclose the text string in single or double quotation marks. For example:
pdf-owner-identifier='Nurse-Lee@hospital.com'

If the string contains double quotation marks, enclose the string in single quotation marks.

**Default value:** None.

**Usage guidelines:**
- IBM AFP to PDF transforms support this attribute. For information, see the documentation for the transform.
- The transform encrypts a PDF document when you specify a user identifier, an owner identifier, or both. Encrypting a PDF document protects it from unauthorized access.
- In most cases, the user and owner identifiers should be different because the user and owner passwords must be different.
- The job submitter can override this value.

**pdf-protect**
This multi-valued attribute specifies one or more actions that users cannot do on encrypted PDF documents.

**Protected actions:** NetSpool PCL Conversion: Print density

**Allowed values:** You can enter one or more fixed values to restrict actions. If you specify more than one value, separate the values with spaces and enclose the list of values in braces {}. For example:

```
-j "pdf-protect=all"
-j "pdf-protect={copy update}"
```

<table>
<thead>
<tr>
<th>Value</th>
<th>Actions users cannot do:</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>• All actions (copy, print, update)</td>
</tr>
<tr>
<td>copy</td>
<td>• Copy or extract content to another document</td>
</tr>
<tr>
<td></td>
<td>• Extract content for accessibility</td>
</tr>
<tr>
<td>print</td>
<td>• Print at low resolution (150 dpi)</td>
</tr>
<tr>
<td></td>
<td>• Print at high resolution</td>
</tr>
<tr>
<td>update</td>
<td>• Change the document</td>
</tr>
<tr>
<td></td>
<td>• Assemble the document (insert, delete, rotate pages)</td>
</tr>
<tr>
<td></td>
<td>• Add comments</td>
</tr>
<tr>
<td></td>
<td>• Fill in form fields or sign</td>
</tr>
<tr>
<td></td>
<td>• Create template pages</td>
</tr>
</tbody>
</table>

**Default value:** No actions are protected.

**Usage guidelines:**
- IBM AFP to PDF transforms support this attribute. For information, see the documentation for the transform.
- The job submitter can override this value.

**pdf-user-identifier**
This single-valued attribute specifies the identifier of the user of an encrypted PDF document. The user identifier is associated with a password that is stored in a separate database. The user enters the user password when opening the encrypted PDF document.
ISPF field name: User identifier

Allowed values: You can enter a text string of 1 - 256 characters. You can enter any combination of letters, numbers, blanks, and special characters that the AFP to PDF transform's Password exit allows. This text string might be case-sensitive, depending on the Password exit. If the text string you specify contains blanks or special characters (such as $ & ( ) > < ' " #), enclose the text string in single or double quotation marks. For example:

```
pdf-user-identifier='Dr-Smith@hospital.com'
```

If the string contains double quotation marks, enclose the string in single quotation marks.

Default value: None. Any user can open the PDF document without a password.

Usage guidelines:

- IBM AFP to PDF transforms support this attribute. For information, see the documentation for the transform.
- The transform encrypts a PDF document when you specify a user identifier, an owner identifier, or both. Encrypting a PDF document protects it from unauthorized access.
- In most cases, the user and owner identifiers should be different because the user and owner passwords must be different.
- The job submitter can override this value.

print-error-reporting-supported

This multi-valued, list attribute specifies the types of errors a printer can report. Print Interface and NetSpool reject print jobs that request error reporting in the print-error-reporting attribute that the printer does not support.

ISPF field name: Print-error reporting supported

Allowed values: Enter one or more of these fixed values:

all The printer can report both print-positioning and invalid-character errors.

character The printer can report invalid-character errors and suppress reporting of print-positioning errors.

none The printer can suppress reporting of both print-positioning and invalid-character errors.

position The printer can report print-positioning errors and suppress reporting of print-positioning errors.

If you specify more than one value, separate the values with spaces and enclose the list in braces. For example:

```
print-error-reporting-supported = {none character}
```

Default value: Print Interface and NetSpool accept all values in the print-error-reporting job attribute.

print-page-header

This single-valued attribute indicates whether IP PrintWay adds a header at the top of each page when formatting data into pages. The header prints on three lines at the top of each page.
**ISPF field name:** Print page header

**Allowed values:** You can enter one of these fixed values:

- **yes**  
  IP PrintWay adds a header.

- **no**  
  IP PrintWay does *not* add a header.

**Default value:** IP PrintWay adds a page header.

**Usage guidelines:**

- IP PrintWay ignores this attribute under any of these conditions:
  - The data set contains carriage control characters. IP PrintWay always uses the carriage control characters to format pages and does not add a page header.
  - Line data was converted to another format such as PCL, PostScript, PDF, SCS, or DSC format.
  - Print Interface converted the line data into text data.
  - The data set contains a PostScript header.
  - `printway-pagination=suppress`.
  - `printway-formatting=none` or `printway-formatting=translate-only`.

- If `protocol-type=email`, specify `print-page-header=no` if you do not want a header added to the e-mail text.

**printer-codepage**

This single-valued attribute specifies the code page used by the printer. Infoprint Server uses this code page as the target when converting line and text data between ASCII and EBCDIC.

**ISPF field name:** Printer code page

**Allowed values:** A valid code page name. Examples of valid code pages are:

- `printer-codepage = ISO8859-1`
- `printer-codepage = IBM-500`

**Default value:** If this attribute is not specified, the default action and code page differs for each component of Infoprint Server:

- Print Interface does not convert data between code pages.
- NetSpool uses the IBM-850 (ASCII) code page.
- IP PrintWay basic mode:
  - E-mail or VTAM protocol: IP PrintWay does not convert data between code pages.
  - LPR, direct sockets, or IPP protocol: IP PrintWay uses the IBM-850 (ASCII) code page.
- IP PrintWay extended mode:
  - E-mail or VTAM protocol: IP PrintWay uses the IBM-1047 (EBCDIC) code page.
  - LPR, direct sockets, or IPP protocol: IP PrintWay uses the IBM-850 (ASCII) code page.

**Usage guidelines:**

- If Print Interface uses this printer definition, you should specify this attribute. If you do not specify a code page, Print Interface does not convert data, so some documents processed by Print Interface might not print correctly.
- For code page names, see [z/OS XL C/C++ Programming Guide](http://www.ibm.com).
If you specify a custom code page, make sure that conversion tables exist to convert between these code pages:
- The code pages in the `document-codepage` and `printer-codepage` attributes.
- The code page for the z/OS locale and the custom code page.
For information about how to create conversion tables, see information about code set conversion utilities in [z/OS XL C/C++ Programming Guide](#).

- In an IP PrintWay printer definition for an ASCII printer, specify an ASCII code page such as ISO8859-1.
- In a PSF printer definition, or in an IP PrintWay printer definition with `protocol-type=vtam`, specify an EBCDIC code page such as IBM-1047.
- In an IP PrintWay printer definition for the e-mail protocol, specify one of these:
  - Any ASCII code page: IP PrintWay converts EBCDIC data from the document code page (default is IBM-1047) to the specified ASCII code page.
  - EBCDIC code page IBM-1047: Sendmail converts EBCDIC data from code page IBM-1047 to an ASCII code page. However, if the code page for the locale on the z/OS system where Infoprint Server is running is not IBM-1047, specify an ASCII code page instead of an EBCDIC code page.
- IP PrintWay basic mode: If neither `document-codepage` nor `printer-codepage` is specified and `old-style-translation=yes`, IP PrintWay basic mode uses the standard TCP/IP translation table.
- NetSpool converts data between code pages only if `netspool-formatting=convert-to-pcl` in the `netspool-options` object class. Otherwise, NetSpool ignores this attribute.

**printway-bottom-margin**
This single-valued attribute specifies the number of blank lines to leave in the bottom margin. IP PrintWay uses this value when formatting data into pages.

**ISPF field name:** IP PrintWay pagination: Margins: Bottom

**Allowed values:** An integer from 0 - 255.

**Default value:** IP PrintWay does not leave a bottom margin.

**Usage guidelines:** IP PrintWay ignores this attribute under any of these conditions:
- The data set contains carriage control characters.
- Line data was converted to another format such as PCL, PostScript, PDF, SCS, or DSC format.
- The data set was placed on the spool by Print Interface.
- The data set contains a PostScript header.
- `printway-formatting=none` or `printway-formatting=translate-only`.
- `printway-pagination=suppress`.
- NetSpool converted the data to PCL format.

**printway-page-height**
This single-valued attribute specifies the number of lines to place on a page. This number includes any blank lines in the top and bottom margins, lines for the optional page header, and data lines. IP PrintWay uses this attribute when formatting data into pages.

**ISPF field name:** IP PrintWay pagination: Page height

**Allowed values:** An integer from 0 - 255.
Default value: IP PrintWay uses 58 lines as the page length.

Usage guidelines: IP PrintWay ignores this attribute under any of these conditions:
- The data set contains carriage control characters.
- Line data was converted to another format such as PCL, PostScript, PDF, SCS, or DSC format.
- Print Interface converted line data into text data.
- The data set contains a PostScript header.
- `printway-formatting=None` or `printway-formatting=translate-only`.
- `printway-pagination=suppress`.
- NetSpool converted the data to PCL format.

`printway-pagination`
This single-valued attribute indicates whether IP PrintWay formats data into pages. When formatting data, IP PrintWay can add a header to each page and leave blank lines for top and bottom margins.

ISPF field name: IP PrintWay pagination

Allowed values: You can enter one of these fixed values:

- `allow` IP PrintWay formats data into pages if possible.
- `suppress` IP PrintWay does not format data into pages.

Default value: IP PrintWay formats data into pages.

Usage guidelines:
- If you specify `allow` (default), you can also specify these attributes:
  - `printway-top-margin`
  - `printway-bottom-margin`
  - `printway-page-height`
  - `print-page-header`
- IP PrintWay ignores this attribute under any of these conditions:
  - Line data was converted to another format such as PCL, PostScript, PDF, SCS, or DSC format.
  - Print Interface converted line data into text data.
  - NetSpool converted the data to PCL format.
  - The data set contains carriage control characters.
  - The data set contains a PostScript header.
  - `printway-formatting=None` or `printway-formatting=translate-only`.

`printway-sosi-mode`
This single-valued attribute specifies a value that indicates the shift-out shift-in (SOSI) mode that IP PrintWay basic mode uses to delimit double-byte character set (DBCS) data in the ASCII data stream.

ISPF field name: SOSI mode

Allowed values: You can enter one of these fixed values:

- `ascii` IP PrintWay translates each EBCDIC SOSI character to an ASCII SOSI character (X'0E' to X'1E' or X'0F' to X'1F').
- `ebcdic` IP PrintWay leaves the EBCDIC SOSI characters unchanged and delimits DBCS data with the EBCDIC SOSI characters.
processing and printer

none  IP PrintWay removes the SOSI characters and does not delimit DBCS data.

space  IP PrintWay translates each EBCDIC SOSI character to an ASCII space character (X'20').

Default value:  IP PrintWay removes SOSI characters and does not delimit DBCS data.

Usage guidelines:  This attribute does not apply when:
- IP PrintWay extended mode processes the data stream.
- \texttt{db-translate-table = jis78kj-ascii, jis78kj-jisroman, jis83kj-ascii, jis83kj-jisroman, or ibmkanji}. For more information, see the \texttt{db-translate-table}.
- \texttt{protocol-type=vtam}.

\textbf{printway-top-margin}

This \texttt{single-valued} attribute specifies the number of blank lines to leave in the top margin. IP PrintWay uses this value when formatting data into pages.

\textbf{ISPF field name:  IP PrintWay pagination: Margins: Top}

Allowed values:  An integer from 0 - 255.

Default value:  IP PrintWay does not leave a top margin.

Usage guidelines:  IP PrintWay ignores this attribute under any of these conditions:
- Line data was converted to another format such as PCL, PostScript, PDF, SCS, or DSC format.
- Print Interface converted line data into text data.
- NetSpool converted the data to PCL format.
- The data set contains carriage control characters.
- The data set contains a PostScript header.
- \texttt{printway-formatting=none} or \texttt{printway-formatting=translate-only}.
- \texttt{printway-pagination=suppress}.

\textbf{resubmit-for-filtering}

This \texttt{single-valued} attribute indicates whether a filter in the \texttt{filters} attribute is to be used for data sets submitted as batch jobs to IP PrintWay basic mode. When \texttt{resubmit-for-filtering=yes}, IP PrintWay resubmits batch data sets to Print Interface. Print Interface calls the filter (if any) associated with the input data format and then writes the data to a new output data set on the JES spool for subsequent processing by IP PrintWay.

\textbf{ISPF field name:  Resubmit for filtering}

Allowed values:  You can enter one of these fixed values:
- yes  At least one filter in the \texttt{filters} attribute applies to batch data sets.
- no  No filters apply to batch data sets.

Default value:  no

Usage guidelines:  
- This attribute does not apply to IP PrintWay extended mode.
- For optimum system performance, specify \texttt{yes} only when needed:
– Specify **yes** if you also specify a transform filter, such as `afp2pcl.dll` or `afpxpcl.dll`, in the `filters` attribute.

– Do **not** specify **yes** if the **only** filter specified is `aopfiltr.so`.

**This attribute has meaning only for IP PrintWay printer definitions. It is ignored for PSF and General printer definitions.**

### `scs-automatic-page-orientation`

This **single-valued** attribute indicates whether NetSpool is to automatically determine the orientation (portrait or landscape) of each page based on the line length and page length of that page. If necessary, NetSpool also reduces the size of the print (the font size) and increases the line density so that data fits on a line. NetSpool uses this attribute only when it converts SCS character string (SCS) data streams to PCL data streams.

**ISPF field name:** NetSpool PCL Conversion: SCS automatic page orientation

**Allowed values:** Enter one of these fixed values:

- **no** NetSpool does not automatically determine the page orientation.
- **yes** NetSpool automatically determines the page orientation if possible. If NetSpool cannot determine the page density and line density, it uses the orientation specified in the `pcl-orientation` attribute.

**Default value:** NetSpool does not automatically determine the page orientation.

**Usage guidelines:**

- NetSpool uses this attribute only when it converts SCS data streams and only when `netspool-formatting=convert-to-pcl`. Otherwise, this attribute is ignored.

- If `scs-automatic-page-orientation=yes`, you should specify values in these attributes:
  - `pcl-print-density`
  - `pcl-line-density`
  - `scs-maximum-line-length`
  - `scs-maximum-page-length`

- NetSpool uses the line and page lengths specified in SCS controls and in the `pcl-print-density`, `pcl-line-density`, `scs-maximum-line-length`, and `scs-maximum-page-length` attributes to determine the page orientation of each page. If the line length is greater than the page length, NetSpool sets the orientation to landscape. Otherwise, it sets the orientation to portrait. When NetSpool sets the orientation to landscape, if the `maximum-line-length` attribute (or the MPP in the SCS SHF control) is greater than 106, NetSpool sets the print density to 15 characters per inch and the line density to 8 lines per inch.

### `scs-bottom-margin`

This **single-valued** attribute specifies the number of the line at which data ends on each page. NetSpool uses this value when it converts SNA character string (SCS) data streams to either line data streams or PCL data streams. IP PrintWay uses this value when it converts line data streams to SCS data streams.

**ISPF field name:** SCS Conversion: Margins: Bottom

**Allowed values:** An integer from 1 - 255. The number must be equal to or greater than the value in the `scs-top-margin` attribute. It must be equal to or less than the value in the `scs-maximum-page-length` attribute.
In this example, the data ends on line 61. Because the page has 66 lines, the bottom margin has 5 blank lines:

```
scs-bottom-margin = 61  scs-maximum-page-length=66
```

**Default value:** No bottom margin. NetSpool uses the current maximum presentation line (MPL) value.

**Usage guidelines:**
- A Set Horizontal Format (SHF) command in the SCS input data stream overrides this value.
- When `scs-bottom-margin=1`, NetSpool does not insert form feeds when the application spaces past the bottom margin. However, NetSpool does insert form feeds when an explicit form feed or a Select Vertical Channel command occurs in the input data.
- NetSpool ignores this attribute if `netspool-formatting = none`.
- IP PrintWay ignores this attribute if `printway-formatting=none` or `vtam-send-as-transparent=yes`.

**scs-horizontal-tabs**

This multi-valued, list attribute specifies the column numbers of the default horizontal tab settings. NetSpool uses this value when it converts SNA character string (SCS) data streams to either line data streams or PCL data streams. NetSpool always sets the first tab to the left margin value. You do not need to specify it. NetSpool ignores a value of 0.

**ISPF field name:** SCS Conversion: Horizontal tabs

**Allowed values:** An integer from 0 - 255. A number greater than zero must be equal to or between the values in the `scs-left-margin` and `scs-right-margin` attributes.

In this example, horizontal tabs are set at columns 6, 25, 50, 75, and 100.

```
scs-horizontal-tabs = {25 50 75 100}  scs-left-margin = 6
```

**Default value:** NetSpool uses tab value 0.

**Usage guidelines:**
- A Set Horizontal Format (SHF) command in the SCS input data stream overrides this value.
- The input data stream can add additional tab positions but cannot remove default tabs set in this attribute.
- NetSpool ignores this attribute if `netspool-formatting = none`.

**scs-left-margin**

This single-valued attribute specifies the number of the first column of data on each page. NetSpool uses this value when it converts SNA character string (SCS) data streams to either line data streams or PCL data streams. IP PrintWay uses this value when it converts line data streams to SCS data streams.

**ISPF field name:** SCS Conversion: Margins: Left

**Allowed values:** An integer from 1 - 255. The number must be equal to or less than the value in the `scs-maximum-line-length` attribute.

In this example, the left margin has 3 blank columns:

```
scs-left-margin = 4
```
Default value: No left margin.

Usage guidelines:
- A Set Horizontal Format (SHF) command in the SCS input data stream overrides this value.
- NetSpool ignores this attribute if netspool-formatting = none.
- IP PrintWay ignores this attribute if printway-formatting none or vtam-send-as-transparent = yes.
- When IP PrintWay converts line data to SCS data, the left margin value in the FCB, if specified, overrides this value.

scs-maximum-line-length
This single-valued attribute specifies the number of columns to place on one line. This number includes the left and right margins. NetSpool uses this value when it converts SNA character string (SCS) data streams to either line data streams or PCL data streams. IP PrintWay uses this value when it converts line data streams to SCS data streams.

ISPF field name: SCS Conversion: Line length

Allowed values: An integer from 1 - 255.

Default value: NetSpool uses column number 80 as the default. IP PrintWay uses the printer’s default value set on the printer’s panel.

Usage guidelines:
- A Set Horizontal Format (SHF) command in the SCS input data stream overrides this value.
- NetSpool uses this value as the default maximum presentation position (MPP) value.
- NetSpool ignores this attribute if netspool-formatting = none.
- IP PrintWay ignores this attribute if printway-formatting = none or vtam-send-as-transparent = yes.

scs-maximum-page-length
This single-valued attribute specifies the number of lines to place on a page. This number includes any blank lines in the top and bottom margins and data lines. NetSpool uses this value when it converts SNA character string (SCS) data streams to either line data streams or PCL data streams. IP PrintWay uses this value when it converts line data streams to SCS data streams.

ISPF field name: SCS Conversion: Page length

Allowed values: An integer from 1 - 255.

Default value: NetSpool uses 1 as the default. IP PrintWay uses the printer’s default set on the printer panel.

Usage guidelines:
- A Set Vertical Format (SVF) command in the SCS input data stream overrides this value.
- NetSpool uses this value as the default SCS maximum presentation line (MPL) value.
- NetSpool ignores this attribute if netspool-formatting = none.
- IP PrintWay ignores this attribute if printway-formatting = none or vtam-send-as-transparent = yes.
When IP PrintWay converts line data to SCS data, the page size value in the FCB, if specified, overrides this value.

**scs-right-margin**
This single-valued attribute specifies the column number at which the right margin starts on each page. NetSpool uses this value when it converts SNA character string (SCS) data streams to either line data streams or PCL data streams. IP PrintWay uses this value when it converts line data streams to SCS data streams.

**ISPF field name:** SCS Conversion: Margins: Right

**Allowed values:** An integer from 1 - 255. The number must be equal to or less than the value in the scs-maximum-line-length attribute.

In this example, the right margin is at column 76. Because the line length is 80, the right margin has 5 blank columns:

```
scs-right-margin = 76  scs-maximum-line-length=80
```

**Default value:** NetSpool uses 80 as the default value. IP PrintWay does not leave a right margin.

**Usage guidelines:**
- A Set Horizontal Format (SHF) command in the SCS input data stream overrides this value.
- NetSpool ignores this attribute if netspool-formatting = none.
- IP PrintWay ignores this attribute if printway-formatting=none or vtam-send-as-transparent=yes.

**scs-top-margin**
This single-valued attribute specifies the number of the first line of data on each page. NetSpool uses this value when it converts SNA character string (SCS) data streams to either line data streams or PCL data streams. IP PrintWay uses this value when it converts line data streams to SCS data streams.

**ISPF field name:** SCS Conversion: Margins: Top

**Allowed values:** An integer from 1 - 255. The number must be less than or equal to the value specified in the scs-maximum-page-length attribute. In this example, NetSpool leaves 5 blank lines in the top margin:

```
scs-top-margin = 6
```

**Default value:** No top margin.

**Usage guidelines:**
- NetSpool also uses this value as the line number for Select Vertical Channel 1.
- A Set Vertical Format (SVF) SCS command in the input data stream overrides this value.
- NetSpool ignores this attribute if netspool-formatting = none.
- IP PrintWay ignores this attribute if printway-formatting=none or vtam-send-as-transparent=yes.

**scs-vertical-tabs**
This multi-valued, list attribute specifies the line numbers of the default vertical tab settings. NetSpool uses these values when it converts SNA character string (SCS) data streams to either line data streams or PCL data streams. The first tab is
always set to the top margin value. Do not specify it. A tab value of 0 is ignored.
The first eleven tabs are also used as line numbers for Select Vertical Channel 2
through 12.

**ISPF field name:** SCS Conversion: Vertical tabs

**Allowed values:** An integer from 0 - 255. A number greater than zero must be
equal to or between the values in the **scs-top-margin** and **scs-bottom-margin**
attributes.

In this example, vertical tabs are set at lines 6, 20, 40, and 50. These vertical
channels are set: CH01=6, CH02=20, CH04=40, CH05=50. These vertical channels
are not set: CH03, CH06 through CH12.

\[
\text{scs-vertical-tabs} = \{20\ 0\ 40\ 50\} \quad \text{scs-top-margin} = 6
\]

**Default value:** NetSpool uses tab value 0.

**Usage guidelines:**
- A Set Vertical Format (SVF) SCS command in the input data stream overrides
  this value.
- The input data stream can add additional tab positions but cannot remove
default tabs set in this attribute.
- NetSpool ignores this attribute if **netspool-formatting = none**.

**trailer-transform-error-page**

This **single-valued** attribute indicates whether transforms write messages for data
stream errors and warnings to a trailer page. The trailer page is the last page in the
output document. Warnings can indicate degraded output.

**ISPF field name:** Trailer error page

**Allowed values:** Enter one of these fixed values:

- **error** The transform writes error messages, but not warning messages, to
  a trailer page. This option does not apply when the
  **fail-on-transform-error=error** or **fail-on-transform-error=warning**
  because no output document is created when an error occurs.

- **no** The transform does not write messages to a trailer page.

- **warning** The transform writes error and warning messages to a trailer page.
  This option does not apply when **fail-on-transform-error=warning**
  because no output document is created when an error or warning
  occurs.

**Default value:**
1. The value of the AOP_TRAILER_ERROR_PAGE environment variable for the
   transform class.
2. **warning**

**Usage guidelines:** For information about whether a transform supports this
attribute, see the documentation for the transform.

**translation-dataset-qualifier**

This **single-valued** attribute specifies the name of the TCP/IP translation table that
IP PrintWay basic mode uses to convert single-byte character set (SBCS) data from
EBCDIC to ASCII. This translation table name is used with both single-byte data
and double-byte data to determine the high-level qualifier of the translation table data set. Specify this attribute only if you have created a custom TCP/IP translate table.

**ISPF field name:** Translation dataset qualifier

**Allowed values:** A valid translation table name.

**Default value:** See Usage Guidelines.

**Usage guidelines:**
- This attribute does not apply to IP PrintWay extended mode.
- If either the **document-codepage** or **printer-codepage** attribute is specified, IP PrintWay uses the code pages to convert data and ignores this attribute.
- If this attribute, the **db-translate-table** attribute, the **document-codepage**, and the **printer-codepage** attribute are not specified, IP PrintWay uses default code pages to convert data. However, you can specify the **old-style-translation** attribute in the FSS definition to force IP PrintWay to use the standard TCP/IP translate table, STANDARD.TCPXLBIN, to convert data.
- IP PrintWay ignores this attribute when **protocol-type=vtam** or **protocol-type=e-mail**.

**Attributes for the protocol object class**

This section lists attributes that are valid when you create Protocol components, which are in object class **protocol**. These attributes are also valid for the **printer** object class.

**Required attributes**

Table 42 summarizes the attributes that are required and optional when you create a printer definition. The required and optional attributes depend on the value you select for the **protocol-type** attribute. You can specify attributes either in the printer definition or in an included Protocol component.

**Note:** When you create a Protocol component, no attributes are required. When you create a default IP PrintWay printer definition, no attributes are required.

**Table 42. Required protocol attributes**

<table>
<thead>
<tr>
<th>Value of protocol-type attribute</th>
<th>Required attributes</th>
<th>Optional attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>direct-sockets</td>
<td>printer-ip-address, port-number</td>
<td>description, operator-security-profile, page-accounting, page-restart</td>
</tr>
<tr>
<td>ipp</td>
<td>printer-uri</td>
<td>description, operator-security-profile</td>
</tr>
<tr>
<td>lpr</td>
<td>printer-ip-address, print-queue-name</td>
<td>description, lpr-xxxx, operator-security-profile, owner, server-user-options</td>
</tr>
</tbody>
</table>
### Description

This **single-valued** attribute specifies a description for the component. The description can help you select the correct component from a list.

**ISPF field name:** Description

**Allowed values:** Any combination of 1-256 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as # $ @ ! = / ). If the value contains blanks or special characters, enclose it in single or double quotation marks.

**Default value:** None.

### lpr-banner-class

This **single-valued** attribute specifies the class name that IP PrintWay passes to the remote LPD for printing on a banner page, a page the LPD can print before the document.

**ISPF field name:** Banner class

**Allowed values:** A combination of 1-31 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as @ $ # , * / ). If the value contains blanks or special characters, enclose it in single or double quotation marks.

**Default value:** IP PrintWay passes the name of the z/OS system to the LPD.

**Usage guidelines:**
- The implementation and configuration of the remote LPD determine how this value is used.
- IP PrintWay uses this value only when it uses the LPR transmission protocol and `lpr-print-banner=yes`.

### lpr-banner-job-name

This **single-valued** attribute specifies the job name that IP PrintWay passes to the remote LPD for printing on a banner page, a page the LPD can print before the document.

**ISPF field name:** Banner job name

**Allowed values:** A combination of 1-99 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as @ $ # , * / ). If the value contains blanks or special characters, enclose it in single or double quotation marks.

---

**Table 42. Required protocol attributes (continued)**

<table>
<thead>
<tr>
<th>Value of protocol-type attribute</th>
<th>Required attributes</th>
<th>Optional attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>e-mail</td>
<td>mail-to-addresses</td>
<td>description, mail-bcc-addresses, mail-cc-addresses, mail-embedded-headers, mail-inline-text, mail-inline-message, mail-from-name, mail-reply-address</td>
</tr>
</tbody>
</table>
Specify %sysout-job-name to pass the z/OS job name instead of the z/OS fully qualified data set name to the LPD. (See “Default value” for information about when IP PrintWay passes the fully qualified data set name to the LPD.) For example:

lpr-banner-job-name=%sysout-job-name

**Default value:** IP PrintWay passes one of these values to the LPD:
1. The value specified in the **sysout-dataset-name** job attribute.
2. One of these values:
   - IP PrintWay extended mode: The file name of documents submitted from remote systems, with the AOPPRINT JCL procedure, or with the **lp** command.
   - IP PrintWay extended mode: The VTAM LU name of the application that submitted the print request to NetSpool.
   - IP PrintWay basic mode and extended modes: The z/OS fully qualified data set name in this format:
     system_name.user_ID.job_name.job_ID.dset_ID.short_dset_name

**Usage guidelines:**
- The implementation and configuration of the remote LPD determine how this value is used.
- IP PrintWay uses this value only if it uses the LPR transmission protocol and lpr-print-banner=yes.

**lpr-filename**
This **single-valued** attribute specifies the file name that IP PrintWay passes to the remote LPD.

**ISPF field name:** Filename

**Allowed values:** A combination of 1-31 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as @ $ # , * - / ). If the value contains blanks or special characters, enclose it in single or double quotation marks.

**Default value:** One of these values:
- IP PrintWay extended mode: The file name of documents submitted from remote systems, with the AOPPRINT JCL procedure, or with the **lp** command.
- IP PrintWay extended mode: The VTAM LU name of the application that submitted the print request to NetSpool.
- IP PrintWay basic mode and extended modes: The z/OS fully qualified data set name in this format:
  system_name.user_ID.job_name.job_ID.dset_ID.short_dset_name

**Usage guidelines:**
- The implementation and configuration of the remote LPD determine how this value is used.
- IP PrintWay uses this value only if it uses the LPR transmission protocol.
- IP PrintWay passes this value to the LPD only if lpr-print-function=p.

**lpr-indent**
This **single-valued** attribute specifies the number of columns that the remote LPD indents the output it generates.
ISPF field name: Indent

Allowed values: An integer from 1 - 2147483646.

Default value: IP PrintWay does not pass a value to the LPD, so output is not indented.

Usage guidelines:
- The implementation and configuration of the remote LPD determine how this value is used.
- IP PrintWay uses this value only if it uses the LPR transmission protocol.

**lpr-mode**
This single-valued attribute specifies the mode that IP PrintWay uses when transmitting data to a remote LPD.

ISPF field name: Mode

Allowed values: You can enter one of these fixed values:

- **control-file-first**
  IP PrintWay transmits the control file before the data file. Not all LPDs support this mode. However, this mode lets some LPDs print data as it is received and print larger files.

- **control-file-last**
  IP PrintWay transmits the control file after the data file. All LPDs that adhere to RFC 1179 support this mode.

- **streaming**
  IP PrintWay transmits the control file before the data file. The remote LPD must support the RECEIVE CONTROL FILE FIRST and RECEIVE DATA FILE WITH UNSPECIFIED LENGTH commands. Specify this value if the target system is an IBM network station.

- **to-remote-psf**
  IP PrintWay transmits files to InfoPrint Manager for AIX or InfoPrint Manager for Windows on the remote system. IP PrintWay:
  - Adds a record length field to each record.
  - Creates -o parameters in the control file. -o parameters contain AFP values specified by the job submitter, such as duplex option.
  - Does not format or translate the data file to ASCII. (IP PrintWay ignores the printway-formatting attribute.)
  - Transmits the control file after the data file.

Default value: IP PrintWay transmits the control file after the data file.

**lpr-optimize-copies**
This single-valued attribute indicates how IP PrintWay is to transmit documents when the job submitter requests multiple copies.

ISPF field name: Optimize copies

Allowed values: You can enter one of these fixed values:

- **yes**
  IP PrintWay transmits the document to the LPD only one time. IP PrintWay tells the LPD how many copies to print in the LPD control file.
no IP PrintWay transmits the document to the LPD multiple times, one time for each copy.

Default value: IP PrintWay does not optimize the transmission of copies.

Usage guidelines:
- Select this field to improve performance, but only if the printer’s LPD supports printing multiple copies of one file.
- When lpr-mode=to-remote-psf, IP PrintWay ignores this attribute and transmits documents only one time because PSF supports printing multiple copies of one file.
- IP PrintWay uses this value only if it uses the LPR transmission protocol.

lpr-print-banner
This single-valued attribute indicates whether the remote LPD is to print a banner page. When lpr-print-bannerg=yes, IP PrintWay sends information for printing on the banner page to the LPD. A banner page is a page the LPD can print before the document.

ISPF field name: Print banner page

Allowed values: You can enter one of these fixed values:
yes The LPD prints a banner page.
no The LPD does not print a banner page.

Default value: The LPD prints a banner page.

Usage guidelines:
- The implementation and configuration of the remote LPD determine how this value is used.
- IP PrintWay uses this value only if it uses the LPR transmission protocol.

lpr-print-function
This single-valued attribute specifies a code that tells the remote LPD what type of data formatting to do.

ISPF field name: Print function

Allowed values: An upper or lowercase letter. These codes usually mean:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>f</td>
<td>Print as a sequence of lines.</td>
</tr>
<tr>
<td>l</td>
<td>Print leaving control characters.</td>
</tr>
<tr>
<td>p</td>
<td>Print with pagination.</td>
</tr>
<tr>
<td>r</td>
<td>Print interpreting the first column as FORTRAN (ANSI) carriage control characters. Supported characters are 1, 0, +, -, and blank.</td>
</tr>
</tbody>
</table>

Default value: IP PrintWay passes code f to the remote LPD.

Usage guidelines:
- Some LPDs require that you specify code l for data that is not to be formatted or that includes transparent data.
The implementation and configuration of the remote LPD determine how this value is used.

IP PrintWay uses this value only if it uses the LPR transmission protocol.

**lpr-restrict-ports**

This *single-valued* attribute indicates whether IP PrintWay must use a z/OS port in the range of 721 to 731 when communicating with the remote LPD. Specify restrict-ports=yes when the remote LPD enforces this port restriction.

**ISPF field name:** Restrict ports

**Allowed values:** You can enter one of these fixed values:

- yes: The z/OS port must be in the range of 721 to 731.
- no: Any z/OS port can be used.

**Default value:** IP PrintWay uses any z/OS port.

**Usage guidelines:**

- When restrict-ports=no, IP PrintWay can use any free port. This increases the probability of finding an available port.
- IP PrintWay uses this value only if it uses the LPR transmission protocol.

**lpr-title**

This *single-valued* attribute specifies a document title that IP PrintWay passes to the remote LPD.

**ISPF field name:** Title

**Allowed values:** A combination of 1-79 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as @ $ # , * - / ). If the value contains blanks or special characters, enclose it in single or double quotation marks.

**Default value:**

1. A title specified by the job submitter.
2. One of these values:
   - IP PrintWay extended mode: The file name of documents submitted from remote systems, with the AOPPRINT JCL procedure, or with the *lp* command.
   - IP PrintWay extended mode: The VTAM LU name of the application that submitted the print request to NetSpool.
   - IP PrintWay basic mode and extended modes: The z/OS fully qualified data set name in this format:

     system_name.user_ID.job_name.job_ID.dset_ID.short_dset_name

**Usage guidelines:**

- The implementation and configuration of the remote LPD determine how this value is used.
- IP PrintWay uses this value only if it uses the LPR transmission protocol.
- A title specified by the job submitter overrides the value specified in this attribute.
**lpr-width**

This **single-valued** attribute specifies the maximum number of columns that the remote LPD puts on a line.

**ISPF field name:** Width

**Allowed values:** An integer from 1 - 2147483646.

**Default value:** IP PrintWay does not pass a width value to the LPD.

**Usage guidelines:**
- The implementation and configuration of the remote LPD determine how this value is used.
- IP PrintWay uses this value only if it uses the LPR transmission protocol.

**mail-bcc-addresses**

This **multi-valued** attribute specifies the e-mail addresses of the “blind copy (bcc)” recipients of an e-mail. A bcc means that other recipients of the e-mail do not see the bcc recipient listed. You can also specify one or more alias names that are defined to z/OS UNIX sendmail. An alias name represents one or more real e-mail addresses. This attribute pertains only to printer definitions with **protocol-type=email**. It is optional for these printer definitions.

**ISPF field name:** BCC addresses

**Allowed values:** You can specify 1-32 e-mail addresses. If you specify more than one value, separate the values by spaces and enclose the list of values in braces {}. Each e-mail address can be 1-60 characters. If the e-mail address contains blanks or special characters (such as @ $ & ( ) > < | ' " #), enclose the entire e-mail address in single or double quotation marks. If the e-mail address contains the special character @, enclose the value in braces even if there is only one value. If the e-mail address contains double quotation marks, enclose the entire address in single quotation marks. Each address or alias name should be in this format:

```
username[@domainname]
```

- **username**
  - The name of the recipient or an alias name that is defined to z/OS UNIX sendmail.

- **@domainname**
  - The domain name of the target system. If you omit @domainname, sendmail uses the name of the system on which sendmail is running. If you specify an alias, omit @domainname.

For example:

```
mail-bcc-addresses = {"user2@xyz.com" dept01list}
mail-bcc-addresses = {"user2@xyz.com"}
```

**Default value:** None.

**Usage guidelines:**
- Infoprint Server does not verify that the value is in the correct format.
- An address that the job submitter specifies overrides this value.
mail-cc-addresses

This multi-valued attribute specifies the e-mail addresses of the “copy (cc)” recipients of an e-mail. A cc means that other recipients of the e-mail can see the cc recipient listed. You can also specify one or more alias names that are defined to z/OS UNIX sendmail. An alias name represents one or more real e-mail addresses. This attribute pertains only to printer definitions with protocol-type=email. It is optional for these printer definitions.

**ISPF field name:** CC addresses

**Allowed values:** You can specify 1-32 e-mail addresses. If you specify more than one value, separate the values by spaces and enclose the list of values in braces {}. Each e-mail address can be 1-60 characters. If the e-mail address contains blanks or special characters (such as @ $ & ( ) > < | ' " #), enclose the entire e-mail address in single or double quotation marks. If the e-mail address contains the special character @, enclose the value in braces even if there is only one value. If the e-mail address contains double quotation marks, enclose the entire address in single quotation marks. Each address or alias name should be in this format:

**username[@domainname]**

- **username**
  The name of the recipient or an alias name that is defined to z/OS UNIX sendmail.

- **@domainname**
  The domain name of the target system. If you omit @domainname, sendmail uses the name of the system on which sendmail is running. If you specify an alias, omit @domainname.

For example:

```plaintext
mail-cc-addresses = {"user3@xyz.com" dept02list}
mail-cc-addresses = {"user3@xyz.com"}
```

**Default value:** None.

**Usage guidelines:**
- Infoprint Server does not verify that the value is in the correct format.
- An address that the job submitter specifies overrides this value.

mail-embedded-headers

This single-valued attribute indicates whether line-data documents can contain e-mail headers. This attribute pertains only to printer definitions with protocol-type=email. It is optional for these printer definitions.

**ISPF field name:** Embedded headers

**Allowed values:** You can enter one of these fixed values:

- **yes**
  IP PrintWay extended mode looks for an e-mail header in the first 32 records of all line-data documents. If a header is found, it sends the e-mail to the addresses in the header and with the subject specified in the header. If no header is found, it sends the e-mail to the addresses specified on the OUTPUT JCL statement, in job attributes, or in the printer definition.

- **no**
  IP PrintWay extended mode does not look for e-mail headers.

**Default value:** IP PrintWay does not look for an e-mail headers.
Usage guidelines:
- IP PrintWay extended mode does not look for e-mail headers in documents with other formats (such as, text, PCL, and PDF).
- If you print VTAM application data that contains e-mail headers, specify $netspool-formatting=convert-to-line$ (default).
- An address or subject in the e-mail header overrides the address and title specified on the OUTPUT JCL statement, in job attributes, and in the printer definition.
- For the format of e-mail headers, see $z/OS Infoprint Server User's Guide$.
- IP PrintWay basic mode ignores this attribute. It does not look for e-mail headers in line-data documents.

mail-from-name
This single-valued attribute specifies the descriptive name or other identifier of the sender of an e-mail. This attribute pertains only to printer definitions with protocol-type=email. It is optional for these printer definitions.

ISPF field name: From name

Allowed values: A combination of 1-60 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as @ $ & ( ) > < | ' " #). If the name contains blanks or special characters, enclose the entire name in single or double quotation marks. If the name contains double quotation marks, enclose the entire name in single quotation marks.

IP PrintWay always includes $userid@domainname$ to identify the sender. The user ID of the job submitter is $userid$. The domain name where Infoprint Server is running is $domainname$. For example: JOHN@SYSTEM1.

For example, this specification:

```plaintext
mail-from-name = "John Q. Sender"
```

Puts this information in the e-mail:

```plaintext
From: John Q. Sender <JOHN@SYSTEM1>
```

Tip: To specify the e-mail address that recipients of an e-mail can reply to, use the mail-reply-address attribute.

Default value: None.

Usage guidelines:
- Infoprint Server does not verify that the value is in the correct format.
- A name that the job submitter specifies overrides this value.

mail-inline-message
This single-valued attribute specifies data that IP PrintWay extended mode includes inline at the beginning of each e-mail. For example, you can specify a standard greeting and text. This attribute pertains only to printer definitions with protocol-type=email. It is optional for these printer definitions.

ISPF field name: Inline message

Allowed values: Up to 292 letters, numbers, blanks, and special characters. If the message contains blanks or special characters, enclose the entire message in single or double quotation marks. You can include control values, such as:
### protocol and printer

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;LF&gt;</code></td>
<td>New line</td>
</tr>
<tr>
<td><code>&lt;SP&gt;</code></td>
<td>Blank character</td>
</tr>
</tbody>
</table>

E-mail programs can interpret control values in different ways.

**Tip:** Infoprint Server converts each blank in the message to `<SP>`. If the message exceeds 292 characters, it is truncated.

**Examples:**

"Greetings:<LF><LF>The monthly sales report is attached.<LF>"

"Greetings:<LF><LF>The<SP>monthly<SP>sales<SP>report<SP>is<SP>attached.<LF>"

This is the message in the e-mail:

```plaintext
Greetings:
The monthly sales report is attached.
[If you include a document in the body of the e-mail, text starts here.]
```

**Default value:** No inline message is included in the body of the e-mail.

**Usage guidelines:**

- IP PrintWay basic mode ignores this attribute.

---

### mail-inline-text

This single-valued attribute indicates whether data in text and line-data documents is included inline in the body of the e-mail. This attribute pertains only to printer definitions with protocol-type=email. It is optional for these printer definitions.

**ISPF field name:** Inline text and line data

**Allowed values:** You can enter one of these fixed values:

- **yes** Text and line data is included inline.
- **no** Text and line data is not included inline. All documents are sent as attachments.

**Default value:** Text and line data is not included inline. All documents are sent as attachments.

**Usage guidelines:**

- Documents in a format other than line data or text (such as, AFP and PDF documents) are always sent as attachments.
- Line data documents transformed to another format (such as, PDF) are always sent as attachments.
- If you print VTAM application data and want to include data inline, specify netspool-formatting=line (default).
- You can separate data from more than one document in an e-mail with a blank line or other text. For a blank line, specify `<LF>` in the document-trailer attribute.
- IP PrintWay basic mode ignores this attribute. It sends text and line data documents as attachments.
mail-reply-address

This **single-valued** attribute specifies the e-mail address that recipients of an e-mail can reply to. You can also specify an alias name that is defined to z/OS UNIX sendmail. An alias name represents one or more real e-mail addresses. This attribute pertains only to printer definitions with **protocol-type=email**. It is optional for these printer definitions.

**ISPF field name:** Reply address

**Allowed values:** A combination of 1-60 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as @ $ & ( ) > < | " ' #). If the name contains blanks or special characters, enclose the entire name in single or double quotation marks. If the name contains double quotation marks, enclose the entire name in single quotation marks. If the e-mail address contains the special character @, enclose the value in braces. The name should be in this format:

`username[@domainname]`

- `username` The name portion of the address, or an alias name that is defined to z/OS UNIX sendmail.
- `@domainname` The domain portion of the target system. If you omit `@domainname`, sendmail uses the name of the system on which sendmail is running.

For example:

```
mail-reply-address = {"mysecretary@xyz.com"}
```

**Default value:** None. However, most e-mail programs use the sender's e-mail address. The default is `userid@domainname`. The user ID of the job submitter is `userid`. The domain name where Infoprint Server is running is `domainname`.

**Usage guidelines:**
- Infoprint Server does not verify that the value is in the correct format.
- An address that the job submitter specifies overrides this value.

mail-to-addresses

This **multi-valued** attribute specifies the e-mail addresses of the recipients of an e-mail. You can also specify one or more alias names that are defined to z/OS UNIX sendmail. An alias name represents one or more real e-mail addresses. This attribute pertains only to printer definitions with **protocol-type=email**. It is required for these printer definitions. The job submitter can override the e-mail addresses during job submission. You can set up just one printer definition for the e-mail protocol because the job submitter can specify the e-mail addresses. You must specify a default e-mail address in this printer definition.

**ISPF field name:** E-mail addresses

**Allowed values:** You can specify 1-32 e-mail addresses. If you specify more than one value, separate the values by spaces and enclose the list of values in braces `{}`. Each e-mail address can be 1-60 characters. If the e-mail address contains blanks or special characters (such as `@ $ & ( ) > < | " ' #), enclose the entire e-mail address in single or double quotation marks. If the e-mail address contains the special character @, enclose the value in braces even if there is only one value. If the e-mail address contains double quotation marks, enclose the entire address in single quotation marks. Each address or alias name should be in this format:
**username[@domainname]**

**username**
The name of the recipient or an alias name that is defined to z/OS UNIX sendmail.

**@domainname**
The domain name of the target system. If you omit @domainname, sendmail uses the name of the system on which sendmail is running. If you specify an alias, omit @domainname.

For example:
```plaintext
mail-to-addresses = {"user1@xyz.com" dept03list}
mail-to-addresses = {"user1@xyz.com"}
```

**Default value:** None.

**Usage guidelines:**
- Infoprint Server does not verify that the value is in the correct format.
- An address that the job submitter specifies overrides this value.

**name**
This single-valued attribute specifies the name of the component.

**Note:** This is a non-settable attribute. Do not specify the name attribute on the PIDU create, force-create, or modify command. Instead, specify the name as an operand on the command. However, you can specify the name attribute when you construct a condition for the where predicate on the list and export commands.

**ISPF field name:** Component Name

**Allowed values:** Any combination of 1-17 letters (a-z, A-Z), numbers (0-9), and special characters (such as $ # @ . _ = /). Blanks are not allowed.

**Default value:** None.

**operator-security-profile**
This single-valued attribute specifies the name of the RACF resource profile in the PRINTSRV class that controls who can work with this printer using Infoprint Central. This attribute applies only to IP PrintWay extended mode.

**ISPF field name:** Operator security profile

**Allowed values:** A combination of letters, numbers, and special characters except for commas, semicolons, parentheses, and blanks. If the value contains special characters, enclose it in single or double quotation marks. Lowercase letters are converted to uppercase. Do not start names with AOP. For example:
```
operator-security-profile = "DENVER.001"
```

**Default value:** None.

**Usage guidelines:**
- To authorize users to a group of printers, specify the same profile name in the IP PrintWay printer definitions and PSF FSA definitions for all printers in the group.
protocol and printer

- If more than one printer definition exists for a printer, specify the same profile name in each printer definition.
- If the profile name is not defined to RACF, or if you omit this attribute, anyone can work with this printer.
- This attribute does not apply to IP PrintWay basic mode or when you select the e-mail protocol.
- For information about the PRINTSRV class, see \[z/OS Infoprint Server Customization\].

owner
This single-valued attribute specifies the owner name that IP PrintWay passes to the remote LPD for printing on the banner page, a page printed before the document.

ISPF field name: Owner

Allowed values: A combination of 1-31 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as: @ $ #, * - /). If the value contains blanks or special characters, enclose it in single or double quotation marks.

Default value: IP PrintWay passes the user ID for the print job to the LPD.

Usage guidelines:
- The implementation and configuration of the remote LPD determine how this value is used.
- IP PrintWay uses this value only if it uses the LPR transmission protocol and lpr-print-banner=yes.

page-accounting
This single-valued attribute indicates whether IP PrintWay extended mode records the number of printed pages in the SMF type 6 accounting record (in field SMF6PGE) for each document.

ISPF field name: Record pages printed for accounting

Allowed values: You can enter one of these fixed values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>yes</td>
<td>IP PrintWay extended mode records the number of printed pages in the SMF record.</td>
</tr>
<tr>
<td>no</td>
<td>IP PrintWay extended mode does not record the number of printed pages in the SMF record.</td>
</tr>
</tbody>
</table>

Default value: IP PrintWay does not record the number of printed pages.

Usage guidelines:
- Specify yes only if the printer supports HP's Printer Job Language (PJL).
- Specify this attribute if the printer supports PJL so that you get more accurate accounting information.
- If you specify this attribute or the page-restart=yes attribute, IP PrintWay extended mode also supports the cancel function from the printer's console.
- IP PrintWay extended mode uses this attribute only if protocol-type=direct-sockets. For other protocols, it ignores this attribute and does not record the number of printed pages in the SMF record.
protocol and printer

- IP PrintWay basic mode always ignores this attribute. It does not record the number of printed pages in the SMF record.
- Documents cannot contain PJL JOB commands. If you use a transform, you might need to customize the transform so that it does not add PJL commands. For information, see z/OS Infoprint Server Customization.

page-restart
This single-valued attribute indicates where IP PrintWay extended mode tells the printer to start printing again after an error occurs. It can tell the printer to start printing from the beginning of the print job or after the last page that the printer reported printed successfully.

ISPF field name: Restart printing after last successful page

Allowed values: You can enter one of these fixed values:

yes  IP PrintWay extended mode tells the printer to start printing after the last page that the printer reported printed successfully.
no   IP PrintWay extended mode tells the printer to start printing from the beginning of the print job.

Default value: IP PrintWay extended mode tells the printer to start printing from the beginning of the print job.

Usage guidelines:
- Specify yes only if the printer supports HP’s Printer Job Language (PJL).
- Specify yes if you send large documents to the printer. This can save paper and printing costs.
- To prevent duplicate pages, set a high value in the response-timeout attribute to give the operator time to add paper or fix a jam.
- If you specify this attribute or the page-accounting=yes attribute, IP PrintWay extended mode also supports the cancel function from the printer’s console.
- IP PrintWay extended mode uses this attribute only if protocol-type=direct-sockets. For other protocols, it ignores this attribute and always restarts printing from the beginning of the print job.
- IP PrintWay basic mode ignores this attribute. Printing always restarts from the beginning of the print job.
- Documents cannot contain PJL JOB commands. If you use a transform, you might need to customize it to not add PJL commands. For information, see z/OS Infoprint Server Customization.

port-number
This single-valued attribute specifies the port number of the remote printer or print server.

ISPF field name: Port number

Allowed values: Specify the port number (1–65545) that is configured in the printer.

Default value: None.

Usage guidelines:
This attribute is required if you create a printer definition and `protocol-type=direct-sockets`. For other protocol types, IP PrintWay ignores this attribute.

A port number specified by the job submitter overrides this attribute.

To determine the correct port number, see the documentation for the network interface card or printer. Some typical port numbers are:

- Port 9100 is used by some Ricoh printers, most HP printers, and most Lexmark printers.
- Port 2501 is used by some Ricoh printers.

In the IP PrintWay default printer definition named DFLTNTRY, omit this attribute because IP PrintWay uses the port number specified on the OUTPUT JCL statement.

### print-queue-name

This **single-valued** attribute specifies the name of the print queue in the remote printer or print server. Specify this attribute if you specify the LPR protocol in the `protocol-type` attribute.

**ISPF field name:** Print queue name

**Allowed values:** A combination of 1-255 letters (a-z, A-Z), numbers (0-9), and special characters (such as # $ @ ! = / -). Blanks are not allowed. The print queue name is case-sensitive on some remote systems, so be sure to use the correct uppercase and lowercase letters. Examples of print queue names are:

- `print-queue-name = TEXT`
- `print-queue-name = PASS`
- `print-queue-name = RAW`

**Default value:** None.

**Usage guidelines:**

- This attribute is required if you create a printer definition and `protocol-type=lpr`. For other protocol types, IP PrintWay ignores this attribute.
- A print queue name specified by the job submitter overrides this value.
- To determine the print queue name, see the documentation for the network interface card, the printer, or the print server. Some common queue names are:
  - `TEXT` and `RAW` are used for some Ricoh printers, most HP printers, and most Lexmark printers. Specify the `RAW` queue for formatted text data, PCL data, and PostScript data.
  - `TEXT` and `PASS` are used for some Ricoh printers. Specify the `PASS` queue for text data that contains a carriage return at the end of each line, PCL data, and PostScript data.
  - If you specify the `PASS` or `RAW` queues and you run IP PrintWay basic mode, also specify 0025 in the **Line termination** field. This causes IP PrintWay basic mode to add a carriage return at the end of each line when it converts line data to text data. IP PrintWay extended mode adds a carriage return at the end of each line by default.
- In the IP PrintWay default printer definition named DFLTNTRY, omit this attribute because IP PrintWay uses the print queue name specified on the OUTPUT JCL statement.

### printer-ip-address

This **single-valued** attribute specifies the Internet Protocol (IP) address or host name of the remote printer or print server.
ISPF field name: Printer IP address

Allowed values: Specify the IP address in dotted-decimal format (nnnn.nnnn.nnnn.nnnn), or specify the host name in place of the dotted-decimal address. Blanks are not allowed. If the value contains special characters, enclose it in quotation marks. If the printer or print server has an IPv6 address, you must specify its host name instead of its colon-hexadecimal format address. Examples of printer IP addresses are:

- printer-ip-address = 9.99.176.133
- printer-ip-address = prt009.net.xyz.com
- printer-ip-address = PRT009

Default value: None.

Usage guidelines:

- If you run IP PrintWay extended mode and specify a host name, define the host name in the Domain Name Server (DNS) before you save the printer definition. If the DNS entry is created after you save the printer definition, Infoprint Central cannot display the printer for this printer definition until someone submits a print job to the printer definition or until you modify an attribute in the printer definition.
- An IP address specified by the job submitter overrides this attribute.
- If another printer definition refers to this printer, use the same uppercase and lowercase letters when you type the host name.
- This attribute is required when you create a printer definition and specify either lpr or direct-sockets in the protocol-type attribute. For other protocol types, IP PrintWay ignores this attribute.
- In the IP PrintWay default printer definition named DFLTNTRY, you can omit this attribute because the job submitter must specify an IP address.

printer-logmode

This single-valued attribute specifies the name of an entry in the VTAM logon-mode table, which defines the session parameters for a printer.

ISPF field name: Printer logmode

Allowed values: You can enter a valid combination of 1–8 letters, numbers, and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If a value contains special characters, enclose the value in quotation marks. Lowercase letters are converted to uppercase.

Default value: The name specified in the DLOGMOD parameter of the VTAM resource definition statement for the printer.

Usage guidelines:

- IP PrintWay uses this value only if protocol-type=vtam.

printer-luname

This single-valued attribute specifies the VTAM network name of the printer. This name must match the name of the VTAM resource definition for the printer. For example, the VTAM LU or LOCAL definition. LU type 0 (DSC/DSE), LU type 1 (SCS) and LU type 3 (DSC/DSE) printers are supported.

ISPF field name: Printer luname
Allowed values: You can enter a valid combination of 1–8 letters, numbers, and special characters (# $ @). The first character cannot be numeric. Blanks and other special characters are not allowed. If a value contains special characters, enclose the value in quotation marks. Lowercase letters are converted to uppercase.

Default value: None.

Usage guidelines:
• This attribute is required if you create a printer definition and `protoc-type=vtam`. For other protocol types, IP PrintWay ignores this attribute.

**printer-uri**
This single-valued attribute specifies the Uniform Resource Identifier (URI) of the remote Internet Printing Protocol (IPP) server running either in a printer or host system. This attribute is required if you create a printer definition and `protoc-type=ipp`.

**ISPF field name:** URL

Allowed values: A combination of letters, numbers, and special characters, as defined by RFC 2396. Blanks are not allowed. If the value contains special characters, enclose it in quotation marks. Examples of URLs are:

```
printer-uri="ipp://myprinter.xyz.com"
printer-uri="http://myprinter.xyz.com:631"
```

Default value: None.

Usage guidelines:
• For URIs prefixed with `ipp`, the default port is 631.
• For IP PrintWay basic mode: If you specify this URI in another printer definition, use the same uppercase and lowercase letters in each printer definition.

**protocol-type**
This single-valued attribute specifies the transmission protocol you want IP PrintWay to use to transmit data sets to the remote system.

**ISPF field name:** Protocol

Allowed values: You can enter one of these fixed values:

- **direct-sockets**: TCP/IP socket to socket protocol.
- **email**: TCP/IP Simple Mail Transfer Protocol (SMTP).
- **ipp**: Internet Printing Protocol (IPP). An IPP server must be running in the remote printer or server.
- **lpr**: TCP/IP line printer (LPR) to line printer daemon (LPD) protocol. An LPD must be running in the remote printer or print server and listening at port 515.
- **vtam**: Virtual Telecommunications Access Method (VTAM). The printer must be a VTAM LU type 0 (DSC/DSE), LU type 1 (SCS), or LU type 3 (DSC/DSE).

Default value: `protocol-type=lpr`

Usage guidelines:
If you specify **direct-sockets**, also specify the **printer-ip-address** and **port-number** attributes.

If you specify **email**, also specify the **mail-to-addresses** attribute.

If you specify **ipp**, also specify the **printer-uri** attribute.

If you specify **lpr**, also specify the **printer-ip-address** and **print-queue-name** attributes.

If you specify **vtam**, also specify the **printer-luname** attribute.

---

**server-user-options**

This **single-valued** attribute specifies information that IP PrintWay sends to the remote LPD. You can specify options that the remote LPD supports but that IP PrintWay does not automatically generate.

**ISPF field name:** User options

**Allowed values:** A combination of 1-255 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as @ $ # , * / ). If the value contains blanks or special characters, enclose it in single or double quotation marks.

**Default value:** None.

**Usage guidelines:**

- Most LPD servers require each -o option to end with a line-feed character (ASCII X'0A'). IP PrintWay automatically adds a line-feed character to the end of the value that you specify for this attribute. However, to specify more than one -o option using this attribute, you must separate them with a line-feed character. Because IP PrintWay converts the entire attribute value from EBCDIC to ASCII, you must specify an EBCDIC line-feed character (X'25'). For example: `server-user-options=-oformdef=F1STN001\x25-oTi=TitleInfo`. You must use a PIDU command to specify this value because it contains a hexadecimal character. You cannot use the ISPF panels to specify a hexadecimal character for this attribute. The ISPF panels display this hexadecimal character as an unprintable character (dot).

- IP PrintWay ignores this attribute when it uses the direct sockets, IPP, or VTAM transmission protocol.

**vtam-checkpoint-pages**

This **single-valued** attribute specifies the number of pages between data-set checkpoints. IP PrintWay requests a definitive response from the printer after the specified number of pages. If a printer error or printer intervention situation occurs, IP PrintWay resends all pages that were sent after the last definitive response from the printer. This makes sure that no data is lost. However, duplicate pages, up to the number specified in this attribute, might be printed.

If a printer error or intervention situation persists after IP PrintWay resends pages from the last data-set checkpoint, IP PrintWay resends all data from the beginning (without using the checkpoint) if retries are requested. In this case, more duplicate pages might be printed.

**ISPF field name:** Checkpoint pages

**Allowed values:** An integer from 0 - 25.

**Default value:** IP PrintWay uses 5.
Usage guidelines:
- 0 means that IP PrintWay takes no checkpoints. If 0 is specified and an error occurs, IP PrintWay retransmits the entire data set if you requested retries in the printer definition. For information about how to specify retries, see the retry-limit and retry-time attributes.
- This attribute is used only if protocol-type=vtam. For other protocol types, IP PrintWay ignores this attribute.
- If you request too frequent checkpoints, printer performance can be adversely affected.
- If you request infrequent checkpoints, more duplicate pages might be printed.

**vtam-send-as-transparent**
This single-valued attribute indicates that IP PrintWay sends output data to the printer as transparent data. IP PrintWay precedes data with transparent data controls but does not convert data to SCS or DSC/DSE format.

**Allowed values:** You can enter one of these fixed values:
- **yes** IP PrintWay transmits data as transparent data.
- **no** IP PrintWay does not transmit data as transparent data.

**Default value:** IP PrintWay does not transmit data as transparent data.

Usage guidelines:
- IP PrintWay uses this attribute only if protocol-type=vtam. For other protocols, IP PrintWay ignores this attribute.
- Specify vtam-send-as-transparent=yes if data is already in a format that the printer accepts and if the SNA gateway requires that data be sent as transparent data.
- You can specify the character that IP PrintWay uses in the transparent data controls in the transparent-data-character attribute.
- IP PrintWay does *not* transmit these types of data as transparent data:
  - Data specified in the document-header and document-trailer attributes
  - Data added by the IP PrintWay Begin Data Set and End Data Set exits
- When vtam-send-as-transparent=yes, IP PrintWay ignores the printway-formatting attribute and processes data as if printway-formatting=none.

**Attributes for the psf-fss object class**
This section lists attributes that are valid when you create PSF FSS definitions, which are in object class psf-fss.

**Tip:** In this section, PSF refers to PSF for z/OS, the AFP Download Plus feature of PSF, or both.

**Note:** If you change the value for an attribute, you must restart the PSF FSS to pick up the new value.

**Required attributes**
All attributes are optional.
**description**

This *single-valued* attribute describes the FSS definition. The description can help you select the FSS definition from a list.

**ISPF field name:** Description

**Allowed values:** Any combination of 1–256 letters (a-z, A-Z), numbers (0-9), blanks, and special characters (such as # $ @ ! = / -). If the value contains blanks or special characters, enclose the value in quotation marks.

**Default value:** None.

**log-messages**

This *single-valued* attribute specifies whether PSF writes messages for print jobs and printers in the Infoprint Server common message log.

**ISPF field name:** Log messages

**Allowed values:** You can enter one of these fixed values:

- **yes** PSF writes messages in the common message log.
- **no** PSF does not write messages in the common message log.

**Default value:** no

**Usage guidelines:** This attribute applies to PSF V4R4. Earlier releases ignore it.

**name**

This *single-valued* attribute specifies the name of the FSS definition. This name must be a unique FSS definition name in the Printer Inventory and must match the name on the JES FSS definition statement.

**Note:** This is a *non-settable* attribute. Do not specify the **name** attribute on the PIDU create, force-create, or modify command. Instead, specify the name as an operand on the command. However, you can specify the **name** attribute when you construct a condition for the **where** predicate on the list and export commands.

**ISPF field name:** FSS name

**Allowed values:** None.

**Default value:** None.

**nst-trace-dsname**

This *single-valued* attribute specifies the name of the data set that PSF directs a notify subtask (NST) trace to. This name must be different than the data set name PSF directs an FSA external trace to. For complete details about this attribute, see [PSF for z/OS: Diagnosis](#).

**ISPF field name:** NST trace dsname

**Allowed values:** You can enter a valid data set name.

**Default value:** None.
Usage guidelines: An NST trace is recorded only if an FSA internal or external trace of the page printing writer (PPWTR) component is also active for that FSA.

**tcpip-job-name**
This single-valued attribute specifies the name of the TCP/IP startup procedure. If you have changed the name of the TCP/IP startup procedure, specify the new name for this attribute. For complete details about this attribute, see [PSF for z/OS: Diagnosis](#).

ISPF field name: TCP/IP job name

Allowed values: You can enter a valid job name. The letters you type are converted to uppercase.

Default value: TCPIP

**trace-prompt**
This single-valued attribute specifies whether the operator is prompted with message APS620A each time the FSS starts. Prompting lets the operator start tracing all FSAs before the FSA starts processing any data sets. For complete details about this attribute, see [PSF for z/OS: Diagnosis](#).

ISPF field name: Trace prompt

Allowed values: You can enter one of these fixed values:

- yes The operator is prompted when the FSS starts.
- no The operator is not prompted.

Default value: no

**trace-table-size**
This single-valued attribute specifies a number that indicates how many 4 KB pages of storage are allocated for the PSF FSA trace table. This allocation occurs only if the trace-mode attribute is internal, ipds, limit, full, or sync. For complete details about this attribute, see [PSF for z/OS: Diagnosis](#).

ISPF field name: Trace table size

Allowed values: You can enter an integer from 1 to 999.

Default value: 32

**unicode-enabled**
This single-valued attribute specifies whether PSF is Unicode-enabled for TrueType and OpenType fonts. When PSF is Unicode-enabled, you can use TrueType and OpenType fonts, and these interfaces are enabled: Unicode encoding transform, UNIX System Services C, and file system.

ISPF field name: Unicode enabled

Allowed values: You can enter one of these fixed values:

- yes PSF is Unicode-enabled.
- no PSF is not Unicode-enabled.

Default value: no
Chapter 20. Using accounting information in SMF type 6 records

IP PrintWay and PSF write SMF type 6 records for data sets that Infoprint Server processes. For the formats of the SMF type 6 records that IP PrintWay and PSF write, see [z/OS MVS System Management Facilities (SMF)](https://www.ibm.com). This section provides additional information that can help you interpret these SMF type 6 records.

### Interpreting the job name, job ID, and user ID fields in the SMF type 6 record

Table 43 describes the contents of the SMF6JBN (job name), SMF6JBid (job ID), and SMF6USID (user ID) fields in the SMF type 6 record. The contents of these fields varies depending on how the print request was submitted to Infoprint Server and whether IP PrintWay or PSF writes the record. However, the contents are the same whether IP PrintWay basic mode or IP PrintWay extended mode writes the record.

**Table 43. Contents of fields SMF6JBN, SMF6JBid, and SMF6USID in SMF type 6 record**

<table>
<thead>
<tr>
<th>If the print request was submitted in this way:</th>
<th>These SMF type 6 fields contain:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SMF6JBN</strong></td>
<td><strong>SMF6JBid</strong></td>
</tr>
<tr>
<td>z/OS UNIX lp command or AOPPRINT JCL procedure.</td>
<td>The value in the optional <strong>sysout-job-name</strong> job attribute. If not specified, the z/OS user ID of the job submitter.</td>
</tr>
</tbody>
</table>
| Batch job, including batch jobs that use the Print Interface subsystem or IP PrintWay basic mode resubmit for filtering function. | The name of the batch job. | The z/OS job ID assigned to the data set. | **IP PrintWay:** The z/OS user ID of the job submitter.  
**PSF:** The z/OS user ID of the user who started the Infoprint Server daemons. |
| Print command or application on a remote system. Print commands include **enq**, LPR, and **print**. Applications include the Infoprint Port Monitor, SAP R/3, and the Windows SMB protocol. | The first 8 characters of the name of the remote job submitter. | The value in the optional **sysout-job-id** job attribute. If not specified, the Infoprint Server job ID. | **IP PrintWay:** The first 8 characters of the name of the remote job submitter.  
**PSF:** The z/OS user ID of the user who started the Infoprint Server daemons. |
| VTAM applications, such as CICS and IMS applications. | The owner of the print job. If no owner is specified, the member name of the NetSpool startup procedure. | The value in the optional **sysout-job-id** job attribute. If not specified, the Infoprint Server job ID. | **IP PrintWay:** The owner of the print job. If no owner is specified, the z/OS user ID of the user who started the Infoprint Server daemons.  
**PSF:** The z/OS user ID of the user who started the Infoprint Server daemons. |
Table 43. Contents of fields SMF6JBN, SMF6JBID, and SMF6USID in SMF type 6 record (continued)

<table>
<thead>
<tr>
<th>If the print request was submitted in this way:</th>
<th>These SMF type 6 fields contain:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>SMF6JBN</td>
</tr>
</tbody>
</table>

Notes:
1. The Infoprint Server job ID starts with the 2-character job prefix specified in the Infoprint Server configuration file, aopd.conf. The default prefix is PS.
2. The name of the remote job submitter in field SMF6JBN is in uppercase characters and might contain a #. A # replaces any character that JES does not allow in a job name. The name of the remote job submitter in field SMF6USID can be in uppercase and lowercase characters because the original case of the name is maintained. For print requests submitted from a Windows workstation, this is the Windows logon name. For print requests submitted with an LPR command, this is the value in the P control code in the LPD control file.
3. The owner of a print job can be specified in the owner job attribute embedded in VTAM application data or in the Default owner field in the printer definition. The owner in both the SMF6JBN and SMF6USID fields is in uppercase characters.

Comparing SMF type 6 records written by IP PrintWay basic mode and extended mode

IP PrintWay basic mode and IP PrintWay extended mode write SMF type 6 records in different formats. Some fields are written only by IP PrintWay basic mode, and some fields are written only by IP PrintWay extended mode.

Tip: If you run both basic mode and extended mode (on different z/OS systems), you can use the same SMF accounting program to process both SMF type 6 record formats. To determine whether the SMF record was written by IP PrintWay basic mode or extended mode, your SMF accounting routine can check the SMF6INDC field in the SMF type 6 record:

- IP PrintWay basic mode: SMF6INDC = '01'
- IP PrintWay extended mode: SMF6INDC = '07'

IP PrintWay basic mode fields: These fields in the SMF type 6 record contain information only if IP PrintWay basic mode writes the record. If IP PrintWay extended mode writes the record, these fields contain binary zeroes.

- SMF6IP1, SMF6IP2, SMF6IP3, SMF6IP4: The dotted-decimal IP address of the printer if IP PrintWay basic mode used the LPR or direct sockets protocol to transmit the data set to the printer.
  Tip: IP PrintWay extended mode writes the printer's IP address in field SMF6URI instead.

- SMF6OUT: This field contains the name of the IP PrintWay basic mode FSA. If you run IP PrintWay extended mode, which does not have an FSA, this field contains zeroes.

IP PrintWay extended mode fields: These fields in the SMF type 6 record contain information only if IP PrintWay extended mode writes the record. If IP PrintWay basic mode writes the SMF record, these fields (except for the SMF6FTL field) are not present.

- SMF6BYTE: The total number of bytes transmitted to the printer.
  Tips:
  - IP PrintWay extended mode also writes the number of bytes in field SMF6BYTE. However, field SMF6BYTE contains a maximum value of 2
gigabytes. Therefore, if your installation prints documents that contain more than 2 gigabytes, your SMF accounting program should use field SMF6BYTD instead of field SMF6BYTE.

- For some printers, IP PrintWay extended mode also writes the number of pages that printed in field SMF6PGE.

- **SMF6FTL**: The level of the SMF record written by IP PrintWay extended mode. For z/OS V1R5 through V1R8, this field contains X'01'.
  
  **Tip**: If IP PrintWay basic mode writes the SMF record, this field contains X'00'.

- **SMF6PGE**: The total number of pages that actually printed, including the pages in all copies of the document. When the printer prints on both sides of a sheet of paper (duplex printing), each side is counted as one page.

  **Tips**:
  - If no pages printed, or if no page count is available, this field contains X'00'.
  - To obtain a page count, you must select the **Record pages printed for accounting** field in the printer definition. For more information, see “Tracking the number of printed pages (extended mode)” on page 187.
  - If you do not want the page count to include any duplicate pages that printed during retries, select the **Restart printing after last successful page** field in the printer definition. For more information, see “Tracking the number of printed pages (extended mode)” on page 187.
  - If a document completes with an error, the page count includes only the pages (if any) that printed before the error occurred. Field SMF6DCI indicates that the document completed with an error.

- **SMF6URIL**: The length of the SMF6URI field.

- **SMF6URI**: The type of protocol that IP PrintWay extended mode used to transmit the data set to the printer or e-mail destination, and the address of the printer. The contents of this field vary depending on the protocol.

  **Tip**: The value in this field is case sensitive. The protocol type is always in lower case.

  **Table 44. Contents of field SMF6URI in SMF type 6 record**

<table>
<thead>
<tr>
<th>When IP PrintWay uses this protocol:</th>
<th>Field SMF6URI contains:</th>
</tr>
</thead>
<tbody>
<tr>
<td>LPR</td>
<td>lpr://hostname/queue</td>
</tr>
<tr>
<td></td>

</tr>
</tbody>
</table>

Example: vtam://P002

Writing an IP PrintWay SMF exit

You can write an IP PrintWay SMF exit to modify or suppress the SMF record before IP PrintWay writes it. You might want to write an SMF exit to:

- Suppress the first SMF record that IP PrintWay basic mode writes when the resubmit for filtering function is used. IP PrintWay basic mode writes one record when it sends the data set to Print Interface, and it writes another record when it sends the data set to the printer.
- Convert the value in the SMF6USID field to uppercase characters.
- Convert the value in the SMF6URI field to uppercase characters.

For information about the IP PrintWay SMF exit, see [z/OS Infoprint Server Customization](#).
Appendix A. Printer attribute tables

Allocation attributes and corresponding OUTPUT or DD statement parameters

This table lists the attributes you can specify in the Allocation section of a printer definition or in an Allocation component. For each attribute, the ISPF field name is listed and the corresponding parameter on an OUTPUT or DD JCL statement.

When you specify a value in a field, Print Interface and NetSpool allocate data sets on the JES spool using the OUTPUT or DD statement parameter that corresponds to the field.

### Table 45. Attributes used for job allocation and the corresponding OUTPUT parameters

1The copies attribute lets you specify a maximum of 32640 copies for print requests processed by Print Interface, while the COPIES JCL parameter lets you specify a maximum of 255 copies.
## Printer attributes used by Print Interface

This table lists the attributes that Print Interface uses in each section of a printer definition. For each attribute, the table lists the ISPF panel field name and whether the attribute is required or optional. Use this table to determine which printer attributes to specify when you configure a printer definition for use by Print Interface. Print Interface ignores all fields that are not listed in this table.

### Table 46. Printer definition fields used by Print Interface

Printer attributes used by IP PrintWay

This table lists the attributes that IP PrintWay uses in each section or component of a printer definition. For each attribute, the table lists the ISPF panel field name and whether the attribute is required or optional. Use this table to determine which printer attributes to specify when you configure a printer definition for use by IP PrintWay. IP PrintWay ignores all fields that are not listed in this table.

Appendix B. ISPF panels

Infoprint Server provides ISPF panels that you can use to create definitions in the Printer Inventory:

- "Main ISPF panel for an IP PrintWay printer definition"
- "Main ISPF panel for a PSF printer definition" on page 456
- "Main ISPF panel for a General printer definition" on page 456
- "ISPF panel for the Allocation section or component” on page 457
- "ISPF panel for the Processing section or component” on page 458
- "ISPF panel for the NetSpool Options section or component” on page 460
- "ISPF panel for the NetSpool End-of-File section or component” on page 461
- "ISPF panel for the IP PrintWay Options section or component” on page 462
- "ISPF panels for the Protocol section or component” on page 463
- "ISPF panel for a printer pool definition” on page 466
- "ISPF panel for an IP PrintWay job selection rule” on page 467
- "ISPF panel for an IP PrintWay FSS definition” on page 467
- "ISPF panel for an IP PrintWay FSA definition” on page 467
- "ISPF panel for a PSF FSS definition” on page 468
- "ISPF panel for a PSF FSA definition for a channel-attached printer” on page 469
- "ISPF panel for a PSF FSA definition for a TCP/IP-attached printer” on page 471
- "ISPF panel for a PSF FSA definition for an SNA-attached printer” on page 473
- "ISPF panel for a PSF FSA definition for AFP Download Plus” on page 475

Main ISPF panel for an IP PrintWay printer definition

This is the first ISPF panel for an IP PrintWay printer definition.

```
IP PrintWay Printer Definition

Printer definition name . _________________ (extend)
Description . _______________________________________________________ (extend)
Location . . _______________________________________________________ (extend)

Section            Component name    Custom values
Allocation         => _________________ => __
Processing         => _________________ => *
NetSpool options   => _________________ => __
NetSpool end-of-file => _________________ => __
IP PrintWay options => _________________ => __
Protocol           => _________________ => *

    Use DEST, CLASS, and FORMS for IP PrintWay printer selection
NetSpool LU name . ________ LU classes . _ _ _ _ _ _ _ _ _ _ _ _ (extend)
```
Main ISPF panel for a PSF printer definition

This is the first ISPF panel for a PSF printer definition.

```
PSF Printer Definition

Printer definition name . _________________
Description . _______________________________________________________ (extend)
Location . . _______________________________________________________ (extend)

Component name  Custom values
Section (enter to list) (enter to customize)
Allocation => __________________ => __
Processing => __________________ => *
NetSpool options => __________________ => __
NetSpool end-of-file => __________________ => __
NetSpool LU name . _______ LU classes . _ _ _ _ _ _ _ _ _ _ _ _ (extend)
```

Main ISPF panel for a General printer definition

This is the first ISPF panel for a General printer definition.

```
General Printer Definition

Printer definition name . _________________
Description . _______________________________________________________ (extend)
Location . . _______________________________________________________ (extend)

Component name  Custom values
Section (enter to list) (enter to customize)

Processing => __________________ => *
NetSpool options => __________________ => __
NetSpool end-of-file => __________________ => __
IP PrintWay options => __________________ => __
NetSpool LU name . _______ LU classes . _ _ _ _ _ _ _ _ _ _ _ _ (extend)
Spooling mode . . 1. Line 2. Stream
```
This is the ISPF panel for the Allocation section of a printer definition and for the Allocation component.

### Spool allocation values:
- **CLASS**
- **LINECT**
- **PRMODE**
- **PRTY**
- **FBC**
- **SEGMENT**
- **THRESHLD**
- **UCS**
- **WRITER**
- **USERDATA**
- **BURST**
- **HOLD**
- **OUTDISP**

**Values for Separator Pages:**
- **Address**
- **Building**
- **Department**
- **Name**
- **Room**
- **Title**

**Resource Related Values:**
- **Form definition**
- **Character sets**
- **Overlay front**
- **Input tray**
- **Output bin**
- **Page definition**
- **Resource library**
- **Resource directories**
- **Image shift x-direction**
- **y-direction**

**Error Reporting Values:**
- **Print error reporting**
- **Error disposition**
- **Print error messages**
- **Maximum messages**

**Other Values:**
- **Notify**
- **Checkpoint pages**
- **Checkpoint seconds**
- **Copies**
- **Copy group**
- **Color map**
- **Com setup member**
- **JES form length**
- **Resolution**
- **AFP parameters**
- **Duplex**
- **Label data pages**
- **Restrict printable area**
- **Table reference characters**
- **Save AFP statistics**

---

**Table reference characters**

**Save AFP statistics**
ISPF panel for the Processing section or component

This is the ISPF panel for the Processing section of a printer definition and for the Processing component.

Document code page __________
Printer code page __________

Supported Data Formats and Associated Filters:
Data format: Filter:
/ Line data
/ MO:DCA-P
/ PostScript
/ Text
/ PCL
/ PDF
/ SAP
/ XML
/ TIFF
/ JPEG
/ Other

Resubmit for filtering

Transforms to AFP:
Fail on error . . . . 1. No 2. Error 3. Warning
Trailer error page . . . 1. No 2. Error 3. Warning

AFP to PDF Transform Encryption:
User identifier __________________________________ (extend)
Owner identifier __________________________________ (extend)
Encryption level 1. Low (40-bit key) 2. High (128-bit key)
Protected actions:
Restrict print . . . . 1. Yes 2. No
Restrict copy . . . . 1. Yes 2. No
Restrict update . . . . 1. Yes 2. No

SCS Conversion:
Line length . . . .
Tabs: Vertical . . . . Page length .
Horizontal . . . .

NetSpool PCL Conversion:
Print density . . .
Line density . . .
Orientation . . . 1. None 2. Portrait 3. Landscape
SCS automatic page orientation

IP PrintWay Line-to-Text Conversion:
Pagination
Margins: Top . . . . Bottom . . . .
Page height . . . 58
Print page header

Maximum document size .
Maximum copies . .
Forms supported . . . . Simplex / Duplex / Tumble
Print-error reporting supported . / Character / Position

Input tray name: Number: (more)
Output bin name: Number: (more)

ISPF panels for the Protocol section or component

These are the ISPF panels for the Protocol section of an IP PrintWay printer definition and for the Protocol component. The Protocol section in a printer definition is different for each protocol: LPR, direct sockets, Internet Printing Protocol (IPP), VTAM, and e-mail. The ISPF panel for the Protocol component is the same for all protocols.

LPR Protocol panel
This is the ISPF panel for the LPR Protocol section of a printer definition.

```
LPR Protocol

Appendix C. InfoPrint Manager options

This section describes the programming interface between Infoprint Server for z/OS and Ricoh InfoPrint Manager for AIX and Windows. This interface is subject to change.

This section lists the options that IP PrintWay transmits in the LPD control file to InfoPrint Manager for AIX and to InfoPrint Manager for Windows. IP PrintWay transmits these options only if you select the Remote PSF option in the Mode field on the Protocol ISPF panel. For more information, see “Printing with InfoPrint Manager for AIX or Windows” on page 206.

The Remote PSF option is intended to be used when you use IP PrintWay to transmit EBCDIC data. Some of the options are meaningful only if the data set contains non-AFP records, and parameters are created only in that case. Of the other parameters that you can create, some are intended to be used in actual processing of the data set, and others are intended to convey information to be used for the eventual distribution of the printed output.

The full option names are described in the next list. Abbreviations that IP PrintWay uses are given in parentheses.

Some option values (such as address values) can contain embedded blanks. Because a blank is a delimiter for options in the control file, each embedded blank is replaced with X'1C'.

Options created if line-mode records exist in the data set

-OFILEFORMAT
  Set to “record”. Indicates that the records are prefixed with length fields.

-OCHARS
  Set to the values of the CHARS or UCS parameter if specified on JCL or defaulted by JES. This value can also be specified in an Infoprint Server job attribute and in the printer definition.

-OCC
  Set to “YES” or “NO”, depending on whether the data set record format specifies carriage control. This value can also be specified in JCL, in an Infoprint Server job attribute, and in the printer definition.

-OCCTYPE
  If the record format specifies carriage control, set to either “a” or “m”, indicating ANSI or machine carriage control. This value can also be specified in JCL, in an Infoprint Server job attribute, and in the printer definition.

-OPAGEDEF
  Set to the value of the PAGEDEF or FCB parameter if specified on JCL. JES can provide a default value if you run IP PrintWay basic mode. This value can also be specified in an Infoprint Server job attribute and in the printer definition. A “P1” prefix is added to the value if necessary.

-OPRMODE
  Set to the value of the PRMODE JCL parameter, only if the value is SOSI1,
SOS12, SOS13, or SOS14. Otherwise, this option is not created. This value can also be specified in an Infoprint Server job attribute and in the printer definition.

-OTRC
Set to “YES” or “NO”, based on the value of the TRC parameter. This value can be specified in an Infoprint Server job attribute and in the printer definition.

Note: IP PrintWay extended mode uses values specified in the printer definition. However, IP PrintWay basic mode uses values specified in the printer definition only if Print Interface or NetSpool allocated the output data set on the JES spool or the Resubmit for filtering field is selected in the printer definition. Values specified by a job submitter, either on JCL or in an Infoprint Server job attribute, always override values specified in the printer definition.

Processing options created for all data set types

-ODATATYPE (odatat)
Set to “line” (l) if any non-AFP records exist in the data set. (AFP records are identified by the presence of a X’5A’ control byte at the beginning of the record.) Otherwise, set to “afp” (a).

-OCOPIES (ocop)
Set to the JCL COPIES transmission count. If COPIES is not specified on JCL, in a job attribute, or in the printer definition, the default is 1.

-ODATAACK (odatac)
Set to the value of the DATACK parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, this option is not created.

-ODUPLEX (odu)
Set to the value of the DUPLEX parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, this option is not created.

-OINTRAY (oin)
Set to the value of the INTRAY parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, this option is not created.

-OFORMDEF (of)
Set to the value of the FORMDEF parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. This option is created even if no form definition is specified. A prefix of X’F1’ is added to the value, if necessary, unless the value is “DUMMY”.

-OOFFSETXB (ooffxb)
Set to the value of the OFFSETXB parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, this option is not created.

-OOFFSETXF (ooffxf)
Set to the value of the OFFSETXF parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, this option is not created.
-OFFSETYB (ooffyb)
  Set to the value of the OFFSETYB parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, this option is not created.

-OFFSETYF (ooffyf)
  Set to the value of the OFFSETYF parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, this option is not created.

-OUTBIN (outbin)
  Set to the value of the OUTBIN parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, this option is not created.

-OPASSTHRU (opa)
  This option consists of these sub-options:

  -FORMS
    Set to the value of the FORMS parameter from JCL or the printer definition. This value can be defaulted by JES.

  -CLASS
    Set to the value of the CLASS parameter from JCL or the printer definition. This value can be defaulted by JES.

  -DESTINATION
    Set to the value of the DEST parameter from JCL or the printer definition. This value can be defaulted by JES.

-Xpage-definition
  Set to the value of the PAGEDEF or FCB parameter if specified on JCL. JES can provide a default value if you run IP PrintWay basic mode. This value can also be specified in an Infoprint Server job attribute and in the printer definition. A “P1” prefix is added to the value if necessary. This parameter is created only if the data stream does not contain any line-mode records.

Note: Values from the printer definition are used if Print Interface or NetSpool allocated the output data set on the JES spool and in some other cases. Values specified by a job submitter always override values specified in the printer definition.

---

**Informational options created for all data set types**

-JOBNAME (ojobn)
  Set to the JES job name associated with the print data set.

-USERID (ous)
  Set to the z/OS user id associated with the print data set.

-NODEID (ono)
  Set to the z/OS node id associated with the print data set.

-OPROGRAMMER (opr)
  Set to the value of the programmer name from the JCL JOB statement. If not specified, this option is not created.

-OPASSTHRU (opa)
  This option can consist of this sub-option:
-SEGMENITID
Set to the value of the segment id of the print data set, if one exists. If it does not exist, the SEGMENTID sub-option is not included the PASSTHRU option.

-OADDRESS1
Set to the value of the first address subparameter from the ADDRESS parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, the OADDRESS1 option is not created.

-OADDRESS2
Set to the value of the second address subparameter from the ADDRESS parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, the OADDRESS2 option is not created.

-OADDRESS3
Set to the value of the third address subparameter from the ADDRESS parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, the OADDRESS3 option is not created.

-OADDRESS4
Set to the value of the fourth address subparameter from the ADDRESS parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, the OADDRESS4 option is not created.

-OBUILDING (obu)
Set to the value of the BUILDING parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, the OBUILDING option is not created.

-ODEPARTMENT (ode)
Set to the value of the DEPT parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, the ODEPARTMENT option is not created.

-ONAME (ona)
Set to the value of the NAME parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, the ONAME option is not created.

-OROOM (oro)
Set to the value of the ROOM parameter on the OUTPUT JCL statement. If not specified, set to the ROOM parameter on the JOB JCL statement. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If no room value is specified, the OROOM option is not created.

-OTITLE (oti)
Set to the value of the TITLE parameter if specified on JCL. This value can also be specified in an Infoprint Server job attribute and in the printer definition. If not specified, the OTITLE parameter is not created.
Appendix D. Sample IP PrintWay printer definitions

This information shows how to fill in Infoprint Server ISPF panels to do these tasks:

<table>
<thead>
<tr>
<th>Task</th>
<th>See page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create components for IP PrintWay printer definitions.</td>
<td>481</td>
</tr>
<tr>
<td>Create a printer definition for a printer that contains an LPD.</td>
<td>491</td>
</tr>
<tr>
<td>Create a printer definition for a printer defined to VTAM.</td>
<td>497</td>
</tr>
<tr>
<td>Create a printer definition for an e-mail destination.</td>
<td>502</td>
</tr>
</tbody>
</table>

For information about how to navigate the Infoprint Server ISPF panels to create components and printer definitions, see these sections:
- “Managing components” on page 251
- “Managing printer definitions” on page 245

Creating components for IP PrintWay printer definitions

This section shows how to fill in ISPF panels to create these components, which are used by the sample IP PrintWay printer definitions.

- Allocation component
- Processing component
- IP PrintWay Options component

In these components, values that might be common to several printer definitions have been specified. Values in the sample components are shown in either normal or bold text:
- Normal text indicates a default value. Default values are displayed automatically in the ISPF panels.
- Bold text indicates a value you must explicitly specify in the component.
Allocation component

This component assumes that the IP PrintWay extended mode job selection rule selects output data sets in JES output class K, or the IP PrintWay basic mode functional subsystem (FSA) is defined to JES with a work-selection criterion of class K. Therefore, K is specified in the CLASS field. For information about how to define job selection rules and IP PrintWay FSAs, see [z/OS Infoprint Server Customization](#).
## Allocation

Component name: **printway**

Processing component for PostScript and PCL printers

Component postscript/pcl is suitable for printers that can accept PostScript, PCL, and text data.

This component assumes that you have installed IBM Print Transform from AFP to Adobe PostScript for z/OS. If you have installed a different transform, specify the filter for the transform in the Filter field.

If you have not installed an AFP to PostScript or AFP to PCL transform, do not select the MO:DCA-P data format, do not specify a transform filter in the Filter field, and do not select the Resubmit for filtering field. The Resubmit for filtering field applies only to IP PrintWay basic mode.

Fields under the SCS Conversion and NetSpool PCL Conversion headings are used only when NetSpool processes input SCS data. If you do not use NetSpool, these fields are ignored.

Processing component for VTAM-controlled printers

Processing component vtam is suitable for a VTAM-controlled printer. Because Infoprint Server can convert text and line data to either SCS or DSC/DSE format, this Processing component accepts both text and line data. Values specified under the SCS Conversion heading are used only when IP PrintWay sends SCS data to the printer. If the VTAM-controlled printer accepts the DSC/DSE data stream, instead of the SCS data stream, these values are ignored.

IP PrintWay Options component

This component changes the response timeout value, specifies a retry time and a retry limit for unsuccessful transmissions, and specifies a retain value for failed transmissions.

Tips:
- IP PrintWay extended mode: Consider specifying a higher value in the Response timeout field to give the operator more time to solve a printer problem before IP PrintWay extended mode resends data to the printer. Resending data can result in duplicate pages. A higher value is suitable for IP PrintWay extended mode because it can send data to other printers while it waits for a response from the printer. For more information, see "Handling unsuccessful data transmissions" on page 180.
- IP PrintWay basic mode: Consider specifying 0D25 in the Line termination field because the IP PrintWay basic mode default is not suitable for many ASCII printers. For more information, see "Converting line data to a text data stream" on page 193.

Creating an IP PrintWay printer definition for the LPR protocol

This section shows how to fill in ISPF panels to create an IP PrintWay printer definition for a remote printer that contains an LPD, for example, an InfoPrint 21 printer. IP PrintWay uses the LPR protocol to transmit data to this printer. This printer definition contains values used by Print Interface, NetSpool, and IP PrintWay.

Job submitters can print on this printer by specifying `mypsprinter` as the name of the print queue or printer definition. JCL users can also print on this printer by specifying CLASS=K and DEST=MYPSPRT on an OUTPUT JCL statement. VTAM applications can print on this printer by specifying LUPRT001 as the secondary LU name.

Values on the printer definition panels are shown in either normal or bold text:

- Normal text indicates either a default value or a value that was specified in an included component. Default values and values from the component are displayed automatically in the ISPF panels.
- **Bold** text indicates a value that you must explicitly specify in the printer definition.

This panel includes the Allocation, Processing, and IP PrintWay Options components that were created in the previous examples. The asterisks next to the Allocation and Protocol sections of the printer definition indicate that one or more fields in these sections contain values that are explicitly specified in this printer definition.

Creating an IP PrintWay printer definition for the VTAM protocol

This section shows how to fill in Infoprint Server ISPF panels to create a printer definition for a VTAM-controlled printer that accepts the SCS data stream, for example, an InfoPrint 40 printer. IP PrintWay uses the VTAM protocol to transmit data to this printer. This printer definition contains values used by Print Interface and IP PrintWay.

Job submitters can print on this printer by specifying myscprinter as the name of the print queue or printer definition. JCL users can also print on this printer by specifying CLASS=K and DEST=MYSCSPRT on an OUTPUT JCL statement.

Values in the sample printer definitions are shown in either normal or bold text:
- Normal text indicates either a default value or a value that is specified in an included component. Default values and values from the component are displayed automatically in the ISPF panels.
- Bold text indicates a value that you must explicitly specify in the printer definition.

This panel includes the Allocation, Processing, and IP PrintWay Options components that were created in the previous examples. The asterisks next to the Allocation and Protocol sections of the printer definition indicate that one or more fields in these sections contain values that are explicitly specified in this printer definition.

Creating an IP PrintWay printer definition for the e-mail protocol

This section shows how to fill in Infoprint Server ISPF panels to create a printer definition for e-mail destinations. This printer definition contains values used by Print Interface, NetSpool, and IP PrintWay.

Job submitters can print on this printer by specifying `deptmail` as the name of the print queue or printer definition. JCL users can also print on this printer by specifying CLASS=K and DEST=DEPTMAIL on an OUTPUT JCL statement. VTAM applications can print on this printer by specifying LU01MAIL as the secondary LU name.

Values in the sample printer definitions are shown in either normal or bold text:
- Normal text indicates either a default value or a value that was specified in an included component. Default values and values from the component are displayed automatically in the ISPF panels when you create a printer definition and include the component.
- **Bold** text indicates that you must explicitly specify the value in the printer definition.

This panel includes an Allocation component that was created in a previous example in this section. The asterisks next to the Allocation, Processing, and Protocol sections of the printer definition indicate that one or more fields in these sections contain values that are explicitly specified in this printer definition.

```
IP PrintWay Printer Definition

Printer definition name . deptmail
Description . Mail list for my department (extend)
Location . ____________________________________________________(extend)

Appendix E. Accessibility

Publications for this product are offered in Adobe Portable Document Format (PDF) and should be compliant with accessibility standards. If you experience difficulties when using PDF files, you may view the information through the z/OS Internet Library website or the z/OS Information Center. If you continue to experience problems, send an email to mhvrcfs@us.ibm.com or write to:

IBM Corporation
Attention: MHVRCFS Reader Comments
Department H6MA, Building 707
2455 South Road
Poughkeepsie, NY 12601-5400
U.S.A.

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully. The major accessibility features in z/OS enable users to:

- Use assistive technologies such as screen readers and screen magnifier software
- Operate specific or equivalent features using only the keyboard
- Customize display attributes such as color, contrast, and font size

Using assistive technologies

Assistive technology products, such as screen readers, function with the user interfaces found in z/OS. Consult the assistive technology documentation for specific information when using such products to access z/OS interfaces.

Keyboard navigation of the user interface

Users can access z/OS user interfaces using TSO/E or ISPF. Refer to z/OS TSO/E Primer, z/OS TSO/E User’s Guide, and z/OS ISPF User’s Guide Vol I for information about accessing TSO/E and ISPF interfaces. These guides describe how to use TSO/E and ISPF, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

z/OS information

z/OS information is accessible using screen readers with the BookServer or Library Server versions of z/OS books in the Internet library at:

http://www.ibm.com/systems/z/os/zos/bkserv/

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurement may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM’s future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrates programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs.

If you are viewing this information softcopy, the photographs and color illustrations may not appear.
Policy for unsupported hardware

Various z/OS elements, such as DFSMS, HCD, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide.
