UNIX System Services Messages and Codes
Note

Before using this information and the product it supports, be sure to read the general information under "Notice" on page 779.

This edition applies to Version 1 Release 11 of z/OS (5694-A01) and to all subsequent releases and modifications until otherwise indicated in new editions.

This is a major revision of SA22-7807-09.

IBM welcomes your comments. A form for readers' comments may be provided at the back of this document, or you may address your comments to the following address:

About this document

This document presents the information you need to use IBM® z/OS UNIX System Services (z/OS UNIX). The z/OS shell and utilities provides commands based on open systems standards and services mentioned in the "Acknowledgments" on page 780. The debugger helps you find and fix errors in C and C++ programs that use z/OS UNIX facilities.

This document provides information to help you identify and isolate problems that may occur in the shell, parallel environment or the debugger. It also helps you correct errors you make in entering commands or using them correctly. Messages are listed in alphanumeric order by message prefix.

Only those messages with explanations are included.

This document also contains both reason and return codes listed by value. In addition, the /usr/sbin/init exit status codes are included.

Some commands in the z/OS UNIX System Services Command Reference have messages that are not listed in this publication. For example, messages generated from the 1d command can be found in z/OS MVS System Messages, Vol 8 (IEF-IGD).

Who should use this document

This document is intended for any user who is trying to resolve problems that may arise in z/OS UNIX in the shells and utilities or debugger. The list of users include the application and system programmer as well as the shell user.

How this document is organized

This document includes a subset of shell and debugger error messages from various utilities, including /bin/login, /usr/sbin/init, OMVS and other TSO/E commands, and the debugger.

The messages in this document include italicized text. Italicized text indicates a variable placeholder for a string, such as a filename or pathname, or a hexadecimal or decimal number.

Some of the messages in this document are accompanied by error codes or additional messages that explain the problem further. Error codes can be generated by components of z/OS, by the XL C/C++ Run-Time Library, or by Language Environment®. You should be able to find more information about them by referring to the z/OS UNIX System Services Programming: Assembler Callable Services Reference or the z/OS Language Environment Debugging Guide. Additional error messages might come from components of z/OS, from RACF®, or from TSO/E. Refer to the messages documentation for these products for explanations.

Error and reason codes are also included.

Using LookAt to look up message explanations

LookAt is an online facility that lets you look up explanations for most of the IBM messages you encounter, as well as for some system abends and codes. Using LookAt to find information is faster than a conventional search because in most cases LookAt goes directly to the message explanation.

You can use LookAt from these locations to find IBM message explanations for z/OS® elements and features, z/VM®, VSE/ESA™, and Clusters for AIX® and Linux®:

- The Internet. You can access IBM message explanations directly from the LookAt Web site at www.ibm.com/servers/eserver/zseries/zos/bkserv/lookat/.
• Your z/OS TSO/E host system. You can install code on your z/OS systems to access IBM message
explanations using LookAt from a TSO/E command line (for example: TSO/E prompt, ISPF, or z/OS UNIX® System Services).

• Your Microsoft® Windows® workstation. You can install LookAt directly from the z/OS Collection
(SK3T-4269) or the z/OS and Software Products DVD Collection (SK3T-4271) and use it from the
resulting Windows graphical user interface (GUI). The command prompt (also known as the DOS >
command line) version can still be used from the directory in which you install the Windows version of
LookAt.

• Your wireless handheld device. You can use the LookAt Mobile Edition from [www.ibm.com/servers/
eserver/zseries/zos/bkserv/lookat/lookatm.html](http://www.ibm.com/servers/eserver/zseries/zos/bkserv/lookat/lookatm.html) with a handheld device that has wireless access and an
Internet browser.

You can obtain code to install LookAt on your host system or Microsoft Windows workstation from:
• A CD in the z/OS Collection (SK3T-4269).
• The z/OS and Software Products DVD Collection (SK3T-4271).
• The LookAt Web site (click Download and then select the platform, release, collection, and location that
suit your needs). More information is available in the LOOKAT.ME files available during the download
process.

Where to find more information
Where necessary, this document references information in other documents about the elements and
features of the z/OS system. For complete titles and order numbers for all z/OS documents, see [z/OS

Direct your request for copies of any IBM publication to your IBM representative or to the IBM branch
office serving your locality.

There is also a toll-free customer support number (1-800-879-2755) available Monday through Friday from
6:30 a.m. through 5:00 p.m. Mountain Time. You can use this number to:
• Order or inquire about IBM publications
• Resolve any software manufacturing or delivery concerns
• Activate the program reorder form to provide faster and more convenient ordering of software updates

Softcopy publications
The z/OS UNIX library is available on the z/OS Collection Kit, SK2T-6700. This softcopy collection
contains a set of z/OS and related unlicensed product documents. The CD-ROM collection includes the
IBM Library Reader™, a program that enables customers to read and print the softcopy documents.

Adobe® Reader to view them.

IBM Systems Center publications
IBM Systems Centers produce IBM Redbooks® publications that can be helpful in setting up and using

These documents have not been subjected to any formal review nor have they been checked for technical
accuracy, but they represent current product understanding at the time of their publication and provide
information on a wide range of topics. You must order them separately. A selected list of these documents
Porting information for z/OS UNIX

A Porting Guide is available at http://www.ibm.com/servers/eserver/zseries/zos/unix/bpxa1por.html. It covers a range of useful topics, including sizing a port, setting up a porting environment, ASCII-EBCDIC issues, performance, and much more.

The porting page also features a variety of porting tips and lists porting resources that will help you in your port.

z/OS UNIX courses

For a current list of courses that you can take, go to http://www.ibm.com/services/learning/.

You can also ask your IBM representative or call 1-800-IBM-TEACH (1-800-426-8322).

z/OS UNIX home page

Some of the tools available from the Web site are ported tools, and some are unsupported tools designed for z/OS UNIX. The code works in our environment at the time we make it available, but is not officially supported. Each tool has a README file that describes the tool and lists any restrictions.

The simplest way to reach these tools is through the z/OS UNIX home page. From the home page, click on Tools and Toys.

The code is also available from ftp://ftp.software.ibm.com/s390/zos/unix/ through anonymous FTP.

---

Restrictions

Because the tools are not officially supported, APARs cannot be accepted.

---

Discussion list

Customers and IBM participants also discuss z/OS UNIX on the mvs-oe discussion list. This list is not operated or sponsored by IBM.

To subscribe to the mvs-oe discussion, send a note to:
listserv@vm.marist.edu

Include the following line in the body of the note, substituting your given name and family name as indicated:
subscribe mvs-oe given_name family_name

After you are subscribed, you will receive further instructions on how to use the mailing list.

The z/OS Basic Skills Information Center

The z/OS Basic Skills Information Center is a Web-based information resource intended to help users learn the basic concepts of z/OS, the operating system that runs most of the IBM mainframe computers in use today. The Information Center is designed to introduce a new generation of Information Technology professionals to basic concepts and help them prepare for a career as a z/OS professional, such as a z/OS system programmer.

Specifically, the z/OS Basic Skills Information Center is intended to achieve the following objectives:

- Provide basic education and information about z/OS without charge
• Shorten the time it takes for people to become productive on the mainframe
• Make it easier for new people to learn z/OS.

To access the z/OS Basic Skills Information Center, open your Web browser to the following Web site, which is available to all users (no login required): http://publib.boulder.ibm.com/infocenter/zos/basics/index.jsp
How to send your comments to IBM

We appreciate your input on this publication. Feel free to comment on the clarity, accuracy, and completeness of the information or give us any other feedback that you might have.

Use one of the following methods to send us your comments:

1. Send an e-mail to mhvrcfs@us.ibm.com
3. Mail the comments to the following address:
   IBM Corporation
   Attention: MHVRCFS Reader Comments
   Department H6MA, Mail Station P181
   2455 South Road
   Poughkeepsie, NY 12601-5400
   U.S.A.
4. Fax the comments to us as follows:
   From the United States and Canada: 1+845+432-9405
   From all other countries: Your international access code +1+845+432-9405

Include the following information:
• Your name and address
• Your e-mail address
• Your telephone or fax number
• The publication title and order number:
  z/OS V1R11.0 UNIX System Services Messages and Codes
  SA22-7807-10
• The topic and page number related to your comment
• The text of your comment.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you.

IBM or any other organizations will only use the personal information that you supply to contact you about the issues that you submit.

If you have a technical problem

Do not use the feedback methods listed above. Instead, do one of the following:
• Contact your IBM service representative
• Call IBM technical support
• Visit the IBM zSeries support Web page at http://www.ibm.com/servers/eserver/support/zseries/
Summary of changes

For z/OS Version 1 Release 11, SA22-7807-10

This document contains information previously presented in z/OS UNIX System Services Messages and Codes, SA22-7807-09, which supports z/OS Version 1 Release 10.

**Changed information**

The following general changes have been made:

- The information previously presented in "Appendix A. z/OS UNIX System Services message modules" has been relocated to become the "Message prefixes and issuing modules" subsection of the new "Chapter 1. Messages".
  - The "z/OS UNIX System Services message modules" table, from the old "Appendix A. z/OS UNIX System Services message modules", has been renamed and reorganized. The new table name is "Table 1. Message prefixes and issuing modules" in the "Message prefixes and issuing modules" subsection of "Chapter 1. Messages".
  - The message prefixes listed in the "z/OS UNIX System Services message modules" table have been made into cross-references to the corresponding message prefix subsection in chapter 1.
- The information previously presented in "Chapter 1. Shell and Utilities Messages" and "Chapter 2. Debugger Messages" is now presented in the "Shell and Utilities messages" and "z/OS Debugger messages" subsections of the new "Chapter 1. Messages".
- Messages with FOMM, FOMO, FOMOG and FOMOH prefixes, previously listed in "Chapter 1. Shell and Utilities Messages" have been moved to the new "Parallel Environment messages" subsection of "Chapter 1. Messages".
- The three subsections in the new "Chapter 1: Messages" that list messages have further been divided into subsections by message prefix.
- The information previously presented in "Chapter 6. zSeries File System Reason Codes" has been relocated within "Table 2. Location of return information" in the "Description and location information" subsection of "Chapter 3. Reason codes (errnojrs)".
- The information previously presented in "Chapter 4. Reason Codes (Errnojrs) Listed by Value" and "Chapter 5. Hierarchical File System (HFS) Reason Codes" has been restructured for readability and is now presented in "Chapter 3. Reason codes (errnojrs)".
- The "Readers' Comments – We'd Like to Hear from You" section at the back of the publication has been replaced with a new "How to send your comments to IBM" section in the front of the publication, located between the "About this document" and "Summary of changes" sections. The hardcopy mail-in form has been replaced with a page that provides information appropriate for submitting reader comments to IBM.

Information applicable to all releases.

You may notice changes in the style and structure of some content in this document—for example, headings that use uppercase for the first letter of initial words only, and procedures that have a different look and format. The changes are ongoing improvements to the consistency and retrievability of information in our documents.

This document contains terminology, maintenance, and editorial changes. Technical changes or additions to the text and illustrations are indicated by a vertical line to the left of the change.
Chapter 1. Messages

Message prefixes and issuing modules

The following table is provided to help you determine what modules are issuing the messages you receive. The left-hand column lists all of the message prefixes issued by z/OS UNIX System Services. The right-hand column provides the module that issues the message.

<table>

Shell and Utilities messages

CDA

CDA0002 An invalid option string is specified.

Explanation: The indicated option is not a valid dbgl option.

In the message text:

string is an invalid option.

User response: Re-enter the dbgl command and specify a valid option.

CDA0003 Binder API failed. retcode:number, rsncode:0xnumber

Explanation: dbgl is unable to retrieve information from the input module. The Binder API has failed.

In the message text:

number is the return code from Binder API. number is the reason code from Binder API.

User response: This is an internal error. Provide the indicated error text to the IBM service representative responsible for your installation.

CDA0004 The file string cannot be opened.

Explanation: Either the input file does not exist, or the permissions for the input file or the directory containing the input file do not have read or search permission set.

In the message text:

string is the input file name.

User response: Ensure the input file exists and that the input file and the directories containing the input file have read and search permissions set.

CDA0005 No debug information was found in string.
**Explanation:** The `dbgld` command is unable to locate any debug information within the input file. No output file will be generated.

In the message text:

*string* is the input file name.

**User response:** Compile at least one compilation unit with the debug compiler option.

---

**CDA0006**  
**Problem Display Name:** Out of memory allocating *number* bytes for *string*.

**Explanation:** The `dbgld` command ran out of memory processing the input file. This may happen with a large input file.

In the message text:

*number* is the number of bytes `dbgld` tries to allocate.  
*string* contains the name of the function trying to allocate the memory.

**User response:** Shut down any large processes that are running. You may need to specify the runtime option `HEAP(,,FREE,,)` to prevent the `dbgld` command from running out of memory.

---

**CDA0007**  
**Problem Display Name:** INTERNAL UTILITY ERROR: Procedure *string*:*number*.

**Explanation:** An internal utility error occurred.

In the message text:

*string* is the procedure where the error has occurred.  
*number* is the line number where the error has occurred.

**User response:** This is an internal error. Provide the indicated error text to the IBM service representative responsible for your installation.

---

**CDA0008**  
**Problem Display Name:** The DLL *string* is not found.

**Explanation:** The indicated Common Debug Architecture run-time library cannot be found.

In the message text:

*string* is the name of the Common Debug Architecture run-time library.

**User response:** The indicated Common Debug Architecture run-time library should be installed in the SCEEERUN2 data set. Verify that the run-time library is installed properly.

---

**CDA0009**  
**Problem Display Name:** An incompatible DLL has been detected.  
The utility requires `LIBDDPI_DLL_VERSION` to be at least 0x*number*.

**Explanation:** The version found in the system is 0x*number*.

In the message text:

*number* is the Common Debug Architecture runtime version that `dbgld` compiled with.  
*number* is the Common Debug Architecture runtime version that is currently being used.

**User response:** Contact the IBM service representative responsible for your installation and verify that you have the latest Common Debug Architecture run time installed.

---

**CDA0010**  
**Problem Display Name:** An incompatible DLL has been detected.  
The utility requires `LIBELF_DLL_VERSION` to be at least 0x*number*.

**Explanation:** The version found in the system is 0x*number*.

In the message text:

*number* is the Common Debug Architecture runtime version that `dbgld` compiled with.  
*number* is the Common Debug Architecture runtime version that is currently being used.

**User response:** Contact the IBM service representative responsible for your installation and verify that you have the latest Common Debug Architecture run time installed.

---

**CDA0011**  
**Problem Display Name:** Cannot find the function *string* in DLL *string*.

**Explanation:** The indicated function cannot be found in the Common Debug Architecture run-time library.

In the message text:

*string* is the name of the function in the Common Debug Architecture run-time library.  
*string* is the name of the Common Debug Architecture run-time library.

**User response:** Contact the IBM service representative responsible for your installation and verify that you have the latest Common Debug Architecture run time installed.

---

**CDA0012**  
**Problem Display Name:** The debug file *string* cannot be opened for reading.

**Explanation:** The file permissions for the debug file do not have read permissions set.

In the message text:
string is the debug file name.

**User response:** Ensure the debug file exists and that it has read permissions set.

---

**CDA0013** The module map file string cannot be opened for writing.

**Explanation:** The file or directory permissions for the module map file do not have write permissions set.

In the message text:

string is the module map file.

**User response:** Ensure the **dbgld** command is being run from a directory with write permission, and the file has write permission if it already exists.

---

**CDA0014** The input file string cannot be processed due to the EDIT=NO attribute.

**Explanation:** **dbgld** cannot process modules that have been bounded with the EDIT=NO option.

In the message text:

string is the file name of the input module.

**User response:** Specify binder option EDIT=YES when binding the module.

---

**CDA0015** The input file string cannot be processed.

**Explanation:** The BINDER API has failed while processing the input module.

In the message text:

string is the file name of the input module.

**User response:** Refer to the Program Management documentation for information about the BINDER API return code and reason code.

---

**CDA0016** The object file produced from string contains ISD debug information.

**Explanation:** The **dbgld** command is converting ISD debug information into DWARF debug information. This process may degrade the performance of the **dbgld** command.

In the message text:

string is the source file name.

**User response:** To increase the performance of the **dbgld** command, please recompile the specified source file with the -g compiler option, rebind your application, and then reissue the **dbgld** command.

---

**CDA0017** The debug side file string is outdated.

**Explanation:** The MD5 signature within the specified debug side file does not match the MD5 signature within the input module.

In the message text:

string is the debug side file name.

**User response:** Recompile the corresponding source file, rebind your application, and then reissue the **dbgld** command.

---

**CDA0018** An error has occurred while processing the ISD debug information for string.

**Explanation:** The **dbgld** command is unable to convert the ISD debug information into DWARF debug information.

In the message text:

string is the source file name.

**User response:** Recompile the specified source file with the -g compiler option, rebind your application, and then reissue the **dbgld** command. If this is not a viable option, please contact the IBM service representative responsible for your installation.

---

**CDA0019** An error has occurred while processing the DWARF debug information for string.

**Explanation:** The **dbgld** command is unable to process the DWARF debug information in the specified debug side file.

In the message text:

string is the debug side file name.

**User response:** This is an internal error. Provide the indicated error text to the IBM service representative responsible for your installation.

---

**CDA0020** The source file string cannot be opened for reading.

**Explanation:** Either the source file does not exist, or the file permissions for the source file do not have read permissions set. The contents of the source file will not be added to the module map.

In the message text:

string is the source file name.

**User response:** Ensure the source file exists and that it has read permissions set.

---
CDA0021 Error writing to module map file string.

Explanation: There may be insufficient disk space to write to the file.

In the message text:

FOMC

FOMC2800 Usage: chcp [-q|r] chcp [-s] -a ASCII_cp chcp [-s] -a ASCII_cp -e EBCDIC_cp chcp [-s] -a ASCII_cp -e EBCDIC_cp

Explanation: This message shows the correct syntax for the chcp command. It is displayed when incorrect or missing command options are used.

User response: Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.

FOMC2801 -string is an unknown chcp command option.

Explanation: The chcp command does not recognize the command-line option displayed in the message.

In the message text:

-string The unknown option flag specified on the chcp command.

User response: Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.

FOMC2802 The -character option appears more than once. All appearances after the first are not accepted.

Explanation: The option displayed in the message appears more than once on the chcp command line. chcp options must be specified only once.

In the message text:

-character The duplicated option flag specified on the chcp command.

User response: Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.

FOMC2803 When using the ASCII code page option (-a), a code page name is required.

Explanation: The -a option was coded on the chcp command line, but no code page name was specified following the -a. When -a is present, a code page name must follow it on the command line. For example: chcp -a ISO8859-1 -e IBM-273.

User response: Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.

FOMC2804 When using the EBCDIC code page option (-e), a code page name is required.

Explanation: The -e option was coded on the chcp command line, but no code page name was specified following the -e. When -e is present, a code page name must follow it on the command line. For example: chcp -a ISO8859-1 -e IBM-273.

User response: Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.

FOMC2805 Specify only one of the query (-q), reset (-r), or set (-s) options on the chcp command line.

Explanation: More than one main operation (-q, -r, or -s) was requested on the chcp command line. The chcp command can perform only one of the query, reset, or set operations each time it is run.

User response: Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.

FOMC2806 "-e string" specifies the name of an ASCII code page. An EBCDIC code page is required.

Explanation: The code page that follows the -e option flag must be an EBCDIC code page. The code page entered on the command line following -e is an ASCII code page.

In the message text:

"-e string"

The name of the ASCII code page.

User response: Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.
FOMC2807  "-a string" specifies the name of an EBCDIC code page. An ASCII code page is required.

Explanation:  The code page that follows the -a option flag must be an ASCII code page. The code page entered on the command line following -a is an EBCDIC code page.

In the message text:

"-a string"

The name of the EBCDIC code page.

User response:  Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.

FOMC2808  number positional parameters starting with "string" are not accepted.

Explanation:  Two or more positional parameters were entered on the chcp command line following the option flags (if any). The message shows the first positional parameter on the command line. The chcp command does not accept any positional parameters.

In the message text:

number  The number of positional parameters specified on the chcp command line.

"string"  The text of the first positional parameter.

User response:  Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.

FOMC2809  Positional parameter "string" is not accepted.

Explanation:  One positional parameter was entered on the chcp command line following the option flags (if any). This positional parameter is shown in the error message. The chcp command does not accept any positional parameters.

In the message text:

"string"  The text of the positional parameter.

User response:  Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.

FOMC2810  The ASCII code page option (-a) must not be specified with the query (-q), or reset (-r) options.

Explanation:  The ASCII code page option (-a) was present on the chcp command line along with either the query (-q) or reset (-r) options. The -a option can be used only when the set option (-s) is present or defaulted. Do not specify either -a or -e when performing a query or reset operation.

User response:  Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.

FOMC2811  The EBCDIC code page option (-e) must not be specified with the query (-q), or reset (-r) options.

Explanation:  The EBCDIC code page option (-e) was present on the chcp command line along with either the query (-q) or reset (-r) options. The -e option can be used only when the set option (-s) is present or defaulted. Do not specify either -a or -e when performing a query or reset operation.

User response:  Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.

FOMC2812  When the set option (-s) is specified or defaulted, either the ASCII code page option (-a) or the EBCDIC code page option (-e) is required.

Explanation:  The set option (-s) was used, but no ASCII or EBCDIC code pages were specified on the command line. When the chcp -s option is used, either the ASCII code page (-a ASCII_CP), the EBCDIC code page (-e EBCDIC_CP), or both code pages must be specified on the command line.

User response:  Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.

FOMC2813  The name for code page "string" contains more than number characters.

Explanation:  The maximum length for chcp code page names is shown in the error message. The ASCII or EBCDIC code page name specified on the command line is too long. Code pages with shorter names must be used.

In the message text:

"string"  The code page name that is too long.
number  The maximum number of characters allowed in a code page name.

User response:  Reenter the chcp command with correct command options. For a description of the chcp options, see z/OS UNIX System Services Command Reference.

FOMC2814  An unexpected error occurred.  error code = number, error data = "string"

Explanation:  An unexpected error occurred while chcp was running. This is an internal error. It is not caused by incorrect command syntax or I/O errors.

In the message text:

error code = number
The code that identifies this unexpected error.

error data = "number"
Error data that is associated with this error. If the string is empty, there is no data associated with this error.

User response:  Report this error to the system programmer.

System programmer response:  This message indicates that there is a problem in the chcp command. Follow the usual procedures for reporting problems in z/OS UNIX.

FOMC2815  The chcp command cannot obtain number bytes of storage required for processing.

Explanation:  The chcp command could not obtain enough storage to run. The chcp command ends immediately whenever this happens.

In the message text:

number  The number of bytes of storage that chcp requested.

User response:  Report this error to the system programmer.

System programmer response:  Make sure that the address spaces used by shell commands have enough storage to run the chcp command.

FOMC2821  The chcp command failed.  The name of the controlling terminal cannot be determined.  function = ctermid(), pathname = ""

Explanation:  The chcp command cannot determine the name of the controlling terminal. No code page operations are possible without the name of the controlling terminal.

User response:  Report this error to the system programmer.

System programmer response:  For more information about this error, see z/OS XL C/C++ Language Reference. Follow any problem determination procedures suggested for the ctermid() output pathname shown in the error message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

FOMC2822  The chcp command failed.  The controlling terminal cannot be used.

function = open(),
pathname = "string",
return value = number,
errno = number (X'hexnum'),
reason code = hexnum,
message = "string"

Explanation:  The chcp command cannot open the controlling terminal. No code page operations are possible if the controlling terminal cannot be opened.

In the message text:

pathname = "string"
The pathname of the controlling terminal

return value = number
The return value reported by the system for this error.

errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = "string"
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response:  Report this error to the system programmer.

System programmer response:  For more information about this error, see z/OS XL C/C++ Language Reference and z/OS UNIX System Services Programming: Assembler Callable Services Reference. Follow any problem determination procedures suggested for the errno value and the other error information shown in the message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.
FOMC2823 This terminal does not support the chcp command.

Explanation: The chcp command cannot be used on this terminal. The terminal does not support code page operations. If you are logged on through the TSO/E OMVS command, the chcp command is not supported.

User response: Do not run the chcp command when using this terminal.

To avoid this message when chcp is invoked from a shell script, and you are logged on through the TSO/E OMVS command, test the _BPX_TERMPATH environment variable. If this environment variable is set to OMVS, bypass the running of the chcp command.

For more information about _BPX_TERMPATH, see z/OS UNIX System Services Command Reference.

FOMC2824 The chcp command failed. The code page capability for this terminal is unknown. function = __tcgetcp(), file descriptor = number, pathname = "string", return value = number, errno = number(X'hexnum'), reason code = hexnum, message = "string"

Explanation: The chcp command tried to determine the current code pages for the terminal. The __tcgetcp() function failed with the errno and reason code in the error message. The chcp command ended immediately.

In the message text:

file descriptor = number
The file descriptor of the controlling terminal.

pathname = "string"
The pathname of the controlling terminal.

return value = number
The return value reported by the system for this error.

erro = number(X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = "string"
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Report this error to the system programmer.

System programmer response: For more information about this error, see z/OS XL C/C++ Run-Time Library Reference. Follow any problem determination procedures suggested for the errno value and the other error information shown in the message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

FOMC2825 The ASCII code page was not changed. The current EBCDIC code page is not set.

Explanation: chcp was run with just the ASCII code page (-a ASCII_cp) specified on the command line. The current EBCDIC code page for the terminal is not known, because the terminal is in binary mode.
Whenever the chcp command is run and the terminal is in binary mode, both the ASCII and EBCDIC code pages must be specified on the command line. The code pages were not changed.

User response: Reenter the chcp command with both the ASCII code page (-a ASCII_cp) and the EBCDIC code page (-e EBCDIC_cp) on the command line. When the terminal is in binary mode, chcp -r can also be used to reset both code pages to the default values.

FOMC2826 The EBCDIC code page was not changed. The current ASCII code page is not set.

Explanation: chcp was run with just the EBCDIC code page (-e EBCDIC_cp) specified on the command line. The current ASCII code page for the terminal is not known, because the terminal is in binary mode.
Whenever the chhcp command is run and the terminal is in binary mode, both the ASCII and EBCDIC code pages must be specified on the command line. The code pages were not changed.

User response: Reenter the chcp command with both the ASCII code page (-a ASCII_cp) and the EBCDIC code page (-e EBCDIC_cp) on the command line.

FOMC2827 The code pages were not changed. ASCII code page "string" cannot be used with EBCDIC code page "string" on this terminal.

Explanation: The ASCII and EBCDIC code pages shown in the error message cannot be used together on this terminal. If the ASCII code page is IBM-932 or IBM-eucJP, the EBCDIC code page must be IBM-939. If the EBCDIC code page is IBM-939, the ASCII code page must be IBM-932 or IBM-eucJP. The code pages were not changed.

User response: Make sure to use only the allowed DBCS code pages on this terminal. Reenter the chcp command with the correct ASCII and EBCDIC DBCS code pages.
FOMC2831  The code pages were not changed. The specified ASCII and EBCDIC code pages cannot be used together. 
function = iconv_open(), tocode = "string", fromcode = "string", return value = number, errno = number (X'hexnum'), reason code = hexnum, message = "string"

Explanation:  The ASCII and EBCDIC code pages shown in the message cannot be used together. It is not possible to convert between these two code pages. The code pages were not changed.

In the message text:

tocode = string
The target code page passed to iconv_open().

fromcode = string
The source code page passed to iconv_open().

return value = number
The return value reported by the system for this error.

errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = "string"
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response:  Make sure the code pages shown in the error message are correct. If not, reenter the chcp command using the -a ASCII_cp and -e EBCDIC_cp options to specify the correct code pages.

If the code pages are correct, report this error to the system programmer.

System programmer response:  For more information about this error, see z/OS UNIX System Services Programming: Assembler Callable Services Reference. Follow any problem determination procedures suggested for the errno value and the other error information shown in the message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

FOMC2832  The code pages were not changed. Conversion from the ASCII code page to the EBCDIC code page cannot be set up. function = iconv(), ASCII code page = "string", EBCDIC code page = "string", input bytes left = number, output bytes left = number, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = "string"

Explanation:  The chcp command must build the ASCII to EBCDIC conversion table for this terminal. Both code pages contain single-byte codes, but chcp could not set up a 256-byte character conversion table. Either iconv() failed with the errno and reason code in the message, or the tables output from iconv() were not 256 bytes long. The code pages were not changed.

In the message text:

ASCII code page = "string"
The requested ASCII code page.

EBCDIC code page = "string"
The requested EBCDIC code page.

input bytes left = number
The number of ASCII code points that can not be converted.

output bytes left = number
The number of EBCDIC code points that are not used.

return value = number
The return value reported by the system for this error.

errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = "string"
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response:  Make sure the code pages shown in the error message are correct. If not, reenter the chcp command using the -a ASCII_cp and -e EBCDIC_cp options to specify the correct code pages.

If the code pages are correct, report this error to the system programmer.

System programmer response:  For more information
about this error, see z/OS XL C/C++ Run-Time Library Reference and z/OS UNIX System Services Programming: Assembler Callable Services Reference.

Follow any problem determination procedures suggested for the errno value and the other error information shown in the message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

FOMC2833  The code pages were not changed. Conversion from the EBCDIC code page to the ASCII code page cannot be set up. function = iconv(), ASCII code page = "string", EBCDIC code page = "string", input bytes left = number, output bytes left = number, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = "string"

Explanation: The chcp command must build the EBCDIC to ASCII conversion table for this terminal. Both code pages contain single-byte codes, but chcp could not set up a 256-byte character conversion table. Either iconv() failed with the errno and reason code in the message, or the tables output from iconv() were not 256 bytes long. The code pages were not changed.

In the message text:

ASCII code page = "string"
The requested ASCII code page.

EBCDIC code page = "string"
The requested EBCDIC code page.

input bytes left = number
The number of EBCDIC code points that can not be converted.

output bytes left = number
The number of ASCII code points that are not used.

return value = number
The return value reported by the system for this error.

errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = "string"
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Make sure the code pages shown in the error message are correct. If not, reenter the chcp command using the -a ASCII_cp and -e EBCDIC_cp options to specify the correct code pages.

If the code pages are correct, report this error to the system programmer.

System programmer response: For more information about this error, see z/OS XL C/C++ Run-Time Library Reference and z/OS UNIX System Services Programming: Assembler Callable Services Reference.

Follow any problem determination procedures suggested for the errno value and the other error information shown in the message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

FOMC2834  The ASCII and EBCDIC code pages cannot be changed. function = __tcsetcp(), ASCII code page = "string", EBCDIC code page = "string", file descriptor = number, pathname = "string", return value = number, errno = number (X'hexnum'), reason code = hexnum, message = "string"

Explanation: The chcp command cannot change the code pages for the terminal. The __tcsetcp() function failed with the errno value and reason code shown in the message.

In the message text:

file descriptor = number
The file descriptor of the controlling terminal.

ASCII code page = "string"
The requested ASCII code page.

EBCDIC code page = "string"
The requested EBCDIC code page.

pathname = "string"
The pathname of the controlling terminal.

return value = number
The return value reported by the system for this error.

errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = "string"
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.
reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = "string"
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Report this error to the system programmer.

System programmer response: For more information about this error, see z/OS XL C/C++ Run-Time Library Reference and z/OS UNIX System Services Programming: Assembler Callable Services Reference.

Follow any problem determination procedures suggested for the errno value and the other error information shown in the message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

FOMC2835 The ASCII and EBCDIC code pages and tables cannot be changed.

function = __tcsettables(), ASCII code page = "string", EBCDIC code page = "string", file descriptor = number,
pathname = "string", return value = number, errno = number (X’hexnum’),
reason code = hexnum, message = "string"

Explanation: The chcp command cannot change the code pages for the terminal. The __tcsettables() function failed with the errno value and reason code shown in the message.

In the message text:

file descriptor = number
The file descriptor of the controlling terminal.

ASCII code page = "string"
The requested ASCII code page.

EBCDIC code page = "string"
The requested EBCDIC code page.

pathname = "string"
The pathname of the controlling terminal.

return value = number
The return value reported by the system for this error.

errno = number (X’hexnum’)
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = "string"
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Report this error to the system programmer.

System programmer response: For more information about this error, see z/OS XL C/C++ Run-Time Library Reference and z/OS UNIX System Services Programming: Assembler Callable Services Reference.

Follow any problem determination procedures suggested for the errno value and the other error information shown in the message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

FOMF

FOMF0100I Cannot open message catalog

Explanation: The message catalog fomfmsgc.cat cannot be opened.

System action: The command will proceed using default messages.

User response: Set your NLS environment variables to be consistent with a language feature installed on your system.

FOMF0101I filename is empty or cannot be read

Explanation: The automount master file could not be read or is an empty file.

System action: The automount configuration was not changed.

User response: Create a /etc/auto.master file or specify a master file pathname as the command argument.

FOMF0102I Usage: automount [-aeqs] [master_file_name]

Explanation: The usage message displays the correct syntax for the automount command. Only one option flag can be specified.

System action: The automount configuration was not changed.
User response: Reenter the automount command using the correct syntax.

FOMF0103I Nothing to configure for file filename
Explanation: The specified map file did not contain any configuration information.
System action: This map file did not change the automount configuration.
User response: Delete the filename from /etc/auto.master or include configuration data in the file.

FOMF0104I Directory does not exist: directory-name
Explanation: The directory that you specified does not exist.
System action: The specified directory is not configured for automount.
User response: Create the directory and reenter the command.

FOMF0105I Line line-number: NAME keyword expected
Explanation: The NAME keyword must be the first keyword in a map file.
System action: This map file does not change the automount configuration.
User response: Correct the specifications in the map file named in the previous FOMF0107I message.

FOMF0106I Line line-number: Invalid keyword: name
Explanation: This symbol is not a valid keyword.
System action: This map file does not change the automount configuration.
User response: Correct the specifications in the map file named in the previous FOMF0107I message.

FOMF0107I Processing file filename
Explanation: This message names the map file being processed.
User response: None

FOMF0108I Managing directory directory-name
Explanation: This message names the directory just configured for the automounter.
User response: None

FOMF0109I Line line-number: Invalid number: number
Explanation: The symbol is not a valid number or is out of range
System action: This map file does not change the automount configuration.
User response: Correct the specifications in the map file named in the previous FOMF0107I message.

FOMF0110I Line line-number: Argument not specified
Explanation: A keyword is missing an argument.
System action: This map file does not change the automount configuration.
User response: Correct the specifications in the map file named in the previous FOMF0107I message.

FOMF0111I Line line-number: NAME * must be the first entry
Explanation: A NAME * statement was found in the map file but was not the first entry.
System action: This map file does not change the automount configuration.
User response: Correct the specifications in the map file named in the previous FOMF0107I message.

FOMF0112I Error issuing PFSCTL: RC=number
ERRNO=number
REASON=number
Explanation: An error occurred when the PFSCTL command was issued. The return codes describe the error.
System action: The automount command terminates.
User response: Correct the error and reenter the command.

FOMF0113I Directory name too long: directory-name
Explanation: The name of the directory to be managed by the automounter cannot contain more than 40 characters.
System action: The specified directory is not configured for automount.
User response: Rename the directory so it has a shorter pathname or reference the directory through a symbolic link that has a shorter pathname.
FOMF0114I Line line-number: MODE must be RDWR or READ
Explanation: The MODE keyword was not specified correctly.
System action: The specified directory is not configured for automount.
User response: Correct the error and reenter the command.

FOMF0115I Line line-number: named-keyword argument is too long
Explanation: The named keyword was not specified correctly.
System action: The specified directory is not configured for automount.
User response: Correct the error and reenter the command.

FOMF0116I Line line-number: SETUID must be YES or NO
Explanation: The SETUID keyword was not specified correctly.
System action: The specified directory is not configured for automount.
User response: Correct the error and reenter the command.

FOMF0117I Mount failed for directory directory-name. Errno=number Reason=number
Explanation: The automounter could not mount itself on the specified directory. The error code and reason code are shown.
System action: The specified directory is not configured for automount.
User response: Correct the error and reenter the command.

FOMF0118I Map file not specified for directory directory-name
Explanation: The automount master file contains a pathname for a directory to manage but no filename for the map file.
System action: The automount configuration is not changed.
User response: Correct the error and reenter the command.

FOMF0119I Line line-number: SECURITY must be YES or NO
Explanation: The SECURITY keyword was not specified correctly.
System action: The specified directory is not configured for automount.
User response: Correct the error and reenter the command.

FOMF0120I Line line-number: AUTOMOVE must be YES or NO
Explanation: The AUTOMOVE keyword was not specified correctly.
System action: The specified directory is not configured for automount.
User response: Correct the error and reenter the command.

FOMF0121I Line line-number: CCSID for TAG is not valid
Explanation: The CCSID decimal value for the TAG keyword has invalid characters or is out of range.
System action: The specified directory is not configured for automount.
User response: Correct the error and reenter the command.

FOMF0122I Line line-number: TAG must include TEXT or NOTEXT
Explanation: The TAG keyword line must specify TEXT or NOTEXT after the CCSID value and the comma.
System action: The specified directory is not configured for automount.
User response: Correct the error and reenter the command.

FOMF0123I Line line-number: Keyword error in allocation string at word word-number: keyword
Explanation: The allocation string specified on ALLOCUSER or ALLOCANY contains an unidentified word. The word number and word are shown.
System action: The specified directory is not configured for automount.
User response: Correct the error and reenter the command.
FOMF0124I Line line-number: LOWERCASE must be YES or NO
Explanation: The LOWERCASE keyword was not specified correctly.
System action: The specified directory is not configured for automount.
User response: Correct the error and reenter the command.

FOMF0125I Automount policy was not changed
Explanation: The automount policy was not changed due to errors found in the automount policy.
System action: The current automount configuration is not changed.
User response: Correct the error and reenter the command.

FOMF0130I Error issuing command: reason
Explanation: The TSO/E command could not be issued through OMVS. Reason provides additional information about the failure.
System action: The TSO/E command is not run.
User response: Correct the problem and try again or use the -t option.

FOMF0131I Allocation for SYSTSIN failed
Explanation: The SYSTSIN DD name could not be allocated. An allocation failure message precedes this message with information about the allocation failure.
System action: The TSO/E command is not run.
User response: Correct the problem and try again.

FOMF0132I Allocation for SYSTSPRT failed
Explanation: The SYSTSPRT DD name could not be allocated. An allocation failure message precedes this message with information about the allocation failure.
System action: The TSO/E command is not run.
User response: Correct the problem and try again.

FOMF0133I TSO Environment service failed: reason
Explanation: The TSO environment could not be established. Reason provides more information about the failure.
System action: The TSO/E command is not run.
User response: Correct the problem and try again.

FOMF0134I TSOLNK failed: reason
Explanation: The TSO service routine could not be invoked. Reason provides more information about the failure.
System action: The TSO/E command is not run.
User response: Correct the problem and try again.

FOMF0135I Command too long or all blanks
Explanation: The argument was either not specified or contains more than 32,768 characters.
System action: The TSO/E command is not run.
User response: Correct the problem and try again.

FOMF0136I Command not found
Explanation: The TSO/E command specified in the argument was not found.
System action: The TSO/E command is not run.
User response: Correct the problem and try again.

FOMF0137I Command syntax error
Explanation: The TSO/E command specified in the argument does not have correct syntax.
System action: The TSO/E command is not run.
User response: Correct the problem and try again.

FOMF0138I Command not supported in background
Explanation: The TSO/E command specified in the argument is not supported in a TSO/E background environment.
System action: The TSO/E command is not run.
User response: This command cannot be run with the tso utility using the -t option. Try to use the -o option.

FOMF0139I Authorized commands are not supported
Explanation: The TSO/E command specified in the argument is not supported through the TSO/E environment service.
System action: The TSO/E command is not run.
User response: This command cannot be run with the tso utility using the -t option. Try to use the -o option.
FOMF0140I Invalid option specified
Explanation: An unsupported option was specified.
System action: The TSO/E command is not run.
User response: Specify a valid option. The supported
options are -t and -o.

FOMF0141I Unable to set 3270 passthrough mode
Explanation: The controlling pseudo-tty does not support 3270 passthrough mode or there is no
controlling pseudo-tty and the -o option was specified.
System action: The TSO/E command is not run.
User response: Reenter the command using the -t option.

FOMF0142I Command abended: reason
Explanation: The TSO/E command abended. Reason provides more information about the abend.
User response: Correct the problem and try again.

FOMF0143I Terminated by signal signal_number
Explanation: The tso shell command terminated due to a signal.

FOMF0144I Fork failed: reason
Explanation: The tso shell command attempted to fork() and the fork failed. Reason provides more
information about the failure.
User response: Correct the problem and try again.

FOMF0145I Data set not allocated to DD_name: data_set
Explanation: The data set could not be allocated to the DD name. An allocation failure message precedes
this message with information about the allocation failure.
System action: The TSO/E command is not run.
User response: Correct the problem and try again.

FOMF0201I Usage: configstk [-s] [config_file_name]
Explanation: The usage message displays the correct syntax for the configstk command.
System action: The configuration was not changed.
User response: Reenter the configstk command using the correct syntax.

FOMF0202I file is empty or cannot be read
Explanation: The configuration file could not be read or is an empty file.
System action: The configuration was not changed.
User response: Reenter the configstk command specifying a correct pathname for the configuration file.

FOMF0203I Error issuing PFSCTL: RC=number ERRNO=number REASON=number
Explanation: An error occurred when the PFSCTL command was issued. The return codes describe the
error.
System action: The configstk command terminates.
User response: Correct the error and reenter the command.

FOMF0204I Line line-number: Invalid device number
Explanation: Device numbers must be specified as four hex digits and the number must be an even
number.
System action: The configuration is not changed.
User response: Correct the error and reenter the command.

FOMF0205I Line line-number: Duplicate device address
Explanation: Cannot duplicate device addresses.
System action: The configuration is not changed.
User response: Correct the error and reenter the command.

FOMF0206I Line line-number: Invalid arguments
Explanation: Unexpected text was found on a HOME or GATEWAY statement.
System action: The configuration is not changed.
User response: Correct the error and reenter the command.

FOMF0207I Too many addresses specified for device device-name
Explanation: No more than 256 IP addresses can be specified for a device.
System action: The configuration is not changed.
User response: Correct the error and reenter the command.

FOMF0221 I buffer-type Buffers allocated: number of maximum-number

Explanation: This displays the number of read or write buffers that are allocated and the maximum number that can be allocated.

FOMF0301 I Usage: extattr [+alps] [-alps] [-F NA|BIN|NIL|CRLF|LFCR|CRNL] file ...

Explanation: The usage message displays the correct syntax for the extattr command.
System action: No file attributes were changed.
User response: Reenter the extattr command using the correct syntax.

FOMF0302 I filename: File not found

Explanation: The file does not exist.
System action: Attributes for the file were not changed.
User response: Reenter the extattr command using a correct filename.

FOMF0303 I filename: service error: rv=number, errno=number, rsn=number

Explanation: An error was encountered processing filename issuing a service call. The return codes describe the error.
System action: No file attributes were changed.
User response: Correct the error and reenter the extattr command.

FOMF0307 I Attributes not set: filename

Explanation: Specified attributes for the file filename could not be set.
System action: No file attributes were changed.
User response: Ensure you have authority to set the attributes.

FOMF0308 I filename: Not a regular file

Explanation: Specified attributes for the file filename could not be set.
System action: No file attributes were changed.
User response: Only set extended attributes on regular files.

FOMF0310 I File Format Flag is not set: filename

Explanation: Specified format flag for the file filename could not be set.
System action: No file format options were changed.
User response: Ensure you have authority to set the attributes.

FOMF0331 I Usage: filecache [-a filename...] filecache [-d filename...] filecache [-p|-q|-r]

Explanation: Incorrect syntax was used on the file cache command.
System action: No files were cached.
User response: Reenter the filecache command using the correct syntax.

FOMF0332 I Conflicting options

Explanation: Conflicting options were specified on the filecache command line.
System action: Files were not cached.
User response: Reenter the filecache command using the correct options.

FOMF0333 I Error issuing PFSCTL: RC=number ERRNO=number REASON=number

Explanation: An error occurred when the PFSCTL command was issued. The return codes describe the error.
System action: The filecache command terminates.
User response: Correct the error and reenter the command.

FOMF0334 I filename: file must be an existing regular file

Explanation: Only regular files that already exist can be cached.
System action: The file was not cached.
User response: Reenter the filecache command naming a regular file.

FOMF0401 I Maximum storage allocation is numberK

Explanation: Shows the maximum amount of storage that can be used by STREAMS message blocks.
FOMF0402I Current storage allocation is numberK
Explanation: Shows the current amount of storage that is in use for STREAMS message blocks.
System action:
User response:

FOMF0501I Async mount proceeding for file-system-name
Explanation: The mount command was accepted and will complete later.

FOMF0502I Mount complete for file-system-name
Explanation: The mount command completed without error.

FOMF0503I Error invoking service-name: return-code
Explanation: The named service call failed with the printed return code.

FOMF0504I service-name error: error-number reason-code
Explanation: The named service call failed with the printed return value and reason code. If diagnostic information is available for these error codes it will follow this message in English.

FOMF0505I number file systems could not be accessed
Explanation: Some file systems could not be accessed.
User response: Rerun the command with superuser authority.

Explanation: This is the syntax description for the mount command.

FOMF0507I mount -q [-v] [-d destsys] pathname...
Explanation: This is a continuation of message FOMF0506I

FOMF0508I Enter Y to proceed with unmount or N to end program
Explanation: -p was specified for prompt mode on the unmount command and a file system is about to be unmounted.

FOMF0509I Asynchronous mount failed for file-system
Explanation: Asynchronous mount processing failed within the specified time.

FOMF0510I Wait time expired. Async mount proceeding for file-system

FOMF0521I Usage: unmount [-R|f] [-vp] [-o unmount_option] name
Explanation: This is the syntax description for the unmount command.

FOMF0531I Usage: chmount [-DRrws] [-d sysname] [-a yesinolunmountlinclude, sysname,...exclude, sysname,...] path
Explanation: This is the syntax description for the chmount command.
FOM1076I ipcrm could not remove IPC member

Explanation: The requested message queue, semaphore set, or shared memory identifier could not be removed. Possible causes include:

- The IPC ID or key value specified on the command line is incorrect.
- The user ID does not have permission to remove the requested IPC member.

The ipcrm command got an error return code from shmtcil(), msgctl(), or semctl(). For more information, see the error descriptions for these functions in z/OS UNIX System Services Command Reference.

User response: Make sure that the correct IPC key or ID is entered on the command line. Issue ipcrm from a user ID that has authority to remove the requested message queue, semaphore set, or shared memory identifier.

FOMN

FOMN0001 usage: pgm [-d] [conf]

Explanation: inetd was invoked with an invalid option. inetd displays the correct usage.

System action: inetd terminates.

System programmer response: Invoke inetd with the correct syntax.

FOMN0003 Sigaction for SIGALRM failed: errdesc, rsn=reason_code

Explanation: inetd was not able to set up a signal handler for SIGALRM.

System action: inetd continues but may later terminate or not correctly initialize if TCP/IP is not already initialized or if TCP/IP is later restarted.

System programmer response: Contact IBM support.

FOMN0004 Sigaction for SIGHUP failed: errdesc, rsn=reason_code

Explanation: inetd was not able to set up a signal handler for SIGHUP.

System action: inetd continues but will terminate immediately if sent a SIGHUP signal rather than terminating cleanly.

System programmer response: Contact IBM support.

FOMN0005 Sigaction for SIGCHLD failed: errdesc, rsn=reason_code

Explanation: inetd was not able to set up a signal handler for SIGCHLD.

System action: inetd continues but will not monitor the termination of child processes. Child processes may become zombies and certain internal services will not process multiple requests.

System programmer response: Contact IBM support.

FOMN0006 Sigaction for SIGTERM failed: errdesc, rsn=reason_code

Explanation: inetd was not able to set up a signal handler for SIGTERM.

System action: inetd continues, but will terminate immediately if sent a SIGTERM signal rather than terminating cleanly.

System programmer response: Contact IBM support.

FOMN0007 Sigaction for SIGINT failed: errdesc, rsn=reason_code

Explanation: inetd was not able to set up a signal handler for SIGINT.

In the message text:

errdesc
Error description associated with the errno returned from sigaction().

reason_code
The reason code returned from sigaction().
reason_code
The reason code returned from sigaction().

System action: inetd continues, but will terminate immediately if sent a SIGINT signal rather than terminating cleanly.

System programmer response: Contact IBM support.

FOMN0008 select: errdesc, rsn=reason_code
Explanation: An error, other than EINTR, was returned on the select() call made by inetd against the sockets descriptors for the services listed in the configuration file.

In the message text:
errdesc
Error description associated with the errno returned from select().

reason_code
The reason code returned from select().

System action: If the errno returned is EMVSERR, and the reason code is JrTcpError, or the ERRNO is EIO, inetd assumes that TCP/IP terminated or a new stack has been started, issues message FOMN0009 and attempts to reinitialize the sockets. For other errors, inetd terminates.

System programmer response: If inetd terminates, contact IBM support.

FOMN0009 TCP/IP TERMINATED
Explanation: inetd has received an error indication which is interpreted as indicating that TCP/IP has terminated or that a new stack has been started. This message is preceded by one or more other messages indicating what error was received.

System action: inetd attempts to reinitialize the sockets for the services in the configuration file. If that fails, inetd attempts to reinitialize the sockets every three minutes.

System programmer response: Start TCP/IP, if appropriate.

FOMN0010 someone wants service
Explanation: This message is issued only if inetd is started with the debug (-d) option. A request has arrived on the port associated with service.

In the message text:

service
The name of a service specified in the configuration file.

System action: inetd will process that request, ultimately invoking the program specified for the service in the configuration file.

System programmer response: None.

FOMN0011 accept, ctrl sd
Explanation: This message is issued only if inetd is started with the debug (-d) option. An accept() has been issued for the socket associated with a new request. accept() has given a new socket descriptor, sd, allowing the socket associated with the service to continue to be listened to, while the new socket descriptor is used when invoking the service for the new request.

In the message text:
sd The socket descriptor returned by accept().

System action: If sd is not −1, inetd will continue process that request, ultimately invoking program specified for the service in the configuration file. If sd is −1, an error message may be issued to the syslog daemon and appropriate processing would be done.

System programmer response: None.

FOMN0012 accept, for service: errdesc, rsn=reason_code
Explanation: An error was returned on the accept() call made by inetd against the socket descriptor for the service.

In the message text:

service
The name of a service specified in the configuration file.

errdesc
Error description associated with the errno returned from accept().

reason_code
The reason code returned from accept().

System action: If the error returned is EBADF, EMVSERR with a reason of JrTcpError, or EIO, inetd assumes that TCP/IP terminated or a new stack has been started, issues message FOMN0009 and attempts to reinitialize the sockets. For EMFILE, inetd closes the socket associated with service and continues, supporting the remaining services. For other errors, inetd terminates.

System programmer response: If errdesc is associated with EMFILE, increase the maximum files per process (MAXFILEPROC in SYS1.PARMLIB member BPXPRMxx). Note that the maximum can also be changed dynamically with the SETOMVS or SET OMVS command, and can be specified on a per-user basis in RACF. If errdesc is associated with EBADF, EMVSERR or EIO, start TCP/IP, if appropriate. If inetd terminates, contact IBM support.
FOMN0014  *fork: errdesc, rsn=reason_code*

**Explanation:** An error was returned on the *fork()* issued to start a new daemon for a request.

In the message text:

- *errdesc:* Error description associated with the errno returned from *fork()*.
- *reason_code:* The reason code returned from *fork()*.

**System action:** inetd continues processing, but abandons the current request.

**System programmer response:** Contact IBM support.

FOMN0015  *getpwnam: username: No such user: errdesc, rsn=reason_code*

**Explanation:** An error was returned on the *getpwnam()* issued in preparation for setting the proper username for a service.

In the message text:

- *username:* A username specified in the configuration file.
- *errdesc:* Error description associated with the errno returned from *getpwnam()*.
- *reason_code:* The reason code returned from *getpwnam()*.

**System action:** inetd continues processing, but abandons the current request.

**System programmer response:** Verify that the username shown is correctly set up in your security product.

FOMN0017  *pid execl program*

**Explanation:** This message is issued only if inetd is started with the debug (-d) option. inetd has forked a child to process a request and is about to exec the program associated with the requested service.

In the message text:

- *pid:* The process id of the process. This is a child of inetd.
- *program:* The program about to be executed.

**System action:** inetd issues the exec. This is the last debug message associated with processing a request.

**System programmer response:** None.

FOMN0019  *execv server: errdesc, rsn=reason_code*

**Explanation:** The execv() of the server programs associated with a request has failed.

In the message text:

- *server:* Pathname of server program being executed.
- *errdesc:* Error description associated with the errno returned from execv().
- *reason_code:* The reason code returned from execv().

**System action:** inetd will abandon the request.

**System programmer response:** Ensure that the server program exists. If the name is wrong, correct the appropriate entry in the inetd configuration file.

FOMN0020  *pid reaped, status=status*

**Explanation:** This message is issued only if inetd is started with the debug (-d) option. A server, previously started by inetd, has ended and inetd has been notified by a SIGCHLD. inetd has issued a *waitpid()* to obtain the status.

In the message text:

- *pid:* The process id of the server which has ended.
- *status:* The status returned from *waitpid()*.

**System action:** inetd processing continues. Normal ending status is 100.

**System programmer response:** None.

FOMN0021  *service: exit status=status*

**Explanation:** A server, with the “wait” option in the inet configuration file, has ended and *waitpid()* returned a status of *status*.

In the message text:

- *service:* Status ending status returned from *waitpid()*.

**System action:** inetd continue processing continues.

**System programmer response:** None.

FOMN0023  *restored service, fd fd*

**Explanation:** This message is issued only if inetd is started with the debug (-d) option. A server, with the “wait” option in the inet configuration file, has ended and inetd is ready to for the next request for this service.

In the message text:
The name of a service specified in the configuration file.

**System action:** inetd continue processing continues.

**System programmer response:** None.

---

**FOMN0024 config_file: errdesc, rsn=reason_code**

**Explanation:** inetd could not open its configuration file.

In the message text:

- **config_file**: Filename specified when inetd was invoked. The default is /etc/inetd.conf.
- **errdesc**: Error description associated with the errno returned from fopen() .
- **reason_code**: The reason code returned from fopen().

**System action:** inetd terminates.

**System programmer response:** Ensure that config_file exists or specify the correct pathname.

---

**FOMN0026 service/protocol: unknown service.**

**Explanation:** The service was requested in the inetd configuration file with the protocol shown, getservbyname() returned an error.

In the message text:

- **service**: A service specified in the inetd configuration file.
- **protocol**: The protocol specified for the service in the inetd configuration file.
- **errdesc**: Error description associated with the errno returned to getservbyname() .
- **reason_code**: The reason code returned to getservbyname().

**System action:** inetd continues processing, but without the service/protocol shown.

**System programmer response:** Ensure that config_file exists or specify the correct pathname.

---

**FOMN0027 service/protocol: socket: errdesc, rsn=reason_code**

**Explanation:** The socket() failed for the service/protocol shown.

In the message text:

- **service**: A service specified in the inetd configuration file.
- **protocol**: The protocol specified for the service in the inetd configuration file.
- **errdesc**: Error description associated with the errno returned from socket() .
- **reason_code**: The reason code returned from socket().

**System action:** inetd continues processing, but without the service/protocol shown. If the errdesc shown is for errno EAGAIN, inetd will assume that TCP/IP is not started and will retry the socket() call again in three minutes.

**System programmer response:** If the errdesc is associated with EAGAIN, start TCP/IP. Otherwise contact IBM support.

---

**FOMN0028 service/protocol: setsockopt (SO_DEBUG): errdesc, rsn=reason_code**

**Explanation:** The setsockopt() with the SO_DEBUG option, failed for the service/protocol shown. Note: SO_DEBUG is set only if the debug (-d) option was specified when invoking inetd.

In the message text:

- **service**: A service specified in the inetd configuration file.
- **protocol**: The protocol specified for the service in the inetd configuration file.
- **errdesc**: Error description associated with the errno returned to setsockopt() .
- **reason_code**: The reason code returned from setsockopt().

**System action:** Contact IBM support.

---

**FOMN0029 service/protocol: setsockopt (SO_REUSEADDR): errdesc, rsn=reason_code**

**Explanation:** The setsockopt() with the SO_REUSEADDR option, failed for the service/protocol shown.

In the message text:

- **service**: A service specified in the inetd configuration file.
- **protocol**: The protocol specified for the service in the inetd configuration file.
- **errdesc**: Error description associated with the errno returned to setsockopt() .
- **reason_code**: The reason code returned from setsockopt().

**System action:** Contact IBM support.
errdesc
Error description associated with the errno returned from setsockopt().

reason_code
The reason code returned to setsockopt().

System action:  inetd continues processing.

System programmer response: Contact IBM support.

FOMN0030  service/protocol: bind: errdesc, rsn=reason_code
Explanation:  The bind() failed for the service/protocol shown.
In the message text:

errdesc
Error description associated with the errno returned from bind().

reason_code
The reason code returned to bind().

System action:  inetd continues processing. Unless the errno associated with errdesc is EADDRINUSE or EACCES, an attempt will be made in three minutes to initialize the socket.

System programmer response:  If the return_code is EACCES or EADDRINUSE, the port is probably in use by or reserved for another application. In particular, by default, both telnet and 3270 telnet use the same port. It may be necessary to select an alternate port in /etc/services.

FOMN0037  Out of memory
Explanation:  While processing the inetd configuration file, memory could not be obtained.

System action:  inetd terminates.

System programmer response:  Increase memory available and restart inetd.

FOMN0041  internal service service unknown
Explanation:  An entry in the inetd configuration file specified "internal" for the server program name, but service is not a supported internal service.
In the message text:

errdesc
Error description associated with the errno returned from strdup().

reason_code
The reason code returned to strdup().

System action:  inetd continues, but does not support service.

System programmer response:  Contact the service name or supply a valid program name.

FOMN0042  strdup: errdesc
Explanation:  While processing inetd configuration file entries, inetd got an error return from a strdup() function call.
In the message text:

errdesc
Error description associated with the errno returned from strdup().

reason_code
The reason code returned to strdup().

System action:  inetd continues, but will not support all services in the inetd configuration file.

System programmer response:  If errdesc is associated with ENOMEM, increase memory available and restart inetd.

FOMN0043  Unable to open pidfile: errdesc, rsn=reason_code
Explanation:  During initialization, inetd was not able to open its lock file.
In the message text:

errdesc
Error description associated with the errno returned from open().

reason_code
The reason code returned to open().

System action:  inetd terminates.

System programmer response:  Correct the condition preventing the open of the file and restart inetd.

FOMN0044  Unable to lock pidfile: errdesc, rsn=reason_code
Explanation:  During initialization, inetd was not able to lock its lock file.
In the message text:

errdesc
Error description associated with the errno returned from fcntl().

reason_code
The reason code returned to fcntl().
**System action:** inetd terminates.

**System programmer response:** If return_code is associated with EAGAIN, inetd is already active. Stop the other inetd if first if you wish to restart it. For other errors, contact IBM service.

---

**FOMN0048 bump_nofile: cannot extend file limit**

**Explanation:** The maximum number of file/socket descriptors has been exceeded.

**System action:** inetd continues, but will not support all requested services.

**System programmer response:** Increase the number of file descriptors allowed per process.

---

**FOMN0049 Unable to get time of day**

**Explanation:** The time built-in service was unable to get the system time.

**System action:** A time of binary zeros is returned to the client.

**System programmer response:** Contact IBM support.

---

**FOMN0051**

```
action: service proto=protocol,
        wait.max=wait.max,
        user.group=user.group builtin=builtin
        server= server
```

**Explanation:** This message is issued only if inetd is started with the debug (-d) option. It is issued during initialization and whenever the sockets are reinitialized. If action is "ADD", the service is being added to the list of supported services; if "FREE", the service is being dropped; if "REDO", the service is being reinitialized.

In the message text:

- `action`  
  - "ADD", "REDO" or "FREE".
- `service`  
  - The name of a service specified in the configuration file.
- `protocol`  
  - The protocol specified for the service in the inetd configuration file.
- `wait`  
  - Zero if "nowait" is specified on the configuration file entry for service.
- `max`  
  - The maximum number of requests for service per 60 second interval before inetd considers it to be a flood of requests.
- `user`  
  - The username server is to run under.

---

**FOMN0061 service/protocol server failing (looping), service terminated**

**Explanation:** The number of requests for the specified service/protocol during the last 60 seconds exceeded the maximum specified in the inetd configuration file.

In the message text:

- `service`  
  - The name of the service specified in the configuration file.
- `protocol`  
  - The protocol specified for the service in the inetd configuration file.

**System action:** The service is stopped. It will be reinitialized in three minutes.

**System programmer response:** None.

---

**FOMN0062 setsid: errdesc, rsn=reason_code**

**Explanation:** During initialization, inetd issued a setsid() to create a new session – separate from the invoking process. The setsid() failed.

In the message text:

- `errdesc`  
  - Error description associated with the errno returned from setsid()
- `reason_code`  
  - The reason code returned from setsid().

**System action:** inetd terminates.

**System programmer response:** Contact IBM support.

---

**FOMN0063 about to issue select numsock**

**Explanation:** This message is issued only if inetd is started with the debug (-d) option. inetd is about to issue a select() on the sockets for the services specified in the inetd configuration file. There is one socket for each service specified in the inetd configuration file.

In the message text:
numsock

The number of socks inetd is about to select on.

**System action:** inetd issues the `select()`. inetd will wait until someone requests one of the services, a signal is received, or an error occurs.

**System programmer response:** None.

FOMN0064 `select returned` `select_rv`

**Explanation:** This message is issued only if inetd is started with the debug (-d) option. `inetd's select()` has ended, returning `select_rv`. Normally, the return value will be either one, indicating that a request has arrived from a client, or -1 indicating an error - generally EINTR.

`select_rv`

The return value returned to the inetd `select()` on sockets.

**System action:** If a request has arrived, inetd processes the request. If the return value is -1, message FOMN0065 is issued.

**System programmer response:** None.

FOMN0065 `select` `erdesc`, `rsn=reason_code`

**Explanation:** This message is issued only if inetd is started with the debug (-d) option. `inetd's select()` has ended, returning `select_rv`. Normally, the return value will be either one, indicating that a request has arrived from a client, or -1 indicating an error - generally EINTR.

`select_rv`

The return value returned to the inetd `select()` on sockets.

**System action:** If an EINTR has been received, inetd re-issues the `select()`. For other errors, message FOMN0008 and possibly FOMN0009 are issued.

**System programmer response:** If FOMN0008 or FOMN0009 is issued, see the response for those messages.

FOMN0066 `pgmname terminating`

**Explanation:** inetd is about to terminate.

In the message text:

`pgmname`

`inetd's program name (inetd).`

**System action:** inetd terminates.

**System programmer response:** If this is an unexpected termination, use other messages to determine the cause. Contact IBM support, if needed.

FOMN0067 `service/protocol` can't set `gid` `gid`:

`erdesc`, `rsn=reason_code`

**Explanation:** This message should not occur because the groupid being set was just obtained from a `getpwnam()`.

In the message text:

`service`

A service specified in the inetd configuration file.

`protocol`

The protocol specified for the service in the inetd configuration file.

`gid` The groupid being set.

`erdesc`

Error description associated with the errno returned from `setgid()`.

`reason_code`

The reason code returned from `setgid()`.

**System action:** inetd terminates the current request, but continues process subsequent requests.

**System programmer response:** Contact IBM support.

FOMN0068 `service/protocol` can't set `uid` `uid`:

`erdesc`, `rsn=reason_code`

**Explanation:** In the message text:

`service`

A service specified in the inetd configuration file.

`protocol`

The protocol specified for the service in the inetd configuration file.

`uid` The userid being set.

`erdesc`

Error description associated with the errno returned from `setuid()`.

`reason_code`

The reason code returned from `setuid()`.

**System action:** inetd terminates the current request, but continues process subsequent requests.

**System programmer response:** Contact IBM support.

FOMN0069 `service/protocol` `setibmsockopt`

`SO_EioIfNewTP):` `erdesc`, `rsn=reason_code`

**Explanation:** The `setibmsockopt()` to request notification if a TCP/IP stack starts (when running with common inet) or stops (when running without common inet, or when the last stack ends with common inet) did not succeed.

In the message text:
service
A service specified in the inetd configuration file.

protocol
The protocol specified for the service in the inetd configuration file.

errdesc
Error description associated with the errno returned from setibmsockopt() .

reason_code
The reason code returned from setibmsockopt() .

System action:  inetd continues, but may not close and restart sockets when TCP/IP stacks are started or recycled.

System programmer response: Contact IBM support.

---

FOMN0070  config: syntax error

Explanation:  An entry in the configuration file is incomplete. Information has to be provided for all fields in a configuration file entry. See the “inet daemon” section in z/OS UNIX System Services Command Reference .

In the message text:

config
The name of the configuration file, inetd.conf by default.

System action: Initialization exits.

System programmer response: Edit the configuration file and provide the information for missing fields.

---

FOMN0071  service: malformed buffer size option 'text'

Explanation:  The syntax for a send or receive buffer size is incorrect. It must be a decimal number, optionally followed by a ‘k’ for kilobytes or ‘m’ for megabytes.

In the message text:

service
A service specified in the inetd configuration file.

text
The value specified on sndbuf= or rcvbuf=.

System action:  Initialization continues with other services specified in the configuration file.

System programmer response: Edit the configuration file and provide a valid buffer size.

---

FOMN0072  service: invalid buffer size 'text'

Explanation:  A negative buffer size was provided.

In the message text:

service
A service specified in the inetd configuration file.

text
The value specified on sndbuf= or rcvbuf=.

System action:  Initialization continues with other services specified in the configuration file.

System programmer response: Edit the configuration file and provide a positive buffer size.

---

FOMN0073  service: too many buffer sizes

Explanation:  More than two buffer sizes were provided for the service.

In the message text:

service
A service specified in the inetd configuration file.

text
The value specified on sndbuf= or rcvbuf=.

System action:  Initialization continues with other services specified in the configuration file.

System programmer response: Edit the configuration file and remove the redundant sndbuf or rcvbuf.

---

FOMN0074  service: invalid protocol specified

Explanation:  An invalid protocol was specified in a configuration file entry for service service.

In the message text:

service
A service specified in the inetd configuration file.

System action: Initialization continues with other services specified in the configuration file.

System programmer response: Edit the configuration file and correct the protocol.

---

FOMN0076  action: localaddr: service: proto=

protocol, sndbuf=sndbuf, rcvbuf=rcvbuf,
wait.max= wait.max,
user.group=user.group builtin=builtin
tserver= server

Explanation:  This message is issued only if inetd is started with the debug (-d) option. It is issued during initialization and whenever the sockets are reinitialized. If action is ”ADD”, the service is being added to the list of supported services; if ”FREE”, the service is being dropped; if ”REDO”, the service is being reinitialized.

In the message text:

action
”ADD”, ”REDO” or ”FREE”.

localaddr
The local IP address specified in the configuration file. An asterisk indicates INADDR_ANY (an “*” in the configuration file) was requested or defaulted.

service
The name of a service specified in the configuration file.
protocol
    The protocol specified for the service in the inetd configuration file.

sndbuf
    The size of the send buffer specified in the configuration file. Zero if not specified.

rcvbuf
    The size of the receive buffer specified in the configuration file. Zero if not specified.

wait
    Zero if "nowait" is specified on the configuration file entry for service.

max
    The maximum number of requests for service per 60 second interval before inetd considers it to be a flood of requests.

user
    The username server is to run under.

group
    The groupname server is to run under. If "(none)" or "ininet", inetd does not set the group name.

built-in
    Zero if the service is not handled directly by inetd.

server
    Pathname of server program to be executed for the service.

System action: inetd continues initialization or re-initialization.

System programmer response: None.

FOMN0077 localaddr service protocol: the address family is not supported by the kernel

Explanation: The protocol chosen resulted in an address family that is not supported.

In the message text:

localaddr
    The local IP address specified in the configuration file. An asterisk indicates INADDR_ANY (an "*" in the configuration file) was requested or defaulted.

service
    The name of a service specified in the configuration file.

protocol
    The protocol specified for the service in the inetd configuration file.

System action: Initialization continues with other services specified in the configuration file.

System programmer response: This can be the result of choosing a protocol of tcp6 or udp6 without kernel support for AF_UNIX6. Check the kernel initialization parameters, BPXPRMxx.

FOMN0078 someone wants service on localaddr

Explanation: This message is issued only if inetd is started with the debug (-d) option. A request has arrived on the port associated with service and the local IP address localaddr.

In the message text:

service
    The name of a service specified in the configuration file.

localaddr
    The local IP address specified in the configuration file. An asterisk indicates INADDR_ANY (an "*" in the configuration file) was requested or defaulted.

System action: inetd will process that request, ultimately invoking the program specified for the service in the configuration file.

System programmer response: None.

FOMN0079 pid execv program

Explanation: This message is issued only if inetd is started with the debug (-d) option. Inetd has forked a child to process a request and is about to exec the program associated with the requested service.

In the message text:

pid
    The process id of the process. This is a child of inetd.

program
    The program about to be executed.

System action: inetd issues the exec. This is the last debug message associated with processing a request.

System programmer response: None.

FOMN0080 localaddr service protocol getaddrinfo errdesc

Explanation: A getaddrinfo() issued by inetd initialization or restart processing failed. This can happen if localaddr is not a valid IP address, if TCP/IP or the resolver is not started or if service/protocol is not defined in /etc/services or the TCP/IP services dataset.

In the message text:

localaddr
    The local IP address specified in the configuration file. An asterisk indicates INADDR_ANY (an "*" in the configuration file) was requested or defaulted.

service
    The name of a service specified in the configuration file.

protocol
    The protocol specified for the service in the inetd configuration file.
**errdesc**

Error description associated with the return value returned from `getaddrinfo()`.

**System action:** inedt continues with the next configuration file entry. It will retry those that fail every three minutes.

**System programmer response:** Start TCP/IP and the resolver, if necessary, and check and correct the inedt configuration file, /etc/services file and/or the TCP/IP services data set. If the inedt configuration file is changed, it will be necessary to either stop and restart inedt, or send it a SIGHUP signal to pick up the changes.

---

**FOMN0081**  
**localaddr service protocol getaddrinfo resolved to multiple addresses**

**Explanation:** A `getaddrinfo()` issued by inedt initialization or restart processing returned more than one IP address. This will happen only if `localaddr` is a name, not an IP address, and that name has more than one IP address associated with it. For instance, if `localaddr` were somesite.ibm.com, and that resolved to three IP addresses.

In the message text:

**localaddr**  
The local IP address specified in the configuration file. An asterisk indicates INADDR_ANY (an "*" in the configuration file) was requested or defaulted.

**service**  
The name of a service specified in the configuration file.

**protocol**  
The protocol specified for the service in the inedt configuration file.

**System action:** inedt continues, but may not close and restart sockets when TCP/IP stacks are started or recycled.

**System programmer response:** Contact IBM support.

---

**FOMN0082**  
**localaddr service protocol setibmsockopt (SO_EioIfNewTP): errdesc, rsn=reason_code**

**Explanation:** The `setibmsockopt()` to request notification if a TCP/IP stack starts (when running with common inet) or stops (when running without common inet, or when the last stack ends with common inet) did not succeed.

In the message text:

**localaddr**  
The local IP address specified in the configuration file. An asterisk indicates INADDR_ANY (an "*" in the configuration file) was requested or defaulted.

**service**  
The name of a service specified in the configuration file.

**protocol**  
The protocol specified for the service in the inedt configuration file.

**errdesc**  
The error description associated with the errno returned from `setibmsockopt()`.

---

**FOMN0083**  
**localaddr service protocol setsockopt (SO_DEBUG): errdesc, rsn=reason_code**

**Explanation:** The `setsockopt()` with the SO_DEBUG option, failed for the `localaddr` and `service/protocol` shown. Note: SO_DEBUG is set only if the debug (-d) option was specified when invoking inedt.

In the message text:

**localaddr**  
The local IP address specified in the configuration file. An asterisk indicates INADDR_ANY (an "*" in the configuration file) was requested or defaulted.

**service**  
The name of a service specified in the configuration file.

**protocol**  
The protocol specified for the service in the inedt configuration file.

**errdesc**  
The error description associated with the errno returned from `setibmsockopt()`.

---

**FOMN0084**  
**localaddr service protocol setsockopt (SO_REUSEADDR): errdesc, rsn=reason_code**

**Explanation:** The `setsockopt()` with the SO_REUSEADDR option, failed for the `localaddr` and `service/protocol` shown.

In the message text:
localaddr
The local IP address specified in the configuration file. An asterisk indicates INADDR_ANY (an "*" in the configuration file) was requested or defaulted.

service
A service specified in the inetd configuration file.

protocol
The protocol specified for the service in the inetd configuration file.

errdesc
Error description associated with the errno returned from setsockopt().

reason_code
The reason code returned to setsockopt().

System action:  inetd continues processing.
System programmer response:  Contact IBM support.

FOMN0085  localaddr; service@protocol: setsockopt
(SO_SNDBUF n): errdesc,
rsn=reason_code

Explanation:  The setsockopt() with the SO_SNDBUF option, failed for the localaddr and service@protocol shown.
In the message text:

localaddr
The local IP address specified in the configuration file. An asterisk indicates INADDR_ANY (an "*" in the configuration file) was requested or defaulted.

service
A service specified in the inetd configuration file.

protocol
The protocol specified for the service in the inetd configuration file.

n
The send buffer size requested in the inetd configuration file.

errdesc
Error description associated with the errno returned from setsockopt().

reason_code
The reason code returned to setsockopt().

System action:  inetd continues processing with either a smaller buffer or the default.
System programmer response:  If the errdesc corresponds to an errno of ENOBUFS, reduce the requested buffer size or consult TCP/IP documentation on how to provide more space. Otherwise, contact IBM support.

FOMN0086  localaddr; service@protocol; setsockopt
(SO_RCVBUF n): errdesc,
rsn=reason_code

Explanation:  The setsockopt() with the SO_RCVBUF option, failed for the localaddr and service@protocol shown.
In the message text:

localaddr
The local IP address specified in the configuration file. An asterisk indicates INADDR_ANY (an "*" in the configuration file) was requested or defaulted.

service
A service specified in the inetd configuration file.

protocol
The protocol specified for the service in the inetd configuration file.

n
The send buffer size requested in the inetd configuration file.

errdesc
Error description associated with the errno returned from setsockopt().

reason_code
The reason code returned to setsockopt().

System action:  inetd continues processing with either a smaller buffer or the default.
System programmer response:  If the errdesc corresponds to an errno of ENOBUFS, reduce the requested buffer size or consult TCP/IP documentation on how to provide more space. Otherwise, contact IBM support.

FOMN0087  localaddr; service@protocol server failing
(looping), service terminated

Explanation:  The number of requests for the specified localaddr and service@protocol during the last 60 seconds exceeded the maximum specified in the inetd configuration file.
In the message text:

localaddr
The local IP address specified in the configuration file. An asterisk indicates INADDR_ANY (an "*" in the configuration file) was requested or defaulted.

service
The name of the service specified in the configuration file.

protocol
The protocol specified for the service in the inetd configuration file.

System action:  The service is stopped. It will be reinitialized in three minutes.
System programmer response:  None.
FOMN0088  localaddr: service/protocol: can’t set gid
gid: errdesc, rsn=reason_code

Explanation: This message should not occur because the
grouid being set was just obtained from a
getpwnam().
In the message text:
localaddr
The local IP address specified in the configuration
file. An asterisk indicates INADDR_ANY (an "*") in
the configuration file) was requested or defaulted.
service
A service specified in the inetd configuration file.
protocol
The protocol specified for the service in the inetd
configuration file.
gid
The groupid being set.
errdesc
Error description associated with the errno returned
from setgid().
reason_code
The reason code returned from setgid().
System action: inetd terminates the current request,
but continues to process subsequent requests.
System programmer response: Contact IBM support.

FOMN0089  localaddr: service/protocol: can’t set uid
uid: errdesc, rsn=reason_code

Explanation: This message should not occur because the
userid being set was just obtained from a
getpwnam().
In the message text:
localaddr
The local IP address specified in the configuration
file. An asterisk indicates INADDR_ANY (an "*") in
the configuration file) was requested or defaulted.
service
A service specified in the inetd configuration file.
protocol
The protocol specified for the service in the inetd
configuration file.
uid
The userid being set.
errdesc
Error description associated with the errno returned
from setuid().
reason_code
The reason code returned from setuid().
System action: inetd terminates the current request,
but continues to process subsequent requests.
System programmer response: Contact IBM support.

FOMN0090  localaddr: service/protocol: socket:
errdesc, rsn=reason_code

Explanation: The socket() failed for the localaddr and
service/protocol shown.
In the message text:
localaddr
The local IP address specified in the configuration
file. An asterisk indicates INADDR_ANY (an "*") in
the configuration file) was requested or defaulted.
service
A service specified in the inetd configuration file.
protocol
The protocol specified for the service in the inetd
configuration file.
errdesc
Error description associated with the errno returned
from socket().
reason_code
The reason code returned from socket().
System action: inetd continues processing, but
without the service/protocol shown. If the errdesc shown
is for errno EAGAIN, inetd will assume that TCP/IP is
not started and will retry the socket() call again in three
minutes.
System programmer response: If the errdesc is
associated with EAGAIN, start TCP/IP. Otherwise
contact IBM support.

FOMN0091  localaddr: service/protocol: bind: errdesc,
rsn=reason_code

Explanation: The bind() failed for the localaddr and
service/protocol shown.
In the message text:
localaddr
The local IP address specified in the configuration
file. An asterisk indicates INADDR_ANY (an "*") in
the configuration file) was requested or defaulted.
service
A service specified in the inetd configuration file.
protocol
The protocol specified for the service in the inetd
configuration file.
errdesc
Error description associated with the errno returned
from bind().
reason_code
The reason code returned to bind().
System action: inetd continues processing. Unless
the errno associated with errdesc is EADDRINUSE or
EACCES, an attempt will be made in three minutes to
initialize the socket.
System programmer response: If the return_code is EACCES or EADDRINUSE, the port is probably in use by or reserved for another application. In particular, by default, both telnet and 3270 telnet use the same port. It may be necessary to select an alternate port in /etc/services.

FOMR

FOMR0201 Only one of -k and -v allowed
Explanation: rlogind was invoked with invalid options. Only one of Kerberos(-k) or Vacuous(-v) options are allowed.
System action: rlogin request terminates.
System programmer response: Invoke rlogind with the correct syntax. See z/OS UNIX System Services Command Reference.

FOMR0202 Can't get peer name of remote host: errdesc
Explanation: getpeername() call failed.
errdesc Error description associated with the errno returned from getpeername().
System action: rlogin request terminates.

FOMR0203 Can't get peer name of remote host: errdesc
Explanation: getpeername() call failed.
errdesc Error description associated with the errno returned from getpeername().
reason_code The reason code returned from getpeername().
System action: rlogin request terminates.

FOMR0204 Setsockopt (SO_KEEPALIVE): errdesc
Explanation: The Setsockopt() with the SO_KEEPALIVE option failed.
errdesc Error description associated with the errno returned from setsockopt().
System action: rlogin session continues.

FOMR0206 Secondary port number error
Explanation: The secondary port number sent by the rlogin client using rcmd() call is in error. rlogind expects 0 (null byte) as the secondary port number, if it does not receive the null byte within 60 seconds from the rlogin client, it assumes something went wrong.
System action: rlogin request terminates.
System programmer response: Contact IBM support.

FOMR0207 Remote host requires Kerberos authentication
Explanation: Remote host requires Kerberos authentication, but the Vacuous(-v) option is specified.
System action: rlogin request terminates.
System programmer response: Verify that remote host is Kerberos authenticated.

FOMR0209 Connection from address on illegal port
Explanation: Connection from the specified IP address is not bound to a reserved port.
address Numerical IP address of the host.
System action: rlogin request terminates.
System programmer response: Verify that the client at the specified address is bound to a reserved port.

FOMR0210 Permission denied
Explanation: Permission for connection from specified IP address and port is denied.
System action: rlogin request terminates.
System programmer response: Verify that client at the specified address is bound to a reserved port.

FOMR0211 Connection received using IP options (ignored): options
Explanation: getsockopt() call was successful. The internet protocol options are:
options IP options string.
System action: rlogin session continues.
System programmer response: This is an informational message only.

FOMR0212 Setsockopt IP_OPTIONS NULL: errdesc
**Explanation:** Explanation: setsockopt() call with IP_OPTIONS failed.

**errdesc**
Error description associated with the errno returned from setsockopt().

**User response:** rlogin request terminates.

**System programmer response:** Consult TCP/IP documentation and z/OS XL C/C++ Run-Time Library Reference. Determine why setsockopt() call failed.

---

**FOMR0213** Host address mismatch.

**Explanation:** Login failed. The user is not authenticated.

**User response:** rlogin request terminates.

---

**FOMR0214** Setgid error errdesc rsn=reason_code

**Explanation:** setgid() call failed to set the required group ID.

**errdesc**
Error description associated with the errno returned from setgid().

**reason_code**
The reason code returned from setgid().

**System action:** rlogin request terminates.

**System programmer response:** For more information on the error description and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

---

**FOMR0215** Initgroups error errdesc rsn=reason_code

**Explanation:** initgroups() call failed.

**errdesc**
Error description associated with the errno returned from initgroups().

**reason_code**
The reason code returned from initgroups().

**System action:** rlogin request terminates.

**System programmer response:** For more information on the error description and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

---

**FOMR0216** Setuid error errdesc rsn=reason_code

**Explanation:** setuid() call failed to set the required user ID.

**errdesc**
Error description associated with the errno returned from setuid().

**reason_code**
The reason code returned from setuid().

**System action:** rlogin request terminates.

**System programmer response:** For more information on the error description and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

---

**FOMR0217** Execlp to rlogind2 error errdesc rsn=reason_code

**Explanation:** Exec function Failed to execute rlogind2.

**errdesc**
Error description associated with the errno returned from execlp().

**reason_code**
The reason code returned from execlp().

**System action:** rlogin request terminates.

**System programmer response:** For more information on the error description and reason code values displayed in this message, see z/OS XL C/C++ Run-Time Library Reference.

---

**FOMR0218** Rlogind: message_string: errdesc rsn=reason_code

**Explanation:** This message line contains the actual message string for rlogin daemon messages.

**message_string**
actual rlogin daemon message with error description and reason code.

**User response:** Look up the actual message and take appropriate action as described.

**System programmer response:** Refer to the actual message.

---

**FOMR0219** Rlogind: message_string

**Explanation:** This message line contains the actual message string for rlogin daemon messages.

**message_string**
actual rlogin daemon message.

**User response:** Look up the actual message and take appropriate action as described.
**System farmer response:** Refer to the actual message.

---

**FOMR0220 Remuser too long**

**Explanation:** The length of the remote user name supplied was invalid.

**System action:** rlogin request terminates.

**User response:** Provide the correct length remote user name when logging in. Refer to local rlogin client documentation.

---

**FOMR0221 Locuser too long**

**Explanation:** The length of the local user name supplied was invalid.

**System action:** rlogin request terminates.

**User response:** Provide the correct length local user name when logging in. Refer to local rlogin client documentation.

---

**FOMR0222 Terminal type too long**

**Explanation:** The length of the terminal type supplied was invalid.

**System action:** rlogin request terminates.

**User response:** Check the length of specified terminal type. Refer to local rlogin client documentation.

---

**FOMR0223 Usage: rlogind -adlmn -k | -v**

**Explanation:** This message shows the correct syntax for the rlogin daemon with Kerberos authentication defined. It is displayed when the syntax supplied is incorrect.

**User response:** Reenter the rlogind command using correct syntax. For a description of the rlogind options, see [z/OS UNIX System Services Command Reference](https://www.ibm.com/support/docview.ws?id=GU74487). 

---

**FOMR0224 Usage: rlogind -adlmn**

**Explanation:** This message shows the correct syntax for the rlogin daemon without Kerberos authentication defined. It is displayed when the syntax supplied is incorrect.

**User response:** Reenter the rlogind command using correct syntax. For a description of the rlogind options, see [z/OS UNIX System Services Command Reference](https://www.ibm.com/support/docview.ws?id=GU74487).

---

**FOMR0225 Login:**

**Explanation:** You are being prompted for your login name.

**User response:** Provide a login name to start the login process.

---

**FOMR0226 <username>'s Password:**

**Explanation:** You are being asked to supply a login password or password phrase.

**User response:** Supply the correct password or password phrase. A password is at most 8 bytes long and a password phrase is 9-100 bytes long. Any character string greater than 100 or zero in length is invalid. Check with your installation security product for additional restrictions.

---

**FOMR0227 Caller is not a member of BPX.DAEMON facility**

**Explanation:** The password verification routine failed. The user ID of the rlogin daemon invoker is not defined in the BPX.DAEMON facility.

**System action:** rlogin session continues.

**System programmer response:** Insufficient authorization of the rlogin daemon: The rlogin daemon uses the _passwd() call to authenticate the remote user. Programs that call _passwd() in a z/OS UNIX environment that is secured with BPX.DAEMON must be defined as program controlled to the security manager. Have your system administrator set the program controlled extended attribute for the rlogin daemon.

---

**FOMR0228 You entered an invalid login name or password**

**Explanation:** The login name or password or password phrase you supplied was invalid. You will be prompted again for the login name.

**User response:** Provide the correct name and password or password phrase. The terminal session will be closed after three invalid attempts.

---

**FOMR0229 Password expired**

**Explanation:** Your password or password phrase has expired.

**User response:** You will be prompted to change it.

---

**FOMR0230 Enter new password:**

**Explanation:** You are being prompted to enter a new password or password phrase because your old one expired.

**User response:** Enter new, valid password or password phrase.
FOMR0231  Re-enter new password:
Explanation: You are changing your password or password phrase, and must reenter the new one for verification.
User response: Reenter the password or password phrase.

FOMR0232  You entered an invalid password
Explanation: While changing your password or password phrase, you entered a new one that was not valid.
User response: Use a password or password phrase that is valid according to your site's requirements.

FOMR0233  New passwords do not match
Explanation: While changing your password or password phrase, the first and second new password or password phrase entries did not match.
User response: You will be prompted to change the password or password phrase again. You have up to three attempts.

FOMR0234  Password too long
Explanation: While changing your password or password phrase, you entered a new one that had more than 255 bytes.
User response: You will be prompted to enter a new password or password phrase again. You have up to three attempts. Use a password or password phrase that is valid according to your site's requirements.

FOMR0235  Read error: errdesc
Explanation: The read request for the banner file failed.
errdesc
  Error description associated with the errno returned from read().
System action: rlogin session continues.
System programmer response: Determine the cause of read failure based on error description. Consult z/OS XL C/C++ Run-Time Library Reference.

FOMR0236  Open error: errdesc
Explanation: The open request for the banner file failed.
errdesc
  Error description associated with the errno returned from open().
System action: rlogin session continues.

FOMR0237  Malloc error
Explanation: The malloc() call failed and storage was not obtained.
System action: Rlogin session continues.

FOMR0238  Password error, errdesc, reason_code
Explanation: This warning message is issued to syslog only if rlogind is started with the debug (-d) option. This message indicates that there was an error during password or password phrase authentication (__passwd() call).
errdesc
  Error description associated with the errno returned from __passwd().
reason_code
  The reason code returned from __passwd().
System action: rlogin session continues.
User response: Check the error description and reason code to identify the error.
System programmer response: z/OS XL C/C++ Run-Time Library Reference.

FOMR0302  usage: rlogind2 -kxadm
Explanation: This message shows the correct syntax for second part of the rlogin daemon. It is displayed when the syntax is incorrect.
k  Specifies that the Kerberos authentication support be enabled.
x  Specifies that the Encrypt support be enabled.
a  Specifies that the requester's Internet address be checked against the local gethostbyname() file. This option has no effect because the rlogin daemon never uses the .rhosts file for authentication.
d  Specifies that the debug option be enabled.
m  Specifies that the multiprocess support in the user address space be enabled.
User response: Reenter the rlogind2 command using the correct syntax.
FOMR0303  user name not specified
Explanation: User name was not passed as argument to second part of the rlogin daemon.
System action: rlogind2 terminates.
System programmer response: The z/OS UNIX version of the rlogin daemon passes the terminal type as its first argument, and the user name as the second argument. Make sure a user name is specified.

FOMR0304  term not specified
Explanation: Terminal type was not passed as argument to second part of the rlogin daemon.
System action: rlogind2 terminates.
System programmer response: The z/OS UNIX version of the rlogin daemon passes the terminal type as its first argument, and the user name as the second argument. Make sure a terminal type is specified.

FOMR0307  ROOT Kerberos login from %s.%s@%s on %s
Explanation: This is a Root Kerberos login authentication information message issued to syslog.
System action: rlogind2 continues processing.
System programmer response: None.

FOMR0309  select mask too small, increase FD_SETSIZE
Explanation: Number of open file descriptors is more than the defined FD_SETSIZE. This error message is issued to syslog.
System action: rlogind2 terminates.
System programmer response: Check the FD_SETSIZE and increase it accordingly. For more information, consult z/OS XL C/C++ Run-Time Library Reference.

FOMR0310  internal error (select mask too small)
Explanation: Number of open file descriptors is more than the defined FD_SETSIZE.
System action: rlogind2 terminates.
System programmer response: Check the FD_SETSIZE and increase it accordingly. For more information, consult z/OS XL C/C++ Run-Time Library Reference.

FOMR0311  select errdesc rsn=reason_code
Explanation: Select() call failed.
errdesc
   Error description associated with the errno returned from select().
reason_code
   The reason code returned from select().
System action: rlogind2 terminates.
System programmer response: Investigate why the select() request failed based on error description and reason code. For more information, consult z/OS XL C/C++ Run-Time Library Reference.

FOMR0312  EOF on socket
Explanation: Read() call on a socket returned an error or zero value indicating EOF. This message is issued to syslog only if rlogind2 is started with the debug (-d) option.
System action: rlogind2 continues processing.

FOMR0313  EOF on master tty
Explanation: Readv() call on a master TTY returned an error or zero value indicating EOF. This message is issued to syslog only if rlogind2 is started with the debug (-d) option.
System action: rlogind2 continues processing.

FOMR0314  child waitpid failed
Explanation: The waitpid() request by parent process to wait for the child process to terminate and save the exit status failed.
System action: rlogind2 continues processing.
System programmer response: Investigate why the waitpid() request failed. For more information, consult z/OS XL C/C++ Run-Time Library Reference.

FOMR0315  child exit status=status
Explanation: The exit status of the child process. This informational message is issued to syslog only if rlogind2 is started with the debug (-d) option.
System action: rlogind2 continues processing.
System programmer response: None.

FOMR0316  Fork utmp error errdesc rsn=reason_code
Explanation: Fork() call failed to create a new process to close the utmp file entry.
errdesc
Error description associated with the errno returned from fork().

reason_code
The reason code returned from fork().

**System action:** rlogind2 terminates.

**User response:**

**System programmer response:** Investigate why the fork() request failed. For more information, consult [z/OS XL C/C++ Run-Time Library Reference](#).

---

**FOMR0317 execl FSUMOCLO error**

**Explanation:** Execl() function failed to execute FSUMOCLO to close the utmp file entry.

**System action:** rlogind2 terminates.

**System programmer response:** Contact IBM support.

---

**FOMR0318 waitpid failed, status=0**

**Explanation:** The waitpid() request by parent process to wait for the child process to update and close the utmp file entry failed.

**System action:** rlogind2 continues processing.

**System programmer response:** Investigate why the waitpid() request failed. For more information, consult [z/OS XL C/C++ Run-Time Library Reference](#).

---

**FOMR0319 utmp error = status**

**Explanation:** There was an error in utmp file update and close processing. The process returned with non-zero value status.

**System action:** rlogind2 continues processing.

**User response:**

**System programmer response:** Check the returned status and investigate the error. For more information on the status value, consult [z/OS XL C/C++ Run-Time Library Reference](#).

---

**FOMR0320 Rlogind2: message_string: errdesc rsn= reason_code**

**Explanation:** This message line contains the actual message string for rlogind2 messages.

**message_string**
actual rlogind2 message.

**User response:** Look up the actual message and take appropriate action as described.

**System programmer response:** Refer to the actual message.

---

**FOMR0321 Rlogind2: message_string**

**Explanation:** This message line contains the actual message string for rlogind2 messages.

**message_string**
actual rlogind2 message.

**User response:** Look up the actual message and take appropriate action as described.

**System programmer response:** Refer to the actual message.

---

**FOMR0322 Out of ptys**

**Explanation:** Could not obtain a free pseudo-TTY. Out of pseudo-TTYs. All pseudo-TTYs may be in use.

**System action:** rlogind2 terminates.

**System programmer response:** Make sure that this master pseudo-TTY is defined correctly. The system looks for pseudo-TTYs starting at /dev/ptyp0000 and continues looking for pseudo-TTYs up through /dev/ptyp9999, in order. As soon as the system fails for one of these pseudo-TTYs, it looks no further.

---

**FOMR0323 open error on line errdesc rsn=reason_code**

**Explanation:** Open() call failed to open a slave pseudo terminal.

**line**
Pseudo-TTY name.

**errdesc**
Error description associated with the errno returned from open().

**reason_code**
The reason code returned from open().

**User response:**

**System programmer response:** Investigate why the open() request failed. For more information on open failure and error description, consult [z/OS XL C/C++ Run-Time Library Reference](#).

---

**FOMR0324 Can not translate current code page**

**Explanation:** Could not initialize the translation tables from ISO8859-1 to EBCDIC codeset name for current locale of the rlogin daemon.

**System action:** rlogind2 terminates.

**System programmer response:** Contact IBM support.
FOMR0325  Packet mode control byte=n
Explanation:  This informational message is issued to syslog only if rlogin daemon is started with the debug (-d) option. This message indicates the control byte of the pty packet mode.
System action:  rlogind2 continues processing.

FOMR0326  __tcsetattr errdesc rsn=reason_code
Explanation:  tcsetattr() call failed to set the extended attributes to master terminal TTY.
errdesc  Error description associated with the errno returned from tcsetattr().
reason_code  The reason code returned from tcsetattr().
System action:  rlogind2 terminates.
System programmer response:  Investigate why the tcsetattr() request failed. For more information, consult z/OS XL C/C++ Run-Time Library Reference

FOMR0327  __tcsetcp errdesc rsn=reason_code
Explanation:  __tcsetcp() call failed to set the terminal code page information for master terminal TTY.
errdesc  Error description associated with the errno returned from __tcsetcp().
reason_code  The reason code returned from __tcsetcp().
System action:  rlogind2 terminates.
System programmer response:  Investigate why the __tcsetcp() request failed. For more information, consult z/OS XL C/C++ Run-Time Library Reference

FOMR0328  __tcgetcp errdesc rsn=reason_code
Explanation:  __tcgetcp() call failed to get the terminal code page information for master terminal TTY.
errdesc  Error description associated with the errno returned from __tcgetcp().
reason_code  The reason code returned from __tcgetcp().
System action:  rlogind2 terminates.
System programmer response:  Investigate why the __tcgetcp() request failed. For more information, consult z/OS XL C/C++ Run-Time Library Reference

FOMR0329  Error using code pages toname and fromname - returning to default code pages
Explanation:  Current code pages are not working correctly. Returning to default code pages.

toname  EBCDIC code page.
fromname  ASCII code page.
System action:  rlogind2 continues processing.
System programmer response:  Investigate why specified code pages are not working correctly.

FOMR0330  Change to binary mode
Explanation:  The binary flag mode has been set to the TTY. This informational message is issued to syslog only if rlogin daemon is started with the debug (-d) option.
System action:  rlogind2 continues processing.

FOMR0331  Change to SingleByte pages toname, fromname
Explanation:  Single-byte conversion table is being initialized to handle new code pages. This informational message is issued to syslog only if rlogin daemon is started with the debug (-d) option.

toname  EBCDIC code page.
fromname  ASCII code page.
System action:  rlogind2 continues processing.

FOMR0332  Change to MultiByte pages toname, fromname
Explanation:  Multibyte conversion table is being initialized to handle new code pages. This informational message is issued to syslog only if rlogin daemon is started with the debug (-d) option.

toname  EBCDIC code page.
fromname  ASCII code page.
System action:  rlogind2 continues processing.

FOMR0333  Unexpected input string
Explanation:  iconv() call to translate the multi byte ASCII character to EBCDIC returned EINVAL error value. The input character is incomplete or invalid.
System action:  rlogind2 terminates.
**System programmer response:** Investigate why input character is incomplete or invalid. For more information, consult z/OS XL C/C++ Run-Time Library Reference.

FOMR0334  Unexpected iconv error

**Explanation:** iconv() call to translate the multi byte ASCII character to EBCDIC failed.

**System action:** rlogin2 terminates.

**System programmer response:** Investigate why the iconv() code conversion request failed. For more information, consult z/OS XL C/C++ Run-Time Library Reference.

FOMR0239  Unsupported address family: n

**Explanation:** Unsupported address family is specified.

n  Specified address family.

**System action:** rlogin request terminates.

**System programmer response:** Specify the correct address family. Supported address families are AF_INET and AF_INET6 (z/OS 1.4 or higher).

FOMR0240  Getnameinfo on "from" address failed: errdesc

**Explanation:** getnameinfo() call failed on from address.

errdesc  Error description associated with the error value returned from getnameinfo().

**System action:** rlogin request terminates.

**System programmer response:** Consult TCP/IP documentation and z/OS XL C/C++ Run-Time Library Reference. Determine why getnameinfo() call failed based on error description.

FOMR0241  Couldn't look up address for hostname: errdesc

**Explanation:** getaddrinfo() call failed for address lookup for the specified hostname.

errdesc  Error description associated with the error value returned from getaddrinfo().

**System action:** rlogin session continues.

**System programmer response:** Consult TCP/IP documentation and z/OS XL C/C++ Run-Time Library Reference. Determine why getaddrinfo() call failed based on error description.
FSUC0501  Load average unavailable
Explanation:  The load average editing command could not be completed.
System action:  Command ends.

FSUC0606  No matching command
Explanation:  Command completion was not successful because the command does not exist.
System action:  Command ends.
User response:  Respecify statement with a valid command.

FSUC0607  Ambiguous command
Explanation:  Command completion as not successful because more than one command matched the specifications.
System action:  Command ends.
User response:  Reissue statement with a different command.

FSUC0721  program-name:  No entry for terminal type string
Explanation:  There was no entry for the specified terminal type in the terminfo database.
System action:  Processing continues.

FSUC0722  program-name:  using dumb terminal settings.
Explanation:  No terminfo could be found, so a dumb terminal is being used.
System action:  Processing continues.

FSUC0801  Unknown switch
Explanation:  An incorrect option was passed to the setty command.  Valid options are: a, q, d, x.
System action:  Command ends.
User response:  Correct the syntax, and reissue statement.

FSUC0802  Invalid argument
Explanation:  An incorrect argument was passed to the setty command.
System action:  Command ends.
User response:  Check the syntax, and reissue command.

FSUC0901  AddXkey:  Null extended-key not allowed.
Explanation:  A null extended-key was issued on the bindkey command.
System action:  Command ends.

FSUC0902  AddXkey:  sequence-lead-in command not allowed
Explanation:  A sequence-lead-in command cannot be bound to multicharacter key binding.
System action:  Command ends.

FSUC0903  DeleteXkey:  Null extended-key not allowed.
Explanation:  A null extended-key was issued on the bindkey -r command.
System action:  Command ends.

FSUC0904  Unbound extended key key
Explanation:  The specified key on the bindkey command was not bound to anything.
System action:  Command ends.
User response:  Respecify command with the proper syntax.

FSUC0905  Some extended keys too long for internal print buffer
Explanation:  The extended key was longer than the 95 character buffer limit.
System action:  Command ends.

FSUC0907  no input
Explanation:  There is no specified function associated with this key.
System action:  Command ends.

FSUC0908  Something must follow:  string
Explanation:  The syntax of your bindkey command is not correct.
System action:  Command ends.
User response:  Check syntax, and reissue statement.
FSUC0909  Octal constant does not fit in a char.
Explanation:  An octal constant was entered which is greater than 400.
System action:  Command ends.
User response:  Respecify command with an octal value less than 400.

FSUC1101  Warning: no access to tty (string).
Explanation:  You do not have access to tty job control. The process specified does not belong to a process in the same session with the tty.
User response:  Contact the system programmer.
System programmer response:  setpgid() or tcsetpgrp() system call failed. These calls succeed only if processed by a super-user, or if id is the real or effective user(group) id of the calling process.

FSUC1102  Thus no job control in this shell.
Explanation:  You do not have access to tty job control. The process specified does not belong to a process in the same session with the tty.
User response:  Contact the system programmer.
System programmer response:  setpgid() or tcsetpgrp() system call failed. These calls succeed only if processed by a super-user, or if id is the real or effective user(group) id of the calling process.

FSUC1305  string: shell built-in command.
Explanation:  The command specified is a shell built-in command. It is a registered command but not found in alias.

FSUC1306  string: Command not found.
Explanation:  The command specified was not found. It is not a registered command nor an alias.
User response:  Check the syntax on the command issued, including options and arguments, and try again.

FSUC1307  where: / in command makes no sense.
Explanation:  The command specified is not a valid command. Cannot process / in command.
User response:  Check the syntax on the command issued, including options and arguments, and try again.

FSUC1308  string is aliased to.
Explanation:  If the command specified is an alias, then display its alias path.

FSUC1309  string is a shell built-in.
Explanation:  The command specified is a shell built-in command.

FSUC1501  string: string: Can’t string string limit.
Explanation:  Unable to set/remove file size limits. Write to stderr file.

FSUC1607  Bad seek type number.
Explanation:  Bad seek type. Valid seek types are 0, 1, and 2.
User response:  Respecify command with valid seek type.

FSUC1701  BUG: waiting for background job!.
Explanation:  Now keep pausing as long as we are not interrupted (SIGINT), and the target process, or any of its friends, are still running.
System programmer response:  Processing continues.
User response:  Please wait for process to return.

FSUC1703  BUG: process flushed twice.
Explanation:  Process id is 0.
System programmer response:  Process is ended.

FSUC1708  BUG: status=status
Explanation:  Unrecognized process status message received.

FSUC1709  (core dumped).
Explanation:  Process ends with core dump.

FSUC1712  string: Already suspended.
Explanation:  Current shell is suspended/stopped.

FSUC1714  job: Cannot superkill a process group
Explanation:  A "kill -K" command specified either a process id (pid) of 0, a negative value, or a shell job, indicating that the superkill should be sent to a process group. This is not supported for superkill.
System action:  Processing of the job or pid job ends. If there are more arguments, the command continues.
User response:  Issue the "kill -K" command only for positive pid values which have not terminated from a prior "kill -KILL".
**FSUC1715**  
*pid: Cannot superkill pid -1 (all processes)*

**Explanation:** A "kill -K" command specified a process id (pid) of -1. Pid -1 indicates that the superkill should be sent to all processes for which you are authorized. This is not supported for superkill.

**System action:** Processing of pid -1 ends. If there are more arguments, the command continues.

**User response:** Issue the "kill -K" command only for positive pid values which have not terminated from a prior "kill -KILL".

**FSUC1716**  
*pid: Cannot superkill without prior KILL signal to process*

**Explanation:** A "kill -K" command specified a process id (pid) that had not been sent a KILL signal at least 3 seconds earlier.

**System action:** Processing of pid ends. If there are more arguments, the command continues.

**User response:** Issue the "kill -KILL" command for the pid. Wait 3 seconds. If the process does not terminate, then issue the "kill -K" command for the pid.

**FSUC1717**  
*pid: __superkill: reason code = reason_code; errno string*

**Explanation:** A "kill -K" command specified a process id (pid) that had not been sent a KILL signal at least 3 seconds earlier. The errno string is displayed with this message.

**System action:** Processing of pid ends. If there are more arguments, the command continues.

**User response:** Issue the "kill -KILL" command for the pid. Wait 3 seconds. If the process does not terminate, then issue the "kill -K" command for the pid.

**FSUC1801**  
*Warning: ridiculously long PATH truncated.*

**Explanation:** Incorrect PATH specified. Exported path exceeds maximum buffer size.

**FSUC1802**  
*Warning: unknown multibyte display; using default(euc(JP)).*

**Explanation:** Incorrect multibyte display type. Using default multibyte display (euc(JP)).

**FSUC1803**  
*Warning: unknown multibyte code number; multibyte disabled.*

**Explanation:** Incorrect multibyte code received. Multibyte disabled.

**FSUC1804**  
*Warning: Invalid multibyte table length (number); multibyte disabled.*

**Explanation:** Incorrect multibyte table length. Multibyte disabled.

**FSUC1805**  
*Warning: bad multibyte code at offset +number; multibyte disabled.*

**Explanation:** Bad multibyte code at offset. Multibyte disabled.

**FSUC2001**  
*Invalid key name string.*

**Explanation:** The specified key name is not valid.

**FSUC2002**  
*Bad key name: string.*

**Explanation:** The specified key name is not valid.

**FSUC2003**  
*Bad command name: string.*

**Explanation:** The command name is not valid.

**FSUC2004**  
*Bad key spec string.*

**Explanation:** Bad key specified.

**FSUC2005**  
*Null string specification.*

**Explanation:** String is empty.

**FSUC2203**  
*Faulty alias precmd removed.*

**Explanation:** You cannot alias precmd.

**FSUC2204**  
*Faulty alias cwdcmd removed.*

**Explanation:** You cannot alias cwdcmd.

**FSUC2205**  
*Faulty alias beepcmd removed.*

**Explanation:** You cannot alias beepcmd.

**FSUC2206**  
*Faulty alias periodic removed.*

**Explanation:** You cannot alias periodic.

**FSUC2323**  
*getwd: Cannot stat / (string).*

**Explanation:** Unable to get status of / directory. Write to stderror file.

**FSUC2324**  
*getwd: Cannot stat . (string).*

**Explanation:** Unable to get status of . directory. Write to stderror file.
FSUC2325  getwd: Cannot stat directory string (string).
Explanation: Unable to get status of working directory. Write to stderr file.

FSUC2326  getwd: Cannot open directory string (string).
Explanation: Unable to open working directory. Write to stderr file.

FSUC2327  getwd: Cannot find . in .. (string).
Explanation: Unable to find . in .. directory. Write to stderr file.

FSUC2333  Unexpected __writedown query return value number
Explanation: A __writedown query operation returned a value that is not recognized by the writedown command.
User response: Contact your system programmer.
System programmer response: Follow local procedures for reporting problems to IBM.

FSUC2502  error: bsd_signal(number) signal out of range.
Explanation: Bsd signal is out of range.
User response: Contact your system programmer.
System programmer response: Determine why bsd_signal was out of range.

FSUC2503  error: bsd_signal(number) - sigaction failed, errno number.
Explanation: Bsd signal failed.
User response: Contact your system programmer.
System programmer response: Determine why bsd signal failed.

FSUC2601  cannot stat string. Please unset watch.
Explanation: Unable to get temporary file status.
User response: Verify that temporary file exists and _PATH_UTMP temporary file environmental variable has been set.

FSUC2602  string cannot be opened. Please unset watch.
Explanation: Unable to open temporary file.
User response: Verify that temporary file exists and _PATH_UTMP temporary file environmental variable has been set.

FSUC2607  name has terminal date from host.
Explanation: Display current element data with host field.

FSUC3004  string: Internal match error.
Explanation: An internal editing command error has occurred.
System action: Command ends.
User response: Contact your system administrator.
System programmer response: Follow local procedures for reporting a problem to IBM.

FSUC3009  tcsh internal error: I don’t know what I’m looking for!
Explanation: An internal error has occurred for a completion command.
System action: Command ends.
User response: Contact your system programmer.
System programmer response: Follow local procedures for reporting a problem to IBM.

FSUC3110  not a directory
Explanation: Completion cannot process successfully because the specified name is not a valid directory.
System action: Command ends.
User response: Reissue the command with a valid directory name.

FSUC3111  not found
Explanation: Completion cannot process successfully because the specified file/directory name cannot be found.
System action: Command ends.
User response: Reissue the command with a valid file/directory name.

FSUC3112  unreadable
Explanation: Completion cannot process successfully because the specified file/directory name cannot be read.
System action: Command ends.
User response: Change permissions of file/directory, or reissue the command with a different, readable file/directory.
FSUC5001  Syntax Error
Explanation:  A command or construct was issued with incorrect syntax.
System action:  Command ends.
User response:  Check the syntax on the command or construct and reissue.

FSUC5002  string is not allowed
Explanation:  You are not allowed to have a < or a numerical digit after a $?, $# or $%.
System action:  Command ends.
User response:  Correct the syntax and reissue the command.

FSUC5003  Word too long
Explanation:  Word used in $ expansion, command substitution or history substitution is more than the buffer can hold.
System action:  Command ends.
User response:  Try to split the expansion to use multiple smaller expansions.

FSUC5004  $< line too long
Explanation:  The input value for $< is longer than the buffer allows.
System action:  Command ends.
User response:  Try to shorten the input and/or split input between multiple reads.

FSUC5005  No file for $0
Explanation:  $0 is the name for the current shell input file. If unknown, this var is unset, and any reference to it is an error.
System action:  Command ends.
User response:  Set $0 and reissue command.

FSUC5006  Incomplete [] modifier
Explanation:  A newline or EOF indicator was reached before the ending ].
System action:  Command ends.
User response:  Respecify command with correct syntax.

FSUC5007  $ expansion must end before ]
Explanation:  The $ expansion was incomplete before reaching the ] character.
System action:  Command ends.
User response:  Respecify command, placing the ] character after variable expansion.

FSUC5008  Bad : modifier in $ (character)
Explanation:  Valid modifiers are limited to luhtpxes.
System action:  Command ends.
User response:  Respecify command with valid modifiers.

FSUC5009  Subscript error
Explanation:  The closing ] on the array subscript was not found after a numerical value.
System action:  Command ends.
User response:  Correct the syntax and reissue the command.

FSUC5010  Badly formed number
Explanation:  Statement indicated requires numerical value.
System action:  Command ends.
User response:  Check the syntax and reissue the statement.

FSUC5011  No more words
Explanation:  argv or variable specified on shift command is either not set or has less than one word as value.
System action:  Command ends.
User response:  Set the shift argument to have enough words, or stop using shift command when all words are shifted.

FSUC5012  Missing file name
Explanation:  Command specified is expecting a filename to be passed as an argument.
System action:  Command ends.
User response:  Respecify the command with the appropriate filename.
### FSUC5013  Internal glob error

**Explanation:** An internal glob error has occurred.

**System action:** Command ends.

**User response:** Contact the system programmer or try and reissue the statement without glob characters.

**System programmer response:** Follow your local procedures for reporting a problem to IBM.

### FSUC5014  Command not found

**Explanation:** The command specified was not found in your search path.

**System action:** Command ends.

**User response:** Check if the command exists, change search path as necessary.

### FSUC5015  Too few arguments

**Explanation:** Function specified requires more arguments than you have listed.

**System action:** Command ends.

**User response:** Check command syntax and reissue the statement.

### FSUC5016  Too many arguments

**Explanation:** Function specified requires fewer arguments than you have listed.

**System action:** Command ends.

**User response:** Check the command syntax and reissue the statement.

### FSUC5017  Too dangerous to alias that

**Explanation:** It is not valid to alias the commands `alias` and `unalias`.

**System action:** Command ends.

**User response:** Do not try and alias these commands.

### FSUC5018  Empty if

**Explanation:** The value of the `if` command cannot be NULL.

**System action:** Command ends.

**User response:** Issue `if` statement with non-null expression.

### FSUC5019  Improper then

**Explanation:** The `then` statement must be followed by a command.

**System action:** Command ends.

**User response:** Reissue `then` followed by a valid command.

### FSUC5020  Words not parenthesized

**Explanation:** The wordlist within the `foreach` statement must be enclosed in parenthesis.

**System action:** Command ends.

**User response:** Enclose the wordlist in parenthesis and reissue the statement.

### FSUC5021  string not found

**Explanation:** Either a `then`, `endif`, `endsw`, end or a case label statement was not found.

**System action:** Command ends.

**User response:** Check the syntax of conditional statement, adding appropriate tag.

### FSUC5022  Improper mask

**Explanation:** Masking values for the `umask` command must be between 0 and 777.

**System action:** Command ends.

**User response:** Reissue the `umask` command with the appropriate masking values.

### FSUC5023  No such limit

**Explanation:** The resource value specified for the `limit` command does not exist. Controllable resources are: `cputime`, `filesize`, `datasize`, `stacksize`, `coredumpsize`, and `memoryuse`.

**System action:** Command ends.

**User response:** Reissue `limit` command with one of the resources listed above.

### FSUC5024  Argument too large

**Explanation:** You have exceeded the maximum or minimum value defined on your system.

**System action:** Command ends.

**User response:** If possible, respecify argument within appropriate boundaries.

### FSUC5025  Improper or unknown scale factor

**Explanation:** The scale factor for the maximum use field of the `limit` command is not valid. Valid values are either k for kilobytes, or m for megabytes.

**System action:** Command ends.

**User response:** Reissue `limit` command with an appropriate scale factor.
FSUC5026  Undefined variable
Explanation: Variable used in specified command is undefined.
System action: Command ends.
User response: Define variable with the set command before using.

FSUC5027  Directory stack not that deep
Explanation: The numerical value following the = is greater than the size of the directory stack.
System action: Command ends.
User response: You can find out how deep the directory stack is with the dirs -v command. Reissue =n where n is no greater than the largest stack value.

FSUC5028  Bad signal number
Explanation: The user specified an unknown signal number on the kill command.
System action: Command ends.
User response: Valid signal names and numbers are listed in z/OS UNIX System Services Command Reference under the kill command.

FSUC5029  Unknown signal; kill -l lists signals
Explanation: The user specified an unknown signal on the kill command.
System action: Command ends.
User response: The -l option will list valid signal names. Reissue the command with a valid signal name.

FSUC5030  Variable name must begin with a letter
Explanation: The variable being initialized after the set command must begin with a letter.
System action: Command ends.
User response: Change name of variable so that a character occupies the first position.

FSUC5031  Variable name too long
Explanation: The variable name after the set command cannot exceed 30 characters in length.
System action: Command ends.
User response: Shorten variable name to less than 30 characters.

FSUC5032  Variable name must contain alphanumeric characters
Explanation: Variable name after the set command is expected to consist only of alphabetic characters, or a combination of alphabetic and numeric characters where the first letter in the variable name is alphabetic.
System action: Command ends.
User response: Change variable name to meet syntax guidelines.

FSUC5033  No job control in this shell
Explanation: This shell does not have job control capabilities.
System action: Command ends.
User response: Do not issue any job control commands.

FSUC5034  Expression Syntax
Explanation: Syntax of specified command is not correct.
System action: Command ends.
User response: Check syntax and respecify command.

FSUC5035  No home directory
Explanation: The $home variable is not set, therefore you cannot issue the cd or chdir command without any arguments.
System action: Command ends.
User response: Either set $home or specify a directory on the cd or chdir command.

FSUC5036  Can't change to home directory
Explanation: The $home variable is not set so using the '~' character to reference your home directory is not valid.
System action: Command ends.
User response: Either set $home or explicitly specify directory.

FSUC5037  Invalid null command.
Explanation: An unexpected NULL string was encountered.
System action: Command ends.
User response: Check syntax and reissue command.
FSUC5038  Assignment missing expression
Explanation: The @ name=expr command is missing the expr argument.
System action: Command ends.
User response: Reissue statement specifying expr argument.

FSUC5039  Unknown operator
Explanation: The operator used in the @ command is not valid.
System action: Command ends.
User response: Check syntax and reissue statement.

FSUC5040  Ambiguous
Explanation: Specified function is ambiguous.
System action: Command ends.
User response: Check syntax, and reissue the statement.

FSUC5041  filename: File exists
Explanation: The specified file already exists and cannot be appended to or overwritten.
System action: Command ends.
User response: Use a different filename, or rename existing file.

FSUC5042  Argument for -c ends in backslash
Explanation: The -c tcsh option cannot be used with a script file that ends in a backslash.
System action: Command ends.
User response: Change name of script so that it does not end in a backslash.

FSUC5043  Interrupted
Explanation: A SIGINT has been received. Specified process has been interrupted.
System action: Specified process has been interrupted.
User response: Check syntax of statement. Make any necessary changes and reissue.

FSUC5044  Subscript out of range
Explanation: User tried to access a value outside the scope of the array.
System action: Command ends.
User response: The $#variable command will tell you how many elements are in the array. Your subscript

FSUC5045  Line overflow
Explanation: A line within the here-document notation exceeded the 1020 character limit.
System action: Command ends.
User response: Use multiple here-documents, so that you can split the input such that it fits within this character limit.

FSUC5046  No such job
Explanation: There is no job with the corresponding name/number.
System action: Command ends.
User response: The jobs -l command will list all current jobs, along with their corresponding process id’s. Any job specified must be listed in the jobs -l output.

FSUC5047  Can’t from terminal
Explanation: The onintr command cannot be issued from a terminal. The hup and nohup commands cannot be issued from a terminal without a corresponding command.
System action: Command ends.
User response: The onintr command can be issued from a script. The hup and nohup commands must be issued with a corresponding command, or can be issued without commands from a script.

FSUC5048  Not in while/foreach
Explanation: A break, end, or continue statement can only be issued from inside a while or foreach loop.
System action: Command ends.
User response: Check syntax of statement. Make any necessary changes and reissue.

FSUC5049  No more processes
Explanation: There are insufficient resources to create another process, or you have already reached the maximum number of processes you can run.
System action: Command ends.
User response: Contact your system administrator.
FSUC5050 No match
Explanation: The wildcard expansion issued in your statement does not expand to a valid argument.
System action: Command ends.
User response: Be more explicit when issuing this statement.

FSUC5051 Missing character
Explanation: Statement missing either -, }, ], or ).
System action: Command ends.
User response: Check syntax and respecify.

FSUC5052 Unmatched character
Explanation: A closing ' or " is missing from your statement.
User response: Check syntax and respecify.

FSUC5053 Out of memory
Explanation: There were not enough system resources to allocate the required memory.
System action: Command ends.
User response: Free up more system resources and try again, or contact your system administrator for additional help.

FSUC5054 Can't make pipe
Explanation: Pipe command cannot be processed.
System action: Command ends.
User response: Check syntax and reissue statement.

FSUC5055 function: return-code
Explanation: A system error has occurred for the specified function.
System action: Command ends.
User response: A correlating return code has been given. Contact your system administrator.
System programmer response: Follow local procedures for reporting a problem to IBM.

FSUC5056 Arguments should be jobs or process id's
Explanation: Arguments to the specified command need to be either jobs or process id's. These can be found using the jobs -l builtin command.
System action: Command ends.
User response: Respecify command with arguments that are found in the jobs -l command.

FSUC5059 No current job
Explanation: Specified command cannot process because there is no current job.
System action: Command ends.

FSUC5060 No previous job
Explanation: Specified command cannot process because there is no previous job.
System action: Command ends.

FSUC5061 No job matches pattern
Explanation: There is no job that matches string in the "%?string" reference.
System action: Command ends.
User response: You can get a list of all current jobs with the jobs command. Use a job from within that list.

FSUC5062 Fork nesting > number; maybe '...' loop
Explanation: There is a maximum nesting limit of 16 processes. This is done to avoid forking loops.
System action: Command ends.
User response: Try to minimize the use of subshells and nested calls to builtin functions.

FSUC5063 No job control in subshells
Explanation: Job commands can only be issued from the parent shell.
System action: Command ends.
User response: Return to parent shell and reissue command.

FSUC5065 string There are suspended jobs
Explanation: There are suspended jobs in the shell that prevent you from exiting.
System action: Command ends, shell still remains active.
User response: To find out what jobs are suspended, issue the jobs command and either resume or kill these jobs.

FSUC5067 No other directory
Explanation: The pushd command with no arguments will exchange the top two elements in the stack. In this case, it cannot process because there is only one directory entry in the stack.
System action: Command ends.
User response: Cannot issue command until there is more than one entry in the stack.

FSUC5068 Directory stack empty
Explanation: The directory stack is empty, so the popd command can neither print values, nor remove directories from it.
System action: Command ends.
User response: Cannot issue command until there are entries in the stack.

FSUC5069 Bad directory
Explanation: The directory specified on the popd command is not valid.
System action: Command ends.
User response: Respecify with a valid entry from the stack. This can be found using the dirs builtin command.

FSUC5071 No operand for -h flag
Explanation: When using the source -h command, no operand was given.
System action: Command ends.
User response: Reissue with an argument after -h.

FSUC5072 Not a login shell
Explanation: The login and logout commands both terminate the login shell. These commands cannot process if they are issued from a non-login shell.
System action: Command ends, shell still remains active.
User response: To exit, issue the exit command.

FSUC5073 Division by 0
Explanation: Divide by 0 is not allowed.
System action: Command ends.
User response: Respecify equation so that a divide by 0 does not occur.

FSUC5074 Mod by 0
Explanation: In the expression a\%b, b was evaluated to be 0 which attempts a divide by 0.
System action: Command ends.
User response: Respecify statement so that b does not equate to 0

FSUC5075 Bad scaling; did you mean string?
Explanation: Scale factors for all resources besides cputime default to k or kilobytes. A scale factor of m or megabytes may also be used. For cputime, the default scaling is in seconds, but m for minutes, h for hours or a time form of mm:ss (where m=minutes and s=seconds) may also be used.
System action: Command ends.
User response: Respecify the limit command with syntax in the proper format.

FSUC5076 Can't suspend a login shell (yet)
Explanation: The suspend command cannot be issued when operating from a login shell.
System action: Command ends, shell still remains active.
User response: Try using the logout command instead.

FSUC5077 Unknown user: user
Explanation: The user specified in user does not exist.
System action: Command ends.
User response: Check that the user exists, check spelling.

FSUC5078 No $home variable set
Explanation: Cannot cd to the home directory as the $home variable is not set.
System action: Command ends.
User response: Set the $home variable, and the reissue command.

FSUC5080 $, ! or < not allowed with $# or $? 
Explanation: An illegal $, ! or < was found in the name portion of $# name or $?name.
System action: Command ends.
User response: Reissue this shell variable without the illegal characters.

FSUC5081 Newline in variable name
Explanation: An illegal newline character was found in the variable name.
System action: Command ends.
User response: Respecify the variable name to exclude any newlines. Respecify the command.
FSUC5082  * not allowed with $# or $?
Explanation:  A wildcard character was found in name portion of either $#name or $?name
User response:  Respecify the shell variable reference without a * in name.

FSUC5083  $<digit> or $#<digit> not allowed
Explanation:  $? or $# cannot be followed by a digit.
User response:  Respecify the shell variable reference with a variable name as an argument.

FSUC5084  Illegal variable name
Explanation:  Variable name must consist only of alphanumeric characters.
User response:  Take any non-alphanumeric characters out of the variable name.

FSUC5085  Newline in variable index
Explanation:  A newline character is not allowed in the index of an array.

FSUC5086  Expansion buffer overflow
Explanation:  While attempting to resolve a variable expansion (such as $expression), the 1020 character buffer limit was exceeded.
User response:  Try and minimize complex expressions.

FSUC5087  Variable syntax
Explanation:  Variable modifiers cannot have a :g or :a at the end of the word selector.
User response:  Correct the syntax of modifiers, and the reissue command.

FSUC5088  Bad ! form
Explanation:  No closing ) was found on the ! history substitution character.
User response:  Check syntax and logic of the statement.

User response:  Correct the syntax of the statement and reissue.

FSUC5089  No previous substitute
Explanation:  There is no previous s substitution for the " modifier to repeat.
User response:  Cannot use this modifier until you issue a valid s substitution. Use another form and/or combination of modifiers to process desired history substitution.

FSUC5090  Bad substitute
Explanation:  The :s/x/y/ modifier format is not of proper syntax.
User response:  Correct the syntax, and reissue the statement.

FSUC5091  No previous left hand side
Explanation:  There is no previous left hand side for the :s/x/y/ modifier format.
User response:  Correct the syntax, and reissue the statement.

FSUC5092  Right hand side too long
Explanation:  The right hand side of the :s/x/y/ modifier format is too long.
User response:  Try to shorten the substitution, try and use another form of history substitution, or manually type in command line.

FSUC5093  Bad ! modifier: modifier
Explanation:  Valid modifiers are: p s & r e h t q x u l g and a.
User response:  Respecify command with valid modifiers.

FSUC5094  Modifier failed
Explanation:  Specified modifier could not complete properly.
User response:  Check syntax and logic of the statement.
FSUC5095  Substitution buffer overflow
System action:  Command ends.

FSUC5096  Bad ! arg selector
Explanation:  The % modifier must be used in conjunction with the !?string? reference (for example, !?string?:% where % will match the entire word matching string.
System action:  Command ends.
User response:  Correct the syntax and reissue the statement.

FSUC5097  No prev search
Explanation:  !?? will repeat the last search command. In this case, there is no previous search command, therefore, this form of history substitution cannot process.
System action:  Command ends.
User response:  Use another form of history substitution.

FSUC5098  string: Event not found
Explanation:  !?string? will be replaced with the most recent history line containing string in line. No match was found, hence, no history substitution can occur.
System action:  Command ends.
User response:  Use another form of history substitution, or explicitly type in the command.

FSUC5099  Too many )'s
Explanation:  There are more closing parenthesis than opening parenthesis.
System action:  Command ends.
User response:  Correct the syntax and reissue the statement.

FSUC5100  Too many ('s
Explanation:  There are more opening parenthesis than closing parenthesis.
System action:  Command ends.
User response:  Correct the syntax and reissue the statement.

FSUC5101  Badly placed (
Explanation:  The syntax of your statement is not correct due to a misplaced (.
System action:  Command ends.
User response:  Correct the syntax and reissue the statement.

FSUC5102  Missing name for redirect
Explanation:  The < or > redirection symbols were used without the appropriate source or target arguments.
System action:  Command ends.
User response:  Reissue the statement with valid arguments on redirection.

FSUC5103  Ambiguous output redirect
Explanation:  Output redirection cannot process because the filename and/or pipe is ambiguous.
System action:  Command ends.
User response:  Correct the syntax, and reissue the statement.

FSUC5104  Can't << within ()'s
Explanation:  The << redirection symbol cannot be used within a set of parenthesis.
System action:  Command ends.
User response:  Reissue the statement without this symbol inside the ()'s. You may want to try putting the << shell input lines inside a variable, or within a file.

FSUC5105  Ambiguous input redirect
Explanation:  Input redirection cannot process because the filename and/or pipe is ambiguous.
System action:  Command ends.
User response:  Correct the syntax, and reissue the statement.

FSUC5106  Badly placed ()'s
Explanation:  The syntax of your statement is not correct due to a misplaced parenthesis.
System programmer response:  Command ends.
User response:  Correct the syntax and reissue the statement.

FSUC5107  Alias loop
Explanation:  You have exceeded the maximum value of 50 nested alias expansions.
System action:  Command ends.
User response:  If possible, do not nest this alias.
**FSUC5108**  
**No $watch variable set**

**Explanation:**  
The `log`/`watchlog` command cannot process because the $watch variable was not set.

**System action:**  
Command ends.

**User response:**  
You must set the $watch variable in order to use this command.

---

**FSUC5109**  
**No scheduled events**

**Explanation:**  
The `-n` option on the `sched` command cannot process because there are no scheduled events to remove.

**System action:**  
Command ends.

**User response:**  
There are no scheduled events to remove, therefore you don't need to take further action.

---

**FSUC5111**  
**Not that many scheduled events**

**Explanation:**  
The `-n` option on the `sched` command cannot process because there are not `n` number of scheduled events.

**System action:**  
Command ends.

**User response:**  
To see what the correct number of the event is, use the `sched` command with no arguments. Reissue `sched -n` with the correct `n` value.

---

**FSUC5112**  
**No command to run**

**Explanation:**  
A corresponding command for the `sched` command was not given.

**System action:**  
Command ends.

**User response:**  
Reissue the command with the correct syntax.

---

**FSUC5113**  
**Invalid time for event**

**Explanation:**  
The time for the `sched` command is not valid.

**System action:**  
Command ends.

**User response:**  
Correct time syntax and reissue statement.

---

**FSUC5114**  
**Relative time inconsistent with am/pm**

**Explanation:**  
Relative time cannot have an AM/PM extension. Relative time is number of hours and minutes away from the current time.

**System action:**  
Command ends.

**User response:**  
Reissue the statement without AM/PM extension.

---

**FSUC5117**  
**Unknown capability `capability`**

**Explanation:**  
The terminal capability passed into the `settc` command is unknown.

**System action:**  
Command ends.

**User response:**  
Reissue statement with a correct terminal capability.

---

**FSUC5118**  
**Unknown termcap parameter `parameter`**

**Explanation:**  
Valid termcap parameters are: `d,2,3,,+,%>,i,r,n,B,D`

**System action:**  
Command ends.

**User response:**  
Reissue statement with a valid termcap parameter.

---

**FSUC5119**  
**Too many arguments for `command`**

**Explanation:**  
More arguments were given for the specified command than it's syntax allows.

**System action:**  
Command ends.

**User response:**  
Correct syntax and reissue statement.

---

**FSUC5120**  
**command requires `number arguments`**

**Explanation:**  
The command specified is not in proper syntax.

**System action:**  
Command ends.

**User response:**  
Correct syntax and reissue command.

---

**FSUC5122**  
**file: return-code. Binary file not executable.**

**Explanation:**  
File failed execution with the specified return code. Even though the file has the proper permissions, it is not an executable file.

**System action:**  
Command ends.

**User response:**  
See the return code description for how to proceed. Check the spelling of the command entered.

---

**FSUC5123**  
**!# History loop**

**Explanation:**  
The `!#` event specification for history substitution has reached its maximum of 10 levels of recursion.

**System action:**  
Command ends.

**User response:**  
Either use another form of history substitution or explicitly type in command.
FSUC5124 Malformed file inquiry
Explanation: The syntax of the filetest command is incorrect.
System action: Command ends.
User response: Correct the syntax, making sure to check the file inquiry operator is valid.

FSUC5125 Selector overflow
Explanation: Expansion of the selector expression exceeded the 2056 character limit.
System action: Command ends.
User response: Try and simplify the expression.

FSUC5129 Invalid completion: argument
Explanation: The specified list argument for the completion rule is not valid.
System action: Command ends.
User response: Reissue command with a valid job.

FSUC5130 Invalid string: string
Explanation: The specified command or separator field is not of the correct syntax.
System action: Command ends.
User response: Respecify rule with correct syntax.

FSUC5131 Missing separator separator after string
Explanation: The syntax of the completion statement is not correct due to the specified missing separator.
System action: Command ends.
User response: Correct syntax and reissue statement.

FSUC5132 Incomplete command: string
Explanation: There is no specified range for the positional completion rule.
System action: Command ends.
User response: Respecify rule with correct syntax.

FSUC5133 No operand for -m flag
Explanation: The syntax for the -m option on the source command is incorrect.
System action: Command ends.
User response: Reissue statement with correct syntax.

FSUC5135 $variable is read-only
Explanation: The specified variable is read only. Any operations that may need to write, append or delete this variable cannot be processed.
System action: Command ends.
User response: Do not set this variable as read only, or use another variable.

FSUC5136 No such job
Explanation: The job specified on the command does not exist. You can get a list of jobs and their corresponding process ID’s by issuing the jobs -l command.
System action: Command ends.
User response: Reissue command with a valid job.

FSUC5137 Unknown colors variable variable
Explanation: The LS_COLORS shell variable could not be processed because the specified variable is not valid.
System action: Command ends.
User response: Correct syntax and reissue statement.

FSUC5138 The autolock feature is not implemented
Explanation: The command set autologout=(x y) was issued in which the y variable was intended to specify the number of minutes the shell can sit idle before it automatically locks.
System action: The autologout command is still implemented, however autologout takes on the value of the y variable, rather than the x.
User response: If this is not the value you want to take effect for autologout, respecify the statement with only one parameter.

FSUC5140 pid/job-number: string
Explanation: The kill() run-time function failed with the specified pid/job number and returned the printed system message. Either the specified signal isn’t supported, the caller does not have permission to send to the process specified, or there are no processes corresponding to the specified pid.
System action: The kill command terminates without sending the signal to the process/job.
User response: Double-check the value of the pid or job number you used when issuing the kill command.
FSUC5141 The afsuser special shell variable is not implemented

Explanation: Since the autolock feature is not implemented, setting this variable offers no benefit.

System action: Processing continues.

User response: None.

FSUC5142 The autocorrect special shell variable is not implemented

FSUM

FSUM1001 The RACF profile for this user does not contain an OMVS segment.

Explanation: The RACF profile for this user does not contain an OMVS segment. Processing terminates.

User response: Contact the system administrator.

System programmer response: Verify if this user has the authority to issue the OMVS command. If so, add an OMVS segment to the RACF profile for this user.

FSUM1002 Unable to set the LOGNAME environment variable.

Explanation: A failure occurred while the LOGNAME environment variable was being set. Processing terminates.

User response: Contact the system programmer.

System programmer response: Determine why the setenv() function failed.

FSUM1003 Unable to set the HOME environment variable.

Explanation: A failure occurred while the HOME environment variable was being set. Processing terminates.

User response: Contact the system programmer.

System programmer response: Verify that the OMVS segment of the user's RACF profile contains a home directory. Determine why the setenv() function failed.

FSUM1004 Cannot change to directory <string>.

Explanation: The current working directory cannot be set to the specified HOME directory for this user ID. Processing terminates.

User response: Contact the system administrator.

System programmer response: Verify that the home directory specified in the OMVS segment of the user's RACF profile exists. Verify that the user has the authority to make this the current working directory.

Explanation: Setting this variable will not automatically invoke the spell-word editor command before each completion attempt.

System action: Processing continues.

User response: To spell check a word, you can manually invoke the spell-word editor command. To find out what this command is mapped to, issue the bindkey command.

FSUM1005 Unable to set the SHELL environment variable.

Explanation: A failure occurred while the SHELL environment variable was being set. Processing terminates.

User response: Contact the system programmer.

System programmer response: Verify that the OMVS segment of this user's RACF profile contains an initial user program name. Determine why the setenv() function failed.

FSUM1006 A shell was not specified. Processing continues using the default shell name.

Explanation: The name of the initial user program (shell) was not specified in the OMVS segment of the user's RACF profile. Processing continues using the default shell name.

User response: Contact the system administrator.

System programmer response: Verify that the OMVS segment of this user's RACF profile contains an initial user program (shell) name.

FSUM1007 Unable to open the message catalog.

Explanation: The message catalog cannot be opened. Processing continues.

User response: Contact the system programmer.

System programmer response: Verify that the message catalog exists in the file system.

FSUM1008 Unable to close the message catalog.

Explanation: The message catalog cannot be closed.

User response: Contact the system programmer.

System programmer response: Investigate why the catclose() function failed.

FSUM1009 Unable to execute the shell.
**Explanation:** The initial user program (shell) was not run. Processing terminates.

**User response:** Contact the system programmer.

**System programmer response:** Verify that the initial user program (shell) exists, and that the user has permission to execute it.

---

**FSUM1010** Cannot obtain the TTY name.

**Explanation:** The TTY name associated with this terminal could not be obtained. No entry will be made in the `/etc/utmpx` file. Processing continues.

**User response:** Contact the system programmer.

**System programmer response:** Investigate why the `ttyname()` function failed.

---

**FSUM1011** Unable to remove the TTY pathname.

**Explanation:** The pathname could not be removed from the TTY name. No entry will be made in the `/etc/utmpx` file.

**User response:** Contact the system programmer.

**System programmer response:** Verify that the pathname for the TTY is correct.

---

**FSUM1012** The initial working directory was not specified.

**Explanation:** The initial working directory was not specified in the OMVS segment of the user's RACF profile. The initial working directory will be set to the root (`/`) directory. Processing continues.

**User response:** Contact the system programmer.

**System programmer response:** Verify that the OMVS segment of the user's RACF profile contains an initial working directory.

---

**FSUM1013** The name of the default shell could not be found.

**Explanation:** The name of the default shell could not be obtained. Processing terminates.

**User response:** Contact the system programmer.

**System programmer response:** Contact IBM support personnel.

---

**FSUM1014** Unable to allocate storage.

**Explanation:** The system could not allocate enough storage to continue. Processing terminates.

**User response:** Contact the system programmer.

**System programmer response:** Determine why there is not enough storage to be allocated.

---

**FSUM1015** Unable to set the TZ environment variable.

**Explanation:** The default time zone could not be set. Processing continues.

**User response:** Contact the system programmer.

**System programmer response:** Determine why the `setenv()` function failed.

---

**FSUM1016** Unable to determine the default path.

**Explanation:** The name of the default pathname could not be determined. The pathname will be set to `/bin`. Processing continues.

**User response:** Contact the system programmer.

**System programmer response:** Contact IBM support personnel.

---

**FSUM1017** Unable to set the PATH environment variable.

**Explanation:** A failure occurred while the `PATH` environment variable was being set. Processing continues.

**User response:** Contact the system programmer.

**System programmer response:** Determine why the `setenv()` function failed.

---

**FSUM1018** The start of the session was not recorded. An unexpected error occurred. Error code = number, reason code = hexnum, error data = hexnum, error string = 'string'

**Explanation:** The start of the shell session was not recorded in the `/etc/utmpx` file, because an unexpected error occurred. This error did not prevent the session from starting.

Because the start of the shell session was not recorded in the `/etc/utmpx` file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

This error message can occur if the `/bin/login` program is accidentally run as a shell command.

In the message text:

- `error code = number`  
  The code for this error.

- `reason code = hexnum`  
  An additional reason code associated with this error. If this value is zero, there is no additional reason code for this error.
error data = hexnum
Additional data associated with this error. If this value is zero, there is no additional reason code for this error.

error string = "string"
A string of characters that provides additional error information. If this string is empty, no error string is available for this error.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

Make sure not to run /bin/login, as a shell command.

System programmer response: This might be an error in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

FSUM1019 The start of the session was not recorded. The slot (in /etc/utmpx) for this terminal could not be updated, or a new slot for the terminal could not be created. Function = pututxline(), terminal name = "string", program name = "string", errno = number (X'hexnum'), reason code = hexnum, message = "string"

Explanation: The login program tried to record the start of the user's shell session in the /etc/utmpx file. An error occurred when the login program issued pututxline(). The start of the shell session was probably not recorded. This error did not prevent the session from starting.

Because the start of the shell session may not have been recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

terminal name = "string"
The name of the pseudo-TTY that was being used when this error occurred.

program name = "string"
The name of the login program.

errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = "string"
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: For more information on the errno and reason code values displayed in this message, see z/OS XL C/C++ Run-Time Library Reference and z/OS UNIX System Services Programming: Assembler Callable Services Reference.

Make sure that the /etc directory exists and that the that /etc/utmpx exists and has the proper permissions.

Make sure that the login program (named in the error message) has the SETUID flag set in its directory entry.

Usage: uconvdef -f source_file -v uconv_table

Explanation: The uconvdef command was not entered correctly. Processing terminates.

User response: Refer to z/OS UNIX System Services Command Reference for the uconvdef syntax and reissue the command.

System programmer response: None

Usage: uconvdef: Start processing the source file is "string".

Explanation: Informational message that the processing of the specified input file by uconvdef started.

User response: None

System programmer response: None

Usage: uconvdef: string created.

Explanation: Informational message that uconvdef completed and that output is contained in the file specified.

User response: None

System programmer response: None

Usage: uconvdef: Output file "string" was not created.

Explanation: Informational message that there is no uconvdef output. This message is accompanied by another message that gives more specific information why processing did not complete.

User response: Use information in the accompanying message to determine and fix the source of the failure or contact the system programmer.

System programmer response: Use information in
the accompanying message to determine and fix the source of the failure.

---
FSUM1105 uconvdef: Not enough space for allocation.

Explanation: The uconvdef function issued a system function call to obtain working storage in which to build output. The function failed and storage was not obtained. The uconvdef process terminates with no output.

User response: Contact the system programmer.

System programmer response: Determine why the malloc() function failed.

---
FSUM1106 uconvdef: Cannot open input file 'string': errno_msg.

Explanation: The fopen() function failed. The file name and errno message associated with the fopen() are in the message. The uconvdef process terminates with no output.

User response: Contact the system programmer.

System programmer response: Determine why the fopen() function failed.

---
FSUM1107 uconvdef: Cannot open temporary file: errno_msg.

Explanation: The fopen() function failed. The errno message associated with the fopen() is in the message. The uconvdef process terminates with no output. Had processing been successful the temporary file would contain the uconvdef output. Then the file would be renamed to the output file name specified on the uconvdef command.

User response: Contact the system programmer.

System programmer response: Determine why the fopen() function failed.

---
FSUM1108 uconvdef: Cannot close input file 'string': errno_msg.

Explanation: The fclose() function failed. The file name and errno message associated with the fclose() are in the message. The uconvdef process continues.

User response: Contact the system programmer.

System programmer response: Determine why the fclose() function failed.

---
FSUM1109 uconvdef: Cannot close temporary file: errno_msg.

Explanation: The fclose() function failed. The errno message associated with the fclose() is in the message. The uconvdef process terminates. The temporary file contains incomplete output and is not usable. The uconvdef process terminates with no output.

User response: Contact the system programmer.

System programmer response: Determine why the fclose() function failed.

---
FSUM1110 uconvdef: Cannot rename temporary file to output file 'string': errno_msg.

Explanation: The rename() function failed. The new file name and errno message associated with the rename() are in the message. The temporary file contains complete output and is usable. The temporary file name is the output file name specified as a parameter on the command uconvdef.tmpXXXXX, where XXXXX is a random number. The uconvdef process terminates.

User response: Contact the system programmer.

System programmer response: Determine why the rename() function failed.

---
FSUM1111 uconvdef: Error while reading input file 'string': errno_msg.

Explanation: The fgets() function failed. The file name and errno message associated with the failure are in the message. The uconvdef process terminates with no output.

User response: Contact the system programmer.

System programmer response: Determine why the function failed.

---
FSUM1112 uconvdef: Error while writing temporary file: errno_msg.

Explanation: The fwrite() function failed. The errno message associated with the failure is in the message. The uconvdef process terminates with no output.

User response: Contact the system programmer.

System programmer response: Determine why the function failed.

---
FSUM1113 uconvdef: 'MB_CUR_MIN' is greater than 'MB_CUR_MAX' default.

Explanation: A value of MB_CUR_MIN was specified in the input file, MB_CUR_MAX was not specified. The default value of MB_CUR_MAX is 1 and the specified value of MB_CUR_MIN cannot exceed this value. The uconvdef process terminates with no output.

User response: Specify a value of MB_CUR_MIN that is less than MB_CUR_MAX in the input file and run uconvdef again with the changed input.

System programmer response: None.
FSUM1114 uconvdef: Line number: space at the line top is not allowed.
Explanation: A line may not begin with a space. The number of the line is contained in the message. The uconvdef process terminates with no output.
User response: Remove the space in the input file and run uconvdef again with the changed input.
System programmer response: None.

FSUM1115 uconvdef: Line number: illegal line format.
Explanation: The number of the line with the illegal format is contained in the message. The uconvdef process terminates with no output.
User response: Correct the line format in the input file and run uconvdef again with the changed input.
System programmer response: None.

FSUM1116 uconvdef: Line number: illegal token.
Explanation: The number of the line with the illegal token is contained in the message. The uconvdef process terminates with no output.
User response: Correct the line in the input file and run uconvdef again with the changed input.
System programmer response: None.

FSUM1117 uconvdef: Line number: illegal value for token 'string'.
Explanation: The number of the line with the illegal token value is contained in the message. The uconvdef process terminates with no output.
User response: Correct the line in the input file and run uconvdef again with the changed input.
System programmer response: None.

FSUM1118 uconvdef: Line number: token 'string' must have value.
Explanation: A token must contain a value. The number of the line and token without a value is contained in the message. The uconvdef process terminates with no output.
User response: Correct the line in the input file and run uconvdef again with the changed input.
System programmer response: None.

FSUM1119 uconvdef: Line number: code set name can be defined only once.
Explanation: A code set name may be defined once. The number of the line that contains the name of the code set being defined again is contained in the message. The uconvdef process terminates with no output.
User response: Correct the line in the input file and run uconvdef again with the changed input.
System programmer response: None.

FSUM1120 uconvdef: Line number: 'UCONV_CLASS' can be defined only once.
Explanation: UCONV_CLASS may be defined once. The number of the line that attempts to define UCONV_CLASS again is contained in the message. The uconvdef process terminates with no output.
User response: Correct the line in the input file and run uconvdef again with the changed input.
System programmer response: None.

FSUM1121 uconvdef: Line number: CHARMAP section is already started.
Explanation: An input file may contain only one CHARMAP section. The number of the line that attempts to begin a second section is contained in the message. The uconvdef process terminates with no output.
User response: Correct the line in the input file and run uconvdef again with the changed input.
System programmer response: None.

FSUM1122 uconvdef: Line number: extra characters.
Explanation: Failed to find a token on input line contained in message. The uconvdef process terminates with no output.
User response: Correct the line in the input file and run uconvdef again with the changed input.
System programmer response: None.

FSUM1123 uconvdef: Line number: conflict with 'UCONV_CLASS'.
Explanation: Conflict with the UCONV_CLASS specified. The length of the code point is greater or smaller that the length allowed by the UCONV_CLASS. The uconvdef process terminates with no output.
User response: Correct the line in the input file and run uconvdef again with the changed input.
FSUM1124 uconvdef: Line number: conflict with 'MB_CUR_MIN' or 'MB_CUR_MAX'.

Explanation: The length of a code point cannot be less than MB_CUR_MIN or greater than MB_CUR_MAX. The error was detected in the line contained in the message. The uconvdef process terminates with no output.

User response: Correct the line in the input file and run uconvdef again with the changed input.

System programmer response: None.

FSUM1125 uconvdef: Line number: conflicting code length.

Explanation: An invalid code point length was detected while processing a multi-byte character set. The error was detected in the line contained in the message. The uconvdef process terminates with no output.

User response: Correct the line in the input file and run uconvdef again with the changed input.

System programmer response: None.

FSUM1126 uconvdef: Line number: range exceeds limits of one byte.

Explanation: Range exceeds the allowable limit of one byte. The uconvdef process terminates with no output.

User response: Correct the line in the input file and run uconvdef again with the changed input.

System programmer response: None.

FSUM1127 uconvdef: Line number: Too many planes.

Explanation: The value of the code point is greater than allowed. The uconvdef process terminates with no output.

User response: Correct the line in the input file and run uconvdef again with the changed input.

System programmer response: None.

FSUM1128 uconvdef: Line number: escape and comment characters must be distinct.

Explanation: The escape and comment characters must be distinct. The error was detected in the line contained in the message. The uconvdef process terminates with no output.

User response: Make the escape and comment characters distinct in the input file and run uconvdef again with the changed input.

User response: Contact the system programmer.

FSUM1129 uconvdef: No code set name is defined.

Explanation: The input file must contain a statement that identifies the code set. The uconvdef process terminates with no output.

User response: Add a code set name statement to the input file and run uconvdef again with the changed input. For example: <code_set_name> "IBM-1047"

System programmer response: None.

FSUM1130 uconvdef: No 'UCONV_CLASS' is defined.

Explanation: The input file must contain a statement that identifies the UCONV_CLASS. The uconvdef process terminates with no output.

User response: Add a UCONV_CLASS statement to the input file and run uconvdef again with the changed input. For example: <uconv_class> "SBCS"

System programmer response: None.

FSUM1131 uconvdef: CHARMAP section must start with 'CHARMAP'.

Explanation: The CHARMAP section of the input file must start with a CHARMAP statement. The uconvdef process terminates with no output.

User response: Add a CHARMAP statement to the input file and run uconvdef again with the changed input.

System programmer response: None.

FSUM1132 uconvdef: CHARMAP section has no 'END CHARMAP'.

Explanation: The input file must contain an END CHARMAP statement. The uconvdef process terminates with no output.

User response: Add an END CHARMAP statement to the input file and run uconvdef again with the changed input.

System programmer response: None.

FSUM1133 uconvdef: Cannot open output file 'string': errno_msg.

Explanation: The fopen() function failed. The file name and errno message associated with the fopen() are in the message. The uconvdef process terminates with no output.

User response: Contact the system programmer.
System programmer response: Determine why the function failed.

FSUM1134  uconvdef: Cannot close output file: 
  errno_msg.
Explanation: The fclose() function failed. The errno message is in the message. The uconvdef process terminates with no output.
User response: Contact the system programmer.
System programmer response: Determine why the function failed.

FSUM1135  uconvdef: Cannot reopen output file: 
  errno_msg.
Explanation: The freopen() function failed. The errno message is in the message. The uconvdef process terminates with no output.
User response: Contact the system programmer.
System programmer response: Determine why the function failed.

FSUM1136  uconvdef: Cannot reposition output file: 
  errno_msg.
Explanation: The fseek() function failed while repositioning the file pointer before a write to the output file. The errno message is in the message. The uconvdef process terminates with no output.
User response: Contact the system programmer.
System programmer response: Determine why the function failed.

FSUM1137  uconvdef: Error while writing output file: 
  errno_msg.
Explanation: The fwrite() function failed while writing to the output file. The errno message is in the message. The uconvdef process terminates with no output.
User response: Contact the system programmer.
System programmer response: Determine why the function failed.

FSUM1201  Cannot create string
Explanation: A problem occurred while the UNIX datagram socket was being created or initialized. This message is generated if one or more of the following events occurred:
  socket()  The socket function could not create a UNIX datagram socket.
  bind()   The bind function could not bind a local name to the UNIX socket descriptor.

chmod()  The chmod function could not change the permissions on the log file.
Processing ends. The name of the log file and the return code information is appended to the error message.
Note: Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.
User response: Contact the system programmer.
System programmer response: Use the return code information to determine the cause of the failure.

FSUM1202  syslog/udp: unknown service
Explanation: The syslog service was not found in /etc/services. Processing continues although syslogd will not attempt to send log data to or receive log data from remote syslogd servers.
Note: Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.
User response: Contact the system programmer.
System programmer response: If you do not want to exchange log data with remote syslogd servers, no action is required. Otherwise, verify that the syslog service using the UDP protocol exists in the /etc/services file or the hlq.ETC.SERVICES data set.

FSUM1203  bind string
Explanation: The bind function for the AF_INET or AF_INET6 socket failed. Processing continues although syslogd does not attempt to send log data to or receive log data from remote syslogd servers. The return code information is appended to the error message.
Note: Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.
User response: Contact the system programmer.
System programmer response: Use the return code information to determine the cause of the bind() failure.

FSUM1204  select string
Explanation: select() failed while monitoring one or more of the following sockets: AF_UNIX, AF_INET or AF_INET6. Processing ends if the failure is for the AF_UNIX socket. If the failure is for the AF_INET or AF_INET6 socket and the return code is EIO, indicating that TCP/IP has been recycled, the AF_INET or AF_INET6 socket will be closed and re-opened. Any other error on the AF_INET or AF_INET6 socket will not
be recovered and message FSUM1205 will be issued. The return code information is appended to the error message.

User response: Contact the system programmer.

System programmer response: Use the return code information to determine the cause of the select() failure.

FSUM1205 An error was detected on the AF_INET socket, syslogd will no longer monitor the socket

Explanation: This message is generated after a nonrecoverable socket error. The return code information is available in the preceding message. This message is for informational purposes only.

User response: None.

System programmer response: None.

FSUM1206 socket string

Explanation: The socket function for the AF_INET or AF_INET6 socket failed. Processing continues although syslogd will not attempt to send log data to or receive log data from remote syslogd servers. The return code information is appended to the error message. If the return code is EAGAIN or the reason code is JrTcpNotActive, syslogd will wait 30 seconds and then re-issue the socket() call. Once TCP/IP is active, the socket() call will be successful and syslogd will then be able to communicate with remote syslogd servers.

User response: Contact the system programmer.

System programmer response: Use the return code information to determine why the socket() function failed.

FSUM1207 recvmsg unix string

Explanation: An error occurred while performing a recvmsg() of a UNIX message. The return code information is appended to the error message. If the return code is EAGAIN indicating that TCP/IP has been recycled, the AF_INET or AF_INET6 socket will be closed and re-opened.

User response: Contact the system programmer.

System programmer response: For errors other than EIO, use the return code information to determine why the recvfrom() function failed.

FSUM1208 __atoe string

Explanation: An error occurred while translating a message from EBCDIC to ASCII. The return code information is appended to the error message.

User response: Contact the system programmer.

System programmer response: Use the return code information to determine the cause of the __atoe() failure.

FSUM1209 recvfrom inet string

Explanation: An error occurred while performing a recvfrom() of an internet message. The return code information is appended to the error message. If the return code is EIO indicating that TCP/IP has been recycled, the AF_INET or AF_INET6 socket will be closed and re-opened.

User response: Contact the system programmer.

System programmer response: Use the return code information to determine why the recvfrom() function failed.

FSUM1210 __etoa string

Explanation: An error occurred while translating a message from ASCII to EBCDIC. The return code information is appended to the error message.

User response: Contact the system programmer.

System programmer response: Use the return code information to determine the cause of the __etoa() failure.

FSUM1211 sendto string

Explanation: An error occurred while performing a sendto() of log data to a remote syslogd server. syslogd stops sending log data to the destination. The return code information is appended to the error message.

User response: Contact the system programmer.

System programmer response: Use the return code information to determine the cause of the sendto() failure.

FSUM1212 unknown priority name priority

Explanation: A priority name found in the configuration file is not valid.

Note: Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.

User response: Contact the system programmer.

System programmer response: Check the configuration file.

FSUM1213 unknown facility name facility

Explanation: A facility name found in the configuration file is not valid.

Note: Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.

User response: Contact the system programmer.
FSUM1214  getaddrinfo string
Explanation: A host name found in the configuration file is not valid. The return code information is appended to the error message.
Note: Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.
User response: Contact the system programmer.
System programmer response: Check the configuration file.

FSUM1215  sigaction string
Explanation: sigaction() failed while working with the SIGHUP signal. syslogd was trying to start a new session with no controlling terminal. The return code information is appended to the error message.
Note: Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.
User response: Contact the system programmer.
System programmer response: Use the return code information to determine the cause of the sigaction() failure.

FSUM1216  fork string
Explanation: fork() could not create a child process. The return code information is appended to the error message.
Note: Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.
User response: Contact the system programmer.
System programmer response: Use the return code information to determine the cause of the fork() failure.

FSUM1217  setsid string
Explanation: setsid() failed to create a new process group. syslogd was trying to start a new session with no controlling terminal. The return code information is appended to the error message.
Note: Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.
User response: Contact the system programmer.
System programmer response: Use the return code information to determine the cause of the setsid() failure.

FSUM1218  Message from syslog@hostname at timestamp
Explanation: This message line precedes the syslogd message line for messages that are displayed to all logged-in users in the OMVS shell. It identifies the host that originated the message and provides the timestamp for the message.
User response: None.
System programmer response: None.

FSUM1219  syslogd: exiting on signal n
Explanation: syslogd has received the displayed signal and is ending. Normally, the displayed signal will be 15 (SIGTERM) indicating that a kill command has been issued for syslogd.
User response: None.
System programmer response: None.

FSUM1220  syslogd: restart
Explanation: This message is written to log files each time syslogd is started.
User response: None.
System programmer response: None.

FSUM1221  syslogd: last message repeated n times
Explanation: The number of the times the previous message has been issued consecutively. A large number might indicate a loop in the application generating the message.
User response: Contact the system programmer.
System programmer response: Investigate the application generating the messages.

FSUM1222  setsockopt string
Explanation: The setsockopt function for the AF_INET or AF_INET6 socket failed. Processing continues although syslogd will not attempt to send log data to or receive log data from remote syslogd servers. The return code information is appended to the error message.
User response: Contact the system programmer.
System programmer response: Use the return code information to determine why the setsockopt() function failed.
FSUM1223 Error return-code/reason-code was returned from libcall: explanation

Explanation: The specified library or system call failed.

libcall is the name of the library or system call.

explanation describes the nature of the error.

return-code is the return code in hexadecimal format.

reason-code is the reason code in hexadecimal format.

System action: Processing continues.

User response: See z/OS XL C/C++ Run-Time Library Reference for more information about libcall.

See [z/OS UNIX System Services Messages and Codes](SysMgmt) for more information about return-code and reason-code.

System programmer response: Use the return-code and reason-code information to determine why the library or system call failed.

FSUM1224 SMF interface disabled — reason

Explanation: An error writing to SMF. syslogd will not attempt to write to SMF again until it reinitializes.

reason describes the nature of the error:

record type 109 not recorded. Record type 109 is used to store syslog messages in SMF. SMF can be configured to ignore records of this type. When these records are ignored, syslogd will not attempt to store them.

syslogd not permitted to BPX.SMF. The userid associated with syslogd must be permitted to SAF resource BPX.SMF. See z/OS UNIX System Services Planning for more information.

unexpected error. Another type of error was reported by SMF. See message FSUM1223 for more information about the error.

System action: Processing continues, but no records will be written to SMF.

User response: None.

System programmer response: Resolve the problem and reinitialize syslogd by sending it the SIGHUP signal.

FSUM1225 syslogd record not written to SMF - reason

Explanation: A transient error occurred writing to SMF. The record being written is lost.

reason describes the nature of the error:

SMF not active. SMF is not active.

SMF buffer shortage. SMF encountered a buffer shortage.

System action: Processing continues. Subsequent errors of the same type will not be reported.

User response: None.

System programmer response: Resolve the problem and reinitialize syslogd by sending it the SIGHUP signal.

FSUM1226 Syntax error at line linenum in filename

Explanation: An invalid statement was encountered while parsing the syslog configuration file. linenum is the line or record number in the syslogd configuration file where the syntax error was found. filename is the name of the syslog configuration file.

System action: syslogd ignores this line and continues.

User response: None.

System programmer response: Correct the invalid statement and send syslogd the SIGHUP signal to cause it to reinitialize. If more information about the syntax error is needed, start syslogd with the -d command-line parameter and look at the debug messages which are displayed.

FSUM1227 Configuration file filename could not be read

Explanation: An error occurred opening or reading the specified configuration file. See message FSUM1223 for more information about the error. filename is the name of the configuration file specified on the syslogd command-line or the default configuration file /etc/syslog.conf.

System action: syslogd ends.

User response: None.

System programmer response: Resolve the problem and start syslogd.

FSUM1228 Open of log file filename did not complete

Explanation: An open() call for the specified file did not complete. It may be a named pipe with no program currently reading from it. filename is the name of a log file specified in the configuration file.

System action: syslogd disables the rule using filename and continues.

User response: None.

System programmer response: Resolve the problem and reinitialize syslogd by sending it the SIGHUP signal.
FSUM1229  syslogd is already active
Explanation:  Another instance of syslogd, or possibly some other program, is already processing the syslogd AF_UNIX socket. The syslogd AF_UNIX socket is /dev/log, or a different one specified with the -p command-line parameter.
System action:  syslogd ends.
User response:  None.
System programmer response:  None.

FSUM1230  Log file filename was created
Explanation:  filename is the name of a log file specified in the syslog configuration file, after the expansion of strftime() format strings. syslogd created the file because it did not already exist and either it contained a strftime() format string or the -c command-line parameter was specified. The directory containing the log file may also have been created if the -c command-line parameter was specified.
System action:  syslogd continues.
User response:  None.
System programmer response:  None.

FSUM1231  syslogd configuration error
Explanation:  The syslog configuration file specified an IPv6 address (or a host name that resolved to an IPv6 address) for messages to be forwarded to but the TCP/IP stack is not IPv6-enabled.
System action:  The rule is disabled and processing continues.
User response:  None.
System programmer response:  Correct configuration error.

FSUM1232  syslogd: running non-swappable
Explanation:  This message is issued to the syslog file when syslogd is able to run non-swappable.
System action:  syslogd continues.
User response:  None.
System programmer response:  None.

FSUM1233  syslogd: running swappable
Explanation:  This message is issued to the syslog file when syslogd is unable to run non-swappable. The return code information is appended to the error message.
System action:  syslogd continues.
User response:  None.

System programmer response:  If you want syslogd to run as non-swappable, do one of the following:
- Do not define the RACF facility, “BPX.STOR.SWAP” and start the syslog daemon from a userid with UID=0.
- Define the facility and give the appropriate userids at least READ access to the facility.

FSUM1234  syslogd record not written to OPERLOG - OPERLOG not active
Explanation:  syslogd attempted to write a log message to the /dev/operlog destination. The write failed with a return code that indicates OPERLOG is not active.
Example:  Not Applicable
System action:  Processing continues. All syslogd log messages that would have been written to the OPERLOG are discarded until the OPERLOG is activated.
Operator response:  If you want syslogd message logging to OPERLOG, start the MVS operations log (OPERLOG). See z/OS MVS Setting Up a Sysplex. If you do not want syslogd message logging to the OPERLOG, notify the system programmer.
User response:  Not Applicable
System programmer response:  If you want syslogd message logging to OPERLOG, modify the syslog configuration file so that syslogd does not write to the /dev/operlog destination and send syslogd the SIGHUP signal to cause it to reinitialize. See z/OS Communications Server: IP Configuration Guide, Configuring the syslog daemon (syslogd).
Problem determination:  Not Applicable
Source:  z/OS Communications Server TCP/IP: syslogd
Module:  syslogd.c
Routing code:  Not Applicable
Descriptor code:  Not Applicable

FSUM1235  Logging has resumed for OPERLOG
Explanation:  This message is issued when syslogd resumes writing log messages to the /dev/operlog destination following the error indicated by message FSUM1234.
Example:  Not Applicable
System action:  Processing continues.
Operator response:  None.
User response:  Not Applicable
System programmer response:  None.
Problem determination:  Not Applicable
FSUM1236  option1 and option2 are mutually exclusive options

Explanation: syslogd was started with options that cannot be specified together.

option1 is one of the syslogd options.

option2 is the other syslogd option specified, which conflicts with option1.

Example: Not applicable.

System action: syslogd ends.

Operator response: None.

User response: Not Applicable.

System programmer response: None.

Problem determination: Not Applicable.

Source: z/OS Communications Server TCP/IP: syslogd
Module: syslogd.c
Routing code: Not Applicable
Descriptor code: Not Applicable

FSUM1237  Job jobname running in local-only mode

Explanation: syslogd was started in the local-only mode.

jobname is the name of the job associated with this instance of syslogd.

Example: Not applicable.

System action: Processing continues.

Operator response: None.

User response: Not Applicable.

System programmer response: None.

Problem determination: Not Applicable.

Source: z/OS Communications Server TCP/IP: syslogd
Module: syslogd.c
Routing code: Not Applicable
Descriptor code: Not Applicable

Automation: Not Applicable

Explanation: This message is written by syslogd when start options that are not valid have been specified or the -? option is used.

Example: Not applicable.

System action: syslogd ends

Operator response: None.

User response: Not Applicable.

System programmer response: None.

Problem determination: Not Applicable.

Source: z/OS Communications Server TCP/IP: syslogd
Module: syslogd.c
Routing code: Not Applicable
Descriptor code: Not Applicable

Automation: Not Applicable

FSUM1240  Hostname name could not be resolved: string

Explanation: A syslog configuration statement specified a hostname that could not be resolved to an IP address.
name  The hostname that could not be resolved to an IP address.

string  The text that describes the problem.

Example:  Not Applicable.

System action:  The syslog configuration statement that references hostname, name, is disabled and processing continues. Periodically, syslogd will retry hostname resolution and if the retry is successful then message FSUM1241 will be issued.

Operator response:  If the syslog configuration file has not been changed and this hostname was previously resolved successfully, this might indicate a problem with the system resolver or a local or remote domain name server. If the syslog configuration file was recently changed, contact the system programmer.

User response:  Not Applicable.

System programmer response:  Verify that the hostname, name, is a valid hostname and is known to the system resolver or domain name system. If the hostname is no longer valid, the syslog configuration file should be modified to remove or correct the configuration statement containing the hostname. If the hostname is valid, refer to z/OS Communications Server Diagnosis Guide, Diagnosing resolver problems.

Problem determination:  Not Applicable

Source:  z/OS Communications Server TCP/IP: syslogd
Module:  syslogd.c
Routing code:  Not Applicable
Descriptor code:  Not Applicable

FSUM1241  Hostname name is now resolved

Explanation:  syslogd successfully resolved the hostname, name.

Example:  Not Applicable.

System action:  The configuration statement that was previously disabled due to hostname resolution failure is enabled.

Operator response:  None.

User response:  Not Applicable.

System programmer response:  None.

Problem determination:  Not Applicable

Source:  z/OS Communications Server TCP/IP: syslogd
Module:  syslogd.c
Routing code:  Not Applicable
Descriptor code:  Not Applicable

FSUM1242  Incorrect IPv6 address type was specified

Explanation:  syslogd encountered an incorrect IPv6 address type during the processing of its configuration file. Use valid global IPv6 addresses in syslog configuration files.

Example:  Not Applicable.

System action:  The syslogd configuration statement containing the incorrect IPv6 address is ignored. Processing continues.

Operator response:  Contact the system programmer to have the syslog configuration file corrected.

User response:  Not Applicable.

System programmer response:  Correct the syslog configuration file. Consider using a hostname rather than a hard-coded IPv6 address.

Problem determination:  Not Applicable

Source:  z/OS Communications Server TCP/IP: syslogd
Module:  syslogd.c
Routing code:  Not Applicable
Descriptor code:  Not Applicable

FSUM1243  Statement on line num in filename was disabled

Explanation:  The syslogd statement on line number num in the syslog configuration file named filename was disabled.

num  The line or record number of the statement in the syslog configuration file.

filename  The name of the syslog configuration file.

Example:  Not Applicable.

System action:  Processing continues.

Operator response:  This informational message follows either message FSUM1240 or message FSUM1234. See the response for that message.

User response:  Not Applicable.

System programmer response:  This informational message follows either message FSUM1240 or message FSUM1234. See the response for that message.

Problem determination:  Not Applicable

Source:  z/OS Communications Server TCP/IP: syslogd
Module:  syslogd.c
**FSUM1244 Statement on line num in filename is enabled**

**Explanation:** The syslogd statement on line number num in the syslog configuration file named filename is enabled.

**num** The line or record number of the statement in the syslog configuration file.

**filename** The name of the syslog configuration file.

**Example:** Not Applicable.

**System action:** Processing continues. The statement that was disabled is now enabled.

**Operator response:** None.

**User response:** Not Applicable.

**System programmer response:** None.

**Problem determination:** See System Programmer Response.

**Source:** z/OS Communications Server TCP/IP: syslogd

**Module:** syslogd.c

**Routing code:** Not Applicable

**Descriptor code:** Not Applicable

**Automation:** Not Applicable

---

**FSUM1245 Incorrect value for parmname parameter**

**Explanation:** An incorrect value has been specified for a syslogd parameter.

**parmname** Is the configuration parameter or start option name that is in error.

**Example:** FSUM1245 Incorrect value for -F parameter.

**System action:** If this message is issued as a result of an incorrect start option value, syslogd ends. If this message is issued as a result of an incorrect parameter value in a syslogd rule or other configuration statement, the rule is disabled or the statement is ignored and processing continues.

**Operator response:** None.

**User response:** Not Applicable.

**System programmer response:** Examine the JCL, script or command that was used to start syslogd. The parameter shown in the message is incorrect. If the message is issued as a result of an error in the syslog configuration file, examine the configuration file and correct the error. See z/OS Communications Server: IP Configuration Guide Chapter 5 for information on how to specify the parameter or start option.

**Problem determination:** See System Programmer Response.

**Source:** z/OS Communications Server TCP/IP: syslogd

**Module:** syslogd.c

**Routing code:** Not Applicable

**Descriptor code:** Not Applicable

**Automation:** Not Applicable

---

**FSUM1246 option1 must be specified with option2**

**Explanation:** A syslogd start option has been specified that requires another option that must also be specified.

**option1** First syslogd start option.

**option2** syslogd start option that must be specified in conjunction with option1.

**Example:** FSUM1246 -c must be specified with -D

**System action:** syslogd ends.

**Operator response:** None.

**User response:** Not Applicable.

**System programmer response:** Examine the JCL, script or command that was used to start syslogd. The first start option shown in the message must be specified in conjunction with the second start option.

**Problem determination:** See System Programmer Response.

**Source:** z/OS Communications Server TCP/IP: syslogd

**Module:** syslogd.c

**Routing code:** Not Applicable

**Descriptor code:** Not Applicable

**Automation:** Not Applicable

---

**FSUM1247 Pipe pipename has been closed**

**Explanation:** There was a timeout writing to the pipe because the pipe was blocked for more than 2 seconds. The pipe has been closed and the syslogd rule with this pipe as its destination has been disabled.

**pipename** Is the name of the pipe that has been closed.

**Example:** FSUM1247 Pipe /tmp/mypipe has been closed

**System action:** syslogd continues to run but will no longer attempt to write log messages to the pipe.

**Operator response:** Check the application that reads the pipe to be sure it is running. If it is not running, it may need to be restarted. After restarting the
application, restart **syslogd** to resume logging to the pipe.

**User response:** Not Applicable.

**System programmer response:** Check the reading application to be sure it is running with the proper amount of CPU resource. It may need more CPU time to be able to keep up with the amount of data being written to the pipe by **syslogd**. Make the necessary adjustments and restart **syslogd** to resume logging.

**Problem determination:** See System Programmer Response.

**Source:** z/OS Communications Server TCP/IP:

**Module:** syslogd.c

**Routing code:** Not Applicable

**Descriptor code:** Not Applicable

**Automation:** Not Applicable

---

**FSUM1248 jobname** INITIALIZATION COMPLETE

**Explanation:** The **syslogd** application completed its initialization. In the message text:

- **jobname**
  The job name of the **syslogd** application.

**Example:** FSUM1248 SYSLOGD INITIALIZATION COMPLETE

**System action:** Syslogd processing continues.

**Operator response:** Not applicable.

**User response:** Not applicable.

**System programmer response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP:

**Module:** syslogd

**Routing code:** 10

**Descriptor code:** 12

**Automation:** This message is written to the system console and syslog. You can automate on this message to determine when syslogd is no longer able to process requests to log messages.

---

**FSUM1249 jobname** SHUTDOWN COMPLETE

**Explanation:** The **syslogd** application ended in response to a STOP command or a terminating signal, or because of an unrecoverable error. In the message text:

- **jobname**
  The job name of the **syslogd** application.

**Example:** FSUM1249 SYSLOGD SHUTDOWN COMPLETE

**System action:** Syslogd ends.

**Operator response:** If you did not intentionally stop the **syslogd** application, contact the system programmer and restart the **syslogd** application when the problem has been resolved.

**User response:** Not applicable.

**System programmer response:** If the **syslogd** application ended because of an unrecoverable error, examine the **syslogd** destination that is configured to receive error messages for the daemon facility to determine the cause of the problem. To determine which syslogd destination contains these messages, look for a rule in the syslogd configuration file similar to the following: daemon.error destination. Because of the flexibility of syslogd rules, the rule you configured for these messages might look different. See the topic on the syslogd daemon in the z/OS Communications Server: IP Configuration Reference documentation for the syntax of syslogd rules.

**Problem determination:** See system programmer response.

**Source:** z/OS Communications Server TCP/IP:

**Module:** syslogd

**Routing code:** 10

**Descriptor code:** 12

**Automation:** This message is written to the system console and syslog. You can automate on this message to determine when syslogd is no longer able to process requests to log messages.

---

**FSUM1250 jobname** ARCHIVE IS IN PROGRESS, RESTART IGNORED

**Explanation:** A MODIFY command was issued to restart syslogd, but a syslogd archive is in progress. The MODIFY command had no effect. In the message text:

- **jobname**
  The job name of the **syslogd** application.

**Example:** FSUM1250 SYSLOGD ARCHIVE IS IN PROGRESS, RESTART IGNORED

**System action:** The MODIFY command is ignored.

**Operator response:** Not applicable.

**User response:** Not applicable.

**System programmer response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP:

**Module:** syslogd

**Routing code:** 10

**Descriptor code:** 12

**Automation:** This message is written to the system console and syslog. You can automate on this message to determine when syslogd is no longer able to process requests to log messages.

---
FSUM1251  jobname ARCHIVE IS IN PROGRESS, STOP DELAYED

**Explanation:** A STOP command was issued to stop syslogd, but a syslogd archive is in progress. The STOP command will be processed when the archive event completes. In the message text:

- **jobname**
  - The job name of the syslogd application.

**Example:** FSUM1251 SYSLOGD ARCHIVE IS IN PROGRESS, STOP DELAYED

**System action:** Syslogd processing continues, and syslogd will stop after the archive completes.

- **Operator response:** Not applicable.
- **User response:** Not applicable.
- **System programmer response:** Not applicable.
- **Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Syslogd

FSUM1253  jobname MODIFY COMMAND UNSUCCESSFUL - SYNTAX ERROR, reason

**Explanation:** An incorrect parameter was specified on a syslogd MODIFY command. In the message text:

- **jobname**
  - The job name of the syslogd application.
- **reason**
  - A description of the type of error that occurred.

The following values are possible:

- **UNKNOWN VERB**. The command verb is not known. For example:
  - MODIFY procname,BADVERB

- **UNKNOWN KEYWORD**. An unknown keyword was specified. For example:
  - MODIFY procname,DISPLAY,BADKEY

- **MISSING KEYWORD**. A required keyword is missing. For example:
  - MODIFY procname,DISPLAY

- **MISSING VALUE**. A required value is missing. For example:
  - MODIFY procname,DISPLAY,ARCHIVE,DETAIL,MAX=999999999999

- **INCORRECT VALUE**. An incorrect value was specified. For example:
  - MODIFY procname,DISPLAY,ARCHIVE,DETAIL,MAX=999999999999

- **MISSING VERB**. The command verb is missing. For example:
  - MODIFY procname,

**Example:**

FSUM1253 SYSLOGD MODIFY COMMAND UNSUCCESSFUL - SYNTAX ERROR, UNKNOWN KEYWORD

**System action:** The syslogd MODIFY command is ignored.

**Operator response:** Verify the syntax of the MODIFY command and reissue the command. See the topic on operator commands and system administration in the z/OS Communications Server: IP System Administrator's Commands documentation for the syntax of the syslogd MODIFY command.

- **User response:** Not applicable.
- **System programmer response:** Not applicable.
Problem determination: See operator response.

Routing code: 10
Descriptor code: 12
Automation: Not applicable.

FSUM1254  jobname MODIFY COMMAND ACCEPTED
Explanation: A MODIFY command was accepted by syslogd. In the message text:
jobname The job name of the syslogd application.
Example: FSUM1254 SYSLOGD MODIFY COMMAND ACCEPTED
System action: Syslogd processing continues.
Operator response: Not applicable.
User response: Not applicable.
System programmer response: Not applicable.
Problem determination: See system programmer response.
Source: z/OS Communications Server TCP/IP:
Syslogd
Module: ezasyarc
Routing code: Not applicable.
Descriptor code: Not applicable.
Automation: Not applicable.

FSUM1255  File system statistics refresh failed
Explanation: An error occurred while syslogd was refreshing file system statistics. Some of the activities that cause the statistics to be refreshed are: a MODIFY DISPLAY or MODIFY ARCHIVE command, a time of day or threshold based archive, or a syslogd restart.
This message is preceded by one or more other error messages that provide more details about the error.
Example: FSUM1255 File system statistics refresh failed
System action: Syslogd processing continues but syslogd is unable to complete the activity that triggered this message. If a MODIFY command was issued, the command is ignored. If an automatic archive was attempted, the archive fails. If syslogd was restarted, the restart completes without refreshing file system statistics.
Operator response: Contact the system programmer.
User response: Not applicable.

System programmer response: Examine the syslogd destination that is configured to receive error messages for the daemon facility to determine if additional error messages explain more about the problem. To determine which syslogd destination contains these messages, look for a rule in the syslogd configuration file similar to the following: daemon.error destination. Because of the flexibility of syslogd rules, the rule you configured for these messages might look different. See the topic on the syslogd daemon in the z/OS Communications Server: IP Configuration Reference documentation for the syntax of syslogd rules. If the problem cannot be resolved with the information provided then restart syslogd with the -d start option to get additional debugging information.
Problem determination: See system programmer response.

Syslogd
Module: ezasyarc
Routing code: Not applicable.
Descriptor code: Not applicable.
Automation: Not applicable.

FSUM1256  jobname activity IS ALREADY IN PROGRESS
Explanation: A MODIFY command was issued to restart syslogd or to start a syslogd archive. The requested type of activity was already in progress, so the MODIFY command had no effect. In the message text:
jobname The job name of the syslogd application.
activity The activity that was already in progress for syslogd. Valid values for activity are RESTART and ARCHIVE.
Example: FSUM1256 SYSLOGD RESTART IS ALREADY IN PROGRESS
System action: The MODIFY command is ignored.
Operator response: Not applicable.
User response: Not applicable.
System programmer response: Not applicable.
Problem determination: Not applicable.

Automation: Not applicable.
FSUM1257  

jobname IS UNABLE TO ARCHIVE BELOW FILE SYSTEM THRESHOLD value

Explanation: During an archive, syslogd was unable to reduce the utilization of one or more z/OS UNIX file systems below 50% of the value configured with the ArchiveThreshold configuration statement. One instance of message FSUM1269 should be written to the syslogd destination that is configured to receive error messages for the daemon facility for each applicable file system. In the message text:

jobname  
The job name of the syslogd application.

value  
50% of the value configured with the ArchiveThreshold configuration statement.

Example:  

FSUM1257 SYSLOGD IS UNABLE TO ARCHIVE BELOW FILE SYSTEM THRESHOLD 35%

System action: Syslogd processing continues.

Operator response: Contact the system programmer.

User response: Not applicable.

System programmer response: Issue the MODIFY proname,DISPLAY,ARCHIVE,DETAIL command to display z/OS UNIX file systems and the syslogd files contained in those file systems, in order to determine which file systems cannot be reduced below the threshold. Examine the syslogd destination that is configured to receive error messages for the daemon facility to determine if additional error messages explain more about the problem. Message FSUM1269 identifies the applicable file systems and the utilization percentage after the archive. To determine which syslogd destination contains these messages, look for a rule in the syslogd configuration file similar to the following: daemon.error destination. Because of the flexibility of syslogd rules, the rule you configured for these messages might look different. See the topic on the syslogd daemon in the z/OS Communications Server: IP System Administrator's Commands documentation for information on configuring syslogd for automatic archiving.

Problem determination: See system programmer response.

Source: z/OS Communications Server TCP/IP: Syslogd

Module: ezasyarc

Routing code: 10

Descriptor code: 12

Automation: This message is written to the system console and syslog. You might want to automate on this message to monitor syslogd automatic threshold archive results.

FSUM1258  

jobname IS UNABLE TO COMPLETE MODIFY type COMMAND

Explanation: A MODIFY command was issued to display syslogd information, or to perform an archive. An internal error was encountered that prevented the MODIFY command from completing successfully. This message is preceded by one or more other error messages that provide more details about the error. In the message text:

jobname  
The job name of the syslogd application.

type  
The type of command that failed, either DISPLAY or ARCHIVE.

Example:  

FSUM1258 SYSLOGD IS UNABLE TO COMPLETE MODIFY DISPLAY COMMAND

System action: The MODIFY command is ignored.

Operator response: Contact the system programmer.

User response: Not applicable.

System programmer response: Examine the syslogd destination that is configured to receive error messages for the daemon facility to determine if additional error messages explain more about the problem. To determine which syslogd destination contains these messages, look for a rule in the syslogd configuration file similar to the following: daemon.error destination. Because of the flexibility of syslogd rules, the rule you configured for these messages might look different. See the topic on the syslogd daemon in the z/OS Communications Server: IP System Administrator's Commands documentation for the syntax of syslogd rules. If the problem cannot be resolved with the information provided then restart syslogd with the -d start option to get additional debugging information.

Problem determination: See system programmer response.

Source: z/OS Communications Server TCP/IP: Syslogd
FSUM1259  jobname ARCHIVE FAILED FOR number FILES

Explanation:  A syslogd archive has failed. The archive attempt was the result of one of the following events:
- A MODIFY procname,ARCHIVE command was issued
- The time of day configured on the ArchiveTimeOfDay configuration statement has passed
- One or more of the z/OS UNIX files systems containing syslogd files reached or exceeded the utilization threshold configured on the ArchiveThreshold configuration statement

In the message text:

jobname  The job name of the syslogd application.
number  The total number of z/OS UNIX files that failed to be archived.

Example:  FSUM1259 SYSLOGD ARCHIVE FAILED FOR 2 FILES

System action:  Syslogd processing continues. When the next archive event occurs, syslogd will attempt to archive the failed files again.
Operator response:  Contact the system programmer.
User response:  Not applicable.
System programmer response:  Examine the syslogd destination that is configured to receive error messages for the daemon facility to determine if additional error messages clarify the problem. To determine which syslogd destination contains these messages, look for a rule in the syslogd configuration file similar to the following: daemon.error destination. Because of the flexibility of syslogd rules, the rule you configured for these messages might look different. See the topic on the syslogd daemon in the z/OS Communications Server: IP Configuration Reference documentation for the syntax of syslogd rules. Message FSUM1263 provides details about each file that failed to be archived. Investigate and take action according to these error messages. If the problem cannot be resolved with the information provided then restart syslogd with the -d start option to get additional debugging information.
Problem determination:  See system programmer response.

Module:  ezasycmd

Routing code:  10
Descriptor code:  12
Automation:  Not applicable.

FSUM1260  jobname ARCHIVE COMPLETE FOR number FILES

Explanation:  A syslogd archive has completed. The archive was the result of one of the following events:
- A MODIFY procname,ARCHIVE command was issued
- The time of day configured on the ArchiveTimeOfDay configuration statement has passed
- One or more of the z/OS UNIX files systems containing syslogd files reached or exceeded the utilization threshold configured on the ArchiveThreshold configuration statement

In the message text:

jobname  The job name of the syslogd application.
number  The total number of z/OS UNIX files that were successfully archived.

Example:  FSUM1260 SYSLOGD ARCHIVE COMPLETE FOR 10 FILES

System action:  Syslogd processing continues.
Operator response:  Not applicable.
User response:  Not applicable.
System programmer response:  Not applicable.
Problem determination:  Not applicable.
Source:  z/OS Communications Server TCP/IP: Syslogd
Module:  ezasyarc
Routing code:  10
Descriptor code:  12
Automation:  This message is written to the system console and syslog. You might want to automate on this message to monitor for syslogd automatic archive failures.

Problem determination:  Not applicable.
Source:  z/OS Communications Server TCP/IP: Syslogd
Module:  ezasyarc
Routing code:  10
Descriptor code:  12
Automation:  This message is written to the system console and syslog. You might want to automate on this message to monitor for syslogd automatic archive failures.

FSUM1261  File system mountpoint archive results: old utilization oldpercent - new utilization newpercent

Explanation:  An automatic archive has been completed by syslogd. This message shows the results of the archive for a given z/OS UNIX file system. In the message text:

mountpoint  The mount point of the z/OS UNIX file system.
oldpercent
The percentage of utilization of the file system before the archive was done.

newpercent
The percentage of utilization of the file system after the archive was done.

Example:  FSUM1261 File system /var/logs/syslogd
archive results: old utilization 72% - new utilization 30%

System action: Syslogd processing continues.
Operator response: Not applicable.
User response: Not applicable.
System programmer response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP:
Syslogd
Module: ezasyarc
Routing code: Not applicable.
Automation: Not applicable.

FSUM1262 File system mountpoint archive complete, file filename - destination dest

Explanation: An automatic archive has been completed by syslogd. This message shows the results of the archive for a given z/OS UNIX file. In the message text:

mountpoint
The mount point of the z/OS UNIX file system.

filename
The name of the z/OS UNIX file that was archived.

dest
The name of the MVS data set that contains the contents of the archived file.

Example:  FSUM1262 File system /var/logs/syslogd archive complete, file /var/logs/syslogd/daemon.log - destination USER1.SYSARCH.DAEMON.G001V005

System action: Syslogd processing continues.
Operator response: Not applicable.
User response: Not applicable.
System programmer response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP:
Syslogd
Module: ezasyarc
Routing code: Not applicable.
Automation: Not applicable.

FSUM1263 File system mountpoint archive failed on function - file filename - destination dest - errordata

Explanation: A syslogd automatic archive has failed. This message shows error information for a given file within a z/OS UNIX file system. In the message text:

mountpoint
The mount point of the z/OS UNIX file system.

function
The archive function that failed, such as allocation, open, or write.

filename
The name of the z/OS UNIX file for which the archive failed.

dest
The name of the MVS data set for which the archive failed.

errordata
Error information that describes the specific error. For C library functions this information is in the form:

`errorstring(errno), errno2`
See the topic areas for errno and errnor for the corresponding values and supporting information.

For dynamic allocation errors this information is in the form:

`error code errorcode, info code infocode`
See z/OS MVS Programming: Authorized Assembler Services Guide documentation for details about the error and info codes for dynamic allocation.

Example:  FSUM1263 File system /var/logs/syslogd archive failed on allocation - file /var/logs/syslogd/daemon.log - destination USER1.SYSARCH.DAEMON - error code 4714, info code 0035

System action: Syslogd processing continues.
Operator response: Contact the system programmer.
User response: Not applicable.
System programmer response: Examine the syslogd destination that is configured to receive error messages for the daemon facility to determine if additional error messages explain more about the problem. To determine which syslogd destination contains these messages, look for a rule in the syslogd configuration file similar to the following: daemon.error destination. Because of the flexibility of syslogd rules, the rule you configured for these messages might look different. See the topic on the syslogd daemon in the z/OS Communications Server: IP Configuration Reference.
Examine the syslogd
System programmer response:

FSUM1264 DSNPrefix specified out of context.

Example:

Explanation: A syslogd configuration statement or parameter is specified out of context. There are 2 possible reasons for this.

- A parameter that is valid only within the bounds of Beginxxx and Endxxx statements is specified outside those bounds. For example, the DSNPrefix parameter is specified outside of the BeginArchiveParms and EndArchiveParms statements. The parameter is ignored in this case.

- A configuration statement or parameter that is not valid within the bounds of Beginxxx and Endxxx statements is specified within those bounds. For example, the ArchiveCheckInterval configuration statement is specified inside of the BeginArchiveParms and EndArchiveParms statements. The entire Beginxxx and Endxxx statement block is treated as an error in this case.

In the message text:

The configuration statement or parameter that was specified out of context.

Example: FSUM1264 DSNPrefix specified out of context.

System action: Syslogd processing continues.

Operator response: Contact the system programmer.

User response: Not applicable.

System programmer response: Examine the syslogd configuration file and correct the statement or parameter that failed. See the topic on the syslogd daemon in the z/OS Communications Server: IP Configuration Reference documentation for the syntax of syslogd configuration statements. Restart syslogd.

Problem determination: See system programmer response.

Source: z/OS Communications Server TCP/IP:
Syslogd
Module: ezasyarc, syslogd
Routing code: Not applicable.
Descriptor code: Not applicable.
Automation: Not applicable.

FSUM1265 jobname AUTOMATIC ARCHIVE FUNCTION NOT ACTIVE

Explanation: The syslogd application was configured to perform automatic archiving, but the automatic archive function is not active due to a configuration error or an internal error. In the message text:

The job name of the syslogd application.

Example: SYSLOGD AUTOMATIC ARCHIVE FUNCTION NOT ACTIVE

System action: Syslogd processing continues, but syslogd will not be able to automatically archive z/OS UNIX files.

Operator response: Contact the system programmer.

User response: Not applicable.

System programmer response: Examine the syslogd destination that is configured to receive error messages for the daemon facility to determine if additional error messages explain more about the problem. To determine which syslogd destination contains these messages, look for a rule in the syslogd configuration file similar to the following: daemon.error destination. Because of the flexibility of syslogd rules, the rule you configured for these messages might look different. See the topic on the syslogd daemon in the z/OS Communications Server: IP Configuration Reference documentation for the syntax of syslogd rules. Investigate and take action according to these error messages. If a configuration error occurred, correct the error and restart syslogd. If the problem cannot be resolved with the information provided then restart syslogd with the -d start option to get additional debugging information.

Problem determination: See system programmer response.

Source: z/OS Communications Server TCP/IP:
Syslogd
Module: ezasyarc
Routing code: 10
Descriptor code: 12
Automation: This message is written to the system console and syslog. You might want to automate on this message to monitor for syslogd automatic archive failures.
FSUM1266  File system **mountpoint** file reinitialization complete, file **filename**

**Explanation:** An archive event has been completed by syslogd, and some syslogd rules were configured with the `-X` parameter, indicating that the z/OS UNIX file should be reinitialized. This message indicates that the reinitialization is complete for a given z/OS UNIX file. In the message text:

- **mountpoint**
  - The mount point of the z/OS UNIX file system.
- **filename**
  - The name of the z/OS UNIX file that was reinitialized.

**Example:** FSUM1266 File system /var/logs file reinitialization complete, file /var/logs/syslog/daemon.trace

**System action:** Syslogd processing continues.

**Operator response:** Not applicable.

**User response:** Not applicable.

**System programmer response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Syslogd

**Module:** ezasyarc

**Routing code:** Not applicable.

**Descriptor code:** Not applicable.

**Automation:** Not applicable.

---

**FSUM1267  FILE SYSTEM SUMMARY**

**Explanation:** A MODIFY proiname,DISPLAY,ARCHIVE command was issued. This message is followed by summary information for z/OS UNIX file systems that contain syslogd files as destinations.

**Example:**

```
FSUM1267 FILE SYSTEM SUMMARY
NAME=OMVS.TMP.HFS
PATH=/SYSTEM/TMP
512-BLOCKS= 169920 USED= 12224 AVAIL= 157696 USAGE= 7%
```

**System action:** Syslogd processing continues.

**Operator response:** Not applicable.

**User response:** Not applicable.

**System programmer response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Syslogd

**Module:** ezasycmd

**Routing code:** 10

**Descriptor code:** 12

**Automation:** Not applicable.

---

**FSUM1268  FILE SYSTEM DETAILS**

**Explanation:** A MODIFY proiname,DISPLAY,ARCHIVE,DETAIL command was issued. This message is followed by detailed information for z/OS UNIX file systems that contain syslogd files as destinations.

**Example:**

```
FSUM1268 FILE SYSTEM DETAILS
NAME=OMVS.TMP.HFS
PATH=/SYSTEM/TMP
512-BLOCKS= 169920 USED= 12224 AVAIL= 157696 USAGE= 7%
FILE SIZE USAGE PATH
  24 0% /TMP/SYSLOG.LOG
1 OF 1 RECORDS DISPLAYED
```

**System action:** Syslogd processing continues.

**Operator response:** Not applicable.

**User response:** Not applicable.

**System programmer response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Syslogd

**Module:** ezasycmd

**Routing code:** 10

**Descriptor code:** 12

**Automation:** Not applicable.

---

**FSUM1269  File system **mountpoint** actual utilization**

**Actual - target utilization** **target**

**Explanation:** During an archive, syslogd was unable to reduce the utilization of a z/OS UNIX file system below 50% of the value configured with the ArchiveThreshold configuration statement. This message shows both the target percentage value (50% of the value configured with the ArchiveThreshold configuration statement), and the actual percentage value that was achieved. This message indicates the results for an individual file system, and is followed by message FSUM1257. In the message text:

- **mountpoint**
  - The mount point of the z/OS UNIX file system.
- **actual**
  - The actual utilization percentage that was achieved.
- **target**
  - 50% of the value configured with the ArchiveThreshold configuration statement.

**Example:** FSUM1269 File system /var/logs/syslogd actual utilization 54% - target utilization 40%

**System action:** Syslogd processing continues.
FSUM1270 Warning: user name name is truncated to 8 characters

Explanation: A rule in the syslogd configuration file appears to be configured with a list of user names as the destination, but the specified user name is too long. In the message text:

name The user name specified on the rule.

Example: FSUM1270 Warning: user name charliebrown is truncated to 8 characters

System action: Syslogd truncates the specified user name to 8 characters.

Operator response: Contact the system programmer.

User response: Not applicable.

System programmer response: Verify that the rule destination is supposed to be a list of user names. If so, specify user names that are no more than 8 characters and restart syslogd. It is possible that the destination is supposed to be a z/OS UNIX file, but the leading slash ('/') character was inadvertently left off. In this case, syslogd interprets the destination as a list of user names. If this is the case, correct the z/OS UNIX file destination and restart syslogd.

Problem determination: See system programmer response.

Source: z/OS Communications Server TCP/IP: Syslogd

Module: ezasyarc

Routing code: Not applicable.

Descriptor code: Not applicable.

Automation: Not applicable.
return code. The second-level TSO/E message indicates what error was reported by IKJPARS:

**FSUM2002I**
IKJPARS could not obtain required storage and issued return code 16.

**FSUM2003I**
IKJPARS detected an error and issued the return code displayed in the second-level TSO/E message.

In the message text:

```
return-code
The return code from the TSO/E IKJPARS service.
```

**System action:** The OMVS command ends and returns to TSO/E without starting a shell session.

**User response:** If the second-level TSO/E message is FSUM2002I, the OMVS command requires more storage than is currently available. To make more storage available, do one of the following:
- Enter the OMVS command directly from the TSO/E READY prompt.
- Enter the OMVS command from a 3270 display with a smaller screen size.
- Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.

If the second-level TSO/E message is FSUM2003I, contact the system programmer with this message number and the IKJPARS return code displayed in the second-level TSO/E message.

**System programmer response:** If the second-level message is FSUM2002I, make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for the TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

If the second-level message is FSUM2003I, see [Z/OS TSO/E Programming Services](https://www.ibm.com) for more information on this error from IKJPARS. If any other messages appeared along with this one, follow the suggested actions for those messages.

**FSUM2002I**
There is not enough virtual storage to run the command.

**Explanation:** This is a TSO/E secondary message that appears following FSUM2001I when you press “?”. For more information, see FSUM2001I.

**System action:** See message FSUM2001I.

**User response:** See message FSUM2001I.

**System programmer response:** See message FSUM2001I.

**FSUM2003I**
Function = IKJPARS, return code = return-code

**Explanation:** This is a TSO/E secondary message that appears following FSUM2001I when you press “?”. For more information, see FSUM2001I.

**System action:** See message FSUM2001I.

**User response:** See message FSUM2001I.

**System programmer response:** See message FSUM2001I.

**FSUM2004I**
The OMVS command could not open the character conversion library.+
Return code = return-code

**Explanation:** The OMVS command tried to open the data set containing the character conversion table. OPEN failed with the return code displayed in the second-level TSO/E message.

Other error messages explaining why OPEN failed may appear along with this message.

In the message text:

```
return-code
The return code from OPEN.
```

**System action:** The OMVS command ends and returns to TSO/E without starting a shell session. Additional error messages may appear if you entered the TSO/E PROFILE WTPMSG command.

**User response:** Contact the system programmer with the OPEN return code displayed in the second-level message.

**System programmer response:** For more information about error return codes from OPEN, see [Z/OS DFSMS](https://www.ibm.com) Macro Instructions for Data Sets. If any other error messages appeared along with this one, follow the suggested actions for those messages.

**FSUM2005I**
Return code = return-code

**Explanation:** This is a TSO/E secondary message that appears following FSUM2004I when you press “?”. For more information, see message FSUM2004I.

**System action:** See message FSUM2004I.

**User response:** See message FSUM2004I.

**System programmer response:** See message FSUM2004I.

**FSUM2006I**
The OMVS command could not load the character conversion table.+
Module conversion-table-name could not be loaded from the system libraries. Module conversion-table-name could not be loaded from data set data-set-name.
**Explanation:** The OMVS command could not load the character conversion table from the specified data set, or from the default system libraries.

Other error messages explaining why the MVS™ LOAD service failed may appear along with this message.

In the message text:

*conversion-table-name*

The name of the character conversion table that could not be loaded.

*data-set-name*

The name of the data set that should have contained the character conversion table.

**System action:** The OMVS command ends and returns to TSO/E, without starting a shell session. Additional error messages may appear if you had entered the TSO/E PROFILE WTPMSG command.

**User response:** Contact the system programmer with the error message number and any variable information provided by the second-level TSO/E message.

**System programmer response:** If other error messages appeared with this one, follow the suggested actions for those messages.

---

**FSUM2007I** Module *conversion-table-name* could not be loaded from the system libraries.

**Explanation:** This is a TSO/E secondary message that appears following FSUM2006i when you press “?”.

For more information see FSUM2006i.

**System action:** See message FSUM2006i.

**User response:** See message FSUM2006i.

**System programmer response:** See message FSUM2006i.

---

**FSUM2008I** Module *conversion-table-name* could not be loaded from data set *data-set-name*.

**Explanation:** This is a TSO/E secondary message that appears following FSUM2006i when you press “?”.

For more information see FSUM2006i.

**System action:** See message FSUM2006i.

**User response:** See message FSUM2006i.

**System programmer response:** See message FSUM2006i.

---

**FSUM2009I** The OMVS command could not close the character conversion library. Return code = *return-code*

**Explanation:** The OMVS command tried to close the data set containing the character conversion table, but failed with the return code displayed in the second-level TSO/E message.

Other error messages explaining why CLOSE failed may appear along with this message.

In the message text:

*return-code*

The return code from CLOSE.

**System action:** The OMVS command ends and returns to TSO/E, without starting a shell session.

**User response:** Contact the system programmer with the error message number and any variable information provided by the second-level TSO/E message.

**System programmer response:** For more information about error return codes from CLOSE, see z/OS DFSMS Macro Instructions for Data Sets.

---

**FSUM2010I** Return code = *return-code*

**Explanation:** This is a TSO/E secondary message that appears following FSUM2009I when you press “?”.

For more information see FSUM2009I.

**System action:** See message FSUM2009I.

**User response:** See message FSUM2009I.

**System programmer response:** See message FSUM2009I.

---

**FSUM2011I** The OMVS command could not delete the character conversion table. Module *conversion-table-name* could not be deleted.

**Explanation:** The OMVS command could not delete the character conversion table that was loaded from the specified data set or from the default system libraries.

Other error messages explaining why DELETE failed may appear along with this message.

In the message text:

*conversion-table-name*

The name of the character conversion table that could not be deleted.

**System action:** The OMVS command ends and returns to TSO/E. The character conversion tables may still be loaded in system storage.

**User response:** Contact the system programmer with the error message number and any variable information provided by the second-level TSO/E message.

**System programmer response:** If other error messages appeared with this one, follow the suggested actions for those messages.
FSUM2012I  Module conversion-table-name could not be deleted.

Explanation: This is a TSO/E secondary message that appears following FSUM2011I when you press “?”.
For more information see FSUM2011I.

System action: See message FSUM2011I.
User response: See message FSUM2011I.
System programmer response: See message FSUM2011I.

FSUM2013I  The OMVS command ended in error.+
OMVS return code = return-code

Explanation: The OMVS command ended because of an error. Other error messages that explain the failure should appear with this message.

In the message text:

return-code
The return code from the C-language portion of the OMVS command, or the runtime library. This is not the return code from the OMVS command returned to a TSO/E CLIST.

The return codes are:

12  An unrecoverable error caused the OMVS command to end. Prior error messages should describe the error.
16  An unexpected error caused the OMVS command to end. Message FSUM2141I, which should appear prior to this message, describes the unexpected error.
100 An internal error caused the OMVS command to end. Message FSUM2145I, which should appear prior to this message, describes the internal error.
111 An internal error caused the OMVS command to end.
112 An internal error caused the OMVS command to end.
113 An internal error caused the OMVS command to end.
200 SIGILL, SIGSEGV, SIGFPE, or SIGABND caused the OMVS command to end.
211 SIGILL, SIGSEGV, SIGFPE, or SIGABND caused the OMVS command to end abruptly, perhaps without the usual error messages.
Other A return code issued from the runtime library. For more information about this return code, see z/OS XL C/C++ User’s Guide

FSUM2014I  OMVS return code = return-code

Explanation: This is a TSO/E secondary message that appears following FSUM2013I when you press “?”.
For more information see FSUM2013I.

System action: See message FSUM2013I.
User response: See message FSUM2013I.
System programmer response: See message FSUM2013I.

FSUM2016I  An unexpected error occurred.+
Error code = error-code, return code = return-code-decimal (X’return-code-hex’),
abend code = abend-code, reason code = reason-code, error data = error-data,
error string = ’error-string’ Error code = error-code, return value = return-value,
errno = errno-decimal (X’errno-hex’), reason code = reason-code, description = ’system-message’
Error code = error-code

Explanation: The OMVS command detected an error, probably in the OMVS command or the message catalog.

In the message text:

error-code
The code for this error.

return-code-decimal
The return code, in decimal, associated with this error. If this value is zero, there is no return code for this error.

return-code-hex
The return code, in hexadecimal, associated with this error. If this value is zero, there is no return code for this error.

abend-code
An abend code associated with this error. If this value is zero, there is no abend code for this error.
reason-code
A reason code associated with this error. If this value is zero, there is no reason code available for this error.

error-data
Additional data associated with this error. If this value is zero, there is no additional data for this error.

error-string
A string of characters that provides additional error information. If this string is empty, no error string is available for this error.

return-value
The return value associated with this error. If this value is zero, there is no return value available for this error.

errno-decimal
The errno value, in decimal, for this error. If this value is zero, there is no errno available for this error.

errno-hex
The errno value, in hexadecimal, for this error.

system-message
The system message corresponding to the returned errno value. If errno is zero, this message is not meaningful.

System action: The OMVS command continues processing after reporting the error.

User response: Contact the system programmer with this message number and the displayed error information from the second-level TSO/E message.

System programmer response: Report the problem to the IBM support center.

FSUM2017I Error code = error-code, return code = return-code-decimal (X'return-code-hex'),
abend code = abend-code, reason code = reason-code, error data = error-data,
error string = 'error-string'

Explanation: This is a TSO/E secondary message that appears following FSUM2016I when you press ".
For more information see FSUM2016I.

System action: See message FSUM2016I.

User response: See message FSUM2016I.

System programmer response: See message FSUM2016I.

FSUM2019I Error code = error-code

Explanation: This is a TSO/E secondary message that appears following FSUM2016I when you press ".
For more information see FSUM2016I.

System action: See message FSUM2016I.

User response: See message FSUM2016I.

System programmer response: See message FSUM2016I.

FSUM2020I No session was started. Not enough storage is available.+
Function = malloc(), bytes required = malloc-bytes,
return value = return-value

Explanation: The OMVS command was unable to get the storage required to start a new session. The second-level TSO/E message gives the number of bytes of storage required.

In the message text:

malloc-bytes
The number of bytes that could not be obtained by the malloc() function.

return-value
The return value from the failing malloc() function.

System action: The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

User response: The OMVS command requires more storage than is currently available. To make more storage available:

• Enter the OMVS command directly from the TSO/E READY prompt.
• Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.

To reduce the OMVS storage requirement:

• Do not try to start so many sessions.
• Enter the OMVS command from a 3270 display with a smaller screen size.
• If the LINES(n) option was used, specify a smaller value for n.
System programmer response: Make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for this TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

FSUM2021I Function = malloc(), bytes required = malloc-bytes, return value = return-value

Explanation: This is a TSO/E secondary message that appears following FSUM2020I when you press “?”.
For more information see FSUM2020I.

System action: See message FSUM2020I.
User response: See message FSUM2020I.
System programmer response: See message FSUM2020I.

FSUM2022I Special characters may appear incorrect on the terminal. OMVS cannot use the codeset in the character conversion table.+ Function = setlocale(), codeset name = 'codeset-name', return value = return-value

Explanation: The TSO/E OMVS command recognized the codeset name in the character conversion table, but was unable to switch to any of the known locales that use the codeset. The setlocale() function failed for all known locales that use the specified codeset.

Data sets for one or more of the locales that use the codeset are probably not available on the system. For more information about the C/370™ locale data sets, see z/OS XL C/C++ Programming Guide.

In the message text:

codeset-name
The name of the codeset specified in the character conversion table.

return-value
The return value from setlocale().

System action: The OMVS command continues.
Characters in error messages and the help panel will not be converted from code page 1047 to the correct 3270 code page before they are written to the terminal. Certain special characters may appear incorrect on the 3270 screen.

User response: If the CONVERT keyword on the OMVS command was used to override the default character conversion table, specify a different table. If the correct table was specified, contact the system programmer.

If the default character conversion table was used, contact the system programmer.

System programmer response: If an IBM-provided character conversion table was being used, make sure that the required locale data sets are available on the system.

If the failure occurred when trying to use a customized table, make sure that the codeset name in the character conversion table is correct, and that all required locale data sets are available on the system.

FSUM2023I Function = setlocale(), codeset name = 'codeset-name', return value = return-value

Explanation: This is a TSO/E secondary message that appears following FSUM2022I when you press “?”.
For more information see FSUM2022I.

System action: See message FSUM2022I.
User response: See message FSUM2022I.
System programmer response: See message FSUM2022I.

FSUM2024I Special characters may appear incorrect on the terminal. OMVS cannot use the locale in the character conversion table.+ Function = setlocale(), locale name = 'locale-name', return value = return-value

Explanation: The TSO/E OMVS command was unable to switch to the locale specified in the character conversion table. The setlocale() function failed with the displayed return value. This error happens only when using customized character conversion tables, which specify a locale name rather than just the codeset name.

The locale name may be incorrect, or data sets for the locale may not be available on the system. For more information about C/370 locale data sets, see z/OS XL C/C++ Programming Guide.

In the message text:

locale-name
The name of the locale specified in the character conversion table.

return-value
The return value from setlocale().

System action: The OMVS command continues.
Characters in error messages and the help panel will not be converted from code page 1047 to the correct 3270 code page before they are written to the terminal. Certain special characters may appear incorrect on the 3270 screen.

User response: If the CONVERT keyword on the OMVS command was used to override the default character conversion table, specify a different table. If the correct table was specified, contact the system programmer.

System programmer response: If an IBM-provided character conversion table was being used, make sure that the required locale data sets are available on the system.
If the default character conversion table was used, contact the system programmer.

System programmer response: This error normally occurs only when using customized character conversion tables. Make sure that the locale name specified in the character conversion table is correct. Make sure that all data sets for that locale are available on the system.

FSUM2025I Function = setlocale(), locale name = 'locale-name', return value = return-value

Explanation: This is a TSO/E secondary message that appears following FSUM2024I when you press “?”.

FSUM2026I No session was started. The shell cannot start, because too many processes are already active for this UID. +

Function = attach_exec, return value = return-value, errno = errno-decimal (X’errno-hex’), reason code = reason-code, description = 'system-message'

Explanation: When you entered the TSO/E OMVS command or OPEN subcommand, close to the maximum number of processes were already active for this UID. Because of this, the process required for the shell could not be created. At least two processes must be available for this UID when you run the TSO/E OMVS command. Also, at least one process must be available for this UID when you run the OPEN subcommand. Each shell session takes up at least one process for this UID. Active z/OS UNIX batch jobs submitted for this TSO/E user ID count as processes for this UID. Other TSO/E user IDs may share the same UID with this TSO/E user ID. If those user IDs are currently using z/OS UNIX, their processes also count toward the maximum allowed for this UID.

In the message text:
return-value
The return value from attach_exec.
errno-decimal
The errno value, in decimal, returned from attach_exec.
errno-hex
The errno value, in hexadecimal, returned from attach_exec.
reason-code
The reason code returned from attach_exec.

System programmer response: If required, increase the maximum number of processes allowed per UID.

FSUM2027I Function = attach_exec, return value = return-value, errno = errno-decimal (X’errno-hex’), reason code = reason-code, description = 'system-message'

Explanation: This is a TSO/E secondary message that appears following FSUM2026I when you press “?”.

System action: The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

User response: Try not to start so many shell sessions. Specify fewer initial sessions on the TSO/E OMVS command.

Wait for any z/OS UNIX batch jobs from this TSO/E user ID to end before reentering the OMVS command or OPEN subcommand. Other TSO/E user IDs may share a common UID with this user ID. Reenter the OMVS command or OPEN subcommand after one of those TSO/E user IDs has finished using z/OS UNIX.

Ask the system programmer to increase the maximum number of processes allowed per UID.

System programmer response: See message FSUM2024I.

FSUM2028I Function = attach_exec, return value = return-value, errno = errno-decimal (X’errno-hex’), reason code = reason-code, description = 'system-message'

Explanation: This is a TSO/E secondary message that appears following FSUM2026I when you press “?”.

System action: See message FSUM2024I.

User response: See message FSUM2024I.

System programmer response: See message FSUM2024I.

For more information see FSUM2024I.
FSUM2028I

No session was started. The shell cannot start, because too many processes are already active in the system. + Function = attach_exec, return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

Explanation: When you entered the TSO/E OMVS command or OPEN subcommand, close to the maximum number of processes were already active in the system. Because of this, the process required for the shell could not be created. The system must be able to start at least two more processes before the TSO/E OMVS command can run. The system must be able to start at least one more process before the OPEN subcommand can run.

In the message text:

return-value
  The return value from attach_exec.
errno-decimal
  The errno value, in decimal, returned from attach_exec.
errno-hex
  The errno value, in hexadecimal, returned from attach_exec.
reason-code
  The reason code returned from attach_exec.
system-message
  The system message corresponding to the returned errno value.

System action: The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

User response: Try not to start so many shell sessions. Specify fewer initial sessions on the TSO/E OMVS command.

Retry the TSO/E OMVS command or OPEN subcommand later, when the system is not so busy.

Ask the system programmer to increase the maximum number processes that can be active at one time.

System programmer response: If required, increase the maximum number of processes allowed for z/OS UNIX. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see z/OS UNIX System Services Planning.

For an explanation of the errno and reason code from attach_exec, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

Follow any suggested actions for this errno value and reason code.

FSUM2029I

Function = attach_exec, return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

Explanation: This is a TSO/E secondary message that appears following FSUM2028I when you press “?”. For more information see FSUM2028I.

System action: See message FSUM2028I.

User response: See message FSUM2028I.

System programmer response: See message FSUM2028I.

FSUM2030I One or more DBCS characters were found in the TSO/E OMVS command ESCAPE operand string. These DBCS characters are ignored.

Explanation: One or more DBCS characters or a Shift Out (SO) character were specified in the TSO/E OMVS command ESCAPE operand. However, only SBCS characters may be used as escape characters. OMVS cannot use DBCS escape characters.

System action: The OMVS command continues processing. None of the DBCS characters in the ESCAPE operand string are treated as escape characters. Any valid SBCS characters in the string are used as escape characters. The accepted escape characters appear at the bottom of the OMVS screen.

User response: Specify only SBCS characters in the OMVS command ESCAPE operand string. Do not specify any DBCS escape characters.

System programmer response: Make sure that any CLISTs or REXX EXECs that invoke OMVS do not specify DBCS characters in the TSO/E OMVS command ESCAPE operand.

FSUM2031I The OMVS command could not start, because not enough storage was available.

Explanation: During OMVS command processing, a request for storage failed. There was not enough storage to issue a more detailed error message that would describe the failing storage request.

System action: The OMVS command ends and returns to TSO/E without starting a shell session.

User response: The OMVS command requires more storage than is currently available. To make more storage available, do one of the following:
• Enter the **OMVS** command directly from the TSO/E READY prompt.
• Enter the **OMVS** command from a 3270 display with a smaller screen size.
• Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.

**System programmer response:** Make sure that this TSO/E user has enough storage to run the **OMVS** command. Increase the default storage SIZE for the TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

---

**FSUM2032I**

The OMVS command failed because it could not obtain required storage.

- **Function** = `malloc()`,
  - bytes required = `malloc-bytes`,
  - return value = `return-value`
- **Function** = `GETMAIN` (below 16 megabytes),
  - bytes required = `bytes-below-16mb`,
  - return code = `return-code`
- **Function** = `GETMAIN`,
  - bytes required = `bytes-anywhere`,
  - return code = `return-code`
- **Function** = `GETMAIN` (subpool 1),
  - bytes required = `subpool-1-bytes`,
  - return code = `return-code`
- **Function** = `GETMAIN` (below 16 megabytes),
  - bytes required = 72

**Explanation:** During OMVS command processing, a request for storage failed. The second-level TSO/E message gives the type of storage request that failed, and the number of bytes requested.

In the message text:

- `malloc-bytes`
  - The number of bytes that could not be obtained by the `malloc()` function.
- `return-value`
  - The return value from the failing `malloc()` function.
- `bytes-below-16mb`
  - The number of bytes of storage required below the 16MB address.
- `return-code`
  - The return code from the failing `GETMAIN` request.
- `bytes-anywhere`
  - The number of bytes of storage required above or below the 16MB address.
- `subpool-1-bytes`
  - The number of bytes of storage required in subpool 1.

**System action:** The OMVS command ends and returns to TSO/E.

**User response:** The OMVS command requires more storage than is currently available. To make more storage available:

- Enter the **OMVS** command directly from the TSO/E READY prompt.
- Enter the **OMVS** command from a 3270 display with a smaller screen size.
- Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.

**System programmer response:** Make sure that this TSO/E user has enough storage to run the **OMVS** command. Increase the default storage SIZE for this TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

The second-level TSO/E message indicates what type of storage ran out:

- **FSUM2033I**
  - Not enough storage to satisfy a `malloc()` request.
- **FSUM2034I**
  - Not enough storage below the 16MB address.
- **FSUM2035I**
  - Not enough storage above or below the 16MB address.
- **FSUM2036I**
  - Not enough storage to satisfy a `GETMAIN` request for subpool 1 storage.
- **FSUM2064I**
  - Not enough storage below the 16MB address (storage is required for the OMVS command with TCLEARQ).
- **FSUM2065I**
  - Not enough storage below the 16MB address (storage is required for the OMVS command with STFSMODE ON).
- **FSUM2066I**
  - Not enough storage below the 16MB address (storage is required for the OMVS command with STTMPMD ON).
- **FSUM2067I**
  - Not enough storage below the 16MB address (storage is required for the OMVS command with STTMPMD OFF).
Not enough storage below the 16MB address (storage is required for the OMVS command with STLINENO).

Explanation: This is a TSO/E secondary message that appears following FSUM2032I when you press “?” For more information, see FSUM2032I.

System action: See message FSUM2032I.
User response: See message FSUM2032I.
System programmer response: See message FSUM2032I.

Explanation: The DEBUG option was specified on the OMVS command when it was entered. The OMVS command tries to record debug data in the data set with a DDNAME of SYSFSUMO. The OMVS command was unable to use this data set.

The errno, reason code, and system message displayed in the second-level TSO/E message may explain more about this error. More information about the errno value and system message can be found in z/OS XL C/C++ Run-Time Library Reference. If the reason code is not zero, more information can be found in z/OS UNIX System Services Programming: Assembler Callable Services Reference.

In the message text:
errno-decimal
The errno value, in decimal, returned from fopen().
errno-hex
The errno value, in hexadecimal, returned from fopen().
reason-code
The reason code returned from fopen().
system-message
The system message corresponding to the returned errno value.

System action: The OMVS command continues processing but does not record any debug data. Additional error messages may appear if you entered the TSO/E PROFILE WTPMSG command.

User response: If you were directed to collect debugging information from the OMVS command, a debug data set is required. If WRAPDEBUG(n) is used, create a data set with room for at least n 80-byte fixed-length records. If WRAPDEBUG(n) is not used, create a data set with room for at least 10,000 80-byte fixed-length records. Use the TSO/E ALLOCATE command to allocate this data set to SYSFSUMO. For example, ALLOCATE FILE(SYSFSUMO) DATASET(XXX). Do not direct the debugging data to the terminal using DATASET(“”) on the ALLOCATE command, because you will prevent the OMVS command from using the display screen. Retry the OMVS command after setting up the debug data set.

If you do not want to record OMVS command debugging data, omit the DEBUG option from the OMVS command, or specify OMVS DEBUG(NO).

System programmer response: If you need to collect
debugging information from the OMVS command, make sure that the SYSFSUMO debug data set is available to the OMVS command. If the WRAPDEBUG(n) option is not used, this data set should have room for at least 10,000 80-byte fixed-length records. If the WRAPDEBUG(n) option is used, this data set should have room for at least \( n \) 80-byte fixed-length records.

FSUM2038I  
Function = fopen(),  
errno = errno-decimal ('X'errno-hex'),  
reason code = reason-code,  
description = 'system-message'  
Explanation: This is a TSO/E secondary message that appears following FSUM2037I when you press "?". For more information, see FSUM2037I.  
System action: See message FSUM2037I.  
User response: See message FSUM2037I.  
System programmer response: See message FSUM2037I.

FSUM2039I  
The OMVS character conversion table defines one or more DBCS characters as escape characters. These DBCS characters are ignored.  
Explanation: The OMVS character conversion table defines one or more DBCS characters or a Shift Out (SO) character as a default escape character. However, only SBCS characters can be defined as escape characters. OMVS cannot use DBCS escape characters.  
System action: The OMVS command continues processing. None of the DBCS characters in the character conversion table are treated as escape characters. Any valid SBCS characters in the table are used as escape characters. The accepted escape characters appear at the bottom of the OMVS screen.  
User response: If OMVS is not using any escape characters, or if the accepted SBCS escape characters are not sufficient, end OMVS and return to TSO/E.  
• Rerun the TSO/E OMVS command using the ESCAPE operand to override the bad default escape characters from the character conversion table. Specify only SBCS characters in the ESCAPE operand.  
• Rerun the TSO/E OMVS command using the CONVERT operand to choose a different character conversion table.  

Report the problem to the system programmer. Along with the message number, include any operands specified on the TSO/E OMVS command when the error occurred.  
System programmer response: Make sure that any character conversion tables created for the TSO/E OMVS command define only SBCS characters as escape characters.

FSUM2040I  
The OMVS command failed because the specified character conversion table contains ASCII characters.  
Explanation: The character conversion table specified on the OMVS command is not usable. The specified table converts between ASCII and EBCDIC characters. The OMVS command cannot use a conversion table that performs this conversion.  
System action: The OMVS command ends and returns to TSO/E, without starting a shell session.  
User response: If the CONVERT keyword on the OMVS command was used to override the default character conversion table name, specify a different table. The table must not perform ASCII to EBCDIC conversion. If the CONVERT keyword was not used, contact the system programmer.  
System programmer response: Make sure that any character conversion tables that are provided for use with the OMVS command do not convert to or from ASCII. If this error message appeared when the CONVERT keyword was not specified on the OMVS command, make sure the default table for the OMVS command does not convert to and from ASCII.

FSUM2041I  
The OMVS command could not start, because module module-name could not be loaded. Abend code = Sabend-code, reason code = reason-code  
Explanation: The OMVS command tried to load the module named in the error message. The MVS LOAD service failed with the abend code and reason code displayed in the second-level TSO/E message. For more information about this abend code and reason code, see z/OS MVS System Codes.  
In the message text:  
module-name  
The name of the load module that could not be loaded.  
abend-code  
The system abend code from the LOAD function.  
reason-code  
The abend reason code from the LOAD function.  
System action: The OMVS command ends and returns to TSO/E without starting a shell session.  
User response: Report this message number and the displayed module name, abend code, and reason code to the system programmer.  
System programmer response: Make sure that the
module named in the error message can be loaded by the OMVS command from the normal system libraries. Follow the suggested actions for the abend code and reason code displayed in the message.

FSUM2042I  Abend code = S, reason code = R

Explanation: This is a TSO/E secondary message that appears following FSUM2041I when you press “?”.
For more information see FSUM2041I.

System action: See message FSUM2041I.
User response: See message FSUM2041I.
System programmer response: See message FSUM2041I.

FSUM2043I  The OMVS command failed because the specified character conversion table is not the correct size. The required size is required-size bytes, but the actual size is actual-size bytes (decimal).

Explanation: The length of the character conversion table specified on the OMVS command is incorrect. The OMVS command requires tables of a certain length. If the CONVERT keyword was used to override the default character conversion table name, the specified name is probably not the name of a character conversion table. If the specified name is correct, the table was probably not built correctly.

In the message text:
required-size
The required length for character conversion tables used by the OMVS command.

actual-size
The actual length of the character conversion table that was loaded.

System action: The OMVS command ends and returns to TSO/E, without starting a shell session.
User response: If the CONVERT keyword on the OMVS command was used to override the default character conversion table, make sure that the specified data set really is a character conversion table, or use the CONVERT keyword to choose a different table. If the CONVERT keyword was not used, contact the system programmer.
System programmer response: Make sure that all character conversion tables for the OMVS command are exactly the required length. If this error message appeared when the CONVERT keyword was not specified on the OMVS command, make sure the default table is the correct length.

FSUM2044I  The required size is required-size bytes, but the actual size is actual-size bytes (decimal).

Explanation: This is a TSO/E secondary message that appears following FSUM2043I when you press “?”.
For more information see FSUM2043I.

System action: See message FSUM2043I.
User response: See message FSUM2043I.
System programmer response: See message FSUM2043I.

FSUM2045I  The OMVS command failed because data in the specified character conversion table is incorrect. The eyecatcher field must be required-eyecatcher (X’required-eyecatcher-hex’) but is actually X’actual-eyecatcher-hex’.

Explanation: The eyecatcher field in the character conversion table specified on the OMVS command is incorrect. The OMVS command requires the correct eyecatcher field in all tables used. If the CONVERT keyword was used to override the default table name, the specified name is probably not the name of a character conversion table. If the specified name is correct, the table was probably not built correctly.

In the message text:
required-eyecatcher
The EBCDIC data that is required in the eyecatcher field of character conversion tables used by the OMVS command.

required-eyecatcher-hex
The hexadecimal data that is required in the eyecatcher field of character conversion tables used by the OMVS command.

actual-eyecatcher-hex
The hexadecimal data that is actually present in the eyecatcher field of the specified character conversion table.

System action: The OMVS command ends and returns to TSO/E, without starting a shell session.
User response: If the CONVERT keyword on the OMVS command was used to override the default table, make sure that the specified data set really is a character conversion table, or use the CONVERT keyword to choose a different table. If the CONVERT keyword was not used, contact the system programmer.
System programmer response: Make sure that the eyecatcher field is correct in all character conversion tables for the OMVS command. If this error message appeared when the CONVERT keyword was not specified on the OMVS command, make sure the eyecatcher field in the default table is correct.
FSUM2046I The eyecatcher field must be 'required-eyecatcher' (X'required-eyecatcher-hex') but is actually X'actual-eyecatcher-hex'.

Explanation: This is a TSO/E secondary message that appears following FSUM2045I when you press "?". For more information see FSUM2045I.

System action: See message FSUM2045I.
User response: See message FSUM2045I.
System programmer response: See message FSUM2045I.

FSUM2047I The OMVS command failed because the specified character conversion table is the wrong version. Version required-version is required, but the actual version is actual-version.

Explanation: The version of the character conversion table specified on the OMVS command is incorrect. The OMVS command requires a different version of the table. If the CONVERT keyword was used to override the default table name, the specified data might not be a character conversion table.

In the message text:

required-version
The version of the character conversion table required by the OMVS command.

actual-version
The version number contained inside the loaded character conversion table.

System action: The OMVS command ends and returns to TSO/E without starting a shell session.
User response: If the CONVERT keyword on the OMVS command was used to override the default character conversion table name, use a different table, or specify a different library. Make sure that the data set name specified is really the name of a character conversion table, or use the CONVERT keyword to choose a different table. If the CONVERT keyword was not used, contact the system programmer.

System programmer response: Make sure that all character conversion tables that are provided for the OMVS command contain the correct version number. If this error message appeared when the CONVERT keyword was not specified on the OMVS command, make sure the version of the default table is correct.

FSUM2048I Version required-version is required, but the actual version is actual-version.

Explanation: This is a TSO/E secondary message that appears following FSUM2047I when you press "?". For more information, see FSUM2047I.

System action: See message FSUM2047I.
User response: See message FSUM2047I.
System programmer response: See message FSUM2047I.

FSUM2049I The OMVS command can be entered only from a display terminal.

Explanation: You tried to invoke the OMVS command from a terminal that is not a display terminal. When the OMVS command tried to find out the screen size, it determined that the terminal was not a display. The OMVS command must be entered from a 3270-type display terminal, or from a workstation with a 3270 emulator.

System action: The OMVS command ends and returns to TSO/E without starting a shell session.
User response: Make sure that you are logged on to a display terminal before you enter the OMVS command. If you are logged on to a display terminal, contact the system programmer.

System programmer response: The terminal in use is not a display terminal. For more information, see return code 8 from the GTTERM macro, in z/OS TSO/E Programming Services.

FSUM2050I Special characters may appear incorrect on the terminal. The codeset ('codeset-name') in the character conversion table is unknown.

Explanation: The codeset name in the character conversion table is not known to the TSO/E OMVS command. This error normally occurs only when using customized character conversion tables. The OMVS command was unable to construct a locale name for setlocale() from the unknown codeset name.

In the message text:

codeset-name
The name of the unknown codeset specified in the character conversion table.

System action: The OMVS command continues. Characters in error messages and the help panel will not be converted from code page 1047 to the correct 3270 code page before they are written to the terminal. Certain special characters may appear incorrect on the 3270 screen.

User response: If the CONVERT keyword on the OMVS command was used to override the default character conversion table, specify a different table. If the correct table was specified, contact the system programmer.

If the default character conversion table was used, contact the system programmer.

System programmer response: This error normally
occurs only when using customized character conversion tables. If the customized table contains a codeset name, it must be a codeset used by a locale supported by OMVS.

If you need to use an installation-provided locale with the TSO/E OMVS command, specify the complete locale name (“Xx_XX.YYY-9999”) instead of the codeset name in the customized OMVS character conversion table.

FSUM2051I The OMVS command failed because the display screen size is not supported. The screen size must be at least minimum-rows by minimum-columns but less than maximum-bytes bytes total. The actual primary screen size is primary-rows by primary-columns (primary-size bytes). The alternate screen size is alternate-rows by alternate-columns (alternate-size bytes).

Explanation: The available screen sizes for the terminal are too large or too small for the TSO/E OMVS command. The OMVS command is unable to use screens that are larger or smaller than the limits shown in the message text.

In the message text:

minimum-rows
The smallest number of rows allowed on a display screen supported by the OMVS command.

minimum-columns
The smallest number of columns allowed on a display screen supported by the OMVS command.

maximum-bytes
The maximum number of characters (rows times columns) allowed on a display screen supported by the OMVS command.

primary-rows
The number of rows in the first screen size supported by the terminal.

primary-columns
The number of columns in the first screen size supported by the terminal.

primary-size
The number of bytes (rows times columns) for the first screen size supported by the terminal.

alternate-rows
The number of rows in the second or alternate screen size supported by the terminal.

alternate-columns
The number of columns in the second or alternate screen size supported by the terminal.

alternate-size
The number of bytes (rows times columns) for the second or alternate screen size supported by the terminal.

System action: The OMVS command ends and returns to TSO/E, without starting a shell session.

User response: Make sure that the OMVS command is entered only from terminals with supported screen sizes. Find another terminal, or use another emulator session with a supported screen size. If possible, reconfigure the terminal or emulator to a different screen size.

System programmer response: If the terminal does have a supported screen size, examine the actual screen size reported in the message. If the number of rows or columns is wrong in the message, the terminal may be reporting the wrong screen size to the system. The system could also be reporting the wrong screen size to the OMVS command. The OMVS command uses GTTERM to determine the screen size.

FSUM2052I The screen size must be at least minimum-rows by minimum-columns but less than maximum-bytes bytes total. The actual primary screen size is primary-rows by primary-columns (primary-size bytes). The alternate screen size is alternate-rows by alternate-columns (alternate-size bytes).

Explanation: This is a TSO/E secondary message that appears following FSUM2051I when you press “?”.

System action: See message FSUM2051I.

User response: See message FSUM2051I.

System programmer response: See message FSUM2051I.

FSUM2053I The OMVS command failed because it could not obtain enough storage to determine the screen size.

Explanation: The OMVS command requests 72 bytes of storage in order to determine the screen size. The request failed.

System action: The OMVS command ends and returns to TSO/E, without starting a shell session.

User response: The OMVS command requires more storage than is currently available. To make more storage available:

• Enter the OMVS command directly from the TSO/E READY prompt.

• Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.
System programmer response: Make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for this TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

The failing GETMAIN request was for 72 bytes below the 16MB address.

FSUM2054I The OMVS command can be entered only from a 3270-type terminal attached through VTAM.

Explanation: The OMVS command tries to put the TSO/E terminal into full-screen mode before displaying data from the shell session. The terminal could not be put into full-screen mode, because it is not a 3270-type terminal attached through VTAM.

System action: The OMVS command ends and returns to TSO/E without starting a shell session.

User response: Make sure you are using a 3270-type terminal or 3270 emulator when you enter the OMVS command. This terminal must be capable of running full-screen TSO/E commands, such as ISPF. If other full-screen commands work properly on this terminal, contact the system programmer.

System programmer response: The terminal must be a 3270-type terminal attached through VTAM. For more information, see return code 8 from the STFSMODE macro in z/OS TSO/E Programming Services.

FSUM2055I The OMVS command cannot use the message catalog.

Function = catopen(),
catalog name = 'catalog-name',
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

Explanation: The OMVS command tried to open the message catalog named in the second-level TSO/E message. This message catalog could not be opened. If the errno value is nonzero, you can find more information about this error in z/OS XL C/C++ Run-Time Library Reference. The displayed reason code can be found in z/OS UNIX System Services Programming, Assembler Callable Services Reference, and may help explain the cause of this error.

In the message text:

catalog-name
  The name of the message catalog that cannot be opened.

return-value
  The return value from the system.

errno-decimal
  The errno value, in decimal, returned from the system; if errno is 0, no errno information is available for this error.

errno-hex
  The errno value, in hexadecimal, returned from the system.

reason-code
  The reason code from the system; if errno is 0, this reason code value may be incorrect.

system-message
  The system message corresponding to the returned errno value; if errno is 0, the displayed system message is not meaningful.

System action: The OMVS command continues running after this error. However, the OMVS command screens might not contain the usual wording. Some OMVS subcommands may not be recognized. Some OMVS command error messages might not contain the usual wording.

User response: Record the message number and the other information from the second-level TSO/E message. Contact the system programmer.

System programmer response: Make sure that the message catalog named in this error message is installed. Make sure that this user has read access to the message catalog. Make sure the user has search permission for all the directories leading to the message catalog.

FSUM2056I

Function = catopen(),
catalog name = 'catalog-name',
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

Explanation: This is a TSO/E secondary message that appears following FSUM2055I when you press “?”.

System action: See message FSUM2055I.

User response: See message FSUM2055I.

System programmer response: See message FSUM2055I.

FSUM2057I

No session was started. This TSO/E user ID does not have access to OpenMVS.

Function = sigprocmask,
return value = return-value-hex,
Explanation: The RACF user profile for this TSO/E user ID does not contain the information needed to use z/OS UNIX.

In the message text:

- **return code** = return-code
- **reason code** = reason-code

**Explanation:** The return value from sigprocmask.

**return-value-hex**

The return value from sigprocmask.

**return-code**

The return code, in hexadecimal, from sigprocmask.

**reason-code**

The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

**System action:** The OMVS command ends and returns to TSO/E without starting a shell session.

**User response:** Ask the system programmer to give this TSO/E user ID access to z/OS UNIX.

**System programmer response:** Place this TSO/E user ID in a RACF group that can use z/OS UNIX, or allow the group currently containing this TSO/E user ID to use z/OS UNIX. For information about setting up user IDs and RACF groups for z/OS UNIX, see z/OS UNIX System Services Planning.

To see other suggested actions for the displayed reason code and return code, refer to z/OS UNIX System Services Programming: Assembler Callable Services Reference.

---

FSUM2058I  Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

Explanation: This is a TSO/E secondary message that appears following FSUM2057I when you press “?”. For more information, see FSUM2059I.

**System action:** See message FSUM2059I.

**User response:** See message FSUM2059I.

**System programmer response:** See message FSUM2059I.

---

FSUM2059I  The OMVS command could not write an informational message, because not enough storage was available.

Explanation: The OMVS command tried to issue a TSO/E message. The message could not be displayed because there was not enough storage.

**System action:** The OMVS command ends and returns to TSO/E. The shortage of storage may also prevent this message from showing up on the terminal.

**User response:** The OMVS command requires more storage than is currently available. To make more storage available:

- Enter the OMVS command directly from the TSO/E READY prompt.
- Enter the OMVS command from a 3270 display with a smaller screen size.

---

FSUM2060I  The OMVS command could not write an informational message, because not enough storage was available.
• Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.

System programmer response: For more information, see return code 16 from the PUTLINE macro in z/OS TSO/E Programming Services.

Make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for the TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

FSUM2062I The OMVS command could not get the next input line, because the terminal was disconnected.

Explanation: The OMVS command could not get the next line of input data from TSO/E, because the terminal was disconnected.

System action: The OMVS command ends and returns to TSO/E. Because the terminal is disconnected, this error message will probably not show up on the screen.

User response: If the terminal is disconnected, log on to TSO/E, then reenter the OMVS command. If the terminal is not disconnected, contact the system programmer.

System programmer response: For more information, see return code 32 from the PUTGET macro in z/OS TSO/E Programming Services.

FSUM2063I The OMVS command could not write an informational message, because the terminal was disconnected.

Explanation: The OMVS command could not write a TSO/E message to the terminal, because it was disconnected.

System action: The OMVS command ends and returns to TSO/E. Because the terminal is disconnected, this error message will probably not show up on the screen.

User response: If the terminal is disconnected, log on to TSO/E, then reenter the OMVS command. If the terminal is not disconnected, contact the system programmer.

System programmer response: For more information, see return code 20 from IKJEFF02 and the PUTLINE macro in z/OS TSO/E Programming Services.

FSUM2064I Function = GETMAIN (below 16 megabytes), bytes required = 72

Explanation: This is a TSO/E secondary message that appears following FSUM2032I when you press “?”.

System action: See message FSUM2032I.

User response: See message FSUM2032I.

System programmer response: See message FSUM2032I.

FSUM2065I Function = GETMAIN (below 16 megabytes), bytes required = 72

Explanation: This is a TSO/E secondary message that appears following FSUM2032I when you press “?”.

System action: See message FSUM2032I.

User response: See message FSUM2032I.

System programmer response: See message FSUM2032I.

FSUM2066I Function = GETMAIN (below 16 megabytes), bytes required = 72

Explanation: This is a TSO/E secondary message that appears following FSUM2032I when you press “?”.

System action: See message FSUM2032I.

User response: See message FSUM2032I.

System programmer response: See message FSUM2032I.

FSUM2067I Function = GETMAIN (below 16 megabytes), bytes required = 72

Explanation: This is a TSO/E secondary message that appears following FSUM2032I when you press “?”.

System action: See message FSUM2032I.

User response: See message FSUM2032I.

System programmer response: See message FSUM2032I.

FSUM2068I Function = GETMAIN (below 16 megabytes), bytes required = 72

Explanation: This is a TSO/E secondary message that appears following FSUM2032I when you press “?”.

System action: See message FSUM2032I.

User response: See message FSUM2032I.

System programmer response: See message FSUM2032I.
FSUM2069I  Function = GETMAIN (below 16 megabytes), bytes required = 72

Explanation:  This is a TSO/E secondary message that appears following FSUM2032I when you press “?”. For more information, see FSUM2032I.

System action:  See message FSUM2032I.

User response:  See message FSUM2032I.

System programmer response:  See message FSUM2032I.

FSUM2070I  Special characters may appear incorrect on the terminal. The length of the codeset string (codeset-length) in the character conversion table is too long.

Explanation:  The field containing the codeset name or locale name in the character conversion table is 64 bytes long. There is a separate length field in the table, which specifies the actual number of bytes used in the codeset name or locale name string. The specified string length was more than 64 bytes.

In the message text:

codeset-length
The length of the codeset string specified in the character conversion table.

System action:  The OMVS command continues. Characters in error messages and the help panel will not be converted from code page 1047 to the correct 3270 code page before they are written to the terminal. Certain special characters may appear incorrect on the 3270 screen.

User response:  If the CONVERT keyword on the OMVS command was used to override the default character conversion table, specify a different table. If the correct table was specified, contact the system programmer.

If the default character conversion table was used, contact the system programmer.

System programmer response:  This error normally occurs only when using customized character conversion tables. Fix the length field in the customized table so that matches the number of characters in the codeset name or locale name string. The maximum possible length is 64 characters.

FSUM2071I  An error occurred while the OMVS command was writing to the debug data set. No more debug information will be recorded.
Function = fwrite(), return value = return-value,
errno = errno-decimal (X’errno-hex’), reason code = reason-code, description = ‘system-message’

Explanation:  The OMVS command was entered with the DEBUG option. The OMVS command was unable to write debugging information to the debug data set. This error may occur when the first data is written, or after some data has been written successfully.

In the message text:

return-value
The return value from the fwrite() function.
errno-decimal
The errno value, in decimal, returned from fwrite(). If errno is 0, no errno information is available for this error.
errno-hex
The errno value, in hexadecimal, returned from fwrite().
reason-code
The reason code returned from fwrite(); if errno is 0, this reason code value may be incorrect.

system-message
The system message corresponding to the returned errno value; if errno is 0, the displayed system message is not meaningful.

System action:  The OMVS command does not record any more debugging data in the debug data set. The OMVS command tries to close the debug data set, but continues all other processing normally.

User response:  If the debug data is important, end the shell session and return to TSO/E. Make sure that the debug data set is defined as a sequential data set with fixed-length 80-byte records. If WRAPDEBUG(n) is not used, make sure that the data set has enough room for at least 10,000 80-byte records. If WRAPDEBUG(n) is used, make sure that the data set has enough room for at least n 80-byte records. If nothing appears to be wrong with the debug data set definition, contact the system programmer.

System programmer response:  Make sure that the debug data set is set up properly. Follow any suggested actions for the errno or reason code displayed in the TSO/E second-level message.

For more information about the displayed errno value from the fwrite() function, see z/OS XL C/C++ Run-Time Library Reference. For information about the return code from the fwrite callable service, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.
FSUM2072I

Function = fwrite(),
return value = return-value,
erro = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

Explanation: This is a TSO/E secondary message that appears following FSUM2071I when you press "?". For more information, see FSUM2071I.

System action: See message FSUM2071I.
User response: See message FSUM2071I.
System programmer response: See message FSUM2071I.

FSUM2073I

An error occurred while the OMVS command was closing the debug data set. Function = fclose(),
return value = return-value,
erro = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

Explanation: The OMVS command tried to close the debug data set. The debug data set is closed when the shell session returns to TSO/E. If message FSUM2071I also appeared, the debug data set was closed because of the write error.

In the message text:
return-value
The return value from the fclose() function.
errno-decimal
The errno value, in decimal, returned from fclose(); if errno is 0, no errno information is available for this error.
errno-hex
The errno value, in hexadecimal, returned from fclose().
reason-code
The reason code returned from fclose(); if errno is 0, this reason code value may be incorrect.
system-message
The system message corresponding to the returned errno value; if errno is 0, the displayed system message is not meaningful.

System action: The OMVS command continues normal processing. The recorded debugging information in the debug data set might or might not be complete.
User response: Contact the system programmer, with the data in the debug data set, and the information from the TSO/E second-level message.

FSUM2074I

Function = fclose(),
return value = return-value,
erro = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

Explanation: This is a TSO/E secondary message that appears following FSUM2073I when you press "?". For more information, see FSUM2073I.

System action: See message FSUM2073I.
User response: See message FSUM2073I.
System programmer response: See message FSUM2073I.

FSUM2075I The OMVS command could not send output data, because the terminal was logged off and could not be reached.

Explanation: The OMVS command could not write TSO/E full-screen data to the terminal, because it was logged off.

System action: The OMVS command ends and returns to TSO/E. Because the terminal is logged off, this error message will probably not show up on the screen.
User response: If the terminal is logged off, log on to TSO/E, then reenter the OMVS command. If the terminal is not logged off, contact the system programmer.
System programmer response: For more information, see return code 20 from the TPUT macro in z/OS TSO/E Programming Services.

FSUM2076I The OMVS command could not send output data to the terminal, because not enough storage was available.

Explanation: The OMVS command could not send full-screen output data to the terminal, because there was not enough storage.

System action: The OMVS command ends and returns to TSO/E. The shortage of storage may also prevent this message from showing up on the terminal.
**User response:** The OMVS command requires more storage than is currently available. To make more storage available, do one of the following:

- Enter the OMVS command directly from the TSO/E READY prompt.
- Enter the OMVS command from a 3270 display with a smaller screen size.
- Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.

**System programmer response:** For more information, see return code 32 from the TPUT macro in z/OS TSO/E Programming Services.

Make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for the TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

---

**FSUM2077I** The OMVS command could not obtain input data, because the terminal was logged off and could not be reached.

**Explanation:** The OMVS command could not obtain TSO/E full-screen data from the terminal, because it was logged off.

**System action:** The OMVS command ends and returns to TSO/E, without starting a shell session.

**User response:** If the terminal is logged off, log on to TSO/E, then reenter the OMVS command. If the terminal is not logged off, contact the system programmer.

**System programmer response:** For more information, see return code 20 from the TGET macro in z/OS TSO/E Programming Services.

---

**FSUM2078I**

No session was started. The home directory for this TSO/E user ID does not exist or cannot be accessed.

**Function = sigprocmask,**

`return value = return-value-hex`,

`return code = return-code`,

`reason code = reason-code`

**Explanation:** This is a TSO/E secondary message that appears following FSUM2078I when you press “?”. For more information, see FSUM2078I.

**System action:** See message FSUM2078I.

**User response:** See message FSUM2078I.

**System programmer response:** See message FSUM2078I.

---

**FSUM2079I**
FSUM2080I  The OMVS command could not request
an immediate response from the
terminal, because it was logged off and
could not be reached.

Explanation:  The OMVS command could not send
output requiring an immediate response from the
terminal, because it was logged off.

System action:  The OMVS command ends and
returns to TSO/E. Because the terminal is logged off,
this error message will probably not show up on the
screen.

User response:  If the terminal is logged off, log on to
TSO/E, then reenter the OMVS command. If the
terminal is not logged off, contact the system
programmer.

System programmer response:  For more
information, see return code 20 from the TPG macro in
z/OS TSO/E Programming Services

FSUM2081I  The OMVS command ended because
OpenMVS is no longer available.

Explanation:  The z/OS UNIX component ended or
was stopped while you were using the OMVS
command.

In the message text:

  139    tsname()

return-value
   The return value from the function. If this value is
zero, there is no return value available for this error.

errno-decimal
   The errno value, in decimal, returned from the
function. If this value is zero, there is no errno
available for this error.

errno-hex
   The errno value, in hexadecimal, returned from the
function.

reason-code
   The reason code returned from the function. If this
value is zero, there is no reason code for this error.

system-message
   The system message corresponding to the errno
value. If errno is zero, this message is not
meaningful.
System action: The OMVS command ends and returns to TSO/E. The OMVS command may also abend with EC6 abend code after this message is displayed.

User response: Wait for z/OS UNIX to be restarted before reentering the OMVS command.

System programmer response: If z/OS UNIX was not stopped or did not end, respond as indicated for the displayed reason code. For a description of the displayed errno and reason code values, see z/OS XL C/C++ Run-Time Library Reference.

FSUM2082I

Error code = error-code,
return value = return-value,
errno = erro-decimal (X’erro-hex’),
reason code = reason-code,
description = ‘system-message’

Explanation: This is a TSO/E secondary message that appears following FSUM2081I when you press “?”. For more information, see FSUM2081I.

System action: See message FSUM2081I.

User response: See message FSUM2081I.

System programmer response: See message FSUM2081I.

FSUM2083I

No session was started. OpenMVS was not active when you entered the OMVS command.

In the message text:
return-value-hex
The return value from sigprocmask.
return-code
The return code, in hexadecimal, from sigprocmask.
reason-code
The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

System action: The OMVS command ends and returns to TSO/E, without starting a shell session.

User response: Contact the system operator, to start z/OS UNIX, if required. Wait for z/OS UNIX to start and become fully active before reentering the OMVS command. If z/OS UNIX is already active, contact the system programmer with the reason shown in the second-level TSO/E message.

System programmer response: If z/OS UNIX is already active, follow the actions suggested in z/OS UNIX System Services Programming: Assembler Callable Services Reference for the displayed reason code.

FSUM2084I Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

Explanation: This is a TSO/E secondary message that appears following FSUM2083I when you press “?”. For more information, see FSUM2083I.

System action: See message FSUM2083I.

User response: See message FSUM2083I.

System programmer response: See message FSUM2083I.

FSUM2085I

No session was started. OpenMVS was stopped and has been restarted. Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

Explanation: A z/OS UNIX application other than the OMVS command is running in this address space. z/OS UNIX stopped and was restarted while that other application was still running. The OMVS command was entered after z/OS UNIX was restarted and before the other application ended.

All z/OS UNIX applications in an address space must end after z/OS UNIX is restarted, before you can enter the OMVS command again.

In the message text:
return-value-hex
The return value from sigprocmask.
return-code
The return code, in hexadecimal, from sigprocmask.
reason-code
The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

System action: The OMVS command ends and returns to TSO/E, without starting a shell session.

User response: Make sure all z/OS UNIX applications have ended. If ISPF is active, end it and get back to the TSO/E READY prompt. End any active REXX exec or CLIST. Then reenter the OMVS command.

If the error recurs, try logging off TSO/E. Log back on and reenter OMVS. If the error still recurs, contact the system programmer with the reason shown in the second-level TSO/E message.
System programmer response: If logging off and back on to TSO/E did not solve the problem, follow the actions suggested in z/OS UNIX System Services Programming: Assembler Callable Services Reference for the displayed reason code.

FSUM2086I  Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

Explanation: This is a TSO/E secondary message that appears following FSUM2085I when you press “?”.
For more information, see FSUM2085I.

System action: See message FSUM2085I.
User response: See message FSUM2085I.
System programmer response: See message FSUM2085I.

FSUM2087I  The SESSIONS(specified-sessions) operand on the OMVS command specified too many sessions. Maximum number of sessions = max-sessions

Explanation: The OMVS command could not start all the sessions asked for by the SESSIONS(n) operand.
The maximum number of sessions that OMVS can start is determined by the MAXPROCUSER or CHILD_MAX value for the system. OMVS cannot start more than MAXPROCUSER/2 shell sessions.

In the message text:

specified-sessions  The number of sessions specified by the OMVS command SESSIONS() operand.

max-sessions  The maximum number of shell sessions that can be started.

System action: The OMVS command tries to start the maximum number of sessions allowed. Processing continues with this reduced number of sessions.
User response: The maximum number of sessions allowed is shown in the message text. Specify no more than this number in the OMVS command SESSIONS() operand.

If more sessions are required, ask the system programmer to increase the value of MAXPROCUSER to at least twice the number of sessions required.

System programmer response: If required, increase the value of MAXPROCUSER to at least twice the number of sessions needed by each user ID.

FSUM2088I  The OMVS command ended unexpectedly. The recovery routine was invoked. OMVS control block address = omvs-block, C control block address = c-block

Explanation: The OMVS command has abended. There is probably another message that contains an abend code.

In the message text:

omvs-block  The address of the main TSO/E OMVS command control block.
c-block  The address of the main runtime library control block.

System action: The OMVS command ends, and control is returned to TSO/E. This message should be accompanied by message FSUM2089I.
User response: If this abend is unexpected, contact the system programmer.
System programmer response: See the recommended response for the abend code in z/OS MVS System Codes.

FSUM2089I  First OMVS module address = module1-address, second OMVS module address = module2-address, PSW = psw0–3 psw4–7

Explanation: This message is displayed after message FSUM2088I. This message contains additional information that may assist in problem determination.
See message FSUM2088I for a description of the error.

In the message text:

module1-address  The address of the main load module for the TSO/E OMVS command.
module2-address  The address of another load module for the TSO/E OMVS command.

psw0–3  The first 4 bytes of the error program status word (PSW).

psw4–7  The second 4 bytes of the error PSW.

System action: The OMVS command ends, and control is returned to TSO/E. This message should be accompanied by message FSUM2088I.
User response: If this abend is unexpected, contact the system programmer.
System programmer response: See message FSUM2088I.
The OMVS command ended because incorrect data was received from the terminal. This is a terminal or system error. No data bytes were received from the terminal.

Function = TGET,
return code = return-code
The first character (X’aid-byte’) was unexpected. Function = TGET,
return code = return-code,
data count = data-count
The location of the cursor was partly missing. Function = TGET,
return code = return-code,
data count = data-count,
data = incomplete-cursor

Unexpected control information was received from the terminal.
Function = TGET,
return code = return-code,
data count = data-count
Data describing the screen location of the input field was incomplete.
Function = TGET,
return code = return-code,
data count = data-count,
data = incomplete-address
The input data came in from an unexpected screen location.
Function = TGET,
return code = return-code,
data count = data-count,
data = unexpected-address
Input data came in from more than one location on the screen.
Function = TGET,
return code = return-code,
data count = data-count,
data from second field = second-field
Input data was received when none was expected. Function = TGET,
return code = return-code,
data count = data-count,
data = unexpected-input
The final character of input data was missing. Function = TGET,
return code = return-code,
data count = data-count,
data = incomplete-input
An unexpected character was found in the input data.
Function = TGET,
return code = return-code,
data count = data-count,
data = unexpected-bytes
Too much input data was received.
Function = TGET,

return code = return-code,
data count = data-count,
data = starting-data
An incorrect DBCS mixed string was received. Function = TGET,
return code = return-code,
data count = data-count,
data = mixed-data

Explanation: The OMVS command received incorrect data from the 3270 terminal. This error is probably caused by a terminal or system problem, and not by what the user entered. The second-level message describes the specific data stream error seen by the OMVS command:

FSUM2092I
The OMVS command issued TGET and received no data from the terminal. In full-screen mode, the terminal should always send in at least 1 byte of data (the AID byte).

FSUM2093I
The first byte of data from the terminal was not one of the expected 3270 AID bytes.

FSUM2094I
Only 2 bytes of data were received from the terminal in full-screen mode. This indicates that the second byte of the cursor address was missing in the data stream.

FSUM2095I
An unexpected display order was received from the terminal. The first display order in the data stream should be the 3270 SET BUFFER ADDRESS (SBA) order.

FSUM2096I
Exactly 5 bytes of input data were received from the terminal. The second byte of the screen address of the first input field is missing.

FSUM2097I
Input data was received from some location other than the usual OMVS command input area at the bottom of the screen. This error can be caused by repeatedly entering data while the normal OMVS command screen is not being displayed.

FSUM2098I
Input data was received from two or more input fields on the same screen. This error can be caused by repeatedly entering data while the normal OMVS command screen is not being displayed.

FSUM2099I
Input data was received while the OMVS command did not have an input area on the screen. This error can be caused by repeatedly entering data while the normal OMVS screen is not being displayed.
FSUM2100I  The data stream received from the terminal ended with a graphic escape (GE) character, but there was no character following the GE.

FSUM2101I  The data stream received from the terminal contained one or more of the following unexpected characters:
            SET ATTRIBUTE (SA)
            START FIELD (SF)
            START FIELD EXTENDED (SFE)
            SHIFT OUT (SO)
            SHIFT IN (SI)
            NULL

FSUM2102I  Too much data was received from the terminal. The data was too long to fit in the normal input area at the bottom of the screen. This error can be caused by repeatedly entering data while the normal OMVS command screen is not being displayed.

FSUM2103I  An odd-length DBCS subfield in a mixed DBCS string was received from the terminal. In addition, the final (odd) byte was out of range for DBCS data. The terminal should never send in odd-length DBCS subfields or incorrect characters in DBCS subfields.

In the message text:

return-code  The return code from TSO/E.

aid-byte  The first byte of data, in hexadecimal, from the terminal. This is the unexpected 3270 AID byte.

data-count  The number of bytes of data received from the terminal.

incomplete-cursor  The 2 bytes of data, in hexadecimal, received from the terminal. The last byte is the incomplete cursor address.

unexpected-order  The first few bytes of data, in hexadecimal, received from the terminal. These bytes contain the unexpected 3270 display order that was received.

incomplete-address  The first 5 bytes of data, in hexadecimal, received from the terminal. The last byte of data is the incomplete screen address of the first input field.

unexpected-address  The first few bytes of data, in hexadecimal, received from the terminal. These bytes contain the unexpected screen address of the input data.

second-field  The first few bytes of data, in hexadecimal, received from the second input field on the screen.

unexpected-input  The first few bytes of data, in hexadecimal, received from the terminal. These bytes contain the unexpected input data.

incomplete-input  The last few bytes of data, in hexadecimal, received from the terminal. The last byte of data is the start of an incomplete graphic escape character.

unexpected-bytes  A few bytes of data, in hexadecimal, received from the terminal. The first byte of data is the unexpected character.

starting-data  The first few bytes of data, in hexadecimal, received from the terminal.

mixed-data  The last few bytes of an odd-length DBCS subfield received from the terminal. The last byte is the usually the Shift In (SI) or Shift Out (SO) character that ends the incorrect subfield.

System action:  The OMVS command ends and returns to TSO/E, ending the shell session.

User response:  Report this problem to the system programmer.

System programmer response:  Examine the bytes of data from the terminal in the second-level message. If there is a terminal data stream error, determine the cause of this error.

If there is too much data or data from unexpected input fields, there may be no terminal or system problem. It is possible that the user repeatedly entered data while the normal OMVS command screen was not being displayed. In these cases, use the DEBUG(DATA) keyword on the TSO/E OMVS command to trace the data from the terminal.

FSUM2092I  No data bytes were received from the terminal. Function = TGET, return code = return-code

Explanation:  This is a TSO/E secondary message that appears following FSUM2091I when you press “?”. For more information, see FSUM2091I.

System action:  See message FSUM2091I.

User response:  See message FSUM2091I.

System programmer response:  See message FSUM2091I.
FSUM2093I

The first character (X'aid-byte') was unexpected. Function = TGET, return code = return-code, data count = data-count

Explanation: This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

System action: See message FSUM2091I.
User response: See message FSUM2091I.
System programmer response: See message FSUM2091I.

FSUM2094I

The location of the cursor was partly missing. Function = TGET, return code = return-code, data count = data-count, data = incomplete-cursor

Explanation: This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

System action: See message FSUM2091I.
User response: See message FSUM2091I.
System programmer response: See message FSUM2091I.

FSUM2095I

Unexpected control information was received from the terminal. Function = TGET, return code = return-code, data count = data-count, data = unexpected-order

Explanation: This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

System action: See message FSUM2091I.
User response: See message FSUM2091I.
System programmer response: See message FSUM2091I.

FSUM2096I

Data describing the screen location of the input field was incomplete. Function = TGET, return code = return-code, data count = data-count, data = incomplete-address

Explanation: This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

System action: See message FSUM2091I.
User response: See message FSUM2091I.
System programmer response: See message FSUM2091I.

FSUM2097I

The input data came in from an unexpected screen location. Function = TGET, return code = return-code, data count = data-count, data = unexpected-address

Explanation: This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

System action: See message FSUM2091I.
User response: See message FSUM2091I.
System programmer response: See message FSUM2091I.

FSUM2098I

Input data came from more than one location on the screen. Function = TGET, return code = return-code, data count = data-count, data from second field = second-field

Explanation: This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

System action: See message FSUM2091I.
User response: See message FSUM2091I.
System programmer response: See message FSUM2091I.

FSUM2099I

Input data was received when none was expected. Function = TGET, return code = return-code, data count = data-count, data = unexpected-input

Explanation: This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.
FSUM2100I

The final character of input data was missing. Function = TGET,
return code = return-code,
data count = data-count,
data = incomplete-input

Explanation: This is a TSO/E secondary message that appears following FSUM2091I when you press “?”. For more information, see FSUM2091I.

System action: See message FSUM2091I.
User response: See message FSUM2091I.
System programmer response: See message FSUM2091I.

FSUM2101I

An unexpected character was found in the input data.
Function = TGET,
return code = return-code,
data count = data-count,
data = unexpected-bytes

Explanation: This is a TSO/E secondary message that appears following FSUM2091I when you press “?”. For more information, see FSUM2091I.

System action: See message FSUM2091I.
User response: See message FSUM2091I.
System programmer response: See message FSUM2091I.

FSUM2102I

Too much input data was received. Function = TGET,
return code = return-code,
data count = data-count,
data = starting-data

Explanation: This is a TSO/E secondary message that appears following FSUM2091I when you press “?”. For more information, see FSUM2091I.

System action: See message FSUM2091I.
User response: See message FSUM2091I.
System programmer response: See message FSUM2091I.

FSUM2103I

An incorrect DBCS mixed string was received. Function = TGET,
return code = return-code,
data count = data-count,
data = mixed-data

Explanation: This is a TSO/E secondary message that appears following FSUM2091I when you press “?”. For more information, see FSUM2091I.

System action: See message FSUM2091I.
User response: See message FSUM2091I.
System programmer response: See message FSUM2091I.

FSUM2107I

The OMVS command ended because OpenMVS was restarted.
Error code = error-code,
return value = return-value,
errno = errno-decimal('errno-hex'),
reason code = reason-code,
description = "system-message"

Explanation: The z/OS UNIX component ended or was stopped while you were using the OMVS command. z/OS UNIX was then restarted.

In the message text:

error-code
The error code shows which function reported that z/OS UNIX was restarted:
68 fork()
70 chdir()
71 getlogin()
72 getpwnam()
73 dup2()
74 open()
75 setsid()
76 close()
77 close()
78 close()
78 close()
79 attach_exec
80 kill()
81 write()
82 read()
83 catopen()
84 sigprocmask()
85 sigaddset()
86 sigemptyset()
87 sigpending()
88 sigismember()

fstat()
fstat()
ptsname()
ttyname()

return-value
The return value from the function. If this value is zero, there is no return value available for this error.

errno-decimal
The_errno value, in decimal, returned from the function. If this value is zero, there is no errno available for this error.

errno-hex
The_errno value, in hexadecimal, returned from the function.

reason-code
The reason code returned from the function. If this value is zero, there is no reason code for this error.

system-message
The system message corresponding to the errno value. If errno is zero, this message is not meaningful.

System action: The OMVS command ends and returns to TSO/E. The OMVS command may also abend with EC6 abend code after this message is displayed.

User response: Make sure all z/OS UNIX applications have ended. If ISPF is active, end it and return to the TSO/E READY prompt. End any active REXX exec or CLIST. Then reenter the OMVS command.

If the error recurs, try logging off TSO/E. Log back on and reenter OMVS. If the error still recurs, contact the system programmer with the reason shown in the second-level TSO/E message.

System programmer response: If logging off and back on to TSO/E did not solve the problem, respond as indicated for the displayed reason code. For a description of the displayed errno and reason code values, see z/OS XL C/C++ Run-Time Library.

Reference

FSUM2108I

Error code = error-code,
return value = return-value,
_errno = errno-decimal (X’errno-hex’),
reason code = reason-code,
description = ’system-message’

Explanation: This is a TSO/E secondary message that appears following FSUM2107I when you press “?”. For more information, see FSUM2107I.

System action: See message FSUM2107I.

User response: See message FSUM2107I.

System programmer response: See message FSUM2107I.

FSUM2109I The OMVS command ended because too many consecutive rewrites of the same screen were required.

Explanation: The OMVS command received many consecutive reshow indications from TSO/E. Each reshow indication causes the OMVS command to completely rewrite the entire screen. If too many consecutive reshow indications occur, the OMVS command may be in a screen refresh loop. This error can be caused by:

• Pressing the <PA2> key many times consecutively without pressing any other keys in between.
• Receiving many files or TSO/E messages from other users continuously for a long period of time while the OMVS command is running.
Running the **OMVS** command with the **DEBUG** option directed to the terminal. This happens if you have allocated the debug file to the terminal using a command such as **ALLOCATE FILE(SYSFSUMO) DATASET(*)**.

**System action:** The **OMVS** command ends and returns to TSO/E.

**User response:** Do not press the <PA2> key consecutively too many times without entering any data or pressing any function keys. Do not allocate the debug file to the terminal. If this error was not caused by one of these two actions, contact the system programmer.

**System programmer response:** If there is no apparent explanation for this error, report the problem to the IBM support center.

---

**FSUM2110I**  
**User abend code** = user-abend-code,  
**reason code** = reason-code

**Explanation:** This is a TSO/E secondary message that appears following FSUM2113I when you press “?”. For more information, see FSUM2113I.

**System action:** See message FSUM2113I.

**User response:** See message FSUM2113I.

**System programmer response:** See message FSUM2113I.

---

**FSUM2111I**  
The **TSO/E-command-name** command ended with return code = return-code-decimal (X’return-code-hex’).

**Explanation:** The TSO/E command ended with the nonzero return code displayed in the message. This TSO/E message is issued only if the **OMVS** command was invoked with the **DEBUG** option.

In the message text:

- **TSO/E-command-name**  
  The name of the TSO/E command that was being run.

- **return-code-decimal**  
  The return code, in decimal, from the TSO/E command.

- **return-code-hex**  
  The return code, in hexadecimal, from the TSO/E command.

**System action:** The **OMVS** command continues processing as usual. The invoked TSO/E command may have failed.

**User response:** Consult the appropriate return code documentation for the TSO/E command. The failing TSO/E command may have issued error messages. Perform the responses for these messages. To suppress this message, enter the **OMVS** command without specifying the **DEBUG** option.

**System programmer response:** Perform the responses in the messages for the TSO/E command. This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 4. For more information about IKJEFTSR return codes, see [z/OS TSO/E Programming Services](https://publib.boulder.ibm.com/infocenter/zos/v1r11/index.jsp?topic=%2Fcom.ibm.zos.v1r11.tsoclamp%2Fpdf%2Fztlabcperf.pdf).

---

**FSUM2112I**  
The **TSO/E-command-name** command ended because of an attention interruption.

**Explanation:** The <Attention> key was pressed while the TSO/E command was running. This attention interruption caused the TSO/E command to end and return to the **OMVS** command.

In the message text:

- **TSO/E-command-name**  
  The name of the TSO/E command that was being run.

**System action:** The TSO/E command ends and returns to the **OMVS** command. The **OMVS** command continues processing normally. The TSO/E command may have issued other error messages.

**User response:** If this error was not caused by pressing the <Attention> key, contact the system programmer. If the TSO/E command issued any error messages, perform the responses for these messages.

**System programmer response:** This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 8. For more information about IKJEFTSR return codes, see [z/OS TSO/E Programming Services](https://publib.boulder.ibm.com/infocenter/zos/v1r11/index.jsp?topic=%2Fcom.ibm.zos.v1r11.tsoclamp%2Fpdf%2Fztlabcperf.pdf).

---

**FSUM2113I**  
The **TSO/E-command-name** command ended abnormally.

**Explanation:** A TSO/E command ended abnormally, with a user or system abend. The abend codes and reason codes are displayed in the second-level TSO/E message. See [z/OS MVS System Codes](https://www.ibm.com/support/docview chống?rs=11540&uid=swg21369316) for the system abend code and reason code. If a user abend code is displayed, see appropriate documentation for user abend codes from this TSO/E command.

In the message text:

- **TSO/E-command-name**  
  The name of the TSO/E command that was being run when the abend occurred.

- **user-abend-code**  
  The user abend code from the TSO/E command.

- **reason-code**  
  The reason code for the abend.

- **system-abend-code**  
  The system abend code from the TSO/E command.
System action: The TSO/E command ends, and control returns to the OMVS command. The OMVS command continues processing normally.

Normally, the system does not request a dump for this error. However, if the DEBUG option was specified on the TSO/E OMVS command, the system requests a dump.

User response: Perform the responses for the user and system abend codes and the reason code. Other error messages may have appeared. If so, perform the responses for those messages.

System programmer response: This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 12. For more information about IKJEFTSR return codes, see z/OS TSO/E Programming Services.

FSUM2114I System abend code = system-abend-code, user abend code = user-abend-code, reason code = reason-code

Explanation: This is a TSO/E secondary message that appears following FSUM2113I when you press “?”. For more information, see FSUM2113I.

System action: See message FSUM2113I.

User response: See message FSUM2113I.

System programmer response: See message FSUM2113I.

FSUM2115I System abend code = system-abend-code, reason code = reason-code

Explanation: This is a TSO/E secondary message that appears following FSUM2113I when you press “?”. For more information, see FSUM2113I.

System action: See message FSUM2113I.

User response: See message FSUM2113I.

System programmer response: See message FSUM2113I.

FSUM2116I The TSO/E-command-name command was not found.

Explanation: The requested TSO/E command was not found, so it could not be run.

In the message text:

TSO/E-command-name
   The name of the TSO/E command that was requested.

System action: The OMVS command continues processing normally. The requested command is not run.

User response: Correct the name of the TSO/E command and try again. If the TSO/E command name was typed correctly, contact the system programmer.

System programmer response: Make sure that the user has access to the requested TSO/E command.

This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 20 and reason code 40. For more information about IKJEFTSR return codes and reason codes, see z/OS TSO/E Programming Services.

FSUM2117I TSO/E-command-name is an unsupported background function.

Explanation: The system cannot run the requested TSO/E command because it is running in the background.

In the message text:

TSO/E-command-name
   The name of the TSO/E command that was requested.

System action: The OMVS command continues processing normally. The requested command is not run.

User response: Contact the system programmer with this message number and the name of the requested TSO/E command.

System programmer response: This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 20 and reason code 52. For more information about IKJEFTSR return codes and reason codes, see z/OS TSO/E Programming Services.

FSUM2118I TSO/E-command-name is an authorized function, but a copy of the function could not be found in an authorized library.

Explanation: The system cannot run the requested TSO/E command. The TSO/E command is authorized but could not be found in an authorized library.

In the message text:

TSO/E-command-name
   The name of the TSO/E command that was to be run.

System action: The OMVS command continues processing normally. The requested authorized command is not run.

User response: Contact the system programmer with this message number and the name of the requested TSO/E command.

System programmer response: This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 20 and reason code 56. For
more information about IKJEFTSR return codes and reason codes, see z/OS TSO/E Programming Services.

If the requested TSO/E command should be authorized, make sure it is available to this TSO/E user in an authorized library. If the requested command is not supposed to be authorized, make sure that it is not marked as authorized.

FSUM2119I  The command name contains a syntax error.

Explanation:  The entered command name is not valid. It contains a syntax error.

System action:  The OMVS command continues processing normally. The requested command was not run.

User response:  Correct the name of the TSO/E command and try it again. If the command name is correct, contact the system programmer.

System programmer response:  This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 20 and reason code 44. For more information about IKJEFTSR return codes and reason codes, see z/OS TSO/E Programming Services.

FSUM2120I

Function = unlockpt(),
file descriptor = unlock-filedescriptor,
terminal name = "TTY-name",
return value = unlock-return-value,
errno = unlock-errno-decimal
(X'unlock-errno-hex'),
reason code = unlock-reason-code,
description = 'system-message'

Explanation:  This is a TSO/E secondary message that appears following FSUM2170I when you press “?”. For more information, see FSUM2170I.

System action:  See message FSUM2170I.

User response:  See message FSUM2170I.

System programmer response:  See message FSUM2170I.

FSUM2121I

TSO/E encountered an unexpected failure while trying to run the command.+ Function = IKJEFTSR,
return code = return-code,
reason code = reason-code

Explanation:  TSO/E reported an unexpected error when running the requested TSO/E command. This error was not detected by the OMVS command.

In the message text:

return-code  The return code from the TSO/E IKJEFTSR service.
reason-code  The reason code from the TSO/E IKJEFTSR service.

System action:  The system displays the error message and waits for the user to request the second-level TSO/E error message or enter the next TSO/E command.

User response:  Note the message ID and the return code and reason code from the second-level message. Contact the system programmer with this information.

System programmer response:  This error was detected by the TSO service routine (IKJEFTSR), which ended with the return code and reason code shown in the second-level TSO/E message. For an explanation of the return code and reason code reported by IKJEFTSR, see z/OS TSO/E Programming Services. Take the appropriate action for this return code and reason code from IKJEFTSR.

FSUM2122I  Function = IKJEFTSR, return code = return-code, reason code = reason-code

Explanation:  This is a TSO/E secondary message that appears following FSUM2121I when you press “?”. For more information, see FSUM2121I.

System action:  See message FSUM2121I.

User response:  See message FSUM2121I.

System programmer response:  See message FSUM2121I.

FSUM2123I

An unknown error was reported while the system was running the command.+ Function = IKJEFTSR,
unknown return code = unknown-return-code
Function = IKJEFTSR,
return code = return-code,
unknown reason code = unknown-reason-code

Explanation:  The system tried to run the requested TSO/E command. The system reported a return code or reason code that was unknown to the OMVS command.

In the message text:

unknown-return-code
The return code from the TSO/E IKJEFTSR service. The OMVS command did not recognize this return code.
The return code from the TSO/E IKJEFTSR service.

The reason code from the TSO/E IKJEFTSR service. The OMVS command did not recognize this reason code.

**System action:** The system displays the error message and waits for the user to request the second-level TSO/E error message or enter the next TSO/E command.

**User response:** Note the message ID and the return code and reason code from the second-level message. Contact the system programmer with this information.

**System programmer response:** This error was detected by the TSO service routine (IKJEFTSR), which ended with the return code and reason code shown in the second-level TSO/E message. The OMVS command did not recognize this return code or reason code. For an explanation of the return code and reason code reported by IKJEFTSR, see z/OS TSO/E Programming Services. Take the appropriate action for this return code and reason code from IKJEFTSR.

**Explanation:** This is a TSO/E secondary message that appears following FSUM2123I when you press “?”.

For more information, see FSUM2123I.

**System action:** See message FSUM2123I.

**User response:** See message FSUM2123I.

**System programmer response:** See message FSUM2123I.

---

**FSUM2124I** Function = IKJEFTSR, unknown return code = unknown-return-code

**Explanation:** This is a TSO/E secondary message that appears following FSUM2123I when you press “?”.

For more information, see FSUM2123I.

**System action:** See message FSUM2123I.

**User response:** See message FSUM2123I.

**System programmer response:** See message FSUM2123I.

---

**FSUM2125I** Function = IKJEFTSR, return code = return-code, unknown reason code = unknown-reason-code

**Explanation:** This is a TSO/E secondary message that appears following FSUM2123I when you press “?”.

For more information, see FSUM2123I.

**System action:** See message FSUM2123I.

**User response:** See message FSUM2123I.

**System programmer response:** See message FSUM2123I.

---

**FSUM2126I** An unexpected error was reported while the system was running the command.

**Explanation:** This is a TSO/E secondary message that appears following FSUM2123I when you press “?”.

For more information, see FSUM2123I.

**System action:** See message FSUM2123I.

**User response:** See message FSUM2123I.

**System programmer response:** See message FSUM2123I.
FSUM2129I

No session was started. The program to start the shell could not be invoked.+

Function = attach_exec,
program name = 'program-name',
return value = return-value,
erro = erro-decimal (X'erro-hex'),
reason code = reason-code,
description = 'system-message'

Explanation: The OMVS command could not invoke the login program that starts the z/OS UNIX shell. The attach_exec function failed with the erro and reason code displayed in the second-level TSO/E message.

In the message text:

program-name
   The name of the login program passed to attach_exec.

return-value
   The return value from attach_exec.

erro-decimal
   The erro value, in decimal, returned from attach_exec.

erro-hex
   The erro value, in hexadecimal, returned from attach_exec.

reason-code
   The reason code returned from attach_exec.

system-message
   The system message corresponding to the returned erro value.

System action: The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

User response: Try the OMVS command or OPEN subcommand again. If this problem persists, contact the system programmer with all information displayed in the second-level TSO/E message.

System programmer response: For an explanation of the erro and reason code from attach_exec, see z/OS UNIX System Services Programming: Assembler Callable Services Reference. Follow any suggested actions for this erro value and reason code.

Check that the program named in the message (the login program) exists in the file system. Make sure the program file has the proper execute permissions so this user can run it and that the permissions for the directory containing the program are set properly so this user is allowed access. Make sure that the SETUID and SETGID flags are not set for this program.

FSUM2131I

The OMVS command was unable to obtain the next input line.+

Function = PUTGET, return code = return-code

Explanation: The OMVS command was unable to obtain the next TSO/E command from the terminal. The system reported an unexpected error. For more information about the displayed return code from PUTGET, see z/OS TSO/E Programming Services.

In the message text:

return-code
   The return code from the TSO/E PUTGET service.

System action: The OMVS command automatically returns from TSO/E mode back to subcommand mode or to the shell.

User response: Contact the system programmer with the message number and the return code displayed in the second-level TSO/E message.

System programmer response: For more information about return codes from PUTGET, see z/OS TSO/E Programming Services. It is possible that the OMVS command was invoked from another application or CLIST. This application or CLIST may have set up the TSO/E input stack in such a way that the OMVS command could not obtain any lines after the user switched to TSO/E.
FSUM2133I

No session was started. No more processes can be started for this UID. Function = sigprocmask,
return value = return-value-hex,
return code = return-code,
reason code = reason-code

Explanation: This UID was already running the maximum allowed number of processes when the OMVS command was entered. The new process required for the OMVS command could not start.

Active z/OS UNIX batch jobs submitted for this TSO/E user ID count as processes for this UID. Other TSO/E user IDs may share the same UID with this TSO/E user ID. If those user IDs are currently using z/OS UNIX, their processes also count toward the maximum allowed for this UID.

In the message text:
return-value-hex
   The return value from sigprocmask.
return-code
   The return code, in hexadecimal, from sigprocmask.
reason-code
   The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

System action: The OMVS command ends and returns to TSO/E, without starting a shell session.

User response: Wait for any z/OS UNIX batch jobs from this TSO/E user ID to end before reentering the OMVS command. Other TSO/E user IDs may share a common UID with this user ID. Reenter the OMVS command after one of those TSO/E user IDs has finished using z/OS UNIX.

Ask the system programmer to increase the maximum number of processes allowed per UID.

System programmer response: If required, increase the maximum number of processes allowed for a UID. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see z/OS UNIX System Services Planning.

To see other suggested actions for the displayed reason code and return code, refer to z/OS UNIX System Services Programming: Assembler Callable Services Reference.

FSUM2134I

Function = sigprocmask,
return value = return-value-hex,
return code = return-code,
reason code = reason-code

Explanation: This is a TSO/E secondary message that appears following FSUM2133I when you press “?”.
For more information, see FSUM2133I.

System action: See message FSUM2133I.

User response: See message FSUM2133I.

System programmer response: See message FSUM2133I.

FSUM2135I

No session was started. No more UIDs can log in to the shell. Function = sigprocmask,
return value = return-value-hex,
return code = return-code,
reason code = reason-code

Explanation: The TSO/E OMVS command was entered when no more UIDs were allowed to use z/OS UNIX. The OMVS command cannot start until some other UID stops using z/OS UNIX.

In the message text:
return-value-hex
   The return value from sigprocmask.
return-code
   The return code, in hexadecimal, from sigprocmask.
reason-code
   The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

System action: The OMVS command ends and returns to TSO/E, without starting a shell session.

User response: Wait for another UID to stop using z/OS UNIX, before reentering the OMVS command.

Ask the system programmer to increase the maximum number UIDs that can use z/OS UNIX.

System programmer response: If required, increase the maximum number of UIDs that can use z/OS UNIX. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see z/OS UNIX System Services Planning.

To see other suggested actions for the displayed reason code and return code, refer to z/OS UNIX System Services Programming: Assembler Callable Services Reference.

FSUM2136I

Function = sigprocmask,
return value = return-value-hex,
return code = return-code,
reason code = reason-code

Explanation: This is a TSO/E secondary message
that appears following FSUM2135I when you press “?”.
For more information, see FSUM2135I.

**System action:** See message FSUM2135I.

**User response:** See message FSUM2135I.

**System programmer response:** See message FSUM2135I.

---

### FSUM2137I

No session was started. Too many processes are already active in the system.+
Function = sigprocmask,
return value = return-value-hex,
return code = return-code,
reason code = reason-code

**Explanation:** The OMVS command was entered when the maximum number of processes was already running. The new process required for the OMVS command could not start.

In the message text:

- **return-value-hex**
  - The return value from sigprocmask.
- **return-code**
  - The return code, in hexadecimal, from sigprocmask.
- **reason-code**
  - The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

**System action:** The OMVS command ends and returns to TSO/E without starting a shell session.

**User response:** Retry the OMVS command later, when the system is not as busy.

Ask the system programmer to increase the maximum number processes that can be active at one time.

**System programmer response:** If required, increase the maximum number of processes allowed for z/OS UNIX. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see [z/OS UNIX System Services Planning](#).

To see other suggested actions for the displayed reason code and return code, refer to [z/OS UNIX System Services Programming: Assembler Callable Services Reference](#).

---

### FSUM2138I

Function = sigprocmask,
return value = return-value-hex,
return code = return-code,
reason code = reason-code

**Explanation:** This is a TSO/E secondary message that appears following FSUM2137I when you press “?”.
For more information, see FSUM2137I.

**System action:** See message FSUM2137I.

**User response:** See message FSUM2137I.

**System programmer response:** See message FSUM2137I.

---

### FSUM2139I

No session was started. Too many files and pseudo-TTYs are already in use.+
Function = open(),
terminal name = 'TTY-name',
return value = return-value,
errno = errno-decimal(X'errno-hex'),
reason code = reason-code,
description = 'system-message'

**Explanation:** OMVS was unable to open the pseudo-TTY required to start a session with the shell. Too many file descriptors were already open for this process. Each open file and pseudo-TTY uses one of the available file descriptors.

This error is most likely to occur if you are trying to start too many shell sessions. Each shell session requires at least one open pseudo-TTY.

It may also occur if you did not enter the OMVS command directly from the TSO/E READY prompt. In this case, other running applications may have open files.

You may have switched to TSO/E while using the OMVS command. If you enter a second OMVS command, both instances of OMVS will have open files, and the combined number of open files may exceed the limit.

In the message text:

- **TTY-name**
  - The pseudo-TTY name that was passed to open() when this error occurred.
- **return-value**
  - The return value from open().
- **errno-decimal**
  - The errno value, in decimal, returned from open().
- **errno-hex**
  - The errno value, in hexadecimal, returned from open().
- **reason-code**
  - The reason code returned from open().
- **system-message**
  - The system message corresponding to the returned errno value.

**System action:** The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.
User response:  Try not to start so many shell sessions. Specify fewer initial sessions on the OMVS command.

If you did not enter the OMVS command from the TSO/E READY prompt, make sure that no other programs that use files are running. This includes OEDIT, OBROWSE, ISHELL, and other instances of the OMVS command. End the other programs that use files, and try the OMVS command again. If the error still occurs, try entering the OMVS command directly from the TSO/E READY prompt.

If you entered the OMVS command directly from the TSO/E READY prompt, contact the system programmer.

System programmer response:  If required, increase the number of open files allowed for a process. For more information about this open() error, see z/OS XL C/C++ Run-Time Library Reference. Follow any recommended actions for this errno and reason code.

---

FSUM2140I

Function = open(),
terminal name = 'TTY-name',
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

Explanation:  This is a TSO/E secondary message that appears following FSUM2139I when you press “?”. For more information, see FSUM2139I.

System action:  See message FSUM2139I.
User response:  See message FSUM2139I.
System programmer response:  See message FSUM2139I.

---

FSUM2141I

An unexpected error caused the OMVS command to end.+
Error code = error-code,
return code = return-code-decimal (X'return-code-hex'),
abend code = abend-code, r
reason code = reason-code,
error data = error-data,
error string = 'error-string'
Error code = error-code,
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

Explanation:  The OMVS command invoked an MVS or z/OS UNIX C function. That function failed with an unexpected return code, reason code, abend code, or errno.

If the failing routine is an ANSI C function (error code = 193), see z/OS XL C/C++ Run-Time Library Reference for a description of the displayed errno value.

If the failing routine is a z/OS UNIX C function (error code = 161, 162, 171-179, or 181-185), see z/OS XL C/C++ Run-Time Library Reference for a description of the displayed errno (z/OS UNIX return code) and reason code values.

If the failing routine is a TSO/E service (error code = 12-15, 21, 23-26, 32, 41-44, 53-56, 58, 62, 66, and 67), see z/OS TSO/E Programming Services Reference ABE-HSP for a description of the displayed return code and reason code values.

If the failing routine is an MVS service (error code = 11 or 29), see z/OS MVS Programming: Assembler Services Reference ABE-HSP for a description of the displayed abend code and reason code values.

If a nonzero abend code is displayed, see z/OS MVS System Codes for a description of the displayed abend code and reason code values.

The system may have issued other error messages that further explain the error.

In the message text:

error-code

The error code shows which function failed:

```

**return-code-decimal**
- The return code, in decimal, from a called function.

**return-code-hex**
- The return code, in hexadecimal, from a called function.

**abend-code**
- An abend code associated with this error. If this value is zero, there is no abend code for this error.

**reason-code**
- A reason code associated with this error. If this value is zero, there is no reason code available for this error.

**error-data**
- Additional data associated with this error. If this value is zero, there is no additional data for this error.

**error-string**
- A string of characters that provides additional error information. If this string is empty, no error string is available for this error.

**return-value**
- The return value from the function. If this value is zero, there is no return value available for this error.

**errno-decimal**
- The errno value, in decimal, returned from the function.

**errno-hex**
- The errno value, in hexadecimal, returned from the function.

**system-message**
- The system message corresponding to the returned errno value. If errno is zero, this message is not meaningful.

**System action:** The OMVS command ends immediately, and returns to TSO/E.

**User response:** Contact the system programmer with this message number and the displayed error information from the second-level TSO/E message.

**System programmer response:** Follow the suggested actions for the abend code, return code, and reason code displayed in the message.

```
FSUM2142I
```

**Error code = error-code,**
**return code = return-code-decimal**
(X’return-code-hex’),
**abend code = abend-code,**
**reason code = reason-code,**

---

FSUM2145I

An internal error caused the OMVS command to end.+

**Error code** = error-code,  
**reason code** = reason-code,  
**error data** = error-data,  
**error string** = error-string

**Error code** = error-code,  
**return value** = return-value,  
**errno** = errno-decimal (X’errno-hex’),  
**reason code** = reason-code,  
**description** = ‘system-message’

**Error code** = error-code

**Explanation:** The OMVS command detected an error, probably in the OMVS command or the message catalog.

In the message text:

**error-code**

The code for this error.

**reason-code**

An additional reason code associated with this error. If this value is zero, there is no additional reason code for this error.

**error-data**

Additional data associated with this error. If this value is zero, there is no additional data for this error.

**error-string**

A string of characters that provides additional error information. If this string is empty, no error string is available for this error.

---

**System programmer response:** See message FSUM2145I.
FSUM2148I  Error code = error-code

Explanation: This is a TSO/E secondary message that appears following FSUM2145I when you press “?”.
For more information, see FSUM2145I.

System action: See message FSUM2145I.
User response: See message FSUM2145I.
System programmer response: See message FSUM2145I.

FSUM2149I

No session was started. No pseudo-TTYs are available.+ Function = stat(),
ending name = 'TTY-name',
return value = return-value,
erro = erro-decimal (X'erro-hex'),
reason code = reason-code,
description = 'system-message'

Explanation: The OMVS command could not obtain a free pseudo-TTY which is required to start a session
with the shell.

All pseudo-TTYs may be in use, or one or more may be
unusable because of error conditions or definition
errors.

If errors prevented the system from using one or more
available pseudo-TTYs, other error messages should
appear. See those messages for more information.

In the message text:
TTY-name
The pseudo-TTY name that was passed to stat() when
this error occurred.

return-value
The return value from stat().

erro-decimal
The erro value, in decimal, returned from stat().

erro-hex
The erro value, in hexadecimal, returned from
stat().

reason-code
The reason code returned from stat().

system-message
The system message corresponding to the returned
erro value.

System action: The shell session is not started. If there are no other active sessions, the OMVS command
ends and returns to TSO/E.

User response: If no other error messages appeared
with this one, all existing pseudo-TTYs may be in use.
You can try the OPEN subcommand or OMVS
command again later.

If other error messages appeared, perform the
responses for those messages. If this problem is
persistent, contact your system programmer with the
information from all displayed messages.

System programmer response: If the pseudo-TTY
name in the second-level message is one higher than
the last pseudo-TTY defined, the OMVS command
looked at all the defined pseudo-TTYs and could not
find one that was usable. If other messages appeared
with this message, errors prevented the OMVS
command from using some of the defined pseudo-TTYs.
For more information, see the descriptions for those
messages.

If all pseudo-TTYs are busy, you may need to define
more pseudo-TTYs. This allows more users to start
shell sessions.

If the displayed pseudo-TTY name is one that should be
defined in the system, an error occurred when the
system tried to see if that pseudo-TTY was defined. For
a description of the erro values and reason codes from
stat(), see [z/OS XL C/C++ RUN-TIME LIBRARY REFERENCE
MADE EASY](https://pubdocs.chz/). Make
sure that this master pseudo-TTY is defined
correctly. The system looks for pseudo-TTYs starting at
/dev/ptyp0000 and continues looking for pseudo-TTYs
up through /dev/ptyp9999, in order. As soon as the
system fails for one of these pseudo-TTYs, it looks no
further.

FSUM2150I

Function = stat(),
ending name = 'TTY-name',
return value = return-value,
erro = erro-decimal (X'erro-hex'),
reason code = reason-code,
description = 'system-message'

Explanation: This is a TSO/E secondary message
that appears following FSUM2149I when you press “?”.
For more information, see FSUM2149I.

System action: See message FSUM2149I.
User response: See message FSUM2149I.
System programmer response: See message FSUM2149I.

FSUM2151I

No session was started. The selected pseudo-TTY could not be
opened.+ Function = open(),
terminal name = 'TTY-name',
return value = return-value,
erro = erro-decimal (X'erro-hex'),
reason code = reason-code,
description = 'system-message'

Explanation: This error message appears with
FSUM2149I to provide additional information. The OMVS command found a free pseudo-TTY. When it tried to open the slave side of this pseudo-TTY, an error occurred. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see [z/OS XL C/C++ Run-Time Library Reference](#).

In the message text:

**TTY-name**
The pseudo-TTY name that was passed to `open()` when this error occurred.

**return-value**
The return value from `open()`.

**errno-decimal**
The errno value, in decimal, returned from `open()`.

**errno-hex**
The errno value, in hexadecimal, returned from `open()`.

**reason-code**
The reason code returned from `open()`.

**system-message**
The system message corresponding to the returned errno value.

**System action:** The system continues to try other defined pseudo-TTYs. However, this message appears only when no other pseudo-TTY is usable. The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

**User response:** Contact the system programmer with all the information from all second-level TSO/E messages that appeared with this one.

**System programmer response:** This message contains information about the first error the system found when trying to open a slave pseudo-TTY. The system was able to open the corresponding master pseudo-TTY, but could not open the slave side. For an explanation of this `open()` error, see [z/OS XL C/C++ Run-Time Library Reference](#). Follow any recommended actions for this errno and reason code.

In general, make sure that for each master pseudo-TTY with a name such as `/dev/ptypNNNN`, there is a corresponding slave pseudo-TTY with a name such as `/dev/ttypNNNN`. Make sure that this slave pseudo-TTY is defined with the proper permissions and the proper major and minor number.

**Note:** The system may have experienced many slave pseudo-TTY `open()` failures. Only the first failure is reported by an error message. Any `open()` errors for other slave pseudo-TTYs might or might not be the same.

---

**FSUM2152I**

Function = `open()`,

terminal name = 'TTY-name',

return value = return-value,

errno = errno-decimal (X'errno-hex'),

reason code = reason-code,

description = 'system-message'

**Explanation:** This is a TSO/E secondary message that appears following FSUM2151I when you press "?". For more information, see FSUM2151I.

**System action:** See message FSUM2151I.

**User response:** See message FSUM2151I.

**System programmer response:** See message FSUM2151I.

---

**FSUM2153I**

No session was started. The process required for the shell could not be created.

Function = `fork()`,

return value = return-value,

errno = errno-decimal (X'errno-hex'),

reason code = reason-code,

description = 'system-message'

**Explanation:** The OMVS command could not create the shell process. The `fork()` function failed with the errno and reason code displayed in the second-level TSO/E message. For an explanation of the errno and reason code, see [z/OS XL C/C++ Run-Time Library Reference](#) and [z/OS UNIX System Services Programming: Assembler Callable Services Reference](#).

The system may be too busy to start new processes at this time.

In the message text:

**return-value**
The return value from `fork()`.

**errno-decimal**
The errno value, in decimal, returned from `fork()`.

**errno-hex**
The errno value, in hexadecimal, returned from `fork()`.

**reason-code**
The reason code returned from `fork()`.

**system-message**
The system message corresponding to the returned errno value.

**System action:** The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

**User response:** Try the OMVS command or OPEN.
subcommand again. If this problem persists, contact the system programmer with all information displayed in the second-level TSO/E message.

System programmer response: For an explanation of the errno and reason code from `fork()`, see z/OS XL C/C++ Run-Time Library Reference. Follow any suggested actions for this errno value and reason code.

FSUM2154I

Function = `fork()
return value = `return-value`
errno = `errno-decimal` (X'errno-hex'),
reason code = `reason-code`,
description = `system-message`

Explanation: This is a TSO/E secondary message that appears following FSUM2153I when you press “?”. For more information, see FSUM2153I.

System action: See message FSUM2153I.

User response: See message FSUM2153I.

System programmer response: See message FSUM2153I.

FSUM2155I

No session was started. The OMVS command side of the pseudo-TTY could not be set up properly.+
Function = `close()`,
file descriptor = `close-file-descriptor`,
terminal name = `TTY-name`,
return value = `close-return-value`,
errno = `close-errno-decimal` (X'close-errno-hex'),
reason code = `close-reason-code`,
description = `system-message`

Function = `fcntl()`,
terminal name = `TTY-name`,
file descriptor = `fcntl-file-descriptor`,
return value = `fcntl-return-value`,
errno = `fcntl-errno-decimal` (X'fcntl-errno-hex'),
reason code = `fcntl-reason-code`,
description = `system-message`

Explanation: The system obtained a pseudo-TTY to use for the session with the shell. While this pseudo-TTY was being prepared, one of two errors occurred:

FSUM2156I

The OMVS command ran `fork()` or `attach_exec` to create the process for the z/OS shell. The main OMVS command process was then unable to close the slave side of the pseudo-TTY. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see z/OS XL C/C++ Run-Time Library Reference.

FSUM2165I

This error message appears along with FSUM2149I to provide additional information. The system found a free master pseudo-TTY. It then tried to issue `fcntl()` to set the close-on-exec flag (FD_CLOEXEC) for the master pseudo-TTY, and `fcntl()` returned this error. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see z/OS XL C/C++ Run-Time Library Reference.

In the message text:

`close-file-descriptor`  
The file descriptor that was passed to `close()` when this error occurred.

`TTY-name`  
The pseudo-TTY name that was in use when this error occurred.

`close-return-value`  
The return value from `close()`.

`close_errno-decimal`  
The errno value, in decimal, returned from `close()`.

`close_errno-hex`  
The errno value, in hexadecimal, returned from `close()`.

`close_reason-code`  
The reason code returned from `close()`.

`system-message`  
The system message corresponding to the returned errno value.

`fcntl-file-descriptor`  
The file descriptor that was passed to `fcntl()` when this error occurred.

`fcntl_return-value`  
The return value from `fcntl()`.

`fcntl_errno-decimal`  
The errno value, in decimal, returned from `fcntl()`.

`fcntl_errno-hex`  
The errno value, in hexadecimal, returned from `fcntl()`.

`fcntl_reason-code`  
The reason code returned from `fcntl()`.

System action: The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

User response: Contact the system programmer with all the information from all second-level TSO/E messages that appeared with this one.

System programmer response: For an explanation of
the errno and reason code from `fcntl()` or `close()`, see [z/OS XL C/C++ Run-Time Library Reference](#). Follow any recommended actions for this errno and reason code.

**Note:** The system may have experienced many master pseudo-TTY `fcntl()` failures if message FSUM2165I was shown. Only the first failure is reported by an error message. Any `fcntl()` errors for other master pseudo-TTYs might not be the same.

</tbody>
</table>

**Explanation:** This is an informational message that appears along with other error messages, FSUM2149I in particular. Those error messages describe an error that prevented the system from using one or more defined master pseudo-TTYs. The system tries to close the unusable master pseudo-TTY before going on to try the next defined pseudo-TTY. The close() function failed with the errno and reason code displayed in the second-level TSO/E message. For an explanation of this errno and reason code, see [z/OS XL C/C++ Run-Time Library Reference](#).

**Note:** The system may have experienced many master pseudo-TTY close() failures. Only the first failure is reported by an error message. Any close() errors for other master pseudo-TTYs might not be the same.

**Explanation:** This is a TSO/E secondary message that appears following FSUM2157I when you press "?". For more information, see FSUM2157I.

**System action:** See message FSUM2157I.

**User response:** See message FSUM2157I.

**System programmer response:** This message contains information about the first error the system found when trying to close a master pseudo-TTY. For an explanation of this close() error, see [z/OS XL C/C++ Run-Time Library Reference](#). Follow any recommended actions for this errno and reason code.

**Note:** The system may have experienced many master pseudo-TTY close() failures. Only the first failure is reported by an error message. Any close() errors for other master pseudo-TTYs might not be the same.
System programmer response: See message FSUM2157I.

FSUM2159I

No session was started. This TSO/E user ID has no defined UID.+
Function = sigprocmask,
return value = return-value-hex,
return code = return-code,
reason code = reason-code

Explanation: There is no UID defined in the RACF user profile for this TSO/E user ID. z/OS UNIX cannot be used unless a UID is assigned.

In the message text:
return-value-hex
The return value from sigprocmask.
return-code
The return code, in hexadecimal, from sigprocmask.
reason-code
The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

System action: The OMVS command ends and returns to TSO/E without starting a shell session.

User response: Ask the system programmer to define a UID for this TSO/E user ID.

System programmer response: Define a UID in the RACF user profile for this TSO/E user ID. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.
To see other suggested actions for the displayed reason code and return code, refer to z/OS UNIX System Services Programming: Assembler Callable Services Reference.

FSUM2161I

Function = sigprocmask,
return value = return-value-hex,
return code = return-code,
reason code = reason-code

Explanation: This is a TSO/E secondary message that appears following FSUM2159I when you press "?". For more information, see FSUM2159I.

System action: See message FSUM2159I.

User response: See message FSUM2159I.

System programmer response: See message FSUM2159I.

FSUM2162I

Function = sigprocmask,
return value = return-value-hex,
return code = return-code,
reason code = reason-code

Explanation: This is a TSO/E secondary message that appears following FSUM2161I when you press "?". For more information, see FSUM2161I.

System action: See message FSUM2161I.

User response: See message FSUM2161I.

System programmer response: See message FSUM2161I.
FSUM2163I

One or more defined pseudo-TTYs cannot be used.+
Function = open(),
  terminal name = 'TTY-name',
  return value = return-value,
  errno = errno-decimal (X'errno-hex'),
  reason code = reason-code,
  description = 'system-message'

Explanation: This error message appears along with FSUM2149I to provide additional information. The system was looking for a free pseudo-TTY. When it tried to open the master side of the pseudo-TTY named in the error message, an open() error occurred. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see z/OS XL C/C++ Run-Time Library Reference.

In the message text:

TTY-name
  The pseudo-TTY name that was passed to open() when this error occurred.

return-value
  The return value from open().

errno-decimal
  The errno value, in decimal, returned from open().

erro-hex
  The errno value, in hexadecimal, returned from open().

reason-code
  The reason code returned from open().

system-message
  The system message corresponding to the returned errno value.

System action: The system continues to try other defined pseudo-TTYs. However, this message appears only when no other pseudo-TTY is usable. The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

User response: Contact the system programmer with all the information from all second-level TSO/E messages that appeared with this one.

System programmer response: This message contains information about the first error the system found when trying to open a master pseudo-TTY. For an explanation of this open() error, see z/OS XL C/C++ Run-Time Library Reference. Follow any recommended actions for this errno and reason code.

Make sure that the master pseudo-TTY (whose name is displayed in the error message) is defined with the proper permissions and the proper major and minor number.

Note: The system may have experienced many master pseudo-TTY open() failures. Only the first failure is reported by an error message. Any open() errors for other master pseudo-TTYs might or might not be the same.

FSUM2164I

Function = open(),
  terminal name = 'TTY-name',
  return value = return-value,
  errno = errno-decimal (X'errno-hex'),
  reason code = reason-code,
  description = 'system-message'

Explanation: This is a TSO/E secondary message that appears following FSUM2163I when you press “?”. For more information, see FSUM2163I.

System action: See message FSUM2163I.

User response: See message FSUM2163I.

System programmer response: See message FSUM2163I.

FSUM2165I

Function = fcntl(),
  terminal name = 'TTY-name',
  file descriptor = fcntl-file-descriptor,
  return value = fcntl-return-value,
  errno = fcntl_errno decimal(X'er-errno-hex'),
  reason code = fcntl_reason-code,
  description = 'system-message'

Explanation: This is a TSO/E secondary message that appears following FSUM2155I when you press “?”. For more information, see FSUM2155I.

System action: See message FSUM2155I.

User response: See message FSUM2155I.

System programmer response: See message FSUM2155I.

FSUM2166I

No session was started. The shell cannot start, because too many processes are already active for this UID.+
Function = fork(),
  return value = return-value,
  errno = errno-decimal(X'errno-hex'),
  reason code = reason-code,
  description = 'system-message'

Explanation: When the TSO/E OMVS command or OPEN subcommand was entered, close to the maximum number of processes were already active for this UID. The process required for the shell could not be
created. At least two processes must be available for this UID when the TSO/E OMVS command is run. At least one process must be available for this UID when the OPEN subcommand is run.

Each shell session takes up at least one process for this UID. Active z/OS UNIX batch jobs submitted for this TSO/E user ID count as processes for this UID. Other TSO/E user IDs may share the same UID with this TSO/E user ID. If those user IDs are currently using z/OS UNIX, their processes also count toward the maximum allowed for this UID.

In the message text:

return-value
  The return value from fork().

errno-decimal
  The errno value, in decimal, returned from fork().

errno-hex
  The errno value, in hexadecimal, returned from fork().

reason-code
  The reason code returned from fork().

system-message
  The system message corresponding to the returned errno value.

System action:  The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

User response:  Try not to start so many shell sessions. Specify fewer initial sessions on the TSO/E OMVS command.

Retry the TSO/E OMVS command or OPEN subcommand later, when the system is not as busy.

Ask the system programmer to increase the maximum number of processes allowed per UID.

System programmer response:  If required, increase the maximum number of processes allowed for a UID. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see z/OS UNIX System Services Planning.

For an explanation of the errno and reason code from fork(), see z/OS XL C/C++ Run-Time Library.

Reference:  Follow any suggested actions for this errno value and reason code.

FSUM2167I

Function  =  fork(),
return value  =  return-value,
errno  =  errno-decimal  (X’errno-hex’),
reason code  =  reason-code,
description  =  ‘system-message’

Explanation:  This is a TSO/E secondary message that appears following FSUM2166I when you press “?”. For more information, see FSUM2166I.

System action:  See message FSUM2166I.

User response:  See message FSUM2166I.

System programmer response:  See message FSUM2166I.

FSUM2168I

No session was started.  The shell cannot start, because too many processes are already active in the system.+

Function  =  fork(),
return value  =  return-value,
errno  =  errno-decimal  (X’errno-hex’),
reason code  =  reason-code,
description  =  ‘system-message’

Explanation:  When the OMVS command or OPEN subcommand was entered, close to the maximum number of processes were already active in the system. The process required for the shell could not be created. The system must be able to start at least two more processes before the OMVS command can run. The system must be able to start at least one more process before the OPEN subcommand can run.

In the message text:

return-value
  The return value from fork().

errno-decimal
  The errno value, in decimal, returned from fork().

errno-hex
  The errno value, in hexadecimal, returned from fork().

reason-code
  The reason code returned from fork().

system-message
  The system message corresponding to the returned errno value.

System action:  The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

User response:  Try not to start so many shell sessions. Specify fewer initial sessions on the TSO/E OMVS command.

Retry the TSO/E OMVS command or OPEN subcommand later, when the system is not as busy.

Ask the system programmer to increase the maximum number of processes that can be active at one time.

System programmer response:  If required, increase
the maximum number of processes allowed for z/OS UNIX. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see z/OS UNIX System Services Planning.

For an explanation of the errno and reason code from \texttt{fork()}, see z/OS XL C/C++ Run-Time Library Reference. Follow any suggested actions for this errno value and reason code.

\textbf{FSUM2169I}

\begin{itemize}
  \item \textbf{Function} = \texttt{fork()},
  \item \textbf{return value} = \texttt{return-value},
  \item \textbf{errno} = \texttt{errno-decimal (X'errno-hex')},
  \item \textbf{reason code} = \texttt{reason-code},
  \item \textbf{description} = \texttt{system-message}
\end{itemize}

\end{itemize}

\textbf{reason code} = \texttt{set-reason-code},
\textbf{description} = \texttt{system-message}

\textbf{Explanation}: The system obtained a pseudo-TTY to use for the session with the shell. While this pseudo-TTY was being prepared, one of four errors occurred:

\textbf{FSUM2090I}
The OMVS command was unable to change the ownership of the slave pseudo-TTY to the real userid. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see z/OS XL C/C++ Run-Time Library Reference and z/OS UNIX System Services Programming: Assembler Callable Services Reference.

\textbf{FSUM2120I}
The OMVS command was unable to unlock the slave pseudo-TTY. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see z/OS XL C/C++ Run-Time Library Reference and z/OS UNIX System Services Programming: Assembler Callable Services Reference.

\textbf{FSUM2180I}
The OMVS command was unable to obtain the attributes (termios structure) for the Pseudo-TTY. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see z/OS XL C/C++ Run-Time Library Reference.

\textbf{FSUM2190I}
The OMVS command was unable to place the pseudo-TTY into 3270 control packet mode. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see z/OS XL C/C++ Run-Time Library Reference.

In the message text:
\begin{itemize}
  \item \texttt{grant-file-descriptor}
    The file descriptor that was passed to \texttt{grantpt()} when this error occurred.
  \item \texttt{TTY-name}
    The pseudo-TTY name that was in use when this error occurred.
  \item \texttt{grant-return-value}
    The return value from \texttt{grantpt()}.
  \item \texttt{grant-errno-decimal}
    The errno value, in decimal, returned from \texttt{grantpt()}.
  \item \texttt{grant-errno-hex}
    The errno value, in hexadecimal, returned from \texttt{grantpt()}.
\end{itemize}
The pseudo-TTY could not be closed after trying to record the end of the session.

Function = close(),
file descriptor = file-descriptor,
terminal name = 'TTY-name',
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

**Explanation:** The system was unable to close the master pseudo-TTY before returning to TSO/E. The pseudo-TTY named in the second-level TSO/E message may be open or closed at this time. For more information on the errno and reason code from close(), see the z/OS XL C++ Run-Time Library Reference.

When the next user tries to use this pseudo-TTY, an error may occur.

In the message text:

file-descriptor
The file descriptor that was passed to close() when this error occurred.

TTY-name
The pseudo-TTY name that was in use when this error occurred.

return-value
The return value from close().

errno-decimal
The errno value, in decimal, returned from close().

erno-hex
The errno value, in hexadecimal, returned from close().

reason-code
The reason code returned from close().

system-message
The system message corresponding to the returned errno value.

**System action:** The OMVS command ends the session. The end of this user's session with the z/OS shell has been recorded, unless other error messages appear along with this one. If there are no other active
sessions, the **OMVS** command ends and returns to TSO/E.

**User response:** Contact the system programmer with the message number and any information displayed in the second-level TSO/E message.

**System programmer response:** For more information about the errno and reason code from `close()`, see [Z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com/support/docview.wss?uid=swg27048997). Follow any suggested actions for this reason code and errno value.

---

**FSUM2172I**

Function = `close()`,

file descriptor = `file-descriptor`,

terminal name = `TTY-name`,

return value = `return-value`,

errno = `errno-decimal` (X'`errno-hex'`),

reason code = `reason-code`,

description = `system-message`

**Explanation:** This is a TSO/E secondary message that appears following FSUM2171I when you press “?”. For more information, see FSUM2171I.

**System action:** See message FSUM2171I.

**User response:** See message FSUM2171I.

**System programmer response:** See message FSUM2171I.

---

**FSUM2173I**

The end of the session may not have been recorded. The recording process could not be canceled, and may still be active.+

Function = `kill()`,

terminal name = `TTY-name`,

process ID = `process-id`,

return value = `return-value`,

errno = `errno-decimal` (X'`errno-hex'`),

reason code = `reason-code`,

description = `system-message`

**Explanation:** This is a TSO/E secondary message that appears following FSUM2173I when you press “?”.

For more information, see FSUM2173I.

**System action:** OMVS ends the shell session. If there are no other active sessions, the **OMVS** command ends and returns to TSO/E.

The end of this user’s session with the shell might not have been recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

**User response:** Contact the system programmer with the message number and any information displayed in the second-level TSO/E message.

**System programmer response:** For more information about the errno and reason code from `kill()`, see [Z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com/support/docview.wss?uid=swg27048997) Follow any suggested actions for this reason code and errno value.

---

**FSUM2174I**

Function = `kill()`,

terminal name = `TTY-name`,

process ID = `process-id`,

return value = `return-value`,

errno = `errno-decimal` (X'`errno-hex'`),

reason code = `reason-code`,

description = `system-message`

**Explanation:** This error message appears along with other error messages, FSUM2189I and FSUM2183I in particular. See the descriptions for those messages for additional information about this error. After starting the logoff recording process, the system had to end the process, using `kill()`, but the `kill()` function failed with the displayed errno and reason code. For more information on the errno and reason code from `kill()`, see [Z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com/support/docview.wss?uid=swg27048997)

The logoff recording process might or might not exist after `kill()`. If message FSUM2189I appeared along with this message, the logoff recording process may have finished as `kill()` was issued. In this case, there is no real problem, except that the logoff recording process took much longer than it should have.

In the message text:

**TTY-name**

The pseudo-TTY name that was in use when this error occurred.

**process-id**

The process ID of the recording process that was passed to `kill()`.

**return-value**

The return value from `kill()`.

**errno-decimal**

The errno value, in decimal, returned from `kill()`.

**errno-hex**

The errno value, in hexadecimal, returned from `kill()`.

**reason-code**

The reason code returned from `kill()`.

**system-message**

The system message corresponding to the returned errno value.

**System action:** OMVS ends the shell session. If there are no other active sessions, the **OMVS** command ends and returns to TSO/E.

The end of this user’s session with the shell might not have been recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

**User response:** Contact the system programmer with the message number and any information displayed in the second-level TSO/E message.

**System programmer response:** For more information about the errno and reason code from `kill()`, see [Z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com/support/docview.wss?uid=swg27048997) Follow any suggested actions for this reason code and errno value.

---

Chapter 1. Messages 121
System programmer response: See message FSUM2173I.

FSUM2175I The end of the session was not recorded. The name of the logged-on user could not be determined.

Explanation: The system needs to determine the name of the TSO/E user, so that the end of the session can be recorded. The system invoked the getlogin (BPX1GLG) function, which returned no user name. For more information about BPX1GLG errors, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

System action: OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E. The end of the user’s session with the shell is not recorded.

Because the end of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

User response: Contact the system programmer.

System programmer response: For a description of errors from BPX1GLG, see z/OS UNIX System Services Programming: Assembler Callable Services Reference. If there are any system error messages on the console, follow the suggested actions for these messages.

FSUM2176I The end of the session was not recorded. The recording process could not start.+

Function = fork(),
terminal name = 'TTY-name',
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

Explanation: The system tried to start the z/OS UNIX process required for the logoff recording program. When fork() was issued, it failed with the errno and reason code displayed in the second-level TSO/E message. For more information on the errno and reason code from fork(), see z/OS XL C/C++ Run-Time Library Reference. If there are any system error messages on the console, follow the suggested actions for these messages.

This error can occur if the system is very busy and cannot start any new processes.

In the message text:

TTY-name
 The pseudo-TTY name that was in use when this error occurred.

return-value
 The return value from fork().

errno-decimal
 The errno value, in decimal, returned from fork().

errno-hex
 The errno value, in hexadecimal, returned from fork().

reason-code
 The reason code returned from fork().

system-message
 The system message corresponding to the returned errno value.

System action: OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E. The end of the user’s session with the shell is not recorded.

Because the end of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

User response: Contact the system programmer with the message number and any information displayed in the second-level TSO/E message.

System programmer response: For more information about the errno and reason code from fork(), see z/OS XL C/C++ Run-Time Library Reference. Follow any suggested actions for this reason code and errno value.

FSUM2177I

Function = waitpid(),

- Function = fork(),
- terminal name = 'TTY-name',
- return value = return-value,
- errno = errno-decimal (X'errno-hex'),
- reason code = reason-code,
- description = 'system-message'

Explanation: This is a TSO/E secondary message that appears following FSUM2176I when you press “?”. For more information, see FSUM2176I.

System action: See message FSUM2176I.

User response: See message FSUM2176I.

System programmer response: See message FSUM2176I.

FSUM2178I

The end of the session may not have been recorded. The recording process ended, or did not start, and the outcome is unknown.+

Function = waitpid(),

- Function = fork(),
- terminal name = 'TTY-name',
- return value = return-value,
- errno = errno-decimal (X'errno-hex'),
- reason code = reason-code,
- description = 'system-message'
terminal name = 'TTY-name',
process ID = process-id

**Explanation:** The system started the logoff recording process to record the end of this user's session with the shell. However, the system was unable to find out what happened to the logoff recording process. That process apparently disappeared from the system.

In the message text:

TTY-name
The pseudo-TTY name that was in use when this error occurred.

process-id
The process ID of the recording process that was passed to waitpid().

**System action:** OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user's session with the shell might not have been recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

**User response:** Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

**System programmer response:** waitpid() was issued for the process ID shown in the second-level TSO/E message. waitpid() returned with errno set to ECHILD, indicating that the logoff recording process was no longer in the system. The OMVS command could not get the ending status from the logoff recording process, so its outcome is not known.

Look for any other error messages or abend messages that might appear on the system console. Follow any recommended actions for these messages.

---

**FSUM2170I**

Function = tcgetattr(),
file descriptor = get-file-descriptor,
terminal name = 'TTY-name',
return value = get-return-value,
errno = get-errno-decimal (X'errno-hex'),
reason code = get-reason-code,
description = 'system-message'

**Explanation:** This is a TSO/E secondary message that appears following FSUM2170I when you press “?”. For more information, see FSUM2170I.

**System action:** See message FSUM2170I.

**User response:** See message FSUM2170I.

**System programmer response:** See message FSUM2170I.

---

**FSUM2180I**

Function = waitpid(),
terminal name = 'TTY-name',
process ID = process-id,
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

**Explanation:** The system started the logoff recording process to record the end of this user's session with the shell. However, the system was unable to find out what happened to the logoff recording process. An error occurred when the OMVS command issued waitpid() to get the ending status from the logoff recording process. waitpid() failed with the errno and reason code displayed in the second-level TSO/E message. For an explanation of the errno value and the reason code, see [z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com/support/knowledgecenter/SX3U73_2.1.0/com.ibm.zos.r21.sib6e幸_120aacs00.txt).

In the message text:

TTY-name
The pseudo-TTY name that was in use when this error occurred.

process-id
The process ID of the recording process that was passed to waitpid().

return-value
The return value from waitpid().

errno-decimal
The errno value, in decimal, returned from waitpid().
errno-hex
The errno value, in hexadecimal, returned from waitpid().

reason-code
The reason code returned from waitpid().

system-message
The system message corresponding to the returned errno value.

System action: OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E. The end of this user's session with the shell might not have been recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

User response: Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

System programmer response: See message FSUM2181I. For more information about the errno and reason code from waitpid(), see z/OS XL C/C++ Run-Time Library Reference. Follow any recommended actions for this errno value and reason code.

FSUM2182I
Function = waitpid(),
terminal name = 'TTY-name',
process ID = process-id,
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

Explanation: This is a TSO/E secondary message that appears following FSUM2181I when you press "?". For more information, see FSUM2181I.

System action: See message FSUM2181I.

User response: See message FSUM2181I.

System programmer response: See message FSUM2181I.

FSUM2183I
The end of the session may not have been recorded. The recording process stopped unexpectedly, before completion, so it was canceled.+

Function = waitpid(),
terminal name = 'TTY-name',
process ID = process-id,
signal = signal-number

Explanation: This is a TSO/E secondary message that appears following FSUM2183I when you press "?". For more information, see FSUM2183I.

System action: See message FSUM2183I.

User response: See message FSUM2183I.

System programmer response: See message FSUM2183I.
The end of the session may not have been recorded. The recording process ended unexpectedly, before completion. 
Function = waitpid(),
terminal name = 'TTY-name',
process ID = process-id,
signal = signal-number

Explanation: The system started the logoff recording process to record the end of this user's session with the shell. That process ended because it received the signal number displayed in the second-level TSO/E message.

This error could have happened if some authorized user issued the kill command to end the logoff process while it was running.

In the message text:
TTY-name
The pseudo-TTY name that was in use when this error occurred.

process-id
The process ID of the recording process that was passed to waitpid().

signal-number
The number of the signal that caused the logoff recording process to end unexpectedly. For a list of z/OS UNIX signal numbers, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

System action: OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user's session with the shell might not have been recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

User response: Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

System programmer response: Make sure that authorized users do not stop or kill the logoff recording process while it is running. If any other error messages appeared at the system console, follow any recommended actions for those messages.

The end of the session was not recorded. The proper location for recording could not be found. 
Function = getutxline(),
terminal name = 'TTY-name',
user name = user-name,
return value = return-value

Explanation: The system was trying to record the end of the user's session with the shell in the /etc/utmpx file. It could not find the record for this user's pseudo-TTY in that file.

In the message text:
TTY-name
The pseudo-TTY name that was in use when this error occurred.

user-name
The name of the logged-on user.

return-value
The return value from getutxline().

System action: OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E. The end of the user's session with the shell is not recorded.

Because the end of the session with the shell was not recorded in the /etc/utmpx file, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

User response: Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

System programmer response: Make sure that the /etc directory is defined, and that /etc/utmpx exists and has the proper permissions. Make sure that /bin/fsumoclo (the logoff recording program) has the SETUID flag set in its directory entry.

For an explanation of the return value from getutxline(), see z/OS XL C/C++ Run-Time Library Reference.
FSUM2188I

Function = getutxline(),
terminal name = 'TTY-name',
user name = user-name,
return value = return-value

Explanation: This is a TSO/E secondary message that appears following FSUM2187I when you press "?". For more information, see FSUM2187I.

System action: See message FSUM2187I.
User response: See message FSUM2187I.
System programmer response: See message FSUM2187I.

FSUM2189I The end of the session might not have been recorded. The recording process took too much time, so it was canceled.

Explanation: The system started the logoff recording process to record the end of this user’s session with the shell. That process did not end within the required time limit. Since the TSO/E terminal is locked until the logoff recording process ends, the process was canceled.

The logoff recording process may have hung. It is also possible that the system is extremely slow, and the logoff recording process was not hung.

System action: OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user’s session with the shell might not have been recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

User response: Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

System programmer response: The logoff recording process may have been hung. This is especially likely if other processes are also hung. Make sure that there is no problem reading and writing the /etc/utmpx file.

If any other error messages appeared at the system console, follow any recommended actions for those messages.

FSUM2190I

Function=grantpt(),
file descriptor = grant-file-descriptor,
terminal name = 'TTY-name',
return value = grant-return-value,
errno = grant_errno-decimal (X'grant_errno-hex'),
reason code = grant_reason-code,
description = 'system-message'

Explanation: This is a TSO/E secondary message that appears following FSUM2170I when you press "?". For more information, see FSUM2170I.

System action: See message FSUM2170I.
User response: See message FSUM2170I.
System programmer response: See message FSUM2170I.

FSUM2191I

Function = pututxline(),
terminal name = 'TTY-name',
errno = errno-decimal (X'errno-hex'),
description = 'system-message'

Explanation: The system invoked the logoff recording program to record the end of the user’s session with the shell. The pututxline() function failed with the errno value displayed in the second-level TSO/E message. For a description of the errno value, see [z/OS XL C/C++ Run-Time Library Reference]. The reason code from pututxline() is not available for this error.

In the message text:

TTY-name
The pseudo-TTY name that was in use when this error occurred.

errno-decimal
The errno value, in decimal, returned from pututxline().

errno-hex
The errno value, in hexadecimal, returned from pututxline().

system-message
The system message corresponding to the returned errno value.

System action: OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user’s session with the shell was probably not recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

User response: Contact the system programmer with the message number and any error information displayed in the second-level TSO/E messages.
System programmer response: Make sure that the logoff recording program (/bin/fsumoclo) has the SETUID flag set in the directory entry. Make sure that the /etc/utmpx file has the correct permissions.

Follow any recommended actions for errno values returned from the pututxline() function.

FSUM2192I

Function = pututxline(),
terminal name = 'TTY-name',
erro = errno-decimal (X'errno-hex'),
description = 'system-message'

Explanation: This is a TSO/E secondary message that appears following FSUM2191I when you press "?". For more information, see FSUM2191.

System action: See message FSUM2191I.
User response: See message FSUM2191I.
System programmer response: See message FSUM2191I.

FSUM2193I  The end of the session was not recorded. The slot for this terminal could not be updated.

Explanation: The system invoked the logoff recording program to record the end of the user’s session with the shell. The pututxline() function failed. The errno and reason code from pututxline() are not available for this error.

System action: OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user’s session with the shell was probably not recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

User response: Contact the system programmer with the message number.

System programmer response: Make sure that the logoff recording program (/bin/fsumoclo) has the SETUID flag set in the directory entry. Make sure that the /etc/utmpx file has the correct permissions.

Follow any recommended actions for errors from the pututxline() function.

FSUM2194I

The end of the session was not recorded. The recording program could not be invoked.+ Function = execve(),
terminal name = 'TTY-name',
program name = 'program-name',
erro = errno-decimal (X'errno-hex'),
description = 'system-message'

Explanation: The system was unable to invoke the logoff recording program. When execve() was issued to invoke the program named in the second-level TSO/E message, an error occurred. The errno value from the failing execve() invocation is displayed in the second-level TSO/E message. For an explanation of the errno value, see [Z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com/support/knowledgecenter/SSS720_1.2.2). The reason code is not available for this error.

In the message text:

TTY-name
The pseudo-TTY name that was in use when this error occurred.

program-name
The name of the logoff recording program passed to execve().

errno-decimal
The errno value, in decimal, returned from execve().

errno-hex
The errno value, in hexadecimal, returned from execve().

system-message
The system message corresponding to the returned errno value.

System action: OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E. The end of the user’s session with the shell is not recorded.

Because the end of the session with the shell was not recorded in the /etc/utmpx file, certain shell commands may show that this user is still logged on. The problem will clear up when the next user logs in to the shell using the same pseudo-TTY that this user had.

User response: Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

System programmer response: For more information about the errno value from execve(), see [Z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com/support/knowledgecenter/SSS720_1.2.2). Follow any recommended actions for this errno value and reason code.

Make sure that /bin/fsumoclo (the logoff recording program) exists in the file system and that it has the execute permissions set in its directory entry. Also make sure that the SETUID flag is set for /bin/fsumoclo.
FSUM2195I

Function = execve(),
terminal name = 'TTY-name',
program name = 'program-name',
errno = errno-decimal (X'errno-hex'),
description = 'system-message'

Explanation: This is a TSO/E secondary message that appears following FSUM2194I when you press "?". For more information, see FSUM2194I.

System action: See message FSUM2194I.
User response: See message FSUM2194I.
System programmer response: See message FSUM2194I.

FSUM2196I The end of the session was not recorded. The recording program could not be invoked.

Explanation: The system was unable to invoke the logoff recording program. When execve() was issued to invoke the program named in the second-level TSO/E message, an error occurred. Neither the reason code nor the errno value from execve() is available for this error.

System action: OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E. The end of the user's session with the shell is not recorded.

Because the end of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that this user is still logged on. The problem will clear up when the next user logs in to the shell using the same pseudo-TTY that this user had.

User response: Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

System programmer response: Make sure that /bin/fsumoclo (the logoff recording program) exists in the file system and that it has the execute permissions set in its directory entry. Also make sure that the SETUID flag is set for /bin/fsumoclo.

FSUM2197I

The end of the session may not have been recorded. The recording program could not get the authority needed to do the recording.

Function = seteuid(),
terminal name = 'TTY-name',
program name = 'program-name',
errno = errno-decimal (X'errno-hex'),
description = 'system-message'

Explanation: The logoff recording program tried to obtain the authority needed to record the end of the user's shell session in the /etc/utmpx file. An error occurred when this program (/bin/fsumoclo) issued seteuid() to obtain the proper authority. The errno value from the failing seteuid() invocation is displayed in the second-level TSO/E message. For an explanation of the errno value, see z/OS XL C/C++ Run-Time Library Reference. The reason code is not available for this error.

In the message text:

TTY-name
The pseudo-TTY name that was in use when this error occurred.

program-name
The name of the logoff recording program being run.

errno-decimal
The errno value, in decimal, returned from seteuid().

errno-hex
The errno value, in hexadecimal, returned from seteuid().

system-message
The system message corresponding to the returned errno value.

System action: OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user's session with the shell was probably not recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

User response: Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

System programmer response: For more information about the errno value from seteuid(), see z/OS XL C/C++ Run-Time Library Reference. Follow any recommended actions for this errno value.

Make sure that the logoff recording program (/bin/fsumoclo) has the SETUID flag set in the directory entry.

FSUM2198I

Function = seteuid(),
terminal name = 'TTY-name',
program name = 'program-name',
errno = errno-decimal (X'errno-hex'),
description = 'system-message'
Explanation: This is a TSO/E secondary message that appears following FSUM2197I when you press "?". For more information, see FSUM2197I.

System action: See message FSUM2197I.

User response: See message FSUM2197I.

System programmer response: See message FSUM2197I.

FSUM2199I The end of the session may not have been recorded. The recording program could not get the authority needed to do the recording.

Explanation: The logoff recording program tried to obtain the authority needed to record the end of the user's shell session in the /etc/utmpx file. An error occurred when this program (/bin/fsumoclo) issued seteuid() to obtain the proper authority. Neither the errno value nor the reason code are available for this error.

System action: OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user's session with the shell was probably not recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

User response: Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

System programmer response: Make sure that the logoff recording program (/bin/fsumoclo) has the SETUID flag set in the directory entry.

FSUM2301 The end of the session was not recorded. An unexpected error occurred. Error code = number, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = "string"

Explanation: The system invoked the logoff recording program to record the end of the user's session with the shell. A z/OS UNIX C function failed with an unexpected error. The error code displayed in the message indicates which z/OS UNIX C function failed.

In the message text:

error code = number
The error code shows which function failed.
161 read() 162 write() 163 seteuid() 164 setuid()

return value = number
The return value reported by the system for this error.

errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. Iferrno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this
message = 'string'
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

FSUM2302 The end of the session was not recorded. An unexpected error occurred. Error code = number, reason code = hexnum, error data = hexnum, error string = 'string'

Explanation: The end of the user's shell session was not recorded because an internal error occurred. This error message can occur if the /bin/fsumocli, /bin/fsumoclo, or /bin/fsumoclp programs are accidentally run as shell commands. These programs are part of the TSO/E OMVS command and should not be run individually.

In the message text:

terminal name = 'string'
The name of the pseudo-TTY that was being used when this error occurred.

program name = 'string'
The name of the logoff recording program.

erro = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = 'string'
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

Make sure that the /etc directory exists and that the /etc/utmpx exists and has the proper permissions. Make sure that the logoff recording program (named in the error message) has the SETUID flag set in its directory entry.
FSUM2304  The end of the session was not recorded. The recording program could not get the authority needed to do the recording. Function = seteuid(), terminal name = 'string', program name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'

Explanation: The logoff recording program tried to obtain the authority needed to record the end of the user's shell session in the /etc/utmpx file. An error occurred when the logoff recording program issued seteuid(). The end of the shell session was probably not recorded. Certain shell commands may show that the user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

In the message text:

  terminal name = 'string'
  The name of the pseudo-TTY that was being used when this error occurred.

  program name = 'string'
  The name of the logoff recording program.

  errno = number (X'hexnum')
  The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

  reason code = hexnum
  The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

  message = 'string'
  A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

Make sure that the logoff recording program (named in the error message) has the SETUID flag set in its directory entry.

FSUM2311  No session was started. An error occurred while the OMVS command was setting up the shell side of the pseudo-TTY. Function = dup2(), file descriptors = number and 0, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

Explanation: The session with the z/OS shell was not started, because the pseudo-TTY could not be set up as the standard output device (stdout) for the shell.

In the message text:

  file descriptors = number and 0
  The current and desired file descriptors for the pseudo-TTY. The pseudo-TTY is currently opened at the current file descriptor. The pseudo-TTY cannot be duplicated to become file descriptor 0.

  return value = number
  The return value reported by the system for this error.

  errno = number (X'hexnum')
  The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

  reason code = hexnum
  The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

  message = 'string'
  A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: z/OS UNIX file descriptor 0 may be in use by an authorized TSO/E program that was still running when the OMVS command or the OPEN subcommand was entered. If so, stop that authorized program and reenter the OMVS command or the OPEN subcommand.

System programmer response: For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.
FSUM2312  No session was started. An error occurred while the OMVS command was setting up the shell side of the pseudo-TTY. Function = dup2(), file descriptors = number and 1, return value = number, errno = number (\texttt{X'hexnum'}), reason code = hexnum, message = \texttt{'string'}

**Explanation:** The session with the z/OS shell was not started. The pseudo-TTY could not be set up as the standard input device (\texttt{stdin}) for the z/OS shell.

In the message text:

- **file descriptors** = number and 1
  - The current and desired file descriptors for the pseudo-TTY. The pseudo-TTY is currently opened at the current file descriptor. The pseudo-TTY cannot be duplicated to become file descriptor 1.

- **return value** = number
  - The return value reported by the system for this error.

- **errno** = number (\texttt{X'hexnum'}
  - The errno value returned by the system for this error. For more information about this errno value, see \texttt{z/OS XL C/C++ Run-Time Library Reference}. If errno = 0, no errno information is available from the system for this error.

- **reason code** = hexnum
  - The reason code returned by the system for this error. For more information about this reason code, see \texttt{z/OS UNIX System Services Programming: Assembler Callable Services Reference}.

- **message** = \texttt{'string'}
  - A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** z/OS UNIX file descriptor 1 may be in use by an authorized TSO/E program that was still running when the OMVS command or OPEN subcommand was entered. If so, stop that authorized program, and reenter the OMVS command or OPEN subcommand.

**System programmer response:** For more information on the errno and reason code values displayed in this message, see \texttt{z/OS UNIX System Services Programming: Assembler Callable Services Reference} and \texttt{z/OS XL C/C++ Run-Time Library Reference}.

FSUM2313  No session was started. An error occurred while the OMVS command was setting up the shell side of the pseudo-TTY. Function = dup2(), file descriptors = number and 2, return value = number, errno = number (\texttt{X'hexnum'}), reason code = hexnum, message = \texttt{'string'}

**Explanation:** The session with the z/OS shell was not started. The pseudo-TTY could not be set up as the standard error device (\texttt{stderr}) for the z/OS shell.

In the message text:

- **file descriptors** = number and 2
  - The current and desired file descriptors for the pseudo-TTY. The pseudo-TTY is currently opened at the current file descriptor. The pseudo-TTY cannot be duplicated to become file descriptor 2.

- **return value** = number
  - The return value reported by the system for this error.

- **errno** = number (\texttt{X'hexnum'}
  - The errno value returned by the system for this error. For more information about this errno value, see \texttt{z/OS XL C/C++ Run-Time Library Reference}. If errno = 0, no errno information is available from the system for this error.

- **reason code** = hexnum
  - The reason code returned by the system for this error. For more information about this reason code, see \texttt{z/OS UNIX System Services Programming: Assembler Callable Services Reference}.

- **message** = \texttt{'string'}
  - A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** z/OS UNIX file descriptor 2 may be in use by an authorized TSO/E program that was still running when the OMVS command or OPEN subcommand was entered. If so, stop that authorized program and reenter the OMVS command or OPEN subcommand.

**System programmer response:** For more information on the errno and reason code values displayed in this message, see \texttt{z/OS UNIX System Services Programming: Assembler Callable Services Reference} and \texttt{z/OS XL C/C++ Run-Time Library Reference}.

FSUM2314  No session was started. An error occurred while the OMVS command was setting up information needed by the shell. Environment variable name = COLUMNS

**Explanation:** No session was started with the z/OS.
shell, because OMVS was unable to format the numeric data for the COLUMNS environment variable required by the shell.

**User response:** Provide the system programmer with this message number and any variable information displayed in the message.

**System programmer response:** This might be an error in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

**FSUM2315**  
No session was started. An error occurred while the OMVS command was setting up information needed by the shell. Function = setenv(), environment variable name = COLUMNS, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

**Explanation:** No session was started with the z/OS shell, because OMVS was unable to set the COLUMNS environment variable required by the shell.

In the message text:

- **return value = number**  
The return value reported by the system for this error.

- **errno = number (X'hexnum')**  
The errno value returned by the system for this error. For more information about this errno value, see [z/OS XL C/C++ Run-Time Library Reference](#).

- **reason code = hexnum**  
The reason code returned by the system for this error. For more information about this reason code, see [z/OS UNIX System Services Programming: Assembler Callable Services Reference](#).

- **message = 'string'**  
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** Provide the system programmer with this message number and any variable information displayed in the message.

**System programmer response:** For more information on the errno and reason code values displayed in this message, see [z/OS UNIX System Services Programming: Assembler Callable Services Reference](#) and [z/OS XL C/C++ Run-Time Library Reference](#).

---

**FSUM2316**  
No session was started. An error occurred while the OMVS command was setting up information needed by the shell. Environment variable name = LINES

**Explanation:** No session was started with the z/OS shell, because OMVS was unable to format the numeric data for the LINES environment variable required by the shell.

**User response:** Provide the system programmer with this message number and any variable information displayed in the message.

**System programmer response:** This might be an error in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

**FSUM2317**  
No session was started. An error occurred while the OMVS command was setting up information needed by the shell. Function = setenv(), environment variable name = LINES, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

**Explanation:** No session was started with the z/OS shell, because OMVS was unable to set the LINES environment variable required by the shell.

In the message text:

- **return value = number**  
The return value reported by the system for this error.

- **errno = number (X'hexnum')**  
The errno value returned by the system for this error. For more information about this errno value, see [z/OS XL C/C++ Run-Time Library Reference](#).

- **reason code = hexnum**  
The reason code returned by the system for this error. For more information about this reason code, see [z/OS UNIX System Services Programming: Assembler Callable Services Reference](#).

- **message = 'string'**  
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** Provide the system programmer with this message number and any variable information displayed in the message.

**System programmer response:** For more information on the errno and reason code values displayed in this message, see [z/OS UNIX System Services](#).
FSUM2318 No session was started. An error occurred while the OMVS command was preparing the pseudo-TTY for use by the shell. Function = close(), file descriptor = number, return value = number, errno = number (X’hexnum’), reason code = hexnum, message = ‘string’

Explanation: No session with the z/OS shell was started, because the OMVS command could not close the pseudo-TTY file descriptor properly. OMVS was trying to close the master pseudo-TTY just before invoking the z/OS shell. This problem could occur if there was another TSO/E program running for the same TSO/E user when the OMVS command was entered. That program might have interfered with the use of the file descriptor for the pseudo-TTY.

In the message text:

file descriptor = number
The file descriptor that was being used when this error occurred.

return value = number
The return value reported by the system for this error.

erro = number (X’hexnum’)
The errno value returned by the system for this error. For more information about this errno value, see z/OS UNIX System Services Programming: Assembler Callable Services Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = ‘string’
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: Make sure that the program named in the error message is available in the hierarchical file system. Make sure that the program file has the proper permissions so that this user can run it. Make sure that the permissions for the directory containing the program are set properly so this user is allowed access.

FSUM2319 No session was started. The program to start the shell could not be invoked. Function = execl(), program name = ‘string’, errno = number (X’hexnum’), reason code = hexnum, message = ‘string’

Explanation: No session was started because OMVS could not invoke the program that starts the z/OS shell.

In the message text:

program name = ‘string’
The name of the program that cannot be executed.

erro = number (X’hexnum’)
The errno value returned by the system for this error. For more information about this errno value, see z/OS UNIX System Services Programming: Assembler Callable Services Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = ‘string’
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: Make sure that the program named in the error message is available in the hierarchical file system. Make sure that the program file has the proper permissions so that this user can run it. Make sure that the permissions for the directory containing the program are set properly so this user is allowed access.

FSUM2320 The starting time of the session could not be recorded. Function = time(), terminal name = ‘string’, errno = number (X’hexnum’), reason code = hexnum, message = ‘string’

Explanation: The system could not obtain the current time. It recorded the start of the shell session, but did not include the starting time in the /etc/utmpx file. This error did not prevent the session from starting.

In the message text:

terminal name = ‘string’
The name of the pseudo-TTY that was being used when this error occurred.

erro = number (X’hexnum’)
The errno value returned by the system for this error.
error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

**reason code = hexnum**
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

**message = 'string'**
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** Provide the system programmer with this message number and any variable information displayed in the message.

**System programmer response:** For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

---

**FSUM2321**
No session was started. An error occurred while the OMVS command was setting up information needed by the shell. Function = setenv(), environment variable name = TERM, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

**Explanation:** No session was started with the z/OS shell, because OMVS was unable to set the TERM environment variable required by the shell.

In the message text:

**return value = number**
The return value reported by the system for this error.

**errno = number (X'hexnum')**
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

**reason code = hexnum**
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

**message = 'string'**
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** Provide the system programmer with this message number and any variable information displayed in the message.

**System programmer response:** For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

---

**FSUM2322**
No session was started. An error occurred while the OMVS command was preparing the pseudo-TTY for use by the shell. Function = setsid(), return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

**Explanation:** No session with the z/OS shell was started, because OMVS was unable to become the session leader for the pseudo-TTY.

In the message text:

**return value = number**
The return value reported by the system for this error.

**errno = number (X'hexnum')**
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

**reason code = hexnum**
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

**message = 'string'**
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** Provide the system programmer with this message number and any variable information displayed in the message.

**System programmer response:** For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

---

**FSUM2323**
No session was started. An error occurred while the OMVS command was preparing the pseudo-TTY for use by the shell. Function = open(), filename = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

**Explanation:** No session with the z/OS shell was started, because OMVS was unable to become the session leader for the pseudo-TTY.

In the message text:

**return value = number**
The return value reported by the system for this error.

**errno = number (X'hexnum')**
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

**reason code = hexnum**
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

**message = 'string'**
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** Provide the system programmer with this message number and any variable information displayed in the message.

**System programmer response:** For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.
Explanation: No session with the z/OS shell was started, because OMVS could not reopen the pseudo-TTY after becoming the session leader. It is possible that this error could occur if the OMVS command or OPEN subcommand was entered when other TSO/E programs already had many files open for this TSO/E user.

In the message text:

`filename = 'string'`

The filename for the pseudo-TTY that could not be reopened.

`return value = number`

The return value reported by the system for this error.

`errno = number (X'hexnum')`

The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

`reason code = hexnum`

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

`message = 'string'`

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Retry the OMVS command or OPEN subcommand when no other TSO/E programs are running to see if this problem goes away. If this problem persists, contact the system programmer.

System programmer response: For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

FSUM2324 The start of the session may not have been recorded. The recording program could not get the authority needed to do the recording. Function = seteuid(),

`terminal name = 'string', program name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'`

Explanation: The login recording program tried to obtain the authority needed to record the start of the user’s shell session in the /etc/utmpx file. An error occurred when the login recording program issued seteuid(). The start of the shell session was probably not recorded. This error did not prevent the session from starting.

Because the start of the shell session may not have been recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

`terminal name = 'string'`

The name of the pseudo-TTY that was being used when this error occurred.

`program name = 'string'`

The name of the login recording program.

`errno = number (X'hexnum')`

The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

`reason code = hexnum`

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

`message = 'string'`

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

Make sure that the login recording program (named in the error message) has the SETUID flag set in its directory entry.

FSUM2325 No session was started. The signaling mechanism between the OMVS command and the shell could not be set up. Function = sigaction(), signal = number, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

Explanation: No session with the z/OS shell was started, because OMVS was unable to reset the catching status for one of the required signals back to the default action.

In the message text:

`signal = number`

The number of the signal being set up when this error occurred. For a list of signal
numbers, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

**return value = number**
The return value reported by the system for this error.

**errno = number (X‘hexnum’)**
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

**reason code = hexnum**
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

**message = ’string’**
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** Provide the system programmer with this message number and any variable information displayed in the message.

**System programmer response:** For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

**FSUM2326** The start of the session was not recorded. The recording program could not get the name of the pseudo-TTY for the session. Function = ttyname(), terminal name = ’string’, file descriptor = number

**Explanation:** The login recording program tried to obtain the name of the pseudo-TTY needed to record the start of the user’s shell session in the /etc/utmpx file. An error occurred when the login recording program issued ttyname(). The start of the shell session was not recorded. This error did not prevent the session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

**terminal name = ’string’**
The name of the terminal returned by ttyname().

**file descriptor = ’number’**
The file descriptor of the pseudo-TTY passed to ttyname().

**errno = number (X‘hexnum’)**
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

**reason code = hexnum**
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

**message = ’string’**
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** Provide the system programmer with this message number and any variable information displayed in the message.

**System programmer response:** For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.
System programmer response: Make sure that the names of pseudo-TTYs used by the TSO/E OMVS command are of the form /dev/ttyPNNNN and /dev/ttytPNNNN. If the pseudo-TTY name shown in the error message is correct, follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

FSUM2328 No session was started. The signaling mechanism between the OMVS command and the shell could not be set up. Function = sigprocmask(), signal = number, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

Explanation: No session with the z/OS shell was started. The z/OS shell must receive control with no signals blocked. OMVS was unable to unblock all signals before invoking the z/OS shell.

In the message text:

signal = number
The number of the signal being set up when this error occurred. For a list of signal numbers, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

return value = number
The return value reported by the system for this error.

errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = 'string'
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

FSUM2329 The start of the session was not recorded. The name of the logged-on user could not be determined.

Function = getlogin (BPX1GLG), return value = hexnum

Explanation: The login recording program tried to obtain the name of the logged-on user needed to record the start of the shell session in the /etc/utmpx file. An error occurred when the login recording program issued BPX1GLG. The start of the shell session was not recorded. This error did not prevent the session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

return value = hexnum
The return value reported by the system for this error.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: For more information on the return value displayed in this message, see z/OS XL C/C++ Run-Time Library Reference.

FSUM2331 The session has ended. Press <Enter> to end OMVS.

Explanation: The session with the z/OS shell has ended. No more input data can be typed into the input area.

User response: If you press the <ENTER> or the <CLEAR> key, or scroll forward, the OMVS command ends and returns to TSO/E. You can also scroll the screen backward, switch to TSO/E, go into subcommand mode, or invoke the help facility.

FSUM2332 The session has ended. Press <Enter> to scroll forward.

Explanation: The session with the z/OS shell has ended. No more input data can be typed into the input area. MORE... appears on the screen because not all the available output data from the session fits on the screen.

User response: If you press the <ENTER> or the <CLEAR> key, the OMVS command automatically scrolls the screen forward. You can also scroll the screen backward, switch to TSO/E, go into subcommand mode, or invoke the help facility.
FSUM2333  No more input data can be sent to the shell.

Explanation: No more input data can be typed into the input area. The z/OS shell is not accepting any more input data from the terminal, but the session with the shell has not yet ended. New output data from the shell may still appear on the screen.

User response: You can scroll the screen forward or backward, switch to TSO/E, go into subcommand mode, or invoke the help facility. If the session does not soon end by itself, you can go into subcommand mode and enter the QUIT subcommand.

FSUM2334  No more input is allowed. Some input data was ignored.

Explanation: No more input data can be typed into the input area. The z/OS shell is not accepting any more input data from the terminal, but the session with the shell has not yet ended. Some earlier input data could not be sent to the shell, and is now permanently lost. New output data from the shell may still appear on the screen.

User response: You can scroll the screen forward or backward, switch to TSO/E, go into subcommand mode, or invoke the help facility. If the session does not soon end by itself, you can go into subcommand mode and enter the QUIT subcommand.

FSUM2335  No more input is allowed. Press <Enter> to scroll forward.

Explanation: No more input data can be typed into the input area. The z/OS shell is not accepting any more input data from the terminal, but the session with the shell has not yet ended. More... appears on the screen, because not all the available output data from the session fits on the screen. In addition, new output data from the shell may still appear on the screen.

User response: If you press the <ENTER> or the <CLEAR> key, the OMVS command automatically scrolls the screen forward. You can also scroll the screen backward, switch to TSO/E, go into subcommand mode, or invoke the help facility. If the session does not soon end by itself, you can go into subcommand mode and enter the QUIT subcommand.

FSUM2336  A session error occurred. Press <Enter> to end OMVS.

Explanation: An error caused the session with the z/OS shell to end. Earlier error messages may contain more information about this error. No more input data can be typed into the input area. MORE... appears on the screen because not all the available output data from the session fits on the screen. In addition, new output data from the shell may still appear on the screen.

User response: If you press the <ENTER> or the <CLEAR> key, or scroll forward, the currently displayed session ends, and OMVS automatically displays another session. You can also scroll the screen backward, switch to TSO/E, go into subcommand mode, or invoke the help facility.

FSUM2337  A session error occurred. Press <Enter> to scroll forward.

Explanation: An error caused the session with the z/OS shell to end. Earlier error messages may contain more information about this error. No more input data can be typed into the input area.

User response: If you press the <ENTER> or the <CLEAR> key, or scroll forward, the currently displayed session ends, and OMVS automatically displays another session. You can also scroll the screen backward, switch to TSO/E, go into subcommand mode, or invoke the help facility.

FSUM2338  A session error occurred. Press <Enter> to remove the message.

Explanation: An error caused the session with the z/OS shell to end. Earlier error messages may contain more information about this error. No more input data can be typed into the input area.

User response: If you press the <ENTER> or the <CLEAR> key, or scroll forward, the error message is removed from the screen so you can see the entire output area. You can also switch to TSO/E, go into subcommand mode, or invoke the help facility. If the
session does not soon end by itself, you can go into subcommand mode and enter the \texttt{QUIT} subcommand.

FSUM2341  The session has ended.  
\textbf{Explanation:} The session with the z/OS shell has ended. No more input data can be typed into the input area.  
\textbf{User response:} You can switch to TSO/E, go into subcommand mode, or return from the help facility.

FSUM2342  A session error occurred.  
\textbf{Explanation:} An error caused the session with the z/OS shell to end. Earlier error messages may contain more information about this error. No more input data can be typed into the input area.  
\textbf{User response:} You can switch to TSO/E, go into subcommand mode, or return from the help facility.

FSUM2343  The session has ended. Press <Enter> to remove the message.  
\textbf{Explanation:} The session with the z/OS shell has ended. No more input data can be typed into the input area.  
\textbf{User response:} If you press the \texttt{<ENTER>}, or the \texttt{<CLEAR>} key, or scroll forward, the error message is removed from the screen so you can see the entire output area. You can also switch to TSO/E, go into subcommand mode, or invoke the help facility.

FSUM2344  A session error occurred. Press <Enter> to remove the message.  
\textbf{Explanation:} An error caused the session with the z/OS shell to end. Earlier error messages may contain more information about this error. No more input data can be typed into the input area.  
\textbf{User response:} If you press the \texttt{<ENTER>}, or the \texttt{<CLEAR>} key, or scroll forward, the error message is removed from the screen so you can see the entire output area. You can also switch to TSO/E, go into subcommand mode, or invoke the help facility.

FSUM2347  The input TSO/E command contains incorrect DBCS data. The command was not executed. Incorrect data = \texttt{string}  
\textbf{Explanation:} The TSO function key was pressed while incorrect DBCS data was in the input area. This incorrect DBCS string cannot be passed to TSO/E to be run as a command.  
In the message text:  
\texttt{string}  Several bytes (in hexadecimal) of incorrect DBCS data from the input area.  
\textbf{User response:} Enter the TSO/E command again. If the second attempt also fails, try pressing \texttt{<CLEAR>} or \texttt{<PA2>} and then enter the TSO/E command again. If you still cannot enter the TSO/E command, clear out all data in the input area and press the TSO function key to switch to TSO/E. Then reenter the TSO/E command. When the command completes, press \texttt{<PA1>} or \texttt{<Attention>} to return to the shell session.  
\textbf{System programmer response:} If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

FSUM2348  \texttt{string} is an unknown subcommand.  
\textbf{Explanation:} Data was entered in the input field in subcommand mode. This data is not one of the known OMVS subcommands.  
In the message text:  
\texttt{string}  The unknown command that was entered.  
\textbf{User response:} If you want to see a list of valid OMVS subcommands, enter HELP, ?, or press the Help key. If you want to enter data for the z/OS shell, press the Return key or use the RETURN subcommand to get out of subcommand mode first. If you want to run a TSO/E command, enter the TSO subcommand or use the TSO key.

FSUM2349  The subcommand contains too many words. Words starting with \texttt{string} are incorrect.  
\textbf{Explanation:} Data was entered in the input field in subcommand mode. This data contained more than one word. All OMVS subcommands contain only one word.  
In the message text:  
\texttt{string}  The second word entered on the command line.  
\textbf{User response:} If you want to see a list of valid OMVS subcommands, enter HELP, ?, or press the Help key. If you want to enter data for the z/OS shell, press the Return key or use the RETURN subcommand to get out of subcommand mode first. If you want to run a TSO/E command, enter the TSO subcommand or use the TSO key.

FSUM2350  The session with the shell ended because of an unexpected I/O error.  
\textbf{Explanation:} An I/O error occurred while waiting for
data from the pseudo-TTY, or for the pseudo-TTY to accept more data. This error caused the session with the z/OS shell to end.

In the message text:

**file descriptor = number**
The file descriptor that was being used when this error occurred.

**terminal name = 'string'**
The name of the pseudo-TTY that was being used when this error occurred.

**return value = number**
The return value reported by the system for this error.

**errno = number (X'hexnum')**
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

**reason code = hexnum**
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

**message = 'string'**
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** If this error occurred shortly after you switched to TSO/E and then returned to the z/OS shell, the TSO/E commands that were invoked may have caused this error. Contact the system programmer with this message number and the variable information displayed in the message.

**System programmer response:** Make sure that TSO/E commands used while OMVS is switched to TSO/E do not use any file descriptors that were opened by the OMVS command.

---

**FSUM2352** The session with the shell ended because of an unexpected I/O error.

**Function = write(), file descriptor = number, terminal name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'**

**Explanation:** An I/O error occurred during an attempt to write input data to the pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

**file descriptor = number**
The file descriptor that was being used when this error occurred.

**terminal name = 'string'**
The name of the pseudo-TTY that was being used when this error occurred.

**errno = number (X'hexnum')**
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

**reason code = hexnum**
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.
reason code, see z/OS UNIX System Services
Programming: Assembler Callable Services
Reference.

message = 'string'
A system error message that describes this
error as reported by errno. If errno = 0, this
message is not meaningful.

User response: If this error occurred shortly after you
switched to TSO/E and then returned to the z/OS shell,
the TSO/E commands that were invoked may have
caus ed this error. Contact the system programmer with
this message number and the variable information
displayed in the message.

System programmer response: Make sure that
TSO/E commands used while OMVS is switched to
TSO/E do not use any file descriptors that were opened by
the OMVS command.

FSUM2353 The session with the shell ended
because of an unexpected I/O error.
Function = read(), file descriptor =
number, terminal name = 'string', return
value = number

Explanation: An I/O error occurred during an attempt
to read output data from the pseudo-TTY. This error
caused the session with the z/OS shell to end.

In the message text:

file descriptor = number
The file descriptor that was being used when
this error occurred.

terminal name = 'string'
The name of the pseudo-TTY that was being
used when this error occurred.

return value = number
The return value reported by the system for
this error.

User response: Provide the system programmer with
this message number and any variable information
displayed in the message.

System programmer response: This might be an
error in z/OS UNIX. Follow the usual problem
determination procedures for diagnosing and reporting
z/OS UNIX problems.

FSUM2353 The session with the shell ended
because of an unexpected I/O error.
Function = tcgetattr(), file descriptor =
number, terminal name = 'string', return
value = number, errno = number
(X'hexnum'), reason code = hexnum,
message = 'string'

Explanation: An I/O error occurred while trying to
obtain the current termios control information for the
pseudo-TTY. This error caused the session with the
z/OS shell to end.

In the message text:

file descriptor = number
The file descriptor that was being used when
this error occurred.

terminal name = 'string'
The name of the pseudo-TTY that was being
used when this error occurred.

return value = number
The return value reported by the system for
this error.

errno = number (X'hexnum')
The errno value returned by the system for this
error. For more information about this errno
value, see z/OS XL C/C++ Run-Time Library
Reference. If errno = 0, no errno information is
available from the system for this error.

reason code = hexnum
The reason code returned by the system for
this error. For more information about this
reason code, see z/OS UNIX System Services
Programming: Assembler Callable Services
Reference.

message = 'string'
A system error message that describes this
error as reported by errno. If errno = 0, this
message is not meaningful.
**User response:**  If this error occurred shortly after you switched to TSO/E and then returned to the z/OS shell, the TSO/E commands that were invoked may have caused this error. Contact the system programmer with this message number and the variable information displayed in the message.

**System programmer response:** Make sure that TSO/E commands used while OMVS is switched to TSO/E do not use any file descriptors that were opened by the OMVS command.

---

**FSUM2356 No more sessions can be started.**

**Maximum number of sessions =** number

**Explanation:** The OPEN subcommand cannot start any more shell sessions. The maximum number of active shell sessions for this user has already been reached. The maximum number of sessions is determined by the value of MAXPROCUSER or CHILD_MAX. No additional sessions can be started if the number of sessions would exceed MAXPROCUSER/2.

In the message text:

- **number** The maximum number of shell sessions that can be active at one time.

**User response:** End some other shell session before starting any new sessions.

Ask the system programmer to increase the value of MAXPROCUSER to allow more sessions. The value for MAXPROCUSER should be at least twice the number of active sessions required.

---

**FSUM2357 The session with the shell ended because of an unexpected I/O error.**

**Function =** tcsetattr(), **file descriptor =** number, **terminal name =** ‘string’, **return value =** number, **errno =** number (X’hexnum’), **reason code =** hexnum, **message =** ‘string’

**Explanation:** An I/O error occurred while trying to reset the current termios control information for the pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

- **file descriptor =** number The file descriptor that was being used when this error occurred.
- **terminal name =** ‘string’ The name of the pseudo-TTY that was being used when this error occurred.
- **return value =** number The return value reported by the system for this error.
- **errno =** number (X’hexnum’) The errno value returned by the system for this error. For more information about this errno value, see [z/OS XL C/C++ Run-Time Library Reference](#). If errno = 0, no errno information is available from the system for this error.
- **reason code =** hexnum The reason code returned by the system for this error.
- **message =** ‘string’ A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**System programmer response:** Make sure that TSO/E commands used while OMVS is switched to TSO/E do not use any file descriptors that were opened by the OMVS command.

---

**FSUM2358 The session with the shell ended because of an unexpected I/O error.**

**Function =** tcflush(), **file descriptor =** number, **terminal name =** ‘string’, **return value =** number, **errno =** number (X’hexnum’), **reason code =** hexnum, **message =** ‘string’

**Explanation:** An I/O error occurred when trying to flush data that was queued for the pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

- **file descriptor =** number The file descriptor that was being used when this error occurred.
- **terminal name =** ‘string’ The name of the pseudo-TTY that was being used when this error occurred.
- **return value =** number The return value reported by the system for this error.
- **errno =** number (X’hexnum’) The errno value returned by the system for this error. For more information about this errno value, see [z/OS XL C/C++ Run-Time Library Reference](#). If errno = 0, no errno information is available from the system for this error.
- **reason code =** hexnum The reason code returned by the system for this error.
The pseudo-TTY was in TSO/3270 passthrough mode when the TSO/E command was run. Make sure that no other users send you messages while a TSO/3270 passthrough command is running. If neither of these errors caused the problem, contact the system programmer.

System programmer response: Correct any errors in the TSO/3270 passthrough application that might have caused this problem. Modify the application so that regular TTY data is less likely to interfere when the terminal is in TSO/3270 passthrough mode. For more information about writing TSO/3270 passthrough applications, see z/OS UNIX System Services Programming Tools.

Explanation: An I/O error occurred when trying send the SIGWINCH signal to the foreground processes using the pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

file descriptor = number
The file descriptor that was being used when this error occurred.

FSUM2360 The session with the shell ended because of an unexpected I/O error.
Function = ioctl(), command = hexnum, file descriptor = number, terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

Explanation: An I/O error occurred when trying send the SIGWINCH signal to the foreground processes using the pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

file descriptor = number
The file descriptor that was being used when this error occurred.
terminal name = 'string'
The name of the pseudo-TTY that was being used when this error occurred.

return value = number
The return value reported by the system for this error.

errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = 'string'
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response:  If this error occurred shortly after you switched to TSO/E and then returned to the z/OS shell, the TSO/E commands that were invoked may have caused this error. Contact the system programmer with this message number and the variable information displayed in the message.

System programmer response:  Make sure that TSO/E commands used while OMVS is switched to TSO/E do not use any file descriptors that were opened by the OMVS command.

FSUM2361 Input data was received from an unexpected area of the screen (row number, column number). This input data was discarded. You may not have entered in the usual input field.

Explanation:  You may have entered input data while the normal OMVS screen was not displayed or was partly overwritten by TSO/E messages. This input data was probably not typed into the normal input field at the bottom of the screen. Make sure all input data is entered in the normal input area at the bottom of the screen.

User response:  If the normal OMVS screen is overlaid or blank, you may need to press <PA2> to force OMVS to rewrite the screen before you enter input data.

System programmer response:  If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

FSUM2362 Input data was received from an empty screen. This input data was discarded. You may have entered the data right after you pressed the <Clear> key, and before the OMVS command could refresh the screen.

Explanation:  Data was probably entered right after the screen was cleared, and before OMVS had a chance to rewrite the normal screen. Make sure all input data is entered in the usual input area at the bottom of the normal OMVS screen.

User response:  If the normal OMVS screen is overlaid or blank, you may need to press <PA2> to force OMVS to rewrite the screen before you enter input data.

System programmer response:  If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

FSUM2363 Input data was received from a screen that was not created by OMVS. This input data was discarded. You may have entered the data while the OMVS screen was not being displayed.

Explanation:  Data was probably entered right after the OMVS screen was interrupted (by a message, for example) and before OMVS had a chance to rewrite the normal screen. Make sure all input data is entered in the usual input area at the bottom of the normal OMVS screen.

User response:  If the normal OMVS screen is overlaid or blank, you may need to press <PA2> to force OMVS to rewrite the screen before you enter input data.

System programmer response:  If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

FSUM2364 Too much input data was received. This input data was discarded. You may have entered the data while the normal OMVS screen was partly overlaid with data from the system. If this happens again, press <PA2> to refresh the screen before entering data.

Explanation:  Data was probably entered right after the OMVS screen was overlaid (by a message, for example) or cleared, and before OMVS had a chance to rewrite the normal screen. Make sure all input data is
entered in the usual input area at the bottom of the normal OMVS screen.

User response: If the normal OMVS screen is overlaid or blank, you may need to press <PA2> to force OMVS to rewrite the screen before you enter input data.

System programmer response: If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

FSUM2365 Data from two or more input fields was received. All the input data was discarded. You may have entered some data outside the normal input field.

Explanation: Data was probably entered right after the z/OS UNIX screen was overlaid (by a message, for example), and before OMVS had a chance to rewrite the normal screen. Some of the data may have been entered in the normal input area, but input data was also typed in somewhere else on the screen. Make sure all input data is entered in the usual input area at the bottom of the normal OMVS screen.

User response: If the normal OMVS screen is overlaid or blank, you may need to press <PA2> to force OMVS to rewrite the screen before you enter input data.

System programmer response: If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

FSUM2366 Input data (starting with 'string') was discarded, because the session with the shell ended.

Explanation: Input data was received from the terminal just as the session with the z/OS shell was ending. This data could not be passed to the shell. This is an informational message telling you which data was not seen by the shell.

In the message text:
'.string' The start of the input data that could not be passed to the z/OS shell. Data before this (if any) was passed to the shell.

User response: If you want to send this data to the shell, use OMVS to reestablish a session with the shell, and then reenter the data.

FSUM2367 Input data was received when none was expected. This input data was discarded. You may have entered the data as the session with the shell was ending, before OMVS had a chance to remove the input area.

Explanation: OMVS replaced the usual input field on the screen with a message describing the end of the session with the z/OS shell. Input data was then received from the terminal when it was not expected. It is possible that you entered data as the input field was being removed. If so, there is no real problem. The input data cannot be passed to the shell because the session has ended.

System programmer response: If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

FSUM2368 The session with the shell ended because of an unexpected I/O error.

Function = tcdrain(), file descriptor = number, terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

Explanation: An I/O error occurred when trying to wait for queued data to be read at slave pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:
file descriptor = number The file descriptor that was being used when this error occurred.
terminal name = 'string' The name of the pseudo-TTY that was being used when this error occurred.
return value = number The return value reported by the system for this error.
errno = number (X'hexnum') The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.
reason code = hexnum The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.
message = 'string' A system error message that describes this
error as reported by errno. If errno = 0, this message is not meaningful.

User response: If this error occurred shortly after you switched to TSO/E and then returned to the z/OS shell, the TSO/E commands that were invoked may have caused this error. Contact the system programmer with this message number and the variable information displayed in the message.

System programmer response: Make sure that TSO/E commands used while OMVS is switched to TSO/E do not use any file descriptors that were opened by the OMVS command.

FSUM2370 The shell process ended, but the session did not end automatically. You may need to run the QUIT subcommand to end the session.

Explanation: OMVS was notified that the z/OS shell process ended, but the slave pseudo-TTY was not closed. OMVS will not automatically end the session until all processes have closed the slave pseudo-TTY. One or more processes may continue to run indefinitely after the shell ends, before the TTY is closed.

User response: If one of these processes is still reading input data from the terminal, you can continue to use the session. Since the shell has ended, you probably cannot run shell commands.

If the shell session appears to hang up after this message is seen, you can enter subcommand mode and use the QUIT, QUITALL, or CLOSE subcommand to end the session.

FSUM2371 The shell process stopped unexpectedly, without ending. You can run the QUIT subcommand to end the session.

Explanation: OMVS was notified that the z/OS shell process stopped, but it did not exit. Whatever stopped the shell may soon cause it to resume. In this case, there is no problem.

User response: If the shell session appears to hang up after this message is seen, you can enter subcommand mode and use the QUIT, QUITALL, or CLOSE subcommand to end the session.

FSUM2372 The shell process ended with a nonzero exit status. Exit status = number

Explanation: The z/OS shell exited with a nonzero status value. This is an informational message that is produced when the DEBUG option is specified on the OMVS command. This nonzero exit status might not indicate a problem.

In the message text:

exit status = number
   The exit status code from the z/OS shell as reported to OMVS.

FSUM2377 The start of the session was not recorded. An unexpected error occurred. Error code = number, reason code = hexnum, error data = hexnum, error string = 'string'

Explanation: The start of the shell session was not recorded in the /etc/utmpx file, because an unexpected error occurred. This error did not prevent the session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

This error message can occur if the /bin/fsumocl, /bin/fsumocl, or /bin/fsumocl programs are accidentally run as shell commands. These programs are part of the TSO/E OMVS command and should not be run individually.

In the message text:

error code = number
   The code for this error.

reason code = hexnum
   An additional reason code associated with this error. If this value is zero, there is no additional reason code for this error.

error data = hexnum
   Additional data associated with this error. If this value is zero, there is no additional reason code for this error.

error string = 'string'
   A string of characters that provides additional error information. If this string is empty, no error string is available for this error.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

Make sure not to run /bin/fsumocl, /bin/fsumocl, or /bin/fsumocl as shell commands.

System programmer response: This might be an error in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.
FSUM2378 The start of the session was not recorded. The slot (in /etc/utmpx) for this terminal could not be updated, or a new slot for the terminal could not be created. Function = pututxline(),
terminal name = 'string', program name = 'string', errno = number (X'hexnum'),
reason code = hexnum, message = 'string'

Explanation: The login recording program tried to record the start of the user's shell session in the /etc/utmpx file. An error occurred when the login recording program issued pututxline(). The start of the shell session was probably not recorded. This error did not prevent the session from starting.

Because the start of the shell session may not have been recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

terminal name = 'string'
The name of the pseudo-TTY that was being used when this error occurred.

program name = 'string'
The name of the login recording program.

errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = 'string'
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

Make sure that the /etc directory exists and that the that /etc/utmpx exists and has the proper permissions. Make sure that the login recording program (named in the error message) has the SETUID flag set in its directory entry.

FSUM2379 The start of the session was not recorded. The system could not obtain information about this user from the user database. Function = getpwnam(),
user name = string, return value = hexnum, errno = number (X'hexnum'),
reason code = hexnum, message = 'string'

Explanation: The login recording program tried to obtain the name of the logged-on user needed to record the start of the shell session in the /etc/utmpx file. An error occurred when the login recording program issued getpwnam(). The start of the shell session was not recorded. This error did not prevent the session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

user name = string
The name of the user passed to getpwnam().

return value = hexnum
The return value reported by the system for this error.

errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = 'string'
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

Make sure that this user is defined in the user data base, and that the user is defined to z/OS UNIX. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.
FSUM2380  No session was started. An error occurred while the OMVS command was setting up information needed by the shell. Function = setenv(), environment variable name = string, new value = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

Explanation:  No session was started with the z/OS shell, because OMVS could not set the one of the environment variables required by the shell.

In the message text:

environment variable name = string
The name of the environment variable that could not be set.

new value = 'string'
The value that the environment variable could not be set to.

return value = number
The return value reported by the system for this error.

errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = 'string'
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response:  Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response:  For more information on the return value displayed in this message, see z/OS XL C/C++ Run-Time Library Reference.

FSUM2381  No session was started. The name of the logged-on user could not be determined. Function = getlogin (BPX1GLG), return value = hexnum

Explanation:  No session was started with the z/OS shell, because OMVS could not obtain the name of the logged-on user.

In the message text:

return value = hexnum
The return value reported by the system for this error.

User response:  Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response:  For more information on the return value displayed in this message, see z/OS XL C/C++ Run-Time Library Reference.

FSUM2382  No session was started. The system could not obtain information about this user from the user database. Function = getpwnam(), user name = string, return value = hexnum, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

Explanation:  No session was started with the z/OS shell, because the system could not obtain the entry for this user in the user data base.

In the message text:

user name = string
The name of the logged-on user passed to getpwnam().

return value = hexnum
The return value reported by the system for this error.

errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = 'string'
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response:  Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response:  For more information on the return value displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

Make sure that this user is defined in the user data.
base, and that the user is defined to z/OS UNIX. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.

**FSUM2383** No initial directory pathname was specified in the user profile. The home directory is set to root.

**Explanation:** Because a home directory was not specified in the OMVS segment of the RACF user profile for this user, the system set the home directory to the root directory, /.

**User response:** If you need to use a home directory other than the root, ask the system programmer to set up a home directory for this TSO/E user ID.

**System programmer response:** If required, specify a home directory in the OMVS segment of the RACF user profile for this TSO/E user ID. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.

**FSUM2384** No session was started. The system cannot set the current working directory to the specified home directory for this user ID. Function = chdir(), directory name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

**Explanation:** No session was started with the z/OS shell, because the home directory for this TSO/E user ID cannot be made the working directory.

In the message text:

- **directory name = 'string'**
  - The home directory specified for this TSO/E user ID.
- **return value = number**
  - The return value reported by the system for this error.
- **errno = number (X'hexnum')**
  - The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.
- **reason code = hexnum**
  - The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.
- **message = 'string'**
  - A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** The OMVS command requires more storage than is currently available. To make more storage available:

- Enter the OMVS command directly from the TSO/E READY prompt.
- Enter the OMVS command from a 3270 display with a smaller screen size.
- Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.
- Use the NOSHAREAS option on the TSO/E OMVS command.

**System programmer response:** Make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for this TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.

**FSUM2385** No session was started. The system cannot obtain required storage.

Function = malloc(), bytes requested = number, return value = number

**Explanation:** No session was started with the z/OS shell, because not enough storage was available.

In the message text:

- **bytes requested = number**
  - The number of bytes of storage that were not available from malloc().
- **return value = number**
  - The return value reported by the system for this error.

**User response:** The OMVS command requires more storage than is currently available. To make more storage available:

- Enter the OMVS command directly from the TSO/E READY prompt.
- Enter the OMVS command from a 3270 display with a smaller screen size.
- Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.
- Use the NOSHAREAS option on the TSO/E OMVS command.

**System programmer response:** Make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for this TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.
FSUM2386  No shell program was specified in the user profile. The default shell ("string") is used.

Explanation: Because a shell path name was not specified in the OMVS segment of the RACF user profile for this user, the system used the default shell program.

In the message text:

("string")

The name of the default shell program.

User response: If you need to use a shell program other than the default, ask the system programmer to specify a shell program for this TSO/E user ID.

System programmer response: If required, specify a shell program in the OMVS segment of the RACF user profile for this TSO/E user ID. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.

FSUM2387  The start of the session may not have been recorded. The outcome of the recording process is unknown.

Function = waitpid(), terminal name = "string", process ID = number (X'hexnum'), return value = number, errno = number (X'hexnum'), reason code = hexnum, message = "string"

Explanation: The login recording process did not complete normally. The login recording process was created, but the system could not determine what happened to it. The process may have disappeared from the system before or after completing. The start of the shell session might or might not have been recorded properly in the /etc/utmpx file. This error does not prevent the shell session from starting.

Because the start of the shell session may not have been recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

terminal name = "string"

The name of the pseudo-TTY that was being used when this error occurred.

process ID = number (X'hexnum')

The process ID of the login recording process.

return value = number

The return value reported by the system for this error.

errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference.

reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = "string"

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

FSUM2388  The start of the session may not have been recorded. The recording process stopped or ended unexpectedly, before completion. Function = waitpid(), terminal name = "string", process ID = number (X'hexnum'), return value = number, status value = number (X'hexnum'), message = "string"

Explanation: The login recording process did not complete normally. The start of the shell session might or might not have been recorded properly in the /etc/utmpx file. This error does not prevent the shell session from starting.

Because the start of the shell session may not have been recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

terminal name = "string"

The name of the pseudo-TTY that was being used when this error occurred.

process ID = number (X'hexnum')

The process ID of the login recording process.

return value = number

The return value reported by the system for this error.

status value = number (X'hexnum')

The status value from waitpid() for the login recording process. For information about the status value, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = "string"

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.
return value = number
The return value reported by the system for this error.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: Make sure that authorized users do not stop or kill the login recording process while it is running. If any other messages appeared at the system console, follow any recommended actions for those messages.

FSUM2389  The message catalog cannot be used.
catalog name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'

Explanation: The OMVS command could not open the message catalog named in the error message. This error does not prevent the session from starting. Default error messages are substituted for the messages in the message catalog. These substituted messages might not contain the usual wording.

In the message text:
catalog name = 'string'
The name of the message catalog that could not be opened.
errno = number (X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.
reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.
message = 'string'
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: Check that the message catalog named in the error message is installed and that this user has read access to the message catalog. Make sure that the user has search permission for all the directories leading to the message catalog.

FSUM2390  The message catalog cannot be closed. catalog name = 'string', errno = number(X'hexnum'), reason code = hexnum, message = 'string'

Explanation: The OMVS command could not close the message catalog named in the error message. This error does not prevent the session from starting.

In the message text:
catalog name = 'string'
The name of the message catalog that could not be closed.
errno = number(X'hexnum')
The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.
reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.
message = 'string'
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: Check that the message catalog named in the error message is installed and that this user has read access to the message catalog. Make sure that the user has search permission for all the directories leading to the message catalog.

FSUM2391  The start of the session was not recorded. The recording program could not start, because too many processes were already active for this UID.
Function = fork(), terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

Explanation: When the TSO/E OMVS command or OPEN subcommand was entered, close to the maximum number of processes were already active for this UID. Because of this, the process required for the login recording could not be created. At least three processes must be available for this UID when the TSO/E OMVS command is run. At least two processes must be available for this UID when the OPEN subcommand is run.

Each shell session takes up at least one process for
This UID. Active z/OS UNIX batch jobs submitted for this TSO/E user ID count as processes for this UID. Other TSO/E user IDs may share the same UID with this TSO/E user ID. If those user IDs are currently using z/OS UNIX, their processes also count toward the maximum allowed for this UID.

The start of the shell session is not recorded. This error does not prevent the shell session from starting. Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

- **terminal name = 'string'**
  - The name of the pseudo-TTY that was being used when this error occurred.

- **return value = number**
  - The return value reported by the system for this error.

- **errno = number (X'hexnum')**
  - The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference. If errno = 0, no errno information is available from the system for this error.

- **reason code = hexnum**
  - The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

- **message = 'string'**
  - A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** Try not to start so many shell sessions. Specify fewer initial sessions on the TSO/E OMVS command.

Wait for any z/OS UNIX batch jobs from this TSO/E user ID to end before reentering the OMVS command or OPEN subcommand. Other TSO/E user IDs may share a common UID with this user ID. Reenter the OMVS command or OPEN subcommand after one of those TSO/E user IDs has finished using z/OS UNIX.

Ask the system programmer to increase the maximum number of processes allowed per UID.

**System programmer response:** For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

If required, increase the maximum number of processes allowed for a UID. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see z/OS UNIX System Services Planning.

**FSUM2392** The start of the session was not recorded. The recording program could not start, because too many processes were already active in the system. Function = 'fork()', terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

**Explanation:** When the TSO/E OMVS command or OPEN subcommand was entered, close to the maximum number of processes were already active in the system. Because of this, the process required for the login recording could not be created. The system must be able to start at least three more processes before the TSO/E OMVS command can run. The system must be able to start at least two more process before the OPEN subcommand can run.

The start of the shell session was not recorded. This error does not prevent the shell session from starting. Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

- **terminal name = 'string'**
  - The name of the pseudo-TTY that was being used when this error occurred.

- **return value = number**
  - The return value reported by the system for this error.

- **errno = number (X'hexnum')**
  - The errno value returned by the system for this error. For more information about this errno value, see z/OS XL C/C++ Run-Time Library Reference.

- **reason code = hexnum**
  - The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

- **message = 'string'**
  - A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** Try not to start so many shell sessions. Specify fewer initial sessions on the TSO/E OMVS command.

Retry the TSO/E OMVS command or OPEN.
subcommand later, when the system is not so busy.
Ask the system programmer to increase the maximum number processes that can be active at one time.

**System programmer response:** For more information on the errno and reason code values displayed in this message, see [z/OS UNIX System Services Programming: Assembler Callable Services Reference](https://www.ibm.com) and [z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com)

If required, increase the maximum number of processes allowed for z/OS UNIX. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see [z/OS UNIX System Services Planning](https://www.ibm.com).

FSUM2393 The start of the session was not recorded. The process required for the login recording program could not be created. Function = fork(), terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

**Explanation:** The OMVS command could not create the process required for the login recording program. The start of the shell session is not recorded. This error does not prevent the shell session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

- **terminal name** = 'string'
  - The name of the pseudo-TTY that was being used when this error occurred.
- **return value** = number
  - The return value reported by the system for this error.
- **errno** = number (X'hexnum')
  - The errno value returned by the system for this error. For more information about this errno value, see [z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com)
- **reason code** = hexnum
  - The reason code returned by the system for this error. For more information about this reason code, see [z/OS UNIX System Services Programming: Assembler Callable Services Reference](https://www.ibm.com)
- **message** = 'string'
  - A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** Try the OMVS command or OPEN subcommand again. If this problem persists, contact the system programmer with this message number and all the variable information displayed in the message.

**System programmer response:** For more information on the errno and reason code values displayed in this message, see [z/OS UNIX System Services Programming: Assembler Callable Services Reference](https://www.ibm.com) and [z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com)

FSUM2394 The start of the session was not recorded. The recording program could not be invoked. Function = execve(), program name = 'string', terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

**Explanation:** OMVS could not invoke the login recording program named in the error message. The start of the shell session could not be recorded in the /etc/utmpx file. This error did not prevent the session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

- **program name** = 'string'
  - The name of the login recording program that could not be invoked.
- **terminal name** = 'string'
  - The name of the pseudo-TTY that was being used when this error occurred.
- **return value** = number
  - The return value reported by the system for this error.
- **errno** = number (X'hexnum')
  - The errno value returned by the system for this error. For more information about this errno value, see [z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com)
- **reason code** = hexnum
  - The reason code returned by the system for this error. For more information about this reason code, see [z/OS UNIX System Services Programming: Assembler Callable Services Reference](https://www.ibm.com)
- **message** = 'string'
  - A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

**User response:** Provide the system programmer with this message number and any variable information displayed in the message.
System programmer response: For more information on the errno and reason code values displayed in this message, see [z/OS UNIX System Services Programming: Assembler Callable Services Reference](https://www.ibm.com) and [z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com).

Check that the login recording program named in the error message is installed properly. Make sure that this program file has the execute permissions set properly so this user ID can run it. Also make sure that the SETUID flag is set in the directory entry for this program.

FSUM2395 No session was started. The NOSHAREAS option on the TSO/E OMVS command must be used to run the specified shell program. Function = execve(), program name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

Explanation: No session was started with the z/OS shell, because OMVS could not invoke the shell program. The SHAREAS option of the TSO/E OMVS command was used or defaulted. OMVS cannot run the specified shell program in the same address space, because the shell is a SETUID or SETGID program.

In the message text:

- **program name = 'string'**
  - The name of the shell program that could not be invoked.

- **return value = number**
  - The return value reported by the system for this error.

- **errno = number (X'hexnum')**
  - The errno value returned by the system for this error. For more information about this errno value, see [z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com). If errno = 0, no errno information is available from the system for this error.

- **reason code = hexnum**
  - The reason code returned by the system for this error. For more information about this reason code, see [z/OS UNIX System Services Programming: Assembler Callable Services Reference](https://www.ibm.com).

- **message = 'string'**
  - A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Rerun the TSO/E OMVS command using the NOSHAREAS option.

Make sure the shell program named in the error is correct. If not, ask the system programmer to change the shell program for this user ID.

System programmer response: For more information on the errno and reason code values displayed in this message, see [z/OS UNIX System Services Programming: Assembler Callable Services Reference](https://www.ibm.com) and [z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com).

Check that the shell program specified in the RACF user profile for this TSO/E user ID is correct. If the shell program is not a SETUID or SETGID program, make sure that the SETUID and SETGID flags are off in the directory entry for the shell. Make sure that the UID and GID for the shell program are correct. Also make sure that the UID and GID for the TSO/E user ID are correct. For information about setting up user IDs for z/OS UNIX, see [z/OS UNIX System Services Planning](https://www.ibm.com).

FSUM2396 No session was started. The shell program could not be invoked. Function = execve(), program name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

Explanation: No session was started with the z/OS shell, because OMVS could not invoke the shell program.

In the message text:

- **program name = 'string'**
  - The name of the shell program that could not be invoked.

- **return value = number**
  - The return value reported by the system for this error.

- **errno = number (X'hexnum')**
  - The errno value returned by the system for this error. For more information about this errno value, see [z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com). If errno = 0, no errno information is available from the system for this error.

- **reason code = hexnum**
  - The reason code returned by the system for this error. For more information about this reason code, see [z/OS UNIX System Services Programming: Assembler Callable Services Reference](https://www.ibm.com).

- **message = 'string'**
  - A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Check that the shell program named in the error message exists in the file system before you enter the OMVS command. Make sure the file system containing the shell program is mounted. If you do not have the authority to put the shell program in the file system or mount the file system containing it, contact the operator or system programmer. If you need to run a different shell program, ask the system programmer to change the shell program for your user ID.
System programmer response: For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

Check that the shell program specified in the RACF user profile for this TSO/E user ID is correct. Make sure that the shell program exists, and that the file system containing it is mounted. Make sure that the permissions for the shell program allow this user ID to run it. Make sure all the directories leading to the specified shell program can be searched by the user. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.

FSUM2397 No session was started. An unexpected error occurred. Error code = number, return value = number, errno = number (X’hexnum’), reason code = hexnum, message = ‘string’

Explanation: No session was started with the z/OS shell, because a z/OS UNIX C function failed with an unexpected error. The error code displayed in the message indicates which z/OS UNIX C function failed.

In the message text:

error code = number
The error code shows which function failed.

reason code = hexnum
The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

message = ‘string’
A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: For more information on the errno and reason code values displayed in this message, see z/OS UNIX System Services Programming: Assembler Callable Services Reference and z/OS XL C/C++ Run-Time Library Reference.

FSUM2398 No session was started. An unexpected error occurred. Error code = number, reason code = hexnum, error data = hexnum, error string = ‘string’

Explanation: No session was started with the z/OS shell, because an internal error occurred.

This error message can occur if the /bin/fsumocl, /bin/fsumoclo, or /bin/fsumoclp programs are accidentally run as shell commands. These programs...
are part of the TSO/E OMVS command and should not be run individually.

In the message text:

- **error code = number**
  The code for this error.

- **reason code = hexnum**
  An additional reason code associated with this error. If this value is zero, there is no additional reason code for this error.

- **error data = hexnum**
  Additional data associated with this error. If this value is zero, there is no additional reason code for this error.

- **error string = ’string’**
  A string of characters that provides additional error information. If this string is empty, no error string is available for this error.

User response: Provide the system programmer with this message number and any variable information displayed in the message.

System programmer response: This might be an error in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

---

**FSUM2399**  
No session was started. The name of the pseudo-TTY for the session could not be determined. Function = ttyname(), terminal name = ’string’, file descriptor = number, errno = number (X’hexnum’), reason code = hexnum, message = ’string’

Explanation: The login program tried to obtain the name of the pseudo-TTY used for the shell session. An error occurred when the login program issued ttyname(). The shell session did not start.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

- **terminal name = ’string’**
  The name of the terminal returned by ttyname().

- **file descriptor = ’number’**
  The file descriptor of the pseudo-TTY passed to ttyname().

- **errno = number (X’hexnum’)**
  The errno value returned by the system for this error. For more information about this errno value, see [z/OS XL C/C++ Run-Time Library Reference](#).

User response: Reenter the c89 command and specify an output filename to be used with the -o option. For example:

c89 -o myprog myprog.c  
c89 -o ”/myload(myprog)” myprog.c  
c89 -c -o /tmp/myprog.o myprog.c

---

**FSUM3002**  
When using the output file option (-o), specify a filename.

Explanation: The -o option requires an option-argument that is the name of an output file to be created by c89. This filename can be a pathname or a data set and member name that begins with two slashes.

User response: Reenter the c89 command and include a library directory pathname after the -L option. For example:

c89 -L mylib myprog.c -l mine

---

**FSUM3007**  
string is not a valid option.

Explanation: The indicated option is not a valid c89 option. To see the valid c89 options, enter the c89 command without any arguments, or look up the
The c89 command will use information in addition to the suffix of the file to determine that the file is to be processed as an object file or as a library.

FSUM3009 When using the library operand (-l), specify a library name.

Explanation: The -l operand requires an option-argument that is the name of a library. c89 uses that name when it searches for the corresponding archive file to be used during link-editing.

User response: Reenter the c89 command and specify a library name to be used with the -l operand. For example:

c89 myprog.c -l mine

FSUM3010 Specify a file with the correct suffix (.string1,.string2,.string3,.string4,.string5,.string6,.string7,.string8,.string9,.string10,.string11), or a corresponding data set name, instead of string9.

Explanation: The c++ command can process either operands whose pathnames end with the .C,.i,.s,.a,.x,.p,.I, or .a suffix, or a corresponding data set name that begins with two slashes. The indicated string is not in either form.

In the message text:

string1 is the C source file suffix. string2 is the preprocessed file suffix. string3 is the Assembler source file suffix. string4 is the object file suffix. string5 is the definition side deck file suffix. string6 is the Prelinker output file suffix. string7 is the IPA Link output file suffix. string8 is the archive file suffix. string9 is the incorrect file name.

User response: Reenter the c89 command and specify a valid pathname or data set name. With the appropriate form, c89 can process the following:

- C source files (.c or .i suffix, or corresponding C source data set name)
- MVS assembler source files (.s suffix, or corresponding assembler source data set name)
- Object files produced by compiling with the c89 command (.osuffix, or corresponding object data set name)
- Object files of IMPORT statements, produced by the linkedit phase with the -Wl,dll option, when processing a DLL which exports symbols (.x suffix, or corresponding object data set name)
- Composite object files optionally produced by the PRELINK step of the linkedit phase of the c89 command (.psuffix, or corresponding object data set name)
- IPA linker object files optionally produced by the IPALINK step of the linkedit phase of the c89 command (.I suffix, or corresponding object data set name)
- Archive files such as those produced by the ar command (.a suffix, or corresponding library data set name)

The c89 command can also process files which do not match any of the above forms. By setting the environment variable [EXTRA_ARGS] to a value of 1, such files will be processed during link-editing. The c89 command description in z/OS UNIX System Services Command Reference.
• Composite object files optionally produced by the PRELINK step of the linkedit phase of the c++ command (.p suffix, or corresponding object data set name)
• IPA linker object files optionally produced by the IPALINK step of the linkedit phase of the c++ command (.I suffix, or corresponding object data set name)
• Archive files such as those produced by the ar command (.a suffix, or corresponding library data set name)

The c++ command can also process files which do not match any of the above forms. By setting the environment variable {_EXTRA_ARGS} to a value of 1, such files will be processed during link-editing. The c++ command will use information in addition to the suffix of the file to determine that the file is to be processed as an object file or as a library.

Alternatively, the -+ option of the c++ command can be used. It overrides the {_EXTRA_ARGS} environment variable. It causes all C source files, as well as any files which are not of any of the above forms, to be processed as C++ source files.

FSUM3012 Specify at least one source, archive, or object operand to be processed.
Explanation: The c89 command requires that you specify at least one operand of the pathname form. Otherwise, c89 has nothing that it can process. A library operand of the -l form alone is not enough input for c89.
User response: Reenter the c89 command and specify at least one operand of the pathname form. For example:
c89 myprog.c

FSUM3015 You cannot specify a data set as a library directory. Specify a valid library directory pathname instead of the data set string.
Explanation: When using the -L option, you can specify only a pathname as a library directory. You cannot specify a data set, because other data sets are not found in directories. If you are trying to specify a C/370 object library to be used as a library by c89, specify that data set name as an argument on the -l operand. This is analogous to specifying an archive file pathname (for which c89 also does not perform a library directory search).
In the message text:
string is the data set name.
User response: Reenter the c89 command and specify a library directory pathname after the -L option. For example:
c89 -L mylib myprog.c

Or, specify a data set after the -l operand. For example:
c89 myprog.c -l //mylib

FSUM3017 Could not compile string. Correct the errors and try again.
Explanation: c89 could not compile the indicated file. You should already have received one or more c89 or C/370 compiler messages (or both) indicating the reason for the failure.
In the message text:
string is the file name.
User response: Correct the errors and then reenter the c89 command.

FSUM3018 Could not assemble string. Correct the errors and try again.
Explanation: c89 could not assemble the indicated file. You should already have received one or more c89 or MVS assembler messages (or both) indicating the reason for the failure.
In the message text:
string is the file name.
User response: Correct the errors and then reenter the c89 command.

FSUM3024 When using the define option (-D), specify a name to be passed to the compiler.
Explanation: The -D option requires an option-argument that is a name. Optionally, after the name, you can specify a value to be used during the compilation as if coded on a #define statement in the C source program.
User response: Reenter the c89 command and specify a name (and, optionally, a value) to be passed to the compiler. (If you do not specify a value, 1 is used.) For example:
c89 -D mydef=2 myprog.c

FSUM3028 When using the undefine option (-U), specify a name.
Explanation: The -U option requires an option-argument that is a name. Optionally, after the name, you can specify a value to be used during the compilation as if coded on a #define statement in the C source program.
User response: Reenter the c89 command and specify a name (and, optionally, a value) to be passed to the compiler. (If you do not specify a value, 1 is used.) For example:
c89 -U _POSIX1_SOURCE myprog.c
When using the include directory option (-I), specify a directory name.

Explanation: The -I option requires an option-argument that is the name of an include directory. This directory name can be a directory pathname or a data set name that begins with two slashes. The C/370 compiler uses that directory name when searching for a header file specified on a #include statement in the C source file.

User response: Reenter the c89 command and specify the include directory name after the -I option. For example:

c89 -I myinc myprog.c

The data definition name string1 cannot be resolved. Specify a valid data set name instead of string2.

Explanation: c89 tried to allocate the indicated data set name dynamically in order to associate it with the indicated data definition. But the dynamic allocation failed because the indicated data set name was incorrect. Some common errors are:

- More than 8 characters were specified for any qualifier of the data set name.
- More than 44 characters were specified for the data set name.
- An incorrect character was specified as part of the data set name.
- A data set name qualifier began with a number.

Unless you enclose the data set name with single quotes, a TSO/E user ID prefix is added to the data set name.

In the message text:

string1 is the data definition name. string2 is the incorrect specification.

User response: Reenter the c89 command and specify a valid data set name. For example:

c89 "//myproj.c(myprog1)"

The data definition name string1 cannot be resolved. It does not begin with //ddname at string2.

Explanation: c89 processed a pseudo-JCL dynamic allocation instruction with incorrect syntax. This is a c89 internal parsing error.

In the message text:

string1 is the data definition name. string2 is the pseudo-JCL dynamic allocation instruction.

User response: Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

System programmer response: Reenter the c89 command with the -v option and redirect stdout to a file. Keep this pseudo-JCL file and the c89 command specified for problem determination.

The data definition name string1 cannot be resolved. Specify a valid data set member name instead of string2(member).string3.

Explanation: The c89 command tried to allocate the indicated data set name dynamically and to associate it with the indicated data definition name. The dynamic allocation failed, probably because the indicated data set member name did not have the correct syntax. Some common syntax errors are:

- More than 8 characters were specified for the member name.
- An incorrect character was specified as part of the member name.
- The member name began with a number.

Unless you enclosed the data set name with single quotes, a TSO/E user ID prefix is added to the data set name.

In the message text:

string1 is the data definition name. string2 is the data set name. string3 is the member name.

User response: Reenter the c89 command line and specify a valid data set member name. For example:

c89 "//myproj.c(myprog1)"

The data definition name string1 cannot be resolved. Specify balanced parentheses for the data definition at string2.

Explanation: c89 processed a pseudo-JCL dynamic
allocation instruction with incorrect syntax. This is a c89 internal parsing error.

In the message text:

_string1_ is the data definition name. _string2_ is the pseudo-JCL dynamic allocation instruction.

**User response:** Environment variables provide necessary system and operational information to c89. Most likely, the values of one or more of these variables was incorrect. Use the **env** command to determine which c89 environment variables are incorrectly set. _z/OS UNIX System Services Command Reference_ describes environment variables in the section on the c89 command.)

**FSUM3046** The data definition name _string1_ cannot be resolved. Specify a numeric _string2_ subparameter for _string3_ instead of _string4_.

**Explanation:** c89 processed a pseudo-JCL dynamic allocation instruction with incorrect syntax. One of the following subparameters had an incorrect value:

- For the DCB parameter, the keyword subparameters are one of the following:
  - LRECL
  - BLKSIZE
- For the SPACE parameter, the positional subparameters are one of the following:
  - BLKLGTH
  - PRIMARY-QTY
  - SECONDARY-QTY
  - DIRECTORY

In the message text:

_string1_ is the data definition name. _string2_ is the subparameter name. _string3_ is the parameter name. _string4_ is the incorrect value specified.

**User response:** Environment variables provide necessary system and operational information to c89. Most likely, the values of one or more of these variables was incorrect. Use the **env** command to determine which c89 environment variables are incorrectly set. _z/OS UNIX System Services Command Reference_ describes environment variables in the section on the c89 command.)

**FSUM3048** The data definition name _string1_ cannot be resolved. Specify a valid _string2_ subparameter instead of _string3_.

**Explanation:** c89 processed a pseudo-JCL dynamic allocation instruction with incorrect syntax. One of the following parameters had an incorrect subparameter:

- DCB

In the message text:

_string1_ is the data definition name. _string2_ is the parameter name. _string3_ is the incorrect value specified.

**User response:** Environment variables provide necessary system and operational information to c89. Most likely, the values of one or more of these variables was incorrect. Use the **env** command to determine which c89 environment variables are incorrectly set. _z/OS UNIX System Services Command Reference_ describes environment variables in the section on the c89 command.)

**FSUM3049** The data definition name _string1_ cannot be resolved. Specify a valid parameter instead of _string2_.

**Explanation:** c89 processed a pseudo-JCL dynamic allocation instruction with incorrect syntax. This is a c89 internal parsing error.

In the message text:

_string1_ is the data definition name. _string2_ is the incorrect value specified.

**User response:** The c89 command is configured by the use of environment variables. Most likely, the value of one or more of these environment variables is incorrect. Use the **env** command to determine which c89 environment variables are incorrectly set. _z/OS_
In the pseudo-JCL, find the statements for the failing special file pathname as follows:

You can determine the actual 
/dev/fdN specified for problem determination.

System programmer response: Reenter the 
c89 command with the -v option and redirect stdout to a file. Keep this pseudo-JCL file and the 
c89 command specified for problem determination.

You can determine the actual 
/dev/fdN character special file pathname as follows:

• In the pseudo-JCL, find the statements for the failing step.

• Beginning with N=3, count all the pathname allocations in the order listed. (Ignore the allocations already in the 
/dev/fdN format, such as 1 and 2.)

FSUM3050 The data definition name string1 cannot be resolved. Specify a valid string2 parameter instead of string3.

Explanation: 
c89 processed a pseudo-JCL dynamic allocation instruction with incorrect syntax. This is a 
c89 internal parsing error. One of the following parameters had an incorrect value:
• DSNTYPE
• PATHOPTS
• PATHMODE

In the message text:

string1 is the data definition name. string2 is the parameter name. string3 is the incorrect value specified.

User response: The 
c89 command is configured by the use of environment variables. Most likely, the value of one or more of these environment variables is incorrect. Use the env command to determine which 
c89 environment variables are incorrectly set. 

UNIX System Services Command Reference describes environment variables in the section on the 
c89 command.)

FSUM3051 The data definition name string1 cannot be resolved. Specify a valid file instead of string2.

Explanation: The 
c89 command tried to allocate for the indicated file pathname dynamically and to associate it with the indicated data definition name.
The dynamic allocation failed because the 
/dev/fdN pathname associated with the file did not have the correct syntax. Normally this cannot be the case because 
c89 validates the character special files 
/dev/fdN for all pathname dynamic allocations before the actual dynamic allocation.

In the message text:

string1 is the data definition name. string2 is the incorrect value specified.

User response: Reenter the 
c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

System programmer response: Reenter the 
c89 command with the -v option and redirect stdout to a file. Keep this pseudo-JCL file and the 
c89 command specified for problem determination.

You can determine the actual 
/dev/fdN character special file pathname as follows:

• In the pseudo-JCL, find the statements for the failing step.

FSUM3052 The data definition name string1 cannot be resolved. The data set was not found. Ensure that data set name string2 is specified correctly.

Explanation: The 
c89 command tried to dynamically allocate the data set name indicated and to associate it with the indicated data definition name.
The dynamic allocation failed, because the data set indicated could not be found. This is probably because the data set does not exist, or is not correctly cataloged (c89 can only work with cataloged data sets). Note that for data set names specified on the 
c89 command line, unless the data set name is enclosed in single quotes, a TSO/E user ID prefix is added to the data set name.

In the message text:

string1 is the data definition name. string2 is the data set name.

User response: Reenter the 
c89 command line and specify an existing data set name. For example:
c89 "//'myuser.myprog.c"

FSUM3053 The data definition name string1 cannot be resolved. The data set was not found. Ensure that data set and member name string2(string3) are specified correctly.

Explanation: The 
c89 command tried to dynamically allocate the indicated data set and member name and to associate it with the indicated data definition name.

But the allocation failed, because the indicated data set and member could not be found. This is probably because the data set does not exist, or is not correctly cataloged (c89 can only work with cataloged data sets). Unless you enclose the data set name with single quotes, a TSO/E user ID prefix is added to the data set name.

In the message text:

string1 is the data definition name. string2 is the data set name. string3 is the member name.

User response: Reenter the 
c89 command and specify an existing data set. For example:
c89 "//'myuser.myproj.c(myprog1)"

FSUM3054 The data definition name string1 cannot be resolved. The file was not found. Ensure that file string2 is specified correctly.

Explanation: The 
c89 command tried to dynamically allocate for the indicated file pathname and to associate it with the indicated data definition name. But the
dynamic allocation failed because the /dev/fdN pathname associated with the indicated file could not be found. Normally this situation does not happen because c89 validates the character special files /dev/fdN for all pathname dynamic allocations before doing the dynamic allocation.

In the message text:

string1 is the data definition name. string2 is the file name.

User response: Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

System programmer response: Reenter the c89 command with the -v option, redirecting stdout to a file. Keep this pseudo-JCL file and the c89 command specified for problem determination.

You can determine the actual /dev/fdN character special file pathname as follows:
- In the pseudo-JCL, find the statements for the failing step.
- Beginning with N=3, count all the pathname allocations in the order listed.
- Ignore the allocations already in the /dev/fdN format (such as 1 and 2).

FSUM3056 The data definition name string1 cannot be resolved. File string2 could not be opened: string2

Explanation: c89 tried to open the indicated file pathname and to associate it with the indicated data definition name. However, the file pathname could not be opened. This is usually because the file does not exist, or you do not have permission to use the file.

The error message from the open function is at the end of the c89 message.

In the message text:

string1 is the data definition name. string2 is the file name. string2 is the error message.

User response: Reenter the c89 command and specify an existing filename to which you have permission. For example:
c89 myprog.c

FSUM3057 The data definition name string1 cannot be resolved. An allocation error occurred for string2 with return code string3, error code string4 hex, and information code string5 hex.

Explanation: A pseudo-JCL dynamic allocation instruction that was processed by c89 failed. c89 did not recognize the return code, error code, and information code resulting from the dynamic allocation function.

In the message text:

string1 is the data definition name. string2 is the data set name. string3 is the return code. string4 is the error code. string5 is the information code.

User response: Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

System programmer response: Reenter the c89 command with the -v option, and redirect stdout and stderr to a file. Keep this pseudo-JCL, error file, and the c89 command specified for problem determination.

You can find the meaning of most dynamic allocation return codes in the chapter on requesting dynamic allocation functions in z/OS MVS Programming

Authorized Assembler Services Guide

FSUM3058 The data definition name string1 cannot be resolved. Specify only a data set name for sequential data set string2 instead of member string3.

Explanation: The c89 command allocated the indicated data set, for which the indicated data set member was specified, and discovered that it is a sequential data set. Sequential data sets do not have members.
For compiler objects, since the name is derived from the source data set name, the source and object data sets must have the same organization (partitioned or sequential).

In the message text:

string1 is the data definition name. string2 is the data set name. string3 is the member name.

User response: Reenter the c89 command line and specify the data set name without a member name. For example:

c89 "//myprog.c"

If the source data set and object data set organizations are not the same, you need to delete (and optionally preallocate) the object data set so the organizations are the same before reissuing the c89 command.

FSUM3059 The data definition name string1 cannot be resolved. Specify only a data set name for partitioned data set string2 instead of member string3.

Explanation: The c89 command allocated the indicated data set, for which the indicated data set member was specified. c89 knows that this should be a reference to a C370LIB object library data set. C370LIB object libraries are specified by giving the data set name only, without referring to any of the data set members. The data set members are automatically included by the Prelinker, as required, during symbol resolution.

In the message text:

string1 is the data definition name. string2 is the data set name. string3 is the member name.

User response: Reenter the c89 command line and specify the C370LIB object library data set name without a member name. For example:

c89 "//myproj.c(myprog)" -l"//mylib"

FSUM3060 Could not open string1: string2

Explanation: The c89 command tried to open the indicated temporary system input stream, but the associated data set could not be opened.

The error message from the open function is at the end of the c89 message.

In the message text:

string1 is the data set name. string2 is the error message.

User response: Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

System programmer response: Try to correct the problem based on the error message. If you do not succeed, reenter the c89 command with the -v option, and redirect stdout and stderr to a file. Keep this pseudo-JCL and error file and the c89 command specified for problem determination.

FSUM3064 Specify fewer arguments for the string1 step.

Explanation: Too many arguments were passed to the indicated step, where the step is one of the following:

- ASSEMBLE
- COMPILE
- IPACOMP
- TEMPINC
- IPATEMP
- IPALINK
- PRELINK
- LINKEDIT

When a program is invoked dynamically under MVS (such as when c89 calls the compiler), the length of the parameter string is architecturally limited.

Most of the c89 arguments have corresponding parameters to the compiler, prelinker, and linkage editor. Therefore, if you specify fewer arguments to c89, a shorter parameter string is passed. For example, perhaps many -I options were specified, or absolute rather than relative names were used.

In the message text:

string1 is the step name.

User response: Shorten the length of the arguments for the indicated step. Normally, you can accomplish this work, reenter the c89 command with the -v option and redirect stdout and stderr to a file. Keep this pseudo-JCL and error file and the c89 command specified for problem determination.
by removing one or more `c89` options or operands. Alternatively, you may be able to use a more terse syntax, such as specifying relative instead of absolute pathnames.

FSUM3065 The string1 step ended with return code string2.

**Explanation:** The indicated step completed with a nonzero return code, where the step is one of the following:

- ASSEMBLE
- COMPIL3E
- IPACOMP
- TEMPINC
- IPATEMP
- IPALINK
- PRELINK
- LINKEDIT

This does not necessarily mean that you need to take action. Normally, another error message from the step precedes this message (for the prelinker, you may need to create a prelink map, such as by using the `-V` option, to see the associated error message).

If a positive return code less than or equal to the value of the environment variable `{_ACCEPTABLE RC}; (or its default value), is returned, the final result of the `c89` command is not affected.

In the message text:

string1 is the step name. string2 is the return code. string3 is the error message.

**User response:** If necessary, correct the error indicated by the preceding message or messages, and reenter the `c89` command.

If a preceding message indicates that there is a problem with a `DD:ddname` (such as `DD:SYSIN`), and it is unclear to which data set or pathname this refers, then reenter the failing `c89` command with the `-v` option to produce pseudo-JCL. To find out which data set or pathname `c89` is allocating to that `ddname`, look at the pseudo-JCL of the failing step for a line beginning with the words “ //ddname DD”. The beginning of each step is identified by the words “//step EXEC”.

FSUM3066 The string1 step ended with return code string2; string3

**Explanation:** The indicated step completed with a nonzero return code, where the step is one of the following:

- ASSEMBLE
- COMPIL3E
- IPACOMP
- TEMPINC
- IPATEMP
- IPALINK
- PRELINK
- LINKEDIT

The error message from the system function is at the end of the `c89` message. Usually this happens because the program used in the indicated step cannot be found. For example, if the compiler program whose name is the value of the environment variable `{_CNAME} (or its default value) is not in the search order used for MVS programs, an error results.

In the message text:

string1 is the step name. string2 is the return code. string3 is the error message.

**User response:** Reenter the `c89` command. If the problem persists, contact the IBM service representative responsible for your installation.

**System programmer response:** Try to correct the problem based on the specific error message associated with the failing step. If you do not succeed, reenter the `c89` command with the `-v` option and redirect `stdout` and `stderr` to a file. Keep this pseudo-JCL and error file and the `c89` command specified for problem determination.

FSUM3067 The archive library string cannot be found.

**Explanation:** `c89` tried to find the indicated archive library, first by using the directories specified on all `-L` options, and then by looking in the “usual places” (`/lib` and then `/usr/lib`). The filename used for the search is the archive library name prefixed with `lib` and suffixed with `a`. But the archive library either does not exist, or you do not have permission to read it. Normally, this error occurs when the library name is incorrectly specified.

In the message text:

string is the archive library name.

**User response:** Reenter the `c89` command and specify an existing library name to which you have permission. For example:

c89 myprog.c -l m

or specify a library directory on the `-L` option that contains the indicated archive library. For example:

c89 -L mylib myprog.c -l mine

**FSUM3068 The data definition name string1 cannot be resolved. Specify the name of a partitioned data set instead of sequential data set string2.**

**Explanation:** The `c89` command allocated the indicated data set and discovered that it has sequential data set organization. `c89` knows that this should be a...
Certain data sets, such as C370LIB object libraries (specified on the -l operand) and executable (load) libraries (specified on the -o option), must always have partitioned organization.

In the message text:

**FSUM3069** The data definition name **string1** cannot be resolved. Specify the name of a sequential data set instead of partitioned data set **string2**.

**Explanation:** The c89 command allocated the indicated data set and discovered that it has partitioned organization instead of sequential organization, because of the DSORG subparameter specified on the DCB parameter of the environment variable associated with this data set.

In the message text:

**string1** is the data definition name. **string2** is the data set name.

**User response:** Reenter the c89 command line and specify a partitioned data set for the library data set name. For example:

c89 "//myproj.c(myprog)" -l"//mylib"

or

c89 -o"//myload(myprog)" "//myproj.c(myprog)"

**FSUM3070** The data definition name **string1** cannot be resolved. Information for character special file **string2**, needed to allocate file **string3**, cannot be obtained: **string4**. Follow local procedures for reporting problems.

**Explanation:** The c89 command uses the /dev/fdN character special files for all pathname allocations. c89 tried to validate the indicated character special file by using the stat function, but that function failed. c89 cannot use the indicated file without the indicated character special file.

In the message text:

**string1** is the data definition name. **string2** is the character special file name. **string3** is the file name. **string4** is the error message.

**User response:** Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

**System programmer response:** Ensure that the /dev/fdN character special files were correctly created with the mknod command, and that there are enough of them. For more information about creating the /dev/fdN character special files required for c89, refer to [z/OS UNIX System Services Planning](https://www.ibm.com/support/knowledgecenter/SSEKQY_11.1.0/com.ibm.zos.zos.tabf.aqx.chap1001957509_111000.pdf).

**FSUM3072** The data definition name **string1** cannot be resolved. Character-special file **string2**, needed to allocate file **string3**, is not character special. Follow local procedures for reporting problems.

**Explanation:** The c89 command uses the /dev/fdN character special files for all pathname allocations. c89 validated the indicated character special file, using the stat function, and determined that the indicated file is not a character special file. c89 cannot use the indicated file without the indicated character special file.

In the message text:

**string1** is the data definition name. **string2** is the character special file name. **string3** is the file name.

**User response:** Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

**System programmer response:** Ensure that the /dev/fdN character special files were correctly created with the mknod command, and that there are enough of them. For more information about creating the /dev/fdN character special files required for c89, refer to [z/OS UNIX System Services Planning](https://www.ibm.com/support/knowledgecenter/SSEKQY_11.1.0/com.ibm.zos.zos.tabf.aqx.chap1001957509_111000.pdf).
responsible for your installation.

**System programmer response:** Ensure that the /dev/fdN character special files were correctly created with the mknod command, and that there are enough of them. For more information about creating the /dev/fdN character special files required for c89, refer to z/OS UNIX System Services Planning.

---

**FSUM3073** The data definition name string1 cannot be resolved. Character-special file string2, needed to allocate file string3, is not minor string4. Follow local procedures for reporting problems.

**Explanation:** The c89 command uses the /dev/fdN character special files for all pathname allocations. c89 validated the indicated character special file, using the stat function, and determined that the indicated character special file does not have the correct minor number. c89 cannot use the indicated file without the indicated character special file.

In the message text:

string1 is the data definition name. string2 is the character special file name. string3 is the file name. string4 is the minor number.

**User response:** Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

**System programmer response:** Ensure that the /dev/fdN character special files were correctly created with the mknod command, and that there are enough of them. For more information about creating the /dev/fdN character special files required for c89, refer to z/OS UNIX System Services Planning.

---

**FSUM3080** Specify an argument shorter than string.

**Explanation:** The c89 command has an internal buffer, which is suitable for any option, option-argument, or operand that is valid for the c89 command. This buffer has a length limitation; the argument (option, option-argument, or operand) was too long. The portion of the argument that c89 could process is indicated in the message.

In the message text:

string is the maximum length.

**User response:** Reenter the c89 command and make sure that the argument is not longer than the length indicated in the message.

---

**FSUM3081** Specify an argument other than null for argument number string.

**Explanation:** The c89 command cannot process a null argument (option, option-argument, or operand).

---

In the message text:

string is the sequence number of the argument.

**User response:** Reenter the c89 command and make sure that the length of the indicated argument string is greater than zero.

---

**FSUM3088**

**Usage:** cc [-CcEFgOpqsVv0123] [-D name[=value]]... [-U name]... [-e function]... [-u function]... [-W phase,option[.option]...][-o outfile] [-l directory]... [-L directory]... [file.c]... [file.i]... [file.s]... [file.o]... [file.x]... [file.p]... [file.I]... [file.a]... [-l libname]...

**Explanation:** This message shows the correct format of the cc command. It is displayed only when you enter cc without any arguments.

---

**FSUM3090**

**Usage:** c89 [-CcEgOrsVv0123] [-D name[=value]]... [-U name]... [-e function]... [-u function]... [-W phase,option[.option]...][-o outfile] [-l directory]... [-L directory]... [file.c]... [file.i]... [file.s]... [file.o]... [file.x]... [file.p]... [file.I]... [file.a]... [-l libname]...

**Explanation:** This message shows the correct format of the c89 command. It is displayed only when you enter c89 without any arguments.

---

**FSUM3091**

**Explanation:** This message shows the correct format of the c++ command. It is displayed only when you enter c++ without any arguments.
FSUM3102  Specify an output file instead of the source file string.

Explanation: The indicated file has the format of a source file (a pathname with a source file suffix). To prevent the source files from being accidentally erased, this format is not allowed for output files.

In the message text:

string is the source file name.

User response: After the -o option, specify an output filename that does not have a source file suffix. For example:

c89 -o myprog.out myprog.c

FSUM3103  Specify an output file instead of the directory file string.

Explanation: The indicated file is a directory file type. A directory file cannot be written to or executed, so this type is not allowed for output files.

In the message text:

string is the directory name.

User response: After the -o option, specify an output filename that is not a directory file type. For example:

c89 -o myprog.out myprog.c

FSUM3104  Specify an output file instead of the FIFO special file string.

Explanation: The indicated file is a FIFO (first-in-first-out) special file type. Writing to a FIFO requires that another process be reading the FIFO. To prevent unexpected behavior (such as this process waiting for another process to open the file for reading), this type is not allowed for output files.

In the message text:

string is the FIFO special file name.

User response: After the -o option, specify an output filename that is not a FIFO special file type. For example:

c89 -o myprog.out myprog.c

FSUM3110  Could not open string1: string2

Explanation: When compiling with optimization level 2, c89 must copy certain files from data sets to HFS files. But c89 could not open the indicated file so it could not copy the corresponding data set to an HFS file.

The error message from the open function is at the end of the c89 message.

In the message text:

string1 is the file name. string2 is the error message.

User response: Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

System programmer response: Try to correct the problem based on the specific error message. If you do not succeed, reenter the c89 command with the -v option and redirect stdout and stderr to a file. Keep this pseudo-JCL and error file and the c89 command specified for problem determination.

FSUM3111  Could not read string1 when copying to string2: string3

Explanation: When compiling with optimization level 2, c89 must copy certain files from data sets to HFS files. But c89 could not read from the indicated data set, which is an output of the compilation, so it could not copy that data set to an HFS file.

The error message from the read function is at the end of the c89 message.

In the message text:

string1 is the data set name. string2 is the file name. string3 is the error message.

User response: Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

System programmer response: Try to correct the problem based on the specific error message. If you do not succeed, reenter the c89 command with the -v option and redirect stdout and stderr to a file. Keep this pseudo-JCL and error file and the c89 command specified for problem determination.

FSUM3112  Could not write string1 when copying from string2: string3

Explanation: When compiling with optimization level 2, c89 must copy certain files from data sets to HFS files. But it could not write to the indicated HFS file, which is an output of the c89 command, so c89 could not copy that file from a data set.

The error message from the write function is at the end of the c89 message.

In the message text:

string1 is the data set name. string2 is the file name. string3 is the error message.

User response: Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

System programmer response: Try to correct the problem based on the specific error message. If you do not succeed, reenter the c89 command with the -v option, and redirect stdout and stderr to a file. Keep this pseudo-JCL and error file and the c89 command specified for problem determination.
FSUM3120  When using the extensions option (-W), specify a phase code and a list of options.

Explanation: The -W option requires an option-argument which is a comma-separated list, beginning with a phase code, and followed by the phase options. For the IPA phase code (-WI), the phase options are optional. The phase options are passed directly to the specified phase. Specifying the IPA phase code indicates that IPA processing be enabled, otherwise IPA processing is disabled.

For information on valid phase codes and how to specify them, see message FSUM3121.

User response: Reenter the c89 command. After the -W option, specify a phase code, followed by a comma and a series of comma separated options that are to be passed to that phase. In the shell, parentheses within arguments must be escaped, either with a backslash or by quoting the argument. For example:

c89 -W "0,lang(extended)" -c myprog.c

c89 -Wl,p,map -o myprog myprog.o

c89 -W I,obj -o myprog myprog.c

FSUM3121  Specify a valid -W phase code (0 or c=compile, a=assemble, I=IPA, l,p=prelink, l,I=IPA link, l=linkedit) instead of string.

Explanation: The -W option was not followed by a valid phase code. The -W option requires an option-argument which is a comma-separated list, beginning with a phase code, and followed by the phase options. For the IPA phase code (-WI), the phase options are optional. The phase options are passed directly to the specified phase. Specifying the IPA phase code indicates that IPA processing be enabled, otherwise IPA processing is disabled.

In the message text:

string is the incorrect phase code specified.

User response: Reenter the c89 command. After the -W option, specify a phase code, followed by a comma and a series of comma separated options that are to be passed to that phase. In the shell, parentheses within arguments must be escaped, either with a backslash or by quoting the argument. For example:

c89 -W "0,lang(extended)" -c myprog.c

c89 -Wl,p,map -o myprog myprog.o

c89 -W I,obj -o myprog myprog.c

FSUM3122  Specify a series of options, separated by commas, for the -W string phase.

Explanation: The -W option was not followed by a valid phase code and then by a comma. The -W option requires an option-argument which is a comma-separated list, beginning with a phase code, and followed by the phase options. For the IPA phase code (-WI), the phase options are optional. The phase options are passed directly to the specified phase. Specifying the IPA phase code indicates that IPA processing be enabled, otherwise IPA processing is disabled.

In the message text:

string is the phase code.

User response: Reenter the c89 command. After the -W option, specify a phase code, followed by a comma and a series of comma separated options that are to be passed to that phase. In the shell, parentheses within arguments must be escaped, either with a backslash or by quoting the argument. For example:

c89 -W "0,lang(extended)" -c myprog.c

c89 -Wl,p,map -o myprog myprog.o

c89 -W I,obj -o myprog myprog.c

FSUM3123  When using the entry option (-e), specify an entry point symbol.

Explanation: The -e option requires an option-argument that is the name of the entry point symbol, to which control will be given when the output file program is executed. This symbol can be an L-name symbol, or an S-name symbol that begins with two slashes.

User response: Reenter the c89 command and specify an entry point symbol to be used with the -e option. For example:

c89 -e mystart myprog.c

c89 -e //MYSTART myprog.c
FSUM3124 When using the unresolved option (-u), specify a symbol to load.

Explanation: The -u option requires an option-argument that is the name of a symbol which is to be added to the table of unresolved symbols. This symbol can be an L-name symbol, or an S-name symbol that begins with two slashes.

User response: Reenter the c89 command and specify a symbol to load with the -u option. For example:
c89 -u mymain file.a
c89 -u //MYMAIN file.a

FSUM3130 Fork failed: string

Explanation: c89 attempted to fork, and the fork failed.

The error message from the fork function is at the end of the c89 message.

In the message text:
string is the error message.

User response: Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

System programmer response: Try to correct the problem based on the specific error message. If you do not succeed, reenter the c89 command with the -v option and redirect stdout and stderr to a file. Keep this pseudo-JCL and error file and the c89 command specified for problem determination.

FSUM3131 Terminated by signal string.

Explanation: c89 was terminated due to a signal.

In the message text:
string is the signal number.

FSUM3033 Directory string1 specified by command option string2 cannot be searched.

Explanation: A directory specified by -I or -L option on the command line can not be searched.

In the message text:
string1 is the directory name. string2 is the option name.

User response: Reenter the c89 command and specify a directory that can be searched.

FSUM3201 Configuration file string is not valid.

Explanation: An invalid configuration file was specified.

In the message text:
string is the configuration file name.

User response: Specify a valid configuration file.

System action: The processing stops.

FSUM3202 Configuration file string cannot be read.

Explanation: Attempt to read the configuration file failed.

In the message text:
string is the configuration file name.

User response: Check the file for corruption and try again.

System action: The processing stops.

FSUM3203 Configuration file string1 does not contain stanza string2.

Explanation: Required stanza was not found in the configuration file.

In the message text:
string1 is the configuration file name. string2 is the stanza name.

User response: Ensure that the stanza matching the command name is defined in the configuration file. If the -F flag option is used to override the default stanza, ensure that the overriding stanza is defined in the configuration file.

System action: The processing stops.

FSUM3204 Configuration file string1 contains incorrect stanza string2.

Explanation: An incorrect stanza was found in the configuration file.

In the message text:
string1 is the configuration file name. string2 is the stanza name.

User response: Ensure that the stanza reported in the message is correctly defined in the configuration file.

System action: The processing stops.

FSUM3205 Stanza string1 contains incorrect attribute string2.

Explanation: An incorrect attribute was specified in the configuration file for the reported stanza.

In the message text:
string1 is the stanza name. string2 is the attribute name.

User response: Correct the attribute specification.

System action: The processing stops.
FSUM3206  Configuration attribute string1 contains an incorrectly quoted string string2.

Explanation:  An attribute that requires quotes is missing a quote.

In the message text:
string1 is the attribute name. string2 is the string.

User response:  Ensure that the attribute has matching opening and closing quotes.

System action:  The processing stops.

FSUM3211  Configuration option string is incorrect for z/OS platform - ignored.

Explanation:  An option specified in the configuration file is not supported on z/OS.

In the message text:
string is the option name.

User response:  Remove the option from the configuration file.

System action:  Option is ignored and the processing continues.

FSUM3207  Configuration option string is missing a subargument.

Explanation:  A subargument of the -F flag option or an option specified in the configuration file is missing.

In the message text:
string is the option name.

User response:  Ensure that a required subargument is correctly specified.

System action:  The processing stops.

FSUM3212  Command option string is incorrect for z/OS platform - ignored.

Explanation:  An option specified on the command line is not supported on z/OS.

In the message text:
string is the option name.

User response:  Remove the option from the command line.

System action:  Option is ignored and the processing continues.

FSUM3208  Command option string is missing a subargument.

Explanation:  A subargument of an option specified on the command line is missing.

In the message text:
string is the option name.

User response:  Ensure that a required subargument is correctly specified.

System action:  The processing stops.

FSUM3215  Configuration option string is not recognized - passed to ld.

Explanation:  An option specified in the configuration file is not recognized as a valid compiler option.

In the message text:
string is the option name.

User response:  Ensure that the option is correct.

System action:  Option is passed to ld and the processing continues.

FSUM3209  Configuration option string contains an incorrect subargument.

Explanation:  A subargument of an option specified in the configuration file is incorrect.

In the message text:
string is the option name.

User response:  Ensure that the required subargument is correctly specified.

System action:  The processing stops.

FSUM3216  Command option string is not recognized - passed to ld.

Explanation:  An option specified on the command line is not recognized as a valid compiler option.

In the message text:
string is the option name.

User response:  Ensure that the option is correct.

System action:  Option is passed to ld and the processing continues.

FSUM3210  Command option string contains an incorrect subargument.

Explanation:  A subargument of an option specified on the command line is incorrect.

In the message text:
string is the option name.

</tbody>
</table>
FSUM3230  Internal compiler error.
Explanation:  An internal compiler error has occurred.
User response:  Report the error to your Service Representative.
System action:  The processing stops.

FSUM3231  Unable to find help file.
Explanation:  The xlc utility was unable to find the help file.
User response:  Ensure that the xlc utility is properly installed. If overriding the NLSPATH environment variable, ensure that it includes the location where the help file is installed.
System action:  The processing stops.

FSUM3233  Input file \textit{string} does not have correct permissions.
Explanation:  The input file does not have read permission.
In the message text:
\textit{string} is the file name.
User response:  Ensure that the input file has proper permissions.
System action:  The processing continues.

FSUM3238  Configuration file \textit{string} does not exist.
Explanation:  The reported configuration file does not exist.
In the message text:
\textit{string} is the configuration file name.
User response:  Provide an existing configuration file.
System action:  The processing stops.

FSUM3243  Object file \textit{string} is not writeable.
Explanation:  The reported object file does not have write permission.
In the message text:
\textit{string} is the name of the object file.
User response:  Ensure that the object file is writeable.
System action:  The processing stops.

FSUM3244  Warning: More than one source file with \textit{string1} and \textit{string2}: \textit{string3} ignored.
Explanation:  More than one source file was specified with flag options such as -c and -o.
In the message text:
\textit{string1} is the name of the first flag option. \textit{string2} and \textit{string3} represent the name of the second flag option.
User response:  Use only one of these flag options on the command line.
System action:  The second flag option is ignored and processing continues.

FSUM3247  Directory \textit{string1} specified by the configuration file option \textit{string2} cannot be searched.
Explanation:  A directory specified by an option in the configuration file can not be searched.
In the message text:
\textit{string1} is the directory name. \textit{string2} is the option name.
User response:  Ensure that the directory can be searched.
System action:  The processing stops.

FSUM3248  Directory \textit{string1} specified by command option \textit{string2} cannot be searched.
Explanation:  A directory specified by an option on the command line can not be searched.
In the message text:
\textit{string1} is the directory name. \textit{string2} is the option name.
User response:  Ensure that the directory can be searched.
System action:  The processing stops.

FSUM3257  Option \textit{string} is not recognized. Option will be ignored.
Explanation:  The reported option was not recognized as a valid option.
In the message text:
\textit{string} is the option name.
User response:  Specify a valid option.
System action:  The option is ignored and the processing continues.
FSUM3265  Compiler component is not installed or
string1 attribute ( = string2 ) in the
configuration file is incorrect.

Explanation:   The reported compiler component is not
an existing program.

In the message text:
string1 is the attribute name. string2 is the value
assigned to the attribute in the configuration file.

User response:   Ensure that the configuration file
attribute for the reported component points to a location
that contains the required program.

System action:   The processing stops.

FSUM3271  The specified option "-string" does not
support suboptions.

Explanation:   Most -q options do not support
suboptions in a negative form. The negative form of the
specified option does not support suboptions. The
specified option is invalid.

In the message text:
string is the name of the invalid option.

User response:   Remove the suboption or use the
positive form of the option and submit the command
again.

System action:   The processing stops.

FSUM3272  Output file string is not writeable.

Explanation:   The reported output file does not have
write permission.

In the message text:
string is the name of the output file.

User response:   Ensure that the output file is
writeable.

System action:   The processing stops.

FSUM3273  Data set is not a valid suboption,
option string is ignored.

Explanation:   The reported option does not support
data sets.

In the message text:
string is the name of the ignored option.

User response:   Specify a UNIX file name instead of a
data set name.

System action:   The option is ignored and the
processing continues.

FSUM3274  Make dependencies are not supported
for data sets, option string1 is ignored.

Explanation:   Make utility does not support data sets
in targets or prerequisites. Make dependencies are not
generated when either the source or the object file is a
data set.

In the message text:
string1 is the ignored option name.

User response:   Specify a UNIX file for both the
source and the object file and recompile.

System action:   The processing ignores the make
depend option and continues.

FSUM3401  The assemble step ended with rc =
number.

Explanation:   Assemble step completed with a
non-zero return code.

In the message text:
number is the return code from the assemble step.

User response:   This does not necessarily mean that
you need to take action. If necessary, correct the error
indicated by the preceding messages, and reenter the
as command.

FSUM3402  Exactly one source file must be
specified.

Explanation:   The as command requires that you
specify exactly one source file. The source file must be
a sequential data set, a PDS member, a PDSE member
or a UNIX System Services file.

User response:   Reenter the as command and specify
exactly one source file.

FSUM3403  The PDS string cannot be assembled.
Specify a PDS member instead.

Explanation:   The indicated input file is a PDS. The as
command requires the input source file to be a
sequential data set, a PDS member, a PDSE member
or a UNIX System Services file.

In the message text:
string is the name of the input source file.

User response:   Reenter the as command and specify
a PDS member.

FSUM3404  The PDSE string cannot be assembled.
Specify a PDSE member instead.

Explanation:   The indicated input file is a PDSE. The as
command requires the input source file to be a
sequential data set, a PDS member, a PDSE member
or a UNIX System Services file.
In the message text:

**string** is the name of the input source file.

**User response:** Reenter the **as** command and specify a PDSE member.

---

**FSUM3405**  The VSAM file **string** cannot be assembled.

**Explanation:** The indicated input file is a VSAM file. The **as** command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

In the message text:

**string** is the name of the input source file.

**User response:** Reenter the **as** command and specify a PDSE member.

---

**FSUM3406**  The block special file **string** cannot be assembled.

**Explanation:** The indicated input file is a block special file. The **as** command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

In the message text:

**string** is the name of the input source file.

**User response:** Reenter the **as** command and specify a PDSE member.

---

**FSUM3407**  The character special file **string** cannot be assembled.

**Explanation:** The indicated input file is a character special file. The **as** command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

In the message text:

**string** is the name of the input source file.

**User response:** Reenter the **as** command and specify a PDSE member.

---

**FSUM3408**  The directory **string** cannot be assembled. Specify a UNIX System Services file instead.

**Explanation:** The indicated input file is a directory. The **as** command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

In the message text:

**string** is the name of the input source file.

**User response:** Reenter the **as** command and specify a UNIX System Services file.

---

**FSUM3409**  The socket file **string** cannot be assembled.

**Explanation:** The indicated input file is a socket file. The **as** command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

In the message text:

**string** is the name of the input source file.

**User response:** Reenter the **as** command and specify a UNIX System Services file.

---

**FSUM3410**  The path name of the working directory cannot be determined.

**Explanation:** The file permissions for the current directory or its parent directories do not have read or search permissions set.

**User response:** Ensure that the current directory and its parent directories have read and search permissions set.

---

**FSUM3411**  The real path for file **string1** cannot be retrieved: errno: **number**, strerror: **string2**

**Explanation:** The **as** command cannot determine the canonicalized absolute path name for the indicated file. The errno is set by realpath().

In the message text:

**string1** is the processing file name. **number** is the errno from realpath(). **string2** is the error message associated with errno.

**User response:** Review the realpath() information in the C/C++ Run-Time Library Reference and use the errno to determine the cause of the error.

---

**FSUM3412**  The file **string1** cannot be opened with attributes: **string2**, errno: **number**, strerror: **string3**.

**Explanation:** The **as** command requires permission to open the indicated file with the indicated permission.

In the message text:

**string1** is the processing file name. **string2** contains the file attributes passed into fopen(). **number** is the errno set by fopen(). **string3** is the error message associated with errno.

**User response:** If the indicated file already exists on your system, rename the file and reenter the **as** command. Review the fopen() information in the XL
C/C++ Run-Time Library Reference and use the errno to determine the cause of the error.

FSUM3416  DD names passed to assembler:
Explanation: This is the message header for displaying the data definition names that are being passed to the assembler. A list of data definition names will follow this message. The message is issued when the --verbose option is specified for the as command.
User response: Reenter the as command without the --verbose option.

FSUM3417  The DLL string is not found.
Explanation: The indicated Common Debug Architecture run-time library cannot be found.
In the message text:
string is the name of the Common Debug Architecture run-time library.
User response: The indicated Common Debug Architecture run-time library should be installed in the SCEERUN2 data set. Verify that the run-time library is installed properly.

FSUM3418  The data set does not exist.
Explanation: This message provides the cause of the failure in data definition name allocation. Message FSUM3421 provides the name of the data set.
User response: Make sure the data set is properly allocated.

FSUM3419  A Ddpi error has been encountered:
   number.
Explanation: An error has occurred while generating DWARF 3.0 debug information.
In the message text:
number is the error number generated by the libddpi APIs.
User response: If you do not require debug information, reenter the as command without the -g option. Otherwise, provide the indicated error number to the IBM service representative responsible for your installation.

FSUM3420  An error has been encountered in string.
Explanation: The indicated message text contains the phase where the error has occurred. The known phases are:
• ESI (extraction of symbol information)
• A2D (ADATA to DWARF conversion)
• POM (production of object map)
In the message text:
string is the phase where the error has occurred.
User response: This is an internal error. Provide the indicated error text to the IBM service representative responsible for your installation.

FSUM3421  An error has occurred when establishing the DD name for string1,string2
Explanation: An error has occurred while the as command uses the SVC99 service to allocate the data definition name.
In the message text:
string1 is the file name. string2 is the SVC99 message.
User response: The cause of the error is indicated in the second part of the message. If the cause of the error is still unclear, reenter the as command with the --verbose option, and redirect the output to a file. Provide this information to the IBM service representative responsible for your installation.

FSUM3422  An error has occurred when reading string1: errno: number, strerror: string2.
Explanation: Unable to read from the indicated file.
In the message text:
string1 is the file being fread(). number is the errno set by fread(). string2 is the error message associated with errno.
User response: This is an internal error. Reenter the as command with the --verbose option, and redirect the output to a file. Provide this information to the IBM service representative responsible for your installation.

FSUM3423  An error has occurred when writing string1: errno: number, strerror: string2.
Explanation: Unable to write to the indicated file.
In the message text:
string1 is the file being fwrite(). number is the errno set by fwrite(). string2 is the error message associated with errno.
User response: This is an internal error. Reenter the as command with the --verbose option, and redirect the output to a file. Provide this information to the IBM service representative responsible for your installation.
FSUM3424  An error has occurred: string.

Explanation:  This is a generic error message. Refer to the error message text for a description of the error.

In the message text:

string contains the cause of the error and the method of recovery.

User response:  Refer to the error message text for information on how to recover from the error.

FSUM3425  The file string does not exist.

Explanation:  The as command cannot find the indicated file.

In the message text:

string is a file name.

User response:  Verify that the file name specified is correct and the proper permissions are set.

FSUM3426  An incompatible DLL has been detected. 0xhexnum1 is the LIBDDP1_DLL_VERSION with which string was compiled. 0xhexnum2 is the LIBDDP1_DLL_VERSION of the DLL.

Explanation:  The Common Debug Architecture run-time version is outdated.

In the message text:

hexnum1 is the Common Debug Architecture run time that is compiled with the as command. string is one of the source file names in the as command. hexnum2 is the Common Debug Architecture run time that is being used to run the as command.

User response:  Contact the IBM service representative responsible for your installation and verify that you have the latest Common Debug Architecture run time installed.

FSUM3427  An incompatible DLL has been detected. 0xhexnum1 is the LIBELF_DLL_VERSION with which string was compiled. 0xhexnum2 is the LIBELF_DLL_VERSION of the DLL.

Explanation:  The Common Debug Architecture run-time version is outdated.

In the message text:

hexnum1 is the Common Debug Architecture run time that is compiled with the as command. string is one of the source file names in the as command. hexnum2 is the Common Debug Architecture run time that is being used to run the as command.

User response:  Contact the IBM service representative responsible for your installation and verify that you have the latest Common Debug Architecture run time installed.

FSUM3428  The listing file name is too long. It must not be more than number characters.

Explanation:  The specified listing file name is too long.

In the message text:

number is the maximum character length for the file name.

User response:  Provide a listing file name with less than the indicated number of characters.

FSUM3429  The object file name is too long. It must not be more than number characters.

Explanation:  The specified object file name is too long.

In the message text:

number is the maximum character length for the file name.

User response:  Provide an object file name with less than the indicated number of characters.

FSUM3430  The option string is specified with multiple source files.

Explanation:  The indicated option can only be specified when there is exactly one input source file.

In the message text:

string is an option name.

User response:  Specify only one source file when using this option.

FSUM3431  Options: string

Explanation:  The as command displays a list of options passed to the assemble step when the command line option --verbose is used.

In the message text:

string contains a list of option names.

User response:  Remove the command line option --verbose to suppress this message.

FSUM3432  Out of memory allocating number bytes for string.

Explanation:  The as command ran out of memory trying to assemble the file. This sometimes happens with large input files.

In the message text:
number is the number of bytes as tries to allocate.  
string contains the name of the function trying to allocate the memory.

User response: Shut down any large processes that are running. You may need to specify the runtime option HEAP(,,FREE,,) to prevent the as command from running out of memory.

FSUM3433 Out of memory allocating number bytes.
Explanation: The as command ran out of memory trying to assemble the file. This sometimes happens with large input files.
In the message text:
number is the number of bytes as tries to allocate.
User response: Shut down any large processes that are running. You may need to specify the runtime option HEAP(,,FREE,,) to prevent the as command from running out of memory.

FSUM3434 SVC99 error code 0xhexnum1, info code 0xhexnum2.
Explanation: This message provides the cause of the failure in data definition name allocation. Message FSUM3421 provides the name of the data set.
In the message text:
hexnum1 is the SVC99 error code. hexnum2 is the SVC99 information code.
User response: Make sure the data set is properly allocated. If the error still persists, reenter the as command with the --verbose option, and redirect the output to a file. Provide this information to the IBM service representative responsible for your installation.

FSUM3437 Unable to allocate string1 data set concatenation. The first data set in error is string2.
Explanation: The as command is unable to process the indicated data set.
In the message text:
string1 is a list of concatenated dataset names. string2 is the data set that is not allocated.
User response: Verify that the data set exists and is properly allocated.

FSUM3438 Unable to load the assembler compiler.
Explanation: The as command can not load the assembler compiler.
User response: Reenter the as command. If the problem persists, contact the IBM service representative responsible for your installation.

FSUM3439 Unable to obtain the file information for string.
Explanation: The as command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.
In the message text:
string is the name of input source file.
User response: Reenter the as command and specify a valid file name.

FSUM3440 Unable to open the debug file string.
Explanation: The indicated file can not be opened for writing.
In the message text:
string is the name of the debug file.
User response: If a file with the same name already exists, give the existing file another name before you reenter the as command.

FSUM3441 Unable to open the listing file string.
Explanation: The indicated file can not be opened for writing.
In the message text:
string is the name of the listing file.
User response: If a file with the same name already exists, make sure it is renamed to another name before you reenter the as command.

FSUM3442 Unable to open the object file string.
Explanation: The indicated file can not be opened for writing.
In the message text:
string is the name of the object file.
User response: If a file with the same name already exists, make sure it is renamed to another name before you reenter the as command.

FSUM3443 Unable to open the source file string for read.
Explanation: The indicated file can not be opened for reading.
In the message text:
string is the name of the input source file.
User response: Make sure the source file exists and has the correct read permission.
FSUM3444 Unable to set up stderr for writing asm error messages.

Explanation: The as command is unable to access files within /dev/ for writing.

User response: This is an internal error. Reenter the as command with the -verbose option, and redirect the output to a file. Provide this information to the IBM service representative responsible for your installation.

FSUM3491 An invalid option string is specified.

Explanation: The indicated option is not a valid as option.

In the message text:
string is an invalid option.

User response: Reenter the as command and specify a valid option.

FSUM3495 The debug file name is too long. It must not be more than number characters.

Explanation: The specified debug file name is too long.

In the message text:
number is the maximum character length for the file name.

User response: Provide a debug file name with less than the indicated number of characters.

FSUM3496 Option string accepts a maximum of number suboptions.

Explanation: The number of given suboptions exceeds the maximum allowed by the option.

In the message text:
string is the option name. number is the maximum number of suboptions allowed.

User response: Use the correct number of suboptions for each option.

FSUM3497 Option string requires a minimum of number suboptions.

Explanation: The number of given suboptions is less than the minimum required by the option.

In the message text:
string is the option name. number is the minimum number of suboptions required.

User response: Use the correct number of suboptions for each option.

FSUM3498 Option string cannot be specified in negative form.

Explanation: The specified option is only allowed in the positive form.

In the message text:
string is the positive form of the option name.

User response: Ensure that a valid Assembler option is specified.

FSUM3499 The option string has invalid syntax.

Explanation: There is no closing parenthesis for the suboptions of the specified option.

In the message text:
string is the option name.

User response: Ensure that the suboptions are enclosed in parenthesis.

FSUM4001 /etc/log created by /usr/sbin/init

Explanation: /usr/sbin/init erased and recreated the /etc/log file during start of z/OS UNIX system services with the START OMVS command.

User response: None.

System programmer response: None.

System action: /usr/sbin/init continues.

FSUM4002 /etc/log created by /usr/sbin/init, <date/time>

Explanation: /usr/sbin/init erased and recreated the /etc/log file at <date/time> during start of z/OS UNIX system services with the START OMVS command.

User response: None.

System programmer response: None.

System action: /usr/sbin/init continues.

FSUM4003 Shell with pathname <name> unaccessible

Explanation: /usr/sbin/init could not find a shell with pathname <name> in z/OS UNIX file system.

User response: Contact your system programmer.

System programmer response: Verify that the shell pathname specified in the /etc/init.options file (default = /bin/sh) is in the z/OS UNIX file system.

System action: /usr/sbin/init exits with status 04 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.
FSUM4004 Script with pathname <name> unaccessible
Explanation: /usr/sbin/init could not find an initialization script with pathname <name> in the z/OS UNIX file system.
User response: Contact your system programmer.
System programmer response: Verify that the script pathname specified in the /etc/init.options file (default = /etc/rc) is in the z/OS UNIX file system.
System action: /usr/sbin/init exits with status 05 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

FSUM4005 Sigaction for SIGALRM handler failed
Explanation: The sigaction() request by /usr/sbin/init to install the SIGALRM signal catcher failed.
User response: Contact your system programmer.
System programmer response: Investigate why the sigaction() request failed.
System action: /usr/sbin/init exits with status 07 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

FSUM4006 Execve <shell-pathname>, script = <script-pathname>, timeout = <time-interval> seconds
Explanation: /usr/sbin/init issued an execve() request to invoke a shell with pathname <shell-pathname> to execute an initialization script with pathname <script-pathname>. /usr/sbin/init is set up to wait <time-interval> seconds for the shell to finish executing the initialization script.
User response: None.
System action: /usr/sbin/init waits while the shell executes the initialization script.

FSUM4007 Fork for <shell-pathname> process space failed
Explanation: The fork() request by /usr/sbin/init to create a child process for the shell with pathname <shell-pathname> failed.
User response: Contact your system programmer.
System programmer response: Investigate why the fork() request failed.
System action: /usr/sbin/init exits with status 0E (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

FSUM4008 Unable to unblock signals for <shell-pathname>
Explanation: The sigprocmask() request by /usr/sbin/init to unblock signals before invoking the shell with pathname <shell-pathname> failed.
User response: Contact your system programmer.
System programmer response: Investigate why the sigprocmask() request failed.
System action: /usr/sbin/init exits with status 16 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

FSUM4009 Execve of shell with pathname <pathname> failed
Explanation: The execve() request by /usr/sbin/init to invoke the shell with pathname <shell-pathname> to execute an initialization script failed.
User response: Contact your system programmer.
System programmer response: Investigate why the execve() request failed.
System action: /usr/sbin/init exits with status 17 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

FSUM4010 Waitpid for <shell-pathname> failed
Explanation: The waitpid() request by /usr/sbin/init to wait for the shell with pathname <shell-pathname> to finish executing the initialization script failed.
User response: Contact your system programmer.
System programmer response: Investigate why the waitpid() request failed.
System action: /usr/sbin/init sends SIGTERM to terminate the shell process group, which includes the shell process and any processes created by the shell to execute the initialization script. Then /usr/sbin/init exits with status 0F (hexadecimal). The system continues.

FSUM4011 Waitpid for <shell-pathname> failed, <date/time>
Explanation: The waitpid() request by /usr/sbin/init at <date/time> to wait for the shell with pathname <shell-pathname> to finish executing the initialization script failed.
User response: Contact your system programmer.
System programmer response: Investigate why the waitpid() request failed.
System action: /usr/sbin/init sends SIGTERM to terminate the shell process group, which includes the shell process and any processes created by the shell to execute the initialization script. Then /usr/sbin/init exits with status 0F (hexadecimal). The system continues.
FSUM4012  Timeout after <time-interval> seconds waiting for <shell-pathname>

Explanation:  /usr/sbin/init received a SIGALRM signal while waiting for the shell with pathname <shell-pathname> to finish executing the initialization script.

Before invoking the shell, /usr/sbin/init issues an alarm() request to generate the SIGALRM signal after <time-interval> seconds.

User response:  Contact your system programmer.

System programmer response:  Investigate if a longer time interval is required for /usr/sbin/init to wait for the shell to finish executing the initialization script. The time interval to wait is specified with the -a option in the /etc/init.options file (default = 10 seconds).

System action:  If the value of the terminate option, -t, specified in the /etc/init.options file is nonzero (default = 1), /usr/sbin/init sends SIGTERM to terminate the shell process group, which includes the shell process and any processes created by the shell to execute the initialization script. Then /usr/sbin/init exits with status 10 (hexadecimal). The system continues.

System action:  /usr/sbin/init notifies z/OS UNIX system services that the shell exited and then exits with status 0. The system continues.

FSUM4013  Timeout, <date/time>, after <time-interval> seconds waiting for <shell-pathname>

Explanation:  /usr/sbin/init received a SIGALRM signal at <date/time> while waiting for the shell with pathname <shell-pathname> to finish executing the initialization script.

Before invoking the shell, /usr/sbin/init issues an alarm() request to generate the SIGALRM signal after <time-interval> seconds.

User response:  Contact your system programmer.

System programmer response:  Investigate if a longer time interval is required for /usr/sbin/init to wait for the shell to finish executing the initialization script. The time interval to wait is specified with the -a option in the /etc/init.options file (default = 10 seconds).

System action:  If the value of the terminate option, -t, specified in the /etc/init.options file is nonzero (default = 1), /usr/sbin/init sends SIGTERM to terminate the shell process group, which includes the shell process and any processes created by the shell to execute the initialization script. Then /usr/sbin/init exits with status 10 (hexadecimal). The system continues.

System action:  /usr/sbin/init notifies z/OS UNIX system services that the shell exited and then exits with status 0. The system continues.

FSUM4014  <shell-pathname> exit with status <stat>

Explanation:  The waitpid() request issued by /usr/sbin/init to wait for the shell with pathname <shell-pathname> to execute the initialization script returned control to /usr/sbin/init because the shell exited with status <stat> (hexadecimal).

User response:  If the status returned by the shell is nonzero, contact your system programmer.

System programmer response:  Investigate why the shell exited with nonzero status.

System action:  /usr/sbin/init notifies z/OS UNIX system services that the shell exited and then exits with status 0. The system continues.

FSUM4015  <shell-pathname> exit with status <stat>, <date/time>

Explanation:  The waitpid() request issued by /usr/sbin/init to wait for the shell with pathname <shell-pathname> to execute the initialization script returned control to /usr/sbin/init at <date/time> because the shell exited with status <stat>.

User response:  If the status returned by the shell is nonzero, contact your system programmer.

System programmer response:  Investigate why the shell exited with nonzero status.

System action:  /usr/sbin/init notifies z/OS UNIX system services that the shell exited and then exits with status 0. The system continues.

FSUM4016  <shell-pathname> terminated by signal <sig>

Explanation:  The waitpid() request issued by /usr/sbin/init to wait for the shell with pathname <shell-pathname> to execute the initialization script returned control to /usr/sbin/init because the shell was terminated by a signal with signal number <sig>.

User response:  Contact your system programmer.

System programmer response:  Investigate why the shell received the terminating signal.

System action:  /usr/sbin/init exits with status 11 (hexadecimal). The system continues.

FSUM4017  <shell-pathname> terminated by signal <sig>, <date/time>

Explanation:  The waitpid() request issued by /usr/sbin/init to wait for the shell with pathname <shell-pathname> to execute the initialization script returned control to /usr/sbin/init at <date/time> because the shell was terminated by a signal with signal number <sig>.

User response:  Contact your system programmer.

System programmer response:  Investigate why the shell received the terminating signal.

System action:  /usr/sbin/init exits with status 11 (hexadecimal). The system continues.
FSUM4018 <shell-pathname> stopped by signal <sig>

**Explanation:** The waitpid() request issued by /usr/sbin/init to wait for the shell with pathname <shell-pathname> to execute the initialization script returned control to /usr/sbin/init because the shell was stopped by a signal with signal number <sig>.

**User response:** Contact your system programmer.

**System programmer response:** Investigate why the shell process received the stop signal.

**System action:** /usr/sbin/init sends SIGTERM to terminate the shell process group, which includes the shell process and any processes created by the shell to execute the initialization script. Then /usr/sbin/init exits with status 12 (hexadecimal). The system continues.

FSUM4019 <shell-pathname> stopped by signal <sig>, <date/time>

**Explanation:** The waitpid() request issued by /usr/sbin/init to wait for the shell with pathname <shell-pathname> to execute the initialization script returned control to /usr/sbin/init at <date/time> because the shell was stopped by a signal with signal number <sig> (hexadecimal).

**User response:** Contact your system programmer.

**System programmer response:** Investigate why the shell process received the stop signal.

**System action:** /usr/sbin/init sends SIGTERM to terminate the shell process group, which includes the shell process and any processes created by the shell to execute the initialization script. Then /usr/sbin/init exits with status 12 (hexadecimal). The system continues.

FSUM4020 Ready signal received

**Explanation:** /usr/sbin/init received a SIGCONT signal from z/OS UNIX system services indicating that system services are now generally available to batch and interactive users. z/OS UNIX system services send the SIGCONT signal in response to /usr/sbin/init’s sending a SIGSTOP signal. /usr/sbin/init sends the SIGSTOP signal when the shell exits after executing the initialization script.

**User response:** None.

**System programmer response:** None.

**System action:** /usr/sbin/init exits with status 0. The system continues.

FSUM4021 Ready signal received, <date/time>

**Explanation:** /usr/sbin/init received a SIGCONT signal from z/OS UNIX system services at <date/time> indicating that system services are now generally available to batch and interactive users.

**User response:** None.

**System programmer response:** None.

**System action:** /usr/sbin/init exits with status 0. The system continues.

FSUM4022 ARG_MAX exceeded parsing <option-value>

**Explanation:** While parsing an option with value <option-value> in the /etc/init.options file, /usr/sbin/init determined that additional bytes required for this value would cause the configurable system variable value, {ARG_MAX}, to be exceeded.

**User response:** Contact your system programmer.

**System programmer response:** Investigate why the ARG_MAX value was exceeded.

**System action:** /usr/sbin/init exits with status 14 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

FSUM4023 ENV_MAX exceeded parsing <env-option-value>

**Explanation:** While parsing an environment variable option, -e, with value <env-option-value> in the /etc/init.options file, /usr/sbin/init determined that the number of environment variables specified in the /etc/init.options file exceeded 25.

**User response:** Contact your system programmer.

**System programmer response:** Investigate why the ENV_MAX value, 25, was exceeded.

**System action:** /usr/sbin/init exits with status 15 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

FSUM4024 Unable to open options file, /etc/init.options

**Explanation:** /usr/sbin/init could not access the options file whose pathname is /etc/init.options.

**User response:** If you expect /usr/sbin/init to use non-default option values, contact your system programmer.
**System programmer response:** Determine if the options file is required to override defaults.

**System action:** /usr/sbin/init continues using default option values.

---

**FSUM4025**  
<partial-option-value> option value too long

**Explanation:** While parsing an option with partial value <partial-option-value> in the /etc/init.options file, /usr/sbin/init determined that the entire value would exceed 255 bytes.

**User response:** Contact your system programmer.

**System programmer response:** Investigate why the maximum option value, 255 bytes, was exceeded.

**System action:** /usr/sbin/init continues using the default option value.

---

**FSUM4026**  
Invalid timeout value = <time-interval>

**Explanation:** The time interval value <time-interval> specified by the -a option in the /etc/init.options file is not valid. It must be a number of seconds less than 10,000. It specifies the number of seconds /usr/sbin/init will wait for the shell to execute the initialization script.

**User response:** Contact your system programmer.

**System programmer response:** Investigate why the -a option value is not a number of seconds less than 10,000.

**System action:** /usr/sbin/init continues using the default option value (180 seconds).

---

**FSUM4027**  
Timeout option value = <time-interval>

**Explanation:** The time interval value <time-interval> specified by the -a option in the /etc/init.options file is valid. /usr/sbin/init will wait this number of seconds for the shell to execute the initialization script.

**User response:** None.

**System programmer response:** None.

**System action:** /usr/sbin/init ignores the incorrect -e option and continues.

---

**FSUM4028**  
Invalid terminate flag = <flag-value>

**Explanation:** The terminate flag value <flag-value> specified by the -t option in the /etc/init.options file is not valid. A nonzero value indicates that /usr/sbin/init should terminate the shell process group if /usr/sbin/init times out while waiting for the shell to execute the initialization script.

**User response:** Contact your system programmer.

**System programmer response:** Investigate why the -t option value is not a digit in the range 0 through 9.

**System action:** /usr/sbin/init continues using the default option value (1 = terminate).

---

**FSUM4029**  
Terminate option flag = <flag-value>

**Explanation:** The terminate flag value <flag-value> specified by the -t option in the /etc/init.options file is valid. A nonzero value indicates that /usr/sbin/init should terminate the shell process group if /usr/sbin/init times out while waiting for the shell to execute the initialization script.

**User response:** None.

**System programmer response:** None.

**System action:** /usr/sbin/init continues using the option value specified.

---

**FSUM4030**  
Invalid environment variable name: <ev-option-value>

**Explanation:** An environment variable option value <ev-option-value> specified by a -e option in the /etc/init.options file is not valid. <ev-option-value> must have the form name=value. name, which specifies the name of an environment variable, must be delimited by leading blanks and a trailing equal sign (=). name cannot contain embedded blanks or equal signs.

**User response:** Contact your system programmer.

**System programmer response:** Investigate why the -e option value is not of form name=value.

**System action:** /usr/sbin/init ignores the incorrect -e option and continues.

---

**FSUM4031**  
Invalid environment variable value: <ev-option-value>

**Explanation:** An environment variable option value <ev-option-value> specified by a -e option in the /etc/init.options file is not valid. <ev-option-value> must have the form name=value. value, which specifies the value of an environment variable, must be delimited by a leading equal sign (=) and trailing blanks. value cannot contain embedded blanks.

**User response:** Contact your system programmer.

**System programmer response:** Investigate why the -e option value is not of form name=value.

**System action:** /usr/sbin/init ignores the incorrect -e option and continues.

---

**FSUM4032**  
Environment variable option string: <name=value>

**Explanation:** The environment variable string <name=value> specified by a -e option in the /etc/init.options file is valid. /usr/sbin/init issues a
setenv() request to add (or replace) the environment variable with name name and value value to its environment variable array. After processing the /etc/init.options file, /usr/sbin/init uses execve() to invoke the shell and to pass it the environment variable array.

User response: None.
System programmer response: None.
System action: /usr/sbin/init continues.

FSUM4033  Invalid shell pathname =<pathname-option-value>
Explanation: The shell pathname <pathname-option-value> specified by the -sh option in the /etc/init.options file is not a valid pathname.
User response: Contact your system programmer.
System programmer response: Investigate why the -sh option value is not valid.
System action: /usr/sbin/init continues using the default option value (/bin/sh).

FSUM4034  Shell pathname option =<pathname-option-value>
Explanation: The shell pathname <pathname-option-value> specified by the -sh option in the /etc/init.options file is valid. /usr/sbin/init uses this pathname to invoke a shell to execute the initialization script.
User response: None.
System programmer response: None.
System action: /usr/sbin/init continues using the specified option value for the shell pathname.

FSUM4035  Invalid script pathname =<pathname-option-value>
Explanation: The script pathname <pathname-option-value> specified by the -sc option in the /etc/init.options file is not a valid pathname.
User response: Contact your system programmer.
System programmer response: Investigate why the -sc option value is not valid.
System action: /usr/sbin/init continues using the default option value (/etc/rc).

FSUM4036  Script pathname option =<pathname-option-value>
Explanation: The script pathname <pathname-option-value> specified by the -sc option in the /etc/init.options file is valid. /usr/sbin/init passes this pathname to the shell as the pathname of the initialization script to be executed.
User response: None.
System programmer response: None.
System action: /usr/sbin/init continues using the specified option value for the script pathname.

FSUM4037  No shell execution option
Explanation: /usr/sbin/init found a shell pathname option, -sh, line in the /etc/init.options file in which the option value field consisted of all blanks followed by the value field continuation character, backslash (\). This -sh option value tells /usr/sbin/init to bypass invoking a shell to execute an initialization script and, instead, to raise SIGSTOP to signal z/OS UNIX system services that the system is ready for multiuser access.
User response: None.
System programmer response: None.
System action: When z/OS UNIX system services send a SIGCONT signal in response to the SIGSTOP signal, /usr/sbin/init exits with status 0. The system continues.

FSUM4038  No value found for -<option-name> option
Explanation: /usr/sbin/init found an option line in the /etc/init.options file for option <option-name>. However, no option value was specified for this option.
User response: Contact your system programmer.
System programmer response: Investigate why an option value was not specified.
System action: /usr/sbin/init ignores this option line and continues.

FSUM4039  Open of message catalog <catalog-name> failed
Explanation: /usr/sbin/init could not open the message catalog with name <catalog-name>.
User response: Contact your system programmer.
System programmer response: Investigate why the open failed.
System action: /usr/sbin/init continues using default message text for messages it writes into the /etc/log file.

FSUM4040  Spawn2 /etc/inittab, timeout =<time-interval> seconds
Explanation: /usr/sbin/init issued a spawn2() request to process the /etc/inittab file. /usr/sbin/init is set up to wait <time-interval> seconds for the /etc/inittab file to be processed.
User response: None.
System action: /usr/sbin/init waits while the /etc/inittab file is processed.

FSUM5001 Usage: chaudit [-adFl] attr file ...
Explanation: You specified incorrect arguments on the chaudit request.
User response: Verify the syntax of the request and reenter the command.

FSUM5002 chaudit: Missing argument(s)
Explanation: You specified an improper number of arguments on the chaudit request.
User response: Verify the syntax of the request and reenter the command.

FSUM5003 chaudit: fatal error during "-F" or "-d" option
Explanation: An unexpected error occurred while the recursive chaudit request was processing.
User response: Reenter the chaudit command. If the problem persists, contact your system administrator.
System programmer response: This error is caused primarily by a stat() failure. Check integrity of filesystem.

FSUM5004 chaudit: read directory "string" failed
Explanation: You are not authorized to perform a read operation on the specified file or directory.
User response: Verify that the file or directory name is correct, verify the permissions to the file, and reenter the command.

FSUM5005 chaudit: stat file "string" failed
Explanation: You are not authorized to perform a stat operation on the specified file or directory.
User response: Verify that the file or directory name is correct, verify the permissions to the file, and reenter the command.

FSUM5006 chaudit: Unknown or missing operator in symbolic attr "string"
Explanation: You specified an incorrect attribute value on the chaudit request.
User response: Verify the syntax of the request and reenter the command.

FSUM5007 chaudit: Unable to open the message catalog
Explanation: The message catalog cannot be opened. Processing continues with the default messages being used.
User response: Contact the system programmer.
System programmer response: Verify that the message catalog exists in the file system.

FSUM5008 chaudit: Unable to close the message catalog
Explanation: The message catalog cannot be closed.
User response: Contact the system programmer.
System programmer response: Investigate why the catclose() function failed.

FSUM5009 chaudit: "string": Operation not permitted
Explanation: You are not authorized to change the file or directory.
User response: Verify that the file or directory is correct, verify the permissions to the file, and reenter the command.

FSUM5010 chaudit: "string": No such file or directory
Explanation: The specified file or directory does not exist.
User response: Verify that the file or directory is correct and reenter the command.

FSUM5011 su: User not authorized to obtain superuser authority.
Explanation: The user ID issuing the su command does not have the proper authorization to switch to superuser.
User response: Verify authorization with the system administrator.

FSUM5012 su: Unable to set up the user environment.
Explanation: The environment variables required by the shell have not been set up.
System action: The command ends.
User response: Contact the system programmer.
System programmer response: Determine why the setenv() function failed.
FSUM5014 su: Unable to open the message catalog.

Explanation: The message catalog cannot be opened. Processing continues with the default messages being used.

User response: Contact the system programmer.

System programmer response: Verify that the message catalog exists in the file system.

FSUM5015 su: No password entered.

Explanation: The password or password phrase of the specified user ID is required. Processing terminates.

User response: Enter the correct password or password phrase when prompted.

FSUM5016 su: Password expired.

Explanation: The password or password phrase of the specified user ID has expired. Processing terminates.

User response: Inform the owner of the specified userid that a new password or password phrase is required.

FSUM5017 su: User not authorized to switch to "userid". Password incorrect.

Explanation: The password or password phrase entered is not correct for the specified user ID.

User response: Enter the correct password or password phrase when prompted.

FSUM5018 su: Program loaded from an uncontrolled library.

Explanation: When the BPX.DAEMON profile is defined in the FACILITY class, any program loaded in the address space where the su command is running must be defined to program control. Because an uncontrolled program has been loaded, the address space is marked "dirty".

System action: The command ends.

User response: Contact your system programmer.

System programmer response: Check the system log for any messages from the security product indicating that the environment has become uncontrolled. (For example, ICH420I may be issued by RACF.) Define the programs or libraries to program control. Either use the RDEFINE command to define the program or library to the RACF PROGRAM class, or use the extattr +p shell command for a z/OS UNIX executable file. Verify that the /bin/su file has the "p" extended attribute and does not have the "s" extended attribute.

FSUM5019 Enter the password for userid:

Explanation: The su command prompts you for the new user ID's password or password phrase.

User response: Enter the password or password phrase of the specified user ID.

FSUM5020 su: User not authorized to switch to "userid".

Explanation: The setuid to the specified user's UID failed because the user is not authorized.

User response: Contact the system programmer.

System programmer response: Determine why the setuid() function failed.

FSUM5021 su: Unable to switch to "userid", due to an error in the OMVS segment of the RACF profile.

Explanation: The setuid to the specified user's UID failed. Processing terminates.

User response: Contact the system administrator.

System programmer response: Verify that the RACF profile for the specified user ID contains an OMVS segment, and that the OMVS segment contains a UID.

FSUM5022 su: User ID "userid" is too long.

Explanation: The specified user ID is not a valid user ID. Processing terminates.

User response: Specify a user ID that is defined.

FSUM5023 su: User ID "userid" does not exist, or the RACF profile does not contain an OMVS segment.

Explanation: The specified user ID was either not defined to RACF or the RACF profile does not contain an OMVS segment. Processing terminates.

User response: Specify a valid user ID or contact the system administrator.

System programmer response: Verify that the RACF profile for the specified user ID contains an OMVS segment.

FSUM5024 su: Unable to get login name

Explanation: Failed to get the login name associated with the current process.

System action: Processing ends.

User response: Check the error code explanation following this message. If invoked from outside the shell, ensure that you are using a user ID with an OMVS segment.
System programmer response: Verify that the profile for the specified user ID contains an OMVS segment.

FSUM5025  su: setuid: reason code = reason code
Explanation: Failed to change the UID of the process.
System action: Processing ends.
User response: Check the reason code explanation. Ensure that you are not running multiple processes in the same address space.
System programmer response: Take the appropriate action based on the reason code.

FSUM5026  su: setgid: reason code = reason code
Explanation: Failed to change the GID of the process.
System action: Processing continues.
User response: Check the reason code explanation. Ensure that you are not running multiple processes in the same address space.
System programmer response: Take the appropriate action based on the reason code.

FSUM5027  su: User is not a surrogate of "userid".
Explanation: The user ID does not have read access to the SURROGAT class profile for the new user ID. Either a password or password phrase was not entered, or the -s option was used.
System action: The command ends.
User response: Contact the system administrator.
System programmer response: Verify that the user ID has read access to the appropriate SURROGAT class profile.

FSUM5028  su: initgroups: reason code = reason code
Explanation: Failed to change the supplementary groups of the process.
System action: Processing continues.
User response: Check the reason code explanation. Ensure that you are not running multiple processes in the same address space.
System programmer response: Take appropriate action based upon the reason code.

FSUM5029  su: getpwnuid: Unable to get login profile for UID(0).
Explanation: Failed to get a user profile associated with UID(0). This is needed for the su - command to switch to a login shell for the superuser.
System action: The command ends.
User response: Contact the system administrator.
System programmer response: Check that a user ID is set up with UID(0).

FSUM5030  su: Out of memory
Explanation: su was unable to allocate memory needed.
System action: The command ends.
User response: Make more memory available.

FSUM5031  su: Unknown option –option
Explanation: You specified an option that is not valid for the su command. If you specified login shell processing, the – must be separated from other arguments.
System action: The command ends.
User response: Check z/OS UNIX System Services Command Reference for a list of options.

FSUM5032  su: getpwnam: Unable to get the OMVS segment of the RACF profile for "userid": error message
Explanation: Failed to retrieve the OMVS segment of the RACF profile information for the user.
System action: The command ends.
User response: Check the error code explanation following this message.

FSUM5033  su: Invalid password entered: reason code = reason code.
Explanation: The password or password phrase entered is invalid.
System action: The command ends.
User response: Check the reason code explanation and take the appropriate action based on the reason code.

FSUM5101  gencat: Unable to open target file.
Explanation: The message catalog file specified as the target of gencat cannot be opened for output.
User response: Contact the system programmer.
System programmer response: Determine why the fopen() function failed.

FSUM5102  gencat: Unable to allocate memory for the catalog.
Explanation: gencat was unable to allocate needed memory.
User response: Contact the system programmer.

System programmer response: Determine why the malloc() function failed.

FSUM5103  gencat: Message is longer than NL_TEXTMAX value of number.

string

Explanation: This message is too long.
User response: Make the message shorter.

FSUM5104  gencat: Invalid set number.

string

Explanation: This set identifier is not a number within the values of 1 to NL_SETMAX.
User response: Change the set number.

FSUM5105  gencat: Message catalog generated normally.

Explanation: gencat has completed successfully.

FSUM5106  gencat: Cannot open gencat’s message catalog. Processing continues normally.

Explanation: The message catalog for gencat’s messages cannot be opened.
System action: Processing continues with the default messages being used.
User response: Contact the system programmer.
System programmer response: Verify that the message catalog exists in the file system.

FSUM5107  gencat: Unexpected newline within quotes.

string

Explanation: The message line ended without an ending quote or continuation character.
User response: Correct the message source file.

FSUM5108  gencat: Invalid message number.

string

Explanation: This message identifier is not a number within the values of 1 to NL_MSGMAX.
User response: Change the message number.

FSUM5109  gencat: Unexpected end of string, no newline or end of quotes.

string

Explanation: The message line ended without a null terminator, but no newline was found.
User response: Correct the message source file.

FSUM5110  gencat: Error writing catalog header.

Explanation: The file pointer consistency check in gencat discovered that an error occurred while writing the header of the message catalog to the target file.
User response: Contact the system programmer.
System programmer response: Contact IBM service.

FSUM5111  gencat: Error writing catalog text.

Explanation: The file pointer consistency check in gencat discovered that an error occurred while writing the text of the message catalog to the target file.
User response: Contact the system programmer.
System programmer response: Contact IBM service.

FSUM5112  gencat: Unable to load catalog string

Explanation: gencat was unable to load the target catalog because it was either not found, or is not a valid message catalog.
User response: Verify that the name is correct and that this file is a valid message catalog created with the gencat command.

FSUM5113  gencat: Unable to read existing catalog file string

Explanation: gencat could not read the existing message catalog file.
User response: Contact the system programmer.
System programmer response: Determine why the fread() function failed.

FSUM5115  gencat: No messages defined in source file.

Explanation: After processing all the source files, there were no messages to be written to the target catalog.
User response: Correct the input file.
FSUM5116  gencat: The message/set numbers became out of order just after set number, msg number

Explanation: All the set numbers and message numbers must be in ascending order in the message file.

User response: Correct the input file.

FSUM5119  gencat: Unable to open source file

Explanation: The message source file specified as the source for gencat cannot be opened for input.

User response: Contact the system programmer.

System programmer response: Determine why the fopen() function failed.

FSUM5131  mkcatdefs: Specified MsgFile name is too long

Explanation: The message file name specified as the first parameter to mkcatdefs is longer than the maximum allowed name.

User response: Correct the name.

FSUM5132  mkcatdefs: Cannot open string

Explanation: Either mkcatdefs cannot open the header file for output, or cannot open one of the source files for input.

User response: Contact the system programmer.

System programmer response: Determine why the fopen() function failed.

FSUM5133  mkcatdefs: There were write errors on file string

Explanation: mkcatdefs found errors while writing to the file.

User response: Contact the system programmer.

System programmer response: Determine why the fprintf() function failed.

FSUM5134  mkcatdefs: Error(s) found: no string created

Explanation: mkcatdefs encountered one or more errors while processing the source files. No output is produced.

User response: Contact the system programmer.

System programmer response: Determine why the functions failed.

FSUM5135  mkcatdefs: string created

Explanation: mkcatdefs successfully created this output file.

FSUM5136  mkcatdefs: No symbolic identifiers; no string created

Explanation: There were no symbolic names specified in the source files. No header is produced.

FSUM5137  mkcatdefs: Invalid set identifier found

Explanation: A set identifier is invalid for one of these reasons:
- A symbolic name contains invalid characters
- A numeric name is out of the range of values allowed for sets.

User response: Correct the identifier for this set.

FSUM5138  mkcatdefs: Set is already assigned or sets not in ascending sequence

Explanation: You used numeric set identifiers that caused the set numbers to get out of ascending order.

User response: Correct the set identifier.

FSUM5139  mkcatdefs: Symbolic name used more than once.

Explanation: You used the same symbolic name before to refer to this set or message. All symbolic names must be unique.

User response: Use a different symbolic name.

FSUM5140  mkcatdefs: Invalid message identifier found

Explanation: A message identifier is invalid for one of these reasons:
- A symbolic name contains invalid characters
- A numeric name is out of the range of values allowed for messages

User response: Correct the identifier for this message.
FSUM5141  mkcatdefs: Message number is already assigned or message numbers not in ascending sequence

string

Explanation: You used numeric message identifiers that caused the message numbers to get out of ascending order.

User response: Correct the message identifier.

FSUM5142  mkcatdefs: Unexpected EOF, a continued message was not finished.

Explanation: Message text ended with the continuation character (\), but this was the last line of the source file.

User response: Correct this message.

FSUM5151  dspmsg: catopen failed

Explanation: The message catalog for this message cannot be opened. A message follows this one which explains the failure.

User response: Contact the system programmer.

System programmer response: Determine why the catopen() function failed.

FSUM5152  dspmsg: catgets failed

Explanation: This message cannot be read from the message catalog. A message follows this one which explains the failure.

User response: Contact the system programmer.

System programmer response: Determine why the catgets() function failed.

FSUM5153  dspmsg: too many arguments number, only 10 allowed.

Explanation: More than ten arguments were passed to be included as variables in the message.

User response: Pass ten or less arguments.

FSUM5154  dspmsg: too few arguments specified. Message requires number1 arguments, but number2 were passed.

Explanation: The message text contains format specifiers for more variables than were passed. This causes printf to program check.

User response: Pass the exact number of variables needed for this message.

FSUM5161  dspcat: No message id allowed with –g option.

Explanation: You cannot specify a message number along with the –g option.

User response: Remove the –g option or the message number.

FSUM5162  dspcat: Unable to open this catalog

Explanation: This message catalog cannot be opened. A message follows this one which explains the failure.

User response: Contact the system programmer.

System programmer response: Determine why the catopen() function failed.

FSUM5164  dspcat: Unable to get this message.

Explanation: This message catalog cannot be read from the message catalog. A message follows this one which explains the failure.

User response: Contact the system programmer.

System programmer response: Determine why the catgets() function failed.

FSUM5165  dspcat: Unable to get this set.

Explanation: This set cannot be read from the message catalog. A message follows this one which explains the failure.

User response: Contact the system programmer.

System programmer response: Determine why the catgets() function failed.

FSUM5171  No $set in string

Explanation: The source file to the mkcatdefs command does not contain any $set directives. This is not a valid source file.

User response: Correct the source file. See the mkcatdefs command for more information.

FSUM5172  Can’t open string

Explanation: The source file to the mkcatdefs command cannot be opened.

User response: Specify a source file that exists.

FSUM5211  User not authorized to issue chroot.

Explanation: The user ID issuing the chroot does not have the proper authorization. You must either be superuser or be a member of BPX.SUPERUSER facility class.
User response: Verify your authorization with the system administrator.

FSUM5212 Usage: chroot directory command
Explanation: You specified the chroot command incorrectly. chroot always needs the directory which specifies the new root directory and command which specifies a command to run with the chroot command.
User response: Re-enter the command using the correct syntax.

FSUM5213 chroot seteuid failed: reason code = reason code
Explanation: Failed to change to UID(0). Processing ends.
User response: Check the reason code explanation and any message that might follow the reason code. Ensure that you are not running multiple processes in the same address space.

FSUM5214 chroot cannot change root
Explanation: chroot failed due to the displayed error.
User response: Check the given return code for more information for the error.

FSUM5215 Unable to execute the shell
Explanation: If the SHELL environment variable is set, chroot uses its value to invoke the shell.
User response: Verify that the shell exists.

FSUM5231 Error obtaining the user login name.
Explanation: The _getlogin1() function could not obtain the login name for the current terminal.
User response: If the problem persists, contact your system administrator.

FSUM5240 Usage: sysvar variable
Explanation: You specified the sysvar command incorrectly. sysvar needs to know the variable for which it must retrieve.
User response: Reenter the command using the correct syntax.

FSUM5241 sysvar: variable is not defined as a system variable
Explanation: sysvar cannot retrieve any information on the requested variable.
User response: Make sure the variable was typed correctly.

System programmer response: Make sure the variable was defined when the system was IPLed.

FSUM5242 Unexpected ASASYMBM error. rc=return code
Explanation: An unexpected return code was returned from the ASASYMBM assembler function.
User response: None.

FSUM5243 fetch() failed for ASASYMBM service — processing terminates
Explanation: ASASYMBM could not be loaded.
User response: None.

FSUM5272 No password entered.
Explanation: A null value was entered at the password prompt. Processing terminates and the password is not changed.
User response: Reissue the command specifying the password or password phrase when prompted.

FSUM6001 Unknown option "–option"
Explanation: You specified an option that is not valid for this command.
User response: Check z/OS UNIX System Services Command Reference for a list of options.

FSUM6003 input file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6004 write error on standard output
Explanation: A system error indicating the cause is displayed with this message.

FSUM6007 insufficient memory for string storage
Explanation: There were not enough free system resources to use for string storage.
User response: Free up more system resources, or modify your program to require less string storage.

FSUM6008 unbalanced char
Explanation: An unbalanced number of parentheses or braces was encountered.
User response: Make sure that all braces and parentheses are paired.
FSUM6013  Missing script file
Explanation:  You specified the –f option without providing the name of a script file.

FSUM6014  not enough available file descriptors
Explanation:  There were less than four available file descriptors.
User response:  Free up more file descriptors.

FSUM6017  Newline in regular expression
Explanation:  A newline was encountered while reading a regular expression.
User response:  Check for a missing / delimiter.

FSUM6018  Newline in string
Explanation:  A newline was encountered while reading a string constant.
User response:  Check for a missing " delimiter.

FSUM6019  EOF in regular expression
Explanation:  The end-of-file character was encountered while reading a regular expression.
User response:  Check for a missing / delimiter.

FSUM6020  EOF in string
Explanation:  The end-of-file character was encountered while reading a string constant.
User response:  Check for a missing " delimiter.

FSUM6022  inadmissible use of reserved keyword
Explanation:  You attempted to use a reserved keyword in an unacceptable way (for example, as a function or variable name).
User response:  Choose a different name for your function or variable.

FSUM6023  attempt to redefine builtin function
Explanation:  You attempted to redefine one of the built-in awk functions.
User response:  Choose a name for your function that is not the name of any built-in function. Refer to the description of the awk command in z/OS UNIX System Services Command Reference for lists of built-in arithmetic and string functions.

FSUM6039  command: not found
Explanation:  You specified a command-name that the shell was unable to find.
User response:  Make sure that command-name is spelled properly and that you have the appropriate permissions.

FSUM6047  unredirected getline in END action
Explanation:  The default output stream has already been closed when the END action is performed, so a getline function must be redirected or it fails.
User response:  Redirect the getline function to read from a named file.

FSUM6048  too many open streams to funcname onto "filename"
Explanation:  awk can only have a limited number of files open at one time. There were too many open files.
User response:  Make sure that unused files are being closed properly, or restructure your program to have fewer files open at the same time.

FSUM6049  insufficient arguments to printf or sprintf
Explanation:  You did not specify enough arguments to match the number required by the specified format string.
User response:  Check your format string and number of arguments.

FSUM6052  Too many fields (LIMIT: number)
Explanation:  awk read a record with more fields than it was able to handle.
User response:  Edit the input file to decrease the number of fields in the record.

FSUM6053  Record too long (LIMIT: number bytes)
Explanation:  awk read a record that was longer than the maximum record size it can handle. On UNIX and POSIX-compliant systems, the maximum record length is 20000 characters.
User response:  Edit the record so that it does not exceed the limit.

FSUM6054  division (/ or %) by zero
Explanation:  An arithmetic operation using / or % resulted in an attempt to divide by zero.
User response:  Modify your program so that division by zero does not occur.
FSUM6055  too deeply nested for in loop (LIMIT: number)
Explanation:  "For" loops can only be nested number levels deep.
User response:  Rewrite the program to use fewer levels of nesting.

FSUM6058  lvalue required in assignment
Explanation:  You did not specify a variable or array element as the left-hand side of an assignment expression.
User response:  Specify a valid variable or array element on the left-hand side of the assignment operator.

FSUM6059  return outside of a function
Explanation:  A return statement was encountered that was not part of a function.
User response:  Only use the return statement inside a function definition.

FSUM6060  may delete only array element or array
Explanation:  You attempted to use the delete statement to delete a scalar variable.
User response:  Only use delete to delete arrays and array element.

FSUM6063  SYMTAB must have exactly one index
Explanation:  You tried to reference the SYMTAB array using more than one index.
User response:  Always reference SYMTAB with exactly one index.

FSUM6069  regular expression error
Explanation:  An error occurred while processing a regular expression.
User response:  Check the regular expression.

FSUM6070  second parameter to "split" must be an array
Explanation:  You invoked the split function but the second parameter was not an array.
User response:  Invoke split with an array as the second parameter.

FSUM6074  Unknown FP error
Explanation:  An unknown error occurred during a floating-point operation.
User response:  Contact your system programmer.

FSUM6075  Domain
Explanation:  A domain error occurred when executing a floating-point operation. For example, taking the square root of a negative number would cause this error.
User response:  Make sure that you are performing a valid mathematical operation.

FSUM6076  Singularity
Explanation:  The program executed a floating-point division that resulted in an infinite value.
User response:  Make sure that you are performing mathematical operations that produces finite results.

FSUM6077  Overflow
Explanation:  The program executed an operation that resulted in a number that is larger than awk can represent on this platform.
User response:  Correct the program to use values that are supported on this system or bc.

FSUM6078  Underflow
Explanation:  The program executed an operation that resulted in a number that is smaller than awk can represent on this platform.
User response:  Correct the program to use values that are supported on this system or bc.

FSUM6079  Total loss of precision
Explanation:  The program executed a floating-point operation that used in an intermediate result that can not be properly generated on this platform.
User response:  Correct the program or use bc.

FSUM6080  Partial loss of precision
Explanation:  The program executed a floating-point operation that used in an intermediate result that can not be properly generated on this platform.

FSUM6081  error in function funcname(arg) at NR=num_records
Explanation:  A math error occurred while performing the function funcname on argument arg.
User response:  Make sure that you are passing a
proper argument to the function *funcname*.

**FSUM6082** Missing fill character
**Explanation:** You specified the –c option but did not provide a character following it.
**User response:** Provide a fill character with the –c option.

**FSUM6083** Missing font file
**Explanation:** You specified the –f option but did not provide the name of a font file following it.
**User response:** Provide a font file with the –f option.

**FSUM6084** Missing width after -w
**Explanation:** You specified the –w option without providing the width argument.
**User response:** Provide the missing width.

**FSUM6085** cannot open font file "*fontfile"
**Explanation:** A system error indicating the cause is displayed with this message.

**FSUM6086** banner: bad HALO font file format in "*fontfile"
**Explanation:** You specified an invalid font file.
**User response:** Use one of the files listed in the FILES section of the banner man page.

**FSUM6088** break statement found outside of loop
**Explanation:** bc encountered a break statement when it was not performing a “for” or “while” loop.
**User response:** Make sure that all “break” statements occur within “for” or “while” loops.

**FSUM6089** warning: body of if/else statement is empty
**Explanation:** You did not supply any statements for the body of an “if” or “if/else” construct. bc only generates this message when you have specified –i option.
**User response:** Make sure that this is what you intended. bc man page bc syntax.

**FSUM6091** bc: error on line line_num of *filename*

**FSUM6092** empty stack (too few arguments ?)
**Explanation:** An error occurred while executing a function, probably because the function was called with fewer arguments than required.
**User response:** Make sure that you call functions with the correct number of arguments.

**FSUM6095** valid array index is 0 through num
**Explanation:** You specified an array index that was not in the range 0 to BC_DIM_MAX-1, where BC_DIM_MAX is a configuration variable indicating the maximum number of elements that a bc array may have.
**User response:** Specify an array index in the indicated range.

**FSUM6096** shell command failed to execute
**Explanation:** You specified the sh statement with command as its argument and bc failed to run command.
**User response:** Check the syntax of the specified command.

**FSUM6101** end of file in comment starting on line num of *filename*
**Explanation:** bc encountered the end-of-file character when reading a comment which begins on line num of the file *filename*.
**User response:** Make sure that the file *filename* contains a /* to end each comment begun with a */.

**FSUM6102** end of file in string starting on line num of *filename*
**Explanation:** bc encountered the end-of-file character when reading a string that begins on line num of the file *filename*.
**User response:** Make sure that the file *filename* contains a double quote (”) at the end of the string.

**FSUM6103** warning: ‘=–’ operator assumed
**Explanation:** This version of bc permits the use of the old style assignment operators like =– rather than =. This can be ambiguous since a=–2 can mean a = -2 or a = -2. bc has assumed that you meant to use the =– operator.
**User response:** Use spaces to clarify the syntax of the expression.
FSUM6104  numerical constant is too long
Explanation:  You specified a numerical constant that was longer than the maximum permitted length, as defined by the value of the configuration variable BC_STRING_MAX.
User response: Specify a shorter numerical constant.

FSUM6105  string is too long
Explanation:  You specified a string that was longer than the maximum permitted length, as defined by the value of the configuration variable BC_STRING_MAX.
User response: Specify a shorter string.

FSUM6107  Unknown option "--option"
Explanation:  You specified an option that is not valid for this command.
User response:  Check z/OS UNIX System Services Command Reference for a list of options.

FSUM6108  bc: execution error on line line of file
Explanation:  This message is a generic "syntax error" message. Refer to the given line number and file; the error may be there or a few lines back.
System action:  The program continues.
User response: See z/OS UNIX System Services Command Reference for more information.

FSUM6110  command too long
Explanation:  You specified a command line to pass to the system with the ! operator that was longer than 1000 bytes.
User response:  Use a shorter command line.

FSUM6112  input radix too big.
User response: Specify a smaller input radix.

FSUM6114  save: args
Explanation:  You attempted to use the s or S operator when there was no value on the stack.
User response:  Make sure that there is at least one value on the stack before trying to use the s and S commands.

FSUM6115  output radix too big.
Explanation:  output radix too big for dc to handle.
User response:  Specify a smaller output radix.

FSUM6116  scale too big.
Explanation:  scale too big for dc to handle.
User response: Specify a smaller scaling factor.

FSUM6117  number expected, string found
Explanation:  dc expected a number but a string value was found.
User response:  Make sure that the stack contains the proper type of value when performing operations using the stack.

FSUM6118  negative argument to Q
Explanation:  You attempted to use the Q operator but the value on the top of the stack was negative. Q cannot take a negative argument.
User response:  Make sure that the stack has a positive number on top when using the Q operator.

FSUM6119  readstk?
Explanation:  You specified a string argument to the Q command. This is invalid. The Q command requires a numeric argument.
User response:  Correct your program.

FSUM6120  L?
Explanation:  You tried to pop a value off an empty stack variable using the L operator.
User response:  Correct your program.

FSUM6121  Q?
Explanation:  You specified a string argument to the Q command. This is invalid. The Q command requires a numeric argument.
User response:  Correct your program.

FSUM6122  negative index
Explanation:  You attempted to use a negative number as an array index.
User response:  Use a positive number as an array index.

FSUM6123  index too big
Explanation:  You attempted to use an array index that was greater than 2047.
User response:  Use an array index that is less than or equal to 2047.
FSUM6124  can not execute number  
Explanation: You attempted to use the x operator to execute a string, but the value on the top of the stack was a number.  
User response: Only use the x operator when there is a string on top of the stack.

FSUM6125  divide by 0  
Explanation: You attempted to divide a number by 0.  
User response: Do not divide numbers by 0.

FSUM6126  exponent must be an integer from 0 to max  
Explanation: You specified an exponent that was not an integer in the range 0 to SHRT_MAX-1.  
User response: Specify an exponent in the valid range.

FSUM6129  octalnum is unimplemented  
Explanation: You specified a character that is not a currently implemented operator. oct_num is the octal value of the character.  
User response: See the description of dc in z/OS UNIX System Services Command Reference or a list of valid operators.

FSUM6130  sqrt of negative number  
Explanation: You attempted to take the square root of a negative number. The sqrt function must be used with positive numbers.  
User response: Only use the sqrt function with positive numbers.

FSUM6131  stack too deep  
Explanation: You attempted to put more values on the stack than it was able to hold. The maximum size of the stack is limited by the size of the maximum integer your system can represent.  
User response: Check for uncontrolled recursion.

FSUM6132  empty stack  
Explanation: You attempted an operation that required popping a value from the stack, but the stack was empty.  
User response: Push a value onto the stack and try the operation again.

FSUM6133  out of memory  
Explanation: There were not enough free system resources to allocate the required space.  
User response: Free up more resources and try again.

FSUM6134  out of memory (fatal)  
Explanation: bc ran out of system resources but was unable to recover sufficient storage to continue.  
User response: Free up more resources and try again. Pay particular attention to large arrays.

FSUM6155  insufficient memory  
Explanation: A system error indicating the cause is displayed with this message.

FSUM6178  cat: input file "filename" is identical with output  
Explanation: You specified filename as both an input and output file. It is also possible that the output file was linked to filename.  
User response: Use a file other than filename as the output file.

FSUM6180  file "filename"  
Explanation: A system error indicating the cause is displayed with this message.

FSUM6181  command: fatal error during "-R" option  
Explanation: You specified the -R option but some file or directory in the directory structure was inaccessible.  
User response: Make sure that you have access to all files in the directory structure.

FSUM6184  command: file "filename": You are not a member of the groupname group  
Explanation: You attempted to change the group ownership of filename to group, but you are not a member of the specified group.  
User response: Specify a group to which you belong.

FSUM6185  command: group "groupname" is unknown  
Explanation: You specified a group name that could not be found in the group database.  
User response: Specify a valid group name or use a valid numeric group ID.
| FSUM6187 | Missing mode argument. |
| Explanation: | You did not specify an argument representing the new access permissions. |
| User response: | Provide the missing argument. |
| FSUM6188 | stat file "filename" |
| Explanation: | A system error indicating the cause is displayed with this message. |
| FSUM6189 | read directory "pathname" |
| Explanation: | A system error indicating the cause is displayed with this message. |
| FSUM6191 | command: user "username" is unknown |
| Explanation: | You specified a user name that could not be found in the user database. |
| User response: | Specify a valid user name or use a valid numeric user ID. |
| FSUM6196 | command: not executable |
| Explanation: | A system error indicating the cause is displayed with this message. |
| FSUM6199 | [read error] |
| Explanation: | An error occurred while attempting to read the indicated file. |
| FSUM6202 | Unknown terminal "term". |
| Explanation: | A path could not be determined for the terminal name, or none of standard input, standard output, and standard error were a terminal. |
| User response: | Make sure that standard input is a terminal, not a redirected file or a pipe. |
| FSUM6203 | No terminfo database. |
| Explanation: | The terminfo database could not be found. |
| User response: | Assign the environment variable TERMINFO to point at a valid database of terminal information. |
| FSUM6210 | cannot determine NAME_MAX |
| Explanation: | A system error indicating the cause is displayed with this message. |
| FSUM6213 | cannot allocate buffer |
| Explanation: | A system error indicating the cause is displayed with this message. |
| FSUM6214 | Bits must be between num1 and num2 |
| Explanation: | You specified a value for the maximum number of bits of compression with the \( \text{--b} \) option that fell outside of the range \( \text{num1} \) to \( \text{num2} \). |
| User response: | Specify a value that falls in the \( \text{num1} \) to \( \text{num2} \) range. |
| FSUM6217 | exec "uncompress" |
| Explanation: | A system error indicating the cause is displayed with this message. |
| FSUM6219 | output file "filename" |
| Explanation: | A system error indicating the cause is displayed with this message. |
| FSUM6220 | tempfile |
| Explanation: | A system error indicating the cause is displayed with this message. |
| FSUM6221 | command: (-D) same count exceeded - aborting |
| Explanation: | compress encountered a line where more than the first 255 characters were identical to those of the previous line. |
| FSUM6229 | command: filename has number other links: unchanged |
| Explanation: | You specified an input file that has more than one link. |
| User response: | Remove the additional links and try again. |
| FSUM6232 | command: unable to create tempfile name |
| Explanation: | A temporary file could not be created in the directory named by \( /\text{tmp} \) directory, or the current directory. |
| User response: | Make sure that you have appropriate permissions to create a temporary file in one of these three directories. |
FSUM6233 command: tempfile pathname too long
Explanation: uncompress create a tempfile based on the name of the file to be un compressed. The name of this file can only be PATHMAX characters long.
User response: Move the compressed file closer to the root of the directory hierarchy before decompressing that file. This creates a shorter path name.

FSUM6234 command: can't stat file
Explanation: A system error indicating the cause is displayed with this message.

FSUM6235 command: filename not a regular file: unchanged
Explanation: You specified a file that was not a regular file. You cannot compress or uncompress directories, FIFOs, or other such files.
User response: Make sure that the specified filename is a regular file.

FSUM6237 no space on device for file "filename"
Explanation: You attempted to copy (or move) a file to filename on a device that has no space for it.
User response: Free up space on the target device or copy (or move) the file to another device.

FSUM6238 cannot unlink source file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6239 cannot unlink target file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6241 Unknown option "--option"
Explanation: You specified an option that is not valid for this command.
User response: Check z/OS UNIX System Services Command Reference for a list of options.

FSUM6242 target "pathname" must be a directory
Explanation: You attempted to copy (or move) two or more files but the target indicated by name was not a directory.
User response: When copying (or moving) two or more files, ensure that the final name on the command line is a directory.

FSUM6243 cannot allocate target string
Explanation: There are not enough free system resources to hold the name of the target file.
User response: Free up more system resources.

FSUM6244 cannot rename "file1" to "file2"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6245 link to target "filename" failed
Explanation: A system error indicating the cause is displayed with this message.

FSUM6246 cannot rmdir "pathname"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6247 stat error for "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6248 unreadable directory "pathname"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6249 recursive copy to directory "pathname"
Explanation: You tried to recursively copy a directory to itself.
User response: Choose a different pathname.

FSUM6250 target "pathname" is not a directory
Explanation: When recursively copying (or moving) multiple files using the -r or -R option, the target must be a directory. You specified a target pathname that is not a directory.
User response: Check spelling of target pathname.

FSUM6251 cannot mkdir "pathname"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6254 "pathname" is a directory (not copied)
Explanation: A system error indicating the cause is displayed with this message.
FSUM6255  fifo "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6256  special file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6257  cannot allocate I/O buffer
Explanation: A system error indicating the cause is displayed with this message.

FSUM6258  cannot open file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6259  target file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6260  write error on file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6261  read error on file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6262  command: must run as setuid root
Explanation: This utility requires it’s binary file to be setuid root.
User response: Use the chmod command to do this or contact your system programmer to run this command.

FSUM6263  Can't find user: "user"
Explanation: Can't find crontab or at job's MVS identity in the user database. Typically, this indicates that the user database was modified while cron was running.
User response: Recreate the crontab file, or contact the system programmer to restart cron.

FSUM6264  Can't find user: "userid"
Explanation: Can't find crontab file's owner in the user database. Typically, this indicates that the user database was modified while cron was running.
User response: Recreate the crontab file, or contact the system programmer to restart cron.

FSUM6265  Can't find user: "user"
Explanation: Can't find crontab file's owner in the user database. Typically, this indicates that the user database was modified while cron was running.
User response: Recreate the crontab file, or contact the system programmer to restart cron.

FSUM6266  Can't stat "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6267  Can't stat "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6268  bad queue: queue
Explanation: A job has been submitted to an invalid queue. (Valid queues are typically the same as the character set on the host machine.)
User response: Resubmit the job to a valid queue.

FSUM6269  allocating queue entries
Explanation: A system error indicating the cause is displayed with this message.

FSUM6270  forking process
Explanation: A system error indicating the cause is displayed with this message.

FSUM6271  unknown process terminated: process_id
Explanation: cron was notified of a terminating process which it did not create. (This indicates a POSIX.1 or POSIX.2 logic error.)
User response: Contact your system programmer. Follow local procedures for reporting a problem to IBM.

FSUM6272  temporary output file
Explanation: A system error indicating the cause is displayed with this message.

FSUM6273  temporary file
Explanation: A system error indicating the cause is displayed with this message.

FSUM6274  couldn't find user
Explanation: cron was unable to find a user ID in the user database. Typically, this indicates that the user database was modified while cron was running.
User response: Contact your system programmer.

FSUM6275  notification process
Explanation: A system error indicating the cause is displayed with this message.
FSUM6324  couldn't find user in password file
Explanation:  cron could not find the user in the user database to print a log message. Typically, this indicates that the user database was modified while cron was running.

FSUM6325  cron: can't open log file!
Explanation:  cron was unable to open its log file. Permissions on the log file or its directory might be incorrect.
User response:  Have your system programmer correct the permissions on the log file or its directory.

FSUM6342  write error
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6349  cannot create temporary file
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6352  Badly formed line offset in "offset"
Explanation:  You specified an offset that was not a valid integer.
User response:  Specify a valid integer for offset.

FSUM6353  error in regular expression regexp
regular_expression_error
Explanation:  You have entered a regular expression incorrectly. See the regular expressions (regexp) section of z/OS UNIX System Services Command Reference for more information.

FSUM6354  Misplaced {number} repetition count
Explanation:  You specified a { number } repetition count before specifying the splitting criteria, or you specified the count without specifying any criteria at all.
User response:  Make sure that any { number } arguments follow the appropriate criteria specification on the command line.

FSUM6355  Badly formed line number "linenumber"
Explanation:  You specified a linenumber that was not a valid integer.
User response:  Specify a valid integer for linenumber.

FSUM6357  Badly formed (repeat) count "number"
Explanation:  You specified a { number } that was not a valid integer.
User response:  Specify a valid integer for number.

FSUM6358  too many file names generated, use "-n" option
Explanation:  More files need to be generated than csplit was able to generate names for, given the number of digits in the numeric portion of file names.
User response:  Use the -n option to increase the number of digits in the numeric portion of file names.

FSUM6359  Generated filenames would be too long
Explanation:  The argument specified for the -n option, when combined with the length of the specified prefix resulted in a generated file name that was longer than the file system permits.
User response:  Specify a shorter prefix or a lower value for the argument of the -n option.

FSUM6361  cannot create temp file
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6362  unable to pipe to sort command
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6363  cannot open temp file "filename"
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6364  tag file "filename"
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6365  Don't know how to process "filename"
Explanation:  A file filename was specified which is not a valid C source file. The file is skipped.
System action:  The command continues.
User response:  If necessary, reissue the ctags shell command with valid C source files as arguments.

FSUM6371  Missing character after -d
Explanation:  You specified the -d option, but did not provide a field separator character as its argument.
User response: Provide the missing field separator character.

FSUM6372  Unknown option "option"
Explanation: You specified an option that is not valid for this command.
User response: Check z/OS UNIX System Services Command Reference for a list of options.

FSUM6374  out of memory
Explanation: There were not enough free system resources to allocate as internal buffers.
User response: Free up more system resources and try again.

FSUM6378  date: no permission to set date
Explanation: You do not have proper permissions for changing the system date.
User response: If you need the system date changed, talk to your system programmer.

FSUM6380  The option "option" does not contain a "="
Explanation: You specified option without providing the required equals sign (=).
User response: Provide the missing equals sign.

FSUM6381  dd: cbs=number given without ascii/ebcdic/ibm/block/unblock conversion
Explanation: You specified the cbs= size option but did not specify a conversion option which uses it.
User response: Provide the missing conversion option.

FSUM6382  dd: out of memory for buffers
Explanation: dd was unable to allocate the system resources that it needed for conversion buffers.
User response: Free up more system resources.

FSUM6383  option=value is an unknown option
Explanation: You specified an option that is not valid for dd.
User response: Check z/OS UNIX System Services Command Reference for a list of options.

FSUM6384  full_blocks+partial_blocks records in full_blocks+partial_blocks records out
Explanation: Displays the number of full blocks or partial blocks read from input and written to output.
System action: The command ends.

FSUM6385  Warning: file1 is tagged with a different ccSID type than what was specified for conversion.
Explanation: The ccSID of the specified file is either of type ASCII, EBCDIC, or INVALID. Either the conversion type specified by the "conv=..." option does not match the encoding type of the ccSID associated with the file, or the ccSID of the specified file is of type invalid. Data may be incorrectly converted.
System action: Processing continues.
User response: Check that the ccSID of the file correctly identifies the encoding of the data. Adjust the "conv=..." option accordingly.

FSUM6388  dd: unknown conversion "string"
Explanation: You specified a conversion value following conv= that dd did not recognize.
User response: Check z/OS UNIX System Services Command Reference for a list of options.

FSUM6389  dd: badly formed number "num"
Explanation: You specified num as a number (for example, a block size), but num did not have the form of a number recognized by dd.
User response: Make sure that num is a valid number, and if it is followed by a letter to indicate the block size unit; check the Options bs= option for a list of valid letters.

FSUM6390  dd: absolute I/O must be in number byte units
Explanation: You attempted to read from, or write to, a device which requires block sizes to be in multiples of its sector size (in this case, num bytes).
User response: Specify a block size that is a multiple of the device’s sector size.

FSUM6391  seek output
Explanation: A system error indicating the cause is displayed with this message.
FSUM6392  seek input  
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6393  read error  
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6398  File file1 is a type1 while file file2 is a type2  
Explanation:  The two files specified on the directory were of different file types. diff can only compare files that have the same file type.  
User response:  Specify two files that have the same file type.

FSUM6404  directory "pathname"  
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6405  insufficient memory (try diff -h)  
Explanation:  diff ran out of system resources when generating the data structures used in the differencing algorithm (see the LIMITS section of diff in z/OS UNIX System Services Command Reference for more information). diff requires fewer system resources than diff algorithm. This may allow it to succeed where the regular algorithm fails.

FSUM6406  cannot allocate name buffer  
Explanation:  There is not enough main storage to allocate the name buffer.  
User response:  Free up system resources and try again.

FSUM6407  Missing number after "option" option  
Explanation:  You specified option but did not specify a number following it.  
User response:  Specify a number following the option option.

FSUM6408  Missing #ifdef symbol after -D  
Explanation:  You did not specify a conditional label on the command line after -D option.

FSUM6409  only one file may be "-"  
Explanation:  Only one of the two files being compared may be the standard input.  
User response:  Specify – (standard input) as, at most, one of the two files to be compared.

FSUM6411  internal error--cannot create temporary file  
Explanation:  diff was unable to create a working file that it needed.  
User response:  Ensure that you either have a /tmp directory or that the environment contains a variable TMPDIR which names a directory where diff can store temporary files. Also, ensure that you have sufficient permissions on this directory to create a temporary file.

FSUM6412  couldn't stat file system for "filesystem"  
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6417  too many lines in file "filename"  
Explanation:  The file filename contained more than the value of the INT_MAX. diff cannot handle a file that large. Try diff with the -h option.

FSUM6418  opening temporary file "filename"  
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6420  string: you must specify exactly 3 input files  
Explanation:  You did not specify exactly three input files on the command line.  
User response:  Specify three input files.

FSUM6422  diff3: no temporary files available  
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6423  diff3: child process  
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6424  diff3: "diff" command failed  
Explanation:  diff3 was unable to complete its function.  
User response:  Contact your system programmer.

FSUM6425  diff3: Insufficient memory  
Explanation:  diff3 was unable to allocate storage for all lines in the input files.  
User response:  Free up more system resources or break up the files.

</tbody>
</table>
FSUM6452  Need space after command
Explanation:  You did not separate a command from its file name argument with a space.
User response:  Reenter the command with the required space.

FSUM6453  Name too long
Explanation:  The file name specified on the ed command line was too long.
User response:  Use a shorter file name.

FSUM6454  Badly formed name
Explanation:  You specified an improperly formed or missing file name with a command which requires a file name as an argument (for example, e or f).
User response:  Correct or provide the file name.

FSUM6455  Illegal command redirection
Explanation:  You attempted to use the f command redirection with the f command.
User response:  Do not use the f command redirection with the f command.

FSUM6456  Restricted shell
Explanation:  You invoked the restricted form of ed (red), but then tried to use a command that is not allowed in the restricted editor (the f command).
User response:  See the Description section of the ed man page for a discussion of the differences between ed and red.

FSUM6457  No remembered file name
Explanation:  You tried to execute a command that uses a remembered file name when there was no remembered file name.
User response:  Issue the command again, but specify a file name this time.

FSUM6458  Mark name must be lower case
Explanation:  You attempted to use the k command to mark an addressed line with a character other than a lowercase letter.
User response:  Use k to mark the line with a lowercase letter.

FSUM6459  Undefined mark name
Explanation:  You attempted to reference a mark name that you have not assigned.
User response:  Use the k command to assign the mark name to a line, or specify a previously assigned mark name.

FSUM6460  'm' and 't' require destination address
Explanation:  You issued an m or t command but did not provide a destination address.
User response:  Provide a destination address with the m or t command.

FSUM6461  Destination cannot straddle source in 'm' and 't'
Explanation:  You specified a range of lines to be moved or copied by m or t that included the destination address.
User response:  Ensure that the specified range of lines for m or t does not include the destination address.

FSUM6462  command not allowed inside g, v, G, or V
Explanation:  You specified a command that cannot be used with the issued global command (g, v, G, or V).
User response:  Check the description of ed in Z/OS UNIX System Services Command Reference or a list of commands that cannot be used with the various global commands.

FSUM6463  Incomplete regular expression.
Explanation:  You issued a g or G command but did not provide a regular expression as an argument.
User response:  Provide a regular expression as an argument to the command.

FSUM6464  the x command has become X (upper case)

FSUM6465  Global command too long
Explanation:  You specified a global instruction (g or v) that was longer than 256 characters, including newlines.
User response:  Specify a global instruction that is less than 256 characters in length.

<td>Either create a template line before the line, or remove the line.</td>
</tr>
<tr>
<td>FSUM6503</td>
<td>find: unable to allocate memory for expression tree</td>
<td>find requires system resources to build an expression tree. There were not enough free resources to do so.</td>
<td>Free up more system resources or specify a less complex expression.</td>
</tr>
<tr>
<td>FSUM6504</td>
<td>find: bad number specification in &quot;string&quot;</td>
<td>You specified an option that takes a numeric value (for example, –atime, –ctime), but you did not specify a valid number after the option.</td>
<td>Ensure that options that take a numeric value are followed by a valid number (only decimal digits, preceded by an optional plus or minus sign).</td>
</tr>
<tr>
<td>FSUM6505</td>
<td>find: &quot;-type character&quot; is invalid</td>
<td>You specified the –type primary but did not follow with a valid character to represent the file type.</td>
<td>Check the description of find in z/OS UNIX System Services Command Reference or a list of valid characters for use with the –type primary.</td>
</tr>
</tbody>
</table>
### FSUM6506: find: non-terminated "primary" argument list

**Explanation:** You specified the `–exec` or `–ok` primary and did not terminate the argument list following it with a semicolon (`;`).

**User response:** Terminate the argument list following `–exec` or `–ok` with a semicolon.

### FSUM6507: find: must specify option after primary

**Explanation:** You specified `–primary`, but did not provide the argument that it requires.

**User response:** Specify a valid argument after `–primary`.

### FSUM6508: cannot stat file "filename" for -newer

**Explanation:** A system error indicating the cause is displayed with this message.

### FSUM6509: find: user name "user" is unknown

**Explanation:** You specified `–user primary`, but did not provide a valid user name. Or you specified `–acl_entry primary` and the `acl_text` has undefined username.

**User response:** Provide a valid user name after the `–user primary`. Or if specified `–acl_entry`, provide valid username in the `acl_text`.

### FSUM6510: find: group name "name" is unknown

**Explanation:** You specified the `–group primary` but did not specify a valid group name. Or you specified `–acl_entry primary` and the `acl_text` has undefined groupname.

**User response:** Specify a valid group name after the `–group primary`. Or if specified `–acl_entry`, provide valid groupname in the `acl_text`.

### FSUM6511: unable to access "pathname"

**Explanation:** A system error indicating the cause is displayed with this message.

### FSUM6512: error reading directory "pathname"

**Explanation:** You attempted to read the directory `pathname`. You do not have read permissions on this directory.

**User response:** If you need to access the directory `pathname`, see your system manager about acquiring read permissions for that directory. If you do not need to access it, no corrective action is required.

### FSUM6515: cannot execute "filename"

**Explanation:** A system error indicating the cause is displayed with this message.

### FSUM6517: Missing offset.

**Explanation:** You specified the `–p` option but did not provide an output page offset as an argument.

**User response:** Provide the missing output page offset.

### FSUM6518: Missing line length.

**Explanation:** You specified the `–l` option but did not provide a line length as an argument.

**User response:** Provide the missing line length.

### FSUM6519: fmt: length "number" is invalid

**Explanation:** You specified a line length that was less than zero or greater than the maximum length (as given by the configuration variable `LINE_MAX`).

**User response:** Use a line length in the range zero to `LINE_MAX`.

### FSUM6527: no room for buffers

**Explanation:** There were not enough free system resources for `grep` to allocate the buffers that it requires.

**User response:** Free up more system resources.

### FSUM6529: out of space for pattern "string"

**Explanation:** `grep` did not have enough system resources available to store the code needed to work with the given pattern (regular expression). The usual cause is that the pattern is very complex.

**User response:** Make the pattern simpler, or free more system resources.

### FSUM6535: Badly formed line/character count "num"

**Explanation:** The value `num`, following a `–b`, `–c`, `–k`, `–l`, `–m`, or `–n` option was not a valid number.

**User response:** Ensure that `num` is a valid number. Refer to [z/OS UNIX System Services Reference](https://www.ibm.com/support/knowledgecenter/SSGAUQ_1.11.0/com.ibm.zos.v1r11.doc/udf_zos_ref.html) for more information on the `find` command.

### FSUM6537: The help command provides a summary of the command manual pages that contains more information than the usage messages printed by most commands. For example, type: help find for information on the 'find' command.
FSUM6541 command: invalid user name: "user"
Explanation: You specified a user name that was not found in the user database.
User response: Check that you spelled the user name correctly.

FSUM6544 Bad file number specification in "string"
Explanation: You specified a file number that was not 1 or 2 with the -j option.
User response: Specify a file number of 1 or 2 when using the -j option.

FSUM6545 Badly constructed output list at "string"
Explanation: You specified an improperly constructed list of output fields with the -o option.
User response: Check the description of the join command in z/OS UNIX System Services Command Reference for details on constructing a list of output fields for the -o option.

FSUM6546 Missing -e string
Explanation: You specified the -e option without a string argument.
User response: Provide the missing string.

FSUM6547 Missing join field number
Explanation: You specified the -j, -1, or -2 option without specifying which field to use as the join field.
User response: Provide the missing join field number.

FSUM6548 Bad join field number
Explanation: You specified a value to indicate the join field that was not a valid number.
User response: Make sure to use a valid number to indicate join the field.

FSUM6549 Missing character after -t
Explanation: You specified the -t option without specifying a field separator as an argument.
User response: Provide the missing field separator.

FSUM6550 Must specify -o with -e
Explanation: You specified the -e option without also specifying the -o option.
User response: Always specify the -o option when using the -e option.

FSUM6551 join: too many -o list elements
Explanation: You specified more than 512 fields in the list of output fields given as the argument to the -o option.
User response: Specify no more than 512 output fields.

FSUM6553 Out of dfa move space: increase num from number
Explanation: There were not enough move entries for lex to process your input.
User response: Increase move table size with the hexnum directive.

FSUM6563 Error writing temp file 'filename'
Explanation: An error occurred while trying to write the temporary file filename.
User response: Check the directory indicated by TMPDIR, or /tmp and ensure that the directory is writable and has sufficient space.

FSUM6564 No lex rules
Explanation: You specified lex input that did not contain any translation rules, possibly due to empty or badly formatted input.
User response: Make sure that your input file is specified properly, and that the contents are properly formatted.

FSUM6565 Write error on filename
Explanation: An error occurred while lex was writing the output file.
User response: Check that space exists on the output device and that you have appropriate permissions to write the file.

FSUM6569 Out of NFA state space: increase num from number
Explanation: You did not reserve enough space for the NFA tables.
User response: Use the number directive to increase the space for the NFA tables.

FSUM6570 Out of DFA state space: increase num from number
Explanation: You did not reserve enough space for the DFA tables.
User response: Use the integer directive to increase the space for the DFA tables.
FSUM6571  Too many character classes (more than num)
Explanation:  lex ran out of space for character classes.
User response:  Simplify your scanner input.

FSUM6572  Too many translations (more than num)
Explanation:  lex ran out of space for translation rules.
User response:  Simplify your scanner input.

FSUM6573  Table for item too large for machine (num bytes)
Explanation:  You attempted to use the lex Malloc function to allocate a block of memory that is larger than the hardware segment size. This error only occurs on systems with segment architecture.
User response:  Use Malloc to allocate a block of memory that is smaller than the hardware segment size.

FSUM6574  No more memory for item
Explanation:  There were not enough free system resources to allocate to item. Your scanner input was too large or too complicated, or you requested too much space for a table.
User response:  Simplify your input expressions, or request less space for tables.

FSUM6579  Too many move (%num) entries: number
Explanation:  You did not reserve enough space for move tables.
User response:  Use the hexnum directive to increase the space for move tables.

FSUM6582  premature eof in prototype
Explanation:  lex encountered an end-of-file character in the prototype file when it was not expecting it, probably due to a badly formatted prototype file.
User response:  Ensure that the prototype file is not corrupted. If using a private prototype file, ensure that it has the same layout as the distributed version.

FSUM6601  Poorly formed char sequence (string)
Explanation:  You specified a [. .], [= =], or [: :] sequence improperly.
User response:  Specify the sequence correctly.

FSUM6602  Unknown class [:class:]
Explanation:  You specified a regular expression containing a character class [:class:] that is not supported in the POSIX locale.
User response:  Rewrite the regular expression.

FSUM6603  Unknown collating element [:col_element:]
Explanation:  You specified a regular expression containing a collating element that is not supported by the POSIX locale.
User response:  Rewrite the regular expression.

FSUM6604  Multi-character collating element [:col_element:] not supported
Explanation:  You specified a regular expression containing a multicharacter collating element that is not supported by the POSIX locale.
User response:  Rewrite the regular expression.

FSUM6605  Collation in [= =] not supported (yet)
Explanation:  You attempted to use an equivalence class [=, collation-symbol =] within a regular expression. lex does not support this construct.
User response:  Rewrite the regular expression.

FSUM6606  Badly formed equivalence class [=equiv_class=]
Explanation:  You attempted to use a multicharacter equivalence class in a regular expression. Lex does not support non-POSIX locales.
User response:  Rewrite the regular expression.

FSUM6614  command: Option –option argument missing
Explanation:  You did not provide an argument for –option.
User response:  Provide the missing argument.

FSUM6630  compress not initialized
Explanation:  The program detected that the compression file was not properly initialized.
System action:  The program ends.
**User response:** Contact your system programmer.

**System programmer response:** Follow local procedures for reporting a problem to IBM.

---

**FSUM6631** bits must be from \( num1 \) to \( num2 \)

**Explanation:** You specified a value for the maximum number of bits of compression that outside the range \( num1 \) to \( num2 \).

**User response:** Specify a value in the range \( num1 \) to \( num2 \).

---

**FSUM6632** no space for compression tables

**Explanation:** There were not enough free system resources to allocate to compression tables.

**User response:** Free up more resources.

---

**FSUM6633** compression not closed

**Explanation:** The program attempted to open a compression file that was already open and initialized.

**System action:** The program ends.

**User response:** Contact your system programmer.

**System programmer response:** Follow local procedures for reporting a problem to IBM.

---

**FSUM6634** compress: unknown error

**Explanation:** An unknown compression error occurred.

**User response:** Contact your system programmer.

---

**FSUM6635** not initialized

**Explanation:** The program attempted to close a file that was not initialized.

**System action:** The program ends.

**User response:** Contact your system programmer.

**System programmer response:** Follow local procedures for reporting a problem to IBM.

---

**FSUM6636** not in compressed format

**Explanation:** You specified a file to be uncompressed that was not in compressed format.

**User response:** Specify a compressed file.

---

**FSUM6637** compressed with \( num1 \) bits, can only handle \( num2 \) bits

**Explanation:** You specified a file to be uncompressed that was compressed with \( num1 \) bits, but this version of `uncompress` handles a maximum of \( num2 \) bit compression.

**User response:** Request a copy of the file compressed using \( num2 \) bit compression.

---

**FSUM6638** no space for decompress tables

**Explanation:** There were not enough free system resources for `uncompress` to allocate to the decompress tables.

**User response:** Free up more resources.

---

**FSUM6639** compressed file is corrupt

**Explanation:** You specified a compressed file that was damaged.

**User response:** Get a new copy of file and try again.

---

**FSUM6640** not closed

**Explanation:** The program attempted to open a file that was already open and initialized.

**System action:** The program ends.

**User response:** Contact your system programmer.

**System programmer response:** Follow local procedures for reporting a problem to IBM.

---

**FSUM6641** unknown error

**Explanation:** An unknown decompression error occurred.

**User response:** Contact your system programmer.

---

**FSUM6642** Insufficient memory

**Explanation:** There were not enough free system resources to perform the specified operation.

**User response:** Free up more resources.

---

**FSUM6643** getgroups failed

**Explanation:** A system error indicating the cause is displayed with this message.

---

**FSUM6644** Unknown or missing operator in symbolic mode "modestring"

**Explanation:** When using the symbolic mode to indicate new access permissions, you specified a string `modestring` which was either missing an operator or contained an unrecognized operator.

**User response:** Make sure that all mode values in symbolic mode contain one of the following operators: +, -, or =.
FSUM6645  Octal mode may contain only digits [0-7] in numstring
Explanation: When using the octal mode to indicate new access permissions, you specified a string numstring which contained a character other than the digits 0 to 7.
User response: Make sure that all mode values in octal mode are valid octal numbers, containing only the digits 0 through 7.

FSUM6647  failed to match
Explanation: A match was found for the specified regular expression.
User response: No action is required.

FSUM6648  invalid collation element
Explanation: You specified a regular expression that contains an invalid collating element.
User response: Make sure that all collating elements in the regular expression are valid in the locale indicated by LC_COLLATE.

FSUM6649  trailing \ in pattern
Explanation: You specified a regular expression with a trailing \. 
User response: Remove the trailing \ or complete the escape sequence.

FSUM6650  newline found before end of pattern
Explanation: You specified a regular expression that contained a newline before the end of the pattern.
User response: Check the regular expression for a missing /.

FSUM6652  number in \[0-9\] invalid
Explanation: You specified a number that was greater than the number of matching subexpressions.
User response: Specify a number that is less than or equal to the number of matching subexpressions.

FSUM6653  \ ] imbalance or syntax error
Explanation: You specified a regular expression that contained a [ ] imbalance.
User response: Make sure that all [ and ] characters appear in matched pairs in the regular expression.

FSUM6654  ( ) or \( \) imbalance
Explanation: You specified a regular expression that contained a ( or \( \) imbalance.
User response: Make sure that all ( and ) characters and all \( and \) characters appear in matched pairs in the regular expression.

FSUM6655  \} or \{ imbalance
Explanation: You specified a regular expression that contained a ( or \( \) imbalance.
User response: Make sure that all ( and ) characters and all \( and \) characters appear in matched pairs in the regular expression.

FSUM6656  invalid endpoint in range
Explanation: You specified a regular expression that contained a range expression with an invalid endpoint.
User response: Specify a valid endpoint.

FSUM6658  invalid character class type
Explanation: You specified a regular expression that contained a reference to an invalid character class.
User response: Make sure that all character classes referenced in the regular expression are valid in the locale indicated by LC_CTYPE.

FSUM6659  syntax error
Explanation: You specified an invalid regular expression.
User response: Correct the syntax of the regular expression.

FSUM6660  contents of \} or \{ invalid
Explanation: The contents of \} or \{ in the specified regular expression were invalid; not a number, too large a number, more than two numbers, first number larger than second.
User response: Make sure that the contents of \} or \{ are valid.

FSUM6661  internal error
Explanation: There was an internal error during the processing of a regular expression.
System action: The program ends.
User response: Follow local procedures for reporting problems to IBM.
FSUM6662 unknown regex error
Explanation: The error code that was passed to regerror is not a known error.
User response: Check your program to verify that errcode was retrieved from regexec or regcomp.

FSUM6700 Charmap information not available.
Explanation: For some reason, locale was unable to list the set of available charmap files.
User response: Contact your system programmer.

FSUM6701 Unknown keyword name 'name'.
Explanation: You specified a name that is not a keyword.
User response: Specify a valid keyword name.

FSUM6708 The following required symbolic names are missing from the charmap file:
Explanation: You specified a charmap file that did not contain certain required symbolic names.
User response: Add the appropriate symbolic names to the charmap file or specify a charmap file that does contain these names.

FSUM6710 Character \x hexnum not specified in charmap file
Explanation: You specified a character (with hexadecimal value hexnum) that was not contained in the charmap file.
User response: Add the character to the charmap file or specify a charmap file that contains this character.

FSUM6715 Implementation restriction. Too many one-to-many mappings; limit num
Explanation: You specified too many one-to-many mappings. The maximum is num.
User response: Specify no more than num one-to-many mappings.

FSUM6721 unknown category name
Explanation: You specified a category that was not LC_CTYPE, LC_COLLATE, LC_TIME, LC_NUMERIC, LC_MONETARY, or LC_MESSAGES.
User response: Ensure that you have spelled the category name correctly and that it is one LC_CTYPE, LC_COLLATE, LC_TIME, LC_NUMERIC, LC_MONETARY, or LC_MESSAGES.

FSUM6729 regular expr error: regular_expression_error
Explanation: You have entered a regular expression incorrectly. See the regular expressions (regexp) section of z/OS UNIX System Services Command Reference for more information.

FSUM6731 Missing order_start keyword
Explanation: You failed to specify an order_start keyword in the LC_COLLATE category definition.
User response: Provide the missing keyword.

FSUM6733 order_start: Too many sort-rules; limit COLL_WEIGHTS_MAX (num)
Explanation: You specified too many sort-rules with the order_start keyword. You are limited to num rules, as specified by the configuration variable COLL_WEIGHTS_MAX.

FSUM6734 order_start: forward/backward are mutually exclusive
Explanation: You specified both the forward and the backward directives as sort-rules with the order_start keyword. These directives are mutually exclusive; you can specify one or the other but not both.
User response: Remove either the forward or the backward directive.

FSUM6736 order_start keyword specified num1 weights; collating element entry for <symbol> gave num2 weights
Explanation: The entry for the symbol collating element specified num2 weights, while the order_start keyword specified that should be num1. The number of weights should be the same in both place.
User response: Ensure that the number of weights for all collating elements agrees with the number of weights given by the order_start keyword.

FSUM6737 Multiple UNDEFINED entries specified
Explanation: The special symbol UNDEFINED appeared more than once in the collation order.
User response: Remove extra occurrences of UNDEFINED.

FSUM6738 Too many weights; limit COLL_WEIGHTS_MAX (num)
Explanation: You specified too many weights in a collation entry. The maximum number of weights is
given by the configuration variable COL_WEIGHTS_MAX (which has the value num).

User response: Specify no more than num weights for any collation entry.

FSUM6739 Multi-character collating element too long; limit num
Explanation: You specified a multicharacter collating element that was more than num characters long.
User response: Make sure that no multicharacter collating element is more than num characters long.

FSUM6741 reading file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6743 String too long -- limit 255 bytes
Explanation: You specified a string that was longer than 255 bytes.
User response: Make sure that all strings are no longer than 255 bytes.

FSUM6745 Insufficient memory
Explanation: A system error indicating the cause is displayed with this message.

FSUM6747 LC_TIME: keyword keyword: Expecting num1 arguments, found num2
Explanation: You specified an incorrect number of arguments for the keyword keyword in the LC_TIME category.
User response: Make sure that you specify the correct number of arguments for each LC_TIME keyword.

FSUM6748 LC_TIME: keyword keyword: already specified
Explanation: You attempted to specify an LC_TIME keyword that had already been specified.
User response: Make sure that LC_TIME keyword is specified only once.

FSUM6749 LC_TIME: keyword keyword is missing
Explanation: You failed to specify a mandatory LC_TIME keyword.
User response: Provide the missing keyword.

FSUM6751 Directory "pathname"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6752 charmap file "string"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6753 sourcefile "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6754 <symbolic-name> too long; limit num characters
Explanation: You specified a <symbolic-name> that was longer than num characters.
User response: Make sure that no <symbolic-name> is longer than num characters.

FSUM6755 Invalid character hexnum in a symbolic-name
Explanation: A symbolic-name included an invalid character which had the hexadecimal value hexnum.
User response: Make sure that all characters in the symbolic-name are valid.

FSUM6762 console device "dev"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6763 writing to console device "dev"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6764 logname: cannot get login name
Explanation: logname was unable to access the system utmpx file, or the process was not a currently logged in user.
User response: Check that the system utmpx file is accessible.

FSUM6768 opening archive arch_name
Explanation: A system error indicating the cause is displayed with this message.
FSUM6769  *string* is not a valid archive
Explanation:  *arch_name* is not a valid archive. The recognized formats are system specific.
User response:  Ensure that you specified the correct file.

FSUM6770  insufficient memory
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6771  opening temporary archive *arch_name*
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6773  rename *arch_name1* to *arch_name2*
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6776  nm: not enough memory for symbol table
Explanation:  There are not enough free system resources to allocate to the symbol table.
User response:  Free up more resources.

FSUM6777  command: file "string": Not an object, executable, or library file
Explanation:  You specified a file on the command line that is not an object file, executable file, or library file.
User response:  Make sure that you specify a file that is one of these three types.

FSUM6780  executable file "filename"
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6781  command: file "string": Not an executable file
Explanation:  You specified a file on the command line that is not an executable file.

FSUM6784  cannot allocate memory for sorting
Explanation:  There were not enough system resources available for *ls* to sort its output.
User response:  Free up more system resources or use option and path names on the command that will produce less output.

FSUM6785  File or directory "name" is not found
Explanation:  You specified a *pathname* that does not exist.
User response:  Check to make sure that you did not omit or misspell any components of *pathname*.

FSUM6786  too many directory entries in "dir"
Explanation:  *ls* ran out of dynamically allocated system resources.
User response:  Free up more system resources.

FSUM6789  allocating *structure*
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6793  EOF in arg list
Explanation:  An end of file was encountered while evaluating the argument list of a macro. The closing parenthesis was not found.
User response:  Check for an omitted closing parenthesis, or truncated input file. Remember that unquoted parentheses in macro arguments must be balanced.

FSUM6795  EOF in comment
Explanation:  An end of file was encountered while copying a comment. The end-of-comment string was not found.
User response:  Check for a missing or mis-typed end-of-comment string (set by the "\*[MACRO changecom]" macro), or a truncated input file.

FSUM6796  EOF in quoted string
Explanation:  An end of file was encountered while scanning a quoted string.
User response:  Check for a missing closing string quote (set by the "\*[MACRO changequote]" macro), or a truncated input file.

FSUM6802  tempnam() failure
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6803  diversion temporary file "filename"
Explanation:  A system error indicating the cause is displayed with this message.
FSUM6807  expression syntax error
Explanation: You specified an expression argument that was not a well-formed expression.
User response: Check for unbalanced parentheses, missing quotes, and undefined variables.

FSUM6808  unbalanced ()
Explanation: An expression contained an unbalanced pair of parentheses.
User response: Provide the missing parenthesis.

FSUM6809  internal expression tree botch

FSUM6810  defn(builtin) in expression
Explanation: The expression supplied to the \[MACRO eval\] macro contains the definition of a built-in macro (as yielded by the \[MACRO defn\] macro).
User response: Either you did not mean to use \[MACRO defn\] here, or you meant to apply it to a macro of your own definition, rather than to a built-in macro.

FSUM6811  no assignments in `eval'
Explanation: You attempted to pass an expression to the \[MACRO eval\] macro that contained an assignment operation. The \[MACRO eval\] macro cannot perform assignments.
User response: Do not pass include assignment operations in expressions being passed to \[MACRO eval\].

FSUM6813  misplaced binary operator
Explanation: An expression contained a binary operator that was not between two integers.
User response: Make sure that all binary operators have an integer on each side.

FSUM6815  insufficient memory to store evaluation
Explanation: There were not enough free system resources to store the evaluation of the expression.
User response: Free up more resources.

FSUM6816  creating temporary file name
Explanation: A system error indicating the cause is displayed with this message.

FSUM6817  temporary file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6818  Missing number of hops after "-h"
Explanation: You specified the –h option without an argument.
User response: Provide the missing argument.

FSUM6819  Missing address after "-r"
Explanation: You specified the –r option without an address argument.
User response: Provide the missing address argument.

FSUM6820  Missing subject after "-s"
Explanation: You specified the –s option without providing a subject string as an argument.
User response: Provide the missing subject string.

FSUM6821  Missing user after "-u"
Explanation: You specified the –u option without a user name argument.
User response: Provide the missing user name.

FSUM6822  Options applying only to interactive use were given.
Explanation: You specified the –e, –f, –H, –N, or –u options when attempting to send mail. These options are only for use when reading mail.
User response: Check the description of mailx 1 in z/OS UNIX System Services Command Reference for usable options when sending mail.

FSUM6823  command: no interactive mailx use
Explanation: You attempted to use interactive mailx commands after calling mailx with the name mail.
User response: Do not use interactive commands with rmail.

FSUM6826  variable storage
Explanation: A system error indicating the cause is displayed with this message.
**FSUM6827**  
*string: read-only variable*

**Explanation:** You cannot change the values of some environment variables, such as HOME and MAILRC, from within mailx. You tried to change the value of such a variable.

**User response:** Do not try to change the value of read-only variables.

**FSUM6828**  
*string: no such variable*

**Explanation:** You tried to make use of a variable that does not exist.

**User response:** Check to make sure that you have spelled the variable name correctly or define the variable with a set command.

**FSUM6829**  
*building pathname pathname*

**Explanation:** A system error indicating the cause is displayed with this message.

**FSUM6830**  
*Misplaced shell meta-character*

**Explanation:** You provided an invalid file name pattern.

**User response:** Ensure that the pattern given is correct.

**FSUM6831**  
*Expansion memory allocation failure*

**Explanation:** The system could not allocate sufficient system resources to perform the requested operation.

**User response:** Free up more resources.

**FSUM6832**  
*Shell syntax error*

**Explanation:** You provided an invalid file name pattern.

**User response:** Ensure that the pattern given is correct.

**FSUM6833**  
*Ambiguous*

**Explanation:** You provided a file name pattern that expanded into more than one file name.

**User response:** Be more specific in naming the file you want.

**FSUM6834**  
*alias storage*

**Explanation:** A system error indicating the cause is displayed with this message.

**FSUM6835**  
*string: no such alias*

**Explanation:** You attempted to unalias alias; however, no alias with this name exists.

**User response:** Make sure that you spelled alias correctly, or specify an alias that does exist.

**FSUM6860**  
*Missing file name*

**Explanation:** You issued a command which requires a file name without providing one.

**User response:** Specify a file name.

**FSUM6861**  
*Missing pipe command*

**Explanation:** You specified the ~| command without providing a shell command.

**User response:** Provide the missing shell command.

**FSUM6864**  
*fork failed*

**Explanation:** A system error indicating the cause is displayed with this message.

**FSUM6865**  
*mail to command "command_name"*

**Explanation:** A system error indicating the cause is displayed with this message.

**FSUM6866**  
*mail to file "filename"*

**Explanation:** A system error indicating the cause is displayed with this message.

**FSUM6869**  
*No recipients specified*

**Explanation:** You attempted to send a mail message without specifying any recipients.

**User response:** When sending mail, please specify recipients either on the command line or on the carbon copy (or blind carbon copy) list.

**FSUM6879**  
*string: no matching "if" statement*

**Explanation:** You issued an else or endif command without a corresponding if command.

**User response:** Ensure that all else and endif commands are preceded by an if command.

**FSUM6880**  
*EOF inside "if" statement*

**Explanation:** While processing an if command, mailx encountered an end-of-file condition.

**User response:** If the if command is in your start-up file, ensure that you have included a corresponding endif command. If you are entering the if in command...
mode, do not enter the EOF character before issuing the **endif** command.

**FSUM6881** cannot lock file "filename"
Explanation: *mailx* was unable to acquire exclusive access to a mail folder.
User response: Wait for a little while and try again.

**FSUM6882** rewriting "filename"
Explanation: A system error indicating the cause is displayed with this message.

**FSUM6883** allocating message header
Explanation: A system error indicating the cause is displayed with this message.

**FSUM6884** allocating message address
Explanation: A system error indicating the cause is displayed with this message.

**FSUM6894** No applicable messages.
Explanation: You specified a message list that does not match any messages in the current mailbox.
User response: No action required.

**FSUM6900** Invalid message number
Explanation: You used a message number of 0 or one that is greater than the number of messages in the mailbox.
User response: Use a message number in the range from 1 to the number of messages in the mailbox.

**FSUM6901** Inappropriate message
Explanation: You tried to perform a command on an inappropriate message. For example, you tried to undelete a message that was not deleted or you tried to respond to a deleted message.
User response: Check the description of the command you are using to ensure that you are using it correctly.

**FSUM6902** No applicable messages
Explanation: You specified a message list that does not match any messages in the current mailbox.
User response: No action required.

**FSUM6903** Referencing before first message
Explanation: You used the - notation to try to reference the message before the first one in the mailbox.
User response: Do not use - when the current message is the first message in the mailbox.

**FSUM6904** Referencing beyond last message
Explanation: You used the + notation to try to reference the next message when the current message was the last one in the mailbox.
User response: Do not use + when the current message is the last message in the mailbox.

**FSUM6905** Non-numeric second argument
Explanation: The second argument in a message list was not numeric.
User response: Ensure that, when specifying a range of messages as arguments for a command, you indicate the first and last message in the range with integers in the range 1 to the number of messages in the current mailbox.

**FSUM6906** No args expected
Explanation: You specified arguments for a command that does not take arguments.
User response: Do not specify arguments for this command.

**FSUM6907** Only one arg allowed
Explanation: You attempted to use a command that takes only one argument, but you specified either more or less than one argument.
User response: Specify only one argument for this command.

**FSUM6908** Variable "cmd" not set.
Explanation: You attempted to use the **pipe** command without specifying a shell command to pipe the messages through and the variable **cmd** was not set.
User response: Either specify a shell command with **pipe** or set the **cmd** to a default shell command to use with **pipe** when no shell command is explicitly specified.

**FSUM6909** command "command"
Explanation: A system error indicating the cause is displayed with this message.
FSUM6911  No value set for "folder" variable
Explanation:  You have not provided a value for the mailx variable folder.
User response:  Provide a value for the variable folder either in the start-up file or in command mode.

FSUM6912  No previous file.
Explanation:  You used # to represent the file name of the previous file when there was no previous file.
User response:  Use a different file name indicator.

FSUM6934  Cannot nest "if"s
Explanation:  You attempted to nest one if command within another.
User response:  Do not nest if commands.

FSUM6935  if: "s" or "r" are permissible arguments
Explanation:  You used an argument other than s or r with the if command.
User response:  Use only s or r as the argument for an if command.

FSUM6939  Missing file after source command
Explanation:  You issued a source without specifying a file name.
User response:  Specify a file name with the source command.

FSUM6940  command file "cmdfile_name"
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6954  string: cannot find out who you are
Explanation:  The mailx command was unable to find your user ID.
User response:  Check with your system programmer.

FSUM6955  fork for shell
Explanation:  A system error indicating the cause is displayed with this message.

FSUM6956  copy buffer
Explanation:  A system error indicating the cause is displayed with this message.
FSUM6977  Missing major/minor device
Explanation: You failed to specify the major or minor device type argument for a character or block special file.
User response: Provide the missing argument.

FSUM6978  character special file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM6979  block special file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM7007  Not that many files ...
Explanation: When using the :p or :n commands, you specified a value for n that would move you past the beginning or the end of the file list.
User response: Specify a smaller value for n.

FSUM7008  No other file ...
Explanation: When using the :e command, you specified a file name of #; however, there was no previous file.
User response: Specify the desired file name explicitly.

FSUM7009  Not enough lines to scroll...
Explanation: When using one of the scrolling commands, you specified a value for n that would move you past the beginning or the end of the file.
User response: Specify a smaller value for n.

FSUM7012  Badly constructed regular expression.
Explanation: more encountered a syntax error in a regular expression.
User response: Check the syntax of the regular expression.

FSUM7013  No remembered regular expression.
Explanation: You tried to use a remembered regular expression; however, there was no remembered regular expression.
User response: Specify the regular expression explicitly.

FSUM7014  No match found for regular expression.
Explanation: more did not find a match for the specified regular expression.
User response: Check that the regular expression was entered correctly.

FSUM7015  Tag tagname not found.
Explanation: You tried to move to tag tagname, but more could not find it.
User response: Check to see that you entered tagname correctly.

FSUM7016  No tags file present.
Explanation: more was unable to open the tags file.
User response: Check that the file tags exists, and that you have appropriate permissions.

FSUM7017  filename: Not a text file
Explanation: You specified the file filename which was not a text file.
User response: Specify a text file.

FSUM7019  string: cannot reopen input file
Explanation: You attempted to view a previously viewed file with the :e command, and when more tried to reopen that file, it could not, or you attempted to reopen the current file (due to a R command or the completion of a shell escape command) and it failed.
User response: Find out what caused the file become unopenable, and fix the problem.

FSUM7024  command: interactive terminal inaccessible
Explanation: more was unable to open the terminal for input.
User response: Make sure that the standard input is assigned to a terminal.

FSUM7027  invalid command: command
Explanation: The command argument to -p or + was invalid.
User response: Fix the syntax of command.

FSUM7028  No such mark
Explanation: You attempted to move to a mark using the 'letter command, but you never defined the mark letter with a ml etter command.
User response: Check the name of the mark to which
you intended to move, and enter the correct name with the 'command, or define a mark with the name specified.

FSUM7029  command: cannot create temporary file
Explanation:  more was unable to create a working file that it needed.
User response:  Ensure that you either have a /tmp directory or that the environment contains a variable TMPDIR which names a directory where more can store temporary files. Also, ensure that you have sufficient permissions on this directory to create a temporary file.

FSUM7030  --More--
Explanation:  This message is displayed at the bottom of the screen when the more command is running.

FSUM7031  cannot create file "filename"
Explanation:  You attempted to use the :w filename command, but more was unable to create the file, probably due to the existence of a file with that name, no space on the destination device, or inappropriate permissions on the destination directory.
User response:  Check that filename does not already exist, that there is space on the destination device, and that you have appropriate permissions on the destination device.

FSUM7032  command: unable to find your user name
Explanation:  newgrp was unable to find your user name in the system user database.
User response:  Contact your system programmer.

FSUM7033  command: unknown group "groupname"
Explanation:  You specified a groupname that was not in the system group database.
User response:  Use the id command to get a list of all groups you may access.

FSUM7034  setgroups call failed
Explanation:  A system error indicating the cause is displayed with this message.

FSUM7035  set group ID to groupname
Explanation:  A system error indicating the cause is displayed with this message.

FSUM7036  setuid
Explanation:  A system error indicating the cause is displayed with this message.

FSUM7037  exec default shell "shell"
Explanation:  A system error indicating the cause is displayed with this message.

FSUM7054  Badly formed number in "string"
Explanation:  You specified an option which requires a numeric argument, but the argument given was not a valid number.
User response:  Provide a valid number as an argument.

FSUM7055  Unknown format character "character"
Explanation:  You specified an unrecognized format character as an argument to the –t option.
User response:  Check the description of od in z/OS UNIX System Services Command Reference for a list of valid format characters.

FSUM7056  Invalid size modifier for "character" format
Explanation:  You specified an invalid size modifier for the char format character.
User response:  Check the description of od in z/OS UNIX System Services Command Reference for the valid size modifiers for each format character.

FSUM7057  Missing argument for "-character" option
Explanation:  You specified the –opt option but did not follow it with the expected argument.
User response:  Provide the expected argument.
Check the description of od in z/OS UNIX System Services Command Reference for a list of valid options and their arguments.

FSUM7058  seek error on input
Explanation:  A system error indicating the cause is displayed with this message.

FSUM7060  od: badly formed offset "string"
Explanation:  You specified an offset that was not a decimal or octal value.
User response:  Specify a valid offset.

</tbody>
</table>
FSUM7089  file size for "filename" is greater than or equal to INT_MAX. Use compress.

Explanation: pack does not support files that are of INT_MAX size or larger and is obsolescent to the compress utility. The compress utility can handle large files.

User response: Use the compress utility.

FSUM7106  cannot determine OPEN_MAX

Explanation: A system error indicating the cause is displayed with this message.

FSUM7107  paste: must specify input files

Explanation: You did not specify any input files.

User response: Specify at least one input file.

FSUM7108  paste: too many files at "filename"

Explanation: You specified more files than paste can handle. filename is the first file that paste was unable to open. The number of files that paste can open depends on the number of files that other processes have open.

User response: Close files that other processes have open to increase the number of files that paste can open.

FSUM7119  command: Too many file arguments.

Explanation: You specified more than one file to be patched on the command line.

User response: Do not specify more than one file to be patched on the command line.

FSUM7120  string: missing argument after "--command" option

Explanation: You specified -- option without providing the required argument.

User response: Check the Options section of the patch man page for a list of options and their arguments.

FSUM7131  If you want to go on, type device/file name when ready

Explanation: There is no more room to write the archive or extract members.

User response: Either press CTRL-C to terminate the pax command or enter the name of a device/file to continue writing to.

FSUM7139  command: compress: string

Explanation: A problem occurred in the compression of the archive.

User response: See the compress man page for a full list of possible compression errors.

FSUM7140  command: decompress: string

Explanation: Normally implies that the archive is corrupted.

User response: See the uncompress man page for a full list of possible compression errors.

FSUM7141  Unable to open terminal "term"

Explanation: A system error indicating the cause is displayed with this message.

FSUM7142  Existing file "filename" is newer

Explanation: filename was not extracted from the archive because an existing file with the same name was newer.

User response: If you really want to extract filename, use the -u option.

FSUM7143  cannot create parent directory to "pathname"

Explanation: A system error indicating the cause is displayed with this message.

FSUM7144  cannot link "name1" to "name2"

Explanation: A system error indicating the cause is displayed with this message.

FSUM7145  command: pathname: links not supported by OS

Explanation: The pax, tar, or cpio file being extracted contained hard links, which are not supported by the operating system. These files are not extracted.

User response: Since this message appears only on systems with no hard link support, there is no way to extract the file as a hard link. One can manually make a copy of the file referenced by the link.

FSUM7146  name1 symbolic link to name2

Explanation: A system error indicating the cause is displayed with this message.
FSUM7147  name1 link to name2
Explanation:  A system error indicating the cause is displayed with this message.

FSUM7148  cannot create file "filename"
Explanation:  A system error indicating the cause is displayed with this message.

FSUM7151  I/O buffer allocation
Explanation:  A system error indicating the cause is displayed with this message.

FSUM7152  command: -6 not supported
Explanation:  You specified the -6 option, which is not currently implemented.
User response:  Do not use the -6 option.

FSUM7153  command: Unknown option "--option"
Explanation:  You specified an option that is not valid for this command.
User response:  Check z/OS UNIX System Services Command Reference or a list of options.

FSUM7154  Must specify one of -i, -o, or -p
Explanation:  When using cpio, you must specify one and only one of the -i, -o, or -p options.
User response:  Specify one of the required options.

FSUM7155  command: -r option disabled with -p
Explanation:  cpio can not use the -r option (rename files) with -p (pass, which copies files from one location to another directory).
User response:  When using the -p option, do not also specify the -r option.

FSUM7158  Bad magic number in archive
Explanation:  Either the wrong file was passed, or the file has been corrupted.
User response:  Check your archive file.

FSUM7159  filename: unsupported file mode mode
Explanation:  When creating a cpio archive, the mode (file type) of the specified file on the file system is not valid for including in a cpio archive.
User response:  Check the file type of the named file, and correct if possible. (The file type may be an extension to POSIX, which is valid on the host operating system, but shouldn't be included in a portable cpio archive.)

FSUM7160  command: Unknown mode field mode
Explanation:  The type of the file specified in the mode field of the cpio archive is not supported by the operating system.
User response:  No action possible, as the file cannot exist on the host system.

FSUM7161  command: "string" not found.
Explanation:  You specified the name of an archive member, but it was not found in the archive.
User response:  Get a full table of contents of the archive to see if you are using the correct name.

FSUM7162  command: file "filename": Unable to represent filename in ISO/IEC 8859 -- not saved
Explanation:  Characters in filename cannot be represented in the character set used in tar archives.
User response:  Rename the specified file to contain only characters in ISO/IEC 8859.

FSUM7163  symbolic link filename
Explanation:  A system error indicating the cause is displayed with this message.

FSUM7164  Bad format in header
Explanation:  Either the wrong file was passed, or the file has been corrupted.
User response:  Check your archive file.

FSUM7165  command: archive file name >num characters
Explanation:  The archive contained a path name that was longer than that permitted on the local system.
User response:  Re-create the archive using a shorter relative path.

FSUM7167  command: interactive EOF
Explanation:  When using the interactive rename option, an end-of-file was encountered.
User response:  None.
FSUM7169  command: cannot set access/modify time on "filename"

Explanation: While filename was being restored, the timestamp could not be restored to its original value. This is most likely due to the lack of appropriate permission to the file.

System action: The program ends.

User response: Obtain the appropriate permission, or disable the restoring of the timestamp by using the -pm option (for pax) or the -m option (for tar).

FSUM7170  filename: cannot set mode

Explanation: A system error indicating the cause is displayed with this message.

FSUM7171  filename: cannot set uid/gid

Explanation: A system error indicating the cause is displayed with this message.

FSUM7172  Warning: file "file": character "character"

Explanation: While attempting to convert data in the archive during a read or write, pax encountered a character that could not be converted to the desired codeset. The character is left untranslated.

System action: The program continues.

User response: See z/OS UNIX System Services Command Reference for more information.

FSUM7173  command: out of memory for link tables

Explanation: There were not enough free system resources to create the needed link tables. When archiving files with multiple links, each link must be remembered.

User response: Archive in smaller pieces.

FSUM7174  command: missing num link(s) to filename

Explanation: Not all links to a given file were archived.

User response: None.

FSUM7175  Missing file characteristics after "p"

Explanation: You specified the -p option without providing an argument that indicated the file characteristics to be preserved.

User response: Provide the missing argument.

FSUM7176  Missing blocking factor after "b"

Explanation: You specified the -b option without providing an argument that indicated the size of an output block.

User response: Provide the missing block size.

FSUM7177  Missing file name after "f"

Explanation: You specified the -f option without providing a file name as an argument.

User response: Provide the missing file name.

FSUM7178  Missing substitution after "s"

Explanation: You specified the -s option without providing a substitution command as an argument.

User response: Provide the missing substitution command.

FSUM7179  Missing format after "x"

Explanation: You specified the -x option without providing an archive format as its argument.

User response: Provide the missing archive format.

FSUM7180  Missing volume pattern after "V"

Explanation: You specified the -V option without providing a volume pattern as an argument.

User response: Provide the missing volume pattern.

FSUM7181  Missing keyword list after "o"

Explanation: You specified the -o option without providing a keyword list as an argument.

User response: Provide the missing keyword list.

FSUM7182  Unable to convert from codeset "codeset1" to codeset "codeset2"

Explanation: The host file name character set (codeset1) was unable to map to and from the archive character set (codeset2).

User response: Correctly specify to and from keywords with the -o option of pax.

FSUM7183  command: can not read archive from terminal

Explanation: You attempted to extract or list an archive from a tty device.

User response: Specify a non-tty file name to pax.
FSUM7184  command: can't use -a or -u with stdout
Explanation: You specified the -a or -u option when sending output to the standard output. These options can only be used with archive files.
User response: Make sure that you specify an archive file when using the -a or -u options.

FSUM7185  command: blocking factor must be at least 512 for read operations
Explanation: You specified a blocking factor of less than 512 bytes and attempted to perform read operations.
User response: Use the -b option to specify a block size of at least 512 bytes.

FSUM7194  command: badly formed number: "string"
Explanation: You specified an invalid number as the argument of a -b option.
User response: Specify a valid number.

FSUM7195  command: overflow in blocking factor: "string"
Explanation: You specified a blocking factor (blocksize) that was too large.
User response: Use a smaller value for blocksize.

FSUM7196  command: blocking factor of 0 not allowed
Explanation: You specified the -b option with an argument that evaluated to zero.
User response: Specify a nonzero value as the argument to the -b option.

FSUM7197  command: invalid archive format selected: 'string'
Explanation: You specified an argument to the -x option that is not a supported format.
User response: Check the description of pax in [z/OS UNIX System Services Command Reference] or a list of supported archive formats.

FSUM7199  command: medium not seekable
Explanation: You attempted to append to an archive which was not seekable.
User response: Create a new archive instead.

FSUM7200  command: pathname: Not a directory
Explanation: You specified pass mode with either the -p option for cpio or the -r and -w options for pax, but the destination given was not a directory.
User response: Make sure that the destination pathname is a directory.

FSUM7203  command: error in string replacement: string
Explanation: An error occurred while string placement was being performed during regular expression processing.
System action: The command ends.
User response: Verify that the regular expressions used are correct and reissue the command.

FSUM7204  Warning: blocking factor blocksize not portable to UNIX
Explanation: You specified a blocking factor (blocksize) that was larger than 20. This may create an archive that does not work on a UNIX system.
User response: To guarantee portability to a UNIX system, use a blocksize of 20 or less. A larger value may work but is not guaranteed.

FSUM7205  TAR file already set
Explanation: You specified the f option more than once on the command line.
User response: Specify the f option only once.

FSUM7206  Must specify one of 'c', 'r', 't', 'u', or 'x'
Explanation: tar requires that you specify one of the c, r, t, u, or x options as the first character of its option string. You failed to do this.
User response: Specify one of the required options at the beginning of the option string.

FSUM7207  command: "z" (compress) option unavailable with "option"
Explanation: The compress option cannot be specified with the "r" (replace) option; compressed archives cannot be appended to.
System action: The program ends.
User response: To add a file to the end of a compressed archive, you can first use the uncompressed utility to uncompress the archive, and later use the compress utility to recompress the archive.
command: tape archive medium not seekable

Explanation: You attempted to use the replace (r) option on an archive file that was not seekable.

User response: Only use the r option with archive files that are seekable.

command: 'u' function not implemented--using 'r'

Explanation: A system error indicating the cause is displayed with this message.

command: string: name too long

Explanation: The path name filename was too long to be included in a tar archive.

User response: Rename or move filename, such that its path name is shorter.

command: string: Unknown mode filename

Explanation: The type of the file specified in the mode field of the tar archive entry is not supported by the operating system.

User response: No action possible, as the file can not exist on the host system.

command: string is a special file--not dumped

Explanation: You attempted to dump a special file filename when writing a non-USTAR tar file.

User response: Do not specify special files to be included in tar archives. If you want to archive special files, use a USTAR format archive.

command: file "hardlink": hard link to "targetfile" ignored: tar format does not permit links to pathnames longer than n

Explanation: The format of the tar and USTAR archives does not allow the storing of files that are hardlinked to files whose name exceeds n characters. Hard links are files that have the same inode value. The first file stored in the archive with the same inode as subsequently archived hardlinks is considered the target of those subsequently archived hardlinks. The name of the target hard link cannot exceed n characters, because the format of the archive only allows for n characters to represent the name of the target hardlink.

System action: The program continues.

User response: For z/OS Release 9 or later, pax and tar support an extended USTAT format, which can store hard links whose target exceeds n characters. See z/OS UNIX System Services Command Reference for more information. For previous versions, the hardlink cannot be stored unless the name of the target hardlink is shortened. For pax, the -i or -r options can be used to rename files.

command: symbolic link "symlink": tar format does not permit symbolic links to pathnames longer than n

Explanation: The format of the tar and USTAR archives does not allow the storing of symbolic links whose target pathname exceeds n characters.

System action: The program continues.

User response: For z/OS Release 9 or later, pax and tar support an extended USTAT format, which can store symbolic links whose target exceeds n characters. See z/OS UNIX System Services Command Reference for more information.

command: filename: name too long...

Explanation: The pax or tar command was using the original UNIX tar format when it encountered filename, whose name was too long to be represented in the archive using the original UNIX tar format. It switched to the USTAR format for the remainder of the archive.

System action: The program continues.

User response: This is an informational message. No corruption occurred to the archive or to filename, and no recovery action is required. To avoid this message, use the "-U" option for tar, to force the use of the USTAR format. For pax, do not use "-x" to specify the tar format; pax will use USTAR as the default.
FSUM7229  scratch file
Explanation: A system error indicating the cause is displayed with this message.

FSUM7230  sorting
Explanation: A system error indicating the cause is displayed with this message.

FSUM7231  updating archive
Explanation: A system error indicating the cause is displayed with this message.

FSUM7252  Badly constructed regular expression.
Explanation: You specified an incorrect regular expression.
User response: Correct the regular expression.

FSUM7253  No remembered regular expression.
Explanation: You attempted to use the I, ?, or ^ command to repeat a previous search; however, no previous search command identified a regular expression to search for.
User response: Explicitly specify the regular expression for which you want to search.

FSUM7257  Missing prompt after -p
Explanation: You specified the -p option without providing a prompt string as its argument.
User response: Provide the missing prompt string.

FSUM7259  Terminfo database not found
Explanation: The terminfo database could not be found.
User response: Set the environment variable TERMINFO to point at a valid database of terminal information.

FSUM7260  term: Unknown terminal type.
Explanation: The terminal type term could not be found in the terminal database.
User response: Check that the TERM environment variable is set correctly.

FSUM7261  term: Unknown terminal type, using dumb.
Explanation: The terminal type term could not be found in the terminal database. The terminal type was set to dumb.

User response: Check that the TERM environment variable is set correctly.

FSUM7263  insufficient memory
Explanation: There were not enough free system resources to perform the requested operation.
User response: Free up more system resources.

FSUM7266  Width is insufficient
Explanation: The line was not wide enough to hold the given number of columns with the given column width; or a column was not wide enough to hold the minimum amount of data.
User response: Use the -w option to increase the width of the page.

FSUM7267  Too many files for merge(-m) option; limit num
Explanation: You specified too many files for the -m option to handle. The limit was num files.
User response: Specify fewer files.

FSUM7280  rm: not allowed to remove pathname
Explanation: You specified either . (current directory) or .. (parent directory) as the final pathname component of pathname. rm will not remove these directories.
System action: Processing for the pathname is skipped, the command continues.
User response: Do not specify . or .. as the final pathname component of pathname.

FSUM7282  rm: use "-r" to remove directory "pathname"
Explanation: You attempted to use rm to remove a directory without specifying the -r option.
User response: Specify the -r option when you want to use rm to remove a directory.

FSUM7283  rm: fatal error during "-r" option
Explanation: A system error indicating the cause is displayed with this message.

FSUM7286  cannot stat entry "filename"
Explanation: A system error indicating the cause is displayed with this message.
FSUM7287 cannot open directory "pathname"
Explanation: A system error indicating the cause is displayed with this message.

FSUM7290 insufficient memory for buffers
Explanation: There were not enough free system resources to allocate as buffers.
User response: Free up more resources.

FSUM7291 "y" command may not be followed by a newline
Explanation: You followed the y command with a newline rather than its required arguments.
User response: Provide the missing arguments.

FSUM7293 non-matching "{" and "}" commands
Explanation: You specified a { command without the matching }.
User response: Provide the missing }.

FSUM7294 garbage after command
Explanation: You specified invalid characters after a script command.
User response: Remove the surplus characters.

FSUM7295 number addresses given for command expecting at most maximum_number
Explanation: You specified a command with number addresses that uses a maximum of maximum_number addresses.
User response: Use the correct number of addresses.

FSUM7296 newline or end of file found in pattern
Explanation: sed encountered a newline or end-of-file character when reading a pattern from the script or script file.
User response: Check the pattern for a missing delimiter.

FSUM7297 Missing script
Explanation: You specified the -e option but did not provide a script as its argument.
User response: Provide the missing script.

FSUM7299 label "label" not found in script
Explanation: You specified label as an argument to the b or t command, but label does not exist in the script.
User response: Make sure that b and t commands refer to labels that exist in the script.

FSUM7300 cannot nest "!" command
Explanation: You attempted to execute one ! command from within another.
User response: Remove any nested ! commands.

FSUM7301 "\" must terminate the "character" command
Explanation: You specified the cmd which requires a backslash (\) required to terminate its input.
User response: Provide the missing \.

FSUM7302 End of file in "cmd" command
Explanation: sed encountered an end of file while parsing the command cmd.
User response: Check the script file for missing closing quotes, missing regular expression delimiters, and other syntactical errors.

FSUM7303 "cmd" command needs a label
Explanation: You specified a command that requires a label as an argument, but you did not provide the label name.
User response: Provide the missing label name.

FSUM7305 no memory file file table
Explanation: There were not enough free system resources to perform the requested operation.
User response: Free up more resources.

FSUM7306 badly formed file name for "cmd" command
Explanation: You specified the cmd which requires a file name as an argument, but the given argument does not have the syntax of a file name.
User response: Specify a valid file name.

FSUM7308 insufficient memory to compile command
Explanation: There were not enough free system resources for sed to compile a given command.
User response: Free up more resources.

FSUM7309 bad regular expression delimiter after \ 
Explanation: You used a backslash (\) to indicate an alternate regular expression delimiter, but you did not follow it with a valid delimiter.

User response: Provide a valid delimiter following the \ (that is, any character other than newline, space, tab, or EOF).

FSUM7310 no remembered regular expression 
Explanation: You issued a command that tried to use a remembered regular expression, but there was no remembered regular expression.

User response: Specify the regular expression explicitly.

FSUM7311 script file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM7315 string: restricted 
Explanation: You were using the restricted version of the shell (for example, by specifying the -r option for sh). The restricted shell does not allow the use of the specified command.

User response: To use the specified command, you must be using a non-restricted shell.

FSUM7316 string: readonly variable 
Explanation: You attempted to change or remove the variable name which was marked as read-only.

User response: Do not attempt to change or remove a read-only variable.

FSUM7317 temporary file (filename) error using here document 
Explanation: A system error indicating the cause is displayed with this message.

FSUM7318 cannot open script "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM7320 missing command after -c 
Explanation: You specified the -c option but did not provide a command as an argument.

User response: Provide the missing command.

FSUM7321 Unknown option "option"
Explanation: You specified an option that is not valid for this command.

User response: Check z/OS UNIX System Services Command Reference or a list of options.

FSUM7322 MKS Korn Shell 

FSUM7325 return: not executing function 
Explanation: You specified a return command when you were not executing a function.

User response: Only use return to return from a function.

FSUM7326 reading script 
Explanation: A system error indicating the cause is displayed with this message.

FSUM7327 signal number num not conventional
Explanation: You specified a signal number num which is not conventional. The signal associated with the signal number is not the same across all platforms.

System action: The command continues. This message does not affect the exit status.

User response: To avoid this message, specify the desired signal name.

FSUM7328 too many outstanding signals

FSUM7329 <(command) and >(command) not implemented
Explanation: You attempted to use <(command) or >(command) which are not implemented in this version of the shell.

User response: Do not use these constructs.

FSUM7330 <<string unclosed
Explanation: The shell encountered an end-of-file character while reading a here document before it encountered name.

User response: Make sure that name appears in the text of the input file.
FSUM7331 too many << in line
Explanation: You specified more than 10 here documents using <<.
User response: Simplify your command line to use fewer here documents.

FSUM7332 syntax error: got string1 expecting string2
Explanation: When processing your input, the shell encountered string1 when it was expecting string2.
User response: Check the description of sh in z/OS UNIX System Services Command Reference or the correct syntax for various shell commands. Reenter your input with the correct syntax.

FSUM7333 Use "exit"
Explanation: You entered an end-of-file (EOF) character (Ctrl-D), but the ignoreeof shell option is set. The ignoreeof option tells the shell not to exit when an EOF character is entered.
System action: The shell continues.
User response: Enter the exit command to exit the shell.

FSUM7334 not an identifier
Explanation: You specified a for, function, or select statement, but did not follow it with a valid identifier.
User response: Provide a valid identifier after the statement.

FSUM7337 coprocess not implemented
Explanation: On DOS, you attempted to use an operation or option that depends on coprocesses. DOS does not support coprocesses.
User response: Do not attempt to use coprocesses on DOS.

FSUM7338 execute: internal error ( number )
Explanation: This is an internal error in the z/OS shell.
System action: The command ends.
User response: Report this error to IBM Service.

FSUM7339 ambiguous redirection
Explanation: You specified a file name in a redirection construct that expands to other than a single word.
User response: Ensure that the file name in a redirection construct expands to a single word.

FSUM7340 file descriptor fd already redirected
Explanation: You attempted to redirect the file descriptor fd which was already being redirected in the same command.
User response: Only redirect a file descriptor once.

FSUM7341 bad file descriptor "fd"
Explanation: You tried to read from, or write to, the file descriptor fd which was not open for that operation.
User response: Open the file descriptor fd for the appropriate operation.

FSUM7342 file "filename" already exists
Explanation: You attempted to redirect output into an existing file, but you have turned on the noclobber option (see set 1).
User response: Use the construct >| filename to redirect the output into an existing file or turn the noclobber option off with set+o noclobber.

FSUM7343 cannot open "filename" for input/output
Explanation: A system error indicating the cause is displayed with this message.

FSUM7345 no file descriptor available
Explanation: You attempted to redirect a file descriptor but none were available. When a file descriptor is redirected, the old value is remembered by the shell by duplicating it to yet another file descriptor. The total number of file descriptors is limited by the system and hence the shell may run out while it looks like your command is using far fewer than the maximum number of descriptors.
User response: Free up a file descriptor.

FSUM7346 no pipes available
Explanation: A system error indicating the cause is displayed with this message.

FSUM7347 cannot open "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM7349 only one co-process allowed
Explanation: You tried to create more than one coprocess.
User response: Do not attempt to create more than one coprocess.
FSUM7350  e_cmd: negative result?
Explanation:  This is an internal error in the z/OS shell.
System action:  The command ends.
User response:  Report this error to IBM Service.

FSUM7351  not found
Explanation:  You attempted to execute a command that could not be found.
User response:  Ensure that the command exists and that the PATH environment variable is valid.

FSUM7352  recursion too deep
Explanation:  You have defined a function that has too many levels of recursion.
User response:  Simplify the function to use fewer levels of recursion.

FSUM7354  "string" is not an identifier
Explanation:  You attempted to use a nonalphanumeric name as an identifier.
User response:  Use only alphanumeric names for identifiers.

FSUM7355  bad file descriptor "fd"
Explanation:  You tried to read from, or write to, the file descriptor fd which was not open for that operation.
User response:  Open the file descriptor fd for the appropriate operation.

FSUM7356  history not available
Explanation:  The shell was unable to open a history file when you logged in.
User response:  Make sure that the environment variable HISTFILE is set to a file which is named properly and for which you have appropriate permissions. You may have to log in again.

FSUM7357  no active co-process
Explanation:  You attempted to receive input from or send output to a coprocess when there was no active coprocess.
User response:  Do not use the -p option when there is no active coprocess.

FSUM7358  no HOME directory
Explanation:  You attempted to use cd to return to your home directory; however, the environment variable HOME was not defined.
User response:  Set the environment variable HOME to the path name of your home directory.

FSUM7359  no previous directory
Explanation:  You tried to use the command cd - to return to your previous working directory; however, there was no record of what your previous directory was.
User response:  Specify the desired directory explicitly.

FSUM7360  pattern "old" not found in "dir"
Explanation:  You tried a command of the form cd old new. However, the name of the current directory dir does not contain any string matching the regular expression old.
User response:  Ensure that the name of the current directory contains the regular expression old.

FSUM7362  writing
Explanation:  A system error indicating the cause is displayed with this message.

FSUM7363  reading
Explanation:  A system error indicating the cause is displayed with this message.

FSUM7364  bad shift count expr
Explanation:  You specified an expression that did not evaluate to a number in the range from 0 to the number of remaining positional parameters.
User response:  Specify an expression that evaluates to a number in the range from 0 to the number of remaining positional parameters.

FSUM7366  "string" not a valid trap name
Explanation:  You specified an unrecognized trap name.
User response:  Check that you spelled the trap name correctly.

FSUM7367  base "number" not in [2,36]
Explanation:  You used the -i option to specify a base for an integer, but the base was not in the range from 2 to 36.
User response:  Specify a base in the range from 2 to 36.
FSUM7369  Cannot restore privileged state
Explanation: You specified +o privileged or –p, but for some reason, the shell cannot restore the affected values.
User response: Exit the current shell and start a new one.

FSUM7411  cannot create temporary file
Explanation: A temporary file was required to perform the requested operations. The shell was unable to create this file, for example, because the disk was full.
User response: Free up more disk space.

FSUM7412  no command matches "command"
Explanation: You asked to edit a command beginning with a particular string, but there was no such command in the history file.
User response: Use the fc command to browse through the history file to ensure that string is entered correctly.

FSUM7421  command is corrupt
Explanation: An internal error occurred in the z/OS shell while it was searching for the command.
System action: The command ends.
User response: Report this error to IBM Service.

FSUM7422  name is not found
Explanation: You specified a name that type was unable to find.
User response: Check that the name exists, was spelled properly, and that you have the appropriate permissions.

FSUM7423  stack overflow
Explanation: You specified an expression that was too complicated for the stack to handle.
User response: Try simplifying the expression.

FSUM7424  misplaced subscript
Explanation: The subscript for an array was missing or invalid.
User response: Make sure that you provide a valid subscript for the array.

FSUM7425  unknown operator
Explanation: You specified an unknown operator.
User response: Check the Arithmetic Substitution subsection of the description of sh in Z/OS UNIX System Services Command Reference or a table showing the valid arithmetic operators.

FSUM7426  base must be in [2,36]
Explanation: You specified a base that was not in the range 2 to 36.
User response: Specify a base in the 2 to 36 range.

FSUM7427  unmatched ? :
Explanation: You specified the ? operator without the :.
User response: Specify the missing :.

FSUM7428  expression: internal error
Explanation: This is an internal error in the z/OS shell.
System action: The command ends.
User response: Report this error to IBM Service.

FSUM7429  assign only to variable
Explanation: You specified an assignment where the left hand side that was not a variable.
User response: Only use the assignment operators to assign values to variables.

FSUM7430  error in arithmetic expression "expr"
Explanation: An error occurred in the arithmetic expression expr.
User response: Look up error in the error listing for more details.

FSUM7431  error in arithmetic expression "expr" near substr
Explanation: An error occurred in the arithmetic expression expr near the substring substr.
User response: Look up error in the error listing for more details.

FSUM7433  string: No such job
Explanation: You specified a nonexistent job identifier.
User response: Use the jobs command to get a list of jobs that are currently job controlled.
FSUM7438  job control disabled

Explanation: You attempted to use the fg or bg command when set-monitor (or set -m) was not set.

User response: Turn on monitor mode with set-monitor or set-m. This mode is not supported on all systems.

FSUM7439  job [job-id] not job controlled

Explanation: You specified the job identifier of a job which was not being job controlled.

User response: Use the jobs command to get a list of jobs currently being job controlled.

FSUM7440  cannot continue job

Explanation: A system error indicating the cause is displayed with this message.

FSUM7441  "string" not a valid signal

Explanation: You specified a non-integer signal for kill that was not a valid signal name, or you specified a signal that is outside the range of valid signal numbers.

User response: Make sure that you specify a valid signal number or name for signal.

FSUM7442  "string" is not a job

Explanation: You specified a job-identifier that is not valid, or a pid (process ID) that is not valid. One example of an invalid pid is a number greater than 2147483647.

User response: Specify a valid job-identifier or pid.

FSUM7443  j_freejob(NULL)!

Explanation: An internal function in the z/OS UNIX shell was invoked with a NULL input parameter. If this occurred after a prior failure, it is normal and may be ignored.

System action: The command ends. The shell continues.

User response: If this occurs repeatedly, or without a prior failure, follow local procedures for reporting problems to IBM.

FSUM7449  pathname: Unknown file type field value `type`

Explanation: A file with an invalid file type was encountered when extracting or listing an archive's contents.

User response: This archive is invalid. No action is possible.

FSUM7452  string: Pathname component too long

Explanation: You specified a directory with a name that was longer than the maximum length indicated by the configuration variable \VARX PATH_MAX. The specified directory is invalid, since no directory can exist with a path name that long.

User response: Specify a valid directory.

FSUM7453  Argument to -n must be numeric

Explanation: You specified an argument to the -n option that was not a number.

User response: Specify a numeric argument for -n.

FSUM7455  command name: warning--file size error in "filename"--file truncated

Explanation: While filename was being written to the archive, the size of the file grew. Only the amount of the file that corresponds to the original size of filename was archived; the contents of filename in the archive no longer match the contents of filename on your file system.

System action: The program continues.

User response: If the truncation of filename is a problem, rebuild the archive.

FSUM7456  command name: warning--file size error in "filename"--file padded with spaces

Explanation: While filename was being written to the archive, another unrelated application caused the size of the file to become smaller. filename was stored in the archive padded with spaces to its original size, and the contents of filename in the archive no longer match the contents of filename on your file system.

System action: The program continues.

User response: If the padding of filename is a problem, rebuild the archive.

FSUM7457  Checksum error on tape (got hexnum1 expected hexnum2 )

Explanation: A bad checksum was found in a tar header.

User response: Check to see if the archive was corrupted.

FSUM7458  command: non-USTAR header in USTAR archive at "string"

Explanation: When reading a USTAR format archive, pax encountered a header without the USTAR magic number.
User response: Check to see if your archive has been corrupted.

FSUM7459  
string:  Component `directory' makes pathname too long.

Explanation: The name component of the specified path name makes the overall path name longer than the maximum length indicated by the configuration variable PATH_MAX.

User response: Use cd to move deeper into the directory structure and try 1c again. This should result in a shorter overall path name.

FSUM7460  
string:  try "c" option for ASCII archive

Explanation: The magic number in the cpio archive header appeared to be in ASCII.

User response: Try using the –x cpio option instead of –x cpio.

FSUM7461  
command:  string:  final component of name too long

Explanation: The USTAR format extends the old tar file name limit from 100 to 256 bytes; however, this requires breaking up the file name into one piece of 156 bytes or less and another piece of 100 bytes or less. The break occurs between directory components (that is, at a slash). In the case of pathname, the second component could not be made to fit into 100 bytes.

User response: Move or rename pathname to have shorter path components.

FSUM7462  
command:  string:  Unable to split name to fit in tar header

Explanation: The USTAR format extends the old tar file name limit from 100 to 256 bytes; however, this requires breaking up the file name into one piece of 156 bytes or less and another piece of 100 bytes or less. The break occurs between directory components (that is, at a slash). In this case, the characteristics of pathname would not allow it to be broken up in such a manner.

User response: Move or rename pathname to have shorter path components.

FSUM7473  
Missing variable assignment

Explanation: You specified the –v option but did not follow it with a variable assignment.

User response: Provide a variable assignment following the –v option.

FSUM7475  
command:  username is not a member of group groupname

Explanation: The user username is not included in the list of users who are members of the group groupname, and the group does not have a password or password phrase.

User response: See your system programmer about adding username to the members of groupname.

FSUM7476  
-f filename invalid if message given

Explanation: On the logger command line, you used the –f to indicate a file from which logger is to read log messages; however, you also provided the argument string to be used as a log message. You cannot use both methods on the same command line.

User response: Either specify a file to be read with the –f option or provide a log message on the command line, but not both.

FSUM7477  
Formatted log message too long -- limit LINE_MAX (num)

Explanation: The formatted log message was longer than num characters. num is the value of the configuration variable LINE_MAX.

User response: Shorten your log message.

FSUM7478  
Warning: newgrp utility probably not setuid to root.

FSUM7483  
bad file name in atjobs directory: "pathname"

Explanation: A file in the atjobs directory was not of the form jobid: queue name. No period (.) was found in the file name.

User response: Have your system programmer remove the file.

FSUM7488  
files too large, trying "-h" option ...

Explanation: You specified the –H option, but there were not enough free system resources to handle the files. diff will now try to compare the files using the –h option.

User response: If you are comparing these two files again, specify the –h option on the command line for faster operation.

FSUM7490  
Missing field separator

Explanation: You specified the –F option but did not follow it with a field separator.

User response: Provide a field separator following the –F option.
FSUM7495  Security error: file "filename" owner is #user_id1, should be #user_id2
Explanation: The user ID of the owner of a crontab file does not match the user ID in the user database corresponding to the name of the crontab file (which is the name of the user who should own it).
User response: Have your system programmer check the setuid and ownership (root) of the crontab program and remove the file.

FSUM7496  Security error: At job directory "pathname": bad owner/mode: cron exiting
Explanation: An atjob file was found without root ownership, or it had other-writable permission.
User response: Have your system programmer fix the ownership and/or permissions on the file, and check the setuid and ownership of the at program.

FSUM7497  Security error: Crontab directory "pathname": bad owner/mode: cron exiting
Explanation: A cron directory was found without root ownership, or it had other-writable permissions.
User response: Have your system programmer make root the owner of the directory and turn off the other-writable permission.

FSUM7499  string: command: symbolic links not supported by OS
Explanation: You attempted to extract a file specified as a symbolic link in the archive. Symbolic links are not supported on all operating systems.
User response: Do not use symbolic links on this system.

FSUM7501  command: bad substitution expression: "sub_pattern"
Explanation: You invoked with a -s option, but the sub_pattern argument was empty, or did not contain a leading delimiter.
User response: Specify a valid sub_pattern argument, such as -s old/new.

FSUM7502  fifo special file "filename": fifo not supported by local o/s
Explanation: You attempted to extract an archive file containing a FIFO file, and the host operating system does not support FIFOs.
User response: Since the operating system does not support FIFOs, no action is possible.

FSUM7506  Unknown tape density "num"
Explanation: You specified a tape drive number followed by an argument that should be a tape density, but the argument was not 1, m, or h.
User response: Specify a valid tape density (1, m, or h).

FSUM7507  Missing file name after "f"
Explanation: You specified the f option but you did not specify the name of an archive file as its argument.
User response: Provide the missing file name.

FSUM7509  Missing blocking factor after "b"
Explanation: You specified the -b option without providing an argument that indicated the size of an output block.
User response: Provide the missing block size.

FSUM7513  Blocking factor "blocksize" is non-numeric
Explanation: You specified the -b option, but the blocksize argument was not a valid number.
User response: Specify a valid number as the value of blocksize.

FSUM7514  Blocking factor larger than number
Explanation: You specified the -b option, but the blocksize argument that you provided is too large.
User response: Use a smaller blocksize.

FSUM7517  command: -O: Must specify -o option
Explanation: You specified the -O option, but did not specify the -o option.
User response: To use the -O option, you must specify the -o option.

FSUM7520  command: -I: Must specify -i option
Explanation: You specified the -I option, but did not specify the -i option.
User response: To use the -I option, you must specify the -i option.

FSUM7522  command: missing directory after -C
Explanation: You specified the -C but did not provide a directory name as an argument.
User response: Provide the missing directory name.
FSUM7524 Only one character allowed after -t

Explanation: You specified a field separator that was longer than one character as an argument to the -t option.

User response: Use a one-character field separator.

FSUM7530  

string: command: msg_file: message must have id in range [1..line]

Explanation: You specified a message identifier outside the valid range.

User response: See the DESCRIPTION section of the gencat man page for the format of message identifiers.

FSUM7531 writing to name

Explanation: A system error indicating the cause is displayed with this message.

FSUM7532  

string: command: msg_file: missing set identifier

Explanation: You omitted the set-id from a $set directive.

User response: See the DESCRIPTION section of the gencat man page for the format of the $set directive.

FSUM7533  

string: command: msg_file: set id must be in range [1..line]

Explanation: You specified a set identifier outside the valid range.

User response: See the DESCRIPTION section of the gencat man page for the format of set identifiers.

FSUM7534  

string: command: msg_file: EOF in string

Explanation: End of file was encountered in a message text string.

User response: See the DESCRIPTION section of the gencat man page for the format of text message.

FSUM7535  

string: command: msg_file: unterminated string

Explanation: An unescaped newline was encountered in a quoted message text string.

User response: See the DESCRIPTION section of the gencat man page for the format of text message.

FSUM7536  

string: command: msg_file: EOF in string escape

Explanation: End of file was encountered in an escape sequence in a message text string.

User response: See the DESCRIPTION section of the gencat man page for the format of text message.

FSUM7538 growing set index

Explanation: A system error indicating the cause is displayed with this message.

FSUM7539 initializing new set

Explanation: A system error indicating the cause is displayed with this message.

FSUM7540 growing message index

Explanation: A system error indicating the cause is displayed with this message.

FSUM7542 copying text to catalog

Explanation: A system error indicating the cause is displayed with this message.

FSUM7543 initializing set index

Explanation: A system error indicating the cause is displayed with this message.

FSUM7544 getting index indirecor

Explanation: A system error indicating the cause is displayed with this message.

FSUM7545 writing index to catalog

Explanation: A system error indicating the cause is displayed with this message.

FSUM7546 allocating set index

Explanation: A system error indicating the cause is displayed with this message.

FSUM7547 <state num1, i = num2 >

FSUM7548 Token buffer overflow

Explanation: Your scanner contained a token that was larger than the token buffer.

User response: Increase the size of the token buffer by editing yylex.c and increasing the size of YYLMAX, then recompile your scanner.
FSUM7552  Push-back buffer overflow
Explanation: Your scanner action code called the unput function too many times in a row, causing the pushback buffer to overflow.
User response: Increase the size of the pushback by editing yylex.c and increasing the size of YYLMAX, then recompile your scanner.

FSUM7553  seeking index in catalog
Explanation: A system error indicating the cause is displayed with this message.

FSUM7554  reading index from catalog
Explanation: A system error indicating the cause is displayed with this message.

FSUM7558  creating temp file name
Explanation: A system error indicating the cause is displayed with this message.

FSUM7559  allocating index
Explanation: A system error indicating the cause is displayed with this message.

FSUM7560  initializing set index
Explanation: A system error indicating the cause is displayed with this message.

FSUM7561  opening catalog
Explanation: A system error indicating the cause is displayed with this message.

FSUM7562  creating temp file name
Explanation: A system error indicating the cause is displayed with this message.

FSUM7679  getcwd
Explanation: A system error indicating the cause is displayed with this message.

FSUM7723  -- core dumped
Explanation: A program called by the shell terminated with a core dump.
User response: Ensure that the program was called correctly.

FSUM7725  history
Explanation: A system error indicating the cause is displayed with this message.

FSUM7726  cannot fork: reason code = reasoncode
Explanation: A system error indicating the cause is displayed with this message.
System programmer response: Take appropriate action based on reason code.

FSUM7727  shell metacharacter in wordexp()
Explanation: The wordexp function was called by the shell to expand a string that contained special shell characters.
User response: Check the program which calls wordexp and ensure that the string to be expanded does not contain any special shell characters.

FSUM7728  bad ${} modifier
Explanation: You specified an invalid modifier in a {} construct.
User response: Check the description of sh in z/OS UNIX System Services Command Reference or a list of valid modifiers in {} constructs.

FSUM7729  missing closing "char"
Explanation: You specified a {, =, \', *, (, [ or and did not provide the corresponding closing character.
User response: Provide the missing closing character.

FSUM7730  string: no expansion of unset variables
Explanation: You attempt to expand an unset variable when set–o nounset was on.
User response: Use set+o nounset to turn nounset off and retry the expansion.

FSUM7731  string: cannot assign
Explanation: You attempted to use the special parameter @ or * either as part of the undefined variable name in the construct ${name=word} or as part of the empty or undefined variable name in the construct ${name :=word}.
User response: Do not use the special parameters @ and * as part of name when using these two constructs.
FSUM7732  string: parameter null or not set
Explanation:  You specified a ${name?} construct where name was not set and no message followed the ?.
User response:  Set name and specify a message after the ?.

FSUM7733  no command substitution permitted
Explanation:  The wordexp function was called by the shell to expand a string that contained command substitution, such as ${cmd} or f(CW' cmd').
User response:  Check the program that called wordexp and ensure that the string to be expanded does not contain any command substitutions.

FSUM7734  substitute: internal error
Explanation:  An internal error occurred in the z/OS UNIX shell word substitution function.
System action:  The command ends. The shell continues.
User response:  Follow local procedures for reporting problems to IBM.

FSUM7739  Illegal instruction
Explanation:  The shell received an illegal instruction signal. This signal typically occurs when a process tries to execute something that is not a valid machine instruction recognized by the hardware.
User response:  Contact your system programmer.

FSUM7766  unbalanced [ ]
Explanation:  You specified a [ without providing the matching ].
User response:  Provide the missing ].

FSUM7767  missing closing )
Explanation:  You specified a ) as part of the test expression but did not provide the closing ).
User response:  Provide the missing ).

FSUM7768  Not a 'Shell Regular Built-in Utility'
Explanation:  You attempted to execute a command that is not a regular built-in utility.
User response:  Specify only shell regular built-in utilities.

FSUM7769  Not enough memory
Explanation:  There were not enough free system resources to perform the requested operation.
User response:  Free up more resources.

FSUM7770  Too many arguments
Explanation:  The system limit for the size of an argument list was exceeded.
User response:  Specify fewer arguments.

FSUM7771  execf failed
Explanation:  The shell could not be executed to run a built-in shell utility.
User response:  Have your system programmer ensure that the shell is both accessible and executable.

FSUM7778  Missing -o file
Explanation:  You specified the -o option without providing a file name as an argument.
User response:  Provide the missing file name.

FSUM7780  -position "string" must follow +position
Explanation:  You specified a -endpos option either before or without a +startpos option.
User response:  Reverse the order of the - and + options on the command line, or provide the missing +startpos option.

FSUM7782  Missing tab list after -t.
Explanation:  You specified the -t option but did not provide a tab list as its argument.
User response:  Provide the missing tab list.

FSUM7782  Missing terminal type after -T.
Explanation:  You specified the -T option but did not provide a terminal type as its argument.
User response:  Provide the missing terminal type.

FSUM7830  Illegal tabs in "tablist".
Explanation:  You specified a tablist which contained either a negative or nonnumeric value.
User response:  Specified a tablist that contains only numbers in ascending order.
FSUM7831 Cannot set margins on terminal "term".
Explanation: You specified the +m margin option, but the terminfo database does not support margins for the terminal term.
User response: Check your terminal definition against the terminal's operation manual for missing information. If the terminal's manual does not provide the necessary information then your terminal does not support margins.

FSUM7832 Cannot set tabs on terminal "term".
Explanation: You attempted to set tab stops on the terminal term, but the terminfo database does not support tabs on that terminal.
User response: Check your terminal definition against the terminal's operation manual for missing information. If the terminal's manual does not provide the necessary information then your terminal does not support tabs.

FSUM7833 "string" are not in ascending order.
Explanation: You specified a list of tab stops that was not in ascending order.
User response: Specify the tab stops in ascending order.

FSUM7835 not enough memory for buffering
Explanation: A system error indicating the cause is displayed with this message.

FSUM7836 re-opening file descriptor "fd"
Explanation: A system error indicating the cause is displayed with this message.

FSUM7842 creating fifo "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM7843 chowning fifo "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM7846 command: standard input must be a terminal.
Explanation: You attempted to invoke talk when the standard input was not a terminal.
User response: Set the standard input to be a terminal.

FSUM7853 creating file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM7854 opening file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM7856 Cannot fork
Explanation: A system error indicating the cause is displayed with this message.

FSUM7859 Bad date conversion
Explanation: You specified an invalid date string on the command line.
User response: Specify a valid date string.

FSUM7860 Only one -r (-f) or -t flag allowed
Explanation: You specified a -f, -r, or -t option on the same command line with one or more other -f, -r, or -t options.
User response: Remove the excess options, leaving only one -f, -r, or -t option.

FSUM7861 stat: age file "filename" inaccessible
Explanation: You specified a filename that either does not exist, or one for which you do not have appropriate permissions.
User response: Check that filename exists, was named properly, and that you have appropriate permissions.

FSUM7864 Unknown terminfo capability "action".
Explanation: You specified a value for action that tput did not recognize as valid terminfo capability.
User response: Check the Description section of the tput man page for a list of valid terminfo capabilities.

FSUM7870 command: odd data
Explanation: The input file contained an odd number of tokens.
User response: Ensure that the input to tsort is valid, and try again.

FSUM7871 not a tty
Explanation: The standard input was not associated with a terminal.
User response: Check if `tty` was meant to be used on a redirected file.

FSUM7876 Missing number of fields to skip
Explanation: You specified the `–f` option without providing the number of fields to skip as its argument.
User response: Provide the missing number of fields.

FSUM7877 Missing character skip count
Explanation: You specified the `–s` option without providing the number of characters to skip as its argument.
User response: Provide the missing number of characters.

FSUM7878 `skip` not a number in "string"
Explanation: You specified an argument to the `+`, `–`, `–f`, or `–s` option that was not a valid number.
User response: Specify a valid number.

FSUM7880 No begin line
Explanation: uudecode did not find a `begin` line in the input file.
User response: Make sure that the file was encoded by uuencode.

FSUM7881 Begin line missing filename
Explanation: There was no file name specified on the `begin` line of the input file, most likely due to a corrupt file.
User response: Get another copy of the encoded file.

FSUM7882 No such user as "user"
Explanation: You specified a file name that used tilde (`~`) expansion, but there no user with the given `username` exists on the local system.
User response: Specify the file name without using tilde expansion, or specify a `username` that does exist.

FSUM7883 No end line
Explanation: uudecode did not find an `end` line in the input file.
User response: Make sure that the file has not been truncated.

FSUM7884 Unable to set mode on "filename"
Explanation: A system error indicating the cause is displayed with this message.
System action: The command ends.
User response: Refer to the system error message and take appropriate action.

FSUM7885 Short file
Explanation: uudecode encountered an end-of-file character before encountering the end of the encoded text.
User response: Make sure that the file has not been truncated.

FSUM7888 What? `command`: No such command from open/visual
Explanation: In Vi mode, you attempted to use one of the Ex commands that are not permitted in this mode.
User response: Do not use `command` in Vi mode.

FSUM7889 Can't undo within global.
Explanation: You attempted to use an undo command within a global command. This is not permitted.
User response: Do not use an undo command within a global command.

FSUM7890 `missing lhs`
Explanation: You attempted to `unmap` or `unabbreviate` a mapping without providing the necessary left-hand-side.
User response: Check the Ex Commands subsection of this man page for a description of the `unmap` and `unabbreviate` commands and their syntax.

FSUM7894 ERROR: File is partially loaded due to too many lines. Editing in read-only mode.
Explanation: vi has an upper limit for the number of lines in a file it can handle. The file the user is editing has surpassed that limit.
System action: The program continues.
User response: If the edits in the file need to be saved, use a different file name when writing out the file, as data loss may occur.
System programmer response: None.
FSUM7895  Failed to preserve file.
Explanation:  vi attempted to write a recoverable version of the current working file to /etc/recover/$LOGNAME, using the exrecover utility.  It is possible that the exrecover command failed, or that the /etc/recover directory is not configured properly.
System action:  The program continues.
User response:  To be sure you have a backup copy of your file, issue a ":w alternatefilename" to write out the current version of the file with this new (not existing) name.  Contact your system programmer for further assistance.
System programmer response:  Verify that the /etc/recover directory exists, and that it has proper permissions.  Verify that /tmp (or wherever vi temporary files are currently being written) is not corrupted or full.  For further assistance, follow local procedures for reporting a problem to IBM.

FSUM7897  Missing filename
Explanation:  You specified a command that required a file name as an argument without providing the file name.
User response:  Provide the missing file name.

FSUM7898  System does not support job control
Explanation:  You attempted to use a job control command (for example, stop) on a system that does not support job control.
User response:  Avoid using commands that require job control.  Request that the system manufacturer support job control.

FSUM7899  Write forms are 'w' and 'w>>'
Explanation:  You specified an invalid syntax for the write command.
User response:  Check the Ex Commands subsection for a description of the write command and its syntax.

FSUM7901  Missing rhs
Explanation:  The right-hand-side expansion of a mapping is missing.
User response:  Provide the missing expansion to define a mapping or macro.  Use the unmap command to remove a mapping or macro.

FSUM7903  No write since last change (:command overrides)
Explanation:  You attempted to run a command before you saved any changes to a file.
User response:  Either save the current changes or use the suggested command to override the error.

FSUM7904  No file
Explanation:  You attempted to reread the current file when there was no current file.
User response:  Specify a file name with the command.

FSUM7905  Extra chars
Explanation:  You specified extraneous characters at the end of the command line that have no function.
User response:  Reenter the command without the extraneous characters.

FSUM7906  Not that many lines in buffer
Explanation:  You specified a line range that included at least one value that was greater than the number of lines in the file.
User response:  Specify a correct line range.  You can use the dollar sign ($) to denote the last line in the file.

FSUM7907  Insufficient memory string
Explanation:  There were not enough free system resources to perform the requested operation.
User response:  Free up more resources.

FSUM7908  Restricted environment
Explanation:  You tried to use an operation that is not permitted in a restricted environment.
User response:  Use an unrestricted version of the editor.  Contact your system programmer if you do not have access to an unrestricted editor.  Also, once the set variable restrict is enabled, it cannot be disabled during the editor session.

FSUM7909  Negative address - first buffer line is 1
Explanation:  You specified a negative number as an address.  The address of the first line of the buffer is 1.
User response:  Specify a positive number as an address.

FSUM7910  Unimplemented EX command
Explanation:  You attempted to use an Ex command that is not implemented on your system.
User response:  Do not use unimplemented commands.
FSUM7911  Global within global not allowed.

Explanation: You specified either a ‘g’ or a ‘v’ as the command to be used with the ex “global” command. The global commands ‘g’ or ‘v’ cannot occur in the list of commands to run globally.

System action: The program continues.

User response: Verify that the command you entered has no errors, or attempt your action through another method. See z/OS UNIX System Services Command Reference for more information.

FSUM7913  No address allowed on this command

Explanation: You specified an address for a command which does not use an address.

User response: Reenter the command without the address.

FSUM7915  Undefined mark referenced

Explanation: You attempted to reference a mark which was not yet defined.

User response: Define the mark using the m command.

FSUM7918  Addr1 > addr2|First address exceeds second

Explanation: You specified two addresses to indicate a range; however, the first address was greater than the second.

User response: When specifying a range, make sure that the first address is less than the second.

FSUM7921  string: No such option@- ‘set all’ gives all option values

Explanation: You attempted to reference an invalid set variable.

User response: Check the Set Option Variables subsection for a list of valid variables, or use the set all command to see the current settings of all variables.

FSUM7922  String too long in option assignment

Explanation: You attempted to assign a string to a variable using the set command, but the size of the string exceeded the allocated storage space.

User response: Specify a shorter string.

FSUM7927  No File

Explanation: You attempted to reread the current file when there was no current file.

User response: Specify a file name with the command.

FSUM7929  Nothing in buffer ‘buf’.

Explanation: You attempted to use the put command to paste text, or the @ command to execute a macro, from the buffer buf which was empty.

User response: Use the yank or delete commands to save text to a buffer.

FSUM7931  Replacement pattern too long - limit num characters

Explanation: You specified a replacement pattern that was too long for the allotted buffer space.

User response: Perform the necessary replacements in increments using shorter replacement patterns.

FSUM7932  Regular expression too complicated

Explanation: The regular expression specified by the user is too long.

System action: The command continues.

User response: Specify a shorter regular expression.

FSUM7933  Can’t escape newline in visual

Explanation: You attempted to use a backslash at the end of a line to escape a newline. This is not permitted in Vi mode.

User response: Do not use a backslash at the end of a line.

FSUM7935  No newlines in re’s|Can’t escape newlines into regular expressions

Explanation: You attempted to search for a newline character in a regular expression. This is not possible.

User response: Do not attempt to search for a newline in a regular expression.

FSUM7936  Command too long

Explanation: You entered a command line that exceeded the input buffer size.

User response: Break the command line in smaller workable components. Create macros or source scripts if the task is going to be performed many times.
FSUM7937  command where?  I command requires a trailing address
Explanation:  You attempted to use command to move or copy a range of lines without specifying a target address.
User response:  Provide the missing target address.

FSUM7938  No filename to substitute for %
Explanation:  You attempted to use % to represent the current file name, but there was no current file name.
User response:  Specify a full file name for the command.

FSUM7939  No alternate filename to substitute for #
Explanation:  You attempted to use # to represent the alternate file name, but there was no alternate file name.
User response:  Specify a full file name for the command.

FSUM7940  Filename too long
Explanation:  You specified a file name that exceeded the maximum length allowed.
User response:  Use a shorter name.

FSUM7941  Too many file names
Explanation:  You specified multiple file names as arguments to a command that only accepts one file name.
User response:  Check the Ex Commands subsection of the vi man page for a list of valid Ex commands and their arguments.

FSUM7942  Argument buffer overflow
Explanation:  You specified a list of command arguments that, after the expansion of the current file name (%) or the alternate file name (#), overflowed the buffer.
User response:  Specify a shorter list of command arguments.

FSUM7943  Incomplete shell escape command - use 'shell' to get a shell
Explanation:  You attempted to use a shell escape without specifying a command.
User response:  To invoke an interactive shell, use the shell command.

FSUM7944  Too long! Result of delete would produce a line too long
Explanation:  You attempted to delete a range of text from the middle of one line to the middle of another.  This would result in joining the remainders of the lines to form a line, the length of which would exceed the maximum line length indicated by the configuration variable LINE_MAX.
User response:  Make shorter lines.

FSUM7945  Line too long
Explanation:  You attempted to add text to a line that would cause its length to exceed the maximum indicated by the configuration variable LINE_MAX.
User response:  Make shorter lines.

FSUM7946  tagstring:  Bad tag file entry
Explanation:  vi encountered an entry in the tags file that it was unable to parse correctly.
User response:  See the man page for ctags 1 for information on how to generate a tags file, or ctags 4 for the correct format of a tags entry.

FSUM7949  Too many nested sources
Explanation:  You attempted to nest too many source files within other source files.
User response:  Reduce the level of nesting.

FSUM7950  Temporary file i/o error--DANGER--write file somewhere else and exit ASAP!
Explanation:  A serious error occurred while performing I/O on the temporary files.
User response:  Save the work space to a different work file name, exit the editor and reenter using the recently saved work file.  If the error persists, contact your system programmer.

FSUM7952  Internal error:  bad seek pointer.
Explanation:  An internal error occurred while processing ed/vi internal buffers.  No file damage has occurred, but ed/vi has lost track of where it is in the file.
User response:  Quit editing the current file, and restart the editor again.  If the error persists, contact your system programmer.
FSUM7953  Internal error: bad write seek.
Explanation: An internal error occurred while processing ed/vi internal buffers. No file damage has occurred, but ed/vi has lost track of where it is in the file.
User response: Quit editing the current file, and restart the editor again. If the error persists, contact your system programmer.

FSUM7954  Internal error: Line out of range.
Explanation: An internal error occurred while processing ed/vi internal buffers. No file damage has occurred, but ed/vi has lost track of where it is in the file.
User response: Quit editing the current file, and restart the editor again. If the error persists, contact your system programmer.

FSUM7955  Internal error: line too long--DANGER.
Explanation: An internal error occurred while processing ed/vi internal buffers. No file damage has occurred, but ed/vi has lost track of where it is in the file.
User response: Quit editing the current file, and restart the editor again. If the error persists, contact your system programmer.

FSUM7957  Nonzero address required on this command
Explanation: You specified zero (0) as a line address for a command which does not accept 0 as a valid line address.
User response: Specify a nonzero line address.

FSUM7960  Internal error: Isave()
Explanation: vi's internal tables, which store line table information, have been corrupted.
System action: The program continues.
User response: If you want to try to save the latest changes, use ":w newfilename" (where newfilename doesn't already exist) to avoid overwriting the current $ file. Check the original file and the new file (newfilename) for corruption, and contact your system programmer.
System programmer response: Follow local procedures for reporting a problem to IBM.

FSUM7969  File is read only
Explanation: You attempted to write to a file that is considered to be read-only by the file system, or you had enabled the set variable readonly.
User response: Save the changes you have made to a different file name. Use chmod to change the file access permissions, and reread the file. If you set the readonly variable to on, you can set it to off before writing the file with set noreadonly or you can use the w! command to force the write.

FSUM7971  Write error (out of space?)
Explanation: A write error occurred. It is possible that there was no disk space left.
User response: Make room on the current disk, or save to another disk that you know has space available.

FSUM7972  File exists - use "w! filename" to overwrite
Explanation: You attempted to write to a file that already exists.
User response: Specify an unused file name, or use the suggested command to overwrite the existing file.

FSUM7976  No previous command to substitute for !
Explanation: You attempted to repeat a previous shell command when no initial shell command had been made.
User response: Specify the shell command explicitly.

FSUM7988  Buffers are 1-9, a-z
Explanation: You specified an invalid buffer name. Buffers A to Z are valid in both Ex and Vi mode, while buffers 1 to 9 are valid only in Vi mode and are read-only.
User response: Specify a valid buffer name.

FSUM7992  Line overflow! Result line of join would be too long
Explanation: You attempted to use the join command to combine several lines into a single line, the length of which would exceed the maximum line length indicated by the configuration variable LINE_MAX.
User response: Specify fewer lines to be joined.
FSUM7994  Too dangerous to map that.
Explanation: You specified a multikey mapping that did not begin with a nonalphabetic character.
User response: Choose a multikey mapping that begins with a nonalphabetic character.

FSUM7995  No identity mappings allowed.
Explanation: You specified a mapping of the form: `map lhs rhs` where `lhs` and `rhs` were identical strings. `vi` reached its limit on the number of mappings, macros, and abbreviations allowed.
User response: Use the `map` and `abbreviate` commands to view the current list of mappings and abbreviations, the use the `unmap` and `unabbreviate` commands to remove those that are not currently required.

FSUM7998  Mapping "macro" is not defined
Explanation: You attempted to use `macro`, which was not defined with a `map` command.
User response: Use `map` to create `macro`.

FSUM8000  Nothing to repeat
Explanation: You attempted to use the `.` command to repeat the previous command; however, you had not entered a previous command.
User response: Only use the `. `command once you have entered at least one command.

FSUM8001  Last repeatable command overflowed the repeat buffer
Explanation: You attempted to repeat a command that overflowed the fixed size repeat buffer.
User response: Reenter the command in full.

FSUM8002  No previous regular expression
Explanation: You attempted to repeat a regular expression search when no initial search had been made.
User response: Specify a regular expression explicitly in your search command.

FSUM8004  Not enough memory for screens
Explanation: `vi` attempted to set up the necessary structures for full-screen operation and failed. There are not enough free system resources to run `vi`.
User response: Free up more resources.

FSUM8008  Digits required after =
Explanation: You attempted to assign a nonnumeric value to a numeric variable using `set`.
User response: Specify a valid number.

FSUM8009  Bad tag
Explanation: You attempted to reference more than one tag on a line.
User response: Specify only one tag name on a line.

FSUM8010  No tags file
Explanation: You specified a tags file with the `tags` variable that `vi` was unable to find.
User response: Check the `Ex Commands` subsection of the `vi` man page for information on using the `set` command to set the `tags` variable, or the man page for `ctags` for information on generating a tags file.

FSUM8011  string: No such tag@in tags file
Explanation: You attempted to reference a tag that was not present in the tags file.
User response: Either use `ctags` to regenerate the tags file, or add the entry by hand to the tags file.

FSUM8020  write: user logged in more than once ...
Writing to tty
Explanation: You tried to write to user's terminal but user was logged in multiple times. `write` writes to user's session on the terminal `tty`.
User response: If you want to write to a different terminal than the one that `write` chose, specify the terminal argument on the command line.

FSUM8023  write: user not logged in on that tty
Explanation: You tried to write to user at a specific terminal but user was not logged in on that terminal.
User response: Retry your `write` command without specifying `terminal`.

FSUM8024  write: user not logged in
Explanation: You tried to write to user's terminal but user was not logged in.
User response: Send e-mail to user.

FSUM8025  target terminal "tty"
Explanation: A system error indicating the cause is displayed with this message.
FSUM8105  pspace: should be num1 is num2
Explanation: An internal error occurred during yacc processing.
System action: The command ends.
User response: Follow local procedures for reporting problems to IBM.

FSUM8145  Undefined nonterminal 'name'
Explanation: A grammar rule referenced a rule or token which is not defined.
User response: Add the appropriate grammar rule or token.

FSUM8149  write: no permission to write to user on terminal tty
Explanation: You tried to write to a user who had disabled communication with mesg.
User response: Send e-mail to user.

FSUM8155  Missing keydefinition after -k
Explanation: You specified the –k option without providing a key definition as an argument.
User response: Provide the missing key definition.

FSUM8181  String started at line num never ends
Explanation: Your grammar contained a string in a yacc action that was not terminated.
User response: Make sure the string is terminated.

FSUM8183  Code segment started at line num never ends
Explanation: Your grammar contained a code segment that lacked an ending %}.
User response: Provide the missing %}.

FSUM8193  Mark must be a lowercase letter.
Explanation: You used the m command to mark a position in the file; however you attempted to name the mark with a character other than a lowercase letter.
User response: Use lowercase letters for all mark names.

FSUM8194  Cannot edit standard input.
Explanation: You attempted to use the v command to edit text that was coming from the standard input stream.
User response: Store the input text in a temporary file and then use more to view that file. This allows you to edit the text if necessary.

FSUM8196  Syntax error in word expansion.
Explanation: You provided an invalid file name pattern.
User response: Check the pattern and try again.

FSUM8210  file "filename...": Line too long
Explanation: A line in the file containing the list of file names is too long.
User response: Inspect the file containing the list of file names for invalid input.

FSUM8211  Null to Expand
Explanation: The system encountered an internal error while trying to expand a null string.
System action: The program ends.
User response: Contact your system programmer.
System programmer response: Follow local procedures for reporting problems to IBM.

FSUM8213  Invalid hop count: num
Explanation: You specified the –h option, but the argument that you provided with it is not a valid number.
User response: Provide a valid number as the argument to the –h option.

FSUM8214  Badly specified macro
Explanation: The syntax of the macro is incorrect.
User response: Use the correct syntax to specify the macro.

FSUM8219  tsmail: writing mailbox "mailbox"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8223  Expansion too long
Explanation: After expansion, the macro is too long for the supplied buffer.
User response: Modify the macro so that it expands to less than STRING_SIZE (8192) bytes.

FSUM8226  make: Error code retcode
Explanation: Make exited for one of these reasons:
• make itself encountered an error while executing a recipe. See the z/OS UNIX System Services
A recipe command executed by make returned with an error code. In this case the error code is the exit status of the failed command.

User response: Make treats this as an error unless the .IGNORE attribute has been used, or if the recipe line was preceded by a - character. If a nonzero return code is acceptable, modify the recipe line in the makefile so that the return code from this command line is ignored.

FSUM8229 Incomplete rule recipe group detected
Explanation: You specified a group recipe but omitted the closing ].
User response: Add the closing square bracket.

FSUM8230 Cannot mix single and group recipe lines
Explanation: You attempted to mix recipe lines with group recipes for the same rule.
User response: Either make the entire recipe a group, or remove the group.

FSUM8231 Found unmatched ‘]’
Explanation: You specified a ] in your makefile for a group recipe without providing the matching [.
User response: Provide the missing [.

FSUM8232 Expecting macro or rule defn, found neither
Explanation: Make expected this line in the makefile to contain a macro or rule definition, but it didn’t. This probably indicates a syntax error in the makefile, or a comment which is missing the # symbol.
User response: Correct this line in the makefile so it follows Make syntax rules. If the line is a comment, ensure that it starts with the # symbol.

FSUM8233 Illegal parser state state
Explanation: Internal error.
System action: The program ends.
User response: Contact your system programmer.
System programmer response: Follow local procedures for reporting problems to IBM.

FSUM8236 Only a single % allowed in a target pattern
Explanation: A metarule target contained more than one ‘%’. It may only contain one.

User response: Remove the additional percent signs.

FSUM8241 Unable to determine current directory
Explanation: make was unable to find out what its current directory was.
User response: Verify that you have all necessary permissions to determine your current directory.

FSUM8242 Operator after special target treated as ‘:’
Explanation: You specified a modifier, such as !, with a rule defining a special target. make ignores any such modifiers.
User response: Remove the extraneous modifier.

FSUM8244 Multiple targets are not allowed in % rules
Explanation: You specified a metarule with more than one target. A metarule can have only one target specified.
User response: Refer to the section in z/OS UNIX System Services Programming Tools on inference rules and correct the makefile.

FSUM8245 Special target must appear alone
Explanation: You specified a special target which cannot appear with any other target in a rule. For example, a rule with .ERROR as a special target cannot mention any other target.
User response: Correct the line.

FSUM8247 Syntax error in % rule, missing % target
Explanation: You specified your meta-rule incorrectly. The target must contain a %.
User response: Correct the syntax of the rule.

FSUM8249 Missing targets or attributes in rule
Explanation: When reading input, make encountered a rule that had no targets or attributes specified.
User response: Correct the syntax of your makefile.

FSUM8253 No .INCLUDE file(s) specified
Explanation: You specified a .INCLUDE special target without providing the names of the files to be included.
User response: Refer to the description of the .INCLUDE target in z/OS UNIX System Services Programming Tools and add the missing file names.
FSUM8257  Attributes possibly ignored
Explanation: A special target may inherit attributes, but only certain attributes take effect on specific special targets.
User response: Refer to the description of make in z/OS UNIX System Services Command Reference for more information about which attributes may be applied to which special targets.

FSUM8260  Nonglobal attributes ignored
Explanation: You specified attributes that are nonglobal. make will ignore them.
User response: Remove the attributes.

FSUM8263  Invalid library format
Explanation: make attempted to access a library that was not in the correct format.
User response: Verify that your library is correct and rebuild it if necessary.

FSUM8267  Too many arguments -- limit num
Explanation: Too many arguments were produced when make tried to execute a line in a recipe.
User response: Simplify the recipe line.

FSUM8565  tsmail: temporary file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8566  tsmail: writing temporary file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8703  No 'makefile' present
Explanation: make was unable to find Makefile or makefile, and did not have any default rules.
User response: Create the missing makefile, or add default rules to startup.mk.

FSUM8704  Missing .END for .IF
Explanation: You specified a .IF statement without the corresponding .END statement.
User response: Provide the missing .END statement, or remove the extra .IF statement.

FSUM8705  No target
Explanation: make had a makefile to process, but did not find a rule defining a target to be made.
User response: Add a target rule to your makefile, or specify a target on the command line.

FSUM8707  Openfile: bad name
Explanation: make attempted to open a file with an invalid or NULL name.
User response: Edit the makefile and correct the file name.

FSUM8708  file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8710  command: file "string": Incorrect format for -D option
Explanation: You attempted to use the -D option to decompress a file that was not compressed with the -D option of compress.
User response: Only use the -D option of uncompress to decompress files compressed with the -D option of compress.

FSUM8714  No more memory
Explanation: make was unable to allocate storage space.
User response: Free up some resources and try again.

FSUM8716  pipe to command "cmd"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8717  tmp file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8718  name: cannot open: string
Explanation: Could not open the file. This message is followed by a system error describing the specific reason for the error.
System action: The program ends.
User response: Refer to the system error message and take appropriate action.
FSUM8721  list file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8723  Unmatched "quote
Explanation: You specified an opening " on a line that did not contain a closing ".
User response: Correct the line.

FSUM8724  .ELSE without .IF
Explanation: You specified a .ELSE statement without a corresponding .IF statement.
User response: Provide the corresponding .IF and .END statements (if necessary), or remove the .ELSE statement.

FSUM8725  Unmatched .END
Explanation: You specified a .END statement without the corresponding .IF statement.
User response: Provide the missing .IF statement, or remove the extra .ELSE statement.

FSUM8726  No macro name
Explanation: A macro assignment = appears without a macro name.
User response: Correct the line.

FSUM8728  Write error on temp file
Explanation: An error occurred while trying to write on a diversion or group recipe temporary file.
User response: Ensure that there is space on the file system containing the temporary file.

FSUM8730  <+ diversion unterminated
Explanation: You specified a <+ to begin a diversion, but did not specify the corresponding +> to end it.
User response: Provide the closing +>.

FSUM8731  Directory stack empty in pop.
Explanation: Internal error.
System action: The program ends.
User response: Contact your system programmer.
System programmer response: Follow local procedures for reporting problems to IBM.

FSUM8732  <+ missing before +>
Explanation: You specified a +> to end a diversion before specifying the corresponding <+ to begin it.
User response: Ensure that corresponding <+ and +> symbols appear in the correct order.

FSUM8733  file: misplaced & in magic file
Explanation: You specified a magic file containing a line beginning with a & that did not follow a regular template line.
User response: Either create a template line before the line, or remove the line.

FSUM8734  cannot access file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8735  Too many mail folders specified on command line.
Explanation: The –f flag was specified, and more than one mail folder was named on the command line.
User response: List only one file name on the command line.

FSUM8736  tsmail: invalid user "user"
Explanation: The name user, which was specified as a recipient of the message, is not a valid user on the system.
User response: Check the spelling of the recipient's name, and try to send your message again.

FSUM8737  tsmail: cannot lock file "filename"
Explanation: The mailbox filename could not be locked, so the message could not be delivered.
User response: Wait a little while and try to send the message again.

FSUM8738  tsmail: re-opening temporary file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8739  tsmail: chowning mailbox "mailbox"
Explanation: A system error indicating the cause is displayed with this message.
FSUM8740 command: input file "filename": error
Explanation: A system error indicating the cause is displayed with this message.

FSUM8741 Number "string"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8742 window size too large
Explanation: You specified a window size (lines per page) with the – or –n option that was greater than the number of lines on the screen (as given by the environment variable LINE).
User response: Specify a smaller window size.

FSUM8743 window size too small
Explanation: You specified a window size (lines per page) with the – or –n option that was less than three.
User response: Specify a window size of at least three lines.

FSUM8745 line line_num: Bad length
Explanation: The length of a line did not match the length indicated by the first character in the line; perhaps the input file was corrupted.
User response: Check that the input is valid uuencoded data.

FSUM8746 line line_num: Line too short (num1 bytes, expecting num2)
Explanation: The length of a line did not match the length indicated by the first character in the line; perhaps the input file was corrupted.
User response: Check that the input is valid uuencoded data.

FSUM8747 No last buffer executed
Explanation: You attempted to repeat a macro when no macros had been previously executed.
User response: Execute a specific macro before attempting to repeat it.

FSUM8749 What?command: Not an editor command
Explanation: You specified command in Ex mode; however, command is not a valid editor command.
User response: Check the Ex Commands section of the vi man page for a list of valid editor commands.

FSUM8750 Badly formed re|Regular expression \ must be followed by / or ?
Explanation: When using a regular expression in an address, you followed a backslash (\) with a character other than / or ?.
User response: Delimit the regular expression with \/ or \?.

FSUM8754 Too long|Result of substitute would produce a line too long
Explanation: You specified a replacement string in a substitute (or s) command that would result in a line that is too long for vi to handle.
User response: Specify a shorter replacement string, or break the original line into two or more shorter lines before performing the substitution.

FSUM8755 Bad RE delimi|Regular expressions cannot be delimited by letters or digits
Explanation: You attempted to use an alphanumeric character to delimit a regular expression.
User response: Use a nonalphanumeric character as the delimiter.

FSUM8756 Environment variable HOME not defined.
Explanation: You attempted to change the current working directory to your home directory by using the cd or chdir command without specifying a path name; however, the environment variable HOME was not defined.
User response: Set HOME to your home directory, or specify the complete path name of your home directory when using cd or chdir.

FSUM8764 Unknown uid num Unable to recover
Explanation: Your user ID could not be found. This ID (typically your login name) is used to locate files that were lost or preserved by the use for subsequent recovery at a later time.
User response: Contact your system programmer.

FSUM8765 Internal error: glob routine: Code code
Explanation: While attempting to get a list of all recovered files, the C/C++ Run-Time Library function glob() failed, for the reason specified by Code. It is possible that an attempt to allocate memory failed.
System action: The program continues.
User response: The return codes of glob are specified in glob.h. Look in glob.h to find the exact reason for the failure, and attempt the command again.
Chapter 1. Messages

FSUM8766  "string": File not found
Explanation: You specified the name of a file that does not exist.
User response: Ensure that you spelled the file name correctly, and that you have appropriate permissions to access the file.

FSUM8770  \<digit> value too large
Explanation: When using a numerical reference to a subexpression within the regular expression, the number used exceeded the number of subexpressions present.
User response: Ensure that numerical references to subexpressions are valid.

FSUM8772  Internal Error:
Explanation: An internal error occurred.
User response: Contact your system programmer. Follow local procedures for reporting a problem to IBM.

FSUM8774  %prec needs a token; string isn't

FSUM8785  grammar file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8786  header file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8787  listing file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8788  parser file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8789  file I/O error
Explanation: A system error indicating the cause is displayed with this message.

FSUM8810  Use yaccp to generate Turbo Pascal code on DOS.

FSUM8811  The prototype for Pascal code is /etc/yyparse.pas.

FSUM8813  Warning: newline in character constant
Explanation: The lexical analyzer encountered a character constant that begins on one line and ends on another. This often indicates a missing quote.
System action: The command continues.
User response: Add the missing quote.

FSUM8819  unlink temp file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8820  write error on temporary file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8821  file "filename" is binary
Explanation: You specified the binary file filename as a diff input file. diff only works on text files.
User response: Only specify text files as diff input files.

FSUM8822  file "filename": line too long: limit LINE_MAX
Explanation: The input line is too long.
User response: Try again with a shorter input line.

FSUM8824  yacc bug:
Explanation: An internal error occurred.
User response: Contact your system programmer. Follow local procedures for reporting a problem to IBM.

FSUM8842  codeset translation initialization
Explanation: The iconv_open() function failed. A system error indicating the cause is displayed with this message.
User response: Contact the system programmer.
System programmer response: Determine why the iconv_open() function failed.

FSUM8843  codeset translation
Explanation: A system error indicating the cause is displayed with this message.

Chapter 1. Messages  251
FSUM8913 unexpected end of file.
Explanation: The end of the file was encountered prematurely.
System action: The program ends.
User response: Check the input file for truncation.

FSUM8955 couldn’t allocate memory (num bytes requested)
Explanation: The system did not have enough free resources to allocate num bytes.
User response: Free up more resources.

FSUM8957 Unexpected EOF in escape sequence
Explanation: While reading the input data, col discovered an escape sequence which was terminated by an unexpected EOF.
User response: Check the input data for unexpected truncation.

FSUM8958 read error on "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8960 can’t stat file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8961 output file "(standard output)"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8962 Error writing "sourcename" to PDSE member "targetname".
Explanation: An error occurred while attempting to write a data member to a PDSE containing program object members. A PDSE cannot contain both program object members and data members.
System action: The command ends.
User response: Use the -X option on the cp or mv command to specify that the member to be copied or moved is a program object member, and try the request again.

FSUM8977 command: source "name1" and target "name2" are identical
Explanation: You specified source and target files that are actually the same file (for example, because of links).
User response: No further action is required.

FSUM8979 target "filename" must exist
Explanation: The destination directory must exist for this utility to work.
User response: Check the command line arguments. You may need to create the target directory.

FSUM8980 can’t create parent directory for target "filename"
Explanation: An error occurred while trying to create the parent directory of the specified target file.
User response: Make sure you have permissions to create the directory.

FSUM8981 Error copying file file1 to file2
Explanation: A system error indicating the cause is displayed with this message.

FSUM8982 command : internal error: unknown return code from m_cp: string
Explanation: An internal error occurred.
User response: Contact your system manager.

FSUM8983 Cannot reset times on file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8984 Cannot reset permissions on file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8985 Cannot reset uid or gid on file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM8986 must run as setuid root
Explanation: The program issuing this message must run with effective user ID of root-- the setuid bit should be set on and the program should also have root ownership.
User response: Contact system administrator. For security reasons, verify that the program issuing this message should run setuid root. If so, turn on setuid bit for the program ("chmod u+s program") and ensure root ownership ("chown root program").
FSUM8987 you are not authorized to use at. Sorry.
Explanation: The system programmer had not configured at to allow you to use it.
User response: Contact your system programmer about gaining access to at.

FSUM8988 bad time format
Explanation: You specified a time format that at does not recognize.
User response: Check the Time Specification subsection of the at man page for a list of valid time formats.

FSUM8989 unable to spool at job.
Explanation: at was unable to create a spool file, in which to store the job.
User response: Contact your system programmer.

FSUM8990 at job "at_job": insufficient permission.
Explanation: You attempted to remove an at_job which but you did not submit.
User response: Only the user root can remove arbitrary at-jobs.

FSUM8991 No time specified
Explanation: You did not specify a time specification on the command line.
User response: Specify a time specification.

FSUM8992 Invalid time keyword
Explanation: You specified what appeared to be a time keyword, but at does not recognize it as a valid time keyword.
User response: Use only noon, midnight, next, and now as time keywords.

FSUM8993 Two digits must follow ".:"
Explanation: You specified a colon (:) to separate hours from minutes, but you did not follow it with two digits.
User response: When specifying minutes after a colon (:) you must use a two digit number.

FSUM8994 hour must be 1-12 for 12 hour clock
Explanation: You provided an a.m./p.m. designation, but you specified an hour that was not in the range 1 to 12.
User response: When using the 12 hour clock,
specify an hour in the range 1 to 12.

FSUM8995 hour or minute out of range
Explanation: When specifying a time in the format hh : mm, the hour value (hh) was not in the range 0 to 23 or the minute value (mm) was not in the range 0 to 59.
User response: Specify a time where the hour and minute values fall within the ranges 0 to 23 and 0 to 59 respectively.

FSUM8996 TZ environment variable must be set
Explanation: The environment variable TZ was not set.
User response: Assign a value to the variable TZ (see the timezone man page for more details), or specify a time zone in the time specification.

FSUM8997 date must follow month
Explanation: You specified the day of the month before the month name in your time specification.
User response: Always specify the month name before the day of the month.

FSUM8998 year must follow ","
Explanation: You specified a comma (,) in your time specification, but you did not provide a year following it.
User response: Provide the missing year.

FSUM8999 invalid year
Explanation: You specified a year that was not in the range 1970 to 2036.
User response: Specify a year in the range 1970 to 2036.

FSUM9000 increment requires number
Explanation: You specified a + to indicate an increment, but you did not provide a number following it.
User response: Provide the missing number following the +.

FSUM9001 invalid increment unit
Explanation: You specified an invalid unit for the increment in the time specification.
User response: Check the Time Specifications subsection of the at man page for a list of valid units.
FSUM9002  garbage after time specification
Explanation:  You specified extra characters after the end of the time specification on the command line.
User response:  Check the Time Specifications subsection of the at man page for the proper syntax of time specifications and remove the extra characters.

FSUM9003  "next" must not specify year
Explanation:  You specified the next time format with a year. at does not support this form of time specification.
User response:  Do not specify a year with next.

FSUM9004  "next" requires either date or weekday
Explanation:  You attempted to use the next time format without specifying a date or weekday.
User response:  Specify a date or weekday when using the next time format.

FSUM9005  string: invalid year
Explanation:  You specified a year that was not in the range 1970 to 2000.

FSUM9007  Field delimiter specified by -d must be one character
Explanation:  You specified a field delimiter (as an argument to the -d option) that was more than one character long.
User response:  Specify a single character field delimiter.

FSUM9008  file "[standard input]"
Explanation:  A system error indicating the cause is displayed with this message.

FSUM9010  date: bad format or date output longer than number bytes
Explanation:  The format string supplied to date is invalid, or the output is longer than the size of the date buffer.
User response:  Confirm that the date format string on the command line is valid.

FSUM9086  no space for line table
Explanation:  There were not enough free system resources to allocate initial resources for ed.
User response:  Free up more system resources and restart program.

FSUM9087  Input line too long
Explanation:  You entered an ed command which was too long.
User response:  Simplify the command and try again.

FSUM9088  no memory for pages
Explanation:  There were not enough free system resources to allocate initial resources for ed.
User response:  Free up more system resources and restart program.

FSUM9090  no memory for line number tables
Explanation:  There were not enough free system resources to allocate initial resources for ed.
User response:  Free up more system resources and restart program.

FSUM9091  Result of substitution would produce a line too long
Explanation:  You specified a replacement string in a substitution command that would produce a line that is too long for ed to handle.
User response:  Specify a shorter replacement string or split the original line into shorter lines before performing the substitution.

FSUM9092  Result line of join too long
Explanation:  You attempt to use the j command to join a range of lines into one line; however, the resulting line would be too long for ed to handle.
User response:  Specify a smaller range of lines to be joined.

FSUM9094  find: must specify a command after -exec/-ok
Explanation:  You specified either the -exec or the -ok primary without specifying a command to be performed.
User response:  Provide the missing command.

FSUM9104  terminfo definition file "filename"
Explanation:  A system error indicating the cause is displayed with this message.

FSUM9105  terminfo database "filename"
Explanation:  A system error indicating the cause is displayed with this message.
FSUM9106  terminfo database directory
"pathname"

Explanation: A system error indicating the cause is displayed with this message.

FSUM9110  Not enough memory for use_list element

Explanation: There were not enough free system resources to allocate for the use_list element.
User response: Free up more resources.

FSUM9118  Failed to allocated memory.

Explanation: There were not enough free system resources to perform the desired operation.
User response: Free up more resources.

FSUM9139  Failed to allocate required memory.

Explanation: There were not enough free system resources to perform the desired operation.
User response: Free up more resources.

FSUM9140  Terminal "term" has insufficient capabilities for Curses.

Explanation: Your TERM environment variable setting provides insufficient functions from the curses library to support this program. This most likely occurs when running vi from the OMVS shell, which sets TERM=dumb.
User response: vi cannot be run from the OMVS shell. vi can only be run via a "raw-mode" session, such as telnet or rlogin. The value of TERM should not be changed from the setting assigned by your terminal.

FSUM9153  Cannot chdir to directory-name

Explanation: Could not change directory to directory-name.
System action: The program ends.
User response: The system error displayed with this message indicates the cause.

FSUM9154  Shell ( filename ) not executable.

Explanation: The newgrp utility attempted to invoke a new shell named filename, but it could not be run.
System action: The newgrp command ends, and the shell from which newgrp was issued is terminated (because newgrp has already replaced the shell's process image).
User response: Check that the filename is a valid shell (command interpreter) and that it has the correct permissions.

FSUM9156  login: cannot fork passwd command

Explanation: A system error indicating the cause is displayed with this message.

FSUM9164  Internal error: 10 too small in Get_token()

Explanation: An internal error occurred.
User response: Contact your system programmer. Follow local procedures for reporting a problem to IBM.

FSUM9165  .IF .ELSE ... .END nesting too deep

Explanation: The nesting of .IF .ELSE ... .END structures is too deep.
User response: Modify your makefile so that these structures are not nested as deep.

FSUM9169  Internal, buildList buffer too small

Explanation: Internal error.
System action: The program ends.
User response: Contact your system programmer.
System programmer response: Follow local procedures for reporting problems to IBM.

FSUM9170  <> diversion cannot be nested

Explanation: You attempted to put one <> diversion inside another <> diversion. make does not permit this.
User response: Remove the nested <> diversion.

FSUM9174  reading file

Explanation: A system error indicating the cause is displayed with this message.

FSUM9179  seek past EOF on input

Explanation: The seek offset specified on the command line was greater than the size of the input file.
User response: Check the offset and try again.

FSUM9181  string: component too long.

Explanation: One of the components of the path name provided is longer than is allowed by the filesystem (or by POSIX, if -p was specified).
User response: Try to shorten the component or components of the path name.
| FSUM9182 | string: pathname too long. |
| Explanation: | The length of the path name provided is longer than that allowed by the filesystem (or by POSIX, if –p was specified). |
| User response: | Try to shorten some of the components of the path name, in order to reduce the overall length of the path name. |

| FSUM9183 | string: Not searchable. |
| Explanation: | You specified a path name pathname that was not searchable. |
| User response: | Specify a different path name. |

| FSUM9184 | string: requested format differs from the existing archive format |
| Explanation: | You used the –a option with –xformat, where the archive already existed with a different format. |
| User response: | Do not specify the format when appending to an existing archive, or specify the correct format. |

| FSUM9185 | Symbolic link name too long: Not extracted |
| Explanation: | Couldn't allocate enough memory to hold the symbolic link's name. |
| User response: | Archive contains symbolic name which is too large; no action possible. |

| FSUM9186 | Missing format specification |
| Explanation: | You did not specify a format specification on the command line. |
| User response: | Provide the missing format specification. |

| FSUM9188 | unused argument at "arg" |
| Explanation: | You specified a format string without any conversion specifications. |
| User response: | Add at least one conversion specification to your format string. |

| FSUM9190 | not a valid real argument "string" |
| Explanation: | You specified a format specification that was expecting a real (that is, floating-point) number, but you provided the argument string which was not a valid real number. |
| User response: | Provide a valid real number in place of string. |
FSUM9205 hold space overflow during H command
Explanation: You attempted to "hold" more data than would fit in the sed hold buffer.
User response: Reorganize your script to require less data in the hold buffer.

FSUM9206 Can't chain "cmd" command
Explanation: A system error indicating the cause is displayed with this message.

FSUM9208 cannot redirect (dup2)
Explanation: A system error indicating the cause is displayed with this message.

FSUM9209 cannot execute: reason code = reasoncode
Explanation: A system error indicating the cause is displayed with this message.
System programmer response: Take appropriate action based on reason code.

FSUM9210 Traced functions not effective unless -o korn is set
Explanation: "typeset -f function" (turn on tracing for the named function) was specified, but KornShell mode wasn't enabled.
User response: Don't specify "typeset -f", or enable KornShell mode with "set -o korn".

FSUM9221 get limit failed
Explanation: A system error indicating the cause is displayed with this message.

FSUM9222 set limit failed
Explanation: A system error indicating the cause is displayed with this message.

FSUM9224 bad number "num"
Explanation: Invalid string given where a number was expected. (MAILCHECK, TMOUT, OPTIND, HISTSIZE, and COLUMNS environment variables, or array subscript.)
User response: Specify a decimal number (containing only the digits 0 through 9) to the appropriate environment variables or subscripts.

FSUM9225 no memory: system_error
Explanation: A memory allocation failed with the error indicated.
User response: Take appropriate action to make virtual memory available based on the error indicated as part of this message.

FSUM9230 Internal error: j_close: no processes
Explanation: An internal error occurred.
User response: Contact your system programmer. Follow local procedures for reporting a problem to IBM.

FSUM9247 "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUM9249 Failed to allocate required memory.
Explanation: A system error indicating the cause is displayed with this message.

FSUM9259 Need an explicit type for $n when n <= 0
Explanation: In a grammar with a union declaration, an action references a Yacc symbol value $n, where n <= 0, but no type is specified for $n.
User response: Add an explicit type, of the form $type

FSUM9261 Need a type for name
Explanation: In a grammar with a union declaration, an action is referencing a Yacc symbol value that does not have a type associated with it.
User response: Use %type rule to assign a type to a rule, or %token rule to assign a token. Alternatively, you can use explicit types within the action, in the form $f$token.

FSUM9268 Too many makefiles specified.
Explanation: You specified too many files using the -f option.
User response: Combine one or more files into a single file.

FSUM9270 Too many open files. Max nesting level is num
Explanation: You have exceeded the maximum limit of .INCLUDES.
User response: Check to see if you have recursively included a make file, or simplify your makefile.
FSUM9271 Could not create string "string1/string2"
Explanation: A system error indicating the cause is displayed with this message.
User response: Contact your system administrator.

FSUM9272 "TTY" group not found -- contact your system administrator
Explanation: Unable to find the group that owns all the terminals. The name of this group is an installation option. The getgrgid() function reported the failure.
User response: Contact your system administrator.

FSUM9273 Not setgid to group 'term_group' -- contact your system administrator
Explanation: The process does not belong to the term_group group. It must belong to this group in order to run successfully.
User response: Contact your system administrator.

FSUM9276 can't pass scalar to 'var[]'
Explanation: You tried to pass a scalar value to a function expecting an array parameter.
User response: Correct your program.

FSUM9277 can't pass array to 'var'
Explanation: You tried to pass an array into a function expecting a scalar parameter.
User response: Correct your program.

FSUM9278 built-in 'var' can't be used as a parameter or auto variable
Explanation: You tried to use the name of a built-in function or variable as a parameter or local variable in a function.
User response: Correct your program.

FSUM9279 string() is not a function
Explanation: You tried to use name as a function when it was not defined as such.
User response: Correct your program, or make sure that the spelling of name is the same as was used when defining the function.

FSUM9280 'string' can only have values from num1 through num2
Explanation: You tried to assign a value to a built-in variable that is outside the permitted range.
User response: Check z/OS UNIX System Services Command Reference and correct your program to use a value that is within the acceptable range for that variable.

FSUM9281 while executing function funcname()
Explanation: An error occurred while executing the named function.
User response: Determined by remainder of message.

FSUM9283 internal error: Converting wide character back to MB
Explanation: An internal error occurred.
User response: Contact your system manager.

FSUM9285 Number "string" not in range num1..num2
Explanation: An invalid user ID was specified.
User response: Ensure that the command line arguments are correct.
Chapter 1. Messages

FSUM9356  string: Internal error: nextrecord: Unexpected status return from m_fgetws: status
Explanation: An internal error occurred.
User response: Contact your system manager.

FSUM9357  Writing to standard output
Explanation: A system error indicating the cause is displayed with this message.

FSUM9358  Writing unpaired records
Explanation: A system error indicating the cause is displayed with this message.

FSUM9364  Bad date conversion: string
Explanation: The string passed to m_readdate was not in a format that the function recognized.
User response: Check the format of the date and try again.

FSUM9366  invalid multibyte character
Explanation: An invalid multibyte character was encountered during the processing of a regular expression.
System action: The command ends.
User response: Check the regular expression for invalid multibyte characters and reissue the command.

FSUM9368  command: Only printable characters are permitted in log messages.
Explanation: You specified a nonprintable character in a log message.
User response: Replace the nonprintable character with one or more printable characters.

FSUM9369  cannot allocate storage for environment
Explanation: There is not enough free memory to build the new shell environment.
System action: The command ends.
User response: Free up more resources and issue the command again.

FSUM9370  cannot set supplementary groups

FSUM9374  command: Failed to strip file "string".
Explanation: An error occurred while trying to strip an executable file.
User response: No action possible.

FSUM9378  Special target [target] cannot be a prerequisite
Explanation: You tried to use a special target as a prerequisite.
User response: Edit the makefile, and remove the special target from the prerequisite list.

FSUM9379  Option -c failed to change directory to "pathname": system_error
Explanation: A system error indicating the cause is displayed with this message.

FSUM9380  command: Unknown option --option
Explanation: You specified an option that is not valid for this command.
User response: Check z/OS UNIX System Services Command Reference or a list of options.

FSUM9381  command: Option --string argument missing
Explanation: You specified the --option option without providing its required argument.
User response: Provide the missing argument.

FSUM9383  Configuration file `filename' not found
Explanation: Could not open the MAKESTARTUP configuration file.
User response: The MAKESTARTUP file may be either misnamed or missing. Ensure that the MAKESTARTUP file exists, and that it is accessible. This may require setting the \MACRO MAKESTARTUP macro or MAKESTARTUP environment variable.

FSUM9384  Unable to return to directory `pathname'
Explanation: Make could not set the directory back to the original directory. The original directory may have been deleted, renamed, or had its permissions changed since Make was started.
User response: Ensure that the directory exists and has the correct permissions. Attempt the make operation again.
FSUM9385  file "filename"
Explanation: A system error indicating the cause is
displayed with this message.

FSUM9387  Unable to change directory to 
'pathname'
Explanation: Make could not set the directory back to
the specified directory. The specified directory may have
been deleted, renamed, or had its permissions changed
since Make was started.
User response: Ensure that the directory exists and
has the correct permissions. Attempt the make
operation again.

FSUM9392  file is binary
Explanation: A file that was supposed to contain rules
contained binary data.
User response: Ensure that the correct file name is
specified and that the contents of the specified file are
correct.

FSUM9393  line too long: limit num
Explanation: The makefile contains a line that
exceeds the LINE_MAX limit.
User response: Shorten the line. You can use the
continuation character (backslash) to spread long rules
over several lines in the makefile.

FSUM9394  error reading file
Explanation: A system error indicating the cause is
displayed with this message.

FSUM9419  Mismatched braces in token 'token'
Explanation: The number of open braces (\{) does not
match the number of close braces (\}) in this token.
User response: Edit the token so that each open
brace has a matching close brace.

FSUM9424  Argument string to (modifier) must be
quoted with "
Explanation: The argument to this macro expansion
must be quoted using double quotes.
User response: Modify the macro expansion so that
the argument is quoted using double quotes.

FSUM9428  Ambiguity in target_list targets [target],
chose string
Explanation: The target list supplied to make is
ambiguous and make chose string as the target from
this list.
System action: The command continues.
User response: If the target chosen by make is not
the intended target for the current rule, then reformat
the target list to be unambiguous and reissue the make
command.

FSUM9429  meta-rule too long: "rule"
Explanation: The meta-rule contained its maximum
number of characters before Make reached the end of
the meta-rule.
User response: Shorten the meta-rule so it fits in
DONE_STATE characters.

FSUM9430  Internal, bad current dfa state num in
[node_name]
Explanation: An internal error occurred.
User response: Contact your system administrator.

FSUM9431  Only one .SETDIR attribute allowed in
rule line
Explanation: You have a rule with more than one
.SETDIR attribute.
User response: If you want Make to search for a file
in a number of different directories, use the .SOURCE
special target.

FSUM9432  Duplicate entry [target] in target list
Explanation: The makefile has duplicate entry target
in target list.
System action: The command continues.
User response: Edit the makefile to remove the
Duplicate entry from target list.

**FSUM9433**  Duplicate entry `[prereq]` in prerequisite list

**Explanation:** The makefile has duplicate entry `prereq` in the prerequisite list.

**User response:** Edit the makefile to remove the duplicate entry from the prerequisite list.

**FSUM9434**  Multiply defined recipe for target `target`

**Explanation:** You specified more than one recipe for `target` in different rules, and the rules use the `:` operator.

**User response:** Either use the `:` operator to handle independent recipes, or correct your makefile.

**FSUM9435**  Empty recipe for special target `target`

**Explanation:** The special target specified requires that a recipe also be specified for it.

**User response:** Refer to the documentation for the target and add an appropriate recipe.

**FSUM9436**  `string` ignored on suffix rule `[.SETDIR]`

**Explanation:** The attribute is ignored, so it cannot be applied to this suffix rule.

**User response:** Remove the attribute from the suffix rule.

**FSUM9437**  Imported macro `"macroname"` not found in environment

**Explanation:** `make` attempted to import a macro that was not present in the program environment.

**User response:** Define the appropriate environment variable, remove the import rule, or add the `.IGNORE` attribute to the import rule.

**FSUM9439**  Include file `filename` not found

**Explanation:** `make` couldn’t find the file `filename`.

**User response:** Check that the file exists, was named properly and that you have the appropriate permissions. Also check the prerequisites of the `.INCLUDIRS` target to make sure that it specifies the correct path.

**FSUM9441**  Target `"target"` cannot mix `"::"` and `"::"` rules

**Explanation:** You defined a rule for `target` using the `::` operator, and then followed this with another rule for `target` using the `:` operator.

**User response:** Either modify the second rule to use `::` or remove it.

**FSUM9453**  Library(member) : Can’t touch library member

**Explanation:** Warning: The command failed when trying to touch the library member to force the modify time to the present.

**System action:** The program continues.

**User response:** Check the library and try again.

**FSUM9454**  `string` macro not defined

**Explanation:** You tried to execute a recipe that required the shell and either the `"[MACRO GROUPSHELL]` macro or the `SHELL` macro was not defined.

**User response:** Make sure that the macro is defined properly in your makefile or `startup.mk` file.

**FSUM9456**  Cannot open `"pathname"`

**Explanation:** `make` was unable to open a temporary file for a diversion or group recipe. You may not be able to write to your `TMPDIR` directory.

**User response:** Make sure that the `TMPDIR` environment variable is set up properly, that you have the appropriate permissions in that directory and that there is space on the file system.

**FSUM9464**  Allocating buffer for backslash interpretation

**Explanation:** A system error indicating the cause is displayed with this message.

**FSUM9465**  Internal error: Converting `"number"` format argument from wide to MB

**Explanation:** A system error indicating the cause is displayed with this message.

**FSUM9466**  Internal error: unexpected return value from `bs()`

**Explanation:** A system error indicating the cause is displayed with this message.

**FSUM9467**  Argument `"arg"`

**Explanation:** A system error indicating the cause is displayed with this message.

**FSUM9503**  Cannot open file `"filename"` in `"cmd"` command

**Explanation:** The file named in the `cmd` command could not be opened, either because the maximum number of files was already open, or because you were not permitted to write to `file`.
**User response:** Either simplify your script, so that it requires fewer open files, or check to ensure that you do have permission to write to the file.

**FSUM9505 Warning: unknown process process_id terminated**

**Explanation:** This process has either ended normally or was terminated by a signal. The shell issued this message because even though this process is a child of the shell, its process id is unknown to the shell.

**System programmer response:** The receipt of this message generally indicates an error in fork() processing.

**FSUM9514 Input read error.**

**Explanation:** While in Vi mode, the editor received an EOF as command input- which terminated the editing session. This occurs when the standard input is a file rather than a terminal and the file ends without an exit command.

**User response:** Add a proper exit command to the command file.

**FSUM9526 Could not change name of utmpx database to "filename"**

**Explanation:** An error occurred while attempting to change the utmpx database name to filename. It is possible there were not enough free system resources to allocate an internal buffer.

**System action:** Program ends.

**User response:** Double-check the name of the file or free up some system resources and reissue the command.

**FSUM9527 filename is not a valid utmpx file**

**Explanation:** While reading entries from the utmpx database, specified by filename, a value for the ut_type field of the utmpx structure was out of range. See z/OS UNIX System Services Command Reference for more information.

**System action:** Program ends.

**User response:** If the file used by the who utility is the default /etc/utmpx file, then contact system programmer. If a different file was specified, then verify this file is not corrupted and in the proper format.

**System programmer response:** Verify /etc/utmpx is not corrupted.

**FSUM9528 file "filename" is binary**

**Explanation:** A system error indicating the cause is displayed with this message.

**FSUM9529 file "filename": line too long: limit LINE_MAX**

**Explanation:** A system error indicating the cause is displayed with this message.

**FSUM9532 can't open parser resource file "filename"**

**FSUM9533 disk error: cannot write temp file**

**Explanation:** A system error indicating the cause is displayed with this message.

**FSUM9564 Insufficient disk space on device or Bad temporary file (read)**

**Explanation:** Yacc encountered a problem while reading a temporary file.

**User response:** Ensure that the disk is not full or defective.

**FSUM9566 expanded length of string too long; limit char_set_size**

**Explanation:** You specified a string that expanded to a length greater than the number of characters in the character set. Since a given character may appear only once in the first string, you specified a character more than once in that string.

**User response:** Remove any repeated characters in the first string.

**FSUM9567 Starting endpoint hexnum1 does not precede the second endpoint hexnum2**

**Explanation:** The starting point of a range of characters is after the end point you have indicated.

**User response:** Reverse the start and end points of the range.

**FSUM9569 Invalid character class class**

**Explanation:** You specified a character class class that is not defined in the locale indicated by LC_CTYPE.

**User response:** Specify a character class that is defined in the locale indicated by LC_CTYPE.
FSUM9570  Collation string is not supported in [=equiv=]
Explanation:  You specified a string for equiv in a [=equiv=] expression that contained more than one character. tr accepts only a single character for the equivalence class.
User response:  Specify a one-character equivalence class.

FSUM9571  syntax error in [x*n] expression expression.
User response:  Provide the missing ].

FSUM9572  [x*0] construct may only occur once
Explanation:  You tried to fill the string using the [x*0] construct more than once.
User response:  Remove the second fill request.

FSUM9573  Multibyte conversion
Explanation:  A system error indicating the cause is displayed with this message.

FSUM9575  Corrupt multibyte character file
"filename"
Explanation:  File filename contains incomplete multibyte characters.
System action:  The command continues.
User response:  Make sure that file filename contains complete multibyte characters.

FSUM9581  memory allocation failure
Explanation:  A system error indicating the cause is displayed with this message.

FSUM9586  input file filename
Explanation:  A system error indicating the cause is displayed with this message.

FSUM9587  command; input line to long in filename
Explanation:  A line in the input file filename was longer than LINE_MAX bytes.
User response:  Use cmp to compare non-text files.

FSUM9588  command; input file filename is a binary file
Explanation:  You specified filename as the input file; however, filename is a binary file. uniq only works with text files.
User response:  Specify a text file as the input file.

FSUM9593  dd: only one of conv=ucase and conv=lcase may be specified
Explanation:  You specified both ucase and lcase. These options are mutually exclusive; you can specify only one.
System action:  The program ends.
User response:  Select ucase or lcase and rerun the command.

FSUM9594  dd: only one of conv=block and conv=unblock may be specified
Explanation:  You specified both block and unblock. These options are mutually exclusive; you can specify only one.
System action:  The program ends.
User response:  Select block or unblock and rerun the command.

FSUM9595  dd: only one character set translation option may be specified
Explanation:  The asci, ebcidic, ibm, and convfile translation options are mutually exclusive. You specified more than one of these options.
System action:  The program ends.
User response:  Select only one translation option and rerun the command.

FSUM9602  unable to create tempfile name
Explanation:  A temporary file could not be created. A system error indicating the cause follows this message. The problem is usually caused by lack of space on the output device, or lack of appropriate permissions to create the file.
System action: The program ends.
User response: Refer to the system error message and take appropriate action.

FSUM9603 output path or file name too long
Explanation: The pathname of the temporary file exceeds system limits.
System action: The program ends.
User response: Because the name of the temporary file is based on the pathname of the input file, shorten the pathname of the input file by renaming it and/or moving it to a directory with a shorter name.

FSUM9604 file "filename" already exists; not overwritten
Explanation: The output file "filename" already exists and will not be overwritten.
System action: The program ends.
User response: Remove or rename "filename".

FSUM9620 File read error
Explanation: ed experienced a problem reading the file. A system error message follows.
System action: The program continues.
User response: Respond to the accompanying system error message.

FSUM9630 Number "num" not in range min.max
Explanation: The number you specified, "num", is not within the allowable range of numbers.
System action: The program ends.
User response: Specify a number in the range min and max.

FSUM9631 Number "num" not in range min.max
Explanation: The number you specified, "num", is not within the allowable range of numbers.
System action: The program ends.
User response: Specify a number in the range min and max.

FSUM9632 Number "num" not in range min.max
Explanation: The number you specified, "num", is not within the allowable range of numbers.
System action: The program ends.
User response: Specify a number in the range min and max.

FSUM9633 Number "number" not in range 0 ... unsigned long max
Explanation: Input data fell outside of the accepted range, because you attempted to enter a negative number.
System action: The program ends.
User response: Enter only non-negative numbers.

FSUM9661 pipe buffer
Explanation: While attempting to pipe a message through a command, mailx was not able to allocate enough memory.
System action: The program continues.
User response: Free up system resources and retry the command.

FSUM9666 No messages satisfy : subcommand line
Explanation: No messages in the mailbox matched the subcommand given.
System action: The program continues.
FSUM9667  No applicable messages about "subcommand line"
Explanation: No messages in the mailbox had a subject line that matched the one given by the user.
System action: The program continues.

FSUM9668  No applicable messages from "subcommand line"
Explanation: The system could not find a mail message from the specified user.
System action: The program continues.

FSUM9669  Unrecognized scrolling command "command"
Explanation: The user gave a scrolling command that was not valid.
System action: The program continues.
User response: To scroll forwards, use '+' or 'z+'. To scroll backwards, use '-' or 'z-'.

FSUM9673  pathname: Nonportable character 'c' (xx) found.
Explanation: pathname contains the character c (represented in hex by xx), which is not in the portable filename character set.
System action: The program ends.
User response: Rename pathname so that it does not include this character.

FSUM9674  pathname: Nonportable byte xx found.
Explanation: pathname contains the non-printable character with hex byte value of xx, which is not in the portable filename character set.
System action: The program ends.
User response: Rename pathname so that it does not include this character.

FSUM9679  Existing file "filename" exists; it will not be overwritten
Explanation: The -k (do not overwrite) option was specified for a pax restore, and pax has determined that filename already exists on the file system. The version of filename in the archive will not be restored.
System action: The program continues.
User response: This is an informational message. No response is required.

FSUM9681  n.illegal character sequence(s) for codeset extracting file "filename"
Explanation: While filename was being extracted, n characters could not be translated from and to codesets specified on the "-o to=" option. The n characters are left untranslated.
System action: The program continues.

FSUM9682  Cannot append to compressed archive
Explanation: The -a (append) option cannot be used on a compressed archive.
System action: The program ends.
User response: To add a file to the end of a compressed archive, you can first use the uncompress utility to uncompress the archive, and later use the compress utility to recompress the archive.

FSUM9684  Error: -o "option string": Invalid syntax
Explanation: The -o option was used with an invalid syntax near option string.
System action: The program ends.
User response: Correct the -o syntax near option string.

FSUM9696  !write error on file "filename"
Explanation: An error occurred writing to filename. A system error message that indicates the reason for the error follows this message. The problem is usually caused by lack of space on the output device, or lack of appropriate permissions to write the file.
System action: The program ends.
User response: Refer to the accompanying system error message and take appropriate action.

FSUM9697  Badly formed sort key position "position"
Explanation: The key position was not specified correctly.
System action: The program ends.
User response: Check the format and try again.
FSUM9698  Must specify number in "-option"
Explanation:  Only numeric input data is accepted.
System action:  The program ends.
User response:  Use proper numeric data and try again.

FSUM9700  too many key field positions specified
Explanation:  sort is limited in the number of key positions that can be specified. See z/OS UNIX System Services Command Reference for more information.
System action:  The program ends.
User response:  Use fewer key fields.

FSUM9701  key value in "string" out of bounds
Explanation:  The key value must be between 1 and LINEMAX.
System action:  The program ends.
User response:  Change the key value.

FSUM9702  invalid key specification "key"
Explanation:  If you specify a key using m.n notation, you cannot specify 0 in the n position.
System action:  The program ends.
User response:  Respecify the command using proper key syntax. See z/OS UNIX System Services Command Reference for more information.

FSUM9704  file "filename": no newline at end of file
Explanation:  The file did not end in a newline character. A newline character was added.
System action:  The program continues.
User response:  To avoid this message in the future, add a newline to the end of the file.

FSUM9705  file "filename": line too long: limit max -- truncated
Explanation:  The line exceeded the allowed length, and as a result was truncated. This could be due to a missing newline character.
System action:  The program continues.
User response:  To avoid this message in the future, make sure the line length does not exceed the stated limit and that the file is not missing newline characters.

FSUM9707  file "filename": line linenumber: non-unique key in record:
Explanation:  The field selected is not suitable as a key field because its values are not unique for each record.
System action:  The program ends.
User response:  Select a different key field and try again.

FSUM9708  file "filename": line linenumber: not ordered properly at:
Explanation:  The fields of the given record were apparently out of sequence in comparison with previous records.
System action:  The program ends.
User response:  Check for missing field(s), or reorder the given record to match the previous records.

FSUM9710  temporary file error "filename"
Explanation:  crontab was unable to open the named temporary file. This could be due to insufficient free storage, or a problem with the /tmp directory.
System action:  The program ends.
User response:  Make sure that /tmp exists and is not full, try freeing up system resources, and retry the command.

FSUM9712  Upper/lower case conversion must be specified in the same relative positions
Explanation:  The upper or lower character class specified in string2 does not correspond to the opposite lower or upper character class specified in string1.
System action:  The program ends.
User response:  Change the position of the upper or lower character class in string2 to correspond with the lower or upper character class in string1.

FSUM9771  string: cannot use TCP device with cu.
Explanation:  A TCP Device was specified for this system. cu cannot connect to another system over the TCP/IP network.
User response:  Use another device type.
FSUM9835  initialization failed.
Explanation: Common initialization for uucp commands failed, due to an error in reading the uucp configuration file.
User response: Make sure the uuuc command has been run to create the uucp configuration file. See the uuuc command description.

FSUM9922  internal execution tree error at "string"
Explanation: awk encountered an error at the named step.
System action: The program continues in an error state and may end later.
User response: See z/OS UNIX System Services Command Reference for more information on awk.

FSUM9926  error reading file
Explanation: An unspecified error occurred in trying to read the file. A system error message that explains the error follows this message.
System action: The program continues.
User response: Respond to the system error message.

FSUM9927  error splitting record: line
Explanation: awk encountered a syntax error on the given line.
System action: The program continues.
User response: Correct the error and retry. See z/OS UNIX System Services Command Reference for more information.

FSUM9928  invalid wide character hex character code
Explanation: awk encountered a character that was not a valid wide character.
System action: The program continues.
User response: Contact your system programmer.
System programmer response: Follow local procedures for reporting a problem to IBM.

FSUM9942  "argument" ignored, same basename as "argument"
Explanation: Duplicate arguments are not allowed.
System action: The program continues.
User response: To avoid this message in the future, remove the duplicate argument.

FSUM9943  file(s) contain a character outside the domain of the collating sequence
Explanation: One or more characters in the file(s) has an incorrect character, based on information in the LC_COLLATE category of the current locale.
System action: The program continues.
User response: Review the file(s) for incorrect characters (see LC_COLLATE).

FSUM9948  Warning: useless variables:
Explanation: The listed variables are either redundant or not used.
System action: The program continues.
User response: Review your code to see if the listed variables can be eliminated, or if the code that uses them is missing.

FSUM9949  invalid character "character"
Explanation: awk encountered a character that it did not recognize as alphanumeric, whitespace, or a special character to awk (such as a metacharacter).
System action: The program ends.
User response: Check your input for characters that are not valid, and check that the codeset of the input data matches the codeset of the shell environment.

FSUM9950  input lines truncated - result questionable
Explanation: One or more input lines are longer than grep can handle. grep assumes that the file it is searching has lines terminated by newline characters. When no newline character is found, the line is either truncated or split into multiple lines. A common cause of this message is the use of a binary file as input to the grep command.
System action: The program continues. This message does not affect the exit status.
User response: Shorten the line or lines, if possible. Do not use grep to search binary files.

FSUM9952  history file $HISTFILE " file "
Explanation: The z/OS shell command history file specified by the HISTFILE variable could not be opened.
System action: The shell continues to run with the default history file: $HOME/.sh_history.
User response: Take appropriate action based on the specific error description at the end of this message.
FSUM9954  bad month "month number"
Explanation: Months range from 1 to 12.
System action: The program ends.
User response: Enter again with a valid month number.

FSUM9955  invalid year "year"
Explanation: Years range from 1 to 9999.
System action: The program ends.
User response: Enter again with a valid year.

FSUM9956  bad month "month"
Explanation: The month name, spelling, or abbreviation was incorrect.
System action: The program ends.
User response: Check the spelling of the month, or use the first 3 letters of the month name as an abbreviation.

FSUM9998  cannot determine PATH_MAX
Explanation: The program was unable to get the size limit for filenames (including their directory path) from the system.
System action: The program ends.
User response: Contact your system programmer.
System programmer response: Follow local procedures for reporting problems to IBM.

FSUM9999  invalid queuename 'queuename'
Explanation: Queue name must be a single-byte character long, and must not be a space, tab, newline, or NULL.

FSUM9991  time specified has already expired
Explanation: You specified a time that was in the past.
User response: Reissue the command with a correct time.

FSUM9992  must run as root, and be run by root
Explanation: cron can only be started by a superuser.
System action: The program ends.
User response: Contact your system administrator to start cron.

FSUM9993  cron already running, pid # pid number
Explanation: You may only start cron once, and it is already running.
System action: The cron that is already running continues to run.

FSUM9994  cron already running
Explanation: You may only start cron once, and it is already running.
System action: The cron that is already running continues to run.

FSUM9995  bad format in queuedefs
Explanation: There is a bad format in the queuedefs file. The queue format is queuename,#j##n##w, where queuename is a single character and # is a numeric value followed by a letter: j for the maximum number of jobs, n for null value, or w for wait to reschedule.
System action: The program ends.
User response: Check the queuedefs file for errors. See z/OS UNIX System Services Command Reference for more details.

FSUM9996  insufficient permission for -u
Explanation: The -u option can only be used by a superuser.
System action: The program ends.

FSUM9997  You are not authorized to use cron. Sorry.
Explanation: Either your user ID is not in cron.allow, or it is in cron.deny.
User response: Contact your system administrator.

FSUM9998  can't remove your crontab file
Explanation: crontab was unable to remove the crontab file.
System action: The program ends.
User response: Check the permissions on the crontab file and verify that write permission has been granted.

FSUMA003  Unexpected character found in line: line
Explanation: crontab was expecting to find either a valid number or an '*' character followed by a non-blank (space or tab) character.
System action: The program continues.
User response: Check the input line. See z/OS UNIX
FSUMA004  Number out of bounds in line: line
Explanation:  crontab encountered a number in the input line that is outside of the allowed range.
System action:  The program ends.
User response:  Check the input line. See z/OS UNIX System Services Command Reference or the correct format.

FSUMA005  Missing command on line: line
Explanation:  crontab was expecting to find a command on the given input line and failed to detect one.
System action:  The program ends.
User response:  Check the input line for incorrect format.

FSUMA007  Warning: string already defined in filename
Explanation:  A duplicate identifier was found in the given file.
System action:  The program continues.

FSUMA008  DLL in use
Explanation:  The system is unable to run the program while the DLL is in use by another program or another instance of this program.
System action:  The program ends.
User response:  Make sure diff isn’t running in a background process (use ps to detect this). If it is, either use the kill command to end it or use the fg command to bring it to the foreground. If the problem persists, contact your system administrator.

FSUMA009  filename: Not a directory
Explanation:  dircmp can only be used to compare directories.
System action:  The program ends.
User response:  If you are comparing files, use diff or cmp; otherwise, verify that both arguments to dircmp are directories.

FSUMA051  filename: not executable, object, or library format
Explanation:  The input to the nm command must be a single executable file, a single object file or an archive library of object files.
System action:  The program ends.
User response:  Specify the appropriate type of file as input to nm and execute the command again.

FSUMA081  database file " file "
Explanation:  The program was unable to open the named file for reading.
System action:  The program continues.
User response:  Check to make sure the file exists and that you have permission to read it.

FSUMA083  command: Unknown terminal "term"
Explanation:  The terminal type term could not be found in the terminal database.
User response:  Check that the TERM environment variable is set correctly, and that an entry exists in the terminfo database for that terminal type.

FSUMA084  Multibyte conversion error.
Explanation:  An error occurred in converting between types wide character and multibyte. It is possible that an incorrect multibyte character was encountered.
User response:  Check the data for incorrect multibyte characters, and try again.

FSUMA093  write error on standard output
Explanation:  The program was unable to write to standard output.
System action:  The program ends.
User response:  Contact your system programmer.
System programmer response:  Follow local procedures for reporting problems to IBM.

FSUMA094  file is not a normal file—can’t patch.
Explanation:  You attempted to patch a file that is not a regular file.
System action:  The program ends.
User response:  Make sure there were no typos in the filename, then check the file itself for errors.

FSUMA096  Not enough memory to try swapped hunk! Assuming unswapped.
Explanation:  patch was unable to allocate memory from the system. This may be due to insufficient storage space in the system.
System action:  The program continues.
User response:  Free up system resources and retry the command.
FSUMA099  Hunk number failed at line number
Explanation:  patch was unable to process the given hunk. Unless you specify otherwise, those hunks that failed will be saved in a file in the current directory.
System action:  The program continues.
User response:  Check the patch file for corruption.

FSUMA112  patch: misordered hunks! output will be garbled.
Explanation:  A problem arose with the patch file (a diff file); patch could not properly match a line in the patch file with the file being updated.
System action:  The program continues.
User response:  Restore the file from backup, and retry.

FSUMA113  patch: misordered hunks! output will be garbled.
Explanation:  A problem arose with the patch file (a diff file); patch could not properly match a line in the patch file with the file being updated.
System action:  The program continues.
User response:  Restore the file from backup, and retry.

FSUMA116  This appears to be the wrong kind of patch.
Explanation:  The diff type you specified did not match the actual type of the patch.
System action:  The program continues.
User response:  Respecify the diff type (context, ed, or normal) so that it matches the actual type of the file. For more information, see z/OS UNIX System Services Command Reference under “diff” and “patch”.

FSUMA130  Unexpected end of file in patch.
Explanation:  While processing a segment of the patch file, patch ran across an unexpected end of file. The patch file could be corrupted.
System action:  The program ends.
User response:  Recreate the patch file, restore the file to be updated from backup, and rerun the program.

FSUMA131  Unexpected end of hunk at line line number.
Explanation:  patch came across the end of the current hunk (segment) of the patch file sooner than expected.
System action:  The program continues.
User response:  Examine the patch file for errors.

FSUMA132  Unexpected *** at line line number : line
Explanation:  patch came across the start or end of a hunk or segment sooner than expected.
System action:  The program continues.
User response:  Examine the patch file for errors.

FSUMA133  Duplicate "---" at line line number
Explanation:  patch came across the start or end of a hunk or segment sooner than expected. This may be

FSUMA111  Out-of-sync patch, lines starting line, ending line --mangled text or line numbers, maybe?
Explanation:  While attempting to apply the current hunk, patch encountered an error.
due to an extraneous "---" marker.

**System action:** The program continues.

**User response:** Examine the patch file for errors.

---

**FSUMA134** Premature "---" at line line number --check line numbers at line line number.

**Explanation:** The "---" indicator of the next section of the patch file was encountered sooner than expected.

**System action:** The program continues.

**User response:** Examine the patch file for errors.

---

**FSUMA135** Overdue "---" at line line number --check line numbers at line line number.

**Explanation:** The "---" indicator of the next section of the patch file was expected and not found.

**System action:** The program continues.

**User response:** Check the line numbers specified; the patch file may have been edited or otherwise corrupted.

---

**FSUMA136** Hunk too large ( quantity lines) at line line number : line

**Explanation:** The current hunk exceeds the maximum allowable hunk size.

**System action:** The program continues.

**User response:** Check the line numbers specified; the patch file may have been edited or otherwise corrupted.

---

**FSUMA137** No --- found in patch at line line number

**Explanation:** The "---" marker, which marks the beginning of replacement text was expected and not found.

**System action:** The program continues.

**User response:** Examine the patch file for corruption.

---

**FSUMA139** Replacement text or line numbers mangled in hunk at line line number

**Explanation:** The patch file may have been corrupted or applied in the reverse order.

**System action:** The program continues.

**User response:** Examine the patch file for corruption.

---

**FSUMA140** Unexpected end of file in patch at line line number

**Explanation:** Patch encountered the end-of-file marker before it had finished processing the patch file.

**System action:** The program continues.

**User response:** Check the patch file for corruption or truncation.

---

**FSUMA144** Not enough memory to swap next hunk!

**Explanation:** This message occurs only when you use the -R option on the command line. Patch was unable to allocate memory to swap a hunk to/from the patch file.

**System action:** The program continues.

**User response:** To avoid this problem in the future, try freeing up system resources.

---

**FSUMA145** Malformed patch at line line number : line

**Explanation:** Patch was expecting to find a digit and did not find one.

**System action:** The program ends.

**User response:** Check the patch file for errors.

---

**FSUMA157** at ".so filename ", file nesting level too deep

**Explanation:** You attempted to push more than 64 files onto the stack.

**System action:** The program ends.

**User response:** Try breaking up the spell command so that you do not need to examine more than 64 files at one time.

---

**FSUMA162** hash table

**Explanation:** The system was unable to allocate storage for the hash table.

**System action:** The program ends.

**User response:** Free up system resources, or add more main storage.

---

**FSUMA163** hash file "file"

**Explanation:** The program was unable to open the named file.

**System action:** The program ends.

**User response:** Check the file permissions. If the failure persists, contact your system administrator.
FSUMA164 hash file "file" write
Explanation: The program was unable to write to the named file.
System action: The program ends.
User response: Refer to the system error message that accompanies this message.

FSUMA176 Incomplete multibyte sequence on command line
Explanation: The multibyte character sequence specified in the input or output translation string is incomplete.
System action: The program ends.
User response: This is most likely due to a missing 'SI (shift in) character following a 'SO (shift out).

FSUMA186 Internal error: wc fputs().
Explanation: In attempting to write a wide character string to a stream, an internal error occurred during conversion to multibyte.
System action: The program continues.
User response: Consult your system programmer, or follow local procedures for reporting a problem to IBM.
System programmer response: Follow local procedures for reporting a problem to IBM.

FSUMA187 Failed to expand words.
Explanation: vi was unable to expand the %, #, ! commands on the input line.
System action: The program continues.
User response: Check the input line for mistyped arguments or files.
System programmer response: None.

FSUMA194 Problem creating pathname (path)
Explanation: This is a system error that may have been caused by either of the following situations (though other causes are possible): 1. pathname length exceeds PATH_MAX. 2. insufficient memory to create the pathname.
System action: The program ends.
User response: Contact your system programmer.
System programmer response: Follow local guidelines for reporting the problem to IBM.

FSUMA196 temporary file error
Explanation: wall was unable to open a temporary file. There could be insufficient system resources, for example, not enough storage or open file pointers.
System action: The program ends.
User response: Free up system resources and try again if necessary.

FSUMA197 write error on temporary file
Explanation: An error occurred while the program was attempting to write to a temporary file.
System action: The program ends.
User response: Make sure that system resources have not been used up, as insufficient free storage could cause this problem.

FSUMA860 Recursive alias "alias" not expanded
Explanation: This alias was part of another alias, and exceeded the maximum recursive depth allowed.
System action: The program continues.
User response: Redefine the alias so that an alias name is not part of the definition.

FSUMA872 cannot open file "filename"
Explanation: A system error indicating the cause is displayed with this message.

FSUMA873 !cannot create or open file for writing "pathname"
Explanation: "pathname" could not be opened. A system error indicating the cause follows this message. The problem is usually caused by lack of space on the output device, or lack of appropriate permissions to create the file.
System action: The program ends.
User response: Refer to the system error message and take appropriate action.

FSUMA874 csplit argument must be one of:

/regex/[+-offset] regular expression, %regex%[+-offset] non copied regular expression, number line number, (number) repetition count for previous argument

Explanation: You entered a csplit argument that did not look like a regular expression, line number, or repeat count.
User response: Check the syntax of your command
line, correct any mistakes, and reenter it.

FSUMA875  Badly formed regular expression
"regexp"

Explanation:  You specified a regular expression that did not conform to the rules for regular expressions.

User response:  Correct the regular expression.

FSUMA876  invalid number (num) specified with -n option (max max allowed)

Explanation:  The number num that was specified for the -n option exceeds the allowable value max.

System action:  The program ends.

User response:  Respecify a number that is less than or equal to max.

FSUMA877  !read error on file "pathname" at line n

Explanation:  An error occurred in file "pathname" at line n that prevented the file from being read.  A system error indicating the cause follows this message.

System action:  The program ends.

User response:  Refer to the system error message and take appropriate action.

FSUMA878  file "pathname", line n: contains binary data

Explanation:  "pathname" at line n contains data that is not text.  This program requires text data.

System action:  The program ends.

User response:  Verify that "pathname" is a text file.

FSUMA879  file "pathname", line n: line length exceeds limit of max

Explanation:  The length of line n in "pathname" exceeds the the maximum allowed value max.

System action:  The program ends.

User response:  Because the name of "pathname" is based on the pathname of the input file, shorten the pathname of the input file by renaming it and/or moving it to a directory with a shorter name.

FSUMA882  " string " : Premature end of file

Explanation:  csplit encountered the end of file before it was expected.  This usually indicates that the last line of the input file is not terminated by a line-end character.

System action:  The program ends.

User response:  csplit operates on text files.  Verify that the file consists of complete text lines.

FSUMA883  " string " : Out of range

Explanation:  This is most likely the result of specifying a negative offset from a regular expression that resulted in a negative number of lines to output.

System action:  The program ends.

User response:  Reattempt the command with a smaller negative offset, or change the regular expression.

FSUMA884  !memory allocation error

Explanation:  You ran out of memory.

System action:  The program ends.

User response:  Obtain more memory.

FSUMA885  find: could not execute cpio utility

Explanation:  popen failed to execute cpio.  Another message is displayed describing the error.

System action:  The program ends.

User response:  Look up the associated error message.

FSUMA888  Nice priority must range from num1 to num2

Explanation:  You specified a priority value that was not in the range num1 to num2.

User response:  Specify a priority value that falls in the given range.

FSUMA891  No such user as " user "

Explanation:  The user specified with the -u option is not known on this system.  Either the user name or the numeric user ID is not defined in the user database.

System action:  The command ends.

User response:  Specify a valid user name or user ID.

FSUMA893  renice nice_val [-v] [-p] pid ... [-g gid ...]
          [-p pid ...] [-u user ...]

Explanation:  Usage messages display the correct syntax for a command that you may have entered incorrectly.

FSUMA894  renice nice_val [-v] -g gid ... [-g gid ...]
          [-p pid ...] [-u user ...]

Explanation:  Usage messages display the correct syntax for a command that you may have entered incorrectly.
FSUMA895  renice nice_val [-v] -u user ... [-g gid ...]
           [-p pid ...] [-u user ...]
Explanation: Usage messages display the correct syntax for a command that you may have entered incorrectly.

FSUMA897  pathchk: warning: pathconf(“pathname”, varcode) returns ‘syserror’. Using varcode2 = rc
Explanation: An error occurred executing the C-runtime function pathconf() on pathname using varcode= varcode.
System action: The program ends.
User response: Refer to the system error message and take appropriate action. Contact your system programmer for additional help.

FSUMA902  can’t access your terminal
Explanation: The invoking process does not have a controlling terminal.
User response: When running ps without a controlling terminal, you must specify one of the -6, -g, -p, -t, -u, or -u options to identify the processes on which ps is to report.

FSUMA903  process table
Explanation: A system error indicating the cause is displayed with this message.

FSUMA904  no matching processes found.
Explanation: ps did not find any any processes which matched the specified search criteria.
User response: Confirm the command options for ps.

FSUMA905  badly constructed format string "format"
Explanation: The output format string was not correct.
User response: Check the description of ps in z/OS UNIX System Services Command Reference or a list of possible format specifications.

FSUMA906  parsing format string
Explanation: A system error indicating the cause is displayed with this message.

FSUMA907  out of memory
Explanation: There were not enough free system resources to allocate the required space.

User response: Free up more resources and try again.

FSUMA909  bad numeric ID at "--command option"
Explanation: You specified a numeric identifier for a process, group, or session that was not a valid number.
User response: Make sure that all numeric IDs are valid numbers.

FSUMA910  unknown user ID at "--u command"
Explanation: You specified an unknown login name or a bad user ID as an argument to the --u option.
User response: Check the arguments to the --u option carefully.

FSUMA911  undefined function
Explanation: The command is identified as an undefined function. Possible causes: 1. The command name was marked with the "typeset -u" or "autoload" command, and the definition was not found in FPATH. 2. A filename matching the command name was found in FPATH, but the file did not contain a function definition of that name.
System action: The command ends.
User response: Define the function, or set the FPATH variable to include a directory that contains a file with the command name. The contents of this file must include a function definition for the command name.

FSUMA912  Cannot set locale: The internationalization variable settings are invalid.
Explanation: The shell called the “setlocale(LC_ALL, "")” function, which failed. This is probably a result of an invalid or corrupted locale file.

FSUMA917  job control disabled
Explanation: You attempted to use the fg or bg command when set–o monitor (or set –m was not set.
User response: Turn on monitor mode with set –monitor or set –m.

FSUMA921  Option –option argument missing
Explanation: You did not provide an argument for –option.
User response: Provide the missing argument.
FSUMA922  -l number too large
Explanation:  You specified the –l option with a numeric argument that was greater than 1023.
User response:  Specify an argument to the –l option that is less than 1024.

FSUMA923  -n number too large
Explanation:  You specified the –n option with a numeric argument that was greater than 1023.
User response:  Specify an argument to the –n option that is less than 1024.

FSUMA924  !could not fork()
Explanation:  xargs could not fork a new process. A system error indicating the cause is displayed with this message.
System action:  The program ends.
User response:  Take appropriate action based on the reason code.

FSUMA925  path: command not found
Explanation:  The command path cannot be found, or you do not have permission to access it.
System action:  The program ends.
User response:  Verify that you spelled the command correctly and that you have the correct permission to access it.

FSUMA930  command: Unknown option –option
Explanation:  You specified an option that is not valid for this command.
User response:  Check z/OS UNIX System Services Command Reference for a list of options.

FSUMA932  argument: input file can’t be a directory
Explanation:  Directories may not be used as input source.
System action:  The program ends.
User response:  Specify a non-directory file as input source.

FSUMA934  Warning: increment number changed to number
Explanation:  The increment specified on the nice command resulted in a nice value that was not valid. The increment was adjusted to result in a valid nice value.
System action:  The command continues.
User response:  No action is needed. To avoid this warning, specify a priority increment that, when added to the current nice value, results in a valid nice value (0-39).

FSUMA935  command not executable
Explanation:  The command specified as an argument on the nice command could not be run. A specific error description follows this message.
System action:  The nice command ends.
User response:  Specify an executable command as an argument on the nice command.

FSUMA957  translation code code not valid
Explanation:  The value of code fell outside the range of values for an unsigned character.
System action:  The program continues.
User response:  Change either the variable type or the value assigned to it.

FSUMA958  duplicate translation on ‘character’
Explanation:  During the processing of a new translation table, a character was redeclared.
System action:  The program continues.
User response:  Remove the extraneous declaration.

FSUMA959  undefined start condition ‘name’
Explanation:  A <start state> was used in a pattern, but lex was unable to find it in the list of declared start states.
System action:  The program continues.
User response:  Declare the start state, or correct the name if it is misspelled.

FSUMA960  bad (NAME) syntax
Explanation:  lex encountered a character in a (NAME) that was not an alphabetic, numeric, or ‘_’ (underscore). There could be a missing ‘)’ at the end of a previous declaration.
System action:  The program continues.
User response:  Remove the illegal character(s) from the (NAME) declaration or add the missing ‘)’.
FSUMA961  definition not defined
Explanation: After seeing a (definition), lex was unable to find it in the list of declared substitutions.
System action: The program continues.
User response: Replace the declared substitution, or define it in the definition section.

FSUMA962  nested { definition } expansion
Explanation: You may have attempted to place a call to a macro with the definition of that macro.
System action: The program continues.
User response: Remove the recursive macro call, or change the macro to a function that can be called recursively.

FSUMA963  ?possibly non-portable character class
Explanation: The defined character class may not be fully portable because of the inclusion of system or locale-specific characters, numbers, or symbols.
System action: The program continues.
User response: If you want to find a more portable (POSIX-defined) definition of the desired character class, consult z/OS UNIX System Services Command Reference or a lex manual.

FSUMA964  Incomplete %{ declaration
Explanation: lex could not find the trailing %}, which needs to be the first and only thing on a line.
System action: The program ends.
User response: Add or correct the missing %}.

FSUMA965  Too many start conditions
Explanation: During processing of the definition section, the number of start conditions exceeded the size of lex's static internal table. The default number of start conditions is 100.
System action: The program ends.
User response: Use fewer start conditions.

FSUMA966  can't determine look ahead
Explanation: lex ran into a conflict in lookahead tokens, and did not know how to resolve it.
System action: The program continues.
User response: Simplify or expand the grammar rules to remove the conflict.

FSUMA967  % character class not defined
Explanation: After seeing a % character class, lex was unable to find it in the list of declared character classes.
System action: The program continues.
User response: Replace the declared character class, or define it in the list of declared character classes.

FSUMA968  nested { % } expansion
Explanation: You may have attempted to place a call to a macro with the definition of that macro.
System action: The program continues.
User response: Remove the recursive macro call, or change the macro to a function that can be called recursively.

FSUMA969  ?possibly non-portable character class
Explanation: The defined character class may not be fully portable because of the inclusion of system or locale-specific characters, numbers, or symbols.
System action: The program continues.
User response: If you want to find a more portable (POSIX-defined) definition of the desired character class, consult z/OS UNIX System Services Command Reference or a lex manual.

FSUMA970  Incomplete %{ declaration
Explanation: lex could not find the trailing %}, which needs to be the first and only thing on a line.
System action: The program ends.
User response: Add or correct the missing %}.

FSUMA971  Too many start conditions
Explanation: During processing of the definition section, the number of start conditions exceeded the size of lex's static internal table. The default number of start conditions is 100.
System action: The program ends.
User response: Use fewer start conditions.

FSUMA972  can't determine look ahead
Explanation: lex ran into a conflict in lookahead tokens, and did not know how to resolve it.
System action: The program continues.
User response: Simplify or expand the grammar rules to remove the conflict.

FSUMB031  ?, *, + or - not preceded by valid regular expression
Explanation: You specified a regular expression that contained a ?, *, +, or - which was not preceded by a valid regular expression.
User response: Make sure that every unquoted ?, *, +, or - in the regular expression is preceded by a valid regular expression.

FSUMB039  error setting termios attributes
Explanation: A system error indicating the cause is displayed with this message.

FSUMB040  unknown mode string
Explanation: You specified an unknown stty operand.
User response: Check the description of stty in z/OS UNIX System Services Command Reference for a list of valid stty operands.

FSUMB041  Mode * mode * not supported in this window
Explanation: The system was unable to set the number of rows in this window.
System action: The program ends.

FSUMB042  missing number after string
Explanation: You did not specify a numeric value as the argument of operand.
User response: Supply an appropriate number as the argument of operand.

FSUMB043  internal error 1
Explanation: An internal error occurred in stty while trying to set the stty modes.
System action: The command ends.
User response: Follow local procedures for reporting problems to IBM.

FSUMB045  failed to get termios attributes
Explanation: A call to tcgetattr() failed to return the necessary information.
User response: Contact your system programmer.

FSUMB046  missing character after "command"
Explanation: You did not specify a control character as the argument of command.
User response: Supply an appropriate argument for command.
FSUMB047  badly formed operand character "char"
Explanation:  You specified operand as the argument to command but operand is not a valid control character.
User response:  Specify a valid control character.

FSUMB048  missing speed after "command"
Explanation:  You did not specify a baud rate with the ispeed or ospeed operand.
User response:  Supply a valid baud rate.

FSUMB049  argument "arg" not valid after operand
Explanation:  You specified an invalid baud rate, arg, after the ispeed or ospeed operand.
User response:  Contact your system programmer or check your reference manuals for a list of baud rates supported by your machine.

FSUMB077  Detected circular dependency using [target]
Explanation:  After expansion, a target depends upon itself. Make does not permit this.
User response:  Modify the makefile to eliminate the circular dependency.

FSUMB082  result of substitution too long
Explanation:  The resulting filename after the substitution specified on the "-s" option exceeds the maximum filename length allowed.
System action:  The program continues.
User response:  Use a shortened substitution string.

FSUMB083  Unknown option "+option"
Explanation:  You specified an option that is not valid for this command.
User response:  Check z/OS UNIX System Services Command Reference for a list of options.

FSUMB084  Option "option" requires an argument
Explanation:  You specified an option that is not valid for this command.
User response:  Check z/OS UNIX System Services Command Reference for a list of options.

FSUMB085  Invalid XQT file format - 'U' line not found (jobname)

FSUMB091  literal newline characters are not allowed in EREs
Explanation:  An attempt was made to place a newline character after the "."

FSUMB261  Bad list for -f, -b, or -c option [list]
Explanation:  You specified a list for the –f, –b, or –c option that contained non-numeric entries.
User response:  Specify a list that contains only numeric entries.

FSUMB262  Badly formed range in list [list]
Explanation:  You specified a list containing the range num1-num2 where num2 was less than num1. Ranges must be specified with the lower value first.
User response:  Reenter the command line, making sure to list the lower value first when specifying the range.

FSUMB263  Must specify "-f", "-b" or "-c" option
Explanation:  You did not specify any of the –f, –b, or –c options.
User response:  Specify one of the three options.

FSUMB264  Bad range "num1-num2" in list
Explanation:  You specified a list containing the range num1 - num2 where num2 was less than num1. Ranges must be specified with the lower value first.
User response:  Reenter the command line, making sure to list the lower value first when specifying the range.

FSUMB265  no fields specified in list [list]
Explanation:  cut did not recognize anything in list as indicating a field.
User response:  Check the syntax of the list and reenter the command.

FSUMB291  Invalid number "number".
Explanation:  The number must be between the LONGLONG_MAX and the LONGLONG_MIN.
User response:  Respecify command with an appropriate number.
FSUMB293 Invalid option character "unit_character" in "user_string".

Explanation: The unit character unit specified by the user is invalid. Valid unit characters are b, c, k, l or m.

System action: The command ends.

User response: Reissue the command with a correct unit.

FSUMB294 Argument "unit1" is mutually exclusive with previously specified "unit2" option.

Explanation: The unit character unit1 cannot be specified by the user because unit2 was already specified. There cannot be two unit specifiers on the same command line.

System action: The command ends.

User response: Reissue the command specifying only one unit character.

FSUMB322 Argument to –n must be numeric.

Explanation: The –n option requires a numeric argument. This message occurs when a non-numeric value is detected as the argument to –n.

User response: Make sure that the command was entered correctly and use a numeric value for –n.

Explanation: The specified file can not be opened.

System action: The command fails for the file specified in the error message.

User response: Check the system error message displayed with this message.

FSUMB408 submit: target Not accepted by JES.

Explanation: The specified file or data set is not accepted as a JES job.

System action: The command fails for the file or data set specified in the error message.

User response: Verify that the file or data set member is in the correct JES format and reenter the command.

FSUMB409 submit: target Could not submit empty job.

Explanation: The specified file or data set is empty and cannot be submitted to JES.

System action: The command fails for the file or data set specified in the error message.

User response: Verify that the file or data set member contains data and reenter the command.

FSUMB410 Unknown option "–option".

Explanation: You specified an option that is not valid for this command.

User response: Check z/OS UNIX System Services Command Reference for a list of valid options.

FSUMB411 submit: data set Could not allocate data set.

Explanation: The specified data set cannot be allocated.

System action: The command fails for the data set specified in the error message.

User response: A system error message may have been displayed with this message. Verify that the specified data set exists.

FSUMF004 Unknown or missing operator in symbolic audit mode "operator".

Explanation: There is a missing or invalid operator in the specified symbolic –audit or –aaudit.

User response: Refer to the description of the find command in z/OS UNIX System Services Command Reference for the correct values and reenter the command.

FSUMF005 Octal audit mode may contain only digits [0-7] in option.

Explanation: When you specify attributes in octal audit mode, the possible values are expressed by some combination of the digits 0 through 7 (for example, 777). You have specified a number outside that range or you have specified characters along with or instead of digits.

User response: Check the description of the find command in z/OS UNIX System Services Command Reference for the correct values and reenter the command.

FSUMF006 getgroupsbyname failed

Explanation: This message indicates a system error.

User response: Record any other messages and return codes that appear with this one and consult your system programmer or follow local procedures for reporting a problem to IBM.

FSUMF007 Invalid printer format: "forms".

Explanation: You specified too many arguments for –d (dest) on the lp command. "Destination_name", "class" and "forms" are the only permissible arguments on –d. They must be specified in that order.
Chapter 1. Messages

User response: Reissue the command with valid arguments on –d.

FSUMF008 Invalid class: "class"
Explanation: You specified the class operand of the lp command incorrectly. class can’t be longer than one character. Valid values are A-Z and 0-9, but your installation may not have all valid values defined.
User response: Reissue the command with an appropriate value for class.

FSUMF009 Unable to access printer.
Explanation: Dynamic allocation to SYSOUT could not be made. The MVS system did not recognize one or more of the operands you specified on the –lp command.
User response: Check what you specified for “destination_name”, “class”, and “forms”. You may need assistance from your local help desk or a system programmer.

FSUMF010 Unable to open printer ddn('ddn')
Explanation: The system could not OPEN the SYSOUT data set.
User response: This message probably indicates a system error. Consult your system programmer or follow local procedures for reporting a problem to IBM.

FSUMF011 logger: Priority: Priority must be 1-16
Explanation: You have specified an invalid priority value on the logger command. The priority value you specify on logger is used as the DESC= value on an MVS WTO command.
User response: Consult [z/OS JES3 Messages], which describes what this descriptor means and gives the appropriate values for it. Reissue the command.

FSUMF012 logger: Dest: Destination must be 1-128
Explanation: You have specified an invalid destination number on the logger command. This number is used as a route code by the MVS WTO command.
User response: Consult [z/OS JES3 Messages], which describes what this descriptor means and gives the appropriate values for it. Reissue the command.

FSUMF013 logger: wto failed, rc= rc
Explanation: The logger command could not write your message to the operator console.
User response: Record the return code and any associated messages that appear with this one and consult your system programmer.

FSUMF014 There is no function provided for this utility
Explanation: The function is not supported on z/OS UNIX.

FSUMF015 Unexpected EOF on "string"
Explanation: End of file was reached unexpectedly.

FSUMF016 Writing archive file "file"

FSUMF017 string(string): Bad magic #hexnum
Explanation: Either the wrong file was passed, the file has been corrupted, or if file is of goff object format, records are not fixed at 80 bytes.
User response: Check your archive file.

FSUMF018 Bad byte count on ESD card: offset
Explanation: The object deck was corrupted.
System action: The program ends.
User response: Recompile the source to create another object deck.

FSUMF019 Bad length on XSD card: offset, length
Explanation: The object deck was corrupted.
System action: The program ends.
User response: Recompile the source to create another object deck.

FSUMF020 File "filename": Unexpected end of file or archive member
Explanation: The file or archive member does not end with an End record. The file or archive member was corrupted.
System action: The program ends.
User response: Reprocess the file or archive member. You may need to recompile the specified file.

FSUMF021 Write permission required to strip "input_file"
Explanation: The user or process does not have write permission to the input file.
User response: Make sure that your user ID or process has write permission to the file.
FSUMF022 Cannot set priority
Explanation: The request to set or change the scheduling priority of one or more processes failed.

FSUMF047 Cannot update cron
Explanation: Check to make sure that the command you are using: crontab, at, or batch is owed by uid=0 and has set-user-ID bit on.

FSUMF060 man: glob() failure
Explanation: The glob() function failed to generate a pathname. Possible reasons include: insufficient permission to fully search directory paths, inability to allocate memory, or an internal error that caused the function to end.
System action: The program ends.
User response: The pathname that was attempted is printed if the -x option was selected. It may be necessary to contact your system administrator if permissions are not set to allow access. If insufficient memory or storage was the cause, try freeing up system resources and reattempting the program.

FSUMF061 Cannot format string
Explanation: man cannot format this man page because there is no troff formatter shipped with z/OS UNIX.
User response: Format this man page on a system that supports nroff or troff. Then return the formatted man page to z/OS UNIX and install it in the appropriate /usr/man/LANG/catN directory. Then man will be able to find it.

FSUMF062 man: mkdir( path ) failure
Explanation: The mkdir() function failed to create the named directory. Possible reasons for the failure include: the pathname names a symbolic link; the process did not have search permission on some component of the pathname; the pathname is too long (it exceeds PATH_MAX); there is insufficient storage; a component of the pathname prefix is not a directory; or the parent directory is on a read-only file system.
System action: The program ends.
User response: Check the pathname for any of the above errors. It may be necessary to contact your system administrator for errors involving permissions. In the event of insufficient storage, try freeing up system resources or adding more storage.

FSUMF063 string has been corrupted.
Explanation: Previous goff card read specified that it was to be continued on next card, but when next card was read it was not of goff type.
User response: Recompile the file, run utility again.

FSUMF067 WARNING: syslist data invalid for file
system. offset: syslist offset
length:syslist length
Explanation: The system list data returned from a call to w_getmntent() is in a state that should not occur. This may not affect your operation.
System action: df continues without error.
User response: Note the error indicated as part of this message and contact your system programmer. Obtain internal debug info by issuing df with -D option, and supply that data to system programmer as well.

FSUMF068 name1 external link to name2
Explanation: A system error indicating the cause is displayed with this message.

FSUMF070 internal error creating file "filename"
--BPX1CHR failure.
Explanation: An unexpected error occurred while restoring the external attributes of filename.
User response: This problem cannot be fixed by the user. Follow local procedures for reporting the problem to IBM.

FSUMF071 filename: user not authorized to restore extended attribute "c"
Explanation: The user attempted to set the "a", "p", or "l" extended attribute but does not have the proper authorization.
User response: To be able to set the "a" attribute, you must have at least READ access to the BPX.FILEATTR.APF facility class profile. To be able to set the "p" attribute, you must have at least READ access to the BPX.FILEATTR.PROGCTL facility class profile. To be able to set the "l" attribute, you must have at least read access to the BPX.FILEATTR.SHARELIB facility class profile. See z/OS UNIX System Services Planning for more information.
FSUMF074 Cannot append to an archive which is a PDS member.

Explanation: You attempted to append to an archive which is a PDS member. This is not supported.

User response: To append to an archive which is a PDS member, the archive must first be copied into an HFS file or an MVS sequential dataset.

FSUMF075 cmd: A special header file was created for "filename"

Explanation: The pax or tar utility created a special header file in order to preserve file characteristics of filename that could not otherwise be preserved using the specified archive format. This message will be followed by one or more messages indicating the specific characteristics that were preserved.

User response: This is an informational message and does not indicate an error with the archive created. Refer to the z/OS UNIX System Services Command Reference for more information about the pax/tar special header files.

FSUMF076 target of linktype link ("filename") exceeds n chars.

Explanation: The target of the specified link exceeds the number of characters supported by the pax/tar USTAR format. To store it in the archive requires the use of a special header file.

User response: This is an informational message. Due to pathname length limitations, the specified link cannot be stored in the archive using the standard archive format. The use of special header records will be required to store the link. Refer to the z/OS UNIX System Services Command Reference for more information about the pax/tar special header files.

FSUMF077 cmd: Format error in special header file: "reason"

Explanation: A pax/tar special header file could not be processed due to an error in its format. The reason is shown.

User response: This is an internal error that should not occur under normal circumstances and is most likely an indication that a portion of the archive is corrupted. Verify that the archive was not corrupted (generally due to incorrect transfer between systems). If problem persists, follow local procedures for reporting a problem to IBM.

FSUMF078 Special header ignored. Version number n not supported.

Explanation: The pax/tar archive being read contains a special header which is at a higher level than your version of pax/tar supports. The header will be ignored and any characteristics described within the header will not be applied to the file the header pertains to.

User response: The special header summary file for this archive contains a description of all attributes defined in the special header files for this archive and can be used to manually restore the characteristics. Refer to the z/OS UNIX System Services Command Reference for more information about pax/tar special headers.

FSUMF079 Warning: unsupported field "name" in special header.

Explanation: The special header file describes a file characteristic that is not supported by your present level of pax/tar and so cannot be restored. This is most likely due to the archive having been created with a newer version of pax/tar.

User response: The special header summary file for this archive contains a description of all attributes defined in the special header files for this archive and can be used to manually restore the characteristics that could not be restored in this file. Refer to the z/OS UNIX System Services Command Reference for more information about pax/tar special header files.

FSUMF080 cmd: error writing summary special header to archive.

Explanation: An error occurred while writing the summary special header file to the archive. An error message describing the reason for the error will also be provided.

User response: If possible, correct the underlying cause of the error as described by the reason message. For additional help, contact your system programmer or follow local procedures for reporting a problem to IBM.

FSUMF081 cmd: Special header file(s) were created for one or more component files in this archive.

Explanation: The purpose of this message is to inform you that one or more special header files were created during the writing of the archive.

User response: This is an informational message and does not indicate an error with the archive created. It's purpose is to inform you that one or more files had attributes which could not normally be stored using the default pax/tar archive and so were stored using special header files. Refer to the z/OS UNIX System Services Command Reference for more information about pax/tar special header files.
FSUMF082 warning: file "pathname" not extracted from archive, substitution resulted in empty filename

Explanation: The substitution pattern specified by the pax -s option resulted in "pathname" being replaced by an empty string, consequently, "pathname" was not extracted from the archive.

User response: This is an informational message. If you wish "pathname" to be extracted, specify a different substitution pattern or extract "pathname" in a separate command.

System action: pax continues without error.

FSUMF083 warning: file "pathname" not added to archive, substitution resulted in empty filename

Explanation: The substitution pattern specified by the pax -s option resulted in "pathname" being replaced by an empty string, consequently, "pathname" was not written to the archive.

User response: This is an informational message. If you wish "pathname" to be written, specify a different substitution pattern or append "pathname" in a separate command.

System action: pax continues without error.

FSUMF084 warning: file "pathname" not copied, substitution resulted in empty filename

Explanation: The substitution pattern specified by the pax -s option resulted in "pathname" being replaced by an empty string, consequently, "pathname" was not copied to the target directory.

User response: This is an informational message. If you wish "pathname" to be copied, specify a different substitution pattern or copy it manually using the cp utility.

System action: pax continues without error.

FSUMF115 ps internal error return code processing BPX1GTH.

Explanation: An unexpected error occurred while processing the results from a call to the callable service BPX1GTH (__getthent: "get thread data").

User response: This problem cannot be fixed by the user. Follow local procedures for reporting the problem to IBM. Please note the "internal error" number. If the problem can be recreated, run the same ps command with the "-z" (debug) option and save the debug file created.

FSUMF125 fldata() failed for MVS data set "name"

Explanation: cp/mv failed when trying to retrieve information about the name MVS data set.

User response: Check the MVS data set name based on the error indicated as part of this message.

FSUMF127 cannot reset File Format for file "filename"

Explanation: Not all file systems support the file format.

User response: Check that the file system you are using for your target supports file formats.

FSUMF128 user not authorized to restore File Format for file "filename"

Explanation: File format could not be restored for the filename.

User response: Check file permissions.

FSUMF129 cannot reset extended attribute "attribute" for file "filename"

Explanation: Not all file systems support the extended attributes.

User response: Check that the file system you are using for your target, supports the extended attribute you are trying to set.

FSUMF130 cannot reset extended attributes for file "filename"

Explanation: Not all file systems support the extended attributes.

User response: Check that the file system you are using for your target, supports the extended attributes you are trying to set.

FSUMF131 appending "suffix" to file "filename" exceeds PATH_MAX

Explanation: You are trying to append a suffix which will cause the filename to exceed the PATH_MAX length.

FSUMF132 suffix "suffix" and filename "filename" are the same

Explanation: You are trying to drop a suffix which is the same as the filename. Dropping suffix will leave the filename to be an empty string.
FSUMF133 source "filename" is not a supported type of file for this operation
Explanation: You are trying to do an operation on a file that is not supported.
User response: Check the documentation for this command to see which type of files are supported.

FSUMF134 source "filename" is a directory, not allowed for MVS data set target
Explanation: You are trying to do an operation where the source is a directory and the target is a MVS data set. This source/target combination is not supported.

FSUMF135 source "filename" is either a sequential data set or a partitioned data set, not allowed for partitioned data set target
Explanation: You are trying to do an operation where the source is either a sequential data set or a partitioned data set and the target is a partitioned data set. This source/target combination is not supported.

FSUMF136 sequential data set source and director target is not supported
Explanation: You are trying to do an operation where the source is a sequential data set and the target is a directory. This source/target combination is not supported.

FSUMF137 partitioned data set source and a file target is not allowed
Explanation: You are trying to do an operation where the source is a partitioned data set and the target is a file. This source/target combination is not supported.

FSUMF138 partitioned data set "name" must exist
Explanation: You specified a partitioned data set name that was not found.
User response: Check that you specified the correct partitioned data set name and that it exists.

FSUMF139 fetch() failed for IEWBIND
Explanation: fetch() of IEWBIND for copying/moving executables to/from PDS failed.
User response: Note the error indicated as part of this message and contact your system programmer.

FSUMF140 IEWBIND function "function" failed with return code return_code and reason code reason_code
Explanation: IEWBIND failed for the given function.
User response: Look in z/OS MVS Program Management: Advanced Facilities to check the return code and reason code.

FSUMF141 filename exceeds the pathname limit for IEWBIND
Explanation: The filename specified exceeds what is allowed for pathname length in IEWBIND.

FSUMF142 format is not a supported File Format
Explanation: The file specified has an unsupported File Format.

FSUMF143 name exceeds the maximum data set length
Explanation: The data set name specified exceeds the allowable length.
User response: Check the name and try again.

FSUMF144 remove() failed for file filename
Explanation: cp/mv was unable to remove filename.
User response: Check the filename based on the error indicated as part of this message.

FSUMF145 error when traversing the PDS(E) name
Explanation: While traversing the PDS(E) for a member list, an error was encountered.
User response: Check the partitioned data set and try again.

FSUMF146 cannot find member in PDS(E)
Explanation: The member cannot be found in the PDS(E) anymore.
User response: Check the partitioned data set and try again.

FSUMF147 either name or name2 not found in name3
Explanation: One of the members cannot be found in the partitioned data set anymore.
User response: Check the partitioned data set and try again.

FSUMF148 command: spanned records are not supported
Explanation: You tried to cp/mv to/from a MVS data set which has spanned records.
User response: Move the data to a data set with non-spanned records.
FSUMF149 sequential data sets cannot be copied nor moved as executables

Explanation: You specified to cp/mv a MVS sequential data set as an executable.

User response: Check to make sure you have the correct MVS data set name.

FSUMF154 filename is not a load module

Explanation: You specified to cp/mv the filename as an executable but it's not a load module.

User response: Check to make sure you have the correct file name.

FSUMF155 filename must be in undefined record format to store a load module

Explanation: You specified to cp/mv an executable to a MVS data set that is not in undefined record format.

User response: Check to make sure you have the correct target name or chose one that is in undefined record format.

FSUMF156 "filename" is a partitioned data set, not supported for MVS target

Explanation: You tried to cp/mv from a partitioned data set, to a MVS data set. This source/target combination is not supported.

User response: Check the documentation for the supported source/target combinations.

FSUMF157 filename is an existing sequential data set, no member allowed

Explanation: You specified a member name for a MVS sequential data set. MVS sequential data sets do not have members.

User response: Check to make sure you have the correct file name.

FSUMF158 Dynalloc failed with error code=error_code, info code=info_code for filename

Explanation: The dynamic allocation failed for filename.

User response: Check the dynalloc() error and info codes.

FSUMF159 command : localtime() failed

Explanation: A system call to convert the calendar to local time has failed.

User response: Contact your system programmer.

System programmer response: There may be a problem with the TZ environment variable or the current LC_TOD locale category (assuming a POSIX environment).

FSUMF160 Unable to change back to current working directory "pathname"

Explanation: Could not set the directory back to the original directory. The original directory may have been deleted, renamed, or had its permissions changed since command was started.

User response: Ensure that the directory exists and has the correct permissions and cd back to it.

FSUMF161 No recovery files for "name"

Explanation: You specified a file name that does not contain any recovery files in /etc/recovery/$LOGNAME.

User response: Check value of TMP_VI environment variable, and run the exrecover utility. Search your file system for any VI* files which may have been written during another session using a different value for TMP_VI.

FSUMF162 fuser: Options -c and -f are mutually exclusive.

Explanation: You have specified both the -c and -f options. You can specify one or the other, but not both.

User response: If you want the specified file argument to represent a file system, use -c. Otherwise, use -f for fuser to report only file.

FSUMF165 Could not send SIGKILL signal to process process.

Explanation: The SIGKILL signal could not be sent to the process because the process does not exist or the user does not have permission to send the SIGKILL signal to the process.

User response: If the target process is still running, the program sending the SIGKILL must be run from an authorized user.

FSUMF166 BPX1GMN failed for device named by pathname devno=n, rc=return_code, reason=reason_code

Explanation: The callable service BPX1GMN returned with an unexpected return value when querying the mountpoint for the file system (with device number n) named by pathname.

User response: This error indicates a problem with the device d or an internal error. Retry the command. If it continues to fail, note the return code and reason code and follow local procedures for reporting the problem to IBM.
FSUMF167  BPX1GTH() failed. Return
code=return_code, reason
code=reason_code

Explanation: An unexpected error occurred while processing the results from a call to the callable service BPX1GTH (_getthent: "get thread data").

User response: This problem cannot be fixed by the user. Follow local procedures for reporting the problem to IBM. Please note the return code and reason code.

FSUMF168  w_getmntent could not obtain mount point for "filesystem".

Explanation: The pathname for the mount point is not currently available for this file system.

User response: This condition may be transitory. Try issuing the command again. Otherwise, contact system programmer.

System programmer response: More detailed information can be found from the MVS console command display omvs.f.

FSUMF170  getsyntax: Cannot retrieve the variant character definitions from the current locale.

Explanation: Unable to locate variant character information/definitions for the current locale.

User response: Contact system programmer.

System programmer response: Ensure current locale has LC_SYNTAX defined correctly.

FSUMF171  cp/mv of link "filename1" to target "filename2" failed

Explanation: Unable to copy/move the filename1.

User response: Check the system error message displayed with this message.

FSUMF172  MVS data set name name is too long

Explanation: The data set name exceeds the allowable length.

User response: Check the data set name and try again.

FSUMF173  Warning: dirname is a directory and will not be traversed without -R.

Explanation: A directory was encountered by the chtag command. Only files, not directories can have a filetag.

User response: If you wanted to recursively traverse the directory, and tag/print all of the files contained within it, you must use the -R option. No further action is needed if you wanted to ignore the contents of the directory.

System action: chtag continues.

FSUMF174  command: You must enter a codeset name or a ccsid between 0 and 65535 (USHRT_MAX).

Explanation: Either the codeset name you specified does not convert to a ccsid, a ccsid was not entered, or the given ccsid is out of range ( 0 <= ccsid <= USHRT_MAX ).

User response: Respecify command with a valid character code set name or ccsid.

System action: chtag command ends.

FSUMF175  command: chattr() or fchattr() could not set filetag for filename.

Explanation: The chattr() or fchattr() service failed.

User response: Check the system error message displayed with this message.

System action: The filetag of the file specified in the error message will not be changed. The command continues.

FSUMF177  filename: To set txtflag on, you must have a valid character codeset.

Explanation: You either explicitly tried to turn on txtflag and set a ccsid equal to 0 or 0xFFFF (binary), or you tried to change one of the fields of the filetag which would result in this combination.

User response: Find out what state the filetag is in with the -p or -v option, then issue the chtag command with a valid combination of options.

System action: The filetag of the file specified in the error message will not be changed. The command continues.

FSUMF178  Arithmetic error, division by 0 or overflow.

Explanation: awk encountered a floating-point math error. There was either a division by 0 error, or an overflow of a double floating point variable. The allowable range for double floating point numbers is 5.397605e-79 to 7.237006e+75 (for positive numbers).

User response: Check your awk program and data. There could be a formula error, or a range value might have been exceeded. (For example, calculating 57! will exceed the maximum allowed range.)
FSUMF179 command: internal error executing __toCSName(ccsid,...)

Explanation: During the execution of the command utility, an unexpected error occurred calling __toCSName with the value ccsid. The system error indicating the cause is displayed with this message. If appropriate, command will display the ccsid rather than the codeset name.

System action: command continues.

User response: Refer to the z/OS XL C/C++ Run-Time Library Reference for an explanation of the system error and contact your system programmer as required.

FSUMF180 ERROR: unable to query existing signal handler

Explanation: The sigaction call returned a failure while attempting to query the existing signal handler.

System action: The command ends.

User response: Refer to the z/OS XL C/C++ Run-Time Library Reference for possible reasons this call may have failed. If unable to resolve, contact your system programmer.

System programmer response: Follow local guidelines for reporting a problem to IBM.

FSUMF181 WARNING: unable to reset the signal handler for signal back to its previous state. It has been set back to the system default.

Explanation: For unknown reasons, the sigaction function returned an error while attempting to restore the previous signal handler. In this case, the signal handler has been restored to the system default.

System action: The command continues.

User response: If desired, reset the signal handler manually. For more information see the z/OS XL C/C++ Run-Time Library Reference.

FSUMF182 Could not turn autoconversion off for file

Explanation: During the execution of a command, thefcntl() failed. The system error indicating the cause is displayed with this message.

System action: The command will fail for the file specified in error message.

User response: Refer to the z/OS XL C/C++ Run-Time Library Reference for an explanation of the system error and contact your system programmer as required.

FSUMF183 fileno() failed and could not turn autoconversion off for file

Explanation: During the execution of the head or tail command, the fileno() failed and therefore could not turn autoconversion off. The system error indicating the cause is displayed with this message.

System action: The head or tail command will fail for the file specified in error message.

User response: Refer to the z/OS XL C/C++ Run-Time Library Reference for an explanation of the system error and contact your system programmer as required.

FSUMF186 warning: codeset conversion performed on "file" which is tagged "mixed".

Explanation: Codeset conversion was performed on file which is tagged as "mixed" (textflag off and a valid codeset value). Because this file might contain non-text data, this message is a warning that some data might have been corrupted as a result of the conversion.

System action: Processing continues.

User response: If the file contains non-text data, do not perform translation or use "-o fromfiletag".

FSUMF187 unable to determine ccsid for codeset "codeset"

Explanation: A ccsid (numerical id associated with a codeset) could not be determined for the specified codeset. This is mostly likely due to an incorrect spelling or the codeset is not supported on your system.

System action: processing does not continue--application ends.

User response: Verify that the codeset is valid.

FSUMF188 warning: codeset conversion performed on "file" which is tagged "binary".

Explanation: Codeset conversion was performed on file which is tagged as "binary". Because this file is identified as containing non-text, this message is a warning that some or all of the data in the file might have been corrupted as a result of the conversion.

System action: Processing continues.

User response: If the file contains non-text data, do not perform translation or use "-o fromfiletag".

286 z/OS V1R11.0 UNIX System Services Messages and Codes
FSUMF189  warning:  file is tagged with a different codeset than the "from=" codeset.
Explanation:  file is tagged with a different codeset than the codeset identified on the "from=" option. Consequently, converting this file using the "from=" codeset will cause the data in the file to be corrupted.
System action:  The file is converted and processing continues.
User response:  To prevent this file from being incorrectly converted, do not specify it for extraction or removal, or use the "-o fromfiletag" option to cause pax to use the file's codeset rather than the one specified on the "from=" option.

FSUMF190  The "fromfiletag" and "setfiletag" options are not valid without "-o from=,to=".
Explanation:  The "-o fromfiletag" and "-o setfiletag" are only valid when used with the "-o from=,to=" option.
System action:  The application ends abnormally.
User response:  Either specify the "-o from=,to=" option, or do not use the "-o fromfiletag" or "-o setfiletag" options.

FSUMF191  preserving filetag information
Explanation:  This message indicates that a special header record has been created to preserve filetag information associated with this file.
System action:  Processing continues.
User response:  This is an informational message. Filetag information cannot be stored in the archive using the standard archive format. The use of special header records will be required to preserve the filetag information. Refer to the z/OS UNIX System Services Command Reference for more information about the pax/tar special header files.

FSUMF192  fcntl() failed and could not set autoconversion for file
Explanation:  During the execution of the lex or yacc command, the fcntl() failed. The system error indicating the cause is displayed with this message.
System action:  The lex or yacc command will fail for the file specified in error message.
User response:  Refer to the z/OS XL C/C++ Run-Time Library Reference for an explanation of the system error and contact your system programmer as required.

FSUMF193  find: "--option option argument" is invalid
Explanation:  The given option and/or the argument are incorrect.
User response:  Check for the correct options in the z/OS UNIX System Services Command Reference and try again.

FSUMF194  unable to determine codeset for ccsid "ccsid" for file file
Explanation:  You specified the -F option and the source's filetag's ccsid does not have a corresponding codeset.
User response:  Check for the correct options in the z/OS UNIX System Services Command Reference and try again.

FSUMF195  file is tagged with a different codeset than the "-f codeset".
Explanation:  You specified the -F and -f option and the source's filetag's ccsid does not match the -f codeset given.
User response:  Check for the correct options in the z/OS UNIX System Services Command Reference and try again.

FSUMF196  file is untagged and -f codeset was not specified
Explanation:  You specified -F option without -f codeset however, the source file has no filetag set.
User response:  Check for the correct options in the z/OS UNIX System Services Command Reference and try again.

FSUMF197  catalog should be a binary file but is tagged as text
Explanation:  Message catalog is always a binary file.
User response:  Check the catalog specified, untag and try again.

FSUMF198  Could not reset autoconversion
Explanation:  Utility could not turn back the autoconversion for the thread.
User response:  Try again.

FSUMF208  command: stdin ("-") can only be used once.
Explanation:  During the execution of the command utility, stdin was specified for use in more than one place, either as input for files containing ACL entry data,
or as pathnames on which setfacl will operate.

**System action:** The command will fail with a usage message.

**User response:** Respecify the command using proper syntax. See [z/OS UNIX System Services Command Reference](http://www.ibm.com) for more information.

---

**FSUMF209**  
command: option text Unable to parse text into an ACL: failing entry

**Explanation:** During the execution of command, a call to acl_from_text() failed due to a parsing error at the specified entry, or due to invalid specification of delimiters. The setfacl option that was currently being processed is displayed in option text.

**System action:** The command will fail with an error.

**User response:** Respecify the command using proper syntax. See [z/OS UNIX System Services Command Reference](http://www.ibm.com) for more information.

---

**FSUMF220**  
command: option text The given input did not contain any ACL entries.

**Explanation:** The ACL entry data supplied by the user via stdin or command-line is either empty or contained only white-space or comments. The setfacl option that was currently being processed is displayed in option text.

**System action:** The command will fail with an error.

**User response:** Verify that all ACL input data does not contain duplicate entries.

**System programmer response:** None.

---

**FSUMF221**  
option text ACL text contains more than three base ACL entries: error text

**Explanation:** A call to acl_from_text() failed with E2BIG because too many base entries were specified in the ACL entry text. The setfacl option that was currently being processed is displayed in option text. The failing entry or a descriptive message is displayed in error text.

**System action:** The command will fail with an error.

**User response:** Verify the ACL entry data has the proper number of base ACL entries.

**System programmer response:** None.

---

**FSUMF222**  
option text acl_from_text() failed.

**Explanation:** A call to acl_from_text() failed. The errno is displayed. The setfacl option that was currently being processed is displayed in option text.

**System action:** The command will fail with an error.

**User response:** Refer to the [z/OS XL C/C++ Run-Time Library Reference](http://www.ibm.com) or an explanation of the system error. If unable to resolve, contact your system programmer.

**System programmer response:** Follow local procedures for reporting problems to IBM.

---

**FSUMF223**  
Internal error. descriptive text: return code or value in error

**Explanation:** Possibly, a call to a run-time function, specified in descriptive text failed with return code. In this case, the errno is displayed. descriptive text may also contain the name of a function which failed.

**System action:** The command will exit with an error.

**User response:** Contact system programmer.

**System programmer response:** Follow local procedures for reporting problems to IBM.

---

**FSUMF227**  
command: Extended ACL entry not unique for id

**Explanation:** A call to acl_valid() failed because an extended ACL entry is not unique for the user id or group id (specified by id) There may exist only one ACL entry for a given user id or group id.

**System action:** The command will exit with an error.

**User response:** Verify that all ACL input data does not contain duplicate entries.

**System programmer response:** None.

---

**FSUMF228**  
command: Base ACL entry not unique for tag type: base entries

**Explanation:** A call to acl_valid() failed because a base ACL entry was specified more than once. The base entries are displayed by base entries The “user”, “group” and “other” base ACL entries may each be specified only once.

**System action:** The command will exit with an error.

**User response:** Verify that all ACL input data does not contain duplicate base ACL entries. If ACL type appears as “unknown”, it is an internal error, and contact system programmer.

**System programmer response:** Follow local procedures for reporting problems to IBM.

---

**FSUMF229**  
command: warning: pathname is not a directory so type of ACL ACL cannot be changed.

**Explanation:** An attempt was made to change the File Default or Directory Default ACL entries on a pathname which is not a directory. File Default and Directory Default ACL entries are only associated with directories.
FSUMF230 Unable to delete ACL type ACL from pathname

Explanation: The setfacl command was unable to delete the ACL of type ACL type from pathname. This may have occurred if user attempted to delete an ACL (with -D option), or if a user attempted to set an ACL (with -s or -S). When performing a “set” operation, the entire ACL for the file is replaced, so any existing ACLs are deleted.

System action: The command will continue to the next file, unless -a (abort) was specified.

User response: None.

System programmer response: None.

FSUMF231 command: Failure setting ACL type ACL for pathname: three base entries are required.

Explanation: The user is attempting to set (replace) an ACL of type ACL type, but the three required base entries were not specified.

System action: The command will exit with an error.

User response: None.

System programmer response: None.

FSUMF232 acl_set_file() failed on ACL type ACL for "pathname": return value: return value

Explanation: A call to acl_set_file() failed for pathname while trying to modify the ACL of type ACL type and returned return value.

System action: The command will continue to the next file, unless -a (abort) was specified.

User response: None.

System programmer response: None.

FSUMF233 command: Base ACL entry not unique or has invalid type.

Explanation: A call to acl_set_file() failed because a base ACL entry is not unique for the user id or group id, or the entry contains an invalid type. There may exist only one ACL entry for a given user id or group id.

System action: The command will continue to the next file, unless -a (abort) was specified.

User response: None.

System programmer response: None.

FSUMF234 command: Extended ACL entry not unique or has invalid type: string

Explanation: A call to acl_set_file() failed because an extended ACL entry is not unique for the user id or group id, or the entry contains an invalid type. There may exist only one ACL entry for a given user id or group id.

System action: The command will continue to the next file, unless -a (abort) was specified.

User response: None.

System programmer response: None.

FSUMF235 command: The entries file: "file" is empty.

Explanation: A file, intended to hold ACL entry data as input to setfacl, contains no entries.

System action: The command will exit with an error.

User response: None.

System programmer response: None.

FSUMF236 acl_init() failed.

Explanation: The C-RTL acl_init() function failed.

System action: The command terminates.

User response: None.

System programmer response: None.

FSUMF237 acl_to_text() failed when processing file "filename"

Explanation: The C-RTL acl_to_text() function failed.

System action: The command terminates.
User response: Check the EDC message for cause of failure.

FSUMF238 The -acl_entry primary allows only a single acl entry
Explanation: The acl_entry primary allows only one extended acl entry.
System action: The command terminates.
User response: Check that the acl_text you specified for -acl_entry does not contain any commas or newlines. Look in z/OS UNIX System Services Command Reference or correct syntax.

FSUMF239 The specified acl_text for -acl_entry primary has unknown tag type
Explanation: The acl_text does not contain a valid tag type.
System action: The command terminates.
User response: Look in the z/OS UNIX System Services Command Reference or valid syntax.

FSUMF240 The specified acl_text for -acl_entry primary has incorrect permission field
Explanation: The acl_text specified has invalid permissions.
System action: The command terminates.
User response: Look in the z/OS UNIX System Services Command Reference or valid syntax.

FSUMF241 Incorrect syntax of acl_text for -acl_entry primary.
Explanation: The acl_text specified has invalid syntax.
System action: The command terminates.
User response: Look in the z/OS UNIX System Services Command Reference or valid syntax.

FSUMF242 command: warning: seclabel "seclabel" already exists for "filename"
Explanation: The current file already has a seclabel assigned. Once a file is assigned a seclabel, chlabel cannot be used to change it.
System action: The command continues to the next file.
User response: Remove the seclabel from the file and reissue chlabel.

FSUMF243 command: chattr() could not set seclabel for "filename"
Explanation: The chattr() service failed. The system error indicating the cause is displayed with this message.
System action: The file specified in the error message will not be changed. The command continues.
User response: Refer to the z/OS XL C/C++ Run-Time Library Reference or an explanation of the system error and contact your system programmer as required.

FSUMF244 command: warning: -h or -L not specified. Symbolic link "filename" not changed.
Explanation: The current file is a symbolic link. To change the seclabel for a symbolic link, or for the file to which it points, either -h or -L must be specified.
System action: The command continues to the next file.
User response: Specify either -h or -L to assign a seclabel for filename.

FSUMF246 command: lchattr() could not set seclabel for "filename"
Explanation: The chattr() service failed. The system error indicating the cause is displayed with this message.
System action: The file specified in the error message will not be changed. The command continues.
User response: Refer to the z/OS XL C/C++ Run-Time Library Reference or an explanation of the system error and contact your system programmer as required.

FSUMF247 command: seclabel cannot be greater than numchars characters.
Explanation: The system's limit for the size of a seclabel is numchars.
System action: Command terminates.
User response: Reissue the command using a valid seclabel.

Explanation: The current file resides on a separate file system than that of the originating file for which chlabel was called.
System action: The command continues to the next file.
User response: Specify -c to allow chlabel to cross device boundaries, or reissue chlabel to specifically assign a seclabel for `filename`.

FSUMF249 Error during directory traversal of `pathname`

Explanation: An error occurred while traversing the directory `pathname`. The system error indicating the cause is displayed with this message.

System action: The directory traversal for this pathname terminates and the command continues.

User response: Refer to z/OS XL C/C++ Run-Time Library Reference for an explanation of the system error.

FSUMF250 command name: Error during directory traversal of `pathname`.

Explanation: An error occurred while traversing the directory `pathname`.

System action: The directory traversal for this pathname terminates and the command continues.

User response: If unable to resolve, contact the system programmer.

System programmer response: Follow local procedures for reporting problems to IBM.

FSUMF271 Invalid user/uid for option -e

Explanation: User specified the option -e with an argument that could not be mapped to a username nor uid.

System action: The utility terminates immediately.

User response: Correct the argument for option -e and try the command again.

FSUMF272 Could not get username for -e uid (uid)

Explanation: User specified the option -e uid and that uid could not be mapped to a username. This option requires that the uid is mapped to a username so that a supplementary group list can be obtained.

System action: The utility terminates immediately.

User response: Check the uid used with -e option and try again.

FSUMF273 Could not get supplementary group for user `user`

Explanation: User specified the option -e user. This option requires that a supplementary group list is obtain and it could not be.

System action: The utility terminates immediately.

User response: Check the EDC message for cause of failure.

FSUMF274 WARNING: file " `filename` " is not a regular file nor a directory... skipping

Explanation: ACLs can only be set on regular files and directories.

System action: The utility continues on the next file.

User response: Check the filenames and try again.

FSUMF275 WARNING: file " `filename` " is not a directory

Explanation: The user specified a -d or -f option which applies only to directories.

System action: The utility continues to the next file.

User response: Check the option and/or filenames and try again.

FSUMF277 acl_to_text() failed and could not display extended acl entries for file `filename`

Explanation: The C-RTL function is used to convert the extended acl entries into a string to be displayed. That function failed.

System action: The utility continues.

User response: Check the additional errors being displayed.

FSUMF278 Someone is adding ACL entries as we try to get them for file `filename`

Explanation: While the utility is trying to get all the ACL entries, the number of extended ACL entries in the file is increasing.

System action: The utility continues.

User response: Reissue the command.

FSUMF279 Could not get acl_type ACL for file " `filename` "

Explanation: There was an error when the command tried to get the ACL information for the file.

System action: The utility terminates immediately if out of memory otherwise it continues.

User response: Check the additional errors being displayed.

FSUMF280 Could not restore acl_type ACL for file " `filename` "

Explanation: There was an error when the command tried to restore ACL information for the target file.

System action: The utility continues.
User response: Check the additional errors being displayed.

FSUMF300 Unable to allocate output descriptor:
  bpxwdyn return code=rc

Explanation: The internal routine bpxwdyn failed while attempting to create an output descriptor. rc is the return code value returned from bpxwdyn. This error should not occur under normal circumstances and may be the result of an internal problem with bpxwdyn or the utility that invoked it.

System action: The utility terminates immediately.

User response: Retry the command and if the problem persists, note the return code and follow local procedures for reporting a problem to IBM.

FSUMF301 Unable to allocate output descriptor:
  reason code=rsn, info code=info

Explanation: The utility was unable to allocate an output descriptor. rsn is the dynamic output return code (S99ERROR) and info is the information code (S99INFO).

System action: The utility terminates immediately.

User response: A return code of 0x4 and info code of 0x0401 are most likely caused by the utility running in shared address space. Turn off the shared attribute bit using extattr and contact your system programmer to investigate the process used to install the utility. All other codes can be looked up in the dynamic output return codes table found in the z/OS MVS Programming: Authorized Assembler Services Guide. If the problem cannot be resolved, note the return and info codes and contact your system programmer or follow local procedures for reporting a problem to IBM.

FSUMF302 readdir() failed: reason code hex_{value}

Explanation: The C-RTL function readdir() failed.

System action: The command terminates.

User response: Check the EDC message and the errno2 reason code given.

FSUMF310 preserving ACL information

Explanation: This message indicates that a special header record has been created to preserve extended ACL (Access Control List) information associated with this file.

System action: Processing continues.

User response: This is an informational message. Extended ACL information cannot be stored in the archive using the standard archive format. The use of special header records will be required to store the ACL information. Refer to the z/OS UNIX System Services Command Reference for more information about the pax/tar special header files.

FSUMF311 cmd: cannot set ACLs.

Explanation: This message is displayed when the cmd utility could not set ACLs on one or more files. Additional messages may be displayed with more specific information on the failure. Generally, this error indicates that the user does not have sufficient authority.

System action: Processing ends.

User response: Review any additional messages for the reason and take appropriate action. Verify that you have sufficient authority.

FSUMF312 unknown error: ioctl(action) failed,
  reason=0xhexnum1, info=0xhexnum2

Explanation: An unexpected error occurred when attempting to perform action with ioctl(). The reason code and info code are provided.

System action: The program ends.

User response: This error indicates an unexpected problem retrieving or setting ACLs which is not expected. Retry the command. If it continues to fail, note the reason code and info code and follow local procedures for reporting the problem to IBM.

FSUMF313 Could not restore ACLs. Too many entries.

Explanation: The system limit for ACL entries per file is less than the number of ACL entries attempted to be set.

System action: The program ends.

User response: Determine the ACL entries limit for your system and set no more than this limit. For pax and tar, the -oA or -LA options, respectively, can be used to display the ACLs being set. This information can be captured and used to manually restore ACL entries.

FSUMF314 pathname too long to be saved in tar format-- saved as: newpath

Explanation: The pathname of the source file is greater than 100 characters and so cannot be stored using the original tar archive format. It has been shortened to a new pathname newname that is less than or equal to 100 characters.

System action: Program continues.

User response: If the new name will not cause a problem, the user does not need to take any action. If the new pathname may cause a problem, the user may choose to specify the -U option which will cause tar to use the USTAR archive format which allows pathnames...
up to 255 characters, or the user may choose to simply rename the source file.

FSUMF315 Cannot define temporary file

Explanation: A temporary file was required to perform the requested operation (such as command substitution). The shell was unable to define a unique filename in a temporary directory. This may be due to a problem with the directory.

System action: The operation ends. The shell continues.

User response: If the TMPDIR variable specifies a directory name, ensure that it is a writable directory for the user. If TMPDIR is not defined, ensure that /tmp exists as a writable directory.

FSUMF316 Cannot open temporary file filename

Explanation: A temporary file was required to perform the requested operation (such as command substitution). The shell was unable to create or open the temporary file. A system error indicating the reason is displayed with this message.

System action: The operation ends. The shell continues.

User response: Fix the error indicated by the system error message.

FSUMF317 Integer overflow

Explanation: You specified an integer value that exceeds the maximum integer value allowed, as limited by the configuration variable LONG_MAX.

User response: Specify an integer within the valid range.

FSUMF318 The file owner uid (uid) does not match job owner uid (uid)

Explanation: The job owner who originally issued the cronjob or at job, is not the owner of the file containing the job. Either the file was modified or created manually or the username’s uid was changed.

User response: Using the content of the cronjob or at job, re-issue the cronjob/at command. The cronjob/at job files should never be changed nor created manually.

FSUMF319 File tag exists but pax cannot store the tag information using this format/option(s) for file filename

Explanation: The filename has the file tag set but the pax format/option used cannot store that information in the archive. In order to store the file tag, one of the following must be used: _OS390_USTAR=Y environment variable, -o saveext, or -x os390.

User response: Use the pax format/options which allow storing file tag information. Refer to z/OS UNIX System Services Command Reference or more information.

FSUMF320 Command: symbolic link “symlink”: this format/option(s) does not permit symbolic links to pathnames longer than n

Explanation: The format of the tar and USTAR archives does not allow the storing of symbolic links whose target pathname exceeds n characters. In order to store the greater than 100 characters symbolic links, one of the following must be used: _OS390_USTAR=Y environment variable, -o saveext, or -x os390.

System action: The program continues.

User response: For z/OS Release 8 or later, pax and tar support an extended USTAR format, which can store symbolic links whose target exceeds n characters. See z/OS UNIX System Services Command Reference or more information.

FSUMF323 ACLs exist but pax cannot store the ACL information using this format/option(s) for file filename

Explanation: The filename has the ACL set but the pax format/option used cannot store that information in the archive. In order to store the ACL, one of the following must be used: _OS390_USTAR=Y environment variable, -o saveext, or -x os390.

User response: Use the pax format/options which allow storing the ACLs information. Refer to z/OS UNIX System Services Command Reference or more information.

FSUMF324 ACLs exist but tar cannot store the ACL information using this format/option(s) for file filename

Explanation: The filename has the ACL set but the tar format/option used cannot store that information in the archive. In order to store the ACL, one of the following must be used: _OS390_USTAR=Y environment variable with -U, -UX, or -S.

User response: Use the tar format/options which allow storing the ACLs information. Refer to z/OS UNIX System Services Command Reference or more information.

FSUMF325 File tag exists but tar cannot store the tag information using this format/option(s) for file filename

Explanation: The filename has the file tag set but the tar format/option used cannot store that information in the archive. In order to store the file tag, one of the following must be used: _OS390_USTAR=Y environment variable, -o saveext, or -x os390.

User response: Use the tar format/options which allow storing file tag information. Refer to z/OS UNIX System Services Command Reference or more information.
environment variable and -U, -UX, or -S.

**User response:** Use the tar format/options which allow storing file tag information. Refer to [z/OS UNIX System Services Command Reference](https://www.ibm.com/support/docview.wss?uid=swg21275812) for more information.

---

**FSUMF327**  \_writedown failed

**Explanation:** A system error indicating the cause is displayed with this message.

**System action:** The command ends with an error exit status.

---

**FSUMF328**  Unexpected \_writedown query return value number

**Explanation:** A \_writedown query operation returned a value that is not recognized by the writedown command.

**System action:** The command ends with an error exit status.

**User response:** Contact the system programmer.

**System programmer response:** Follow local procedures for reporting problems to IBM.

---

**FSUMF329**  Cannot create temporary file "filename"

**Explanation:** A system error indicating the cause is displayed with this message.

**System action:** The command continues for the next file.

**User response:** Check the cause of error and after correcting the problem, issue the command again.

---

**FSUMF332**  Arithmetic overflow on limit number

**Explanation:** You specified a limit value that, when multiplied by the unit size, exceeds the maximum value allowed. The result of this multiplication must fit in an unsigned 64-bit integer.

**User response:** Specify a limit value within the valid range.

---

**FSUMF333**  CMD: command The file owner uid (uid) does not match job owner uid (uid)

**Explanation:** The job file owner must match the MVS identity of the user who issued the job, unless the job file owner is uid(0). The crontab/at jobs must not be created or changed directly without using crontab/at commands.

**System action:** The program continues to next item.

**User response:** Check the crontab/at job and re-issue under environment where the MVS identity is the same as the real uid (or uid is 0). See [z/OS UNIX System Services Command Reference](https://www.ibm.com/support/docview.wss?uid=swg21275812) for more information.
FSUMF339  Premature end of file reached on archive "filename". Extracted file "filename" is incomplete.
Explanation:  Pax or tar has read to the end of the archive file and it is not complete. It is possible the archive is corrupted.
System action:  The command ends.
User response:  Make sure the archive file is complete before reissuing the command.

FSUMF342  pid : Cannot superkill pid -1 (all processes)
Explanation:  A "kill -K" command specified a process id (pid) of -1. Pid -1 indicates that the superkill should be sent to all processes for which you are authorized. This is not supported for superkill.
System action:  Processing of pid -1 ends. If there are more arguments, the command continues.
User response:  Issue the "kill -K" command only for positive pid values which have not terminated from a prior "kill -s KILL".

FSUMF343  pid : Cannot superkill a process group
Explanation:  A "kill -K" command specified a process id (pid) of 0 or a negative value, indicating that the superkill should be sent to a process group. This is not supported for superkill.
System action:  Processing of pid ends. If there are more arguments, the command continues.
User response:  Issue the "kill -K" command only for positive pid values which have not terminated from a prior "kill -s KILL".

FSUMF344  pid : Cannot superkill without prior KILL signal to process
Explanation:  A "kill -K" command specified a process id (pid) that had not been sent a KILL signal at least 3 seconds earlier.
System action:  Processing of pid ends. If there are more arguments, the command continues.
User response:  Issue the "kill -s KILL" command for the pid. Wait 3 seconds. If the process does not terminate, then issue the "kill -K" command for the pid.

FSUMF345  pid : __superkill: reason code = reason_code
Explanation:  A "kill -K" command invoked the __superkill() service, which failed with the reported reason code.
System action:  Processing of pid ends. If there are more arguments, the command continues.
User response:  Take appropriate action based on reason code.

FSUMF346  job : pid : Cannot superkill a process group
Explanation:  A "kill -K" command specified a shell job, which indicates that the superkill should be sent to a process group. This is not supported for superkill.
System action:  Processing of job ends. If there are more arguments, the command continues.
User response:  Issue the "kill -K" command only for pids which have not terminated from a prior "kill -s KILL".

FSUMF347  job : pid : __superkill: reason code = reason_code
Explanation:  A "kill -K" command invoked the __superkill() service, which failed with the reported reason code.
System action:  Processing of job ends. If there are more arguments, the command continues.
User response:  Take appropriate action based on reason code.

FSUMF348  Unexpected wordexp() return value number
Explanation:  A word expansion operation returned a value that is not recognized by the mailx command.
System action:  The command continues.
User response:  Verify the user issuing mailx has a default HOME directory defined. If unable to resolve the problem, contact the system programmer.
System programmer response:  Follow local procedures for reporting problems to IBM.

FSUMF349  "file_name": block size of target is 0.
Explanation:  MVS target has an invalid blocksize.
System action:  The command ends.
User response:  Make sure the block size of MVS target is valid.

FSUMF350  I/O buffer is not big enough. buffer size : size data or attribute : size
Explanation:  System is unable to allocate I/O buffer big enough.
System action:  The command ends.
User response:  Contact your system programmer.
System programmer response:  Follow local procedures for reporting a problem to IBM.
FSUMF351 "file_name": record length of target is invalid.
Explanation: MVS target has an invalid record length.
System action: The command ends.
User response: Make sure the record length of MVS target is valid.

FSUMF352 Warning: IEWBIND function "function" had return code return_code and reason code reason_code
Explanation: During converting load module format, IEWBIND function had return code greater than 0.
System action: The command continues.
User response: Check the return code and reason code in z/OS MVS Program Management: Advanced Facilities.

FSUMF353 __chattr() could not set audit_flag_type audit flags for filename
Explanation: The __chattr() service failed.
User response: Check the system error message displayed with this message. To set auditor audit flags the invoking user id must have the AUDITOR attribute set in the system security product.
System action: The audit flags of the file specified in the error message were not changed. The command continues.

FSUMF354 timestamp cron: failed to start a scheduled job. See the cron log for details.
Explanation: The cron daemon could not start a scheduled job.
User response: Check the cron log for details of the error.
System action: The cron daemon continues. Failed at or batch jobs are deleted from the queues. If the error indicated in the log is corrected, a failed crontab job will be started when it is next scheduled to run.

FSUMF355 tmpnam() returned an empty filename
Explanation: tmpnam() was unable to define a unique file name in a temporary directory. This may be due to a problem with the directory.
User response: If the TMPDIR variable specified a directory name when the cron daemon was started, ensure that it is a writable directory for the user who started the cron daemon. If TMPDIR was not defined, ensure that /tmp exists as a writable directory.
System action: The cron daemon continues.

FSUMF356 Preserving pathname information which is too long to store in a USTAR header.
Explanation: This message indicates that a special header record has been created to preserve pathname information that is too long to be stored in the USTAR header block. This can be due to a number of reasons:
1. The pathname is greater than 255 characters long.
2. The pathname cannot be split on a / such that the final component after the split fits in the 100 character name field of the tar header block.
3. The initial component after the split is too long to fit in the 155 character prefix field of the tar header block.
System action: Processing continues.

FSUMF357 No value specified after -W keyword "keyword".
Explanation: -W keyword keyword requires keyword=value format.
System action: The command ends.
User response: Specify a value after the keyword.

FSUMF358 Cannot copy symbolic link symbolic_link to an MVS data set.
Explanation: An attempt was made to copy or move a symbolic link to an MVS data set with -P when variable _UNIX03=YES is set. Symbolic links only exist in UNIX file systems.
System action: Processing for the symbolic link ends and the command continues.
User response: Make sure the target is not an MVS data set when using -P to process symbolic links.

FSUMF359 Syntax error on -W argument : error
Explanation: A syntax error occurred while parsing the -W argument string.
System action: The command ends.
User response: Fix the syntax error and try again.

FSUMF360 Error processing -W argument : error
Explanation: An error indicated by error occurred while parsing the -W argument string.
System action: The command ends.
**User response:** Take appropriate action based on the displayed error. If unable to resolve the error, contact your system programmer.

**System programmer response:** Follow local procedures for reporting a problem to IBM.

---

**FSUMF368**  
**chmod() failed while changing the file permissions for filename.**

**Explanation:** An error occurred while attempting to change the file permissions for filename. The system error indicating the cause is displayed with this message.

**System action:** The command continues.

**User response:** Refer to [z/OS XL C/C++ Run-Time Library Reference](#) for an explanation of the system error. If unable to resolve the error, contact your system programmer.

**System programmer response:** Follow local procedures for reporting a problem to IBM.

---

**FSUMF372**  
**Error processing pax extended header.**

**Explanation:** There is a formatting error in a pax extended header in the archive being processed.

**System action:** The command ends.

**User response:** Verify that the archive file is not corrupted.

**System programmer response:** Follow local procedures for reporting a problem to IBM.

---

**FSUMF373**  
**Invalid value "value" for keyword "keyword" for file "filename"**

**Explanation:** pax could not set the attribute corresponding to the specified keyword while extracting or listing the file indicated. The user specified an invalid value for an extended header keyword.

**System action:** The command continues.

**User response:** Verify the syntax for the extended header keyword.

**System programmer response:** If the correct syntax is specified and the problem persists, follow local procedures for reporting a problem to IBM.

---

**FSUMF382**  
**A break or continue statement cannot occur outside of a loop.**

**Explanation:** A break or continue statement can only be inside the do/while/for loop.

**System action:** The command ends.

**User response:** Verify that the location of the break or continue statement is correct.

---

**FSUMF383**  
**No remembered replacement string.**

**Explanation:** Before you can use the % character as the replacement string, the s command must have been previously issued. This error only occurs when variable _UNIX03=NO is set.

**System action:** The command continues.

**User response:** If there was no previous s command, do not use the % character as the replacement string.

---

**FSUMF384**  
**Mark name 'variable' is not currently present in the edit buffer.**

**Explanation:** An error occurred while attempting to access a mark that is not present in the edit buffer. This error only occurs when variable _UNIX03=NO is set.

**System action:** The command continues.

**User response:** Make sure variable has been set to
mark a line and the line has not been deleted or modified.

FSUMF385 The '!' command cannot be followed by blank characters.
Explanation: The '!' command cannot be followed by blank characters. This error only occurs when variable _UNIX03=YES is set.
System action: The command ends.
User response: Reissue the command without any blank characters after the '!' command.

FSUMF386 The filename argument "filename" must be preceded by one or more blank characters.
Explanation: When using the s command with the w flag, the filename argument filename must be preceded by one or more blank characters. This error only occurs when variable _UNIX03=YES is set.
System action: The command ends.
User response: Add one or more blank characters before the filename argument in the s command. For example, change 's/a/b/wfile' to 's/a/b/w file'.

FSUMF388 The label is too long and cannot allocate buffer.
Explanation: The label was too long and there was not enough memory when trying to resize the pattern buffer to contain the label.
System action: The command ends.
User response: Reduce label's length.

FSUMF389 Input line is too long and cannot allocate buffer.
Explanation: A line in the input file was too long and there was not enough memory when trying to resize the pattern buffer.
System action: The command ends.
User response: Make sure that the input file is a text file and every line is not longer than 10240 bytes.

FSUMF390 Pattern space overflow during G command and cannot allocate buffer.
Explanation: The content of the hold buffer was too long to be appended to the pattern buffer, and there was not enough memory when trying to resize the pattern buffer.
System action: The command ends.
User response: Place a smaller amount of text in the hold buffer.

FSUMF391 Hold space overflow during H command and cannot allocate buffer.
Explanation: The content of the pattern buffer was too long to be appended to the hold buffer, and there was not enough memory when trying to resize the hold buffer.
System action: The command ends.
User response: Place a smaller amount of text in the pattern buffer.

FSUMF397 name: cannot open: string
Explanation: Could not open the file. This message is followed by a system error describing the specific reason for the error.
System action: The program continues.
User response: Refer to the system error message and take appropriate action.

FSUMF400 file: internal error
Explanation: There was an internal error when reading the magic files.
System action: The command ends.
User response: Follow local procedures for reporting problems to IBM.

FSUMF403 Invalid keyword "keyword" in listopt string.
Explanation: pax could not process the listopt string because it contained an invalid keyword in a format specifier.
System action: The command ends.
User response: The keyword must be one of the field name entries in ustar header block and octet-oriented cpio archive entry or one of the pax extended header keywords.

FSUMF404 Path name is too long(> length)
Explanation: The path name specified on the command line exceeds the displayed number bytes.
System action: The command ends.
User response: Path name exceeds a limitation of ls command and it is not supported.

FSUMF405 Warning: Non-object file "filename(member_name)" was partially processed as an object file. Symbol processing for this file is ended. Bad magic 0x/hexadecimal was found.
Explanation: For the ar command, archive file
member member_name had object file format records and external symbols may have been added to the archive symbol table. When ar found an invalid record starting with hexadecimal, it treated the file as a non-object file. The file is a member of the archive, but additional external symbols from the file were not added to the archive symbol table. For the nm command, file filename or archive file member member_name had object file format records and the external symbols for the file may have been output. When nm found an invalid record starting with hexadecimal, it stopped displaying external symbols from the file. For the make command, archive file member member_name had object file format records and the external symbols may have been recognized. When make found an invalid record starting with hexadecimal, it stopped searching external symbols of the archive file member.

System action: The command continues without setting an exit status.

User response: Check the file or archive file member to make sure it is not corrupted. If the file is an object file, it has an invalid format, and needs to be replaced. If the file is not an object file, no action is required.

---

FSUMF406 shglob: Internal error
(ep=0xhexadecimal)

Explanation: An internal error occurred in the shell during pathname expansion.

System action: The shell continues to run.

User response: Follow your local procedures for reporting problems to IBM.

---

FSUMF407 closedir failed in pathname expansion.

Explanation: The closedir operation failed during shell pathname expansion. This message is followed by a system error describing the specific reason for the failure.

System action: The shell continues to run.

User response: Refer to the system error message and take appropriate action. If the problem continues, follow your local procedures for reporting problems to IBM.

---

FSUMF408 Warning: A break or continue statement occurred outside of a loop.

Explanation: A break or continue statement should only be inside the do/while/for loop.

System action: The awk script exits the current pattern or function and the command continues.

User response: Verify that the location of the break or continue statement is correct.
Parallel Environment messages

FOMM

FOMM0001 Invalid source task (number) in string, task number

Explanation: The value of src (source task ID) is out of range.
User response: Make sure that the source task id is within the range 0 to N-1, where N is the number of tasks in the partition.

FOMM0002 Invalid destination task (number) in string, task number

Explanation: The value of dest (destination task id) is out of range.
User response: Make sure that the destination task id is within the range 0 to N-1, where N is the number of tasks in the partition.

FOMM0004 Invalid message type (number) in string, task number

Explanation: The value specified for type (message type) is out of range.
User response: Make sure that the message type is within the allowable range.

FOMM0006 Invalid message buffer addr= number in string, task number

Explanation: The message buffer address cannot be valid.
User response: Make sure that the buffer is correctly identified in the call.

FOMM0013 Out of memory, task number

Explanation: There is insufficient memory available to continue.
User response: Reduce the size of user storage required per task.

FOMM0014 Internal error: string, task number

Explanation: An internal software error occurred during execution.
User response: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMM0015 System error: string, task number

FOMM0017 Receive buffer too small, task number

Explanation: The buffer specified for the operation was too small to hold the received message.
User response: Increase the size of the buffer or reduce the size of the message.

FOMM0018 Too many messages, task number

Explanation: Too many outgoing and incoming messages have been posted without being completed.
User response: Make sure that MP_WAIT (mpc_wait) is being called to complete pending non-blocking sends and receives. In addition, make sure that for each message sent, there is a corresponding receive issued by some task.

FOMM0021 Invalid task rank (number) in string, task number

Explanation: The same source task was not specified by each task in the group.
User response: Make sure that each task specifies the same source task.

FOMM0024 Invalid task group list (number) in string, task number

Explanation: The list of task ids for the group (glist) contains one or more invalid task ids.
User response: Make sure that the local task id is included in the group list, and that all of the task ids in the list are within the range 0 to N-1, where N is the number of tasks in the partition.

FOMM0026 Inconsistent source task in string, task number

Explanation: The same source task was not specified by each task in the group.
User response: Make sure that each task specifies the same source task.

FOMM0027 Inconsistent destination task in string, task number
**Explanation:** The same destination task was not specified by each task in the group.

**User response:** Make sure that each task specifies the same destination task.

---

**FOMM0028** Inconsistent message length in *string, task number*

**Explanation:** The same message length was not specified by each task in the group.

**User response:** Make sure that each task specifies the same message length.

---

**FOMM0029** Inconsistent step value in *string, task number*

**Explanation:** The same value of step was not specified by each task in the group.

**User response:** Make sure that each task specifies the same step value.

---

**FOMM0030** Inconsistent flag value in *string, task number*

**Explanation:** The same value of flag was not specified by each task in the group.

**User response:** Make sure that each task specifies the same flag value.

---

**FOMM0031** Inconsistent gsize value in *string, task number*

**Explanation:** The same value of gsize was not specified by each task in the group.

**User response:** Make sure that each task specifies the same gsize value.

---

**FOMM0032** Inconsistent label value in *string, task number*

**Explanation:** The same value of label was not specified by each task in the group.

**User response:** Make sure that each task specifies the same label value.

---

**FOMM0033** Inconsistent task group list in *string, task number*

**Explanation:** The same task group list was not specified by each task in the group.

**User response:** Make sure that each task specifies the same task group list.

---

**FOMM0035** Buffer changed before message completion, task number

**Explanation:** The contents of a buffer posted by a non-blocking send operation were modified before the send was completed.

**User response:** Make sure that the buffer used to send a message is not reused before a WAIT or STATUS operation indicates that the send is complete.

---

**FOMM0050** Invalid buffer pointer

**Explanation:** This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred. Since much of the information defining an MPI message buffer is buried in the MPI_Datatype, accurate detection of an invalid buffer would be prohibitively expensive. Although this error class is defined by the MPI Standard, it is not used.

**User response:** See the entry for the specific error code returned by the MPI function.

**Problem determination:** MPI_ERR_BUFFER

---

**FOMM0051** Invalid count argument

**Explanation:** This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.

**User response:** See the entry for the specific error code returned by the MPI function.

**Problem determination:** MPI_ERR_COUNT

---

**FOMM0052** Invalid datatype argument

**Explanation:** This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.

**User response:** See the entry for the specific error code returned by the MPI function.

**Problem determination:** MPI_ERR_TYPE

---

**FOMM0053** Invalid tag argument

**Explanation:** This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.

**User response:** See the entry for the specific error code returned by the MPI function.

**Problem determination:** MPI_ERR_TAG

</table>
FOMM0066 Internal MPI error
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_INTERN

FOMM0067 Error code is in status
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_IN_STATUS

FOMM0068 Pending request
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_PENDING

FOMM0069 Invalid info key
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specified error code returned by the MPI function.
Problem determination: MPI_ERR_INFO_KEY

FOMM0070 Invalid info value
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_INFO_VALUE

FOMM0071 Info key not defined
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_INFO_NOKEY

FOMM0072 Invalid info
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_INFO

FOMM0073 Invalid file handle
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_FILE

FOMM0074 Collective arguments not identical or erroneous collective call order
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_NOT_SAME

FOMM0075 Invalid access mode
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_AMODE

FOMM0076 Unsupported data representation
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_UNSUPPORTED_DATAREP

FOMM0077 Unsupported operation
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_UNSUPPORTED_OPERATION
FOMM0078 File does not exist
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_NO_SUCH_FILE

Problem determination: MPI_ERR_NO_SUCH_FILE
FOMM0079 File exists
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_FILE_EXISTS

Problem determination: MPI_ERR_FILE_EXISTS
FOMM0080 Invalid file name
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_BAD_FILE

Problem determination: MPI_ERR_BAD_FILE
FOMM0081 Permission denied
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_ACCESS

Problem determination: MPI_ERR_ACCESS
FOMM0082 Not enough space
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_NO_SPACE

Problem determination: MPI_ERR_NO_SPACE
FOMM0083 Quota exceeded
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_QUOTA

Problem determination: MPI_ERR_QUOTA
FOMM0084 Read-only file or file system
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_READ_ONLY

Problem determination: MPI_ERR_READ_ONLY
FOMM0085 File currently in use
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_FILE_IN_USE

Problem determination: MPI_ERR_FILE_IN_USE
FOMM0086 Data representation already defined
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_DUP_DATAREP

Problem determination: MPI_ERR_DUP_DATAREP
FOMM0087 An error occurred in data conversion
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_CONVERSION

Problem determination: MPI_ERR_CONVERSION
FOMM0088 Known I/O error not in this list
Explanation: This is an MPI error class, returned by MPI_Error_class. It provides a broad description of the type of error that occurred.
User response: See the entry for the specific error code returned by the MPI function.
Problem determination: MPI_ERR_IO

Problem determination: MPI_ERR_IO
FOMM0100 No error
Explanation: The function completed successfully.
User response: No response required.
Problem determination: MPI_SUCCESS
FOMM0101  Invalid source rank (number) in string, task number
Explanation: The value of source (source rank) is out of range.
User response: Make sure that the source rank is within the range 0 to N-1, where N is the number of tasks in the communicator group.
Problem determination: MPI_ERR_RANK

FOMM0102  Invalid destination rank (number) in string, task number
Explanation: The value of dest (destination rank) is out of range.
User response: Make sure that the destination rank is within the range 0 to N-1, where N is the number of tasks in the communicator group.
Problem determination: MPI_ERR_RANK

FOMM0103  Invalid count (number) in string, task number
Explanation: The value of count (element count) is out of range.
User response: Make sure that the count is greater than or equal to zero.
Problem determination: MPI_ERR_COUNT

FOMM0104  Invalid message tag (number) in string, task number
Explanation: The value specified for tag (message tag) is out of range.
User response: Make sure that the message tag is within the range zero to val, as specified by MPI_Attr_get(MPI_COMM_WORLD,MPI_TAG_UB,&val,&flag).
Problem determination: MPI_ERR_TAG

FOMM0105  Invalid group handle (number) in string, task number
Explanation: The specified group handle is undefined or NULL.
User response: Make sure that the group handle is either predefined or was returned by an MPI function.
Problem determination: MPI_ERR_GROUP

FOMM0106  Negative length or position for buffer (number) in string, task number
Explanation: The value specified does not represent a valid buffer.
User response: Make sure that the buffer is non-zero.

Problem determination: MPI_ERR_BUFFER

FOMM0107  Invalid stride (number) in string, task number
Explanation: The value specified for stride is invalid.
User response: Make sure that the value(s) of stride is non-zero.
Problem determination: MPI_ERR_ARG

FOMM0108  Invalid use of NULL request in string, task number
Explanation: A NULL request is not allowed as input to the function.
User response: Make sure that the request is valid.
Problem determination: MPI_ERR_REQUEST

FOMM0109  Uncommitted datatype (number) in string, task number
Explanation: The datatype handle has not been committed.
User response: Make sure that you call MPI_Type_commit to commit the datatype before using it in the specified function.
Problem determination: MPI_ERR_TYPE

FOMM0110  Attempt to free a predefined datatype (number) in string, task number
Explanation: It is invalid to attempt to free a predefined datatype.
User response: Only call MPI_Type_free for user-defined datatypes.
Problem determination: MPI_ERR_TYPE

FOMM0111  Invalid blocklength (number) in type constructor string, task number
Explanation: The value specified for blocklength is invalid.
User response: Make sure that blocklength is greater than or equal to zero.
Problem determination: MPI_ERR_COUNT

FOMM0112  Collective requests not supported in string, task number
Explanation: This function does not support the non-blocking collective communication extensions to MPI.
User response: Only use point-to-point request handles with this function.
Problem determination: MPI_ERR_REQUEST

FOMM0113 Out of memory in string, task number
Explanation: There is insufficient memory available to continue.
User response: Reduce the size of user storage required per task.

Problem determination: MPI_ERR_INTER

FOMM0114 MPI internal error: string in string, task number
Explanation: An internal software error occurred within MPI, during execution.
User response: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

Problem determination: MPI_ERR_INTER

FOMM0115 System error: string in string task number
Explanation: A system software error occurred during execution.
User response: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

Problem determination: MPI_ERR_INTER

FOMM0116 Null function not allowed in string, task number
Explanation: The value NULL (zero) was specified for function.
User response: A valid function must be specified. If a do-nothing function is desired, it must be supplied by the user.

Problem determination: MPI_ERR_OTHER

FOMM0117 User pack or receive buffer is too small (number) in string, task number
Explanation: The buffer specified for the operation was too small to hold the message. In the PACK and UNPACK cases it is the space between current position and buffer end which is too small.
User response: Increase the size of the buffer or reduce the size of the message.

Problem determination: MPI_ERR_TRUNCATE

FOMM0118 Invalid datatype (number) in string, task number
Explanation: The datatype is not a valid argument to the function.
User response: The MPI_Datatypes (MPI_LB, MPI_UB, MPI_PACKED) are not valid in all functions. Make sure the type being use is valid for the function.

Problem determination: MPI_ERR_TYPE

FOMM0119 Datatype already committed (number) in string, task number
Explanation: It is invalid to try to commit a datatype that is already committed.
User response: Avoid calling MPI_Type_commit more than once per user defined datatype.

Problem determination: MPI_ERR_TYPE

FOMM0120 Declaration has upper bound < lower bound (number) in string, task number
Explanation: No datatype can be defined with negative extent (upper bound less than lower bound).
User response: Make sure any MPI_LB or MPI_UB argument to MPI_Type_struct is consistent with the layout being defined.

Problem determination: MPI_ERR_ARG

FOMM0121 Invalid rank (number) in string, task number
Explanation: The value specified for rank is out of range.
User response: Make sure that rank is within the range 0 to N-1, where N is the number of tasks in the group or communicator.

Problem determination: MPI_ERR_RANK

FOMM0122 Invalid dimension (number) in string, task number
Explanation: The specified dimension is invalid.
User response: Make sure that all dimension values are valid for the function.

Problem determination: MPI_ERR_DIMS

FOMM0123 MPI_DATATYPE_NULL not valid in string, task number
Explanation: The datatype is one which has already been freed.
User response: Free a datatype only when it is known that it will not be needed again.
Problem determination:  MPI_ERR_TYPE

FOMM0124  Illegal use of predefined key (number) in string, task number
Explanation:  The specified keyval is predefined.
User response:  Only user-defined keys are allowed with this function.
Problem determination:  MPI_ERR_OTHER

FOMM0125  Duplicate rank (number) in string, task number
Explanation:  A duplicate rank was found in the group list.
User response:  Make sure that each rank in the group list is included only once.
Problem determination:  MPI_ERR_RANK

FOMM0126  Inconsistent message size (number) in string, task number
Explanation:  Collective operations require that the amount of data sent must equal the amount received, pairwise between nodes.
User response:  Make sure that all (count,datatype) pairs used in collective communication operations specify the same number of bytes for sender and receiver.
Problem determination:  MPI_ERR_NOT_SAME

FOMM0127  Inconsistent reduction operator (number) in string, task number
Explanation:  The participants in a collective operation did not all specify the same value for op.
User response:  Make sure that op is identical for all tasks making the call.
Problem determination:  MPI_ERR_NOT_SAME

FOMM0128  Inconsistent root node (number) in string, task number
Explanation:  The participants in a collective operation did not all specify the same value for root.
User response:  Make sure that root is identical for all tasks making the call.
Problem determination:  MPI_ERR_NOT_SAME

FOMM0129  Can’t use an intercommunicator (number) in string, task number
Explanation:  Only intracomunicators are valid with this function.
User response:  Make sure that comm is a handle for an intracommunicator.
Problem determination:  MPI_ERR_COMM

FOMM0130  Can’t use an intracommunicator (number) in string, task number
Explanation:  Only inter-communicators are valid with this function.
User response:  Make sure that comm is a handle for an intercommunicator.
Problem determination:  MPI_ERR_COMM

FOMM0131  Can’t free a predefined communicator (number) in string, task number
Explanation:  It is illegal to try to free a predefined communicator.
User response:  Only attempt to free user-defined communicators.
Problem determination:  MPI_ERR_COMM

FOMM0132  Only valid with graph topology (number) in string, task number
Explanation:  This function is only valid for communicators with graph topologies.
User response:  Make sure that the communicator has a graph topology. See MPI_Graph_create.
Problem determination:  MPI_ERR_COMM

FOMM0133  Only valid with cartesian topology (number) in string, task number
Explanation:  This function is only valid for communicators with cartesian topologies.
User response:  Make sure that the communicator has a cartesian topology. See MPI_Cart_create.
Problem determination:  MPI_ERR_COMM

FOMM0134  A Buffer is already attached in string, task number
Explanation:  An attempt was made to attach a buffer when a buffer was already attached.
User response:  Call MPI_Buffer_detach first to remove the current buffer.
Problem determination:  MPI_ERR_OTHER

FOMM0135  Illegal send buffer update in string, task number
Explanation:  The contents of a buffer posted by a non-blocking send operation were modified before the send was completed.
User response: Make sure that the buffer used to send a message is not reused before a WAIT or STATUS operation indicates that the send is complete.

Problem determination: MPI_ERR_OTHER

FOMM0136 Invalid communicator (number) in string, task number
Explanation: The value used for communicator is not a valid communicator handle.
User response: Make sure that the communicator is valid (predefined or created by an MPI function) and has not been freed by MPI_Comm_free.
Problem determination: MPI_ERR_COMM

FOMM0137 Invalid keyval (number) in string, task number
Explanation: The value used for keyval is not a valid attribute key handle.
User response: Make sure that the key handle is valid (predefined or created by an MPI function) and has not been freed by MPI_Keyval_free.
Problem determination: MPI_ERR_ARG

FOMM0138 Undefined datatype (number) in string, task number
Explanation: The datatype handle does not represent a defined datatype.
User response: Make sure the MPI_Datatype argument is either an MPI predefined type or has been defined by an MPI type constructor function.
Problem determination: MPI_ERR_TYPE

FOMM0139 Invalid reduction operation (number) in string, task number
Explanation: The value used for op is not a valid reduction operation handle.
User response: Make sure that the op handle is valid (predefined or created by an MPI function) and has not been freed by MPI_Op_free.
Problem determination: MPI_ERR_OP

FOMM0140 Invalid error code (number) in string, task number
Explanation: The value used for code is not a valid error code.
User response: Make sure that the error code was returned by an MPI function.
Problem determination: MPI_ERR_ARG

FOMM0141 Invalid error handler (number) in string, task number
Explanation: The value used for errhandler is not a valid error handler handle.
User response: Make sure that the errhandler handle is valid and has not been freed by MPI_Errhandler_free. A valid errhandler handle is one which is predefined or which was created by a call to create an errhandler for the same object type (for example, a file error handler cannot be used as the error handler for a communicator.
Problem determination: MPI_ERR_ARG

FOMM0142 Invalid task count (number) in string, task number
Explanation: An invalid number of tasks was specified (either explicitly, or implicitly).
User response: Make sure that the number of tasks is non-negative, and is not greater than the size of the communicator.
Problem determination: MPI_ERR_ARG

FOMM0143 Invalid dimension count (number) in string, task number
Explanation: The value specified for ndims is invalid.
User response: Make sure that the number of dimensions is greater than zero.
Problem determination: MPI_ERR_DIMS

FOMM0144 There is no solution in string, task number
Explanation: There is no set of dimensions which satisfies the conditions required by a call to MPI_Dims_create.
User response: Modify the parameters used in the call to MPI_Dims_create so that a solution is possible.
Problem determination: MPI_ERR_DIMS

FOMM0145 Invalid array size (number) in string, task number
Explanation: An array size was specified to be less than zero.
User response: Make sure that all array sizes (specified by maxdims, maxedges, maxindex, etc.) are non-negative.
Problem determination: MPI_ERR_ARG
FOMM0146 Invalid neighbor rank (number) in string, task number

Explanation: An invalid rank was used for an element of the edges array.

User response: Make sure that all elements of the edges array are greater than or equal to zero, and less than nnodes.

Problem determination: MPI_ERR_RANK

FOMM0147 Invalid coordinate (number) in string, task number

Explanation: The value specified is not a valid process coordinate in the communicator comm.

User response: Make sure that each coordinate is in the range zero to N-1, where N is the size of the corresponding dimension of the cartesian topology associated with comm.

Problem determination: MPI_ERR_ARG

FOMM0148 Invalid root (number) in string, task number

Explanation: The value specified for root is not a valid process rank in the communicator comm.

User response: Make sure that root is within the range zero to N-1, where N is the number of tasks in the group associated with comm. N can be determined by calling MPI_Comm_size.

Problem determination: MPI_ERR_ROOT

FOMM0149 MPI is already initialized in string, task number

Explanation: A call to MPI_Init was made when MPI was already initialized.

User response: If in doubt, make sure that MPI is not already initialized (by calling MPI_Initialized) before calling MPI_Init.

Problem determination: MPI_ERR_OTHER

FOMM0150 MPI is not initialized in string, task number

Explanation: A call to an MPI function other than MPI_Init or MPI_Initialized was made before MPI was initialized.

User response: Call MPI_Init before any other MPI function other than MPI_Initialized.

Problem determination: MPI_ERR_OTHER

FOMM0151 MPI is already finalized in string, task number

Explanation: A call to an MPI function was made when MPI was in the finalized state.

User response: Do not call any MPI function after calling MPI_Finalize.

Problem determination: MPI_ERR_OTHER

FOMM0152 Inconsistent algorithm selected in string, task number

Explanation: The collective function resulted in different algorithms being selected by different nodes.

User response: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

Problem determination: MPI_ERR_INTERN

FOMM0153 Inconsistent datatype (number) in string, task number

Explanation: Different datatypes were used by different tasks in the collective communication operation.

User response: Make sure that all tasks use the same datatype.

Problem determination: MPI_ERR_NOT_SAME

FOMM0154 Not a persistent request (number), string, task number

Explanation: An attempt was made to start a non-persistent request.

User response: Make sure that the request handle is associated with a persistent request (for example, it was returned by MPI_Send_init, MPI_Recv_init, etc.).

Problem determination: MPI_ERR_REQUEST

FOMM0155 Invalid number of ranks specified (number) in string, task number

Explanation: The number of process ranks specified (either explicitly or implicitly) is out of range.

User response: Make sure that the rank count is between zero and the number of tasks in the group, inclusive.

Problem determination: MPI_ERR_ARG

FOMM0156 Group is not a subset of communicator (number), in string, task number

Explanation: The group specified in MPI_Comm_create is not a subset of the group associated with comm.
User response: Make sure that all of the process ranks in group are also in comm.

Problem determination: MPI_ERR_GROUP

FOMM0157 Invalid request handle (number) in string, task number
Explanation: The value specified is not a valid request handle.
User response: Make sure that the request handle was returned by an MPI function.
Problem determination: MPI_ERR_REQUEST

FOMM0158 Persistent request already active (number) in string, task number
Explanation: An attempt was made to start a persistent request when the request was already active.
User response: Complete the request by calling MPI_Wait, MPI_Test, etc. before starting it again.
Problem determination: MPI_ERR_REQUEST

FOMM0159 Can't free an active receive request (number) in string, task number
Explanation: An attempt was made to free an active receive request (by calling MPI_Request_free).
User response: Active receive requests should never be freed, as there is no way to verify that the receive has completed.
Problem determination: MPI_ERR_REQUEST

FOMM0160 Too many communicators (number) in string, task number
Explanation: MPI is unable to create a new communicator because the maximum number of simultaneous communicators would be exceeded.
User response: Be sure to free unneeded communicators with MPI_Comm_free so that they can be reused.
Problem determination: MPI_ERR_COMM

FOMM0161 Can't free a predefined reduction op (number) in string, task number
Explanation: An attempt was made to free a predefined MPI reduction op.
User response: Only use MPI_Op_free to free user-defined ops.
Problem determination: MPI_ERR_OP

FOMM0162 Can't free a predefined error handler (number) in string, task number
Explanation: An attempt was made to free a predefined MPI error handler.
User response: Only use MPI_Errhandler_free to free user-defined error handlers.
Problem determination: MPI_ERR_ARG

FOMM0163 Copy callback failed in string, task number
Explanation: A non-zero return code was returned by the copy callback function associated with an attribute keyval. The specific value returned by the copy callback function is not available via MPI.
User response: Make sure that user-defined copy callback functions are functioning correctly, and are returning MPI_SUCCESS upon successful completion.
Problem determination: MPI_ERR_OTHER

FOMM0164 Delete callback failed in string, task number
Explanation: A non-zero return code was returned by the delete callback function associated with an attribute keyval. The specific value returned by the copy callback function is not available via MPI.
User response: Make sure that user-defined delete callback functions are functioning correctly, and are returning MPI_SUCCESS upon successful completion.
Problem determination: MPI_ERR_OTHER

FOMM0165 Out of buffer space in string, task number
Explanation: There is insufficient buffer space available to complete the buffered send.
User response: Use MPI_Buffer_attach to attach a larger buffer.
Problem determination: MPI_ERR_BUFFER

FOMM0166 Local and remote leaders are the same (number) in string, task number
Explanation: The local and remote leaders are not allowed to be the same task, as this would create an intercommunicator with overlapping local and remote groups.
User response: Make sure the local and remote leaders are distinct.
Problem determination: MPI_ERR_RANK
FOMM0167  Local and remote groups overlap (number) in string, task number

Explanation: The local and remote groups are not allowed to overlap.

User response: Make sure the local and remote groups are disjoint.

Problem determination: MPI_ERR_RANK

FOMM0168  Invalid reduction operation/datatype combination (number) in string, task number

Explanation: The combination of reduction operation and datatype specified is not allowed.

User response: Check the MPI documentation to determine which datatypes are allowed with each reduction operation.

Problem determination: MPI_ERR_TYPE

FOMM0169  Invalid buffer size (number) in string, task number

Explanation: The size of a buffer must be greater than or equal to zero.

User response: Make sure that the buffer size is non-negative.

Problem determination: MPI_ERR_ARG

FOMM0170  Invalid direction (number) in string, task number

Explanation: The direction value was out of range.

User response: Make sure that the direction is between zero and N-1, where N is the number of dimensions in the communicator topology.

Problem determination: MPI_ERR_DIMS

FOMM0171  Communication subsystem error (number) in string, task number

Explanation: An internal error occurred, within the communication subsystem during execution.

User response: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

Problem determination: MPI_ERR_INTERN

FOMM0172  Invalid color (number) in string, task number

Explanation: A negative value was used for color.

User response: Make sure that color is greater than or equal to zero, or is MPI_UNDEFINED.

Problem determination: MPI_ERR_ARG

FOMM0173  Invalid node degree (number) in string, task number

Explanation: A negative value was used for an element of the index array.

User response: Make sure that the index array contains only non-negative entries.

Problem determination: MPI_ERR_ARG

FOMM0174  Too many messages in string, task number

Explanation: Too many outgoing and incoming messages have been posted without being completed.

User response: Make sure that MPI_WAIT, MPI_TEST, or one of the other MPI wait or test functions is being called to complete pending sends and receives. In addition, make sure that for each message sent, there is a corresponding receive issued by some task.

Problem determination: MPI_ERR_OTHER

FOMM0175  No receive posted for ready mode send in string, task number

Explanation: A ready mode send was posted for which there was no corresponding receive. This error is flagged only at the destination. It cannot be detected at the sender.

User response: When ready mode send (MPI_RSEND, MPI_IRSEND) is used, make sure that the corresponding receive has already been posted on the destination node. This error always uses MPI_ERRORS_ARE_FATAL as its error handler. Any user defined error handler is ignored.

Problem determination: MPI_ERR_OTHER

FOMM0176  One or more tasks became unreachable via string, task number

Explanation: Some node or switch adapter that is part of the MPI job has been reset or shutdown. There may be hardware problems.

User response: Restart job. Consider checking with local system support first to learn whether they are aware of the underlying problem and are dealing with it.

Problem determination: MPI_ERR_OTHER

FOMM0177  A nonblocking collective communication failed to complete string, task number

Explanation: A nonblocking collective communication operation has failed to complete at the time
MPI_Finalize is called. This is most likely the result of an infinite loop in a reduction operation.

**User response:** This message should not be seen in a program which has correctly waited on every nonblocking request. Make sure every request is completed before calling MPI_FINALIZE.

**Problem determination:** MPI_ERR_OTHER

---

FOMM0178 A negative number of triplets was specified (number) in string, task number

**Explanation:** The number of range triplets specified must be positive. Zero is accepted as a valid number though calling the range include or exclude function with zero ranges is probably not useful.

**User response:** Correct the number of ranges argument.

**Problem determination:** MPI_ERR_ARG

---

FOMM0179 The values of first and last are inconsistent with stride (number) in string, task number

**Explanation:** For each range, the value of last need not be greater than the value of first but when last is less than first, the stride must be negative and when it is greater, the stride must be positive.

**User response:** Use values of (first, last, stride) which agree.

**Problem determination:** MPI_ERR_ARG

---

FOMM0180 MPI CANCEL was attempted on an inactive persistent request (number) in string, task number

**Explanation:** A persistent request only represents a communication when it is active. It is made active by an MPI_START and made inactive by MPI_WAIT or MPI_TEST. Since there is no communication to cancel, MPI CANCEL cannot be applied to an inactive request.

**User response:** Avoid using MPI_Cancel on a persistent request that does not currently involve a communication.

**Problem determination:** MPI_ERR_REQUEST

---

FOMM0181 MPI calls are not permitted on MPL callbacks string, task number

**Explanation:** The Receive and call facility is part of MPL and does not support MPI calls on handlers created by MP_RCVNCALL.

**User response:** Use only the prescribed set of MPL calls on callbacks.

**Problem determination:** MPI_ERR_OTHER

---

FOMM0182 The value given for high disagrees with rank zero number, task number

**Explanation:** All members of the intercommunicator local group must give the same value for high. For the purpose of this error message, rank zero is presumed to have the correct value with which others can be compared.

**User response:** Decide which value is correct and use it for the entire group.

**Problem determination:** MPI_ERR_ARG

---

FOMM0183 An asymmetric graph was specified string, task number

**Explanation:** For each edge, a to b, specified in a graph, there must also be an entry in edges to specify the edge b to a.

**User response:** Correct the asymmetry in the graph.

**Problem determination:** MPI_ERR_ARG

---

FOMM0184 MPI was not finalized in string, task number

**Explanation:** An MPI program exited without calling MPI_Finalize. The parallel job is terminated with an error exit code.

**User response:** Correct the program and/or determine if the program terminated abnormally, perhaps via a library routine calling exit(0) after encountering an error condition.

**Problem determination:** MPI_ERR_REQUEST

---

FOMM0185 Locally detected error occurred on another task in string, task number

**Explanation:** Another task detected an input argument error on a collective operation. This error will be flagged only when special checking is active. Setting MP_EUIDEVELOP to yes turns on such checking for collective communications. The checking is always active for MPI-IO collective calls so deadlock can be avoided with the default MPI_ERRORS_RETURN error handler. When an errors_return error_handler is in effect, this return code will be seen at tasks which did not detect a local error. The task(s) which do detect local errors can print a message identifying the local error. Tasks which do not detect a local error will not print any message. The return code alerts the user that the collective operation has failed because of errors elsewhere.

**User response:** Correct the program ensuring that all tasks have correct input. Focus on the tasks which indicate a local error.

**Problem determination:** MPI_ERR_OTHER
FOMM0186 Consistency error detected on another task in string, task number

Explanation: In a collective routine, two or more tasks have detected that they have been provided inconsistent arguments when MPI requires that all callers have matching arguments. This error will be flagged only when consistency checking is active. Setting MP_EUIDEVELOP to yes turns on such checking for collective communications and collective IO. When an errors_return error handler is in effect, this return code will be seen at tasks which did not detect the inconsistency. The task(s) which do detect an inconsistency can print a message identifying the inconsistency. Tasks which return this code will not print any message. The return code alerts the user that the collective operation has failed because of errors detected elsewhere. This error message cannot identify which values are correct and which are not.

User response: Correct the program ensuring that all tasks have correct and consistent arguments to collective calls.

Problem determination: MPI_ERR_OTHER

FOMM0187 Datatype size cannot be expressed as an integer or MPI_Aint in string, task number

Explanation: A call to create a user-defined datatype would create a type with a size whose magnitude is too great to be expressed by an integer or MPI_Aint.

User response: Restructure the program to use datatypes of smaller magnitude.

Problem determination: MPI_ERR_OTHER

FOMM0188 Datatype stride cannot be expressed as an integer or MPI_Aint in string, task number

Explanation: A call to create a user-defined datatype would create a type with a stride whose magnitude is too great to be expressed by an integer or MPI_Aint.

User response: Restructure the program to use datatypes of smaller magnitude.

Problem determination: MPI_ERR_OTHER

FOMM0189 Datatype extent cannot be expressed as an integer or MPI_Aint in string, task number

Explanation: A call to create a user-defined datatype would create a type with an extent or true extent set by MPI_LB or MPI_UB, whose magnitude is too great to be expressed by an integer or MPI_Aint.

User response: Restructure the program to use datatypes of smaller magnitude.

Problem determination: MPI_ERR_OTHER

FOMM0190 Datatype upper or lower bound cannot be expressed as an integer or MPI_Aint in string, task number

Explanation: A call to create a user-defined datatype would create a type with an upper bound, lower bound or other displacement within the datatype whose magnitude is too great to be expressed by an integer or MPI_Aint. The bound or displacement which overflowed could be based on either range of bytes touched or on MPI_LB and MPI_UB positions.

User response: Restructure the program to use datatypes of smaller magnitude.

Problem determination: MPI_ERR_OTHER

FOMM0251 MPI-IO operations attempted in single threaded environment in string, task number.

Explanation: MPI-IO operations can only be performed if the MPI environment is multi-threaded.

User response: Make sure the MP_SINGLE_THREAD environment variable is not set or is set to “NO”.

Problem determination: MPI_ERR_OTHER

FOMM0252 Attention: The number of concurrent nonblocking collective operations exceeds the limit in string, task number.

Explanation: In the threaded library, each nonblocking collective communication call is carried out on a separate thread. There is a limited number of threads to service these requests. Extra requests will be queued, which may lead to a deadlock condition depending on the starting order of the nonblocking collective communication requests. This condition can occur only with nonblocking collective communication, an IBM extension to standard MPI.

User response: There are two possible user responses, if the user requires only a few outstanding collective communication operations, the user should ensure that other nonblocking requests have been waited on to keep the number of outstanding requests smaller than the available threads. If the user requires many outstanding nonblocking requests, the user should manage their own pool of threads and call the blocking collective routines on those threads.

FOMM0253 Conflicting collective operations on communicator in string, task number

Explanation: Any program which creates two or more concurrent collective operations on a single communicator is erroneous. This error is due to a race condition which occurs when two or more threads issue
collective calls using the same communicator without enforcing an order. Programs which contain this race condition may sometimes complete normally, sometimes receive this message, and sometimes exhibit unexpected failures in collective communication. This error is detected only by those calls which create a new communicator or file handle.

User response: Add thread synchronization to the program to ensure that the same communicator is not used concurrently by two different collective communications calls in the same process.

Problem determination: MPI_ERR_OTHER

FOMM0254 MP_SINGLE_THREAD is set in a multi-threaded program in string, task number

Explanation: The MP_SINGLE_THREAD environment variable is set, but multiple threads are executing.

User response: Unset the MP_SINGLE_THREAD environment variable and rerun the program.

Problem determination: MPI_ERR_OTHER

FOMM0255 It is not valid to decode a named predefined datatype. In string, task number.

Explanation: The datatype given is a named predefined datatype which cannot be decoded.

User response: When attempting to decode a datatype be sure that it is a derived datatype. MPI_TYPE_ENVELOPE may be used to identify predefined types.

Problem determination: MPI_ERR_TYPE

FOMM0256 Maximum array size is not big enough in string, task number.

Explanation: The maximum size of an array, passed by an argument, is not big enough for the amount of information that needs to be returned.

User response: Check the function call to make sure the correct arguments have been used and that a big enough storage area has been allocated.

Problem determination: MPI_ERR_ARG

FOMM0257 Key is not defined in info string, task number.

Explanation: The key passed to MPI_INFO_DELETE does not exist in the info which was passed in.

User response: Check the function call to make sure the correct arguments have been used.

Problem determination: MPI_ERR_INFO_NOKEY

FOMM0258 Insufficient memory to satisfy request string, task number

Explanation: MPI_Alloc_mem() was unable to obtain the requested memory.

User response: Reduce the size of user storage required per task.

Problem determination: MPI_ERR_NO_MEM

FOMM0259 Invalid key type string, task number

Explanation: The value used for key does not match the object type. Keys created for one MPI object type cannot be used to set attributes for a different object type.

User response: Make sure that the key was created by a call to a create keyval function for the same object type (communicator, type or window).

Problem determination: MPI_ERR_ARG

FOMM0260 Wrong error handler handle type string, task number

Explanation: The value used for errhandle does not match the object type. Error handler handles created for one MPI object type cannot be used to set an error handler for a different object type.

User response: Make sure that the handle was created by a call to a create errhandle function for the same object type (communicator, file or window).

Problem determination: MPI_ERR_ARG

FOMM0270 Error in asynchronous support code: number in string, task number

Explanation: An internal software error occurred during execution of the asynchronous code which supports some MPI functions.

User response: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

Problem determination: MPI_ERR_INTERN

FOMM0271 Error in I/O error logging: number in string, task number

Explanation: An internal error occurred during I/O error logging.

User response: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

Problem determination: MPI_ERR_INTERN
FOMM0272  Error in I/O operation tracing: number in string, task number
Explanation:  An internal error occurred during I/O operation tracing.
User response:  Gather information about the problem and follow local site procedures for reporting hardware and software problems.
Problem determination:  MPI_ERR_INTERNAL

FOMM0273  Error in I/O responder delay tracing: number in string, task number
Explanation:  An internal error occurred during I/O responder delay tracing.
User response:  Gather information about the problem and follow local site procedures for reporting hardware and software problems.
Problem determination:  MPI_ERR_INTERNAL

FOMM0274  Error while loading the I/O monitor library: number — string, task number
Explanation:  An internal error occurred while the I/O monitor library was being loaded.
User response:  Make sure the I/O monitor library is installed in the appropriate directory.
Problem determination:  MPI_ERR_INTERNAL

FOMM0280  Invalid info key string, task number
Explanation:  The info key specified is too long.
User response:  Make sure that the info key length is less than MPI_MAX_INFO_KEY.
Problem determination:  MPI_ERR_INFO_KEY

FOMM0281  Invalid info value string, task number
Explanation:  The info value specified is too long.
User response:  Make sure that the info value length is less than MPI_MAX_INFO_VAL.
Problem determination:  MPI_ERR_INFO_VALUE

FOMM0282  Invalid info key number (number) in string, task number
Explanation:  The info key number specified must be between 0 and N-1, where N is the number of keys currently defined in the info argument.
User response:  Correct the info key number argument.
Problem determination:  MPI_ERR_ARG

FOMM0283  Invalid info argument (number) in string, task number
Explanation:  The info handle provided does not represent a valid MPI_Info object.
User response:  Make sure the info argument has been created and has not been freed yet.
Problem determination:  MPI_ERR_INFO

FOMM0300  Invalid file handle (number) in string, task number
Explanation:  The file handle specified is not associated with an open file.
User response:  Make sure the file has not already been closed.
Problem determination:  MPI_ERR_FILE

FOMM0301  Pathname too long string, task number
Explanation:  The pathname specified is too long.
User response:  Shorten the pathname.
Problem determination:  MPI_ERR_BAD_FILE

FOMM0302  Invalid access mode (number) in string, task number
Explanation:  The amode argument specified is invalid.
User response:  Correct the amode argument.
Problem determination:  MPI_ERR_AMODE

FOMM0303  File or directory does not exist string, task number
Explanation:  The name specified does not correspond to an existing file or directory.
User response:  Correct the filename argument.
Problem determination:  MPI_ERR_NO_SUCH_FILE

FOMM0304  Unsupported operation on sequential access file string, task number
Explanation:  The operation attempted is not supported on a file opened in MPI_MODE_SEQUENTIAL amode.
User response:  Close the file and reopen it with the appropriate amode.
Problem determination:  MPI_ERR_UNSUPPORTED_OPERATION
**FOMM0305: Pending I/O operations when closing a file**

*Explanation:* The file is being closed while there are still pending I/O operations on it. MPI_FILE_CLOSE does not provide an implicit MPI_WAIT on uncompleted nonblocking file operations.

*User response:* Modify the program so that all I/O operations are complete prior to closing the file.

*Problem determination:* MPI_ERR_OTHER

---

**FOMM0306: Unclosed files when finalizing**

*Explanation:* There are still open files when MPI_FINALIZE is called.

*User response:* The user should make sure that all files are closed prior to calling MPI_FINALIZE.

*Problem determination:* MPI_ERR_OTHER

---

**FOMM0307: Invalid environment**

*Explanation:* The user should only use documented “MP_” environment variables.

*User response:* Contact IBM Service.

*Problem determination:* MPI_ERR_OTHER

---

**FOMM0308: Invalid order**

*Explanation:* The value of the order argument in the type constructor call must be either MPI_ORDER_FORTRAN or MPI_ORDER_C.

*User response:* Correct the value of the order argument.

*Problem determination:* MPI_ERR_ARG

---

**FOMM0309: Invalid array element**

*Explanation:* One element of the array has an invalid value (either negative or zero).

*User response:* Correct the value of the array element.

*Problem determination:* MPI_ERR_ARG

---

**FOMM0310: Invalid element in array_of_distribs**

*Explanation:* One element of the array_of_distribs argument to MPI_TYPE_CREATE_DARRAY has an invalid value (not one of MPI_DISTRIBUTE_BLOCK, MPI_DISTRIBUTE_CYCLIC, MPI_DISTRIBUTE_NONE).

*User response:* Correct the value of the array_of_distribs element.

*Problem determination:* MPI_ERR_ARG

---

**FOMM0311: Invalid element in array_of_dargs**

*Explanation:* One element of the array_of_dargs argument to MPI_TYPE_CREATE_DARRAY has an invalid value (either negative or zero, and different from MPI_DISTRIBUTE_DFLT_DARG).

*User response:* Correct the value of the array_of_dargs element.

*Problem determination:* MPI_ERR_ARG

---

**FOMM0312: Invalid group size**

*Explanation:* The value of the size argument must be positive.

*User response:* Correct the value of the size argument.

*Problem determination:* MPI_ERR_ARG

---

**FOMM0313: Invalid grid size**

*Explanation:* The cartesian grid of processes defined by arguments ndims and array_of_psizes to MPI_TYPE_CREATE_DARRAY() has a size different from argument size.

*User response:* Correct either the value of the size argument or the values of the array_of_psizes elements.

*Problem determination:* MPI_ERR_ARG

---

**FOMM0314: Invalid psize element**

*Explanation:* One element of the array_of_psizes argument to MPI_TYPE_CREATE_DARRAY must have a value of 1 since distribution MPI_DISTRIBUTE_NONE has been set in that dimension.

*User response:* Correct the value of the array_of_psizes element.

*Problem determination:* MPI_ERR_ARG

---

**FOMM0315: Invalid block distribution**

*Explanation:* The values of the three arguments array_of_psizes, array_of_dargs, and array_of_gsizes do not satisfy the condition: array_of_psizes[i] * array_of_dargs[i] >= array_of_gsizes[i], whereas distribution MPI_DISTRIBUTE_BLOCK has been set in dimension i.

</tbody>
</table>
FOMM0340 Invalid file size (number) in string, task number

Explanation: The size of a file must be greater than or equal to zero.

User response: Make sure that the file size is non-negative.

Problem determination: MPI_ERR_ARG

FOMM0341 Invalid whence (number) in string, task number

Explanation: The whence argument has an invalid value.

User response: Make sure that the whence argument is equal to either MPI_SEEK_SET, MPI_SEEK_CUR, or MPI_SEEK_END.

Problem determination: MPI_ERR_ARG

FOMM0342 Invalid file position string, task number

Explanation: A seek operation led to a negative position in the current file view.

User response: Modify the whence and offset arguments in order to ensure that the new position in the current file view is positive or null.

Problem determination: MPI_ERR_ARG

FOMM0343 Inconsistent offsets string, task number

Explanation: A seek operation on a shared file pointer is not using the same offset on all participating processes.

User response: Modify the values of offset and make sure they are identical on all processes.

Problem determination: MPI_ERR_NOT_SAME

FOMM0344 Inconsistent whences string, task number

Explanation: A seek operation on a shared file pointer is not using the same whence on all participating processes.

User response: Modify the values of whence and make sure they are identical on all processes.

Problem determination: MPI_ERR_NOT_SAME

FOMM0345 Pending split collective operation string, task number

Explanation: A collective data access operation is attempted while a split collective operation is pending on the same file handle.

User response: Make sure all collective data access operations are executed in the same order on all processes. If required implement inter-thread synchronization to ensure the same order.

Problem determination: MPI_ERR_OTHER

FOMM0346 No pending split collective operation string, task number

Explanation: The end phase of a split collective data access operation is being attempted while there is no pending split collective operation currently associated with the file handle.

User response: Make sure a begin phase has been issued on the file handle prior to the call to the end phase.

Problem determination: MPI_ERR_OTHER

FOMM0347 Pending I/O operations when preallocating file blocks string, task number

Explanation: A preallocate operation is being attempted while there are still pending I/O operations on the file.

User response: The user should modify the program so that all I/O operations are complete prior to preallocating file blocks.

Problem determination: MPI_ERR_OTHER

FOMM0348 Duplicated data representation string, task number

Explanation: The data representation is already registered.

User response: The user is attempting to register the same data representation a second time. Make sure the name of the data representation is correct.

Problem determination: MPI_ERR_DUP_DATAREP

FOMM0349 Data representation name too long string, task number

Explanation: The name specified for the data representation to be registered is too long.

User response: Shorten the name.

Problem determination: MPI_ERR_ARG

FOMM0350 Invalid filetype string, task number

Explanation: The user is attempting to define a file view for which filetype is not derived from etype.

User response: Modify the filetype and/or the etype arguments in order to ensure that filetype is derived from etype.

Problem determination: MPI_ERR_ARG
FOMM0351  Read conversion error (number) in string, task number
Explanation: The conversion attempted during a read operation failed.
User response: For more information, check the error code returned by the conversion function.
Problem determination: MPI_ERR_CONVERSION

FOMM0352  Write conversion error (number) in string, task number
Explanation: The conversion attempted during a write operation failed.
User response: For more information, check the error code returned by the conversion function.
Problem determination: MPI_ERR_CONVERSION

FOMM0353  Inconsistent flags string, task number
Explanation: A set_atomicity operation is not using the same flag on all participating processes.
User response: Modify the values of flag and make sure they are identical on all processes.
Problem determination: MPI_ERR_NOT_SAME

FOMM0354  Conversion of MPI_BYTE items is invalid string, task number
Explanation: The only valid data representation for MPI_BYTE items is native.
User response: Change the data representation to native or change the elementary datatype.
Problem determination: MPI_ERR_ARG

FOMM0402  Internal ftruncate failed (number) in string, task number
Explanation: An internal call to ftruncate() failed.
User response: Check error number and take appropriate action.
Problem determination: MPI_ERR_IO

FOMM0403  Internal open failed (number) in string, task number
Explanation: An internal call to open() failed.
User response: Check error number and take appropriate action.
Problem determination: MPI_ERR_IO

FOMM0404  Internal close failed (number) in string, task number
Explanation: An internal call to close() failed.
User response: Check error number and take appropriate action.
Problem determination: MPI_ERR_IO

FOMM0405  Internal fsync failed (number) in string, task number
Explanation: An internal call to fsync() failed.
User response: Check error number and take appropriate action.
Problem determination: MPI_ERR_IO

FOMM0406  Internal lseek failed (number) in string, task number
Explanation: An internal call to lseek() failed.
User response: Check error number and take appropriate action.
Problem determination: MPI_ERR_IO

FOMM0407  Internal read failed (number) in string, task number
Explanation: An internal call to read() failed.
User response: Check error number and take appropriate action.
Problem determination: MPI_ERR_IO

FOMM0408  Internal write failed (number) in string, task number
Explanation: An internal call to write() failed.
User response: Check error number and take appropriate action.

Problem determination: MPI_ERR_IO

FOMM0409 Internal fstat failed (number) in string, task number
Explanation: An internal call to fstat() failed.
User response: Check error number and take appropriate action.
Problem determination: MPI_ERR_IO

FOMM0410 Internal fstatvfs failed (number) in string, task number
Explanation: An internal call to fstatvfs() failed.
User response: Check error number and take appropriate action.
Problem determination: MPI_ERR_IO

FOMM0425 Invalid window handle (number) in string, task number
Explanation: The window handle specified is not associated with an existing window.
User response: Make sure that the window has been created by MPI_Win_create.
Problem determination: MPI_ERR_WIN

FOMM0426 Invalid window size (number) in string, task number
Explanation: The value specified for the size of the window buffer is less than zero.
User response: Make sure that the window buffer size is non-negative.
Problem determination: MPI_ERR_SIZE

FOMM0427 Invalid window displacement unit (number) in string, task number
Explanation: The value specified for the local window displacement unit is less than one.
User response: Make sure that the local displacement unit is positive.
Problem determination: MPI_ERR_DISP

FOMM0428 Can't create RMA window in single threaded environment in string, task number
Explanation: MPI 1sided operations can only be created if the MPI environment is multi-threaded.
User response: Make sure the MP_SINGLE_THREAD environment variable is not set or is set to NO.
Problem determination: MPI_ERR_OTHER

FOMM0429 Invalid origin count (number) in string, task number
Explanation: The value specified for the origin element count is less than zero.
User response: Make sure that the count is non-negative.
Problem determination: MPI_ERR_COUNT

FOMM0430 Invalid origin datatype (number) in string, task number
Explanation: The origin datatype handle is invalid.
User response: Make sure that the handle is associated with either a predefined datatype (except MPI_LB, MPI_UB, and MPI_PACKED) or an existing derived datatype which has been committed via MPI_Type_commit.
Problem determination: MPI_ERR_TYPE

FOMM0431 Invalid target rank (number) in string, task number
Explanation: The value specified for the target rank is out of range.
User response: Make sure that the target rank is within the range 0 to N-1, where N is the number of tasks in the communicator group associated with the window.
Problem determination: MPI_ERR_RANK

FOMM0432 Invalid target displacement (number) in string, task number
Explanation: The value specified for the displacement in the target window buffer is less than zero.
User response: Make sure that the displacement is non-negative.
Problem determination: MPI_ERR_ARG

FOMM0433 Invalid target count (number) in string, task number
Explanation: The value specified for the target element count is less than zero.
User response: Make sure that the count is non-negative.
Problem determination: MPI_ERR_COUNT
FOMM0434 Invalid target datatype (number) in string, task number
Explanation: The target datatype handle is invalid.
User response: Make sure that the handle is associated with either a predefined datatype (except MPI_LB, MPI_UB, and MPI_PACKED) or an existing derived datatype which has been committed via MPI_Type_commit.
Problem determination: MPI_ERR_TYPE

FOMM0435 Origin buffer too small (number) in string, task number
Explanation: The total amount of data requested for sending from an MPI_Get target is larger than the amount of data specified for receiving at the origin.
User response: Make sure the total number of bytes sent from the target is less than or equal to the number of bytes received by the origin.
Problem determination: MPI_ERR_TRUNCATE

FOMM0436 Target buffer too small (number) in string, task number
Explanation: The total amount of data requested for sending from an MPI_Put or MPI_Accumulate origin is larger than the amount of data specified for receiving at the target.
User response: Make sure the total number of bytes sent from the origin is less than or equal to the number of bytes received by the origin.
Problem determination: MPI_ERR_TRUNCATE

FOMM0437 Target buffer starts outside target window (number) in string, task number
Explanation: The leftmost byte of the data requested to be sent or received by a target of an RMA communication lands before the window buffer start in memory.
User response: Make sure all the data is positioned after the window buffer start.
Problem determination: MPI_ERR_TRUNCATE

FOMM0438 Target buffer ends outside target window (number) in string, task number
Explanation: The rightmost byte of the data requested to be sent or received by a target of an RMA communication lands beyond the window buffer end in memory.
User response: Make sure all the data is positioned before the window buffer end.
Problem determination: MPI_ERR_TRUNCATE

FOMM0439 Target outside access group (number) in string, task number
Explanation: The target specified for an RMA communication call either is not a member of the group specified by a previous call to MPI_Win_start, or is not locked by a previous call to MPI_Win_lock.
User response: Make sure that the target is in the origin's access group.
Problem determination: MPI_ERR_RANK

FOMM0440 Origin datatype inappropriate for MPI_ACCUMULATE (number) in string, task number
Explanation: The specified origin datatype is neither a predefined datatype nor a derived datatype whose all basic components are of the same predefined datatype.
User response: Make sure that the datatype is built of a single predefined datatype.
Problem determination: MPI_ERR_TYPE

FOMM0441 Target datatype inappropriate for MPI_ACCUMULATE (number) in string, task number
Explanation: The specified target datatype is neither a predefined datatype nor a derived datatype whose all basic components are of the same predefined datatype.
User response: Make sure that the datatype is built of a single predefined datatype.
Problem determination: MPI_ERR_TYPE

FOMM0442 Incompatible origin and target datatypes in string, task number
Explanation: The origin and target datatypes specified for MPI_Accumulate are built of different predefined datatypes.
User response: Make sure that the origin and target datatypes' basic types are the same.
Problem determination: MPI_ERR_TYPE

FOMM0443 Invalid accumulate operation (number) in string, task number
Explanation: The value of the combine operation handle specified for MPI_Accumulate is invalid.
User response: Make sure that the operation handle is predefined.
Problem determination: MPI_ERR_OP
FOMM0444  Group is not a subset of window group 
\((number)\) in string, task number

Explanation: The task group whose handle is passed 
to MPI_Win_start or MPI_Win_post is not a subgroup of the 
task group associated with the RMA window. 

User response: Make sure that all of the process 
ranks in the specified group are also in the window 
group. 

Problem determination: MPI_ERR_GROUP

FOMM0445  Invalid synchronization assertion 
\((number)\) in string, task number

Explanation: The assertion value specified for an 
RMA synchronization call is invalid. 

User response: Make sure the assertion value is 
either zero or an OR-sum of the assertion values valid 
for this synchronization call. 

Problem determination: MPI_ERR_ASSERT

FOMM0446  Invalid lock type \((number)\) in string, task number

Explanation: The RMA lock type value specified for 
MPI_Win_lock is invalid. 

User response: Make sure the lock type value is 
either MPI_LOCK_EXCLUSIVE or 
MPI_LOCK_SHARED. 

Problem determination: MPI_ERR_LOCKTYPE

FOMM0447  Origin holds no lock on the target 
\((number)\) in string, task number

Explanation: The target whose rank value has been 
specified for MPI_Win_unlock had not been previously 
locked by the origin task through an MPI_Win_lock call. 

User response: Make sure the target has been locked 
by the origin task. 

Problem determination: MPI_ERR_RANK

FOMM0448  RMA communication call outside 
access epoch in string, task number

Explanation: An RMA communication call is attempted 
at a point when no access epoch is in effect. 

User response: Make sure the call is preceeded by 
an RMA synchronization call starting an access epoch 
(either MPI_Win_fence or MPI_Win_start or 
MPI_Win_lock). 

Problem determination: MPI_ERR_RMA_CONFLICT

FOMM0449  Access epoch already in effect in 
string, task number

Explanation: An access epoch start at the origin task 
is attempted while another access epoch previously 
started at the same origin task (by either MPI_Win_start 
or MPI_Win_lock or MPI_Win_fence followed by an 
RMA communication call) is still in effect. 

User response: Make sure the previously started 
access epoch is terminated by the appropriate 
synchronization call (MPI_Win_complete or 
MPI_Win_unlock or another MPI_Win_fence 
respectively) before starting the new access epoch. 

Problem determination: MPI_ERR_RMA_SYNC

FOMM0450  Exposure epoch already in effect in 
string, task number

Explanation: An exposure epoch start at the target 
task is attempted while another exposure epoch 
previously started at the same target task by 
MPI_Win_post or MPI_Win_fence followed by a target 
processing of RMA communications, is still in effect. 

User response: Make sure the previously started 
exposure epoch is terminated by respectively 
MPI_Win_wait (or MPI_Win_test returning TRUE), or 
another MPI_Win_fence, before starting the new 
exposure epoch. 

Problem determination: MPI_ERR_RMA_SYNC

FOMM0451  No access epoch to terminate in string, 
task number

Explanation: An MPI_Win_complete or 
MPI_Win_unlock called at a point where no access 
epoch started by respectively MPI_Win_start or 
MPI_Win_lock, is in effect. 

User response: Make sure the call is preceeded by 
the appropriate call starting an access epoch. 

Problem determination: MPI_ERR_RMA_SYNC

FOMM0452  No exposure epoch to terminate in 
string, task number

Explanation: An MPI_Win_wait or MPI_Win_test 
called at a point where no exposure epoch started by 
MPI_Win_post is in effect. 

User response: Make sure the call is preceeded by 
an MPI_Win_post call starting an exposure epoch. 

Problem determination: MPI_ERR_RMA_SYNC
FOMM0453  Unsolicited access of local window
while exposed in string, task number

Explanation: The local target window has been
accessed by an origin task which is not a member of
the exposure group, during the epoch being terminated
by MPI_Win_wait or MPI_Win_test on the target.

User response: Make sure RMA accesses of the
target window throughout the exposure epoch are made
only by the members of the group specified in the
MPI_Win_post call starting the exposure epoch.

Problem determination: MPI_ERR_RMA_CONFLICT

FOMM0454  Unsolicited access of target window
while locked (number) in string, task number

Explanation: The locked target window has been
accessed by an origin task which does not hold an RMA
lock on that target, during the lock period being
terminated by MPI_Win_unlock on the lock origin.

User response: Make sure the RMA accesses of the
target window throughout the lock period are made
only by the origin tasks who have secured an RMA lock on
the target via a call to MPI_Win_unlock.

Problem determination: MPI_ERR_RMA_CONFLICT

FOMM0455  Can't lock an exposed window at the
target (number) in string, task number

Explanation: An exposure epoch (started either by
MPI_Win_fence followed by the target's RMA
communication processing or by MPI_Win_post) is in
effect on the target the origin task attempts to lock via
MPI_Win_lock.

User response: Make sure the target window is not
exposed to RMA accesses at the time of the lock
attempt.

Problem determination: MPI_ERR_RMA_SYNC

FOMM0456  Can't start exposure epoch on a locked
window in string, task number

Explanation: An attempt is made to start an exposure
epoch (via either MPI_Win_post or MPI_Win_fence)
while at least one RMA lock is held on the target
window.

User response: Make sure all of the RMA locks on
the target window are released by the responsible origin
tasks via MPI_Win_unlock prior to starting an exposure
epoch at the target.

Problem determination: MPI_ERR_RMA_SYNC

FOMM0457  Pending origin activity when freeing a
window in string, task number

Explanation: An access epoch previously started at
the task has not been terminated by the MPI_Win_free
time.

User response: Make sure the access epoch has
been terminated by an appropriate synchronization call.

Problem determination: MPI_ERR_RMA_SYNC

FOMM0458  Pending target activity when freeing a
window in string, task number

Explanation: An exposure epoch or lock period
previously started at the task has not been terminated
by the MPI_Win_free time.

User response: Make sure the exposure epoch has
been terminated by an appropriate synchronization call,
and all RMA locks held on the target are released by
the lock origins via MPI_Win_unlock.

Problem determination: MPI_ERR_RMA_SYNC

FOMM0459  RMA communication call in progress
in string, task number

Explanation: An RMA communication call is being
executed by another thread at the origin task
concurrently with an RMA synchronization call.

User response: Make sure no RMA communication
calls are being executed by any other thread at the
task.

Problem determination: MPI_ERR_RMA_OTHER

FOMM0460  RMA synchronization call in progress
in string, task number

Explanation: An RMA synchronization call is being
executed by another thread at the task concurrently with
either an RMA synchronization or an RMA
communication call.

User response: Make sure no RMA synchronization
calls are being executed by any other thread at the
task.

Problem determination: MPI_ERR_RMA_OTHER
FOMO0000 Dynamic memory allocation failed in module string line number
Explanation: An internal request for dynamic memory allocation failed.
User response: System resources may be exceeded temporarily. Retry the job. If this fails, contact the System Administrator to determine if there is a general setup problem. Otherwise, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0001 No man page available for poe
Explanation: User has requested that the poe man page be displayed (via -h option), but the /usr/man/cat1/poe.1 file does not exist, or some directory in the path leading to the file is not searchable.
User response: Check that the file exists and that all directories in the path leading to the file are searchable. The pedocs files set may need to be installed if the file doesn’t exist.

FOMO0002 Error initializing communication subsystem.
Explanation: The remote node terminates.
User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0007 Error initializing communication subsystem: return code number
Explanation: The remote node was unable to initialize its communication subsystem. This message gives the return code from the function called. The remote node terminates.
User response: Verify that the communication subsystem is running properly.

FOMO0011 tcp service string unknown
Explanation: The Partition Manager terminates.
User response: The PM daemon, pmd, is not known to the system. Review the results of installation to assure that the daemon specified by inetd is startable on each remote node.

FOMO0012 pm_contact: socket
Explanation: The Partition Manager terminates as it could not create a socket.
User response: The message is followed by an explanatory sentence. Check that the number of sockets required does not exceed the number available.

FOMO0013 pm_contact: setsockopt
Explanation: The Partition Manager continues but some socket options may not be set correctly.
User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0018 Couldn’t get info for hostname string
Explanation: The Partition Manager terminates.
User response: The name mentioned cannot be identified. Check that the host name is spelled correctly and is known by name to the node on which the Partition Manager is running. If hostname is blank, allocation has failed. Also, check if there was a name server problem.

FOMO0019 pm_contact: connect failed
Explanation: The Partition Manager terminates.
User response: The Partition Manager is unable to connect to a remote node. Message FOMO0020 follows. Probable PE system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0020 Couldn’t connect to task number (string)
Explanation: The Partition Manager terminates.
User response: For the indicated remote task number and indicated host name, socket connection could not be established. Check for valid names.

FOMO0022 setsockopt(SO_LINGER)
Explanation: The Partition Manager continues.
User response: An error occurred in setting the LINGER socket option. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0024 string: no response; rc = number
Explanation: The Partition Manager terminates.
User response: No acknowledgment of startup was received from the pmd daemon running on the indicated node. Check for error message from that node. The return codes are:
-1 EOF on connection
1 I/O error
2 allocation error

Check if pmd (possibly specified with MP_PMDSUFFIX) is available and executable.
FOMO0025 unexpected acknowledgment of type string from remote node
Explanation: The Partition Manager received an unexpected acknowledgment during initialization. Initialization with a remote node has failed.
User response: Check the remote node log file to determine the reason for failure. Probable PE error.

FOMO0026 Couldn't create socket for PM Array
Explanation: The Partition Manager terminates. An explanatory sentence follows.
User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0027 Write to PM Array
Explanation: The Partition Manager continues. An explanatory sentence follows.
User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0028 pm_mgr_handle; can't send a signal message to remote nodes
Explanation: The Partition Manager terminates. An explanatory sentence follows.
User response: Probable PE error. This error has occurred in the Partition Manager signal handler. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0029 Caught signal number (string), sending to tasks...
Explanation: The indicated signal is not used specifically by Partition Manager and is being passed on to each remote task.
User response: Verify that the signal was intended.

FOMO0031 task number is alive
Explanation: The message is sent from the indicated task in response to signal SIGUSR2.
User response: Verify that the signal was intended.

FOMO0032 exiting...
Explanation: The message is sent from the indicated task in response to signal SIGINT, and the remote node is exiting.
User response: Verify that the signal was intended.

FOMO0034 task signal number: string
Explanation: The message is sent from the indicated task in response to the indicated signal, which is not handled explicitly by the Partition Manager.
User response: Verify that the signal was intended.

FOMO0036 sigaction(SIGHUP)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0037 sigaction(SIGINT)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0038 sigaction(SIGQUIT)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0039 sigaction(SIGILL)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0040 sigaction(SIGTRAP)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0041 sigaction(SIQUIT)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0043 sigaction(SIGFPE)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.
FOMO0044 sigaction(SIGBUS)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0045 sigaction(SIGSEGV)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0046 sigaction(SIGSYS)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0047 sigaction(SIGPIPE)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0048 sigaction(SIGALRM)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0049 sigaction(SIGTERM)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0050 sigaction(SIGTSTP)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0051 sigaction(SIGCONT)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0052 sigaction(SIGIO)
Explanation: An explanatory sentence follows. The Partition Manager terminates.
Cause: The return from sigaction for the indicated signal is negative.

FOMO0053 invalid number of procs entered
Explanation: The Partition Manager terminates. Incorrect number of tasks specified.
User response: Enter a number from 1 to the max numbers of tasks to be run.

FOMO0071 invalid infolevel
Explanation: The -infolevel option was neither a 0 nor a positive number.
User response: Correct the flag.

FOMO0075 invalid retrytime
Explanation: The -retrytime option was neither a 0 nor a positive number.
User response: Correct the flag.

FOMO0076 invalid pmlights
Explanation: The -pmlights option was neither a 0 nor a positive number.
User response: Correct the flag.

FOMO0079 invalid usrport
Explanation: The -usrport option was neither a 0 nor a positive number less than 32768.
User response: Correct the flag.

FOMO0080 MP_PROCS not set correctly
Explanation: The MP_PROCS environment variable is not a positive number.
User response: Correct the variable.

FOMO0081 MP_INFOLEVEL not set correctly
Explanation: The MP_INFOLEVEL environment variable is neither 0 or a positive number less than 32768.
User response: Correct the variable.
FOMO0095 MP_RETRY not set correctly
Explanation: The MP_RETRY environment variable is neither 0 or a positive number less than 32768.
User response: Correct the variable.

FOMO0096 MP_PMLIGHTS not set correctly
Explanation: The MP_PMLIGHTS environment variable is neither 0 nor a positive number.
User response: Correct the variable.

FOMO0097 MP_USRPORT not set correctly
Explanation: The MP_USRPORT environment variable is neither 0 nor a positive number less than 32768.
User response: Correct the variable.

FOMO0110 pm: atexit
Explanation: The user exit handler could not be installed.
Cause: Probable PE error.
User response: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0113 Stopping the job. Wait 5 seconds for remotes.
Explanation: The Partition Manager has received a SIGTSTP signal and is preparing to stop the job on all the remote nodes. The system will then issue a stop message giving the task number for the job as it would for any <EscChar>Z keyboard interrupt.
User response: Wait for the stop confirmation message (FOMO00127). To continue the job in the foreground, type in `fg tasknumber` after you receive the stop message. To continue the job in the background, type in `bg tasknumber` after you receive the stop message.

FOMO0115 invalid resd option
Explanation: The specification of the `-resd` option was neither YES or NO.
User response: Correct the specification.

FOMO0116 MP_RESD not set correctly
Explanation: The specification of MP_RESD was neither YES or NO.
User response: Correct the specification of MP_RESD.

FOMO0117 Unable to obtain sysplex capacity data, reason: reason (return code).
Explanation: The Partition Manager was unable to retrieve capacity information from the Workload Manager for automatic node selection. The reason might be that all systems in the sysplex are running in compat mode.
User response: The automatic node selection depends on information from the Workload Manager, which is available only for systems running in goal mode. If you want automatic node selection, make sure that at least one system in the sysplex is running in goal mode. Refer to z/OS MVS Programming: Workload Management Services for an explanation of the supplied return (reason) codes.

FOMO0118 string string requested for task number
Explanation: The named host or pool was requested from LoadLeveler® or the Resource Manager for the indicated task number. This informational message is issued when a host list file is read for node allocation.

FOMO0119 Host string allocated for task number
Explanation: The named host was allocated by LoadLeveler® or the Resource Manager for the indicated task number. This informational message is issued when the Resource Manager does implicit node allocation.

FOMO0120 Resource Manager unable to allocate nodes due to internal error
Explanation: A system or socket error occurred when the Resource Manager client attempted to contact the server to request nodes. This is most often caused by loss of the connection between client and server under heavy network loads. An 0023 jm message is often printed before this message which may provide more specific information about the problem.
User response: Retry the job; this should correct the problem if the network was temporarily overloaded. If this fails, contact your system administrator to determine if network is in a stable state before retrying. Otherwise, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0123 Retrying allocation .... press EscChar-C to terminate
Explanation: The requested nodes were not available. However, since the retry option was specified (by either the MP_RETRY environment variable or the `-retry` command-line flag), the Partition Manager will continue requesting nodes at the specified delay interval.
User response: To terminate the allocation request, press <EscChar>C.

FOMO0124 Less than number nodes available
Explanation: The requested nodes were not available by automatic allocation. The reason might be that not enough systems in the sysplex are running in goal mode, or that the capacity available is insufficient for the requested number of tasks.

User response: Make all systems in the sysplex eligible for the automatic allocation by configuring them for goal mode. Otherwise, wait until later when the requested capacity is available. You might want to specify the retry option by either setting the MP_RETRY environment variable or using the -retry command-line flag.

FOMO0125 Fewer nodes (number) specified in string than tasks (number).
Explanation: There was an insufficient number of nodes defined in the host.list file.
User response: The host list file must contain at least as many node specifications as number of tasks requested.

FOMO0126 Unable to read string for current directory
Explanation: The Partition Manager is unable to interpret the data from the pwd command.
User response: Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0127 Executing with develop mode string
Explanation: This is a warning message to inform you that a develop mode of value is currently active which might impact significantly the performance of your program.
User response: If you do not want or need the develop mode turned on, use the MP_EUIDEVELOP environment variable or the -eudevelop flag to set a value of no, normal, or minimum.

FOMO0128 Invalid eudevelop option
Explanation: The eudevelop option was invalid.
User response: Re-specify eudevelop with one of the following options (upper or lower case):
  - min
  - minimum
  - no
  - nor
  - normal
  - deb
  - debug
  - dev
  - develop
  - yes

FOMO0130 Invalid newjob option, should be YES or NO
Explanation: A newjob other than YES or NO was entered.
User response: Re-specify newjob with either YES or NO.

FOMO0131 Invalid pmldlog option, should be YES or NO
Explanation: A pmldlog other than YES or NO was entered.
User response: Re-specify pmldlog with either YES or NO.

FOMO0132 Invalid promptpw option, should be YES or NO
Explanation: A promptpw other than YES or NO was entered.
User response: Re-specify promptpw with either YES or NO.

FOMO0133 Invalid stdoutmode
Explanation: A stdoutmode other than ORDERED, UNORDERED or an integer from 0 to (the number of tasks -1) was entered.
User response: Re-specify stdoutmode with either ORDERED, UNORDERED or a number.

FOMO0134 Invalid mode for stdinmode
Explanation: A stdinmode other than ALL or an integer from 0 to (the number of tasks -1) was entered.
User response: Re-specify stdinmode with either ALL or a number.

FOMO0135 Invalid labelio option, should be YES or NO
Explanation: A labelio other than YES or NO was entered.
User response: Re-specify labelio with either YES or NO.
Invalid MP_NOARGLIST option, should be YES or NO

Explanation: The Partition Manager terminates.

User response: Enter YES or NO for MP_NOARGLIST.

Invalid MP_CMDFILE option, the value is ignored.

Explanation: If you set the MP_CMDFILE environment variable or the -cmdfile option to "none", the MP_CMDFILE environment variable or the -cmdfile option is ignored.

User response: To eliminate this WARNING message, you should remove the MP_CMDFILE setting or specify MP_STDINMODE, which is not case sensitive, to another value other than "none".

Internal Error: Could not broadcast ACK for connect data

Explanation: An error occurred when poe was trying to acknowledge receipt of connect data from all nodes. Either one of the remote nodes is no longer accessible or a system error has occurred.

User response: Verify that the remote nodes in the partition can be contacted by other means. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

The following nodes may be causing connect failures during message passing initialization:

Explanation: The home node has gathered connect data from each of the remote nodes and has determined that one or more nodes have been reported most as not connectable to during message passing initialization. A list of those nodes proceeds this message.

User response: Verify that the node can be contacted by other means. Also, refer to the node-specific error message related to mpci_connect for more information on what could be causing the problem (for example, unauthorized user). If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

Could not open socket for debugger.

Explanation: The call to socket() failed when attempting to open a socket for the parallel debugger.

User response: None.

Could not bind local debug socket address.

Explanation: The call to bind() failed when attempting to bind the local address for the debug socket.

User response: None.

Could not accept debugger socket connection.

Explanation: The call to accept() failed when attempting to make a socket connection with the debugger.

User response: None.

Could not write to debug socket.

Explanation: The call to write() failed when attempting to write to the debug socket.

User response: None.

Could not read message from debug socket.

Explanation: The call to read() failed when attempting to read a message from the debug socket.

User response: None.

MP_CMDFILE is ignored when MP_STDINMODE is set to none

Explanation: If you set the MP_STDINMODE environment variable or the -stdinmode option to "none", the MP_CMDFILE environment variable or the -cmdfile option is ignored.

User response: To eliminate this WARNING message, you should remove the MP_CMDFILE setting or specify MP_STDINMODE, which is not case sensitive, to another value other than "none".

MP_HOLD_STDIN is ignored when MP_STDINMODE is set to none

Explanation: If you set the MP_STDINMODE environment variable or the -stdinmode option to "none", MP_HOLD_STDIN=yes is ignored.

User response: Unset MP_HOLD_STDIN to eliminate the WARNING message, if desired.

Using redirected STDIN for program name resolution

Explanation: You redirected stdin without specifying a program name or command file name, and you did not set the MP_STDINMODE environment variable or the -stdinmode option to "none". Because program behavior is undefined in this case, a warning is issued.

User response: You should set the MP_STDINMODE environment variable or the -stdinmode option to "none". For more details on the MP_STDINMODE environment variable, see z/OS UNIX System Services Parallel Environment: Operation and Use.

select

Explanation: An explanatory sentence follows. The Partition Manager terminates.

User response: The select call to the sockets connecting the Partition Manager with the remote nodes failed. Presumably connection has been lost.
explanatory sentence may give an indication of the source of failure.

**FOMO0160**  I/O error on socket connection with task number

**Explanation:** An explanatory sentence follows. The Partition Manager continues. A read on the socket used to connect the Home Node with the indicated remote task failed. Probably the remote node has closed the connection. The task is marked as exited and processing continues.

**User response:** Examine the communication subsystem for failure.

**FOMO0161**  EOF on socket connection with task number

**Explanation:** Processing continues. The socket used to connect the Home Node with the indicated remote task has closed. Probably the remote node has closed the connection.

**User response:** Examine the communication subsystem for failure.

**FOMO0164**  process_io: read(io command)

**Explanation:** Processing continues. The command sent to the Partition Manager is ignored.

**User response:** Probable system error. An incomplete or invalid I/O command was received by the Partition Manager.

**FOMO0169**  pm_remote_shutdown

**Explanation:** Processing continues. An explanatory sentence is appended.

**User response:** A quit message being sent to all remote nodes could not be written to one of the sockets.

**FOMO0171**  unknown io command

**Explanation:** Processing continues. The data is ignored.

**User response:** An unsupported or invalid I/O command code was received by the Partition Manager from a remote node.

**FOMO0172**  I/O buffer overflow

**Explanation:** The stdout or stderr string overflows the output buffer (8K). The excess is discarded.

**User response:** Probable internal error. Normally, the output is automatically flushed if it exceeds the buffer length. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

**FOMO0183**  Connection to task number blocked. Task abandoned.

**Explanation:** While trying to stop the indicated task on a remote node, the Partition Manager discovered that the socket connection was blocked (unavailable). The remote task is marked as inactive and the Partition Manager continues.

**User response:** Manual intervention may be required to kill the job on the remote node.

**FOMO0200**  pmd: getpeername <string>

**Explanation:** The daemon is unable to identify the partition manager.

**User response:** Probable system or communication subsystem failure.

**FOMO0201**  pmd: setsockopt(SO_KEEPALIVE): <string>

**Explanation:** The daemon is unable to set the indicated socket option. Explanatory sentence is provided.

**User response:** Probable system or communication subsystem failure.

**FOMO0202**  pmd: setsockopt(SO_LINGER): <string>

**Explanation:** The daemon is unable to set the indicated socket option. Explanatory sentence is provided.

**User response:** Probable system or communication subsystem failure.

**FOMO0203**  malformed from address: <string>

**Explanation:** The socket address family is incorrect.

**User response:** Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

**FOMO0207**  pmd: sigaction <string>

**Explanation:** Error when setting up to handle a signal.

**User response:** Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.
FOMO0208 pmd: fork <string>
Explanation: The pmd daemon is unable to fork to execute the user application.
User response: Probable system error.

FOMO0212 pmd: node string: user string denied from access from host string
Explanation: The user is not permitted to run on the indicated node. The Partition Manager exits.
User response: Make sure that the Partition Manager home node machine and user id are identified and have identical passwords. For reason "EDC5157I An internal error has occurred", the problem might be insufficient authorization of the pmd daemon. The pmd daemon uses the _passwd() call to authenticate the remote user. Programs that call _passwd() in a z/OS UNIX environment that is secured with BPX_DAEMON must be defined as program controlled to the security manager. Please have your system administrator set the program controlled extended attribute (extattr +p /bin/pmd) for the pmd daemon.

FOMO0213 pmd: setuid <number>
Explanation: The setuid function failed for a given userid.
User response: Make sure that the user is known by the same number on all systems.

FOMO0214 pmd: chdir <string>
Explanation: An attempt to change to the indicated directory failed.
User response: Make sure that the directory exists.

FOMO0215 can’t run parallel tasks as root
Explanation: The userid of the user running the application can not be 0.
User response: Rerun under a userid other than root.

FOMO0216 POE (number) - pmd (number) - user program (number) versions incompatible
Explanation: The versions of the POE home node, the pmd and the user’s program are incompatible.
User response: Assure that the pmd, POE home node, and libppe.a are at compatible PE version levels. If necessary, install compatible versions. You should check that the user program has been compiled with a version of PE that is compatible with the version of PE on the home node and the pmd. If necessary, recompile the user program using compatible POE home node and pmd versions.

FOMO0235 invalid userid received
Explanation: The userid is not valid on this node.
User response: Run under a valid userid.

FOMO0237 invalid group id received
Explanation: The group id received by the pmd daemon is either negative or non numeric and therefore not valid.
User response: Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0243 invalid environment length received
Explanation: The length received by the pmd daemon is either negative or non numeric and therefore not valid.
User response: Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0247 pmd: setgid <number>
Explanation: The pmd was unable to set the groupid for the remote task.
User response: Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0249 Job number completed with exit status number. Use the ipcrm command to reclaim shared memory if necessary.
Explanation: The job has completed, but probably abnormally terminated and did not reclaim shared memory used by the communication protocols. The job identifier is a hexadecimal value.
User response: Unreclaimed shared memory segments will eventually affect the system’s ability to allocate shared memory, so should be reclaimed periodically. Use the ipcs -m command to identify shared segments in use on each node. The job identifier in this message is the shared memory key for the segment listed in the ipcs command. The segment may then be removed via the ipcrm -m command, where the argument is the memory segment identifier listed in the second column of the ipcs command. This process should be repeated for each node on which the parallel job ran and used the shared memory communication protocol option.

332 z/OS V1R11.0 UNIX System Services Messages and Codes
FOMO0250  task number: string
Explanation:  The given task has received the given signal.
User response:  No response needed.

FOMO0251  task number exited: rc=number
Explanation:  The indicated task has exited. This informational message is displayed when processing completes normally and when the job is terminated by the <Ctrl>-C interrupt key.
User response:  No response needed.

FOMO0252  task number stopped: string
Explanation:  The indicated task has been stopped. The second variable in this message indicates the signal that stopped the task.
User response:  Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0254  User string not authorized on host string
Explanation:  The userid is not found on the given host.
User response:  Add the userid to the host with SMIT.

FOMO0255  Group string does not exist on host string
Explanation:  The group id is not found in /etc/group.
User response:  Add the groupid to the host with SMIT.

FOMO0258  User string not authorized for group string on host string.
Explanation:  The userid is not permitted to access the given groupid on the given host.
User response:  Add the userid to the group access list on the host.

FOMO0304  remote child: error restoring stdout.
Explanation:  The previously closed stdout cannot be restored.
User response:  Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0305  remote child: error restoring stderr.
Explanation:  The previously closed stderr cannot be restored.
User response:  Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0306  pm_atexit: pm_exit_value is number.
Explanation:  Program exit value
User response:  Informational message. No action required.

FOMO0307  remote child: error restoring stdin.
Explanation:  The previously closed stdin cannot be restored.
User response:  Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0308  Invalid value for string: string
Explanation:  Indicated value is not a valid setting for the indicated environment variable or command line option.
User response:  Set to a valid value and rerun.

FOMO0309  Connect failed during message passing initialization, task number, reason: string
Explanation:  The Communication Subsystem was unable to connect this task to one or more other tasks in the current partition for the reason given.
User response:  If a timeout has occurred, the MP_TIMEOUT environment variable is set to too low a value. (The default value is 150 seconds.) If you have not explicitly set the MP_TIMEOUT environment variable and the program being run under POE is NFS mounted, 150 seconds may not be sufficient.

If the reason given indicates "Permission denied", you should ensure the login name and user ID of the user submitting the job is consistent on all nodes on which the job is running.

For any other reason, an internal error has occurred. You should gather information about the problem and follow local site procedures for reporting hardware and software problems.
FOMO0310  Socket open failed during message passing initialization, task number, reason: string

Explanation: The Communication Subsystem was unable to open a socket for message passing for the indicated task for the reason given.

User response: Most likely, an internal error has occurred; gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0330  Error getting environment variable string

Explanation: The internal getenv function failed to get the specified environment variable. The remote node terminates.

User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0332  SSM_CSS_INIT expected and it was not received.

Explanation: System error occurred where an SSM_CSS_INIT was expected for the control pipe input. The remote node terminates.

User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0333  More node information found than expected.

Explanation: An internal error was detected where there was more node information returned from SSM_CSS_INIT than expected. The remote node terminates.

User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0334  SSM not SSM_ACK to our sync request.

Explanation: An internal error was detected where there was no acknowledgment returned for a synchronization request. The remote node terminates.

User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0335  SSM subtype not what was expected

Explanation: An internal error was detected where an unexpected message type was returned. The remote node terminates.

User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0337  Error in starting the user’s code.

Explanation: An internal error was detected after trying to start the user executable code in the remote node. The remote node terminates.

User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0338  Error sending exit request to home node.

Explanation: An internal error was detected after trying to send an exit request to the home node. The remote node terminates.

User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0379  Pool setting ignored when hostfile used

Explanation: User has set the MP_RMPOOL environment variable or the -rmpool command-line option but a hostfile was found.

User response: Ensure that use of the hostfile was intended.

FOMO0380  LoadLeveler step ID is string

Explanation: The indicated step ID was assigned by LoadLeveler to the current interactive job. It may be useful when using the llq command to determine the job status.

User response: None required.

FOMO0400  Invalid value number for stdoutmode

Explanation: User has entered a non-negative value with -stdoutmode or MP_STDOUTMODE which is greater than or equal to the number of processes requested; for SINGLE mode, this value must be between 0 and n-1, where n is the number of processes.

User response: Rerun with valid value.
Chapter 1. Messages

FOMO0401  Invalid value \textit{number} for stdinmode

\textbf{Explanation:} User has entered a non-negative value with -stdinmode or MP_STDINMODE which is greater than or equal to the number of processes requested; for SINGLE mode, this value must be between 0 and \( n - 1 \), where \( n \) is the number of processes.

\textbf{User response:} Rerun with valid value.

FOMO0412  Invalid pulse value.

\textbf{Explanation:} An invalid value was specified for the MP_PULSE environment variable or the -pulse command line flag.

\textbf{User response:} Respecify a valid value for MP_PULSE or -pulse.

FOMO0414  pm_collect: read select error

\textbf{Explanation:} A system error occurred while reading from a remote node. The system error message is appended. POE terminates.

\textbf{User response:} Verify that the remote nodes in the partition can be contacted by other means. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0415  Non-zero status \textit{number} returned from pm_collect

\textbf{Explanation:} An error has occurred in a lower level function.

\textbf{User response:} Perform whatever corrective action is indicated for earlier messages and retry. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0416  \textit{string}: no response; rc = \textit{number}

\textbf{Explanation:} An error occurred on reading data from remote node to home node.

\textbf{User response:} This is an IP communication error between home and remote node. No acknowledgment of startup was received from the \texttt{pmd} daemon running on the indicated node. Check for error message from that node. The return codes are: -1, EOF on connection; 1 I/O error; 2 allocation error.

FOMO0417  Unexpected acknowledgment of type \textit{string} from remote node

\textbf{Explanation:} The Partition Manager received an unexpected data value from remote node during pm_collect function. The data is ignored and processing continues.

\textbf{User response:} None.
FOMO0515  Duplicate node name string in ionodefile
Explanation: A duplicate node that was found in the ionodefile.
User response: Check pathname and ionodefile.

FOMO0600  Number of tasks (number) > maximum (number)
Explanation: User has requested more tasks than maximum number allowed.
User response: Rerun job within defined limits for number of tasks.

FOMO0601  Open of file string failed
Explanation: Specified hostfile could not be opened.
User response: Check pathname and permissions.

FOMO0605  Unexpected EOF on allocation file for task number
Explanation: There were not enough entries in the hostfile for the number of processes specified.
User response: Lower the number of processes or add more entries to the hostfile.

FOMO0609  Unable to open save_hostfile string
Explanation: Specified save hostfile could not be opened.
User response: Check pathname and permissions.

FOMO0610  Error in command broadcast
Explanation: An error occurred in broadcasting the poe command to the partition. Probably one of the remote nodes is no longer accessible. POE terminates.
User response: Verify that the remote nodes in the partition can be contacted by other means. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0612  pm_contact: write select error
Explanation: A system error occurred while writing to a remote node. The system error message is appended. POE terminates.
User response: Verify that the remote nodes in the partition can be contacted by other means. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0613  Unable to send command to task number
Explanation: An error occurred in sending the poe command to the indicated task. Probably the remote node is no longer accessible. POE terminates.
User response: Verify that the remote node in the partition can be contacted by other means. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0614  Unable to send single command to task number
Explanation: An error occurred in sending the poe command to the indicated task. Probably the remote node is no longer accessible. POE terminates.
User response: Verify that the remote node in the partition can be contacted by other means. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0615  strappend failed for string, rc = number
Explanation: The internal string append function failed. The system terminates.
User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0616  gethostbyname failed for home node
Explanation: The internal gethostbyname function failed. The system terminates.
User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0617  pm_getcwd failed, rc = number
Explanation: The internal pm_getcwd function failed. A return code of 1 implies either can’t open pipe to sh or command failed. A return code of 2 means the working directory string is longer than bufsize. The system terminates.
User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0618 The following nodes were not contacted:

Explanation: See message FOMO0623 for a list of the remote nodes that did not respond during the phase indicated by the code in message FOMO0631. It is possible that some nodes were not tried, so the list doesn't necessarily indicate that all the nodes were unavailable. POE terminates.

User response: Probably connectivity to one of the listed nodes has been lost. Verify that the node can be contacted by other means. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0619 string

Explanation: The text provides explanatory information. A preliminary FOMOnumber message indicates the context.

FOMO0620 pm_SSM_write failed in sending the user/environment for taskid number

Explanation: The internal pm_SSM_write function failed. The system terminates.

User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0621 pm_SSM_write failed in sending the partition map information for taskid number

Explanation: The internal pm_SSM_write function failed. The system terminates.

User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0622 unexpected msg from task number, type number Text: string

Explanation: An unexpected message was returned from the indicated task. The system continues.

User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0623 task number: hostname string

Explanation: The line indicates the task number and associated host name. See message FOMO0618 and FOMO0631 for more information.

User response: The list may contain names of failing nodes. Verify that connectivity exists and the pmd daemon is executable on that node.

FOMO0624 Error from sigprocmask for blocking stop signals

Explanation: An error occurred in setting the signal mask to block stop signals during installation. POE terminates.

User response: Probable PE internal error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0625 sigaction(SIGSTOP)

Explanation: An error occurred in setting the flags for the SIGSTOP signal. POE terminates.

User response: Probable PE internal error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0626 got signal number; awaiting response from signal number

Explanation: POE received a signal while processing the responses to a previous signal. The new signal is ignored unless it is the SIGKILL signal.

User response: Often this means that a remote node is not responding. Verify that the node can be contacted by other means. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0627 Task number connection blocked. Task will be abandoned.

Explanation: While shutting down the partition, POE was unable to write to the indicated task, because the socket was blocked. The socket and task are subsequently ignored and the shutdown continues.

User response: Often this means that a remote node is not responding. The tasks running on this node must be terminated manually. Verify that the node can be contacted by other means. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.
FOMO0628  pm_contact: read select error
Explanation: A system error occurred while reading from a remote node. The system error message is appended. POE terminates.
User response: Verify that the remote nodes in the partition can be contacted by other means. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0629  pm_contact: write timeout occurred; nprocs = number
Explanation: The select statement timed out waiting for ready to write to a remote node. A list of nodes not contacted is appended. POE terminates.
User response: Verify that the remote nodes in the partition can be contacted by other means. If necessary, the timeout interval may be set with the environment variable MP_TIMEOUT. The default is 150 seconds. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0630  pm_contact: read timeout occurred; nprocs = number
Explanation: The select statement timed out waiting for ready to read from a remote node. A list of nodes not contacted is appended. POE terminates.
User response: Verify that the remote nodes in the partition can be contacted by other means. If necessary, the timeout interval may be set with the environment variable MP_TIMEOUT. The default is 150 seconds. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0631  pm_contact: signal received; nprocs = number, code = number
Explanation: Operation was terminated by a signal, either created by the user (SIGINT), or with the system (for example, SIGPIPE). POE terminates. The code indicates where in the contact sequence the signal occurred as follows:
2 - connect
3 - write select
4 - write message 1
5 - write message 2
6 - read select
7 - read acknowledgment
8 - end of contact routine
User response: The remote node(s) do not respond. Verify that the node can be contacted by other means. Verify that the pmdv2 daemon is executable on the indicated remote node. If necessary, the timeout interval may be set with the environment variable MP_TIMEOUT. The default is 150 seconds. If the problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0632  Can’t connect to PM Array. errno = number
Explanation: POE tried to connect to the Program Marker Array tool but was unsuccessful. The system error number is returned. Most likely, the Program Marker Array has not been started.
User response: If the Program Marker Array is not being used, ignore this message. Otherwise, terminate POE, start the pmarray, and restart POE. If Program Marker Array has been started, verify the value of the environment variable MP_USRPORT for a valid port number for connection.

FOMO0633  Unexpected EOF on socket to task number
Explanation: POE got a socket EOF when trying to broadcast a message to the partition. The affected node is marked as not active, and the broadcast continues. The broadcast calling routine may take additional actions.
User response: Verify the reason for loss of connection. Often this means that a remote node is not responding. Verify that the node can be contacted by other means. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0634  Non-zero status number returned from pm_parse_args
Explanation: An error has occurred parsing the parameters.
User response: More information or error messages should accompany this message, describing the errors in more detail. Correct the invalid values and retry.

FOMO0635  Non-zero status number returned from pm_mgr_init
Explanation: An error has occurred in a lower level function.
User response: Perform whatever corrective action is indicated for earlier messages and retry. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.
FOMO0636  User requested or EOF termination of pm_command
Explanation: End of file was reached in the specified command file or user typed quit.
User response: If termination is unexpected, verify that command file contains correct number of commands based on MP_PROCS and MP_PGMMODEL settings.

FOMO0637  Non-zero status number returned from pm_command
Explanation: An error has occurred in a lower level function.
User response: Perform whatever corrective action is indicated for earlier messages and retry. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0638  Non-zero status number returned from pm_respond
Explanation: An error has occurred in a lower level function.
User response: Perform whatever corrective action is indicated for earlier messages and retry. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0639  Exit status from pm_respond = number
Explanation: The pm_respond function exited with the indicated status.
User response: If other error messages occurred, perform corrective action indicated for the message(s); otherwise, no action is required.

FOMO0642  End of File from Program Marker Array
Explanation: The socket connecting POE to the Program Marker Array has returned EOF. Execution of POE continues.
User response: If the Program Marker Array has not been deliberately terminated, determine the cause of the EOF, and, if desired, restart POE. Otherwise, ignore the message and allow the POE job to terminate normally.

FOMO0643  Error read from Program Marker Array
Explanation: The socket connecting POE to the Program Marker Array has returned an error condition. POE continues. The defined error codes are:
1 - I/O error on the socket. An explanatory message is appended if errno is set.
2 - POE was unable to allocate storage for the message from PM Array. Probable internal error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.
3 - Some other error. An explanatory message is appended if errno is set.
User response: If the Program Marker Array has not been deliberately terminated, determine the cause of the error, and, if desired, restart POE. Otherwise, ignore the message and allow the POE job to terminate normally. If the error code was 2 or 3, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0644  "Can't route PM Array message to task number"
Explanation: An error occurred while trying to forward a message from the Program Marker array to the indicated task. POE continues, but the connection to PM Array is closed.
User response: Probably the remote task is no longer active, but the Program Marker array responses are backlogged. In this case, the messages can be ignored. Otherwise, look for other failures that may also cause this symptom.

FOMO0645  PM Array message to unknown destination number
Explanation: The PM Array message is not to a remote task and not for the Home Node. The destination code is given. POE continues, but the connection to PM Array is closed.
User response: Probably the PM Array tool is issuing invalid messages. Check the PM Array application.

FOMO0646  PM Array is trying to tell us something ...
Explanation: A message from PM Array is directed to the Home Node. At present there are no Home Node functions responding to the PM Array, so the message text is just printed out.
User response: Verify that the PM Array tool is working correctly.

FOMO0647  string
Explanation: This is the message buffer text from PM Array as described in message FOMO0646.
User response: Verify that the PM Array tool is working correctly.
FOMO0648  Couldn’t tell world about EOF on STDIN
Explanation: An error occurred while broadcasting EOF on STDIN to the partition. The partition is terminated, and POE exits.
User response: Verify that the remote nodes are accessible and restart POE. If the failure continues, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0649  Couldn’t tell task number about EOF on STDIN
Explanation: An error occurred while sending EOF on STDIN to the indicated task. The partition is terminated, and POE exits.
User response: Verify that the remote node is accessible and restart POE. If the failure continues, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0650  No receiver for STDIN bound for number
Explanation: STDINMODE defines a task number that is not active.
User response: Probable user error. Verify the value of STDIN mode set by the environment variable or under program control.

FOMO0651  Error reading input command file
Explanation: An I/O error occurred reading the input command file describing the initialization sequence for pdbx and pedb. Input reverts to STDIN.
User response: If possible, determine which file is being read and correct it. If the problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0652  Error reading STDIN
Explanation: An I/O error occurred reading STDIN. STDIN is subsequently ignored.
User response: Verify that the file used for STDIN is readable. If the problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0653  Couldn’t route data from STDIN to task number
Explanation: An error occurred routing STDIN to the indicated task. The partition is terminated and POE exits.
User response: Verify that the remote task is active. If the problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0654  Allocation error for SSM_read, task number, length number
Explanation: An error occurred allocating storage for a message from a remote node. The partition is terminated and POE exits. The task id and length requested are printed.
User response: Verify that sufficient storage is available to run POE on the Home Node, and that the requested length is not excessive. If the problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0655  Can’t route message to destination number
Explanation: An error occurred routing a message to the indicated destination task. The requested routing is not supported.
User response: If the message is generated by Parallel Environment, this is an internal error. If generated by a user program, this is a user error. Determine the source of the message. If the problem is an internal error, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0656  I/O file string closed by task number
Explanation: The stdio stream indicated has been closed by the indicated task.
User response: Verify if this is the intended operation. If so, ignore the message. This message may also occur at the end of a job that terminates normally.

FOMO0657  Can’t send mpl_init_data to nodes
Explanation: An error occurred in broadcasting the CSS initialization data to the remote nodes. The partition is terminated and POE exits.
User response: The failing routine is pm_address. Look for other symptoms to determine the cause of failure.
FOMO0658  Can't send termination signal to nodes
Explanation:  An error occurred in broadcasting the termination message to the remote nodes. The partition is terminated and POE exits (which is was trying to do, anyway).
User response:  The failing routine is pm_shutdown_job. Look for other symptoms to determine the cause of failure.

FOMO0659  Can't log accounting data from node number
Explanation:  An error occurred in logging the accounting records received from the remote nodes. Execution continues.
User response:  The failing routine is pm_acct_response. Look for other symptoms to determine the cause of failure.

FOMO0660  Partition Manager stopped ...
Explanation:  The Home Node (POE) has stopped in response to a SIGTSTOP (<Ctrl>Z) signal. The remote nodes have been stopped.
User response:  To resume the job, issue SIGCONT, or use the shell job control commands fg or bg.

FOMO0661  signal_sent = number not recognized
Explanation:  The indicated signal was recorded as being sent to the remote nodes, but is not recognized by POE. Execution continues.
User response:  Probable POE internal error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0664  Unknown message type number received
Explanation:  The indicated message type is not known by POE. Execution is terminated.
User response:  Probably the socket contains a non-structured message, which would be a stray. If the source of the stray socket message cannot be determined, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0665  Invalid value for SSM_SINGLE number
Explanation:  The indicated value is invalid as a destination for SINGLE I/O mode. The specification is ignored.
User response:  Verify that the correct value for SINGLE I/O mode is used.

FOMO0666  Out of range value for SSM_SINGLE number
Explanation:  The indicated value is out of range: less than zero, or greater than the number of tasks. The specification is ignored.
User response:  Verify that the correct value for SINGLE I/O mode is used.

FOMO0667  Invalid value for SSM_UNORDERED number
Explanation:  The indicated value is invalid as a specification for UNORDERED I/O mode. The specification is ignored.
User response:  Verify that the correct value for I/O mode is used.

FOMO0668  pm_io_command: error in pm_SSM_write, rc = number
Explanation:  An error occurred while responding to a STDIO MODE QUERY message. The response is abandoned.
User response:  Probable POE internal error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0669  Can't acknowledge IO_command sync
Explanation:  A socket error occurred while broadcasting a synchronization request acknowledgment. The partition is terminated and POE exits.
User response:  One or more remote nodes may not be reachable. Verify that the remote nodes can be contacted, and restart POE. If problems persist, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0670  Illegal stdout mode number
Explanation:  The indicated value for STDOUT mode is not valid. The requested I/O buffering is not performed.
User response:  Correct the value for STDOUT mode.

FOMO0671  Can't acknowledge PMArray data from task number
Explanation:  An error occurred trying to return an acknowledgment to a node sending data to PM Array.
User response:  Probable POE internal error. The error may also be caused by loss of contact with the remote node. Gather information about the problem and
follow local site procedures for reporting hardware and software problems.

FOMO0672 Invalid routing request from task
  number to task number
Explanation: The Home Node has received a message but doesn’t know how to route it to the indicated task (destination).
User response: Probable POE internal error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0673 Invalid mode/destination for STDIN:
  number
Explanation: The requested destination for STDIN is invalid. The request to route STDIN is ignored.
User response: Verify the STDIN I/O mode requested.

FOMO0674 Unexpected return code number from
  pm_SSM_write
Explanation: Internal error has occurred.
User response: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0675 Invalid mode number requested
Explanation: User program has called function MP_STDOUTMODE or mpc_stdoutmode with invalid mode.
User response: Refer to man page for explanation of valid modes.

FOMO0676 Unexpected return code number from
  _mp_in_mode
Explanation: An error may have occurred in a lower level function.
User response: If earlier error messages exist, perform whatever corrective action is indicated for these. If there are no other messages or if problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0677 POE couldn’t get process info for
  process id number
Explanation: The Partition Manager is unable to get the time stamp in the procinfo structure for creating the /tmp/ppe.xxx.attach.cfg file.
User response: Probable PE error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0678 Unsuccessful call to pm_SSM_read
Explanation: Internal error has occurred.
User response: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0680 Invalid mode number requested
Explanation: User program has called function MP_STDINMODE or mpc.stdinmode with invalid mode.
User response: Refer to man page for explanation of valid modes.

FOMO0682 Unexpected return code number from
  _mp_in_mode
Explanation: An error may have occurred in a lower level function.
User response: If earlier error messages exist, perform whatever corrective action is indicated for these. If there are no other messages or if problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0684 Incorrect subtype number received in
  structured socket message
Explanation: Internal error has occurred.
User response: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0685 Unexpected return code number from
  _mp_stdoutmode_query
Explanation: An error may have occurred in a lower level function.
User response: If earlier error messages exist, perform whatever corrective action is indicated for these. If there are no other messages or if problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0686 Invalid option number requested
Explanation: User program has called function MP_FLUSH or mpc_flush with invalid option.
User response: Refer to man page for explanation of valid options.
FOMO0696 Unexpected return code number from _mp_flush

**Explanation:** An error may have occurred in a lower level function.

**User response:** If earlier error messages exist, perform whatever corrective action is indicated for these. If there are no other messages or if problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0701 invalid envc received

**Explanation:** The envc received by the pm daemon is invalid.

**User response:** Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0702 invalid pmdlog argument

**Explanation:** The pmdlog argument received by the pm daemon is invalid.

**User response:** Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0703 invalid nprocs argument

**Explanation:** The nprocs argument received by the pm daemon is invalid.

**User response:** Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0704 invalid newjob argument

**Explanation:** The newjob argument received by the pm daemon is invalid.

**User response:** Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0705 invalid pdbx argument

**Explanation:** The pdbx argument received by the pm daemon is invalid.

**User response:** Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0706 pmd: Error reading node info from home node.

**Explanation:** The node info received by the pm daemon is invalid.

**User response:** Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0707 pmd: error sending node map ack to home node.

**Explanation:** The pm daemon was not able to send a node map ack to the home node.

**User response:** Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0708 pmd: invalid JOBID.

**Explanation:** The pm daemon was not able to send a node map ack to the home node.

**User response:** Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0709 pmd: SSM recv'd not cmd str or exit

**Explanation:** An incorrect SSM was received by the pm daemon from the home node.

**User response:** Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0710 pmd: pipe creation error

**Explanation:** The pm daemon was unable to create pipes to its child.

**User response:** Probable system error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMO0711 parent select errno = number

**Explanation:** select error from pmd parent.

**User response:** Probable system error.

Explanation:
- **FOMO0712**: pm daemon parent was unable to read STDIN.
- **FOMO0713**: pm daemon parent had error sending ack for sig request.
- **FOMO0714**: pm daemon parent was not able to write to its child's STDIN.
- **FOMO0715**: pm daemon parent was not able to write to its child's control pipe.
- **FOMO0716**: pm daemon parent was not able to read STDOUT from the child.
- **FOMO0717**: pm daemon parent was not able to write to STDOUT.
- **FOMO0718**: pm daemon parent was not able to read the control pipe from the child.
- **FOMO0720**: initgroups failed, errno given.
- **FOMO0721**: userinfo() was unable to set user info.
- **FOMO0722**: userid is set to the given userid.
- **FOMO0723**: The child is executing the given program.
- **FOMO0724**: The child failed to execute the given program.
- **FOMO0725**: The remote node PMD was not able to send the node attach data via IP communications to home node. The remote node will now exit.
- **FOMO0726**: pm daemon parent was not able to write to debug engine pipe, which is used to communicate with the node debug server.
- **FOMO0727**: The Partition Manager Daemon detected an error while starting the remote debug engine. The debugger is terminated.
debugger is properly installed on the nodes where the job runs.

**FOMO0735** Free space threshold for message logging reached (task number)

**Explanation:** You requested to log diagnostic messages (through MP_PMDLOG/-pmdlog), but there is less than 1Mb of space remaining in /tmp. Logging will be stopped if /tmp becomes full. Processing continues.

**User response:** Expand the file system or cleanup files in /tmp in order to provide additional space.

**FOMO0736** /tmp filled for task number. Logging is stopped.

**Explanation:** You requested to log diagnostic messages (through MP_PMDLOG/-pmdlog), but the /tmp directory on the indicated remote node was filled during execution. Processing continues, but the logging of diagnostic messages has been stopped for the indicated task.

**User response:** After the job has finished, increase the size of the /tmp directory on the indicated remote node before you execute POE again with MP_PMDLOG=YES.

**FOMO0800** -procs string ignored in remote child

**Explanation:** -procs interpreted only in parent code.

**User response:** No response needed.

**FOMO0801** -hostfile string ignored in remote child

**Explanation:** -hostfile interpreted only in parent code.

**User response:** No response needed.

**FOMO0802** -newjob string ignored in remote child

**Explanation:** -newjob interpreted only in parent code.

**User response:** No response needed.

**FOMO0803** -pmdlog string ignored in remote child

**Explanation:** -pmdlog interpreted only in parent code.

**User response:** No response needed.

**FOMO0804** -pgmmodel string ignored in remote child

**Explanation:** -pgmmodel interpreted only in parent code.

**User response:** No response needed.

**FOMO0805** Invalid programming model specified: string

**Explanation:** -pgmmodel should be either SPMD or MPMD.

**User response:** Re-enter -pgmmodel with either SPMD or MPMD.

**FOMO0806** Invalid retry count string

**Explanation:** Retry count should be an integer.

**User response:** Reenter -retry followed by an integer.

**FOMO0808** Hostfile or pool number must be used to request nodes

**Explanation:** When using the Resource Manager, the environment variable MP_RMPOOL or the command line option -rmpool must be used to specify the pool name, since a hostfile did not exist.

**User response:** Ensure that absence of hostfile was intended, verify command-line or environment variable settings of hostfile, resd, and rmpool, and re-try. Refer to Z/OS UNIX System Services Parallel Environment Operation and Use for further information.

**FOMO0907** Task number terminating due to pulse timeout

**Explanation:** Designated task has been terminated due to a timeout in the POE pulse processing. The connection to the home node may have dropped, or the job may have been hung or abnormally functioning.

**User response:** It is possible that the pulse interval was too small to allow sufficient time for the task to complete. Verify that the node is still up, or that the job was not doing something abnormal. You may also want to increase your interval value with the MP_PULSE environment variable or -pulse command line flag.

**FOMO0908** SSM_PULSE acknowledgment failed for task number.

**Explanation:** There was a failure in sending the acknowledgment message for the POE pulse function from POE to pmd for the indicated task.

**User response:** Possible system error, unless the network connection between the nodes dropped. Otherwise, gather information about the problem and follow local site procedures for reporting hardware and software problems.

**FOMO0909** POE terminating due to pulse timeout for task number.

**Explanation:** POE has determined that there were remote nodes which did not respond during POE pulse processing. There was not enough responses prior to
the pulse timeout interval. The connection to the home node may have dropped, or the job may have been hung or abnormally functioning.

**User response:** It is possible that the pulse interval was too small to allow sufficient time for the task to complete. Verify that the nodes are still up, or that the job was not doing something abnormal. You may also want to increase your interval value with the MP_PULSE environment variable or -pulse command line flag.

---

FOMOA400 Error in creating socket

**Explanation:** The program pmarray terminates. An explanatory sentence is appended.

**User response:** Probable system error. Check the condition(s) given in the explanatory sentence.

---

FOMOA401 Error in binding socket

**Explanation:** The program pmarray terminates. An explanatory sentence is appended.

**User response:** Probable system error. Check the condition(s) given in the explanatory sentence.

---

FOMOA402 Error in listen

**Explanation:** The program pmarray terminates. An explanatory sentence is appended.

**User response:** Probable system error. Check the condition(s) given in the explanatory sentence.

---

FOMOA403 Error in accept

**Explanation:** The program pmarray terminates. An explanatory sentence is appended.

**User response:** Probable system error. Check the condition(s) given in the explanatory sentence.

---

FOMOA404 Error in socket read. File descriptor = number

**Explanation:** The program pmarray terminates. An explanatory sentence is appended.

**User response:** Probable system error. Check the condition(s) given in the explanatory sentence.

---

FOMOA406 Bad message type number

**Explanation:** Internal error has occurred.

**User response:** Gather information about the problem and follow local site procedures for reporting hardware and software problems.

---

FOMOA407 Internal error reading socket message

**Explanation:** Internal error has occurred.

**User response:** Gather information about the problem and follow local site procedures for reporting hardware and software problems.

---

FOMOA409 Invalid action code number, msg type number

**Explanation:** An unexpected message was received during initialization of the Program Marker Array.

**User response:** Restart pmarray; If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

---

FOMO0B001 poe: user string denied from access from host string, reason: string

**Explanation:** The user is not permitted to run on the indicated node. The Partition Manager exits.

**User response:** Specify the correct password for the identified user. If the correct password was entered, you may have to flag poe 'program' controlled.

---

FOMO0B002 string, line number: Task number has already been specified for specific node allocation.

**Explanation:** In the host list file a task number has been specified multiple times for specific node allocation. Since a task can only be executed on one node POE reports an error.

**User response:** Edit the host list file in the specified line and remove the second entry.

---

FOMO0B003 string, line number: Syntax error

**Explanation:** In the specified line of the host list file there is a syntax error.

**User response:** Edit the host list file in the specified line and correct the error.

---

FOMO0B004 No valid nodes for automatic allocation are available.

**Explanation:** This can have the following reasons:
1. When using a host list file: No valid nodes are specified in the host list file for automatic allocation.
2. When not using a host list file and the rmpool option is used: No systems are available where the specified scheduling environment is defined  

User response:  
1. When using a host list file: Edit the host list file and add entries for automatic allocation.  
2. When not using a host list file and the rmpool option is used: Check if the scheduling environment is defined. If these actions are not successful, gather information about the problem and follow local site procedures for reporting hardware and software problems.  

FOMO0B005 Enclave workload management cannot be used by POE. Service: string, reason: string (number).  
Explanation: The Partition Manager received an error from the specified Workload Manager enclave service. Enclave workload management cannot be used.  
User response: Terminate the parallel job if usage of WLM enclaves is critical. Otherwise the parallel jobs continues w/o. using WLM enclave management. Refer to [z/OS MVS Programming: Workload Management Services](https://www.ibm.com/support/knowledgecenter/ST6AS8_9.1.0/com.ibm.zos.zos.lm.uea.doc/chap003533.html) for an explanation of the supplied return (reason) codes.  

FOMO0B006 Error sending string to task number.  
Explanation: An internal error was detected after trying to send the specified string to the shown task.  
User response: Probable Parallel Environment error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.  

FOMO0B007 Error reading string from home node.  
Explanation: An internal error was detected after trying to read the specified string sent from the home node.  
User response: Probable Parallel Environment error. Gather information about the problem and follow local site procedures for reporting hardware and software problems.  

FOMO0B008 Enclave workload management cannot be used by task number. Service: string, reason: string (number).  
Explanation: The shown task received an error from the specified Workload Manager enclave service. Enclave workload management cannot be used.  
User response: Terminate the parallel job if usage of WLM enclaves is critical. Otherwise the parallel jobs continues w/o. using WLM enclave management. Refer to [z/OS MVS Programming: Workload Management Services](https://www.ibm.com/support/knowledgecenter/ST6AS8_9.1.0/com.ibm.zos.zos.lm.uea.doc/chap003533.html) for an explanation of the supplied return (reason) codes.  

FOMO0B009 Userid of poe user does not match userid of the creator of the WLM enclave.  
Explanation: The PMD compares the userid associated with the enclave to the the passed userid and only continues if they match. Otherwise POE terminates. This check is to ensure that PMD cannot be mislead by an enclave, that was not created by its POE.  
User response: Make sure the userid of the poe user and the creator of the WLM enclave is identical.  

FOMO0B010 Error from service: string, reason: string (number), task number.  
Explanation: The shown task received an error from the specified service  
User response: Determine the user action depending on the service failed. Refer to [z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com/support/knowledgecenter/ST6AS8_9.1.0/com.ibm.zos.zos.xlc.run.doc/TOC_run.html) for an explanation of the supplied return (reason) codes.  

FOMO0B011 Error from service: string, reason: string (number).  
Explanation: The Partition Manager received an error from the specified service  
User response: Determine the user action depending on the service failed. Refer to [z/OS XL C/C++ Run-Time Library Reference](https://www.ibm.com/support/knowledgecenter/ST6AS8_9.1.0/com.ibm.zos.zos.xlc.run.doc/TOC_run.html) for an explanation of the supplied return (reason) codes.  

FOMO0B012 Invalid string option, should be yes or no.  
Explanation: The value specified for the shown option is wrong.  
User response: Set it either to yes or no.  

FOMO0B013 Checking Scheduling Environment failed, reason: string  
Explanation: The rmpool option has been set and poe tried to check if the specified scheduling environment exists on a specific z/OS system. For some reason this operation failed.  
User response: Contact the local System Administrator to determine, if you have permission to check scheduling environments.
FOMOG0002  string <number>: Data Display data is not attached to data window [number][number].

Explanation: Cannot access information to update the data window.

System action: Further data viewing will be limited.

FOMOG0013  Range index value number is out of bounds. The index value must be within the range between number and number.

Explanation: You have entered an index that is not within the range of acceptable values for the array selected.

System action: Enter an array range index that is within the range of acceptable values specified at the top of the window.

FOMOG0014  Minimum array element number is greater than maximum element number.

Explanation: You have entered an array range value for minimum index that is greater than maximum index.

System action: Re-enter a value for minimum that is within the correct range.

FOMOG0019  An unrecognized section of the manual has been entered.

Explanation: A string was chosen or typed in to select a section of a manual. The string did not match any of the manual sections listed in the window.

System action: Correct the string in the choice field so it matches one of sections listed under manual selections, and then press <Enter> or click on the OK or Apply button. You could also select a section by clicking with the left mouse button on a section listed under manual selections, and then press the OK or Apply button to bring up the section under InfoExplorer.

FOMOG0021  An unrecognized online help index has been chosen.

Explanation: A string was chosen or typed in to select a section of the online help. The string did not match any of the online help sections listed in the window.

System action: Correct the string in the choice field so it matches the entry in the online help sections that you wish to choose, and press <Enter> or click on the OK or Apply button.

FOMOG0030  Only array ranges with up to number elements can be specified.

Explanation: You have specified an array range that would select more than the maximum allowable array elements. You may only look at a maximum of 1000 elements at a time even if the array is larger than that.

System action: Either enter values for minimum and maximum that define a smaller range of elements, or use a larger value for stride to select fewer array elements within the sub-range.

FOMOG0033  No source file is available for task: number.

Explanation: pedb could not locate a source file to correspond with where the program on this task is stopped. Consequently no source file for this task will appear in the source file window.

System action: pedb processing will continue. You can select a source file using the Get Source File option from the File pull-down or by double clicking on a stack entry which contains a source file name.

FOMOG0034  No source file is available to edit.

Explanation: pedb could not locate a source file to edit. Pressing the edit button causes an edit window to be displayed containing the file that is currently displayed in the pedb source window. Since there is no source file to edit, the edit window will not be displayed.

System action: Normal pedb processing will continue.

FOMOG0035  No task(s) selected.

Explanation: The context has not been set to a task or a task group.

System action: Press a task or group button to set the current context.

FOMOG0036  The STOP function is not available, since pedb is not in PLAY mode.

Explanation: The STOP function is only available when PLAY mode is active. Its purpose is to cancel PLAY mode. The case may be that the stop button was pressed while play mode was in the process of stopping.

System action: None. This is an informational message.

FOMOG0041  Cannot send a request to the remote debugger when a task is RUNNING or PLAYING. No action has been taken on any task.

Explanation: pedb cannot process your request when the task of the current context is RUNNING or
PLAYING. You may have tried to create or delete breakpoints, or tried to press the single step or continue buttons. pedb can only process requests when the task is in DEBUG READY state.

**System action:** You should resend the request when the task is in a DEBUG READY state.

---

**FOMOG0043 Cannot send a request to the following task(s): string. No action has been taken on these tasks.**

**Explanation:** A request has been issued for all tasks in the current context in DEBUG READY state. pedb cannot process your request until all tasks in the current context are in DEBUG READY state. Setting or deleting breakpoints, clicking on STEP OVER, STEP INTO or CONTINUE are examples of actions that cause requests to be sent to all tasks in the current context. You may have tried to create or delete breakpoints, or tried to press the single step or continue buttons. pedb can only process requests when all tasks in the current context are in DEBUG READY state, otherwise, the request is ignored.

**System action:** You should resend the request when the task(s) are in DEBUG READY state.

---

**FOMOG0044 Shell script string could not be located, or can not be executed.**

**Explanation:** The named shell script could not be located in the default directory, /bin or the user directory if specified by environment variable MP_DEBUG_BIN_DIR.

**System action:** Verify that the script is available and has the appropriate permissions to be executed by your login. If MP_DEBUG_BIN_DIR is set, make sure that the named script exists and has the proper permissions or that it does not exist so that the default script supplied with the debugger can be executed.

---

**FOMOG0050 An invalid value: "string" was specified for the Play Delay. Please enter a non-negative integer value. If you click on Cancel, the new delay field will be reset to the previous value of number.**

**Explanation:** An invalid value for the play delay has been entered. Only non-negative integers are valid.

**System action:** Specify a non-negative integer value for the play delay in tenths of seconds.

---

**FOMOG0051 string number: Could not resolve mouse selection to a stack entry.**

**Explanation:** Internal error: You have double-clicked on an entry in a stack window and pedb cannot resolve your selection to a call stack index. No action has been taken. pedb continues processing.

**System action:** Gather information about the problem and follow local site procedures for reporting hardware and software problems.

---

**FOMOG0052 Cannot read attach configuration file.**

**Explanation:** pedb could not read the attach configuration file, which is created when the original POE job was started, and is removed when the job ends.

**System action:**
1. Make sure the correct POE process id was used when invoking the debugger.
2. Check the /tmp directory for the existence of a configuration file containing the POE process id. (For example, check /tmp/.ppe.<poe; pid>.attach.cfg).

---

**FOMOG0053 No tasks listed in attach configuration file.**

**Explanation:** The attach configuration file created when the original POE job was started contained a zero in the first field indicating that POE is between job steps.

**System action:** Wait for the next job step to start which will take a few seconds. Then you can re-enter pedb in attach mode, if you wish.

---

**FOMOG0054 Cannot open attach configuration file.**

**Explanation:** pedb was unable to open the attach configuration file.

**System action:**
1. Make sure that the correct POE process id was used when invoking the debugger.
2. Check the /tmp directory for the existence of a configuration file containing the POE process id. For example, check for /tmp/.ppe.34192.attach.cfg.

---

**FOMOG0055 You are not allowed to delete group "Attached".**

**Explanation:** The default group when running in attach mode, "Attached", is not allowed to be deleted.

**System action:** None. This is an informational message.

---

**FOMOG0056 Missing or invalid argument to -a flag. For information on the correct syntax to use when invoking pedb, type: pedb -h**

**Explanation:** The -a flag requires an integer argument specifying the process identifier of the POE process.

**System action:** Specify the POE process id when using the -a flag. For example, specify pedb -a 34192.
FOMOG0057  Task number has been detached.
Explanation:  A reply was received from the debug engine (dbe) that indicated the specified task has been detached.
System action:  None. This is an informational message.

FOMOG0058  Attached to task number.
Explanation:  The specified task has been attached by the debugger.
System action:  None. This is an informational message.

FOMOG0059  Debugger attached and ready.
Explanation:  All of the specified tasks have been attached, and you are able to start debugging.
System action:  None. This is an informational message.

FOMOG0060  pedb Attach Window
Explanation:  This is the Attach Window help message.
System action:  None.

FOMOG0061  Task number: The following situation occurred on the remote debug engine: string
Explanation:  An error condition was detected by the remote debug engine on this task. The information following this message is from the remote debug engine, and contains information regarding the nature of the problem that occurred at that level.
System action:  If the information provided by the remote debug engine is not sufficient to allow you to rectify the problem, gather all relevant details and follow local site procedures for reporting hardware and software problems.

FOMOG0062  The following flag(s) are not valid when starting the debugger in attach mode: string. Please check for valid flags and retry.
Explanation:  The user attempted to start pedb in attach mode with a command line flag(s) that is not valid. The error message is given and the debugger exits.
System action:  The user should check for valid command line flags and try again.

FOMOG0063  The following environment variables have been ignored since they are not valid when starting the debugger in attach mode: string.
Explanation:  Some of the environment variables the user has set are not valid when starting pedb in attach mode. A message is given indicating what variables have been ignored. The debugger continues.
System action:  Note any environment variable of interest that have been ignored. This message exists to highlight the fact that some of the environment variables that normally have an effect when the POE job is initially started will not have an affect by having them set when the debugger is invoked for attach.

FOMOG0064  Error creating temporary file string.
Explanation:  When starting pedb in attach mode, a temporary host.list file is created, consisting of only the tasks that you selected to attach to. This temporary host.list file is created in /tmp by default, unless you specify a different directory with the TMDIR environment variable. The naming convention for this file is: /tmpdir/.pedb.<poe-pid>host.list; where /tmpdir is either /tmp, or the directory specified by the TMDIR environment variable, if it has been defined, and where <poe-pid> is the process ID of the poe job to be attached to. The message that you received appears when the temporary host.list file cannot be opened, or when errors are detected while writing to the file.
System action:  Verify that there is enough space available in the /tmp filesystem, or if you have specified a directory with the TMDIR environment variable, check the filesystem that contains this directory for sufficient space. You may also want to check to be sure that a file of the same name does not already exist.

FOMOG0065  Could not open socket for debugger to communicate with poe.
Explanation:  The socket() call failed when the debugger tried to set up communications with POE.
System action:  Debugging can continue except that the information about synchronized exit will not be passed back to the debugger from the POE job. Please note that the debugger will most likely not be able to re-attach to this POE job after detaching.

FOMOG0066  Could not make socket connection to poe.
Explanation:  The connect() call failed when the debugger tried to set up communications with POE. The information about a synchronized exit is not passed back to the debugger from the POE job. The debugger probably cannot re-attach to this POE job after detaching.
System action:  You can continue debugging with...
limited function. Please note that the debugger probably cannot re-attach to this POE job after detaching.

FOMOG0067 Could not read message from poe.
Explanation: pedb was unable to read data from the POE debug socket.
System action: Debugging can continue except that the information about synchronized exit may not be passed back to the debugger from the POE job. Please note that the debugger will most likely not be able to re-attach to this POE job after detaching.

FOMOG0068 Could not write to poe debug socket.
Explanation: pedb was unable to write to the POE debug socket.
System action: The debugger was unable to communicate to POE that the debugger is detaching. Please note that the debugger will most likely not be able to re-attach to this POE job.

FOMOG0069 An instance of pedb has already been attached to this POE job.
Explanation: Only one instance of the debugger may be attached to a given POE job at a time. The existence of the /tmp/.pedb.<poe-pid>-host.list; file indicates that a debugger has already attached to this POE job.
System action: If pedb isn't currently attached to the POE job in question, remove the corresponding /tmp/.pedb.<poe-pid>-host.list; file in /tmp, and try again.

FOMOG0070 Could not locate poe configuration file - 'string'.
Explanation: pedb was unable to locate the POE configuration file.
System action: Check to see if the desired POE job is running and if the configuration file was created in /tmp. (For example, check for a /tmp/.ppe.34192.attach.cfg file, where 34192 would be the process id of the POE job.

FOMOG0071 The information in the poe configuration file has been modified and therefore the old information is no longer valid. This is most likely due to a POE job step ending.
Explanation: The POE configuration file, /tmp/.ppe.<poe-pid>-attach.cfg, was modified.
System action: Restart the debugger in attach mode to debug the next POE job step.

FOMOG0072 All tasks have exited. Select OK to detach.
Explanation: All the tasks in the partition have completed program execution. Selecting OK causes pedb to detach from the program and exit. An alternative would be to click on Cancel and then select the Quit option from the File pull-down menu. Please note that this method would kill the POE job as well as causing pedb to exit.
System action: As mentioned above, clicking on this window, and then select the File->Quit option to kill the program and exit the debugger.

FOMOG0073 Missing or invalid argument following the -l flag. For information on the correct syntax to use when invoking pedb, type: pedb -h
Explanation: The -l flag requires the name of a directory that pedb will search for source code files. This argument was missing or invalid.
System action: Specify the name of a directory following the -l flag. This directory should be available to each task in your partition because the -l flag will be passed to each remote dbx debugger.

FOMOG0074 Missing or invalid argument following the -d flag. For information on the correct syntax to use when invoking pedb, type: pedb -h
Explanation: The -d flag requires an integer argument that specifies the nesting depth limit of program blocks.
System action: Specify an integer. Note that this overrides the default nesting depth limit of 25 program blocks.

FOMOG0100 The Load command is ignored because the task number is already loaded.
Explanation: This task has already been loaded with a program.
System action: If the wrong executable has been loaded for a particular task then pedb will have to be restarted.

FOMOG0101 Your program has been loaded.
Explanation: This message is issued when your program has been loaded into the tasks in the partition. This message indicates all the functions available in pedb are available for you to use.
System action: When this message is displayed, you can start debugging on all the tasks in the partition.
FOMOG0104 Cannot find executable 'string'.
Explanation: pedb could not find the specified executable file.
System action: Check that the name and path of the program to be debugged are entered correctly, and verify that the file has the proper permissions.

FOMOG0105 Cannot execute 'string'.
Explanation: The file to be debugged is not executable by this userid.
System action: Check the file permissions, and the results of the id command to ensure that you can execute the file. You may have to change your group or the file permissions.

FOMOG0107 Press a task or group button, because there is no current context.
Explanation: There is no defined context to execute on.
System action: Select a context and re-execute the function.

FOMOG0109 string
Explanation: This message is formatted dynamically from the string you are searching for, and the direction of the search.
Message format is: Searched to the <limit> of the file and did not find <string>:
For example: User specifies a string of my_variable in this find window. If using the First or Next option, the message text will be: Searched to the end of the file and did not find my_variable. If using Previous or Last, the message text will be: Searched to the top of file and did not find my_variable.
System action: Try specifying a different string or use the case sensitive button to ignore case when searching. To search from a different starting point in the text, scroll to that general area, and then left click on the desired starting line.

FOMOG0110 No source file is available for task: number, thread: number.
Explanation: pedb could not locate a source file to correspond with where the program on this task and thread is stopped. Consequently no source file for this task and thread will appear in the source file window.
System action: pedb processing will continue.

FOMOG0111 Source file: string on task: number, thread number is larger than the maximum allowable size, which is 65534 lines.
Explanation: pedb could not load the entire source file into the buffer used to process the Source File window. If you started pedb in normal mode, both pedb and the program will terminate. If you are using pedb in attach mode, pedb will detach from the program and exit, but the program will not be terminated.
System action: If you want the ability to debug all the source code for this program, split the code into multiple files, with each file being less than 65535 lines. After completing this, recompile the program.

FOMOG0112 Array string on task number, thread number has a different number of dimensions. It is excluded from the export.
Explanation: The array with a matching array name on the specified task and thread does not meet the match criteria and is excluded from the export.
System action: The user must be aware of the match criteria when trying to allow multiple matching arrays to exported at the same time. For more information, see z/OS UNIX System Services Parallel Environment: Operation and Use.
FOMOG0115 Array string on task number, thread number has a different minimum range. It is excluded from the export.

Explanation: The array with a matching array name on the specified task and thread does not meet the match criteria and is excluded from the export.

System action: The user must be aware of the match criteria when trying to allow multiple matching arrays to exported at the same time. For more information, see Z/OS UNIX System Services Parallel Environment: Operation and Use.

FOMOG0116 Array string on task number, thread number has matched. It is included in the export.

Explanation: This informational message indicates that this particular array has met the match criteria and will be included in the export.

System action: Continue normal pedb operations because this message indicates successful processing.

FOMOG0117 No matching array found on task number, thread number.

Explanation: No arrays that meet any of the matching criteria have been found on this task and thread.

System action: The user must be aware of the match criteria when trying to allow multiple matching arrays to exported at the same time.

FOMOG0118 pedb does not support message queue debugging for the non-threaded MPI library.

Explanation: Informational message that appears when the user attempts to get message request queue data from an application which is using the non-threaded MPI library.

System action: None.

FOMOG0119 The version of the MPI library being used is not supported by this version of the debugger.

Explanation: An informational message indicating that the version of the debugger being used cannot interpret data from the version of MPI being used.

System action: None.

FOMOG0120 The version of the MPCI library being used is not supported by this version of the debugger.

Explanation: An informational message indicating that the version of the debugger being used cannot interpret data from the version of MPCI being used.

System action: None.

FOMOG0121 The MPI application has not been run in debug mode, therefore, there will be no data on blocking calls and no time-stamp information.

Explanation: Some MPI debugging data is only collected when MPI is run in DEBUG mode.

System action: See the documentation concerning the setting of the MP_EUIDEVELOP environment variable.

FOMOG0122 Could not create a new request record.

Explanation: This is an internal debugger error most likely caused by either a memory allocation failure or the fact that the record already exists.

System action: Try canceling the message queue debugging windows and starting over again. If the error persists try to make sure there is sufficient memory available.

FOMOG0123 Could not retrieve the needed request record.

Explanation: This is an internal debugger error which indicates that a message queue debugging request record that should exist could not be found.

System action: Cancel the message queue debugging windows and start over.

FOMOG0124 Task number is not in pedb 'debug' mode.

Explanation: Informational message.

System action: No response is necessary.

FOMOG0125 Task number is not in the current context for view 0.

Explanation: Informational message.

System action: No response is necessary.

FOMOG0126 MPI has not been initialized for task number.

Explanation: Informational message.

System action: No response is necessary.

FOMOG0127 MPI has been finalized for task number.

Explanation: Informational message.

System action: No response is necessary.
FOMOG0128  Select a new filter (or filters), then press 'Apply' or 'OK'.
Explanation:  Informational message displayed in the Select Filters window.
System action:  No response is necessary.

FOMOG0129  Select a message to get message details or group information.
Explanation:  Informational message displayed in the task message queue window.
System action:  No response is necessary.

FOMOG0130  Could not get message group information.
Explanation:  An error occurred while attempting to retrieve group information for an MPI message record.
System action:  If the error persists cancel and restart the message queue debugging feature.

FOMOG0131  Could not get message details for task number.
Explanation:  An error occurred while attempting to retrieve message detail information for an MPI message record.
System action:  If the error persists cancel and restart the message queue debugging feature.

FOMOG0132  The minimum range value must be greater than the previous lower ranges minimum value.
Explanation:  When changing the queue size scale ranges the new minimum value must be greater than the previous ranges minimum value.
System action:  Open the Scale Range Setting window and try again.

FOMOG0133  Cannot select more than number tags.
Explanation:  The number of tag filters selected is limited.
System action:  Choose fewer than the maximum numbers of tags allowed, as indicated in the message.

FOMOG02075  "string": <number> - Unable to allocate number of bytes in "string"
Explanation:  Internal error: A memory allocation routine failed because there is not enough memory available. pedb continues processing, but it is likely you will have subsequent problems.
System action:  Start pedb again and try the following:
  - Debug your program with a subset of the tasks, or with smaller data segments.
  - Start your program, and use pedb to attach to a smaller set of tasks that are most interesting to you.
  - Contact your System Administrator to increase system resources, if possible.

If you continue to get this error message, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG2204  Could not find event number for string when parsing break/trace information.
Explanation:  An internal error occurred when parsing breakpoint or tracepoint information. pedb was unable to find the event number associated with the breakpoint or tracepoint.
System action:  Retry the previous breakpoint or tracepoint action. If you continue to get this error message, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG2205  Only number breakpoints allowed per view.
Explanation:  The maximum number of breakpoint per view has been reached.
System action:  Select another view to define additional breakpoints, or remove some breakpoints that are no longer needed, and then retry setting the breakpoint.

FOMOG2208  Task number has exited.
Explanation:  The task has exited and can no longer be contacted. No further debugging of the program on this task is allowed in this session.
System action:  None. This is an informational message.

FOMOG2209  Task number has requested exit.
Explanation:  The indicated task has attempted to exit. The program terminates when all tasks have requested exit.
System action:  None. This is an informational message.

FOMOG2212  The group was not added because the first character in the group name specified was not an alphabetic character.
Explanation:  The new group name specified in the
Add Group Window started with a character that was not alphabetic.

**System action:** Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

**FOMOG2213** The group was not added because the group name contained non-alphanumeric characters.

**Explanation:** The new group name specified in the Add Group Window was made up of some character(s) that were neither alphabetic nor numeric.

**System action:** Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

**FOMOG2214** The group was not added because the new group name is longer than the maximum group name length of number.

**Explanation:** The new group name specified in the Add Group Window is longer than the maximum allowed name length.

**System action:** Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

**FOMOG2215** The group was not added because the group name specified was empty.

**Explanation:** When attempting to add a new group, the group name was not specified.

**System action:** Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

**FOMOG2216** Group string already exists.

**Explanation:** When attempting to add a new group, the name of an existing group was specified.

**System action:** Provide a unique group name.

**FOMOG2217** The maximum number of groups has been reached.

**Explanation:** When attempting to add a new group, the total number of groups exceeded the maximum allowed.

**System action:** Delete unwanted groups to make room for new ones.

**FOMOG2218** There were no free group structures.

**Explanation:** When attempting to add a new group, there were no free group structures.

**System action:** Delete unwanted groups to make room for new ones.

**FOMOG2219** No members were chosen.

**Explanation:** When attempting to add a new group, you didn't choose any tasks as its members.

**System action:** Select members for the new group.

**FOMOG2220** Too many members were specified.

**Explanation:** When attempting to add a new group, there were too many members chosen.

**System action:** Select fewer members for the new group.

**FOMOG2221** Cannot delete group “ALL”.

**Explanation:** Removing the group “ALL” is not allowed.

**System action:** None. This is an informational message.

**FOMOG2222** A group cannot be deleted if it is the current context in any view.

**Explanation:** Removing a group if it is the current context is not allowed.

**System action:** Change the context in all views to something other than the group that is to be deleted.

**FOMOG2223** The attempt to delete group: string failed because the group was not found.

**Explanation:** When attempting to remove a group, you specified a group name that does not exist.

**System action:** Check for the proper group name and try again.

**FOMOG2224** The partition is not yet loaded.

**Explanation:** Informational message indicating that your program has not yet been loaded onto the tasks in the partition.

**System action:** If you specified the program name on the pedb command line, wait until all of the tasks have been loaded with your program before starting to debug. If you did not specified the program name on the pedb command line, use the Load Executables option from the File pull-down menu to load one or more programs.
FOMOG2226 Task number has been unhooked.

Explanation: The task has been unhooked, and now the program running on that task is no longer under control of the debugger.

System action: None. This is an informational message.

FOMOG2227 Source file "string" is newer than the object file being debugged.

Explanation: pedb detected a source file that appears to be newer than the executable file being debugged. If the file was changed since the executable file was built, the code displayed in the source window will not match the object.

System action: If one of the source files has been changed, quit the debugger and recompile. This will insure that movement through the program will be correctly depicted in the source area of pedb. If the modification time of the source file is due to copying or tar'ing the file there should not be any mismatch between the actual position in the program and the displayed in the source area. In this case, updating the modification time of the executable with the touch command will prevent this message from appearing.

FOMOG2230 No Items were selected.

Explanation: The user selected Apply or OK on the Variable Selection window without choosing any variables to be displayed.

System action: None. This is an informational message.

FOMOG2232 Could not locate source file: string for task: number.

Explanation: pedb could not locate a source file to correspond with the current program state in this task. Consequently no source file for this task will appear in the source file window.

System action: Check the source file search path and file permissions. pedb processing will continue.

FOMOG2234 Unable to open file "string" for task number.

Explanation: pedb was not able to open the file for reading or determined that the selected file was not a regular file (such as a directory or device).

System action: This typically occurs when manually selecting a new source file for the source window. In this case, the user should check that the filename is valid and the proper permissions are in effect to allow it to be read. If this message occurs because the debugger stopped in a new source file, one may also want to check the source search path using the Source Path window under File on the menu bar. pedb will display no source if it stops in a file it can not read.

FOMOG2235 Source file: string on task: number is larger than the maximum allowable size, which is 65534 lines.

Explanation: pedb could not load the entire source file into the buffer used to process the Source File window. If you started pedb in normal mode, both pedb and the program will terminate. If you are using pedb in attach mode, pedb will detach from the program and exit, but the program will not be terminated.

System action: If you want the ability to debug all the source code for this program, split the code into multiple files, with each file being less than 65535 lines. After completing this, recompile the program.

FOMOG2236 Unknown source file suffix: string, assuming c.

Explanation: The source file had a suffix that was not recognized as a character that represented a language. pedb assumes the source file was written in C. This is the default. Note that some language constructs that are unique to the C language are used on this file.

System action: The source file could be renamed if appropriate.

FOMOG2238 Incorrectly formed member list. No tasks have been added to the group. A member list can contain space or comma separated task numbers, or ranges of task numbers separated by colons or dashes.

Explanation: The range of task numbers is incorrectly specified.

System action: Consult the manual pages for how to create groups in pedb and re-specify the selection. For more information, see z/OS UNIX System Services Parallel Environment: Operation and Use.

FOMOG2240 No executable name was entered.

Explanation: The "OK" was pressed in the Load Executables window without entering or selecting a program name.

System action: Re-open the Load Executables window and enter a program name.

FOMOG2241 Task number loaded with "string string".

Explanation: Describes what executable and arguments were loaded for a particular task.

System action: None. This is an informational message.
FOMOG2242 Unable to send command to task 'number'.

Explanation: An error occurred in sending an pedb command to the indicated task. Probably the remote node is no longer accessible.

System action: Verify that the remote node in the partition can be contacted by other means. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG2243 No more new views are available.

Explanation: During an pedb session there is a limit to how many views can be created. Also, once a view has been closed it cannot be reopened.

System action: You can use the views that are left to continue debugging.

FOMOG2244 ALL tasks have exited. Quit and restart pedb if you wish to continue.

Explanation: All the tasks of the partition have exited.

System action: "Quit" pedb.

FOMOG2245 Internal pedb error at line number in file 'string'.

Explanation: This is a generic message to mark a situation that should not have occurred.

System action: Retry the operation or restart pedb. If you continue to get this error message, gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG2246 Cannot perform this function in a context unless all the tasks are in DEBUGGED state.

Explanation: This is a generic message to mark a situation in which a function could not be performed because not all tasks in the context were in DEBUGGED state.

System action: Switch to a context where all tasks are in DEBUGGED state.

FOMOG2250 Task number has been sent halt execution.

Explanation: Halt execution for this task has been selected. This task was running and a request to the remote debugger has been made to stop the task.

System action: If the remote debugger is able to regain control over the task, the user should be able to continue debugging this task with pedb.

FOMOG2257 Tasks: "string" in group: "string" have been sent halt execution.

Explanation: Halt execution for this group has been selected. For each task in the group that was running, a request to the remote debugger has been made to stop the task.

System action: You will be able to continue debugging on the tasks that the remote debugger is able to regain control over.

FOMOG2259 Unable to write to the directory string.

Explanation: pedb was not able to write to the directory specified. This is the directory that is used to write the temporary files used in visualization.

System action: Check the permissions of the directory. pedb uses this directory for temporary files. The default is /tmp. This can be overridden using the MP_TMPDIR environment variable.

FOMOG2260 Unable to parse the stack trace, placing task: number in exited state.

Explanation: A message was issued indicating that a trace table was unavailable for the function that contains the current program counter.

System action: Further debugging of this task will be limited.

FOMOG2261 Task number is out of range.

Explanation: A task specified on a Select by Range window is not within the acceptable range of values between 0 and the highest task number in your partition.

System action: Retry the range specification using only task numbers between 0 and one less than the value of -procs or MP_PROCS (since the first task is number 0).

FOMOG2262 One or more tasks have not been attached and therefore could not be selected.

Explanation: One or more tasks specified on a Select by Range window have not been attached and therefore could not be selected.

System action: Make sure the desired tasks have been selected. Adjust selection criteria as necessary.

FOMOG2272 A non-integer value has been entered for the array range.

Explanation: A non-integer value was entered in text field the specifies the minimum/maximum array range.

System action: Enter an integer value.
FOMOG2273  The value entered is less than the minimum range. Enter a minimum value greater than or equal to number.

Explanation: The minimum value range is less than the allowable minimum.

System action: Enter a minimum value greater than or equal to the minimum index of the array.

FOMOG2274  Unable to open the file string for exporting.

Explanation: pedb was not able to open the file for writing or determined that the selected file was not a regular file (such as a directory or device).

System action: Check the permissions or type of the file that was selected. Select a valid filename to allow exporting.

FOMOG2276  A non-integer value has been entered for the stride.

Explanation: A non-integer value was entered in text field the specifies the stride value.

System action: Enter an integer value.

FOMOG2277  Zero has been entered for the stride. Enter a non-zero integer value.

Explanation: The stride value must be a non-zero integer.

System action: Enter an integer value that is not zero.

FOMOG2280  A non-integer value has been entered for the minimum range text field.

Explanation: A non-integer value was entered in text field the specifies the minimum array range.

System action: Enter an integer value.

FOMOG2281  A non-integer value has been entered for the maximum range text field.

Explanation: A non-integer value was entered in text field the specifies the maximum array range.

System action: Enter an integer value.

FOMOG2282  The integer value entered for the minimum text field is outside the allowable range of integers.

Explanation: The integer value entered is larger or smaller than the allowable range, which is defined by the largest and smallest integer value.

System action: Enter an integer within the range of the largest and smallest integer value.

FOMOG2283  The integer value entered for the maximum text field is outside the allowable range of integers.

Explanation: The integer value entered is larger or smaller than the allowable range, which is defined by the largest and smallest integer value.

System action: Enter an integer within the range of the largest and smallest integer value.

FOMOG2284  The integer value entered for the stride text field is outside the allowable range of integers.

Explanation: The integer value entered is larger or smaller than the allowable range, which is defined by the largest and smallest integer value.

System action: Enter an integer within the range of the largest and smallest integer value.

FOMOG2285  Task number is not in DEBUG state. It is excluded from the export.

Explanation: A task must be in DEBUG state to be able to participate in an export.

System action: If the user does not care that the task was excluded from the multi array export, the message can be ignored. If the user wants the array from the task to be included in the export, the user must put the task in DEBUG state prior to exporting.

FOMOG2290  Could not run the executable for task: number.

Explanation: The program for the given task encountered a signal when an attempt was made to run it.

System action: This depends on the signal that was encountered, which was given by a previous message. If it was signal 9 there is a good chance that the executable was compiled under an old release and needs to be recompiled.

FOMOG2295  You cannot view the Array Subrange at this time because task: number is running.

Explanation: A task must be in debug state to be able to view an array subrange. You have issued a command that put the task in a running state after the Array Subrange window for the array was opened.

System action: To view array subranges using this window you must allow the task to continue until a debug state has been reached. This can be done by waiting for a running task to return, or if it is blocked, by stepping other tasks or pressing the halt button.
FOMOG2296  You cannot view the array subrange at this time because the program stack has changed since you created this window. The chosen array is out of scope.

Explanation: The array that was chosen in the Array Subrange window is no longer within scope. The program stack has changed due an execution command, such as step or continue. The array chosen may no longer exist due to scoping rules.

System action: If the array chosen by the Array Subrange window can no longer be reached by stepping program execution back into the function or subroutine, the window is no longer useful and should be cancelled. If the function or subroutine can be reentered by controlling program execution, this window can be used when the scope of the variable is consistent with the program stack.

FOMOG3001  Task number: Unable to find variable

Explanation: The remote debug engine was unable to locate information about the variable.

System action: None.

FOMOG3003  Task number: Invalid expression ID

Explanation: Internal error. The remote debug engine was unable to map the given expression id.

System action: None.

FOMOG3005  Task number: Unsupported request code

Explanation: Internal error. The remote debug engine was unable to recognize the request code.

System action: Debugging can most likely continue, but will possibly be limited. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG3006  Task number: Expression name is not valid

Explanation: The remote debug engine was unable to find the scope in which the expression name resided.

System action: None.

FOMOG3008  Task number: Unable to find program to be debugged - check path and name on server

Explanation: The remote debug engine was unable to find the program to be debugged.

System action: Verify that the executable is available on all nodes in the partition in the pathname specified or in the executable search path on the node.

FOMOG3014  Task number: ReplyExpression():

Explanation: Received an error code from a routine that ReplyExpression() called but there was no additional information to pass on.

System action: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG3015  Task: number encountered signal: number - string

Explanation: The program encountered a signal of the type specified.

System action: None. This is an informational message.

FOMOG3016  Task: number has stopped due to a halt execution request.

Explanation: This task has been interrupted via a halt execution request. The current program counter is likely at a location where the code has not been compiled with -g, thus portions of the display may be empty. The halt execution function is implemented with signal SIGINT. If the program has a SIGINT signal handler control will return to the SIGINT signal handler when execution is resumed.

System action: Selecting entries on the stack may be useful to view local variables in the scopes of the call chain. Execution of this task can be continued via the vcr buttons.

FOMOG3017  Task number: No current file name was found, so no local variables are available. The executable may not have been compiled with -g.

Explanation: While attempting to display local variables for the current or selected function, the owning source file could not be found. Not enough information is available to build a local variable list. pedb continues processing.

System action: If this area of the code is of interest, you should recompile the containing object with the -g compiler option, then re-invoker pedb.

FOMOG3018  Task number: No current function name was found, so no local variables are available. The executable may have been stripped.

Explanation: While attempting to display local variables for the current function no function name could
be found at the current program counter. Not enough information is available to build a local variable list. pedb continues processing.

System action: If this area of the code is of interest, you should recompile the containing object with the -g compiler option.

FOMOG3019 Unable to issue the execution request to task: number, because it is not in DEBUGGED state.

Explanation: A request to execute the program has been issued. This task is not in DEBUGGED state so the request will not be honored. pedb continues processing. If the task referenced was part of a group and other tasks in the group did not cause this message, those other tasks will have been processed normally.

System action: None. This is an informational message.

FOMOG3020 process_dbe_task_response(): Internal error: Don't recognize reply code: string, for task: number.

Explanation: An unrecognized message was received from the remote debugger.

System action: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG3021 Play mode has been stopped.

Explanation: Play mode has been terminated by the halt or stop button.

System action: None. This is an informational message.

FOMOG3022 Play mode has been started.

Explanation: Play mode has been initiated by the play button.

System action: None. This is an informational message.

FOMOG3023 The halt button had no effect on tasks: "string" in group: "string", because they were not running.

Explanation: The halt button was selected. No action was taken to stop the execution of the tasks listed because they were not running.

System action: None. This is an informational message.

FOMOG3024 The halt button had no effect on tasks: "string" in group: "string", because they were not running.

FOMOG3025 Task number: Unable to initialize the remote debug engine.

Explanation: Initialization of the remote debug engine has failed on this task.

System action: This message may be followed by a FOMOG-0061 message, which will provide additional information regarding the nature of the problem with the remote debug engine. If this information is not sufficient to rectify the problem, gather all relevant details and follow local site procedures for reporting hardware and software problems.

FOMOG3026 Task number: Initial break point line number contains non-numeric data.

Explanation: A line number and filename have been specified for the initial breakpoint via the MP_DEBUG_INITIAL_STOP environmental variable. The format is filename:line_number. In this case the line number had non numeric characters.

System action: Re-specify the line number in MP_DEBUG_INITIAL_STOP with only numerics.

FOMOG3027 Task number: While attempting to set the initial breakpoint, pedb could not find the file which contains the main routine. Check that the file containing the main routine or the program statement has been compiled with the -g option. The initial breakpoint can be set manually using the MP_DEBUG_INITIAL_STOP environment variable.

Explanation: The remote debug engine is attempting to set an initial breakpoint in the main routine. A line number within a source file that correlated with the main routine was not found.

System action: Check that the file containing the main routine or the program statement has been compiled with the -g option. The initial breakpoint can be set manually via the MP_DEBUG_INITIAL_STOP environment variable.
FOMOG3028  Task number: Remote debug engine was unable to set the initial breakpoint.

Explanation: The remote debug engine was unable to set the initial breakpoint.

System action: Check that the file containing the main routine or the program statement has been compiled with the -g option. Check that the MP_DEBUG_INITIAL_STOP environment variable, if used, is set to an executable line of source code.

FOMOG3029  Task number: Function atoi() could not translate line number string to a number.

Explanation: The translation of the string following the colon in the MP_DEBUG_INITIAL_STOP environment variable failed.

System action: Check that the environment variable MP_DEBUG_INITIAL_STOP has format: filename:line_number and it is set to an executable line of source code.

FOMOG3030  Task number: Internal error: ProcessValueModify(): Call to GetExpressionList() failed.

Explanation: Internal error.

System action: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG3031  Task number: Internal error: ProcessValueModify(): Call to FindTreeNode() failed.

Explanation: Internal error.

System action: Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG3032  Task number: Unable to process the change value request, check types and ranges.

Explanation: The Change Value window was used but the remote debug engine was unable to change the value of the programs variable.

System action: Check that the new value entered is of a type that can normally be assigned to the variable selected. If a range has been used to define the value to be assigned, check that the range is within bounds.

FOMOG3033  Task number: The tracepoint request failed because the selected source line generates no executable code.

Explanation: A source line in the source code window has been selected, and a tracepoint request has been made for that line. The line selected generated no executable code when compiled. No action has been taken.

System action: Select another source line, then request the tracepoint again.

FOMOG3034  Task number: The breakpoint request failed because the selected source line generates no executable code.

Explanation: A source line in the source code window has been selected, and a breakpoint request has been made for that line. The line selected generated no executable code when compiled. No action has been taken.

System action: Select another source line then, request the breakpoint again.

FOMOG3035  Task number: The breakpoint request failed. An invalid source line or invalid condition was specified.

Explanation: A source line in the source code window has been selected, and a breakpoint request has been made for that line. The line selected may not have generated any executable code when compiled. If a condition was specified, it may have been invalid. No action has been taken.

System action: Select another source line or specify a different condition.

FOMOG3036  Task number: The tracepoint request failed. An invalid source line or invalid condition was specified.

Explanation: A source line in the source code window has been selected, and a tracepoint request has been made for that line. The line selected may not have generated any executable code when compiled. If a condition was specified, it may have been invalid. No action has been taken.

System action: Select another source line or specify a different condition.

FOMOG3037  Task number: Internal error: An unsupported breakpoint action has been requested in ReplyBreakpointLocation().

Explanation: Internal error.

System action: Gather information about the problem
and follow local site procedures for reporting hardware and software problems.

**FOMOG3038** Task number: Maximum array range specified is out of bounds.

**Explanation:** The user specified a maximum array range that was out of bounds. Alternatively, it is possible that the array was not allocated due to the optimizations by the compiler.

**System action:** Check the permissible ranges and reset the range values.

**FOMOG3040** Task number: The executable name chosen for debugging resolved to a full pathname where the length of the path prefix exceeds the PATH_MAX flag value or a pathname is longer than the NAME_MAX flag value while the POSIX_NO_TRUNC flag is in effect.

**Explanation:** The remote debugger could not find the program to execute on a task.

**System action:** Check the path for the program on the remote node.

**FOMOG3041** Task number: The executable name chosen for debugging was not found.

**Explanation:** The remote debugger attempted to find the program to execute on a task.

**System action:** Check that the executable file for the program is available on the remote node.

**FOMOG3042** Task number: The executable name chosen for debugging was not a regular file.

**Explanation:** The remote debugger attempted to find the program to execute on a task. The program name specified was not a regular file. It may have been a directory, socket, device or some other special file.

**System action:** Check that the executable file for the program is available on the remote node.

**FOMOG3043** Task number: The executable chosen for debugging did not have execute permission.

**Explanation:** The remote debugger attempted to find the program to execute on a task.

**System action:** Update the permissions on the program file on the remote node.

**FOMOG3044** Task number: The executable chosen for debugging is not an S/390 executable.

**Explanation:** The remote debugger could not find the program to execute on a task.

**System action:** Check that the program file on the remote node is an S/390 executable.

**FOMOG3045** Task number: The executable chosen for debugging did not have read permission.

**Explanation:** The remote debugger could not find the program to execute on a task.

**System action:** Update the permissions on the program file on the remote node.

**FOMOG3046** Task number: The executable chosen for debugging did not have execute or read permission.

**Explanation:** The remote debugger could not find the program to execute on a task.

**System action:** Update the permissions on the program file on the remote node.

**FOMOG3049** All tasks have exited. Select OK to exit, then restart pedb if you wish to continue debugging.

**Explanation:** All the tasks in the partition have exited. There is currently no program restart facility in pedb.

**System action:** Selecting OK will exit pedb. Issue the pedb command again to do further debugging.

**FOMOG3050** The remote debug engine for task: number has failed with: string.

**Explanation:** There is a remote debug engine started for each of the instances of the POE program. One of the remote debug engines has failed. The entire debug session has been terminated.

**System action:** Restart pedb. If the problem persists set the MP_DEBUG_LOG environment flag to 3 and have the log (/tmp/debug_log.pid.task_number) available when reporting the problem.

**FOMOG9999** pedb exiting.

**Explanation:** pedb is terminating due to error as opposed to a deliberate action. Generally this message is preceded by a specific message which gives the reason why pedb quit prematurely.

**System action:** Refer to the message that precedes this error message.
FOMOH0101 Your program has been loaded.
Explanation: This message is issued when your program has been loaded into the tasks in the partition. This message indicates all the functions available in pdbx are available for you to use.
System action: When this message is displayed, you can start debugging the tasks in the partition.

FOMOH0104 The remote debugger on task: number has exited with the following error: string
Explanation: The debugger on the remote node has exited prematurely and pedb will exit.
System action: The error message from the remote debugger is presented. Use the information provided by the remote debugger message to proceed.

FOMOH0105 Error creating temporary file string.
Explanation: When starting pdbx in attach mode, a temporary file is created, consisting of a list of tasks that are executing under the poe job that you specified. The contents of this file are displayed in the menu from which you select the tasks that you wish to attach. This temporary file is created in /tmp by default, unless you specify a different directory with the TMPDIR environment variable. The naming convention for this file is: <tmpdir>/pdbx.<poe-pid>.menu where <tmpdir> is either /tmp, or the directory specified by the TMPDIR environment variable, if it has been defined, and where <poe-pid> is the process ID of the poe job to be attached to. The message that you received appears when the temporary attach task menu file cannot be opened, or when errors are detected while writing to the file.
System action: Verify that there is enough space available in the /tmp filesystem, or if you have specified a directory with the TMPDIR environment variable, check the filesystem that contains this directory for sufficient space. You may also want to check to be sure that a file of the same name does not already exist.

FOMOH1001 Missing command file name following the -c flag. For information on the correct syntax to use when invoking pdbx, type: pdbx -h
Explanation: The -c flag requires the name of a file as an argument. This argument was missing. It is also required that the file have read permissions set for the pdbx user.
System action: Specify the name of a pdbx "command" file following the -c flag. A pdbx "command" file is a file containing valid pdbx commands.

FOMOH1002 Missing or invalid argument following the -I flag. For information on the correct syntax to use when invoking pdbx, type: pdbx -h
Explanation: The -I flag requires the name of a directory that pdbx will search for source code files on the remote tasks. This argument was missing or invalid.
System action: Specify the name of a directory following the -I flag. This directory should be available to each task in your partition because the -I flag will be passed to each remote dbx debugger.

FOMOH1003 Missing or invalid argument following the -d flag. For information on the correct syntax to use when invoking pdbx, type: pdbx -h
Explanation: The -d flag requires an integer argument that specifies the nesting depth limit of program blocks.
System action: Specify an integer. Note that this overrides the default nesting depth limit of 25 program blocks.

FOMOH1004 Usage: pdbx [-h] [program [program arguments]] [-c command_file] [-d nesting_depth] [-I directory [-I directory]...][-F] [--x] [poe options]
Explanation: The pdbx command line has a syntax error.
System action: Make sure that the syntax on the command line is correct. Correct the specific problem identified by the preceding message.

FOMOH1005 Unable to read command file specified by the -c flag.
Explanation: You must specify a command file that you have read access to after the -c flag. The file that you specified after the -c flag did not have read permission so that pdbx could open it for reading.
System action: Check the name of the file and the permissions to ensure that it is readable.

FOMOH1006 You must use the "attach", the "quit" or the "help" command.
Explanation: When starting the debugger in attach mode, at the initial prompt the only allowable commands are attach, quit, or help.
System action: Enter a valid command to continue.
FOMOH1009 Could not create remote pdbx_startup file: "string".

Explanation: For each task to be initialized, the remote dbx requires the creation of a temporary startup file. pdbx requested that the partition manager daemon create the file and the partition manager daemon was unable to do so.

System action: The temporary pdbx_startup file is to be created in the directory specified by the MP_TMPDIR environment variable, the -tmpdir flag, or /tmp. Make sure that this directory is available for writing by you on each node allocated to your partition.

FOMOH1010 Could not read message from poe.

Explanation: pdbx was unable to read data from the POE debug socket.

System action: Debugging can continue except that the information bout synchronized exit may not be passed back to the debugger from the POE job. Please note that the debugger will most likely not be able to re-attach to this POE job after detaching.

FOMOH1012 Cannot switch to context "string", which has RUNNING task(s), until all tasks in the partition have been loaded with a program.

Explanation: Some of the tasks have been loaded with a program and some have not. The tasks that have been loaded are RUNNING and waiting to synchronize with all of the other tasks in the partition. This wait is normal processing that happens at the start of a parallel program to pass ip addresses around in preparation for future message passing calls.

System action: Continue to load programs on the remaining tasks in the partition. At this time you can only switch context to groups and tasks that have all task(s) in DEBUG_READY state.

FOMOH2001 Could not delete the groups events (breakpoints or tracepoints) from task: number, because this task is RUNNING.

Explanation: Since the task was not in DEBUG READY state, pdbx could not delete its events (breakpoints or tracepoints). It is possible to continue but there are some events (breakpoints or tracepoints) that pdbx no longer has a record of.

System action: Issue the group list or tasks command to view the state of the tasks. The tasks in the group that are in RUNNING state are the ones on which pdbx could not delete the events.

FOMOH2002 Could not add the groups events (breakpoints or tracepoints) to task: number, because this task is RUNNING.

Explanation: Since the task was RUNNING and not available for debug commands, pdbx could not add the group events (breakpoints or tracepoints) for this task. It is possible to continue but the group breakpoints will not have been set for this task.

System action: Issue the group list or tasks command to check the state of the tasks. Create a new group after all of the tasks of interest have stopped RUNNING and are under debugger control.

FOMOH2003 Breakpoint or tracepoint: "string" could not be set by pdbx on task: number.

Explanation: The remote dbx was unable to set a breakpoint or tracepoint.

System action: Make sure the requested breakpoint or tracepoint was valid. Use the status command to see what pdbx events have been set. Issue the pdbx where command to find out where the program is on each node.

FOMOH2004 "string" is ambiguous on one or more of the tasks in the current context. Also, the response from 'whatis string" varies from task to task. The following grouping of tasks would give each group the ability to resolve the symbol consistently.

Explanation: If a symbol, typically a function, is found to be ambiguous, pdbx issues a menu to the user that allows him to select the instance(s) to which the command (such as stop in, list, or func) is applied. To simplify the user interface, the parallel debugger requires that all tasks in the partition have a consistent view of the ambiguous symbol, since pdbx can display only one selection menu for a context.

System action: Issue the whatis command to make sure the symbol in question is resolved in the current context. This message is also followed by a table that suggests a set of groups, each of which would resolve the symbol in the same way. Using these or similar groups, you could issue the same command by changing the context as desired.

FOMOH2005 The network connection from pdbx or pedb to task: number failed.

Explanation: An error was encountered when pdbx or pedb attempted to read or write using a socket connection to the task. pdbx or pedb will no longer have any control over this task.

System action: The debugger can continue after a task loses contact with the home node. Under certain circumstances, you might choose to continue debugging.
using the remaining tasks for some period of time.

FOMOH2013 Debugger attached and ready.
Explanation: All of the specified tasks have been attached, and you are able to start debugging.
System action: None. This is an informational message.

FOMOH2014 Internal Error: non-zero status: number returned from pm_respond().
Explanation: Internal Error: The main communication control section of the home node portion of pdbx has indicated a failure.
System action: Restart pdbx, verify that your job runs correctly under poe and that poe is correctly installed and configured for your id. If the problem persists, gather information about it and follow local site procedures for reporting hardware and software problems.

FOMOH2015 Could not open socket for debugger to communicate with poe.
Explanation: The socket() call failed when the debugger tried to set up communications with POE.
System action: Debugging can continue except that the information about synchronized exit will not be passed back to the debugger from the POE job. Please note that the debugger will most likely not be able to re-attach to this POE job after detaching.

FOMOH2016 Could not make socket connection to poe.
Explanation: The connect() call failed when the debugger tried to set up communications with POE. The information about a synchronized exit is not passed back to the debugger from the POE job. The debugger probably cannot re-attach to this POE job after detaching.
System action: You can continue debugging with limited function. Please note that the debugger probably cannot re-attach to this POE job after detaching.

FOMOH2017 Missing or invalid argument to -a flag. For information on the correct syntax to use when invoking pdbx, type: pdbx -h
Explanation: The -a flag requires an integer argument specifying the process identifier of the POE process.
System action: Specify the POE process id when using the -a flag. For example, specify pdbx -a 34192.

FOMOH2018 Program not loaded. Issue 'load' or other context-insensitive command.
Explanation: Your program must be loaded on the partition before the pdbx command is executed.
System action: Load your program into the partition. For more information, see the pdbx load command in z/OS UNIX System Services Parallel Environment: Operation and Use.

FOMOH2019 Cannot specify a context for a context-insensitive command.
Explanation: The command that was entered defines a context-insensitive action for a context-sensitive command. Context insensitive commands cannot be issued in conjunction with context-sensitive commands.
System action: Re-specify your command string without the context-sensitive prefix.

FOMOH2020 Either the alias name which has a 15 character maximum or the alias string which has a 79 character maximum is too long.
Explanation: You have defined an alias that is longer than 15 characters or an alias string that is longer than 79 characters.
System action: Re-specify your alias definition within the allowable maximum limits.

FOMOH2021 Internal error in "string": number - pdbx was unable to resolve the current context into task numbers.
Explanation: The context-sensitive command that you entered has no current context defined.
System action: Select a different context, or create a new group then re-enter the command. If the problem persists, gather information about it and follow local site procedures for reporting hardware and software problems.

FOMOH2022 Task: number has already been loaded with a program.
Explanation: The task number that you specified has already been loaded.
System action: Specify another task that has not been loaded. Issue the group list or tasks command to check the state of the tasks. The tasks in NOT LOADED state are the ones that still need to be loaded with a program.
FOMOH2024 You specified a breakpoint or tracepoint event number on the pdbx delete command that does not exist within the current context.

**Explanation:** The event that you specified does not exist within the current context.

**System action:** Check the event number within your current context. Find event numbers using the `status` or `status all` command.

FOMOH2025 No events were deleted, because of incorrect syntax. The correct syntax is 'delete' followed by an event list where the event list can contain space or comma-separated event numbers, or range(s) of event numbers separated by colons or dashes. 'delete *' will delete every event within the context, while 'delete all' will delete every event in every context.

**Explanation:** Invalid syntax for the pdbx delete command.

**System action:** Specify the delete command followed by a space or comma-separated list of event numbers. Specify ranges of events using a dash or a colon. The command `delete *` will delete all events within the context, while `delete all` will delete all events in all contexts. Find event numbers using the `status` or `status all` command. Consult the man pages for further information regarding the pdbx delete command. Re-issue the command using the correct syntax.

FOMOH2026 EOF detected (and ignored) on STDIN. To exit, use 'quit'.

**Explanation:** Unexpected EOF (user pressed ID) from STDIN.

**System action:** pdbx does not recognize an EOF generated from the keyboard as a request to exit the debugger because it can be inadvertently typed as <Crlt>-d. To exit the debugger, use the `quit` command.

FOMOH2027 The task or group cannot execute remote debugger commands.

**Explanation:** The task or group that is the current context has no tasks in DEBUG READY state.

**System action:** Issue the `group list` or `tasks` command to determine the states of the tasks. Use the `halt` command to bring RUNNING tasks under debugger control.

FOMOH2028 Task number may not have detached properly.

**Explanation:** The write to the task socket did not succeed.

**System action:** None.

FOMOH2029 No remote dbx is available to issue the dhelp command.

**Explanation:** All the tasks are RUNNING and cannot handle the dbx command. The dhelp command needs at least one task to be under debugger control.

**System action:** Issue the `halt` command to bring the RUNNING task(s) under debugger control or issue hook to an unhooked task and re-issue dhelp.

FOMOH2030 The correct syntax is: 'group add group_name member_list'. A member list can contain space or comma-separated member lists, or ranges of task numbers separated by colons or dashes. Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

**Explanation:** Invalid syntax for the pdbx group add command.

**System action:** Consult the man pages for the pdbx group command and re-specify the command. Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

FOMOH2031 No tasks were added to any group because you specified an incorrectly formed member list. A member list can contain space or comma-separated task numbers, or ranges of task numbers separated by colons or dashes.

**Explanation:** The group member list is incorrectly specified.

**System action:** Consult the man pages for the pdbx group command and re-issue the command again.

FOMOH2032 No action was taken because the group name is longer than the maximum group name length of number.

**Explanation:** The group name specified is too long to be processed.

**System action:** Provide a group name that is no longer than 32 characters, which starts with an
alphabetic character, and is followed by any alphanumeric combination.

FOMOH2033 No action was taken because the first character in the group name specified was not an alphabetic character.

Explanation: The group name specified started with some character that was not alphabetic.

System action: Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

FOMOH2034 Cannot create any more groups because the maximum number already exists.

Explanation: You issued the group add command but there are already as many groups defined as can exist.

System action: You need to reduce the current number of groups in order to open up a slot for another group to be created.

FOMOH2035 No action was taken on group "string", because it is the group reserved to contain all of the tasks.

Explanation: You issued the group add command in an attempt to add tasks to the group reserved to contain all of the tasks. No action could be taken because this group already contains all of the tasks.

System action: Specify a different group name on the group add command.

FOMOH2036 Task: number has experienced an error in communicating with pdbx. It cannot be added to a group.

Explanation: The specified task is not communicating properly with the home node, so it is marked as unavailable for any command that attempts communications.

System action: The debugger can continue after a task loses contact with the home node. Under certain circumstances, you might choose to continue debugging using the remaining tasks for some period of time.

FOMOH2037 Cannot add task: number, because it is already in group "string".

Explanation: The task specified on the group add command is already included in the group specified.

System action: Retry the command specifying only task(s) that are not already included within the specified group.

FOMOH2038 No action has been taken because a task number is out of range.

Explanation: The task specified on the group or on command is not an acceptable value.

System action: Retry the range specification using only task numbers between 0 and one less than the value of -procs or MP_PROCS (since the first task is number 0).

FOMOH2039 One task was added to group "string".

Explanation: A task was added to the specified group.

System action: None. This is an informational message.

FOMOH2040 number tasks were added to group "string".

Explanation: The list of tasks was added to the specified group.

System action: None. This is an informational message.

FOMOH2041 The correct syntax is: group change old_name new_name.

Explanation: The group change command was improperly formed.

System action: Re-issue the command specifying the existing group name and the new group name.

FOMOH2042 No action was taken because the group name "string" was not found.

Explanation: The group name you specified to be renamed on the group change command could not be found by pdbx.

System action: Use the group list command to see the list of groups currently defined. Make sure that the group you wish to rename already exists.

FOMOH2043 No action was taken because the group name "string" is already used.

Explanation: The new name, for the group to be renamed, on the group change command already exists. The existing group will not be renamed to avoid confusion or ambiguity.

System action: Use the group list command to see the list of groups currently defined. Make sure that the group name you wish to change the existing group to does not already exist.
FOMOH2044 No action was taken because the new group name is longer than the maximum group name length of number.

Explanation:  The new group name specified on the group change command is too long to be handled.

System action:  Choose a string under 32 characters for the new group name and retry the command.

FOMOH2045 Group "string" has been renamed to "string".

Explanation:  You have given a new group name to a previously existing group.

System action:  Note that the old group name no longer exists.

FOMOH2046 The correct syntax is: 'group delete group_name [member_list]'. A member list can contain space or comma-separated task numbers, or ranges of task numbers separated by colons or dashes. Specify the group name as a string of characters.

Explanation:  The group delete command requires an existing group name as an argument.

System action:  Re-issue the command with a valid member list.

FOMOH2047 Nothing was deleted because the group name "string" was not found.

Explanation:  The group delete command requires an existing group name as an argument. The specified group could not be matched with any of the existing groups.

System action:  Use the group list command to see the list of groups currently defined. Make sure that the group you wish to delete or modify already exists.

FOMOH2048 No action was taken on group "string", because it is the group reserved to contain all of the tasks.

Explanation:  The debugger requires at least one group which represents all the tasks in your partition. This group cannot be deleted or modified.

System action:  You can create a group with all tasks except one or two in two steps:

1. Create a group with all tasks using group add new_group 0-num_procs where num_procs is the number of tasks in your partition.

2. Use group delete new_group member_list to remove one or more tasks from the new group.

FOMOH2049 Incorrectly formed member list. No tasks were deleted from any group. A member list can contain space or comma-separated task numbers, or ranges of task numbers separated by colons or dashes.

Explanation:  You specified a member list with the group delete command, but the member list was not recognized, so no action was taken.

System action:  Re-issue the group delete command with a valid member list.

FOMOH2050 Task: number was successfully deleted from group "string".

Explanation:  A task has successfully been deleted from a group.

System action:  None. This is an informational message.

FOMOH2051 The group "string" was not found.

Explanation:  The group you specified on the group list command is not known to pdbx.

System action:  Re-issue the group list command with a valid group name or issue group list to list all groups.

FOMOH2052 Internal error in "string": number - No action was taken because the group has no members.

Explanation:  You issued the group list on an empty group.

System action:  This is an internal error, retry the command. If the problem persists, gather information about it and follow local site procedures for reporting hardware and software problems.

FOMOH2053 Valid group actions are: add, change, delete and list.

Explanation:  You issued a group command with invalid syntax.

System action:  Check syntax and re-issue the group command.

FOMOH2054 The correct syntax is: 'hook' (with no arguments).

Explanation:  You issued the hook command with one or more arguments. hook takes effect on the current command context or the temporary command context when used in combination with the on command.
Chapter 1. Messages

FOMOH2055 No action has been taken because the task or group is not unhooked, or has completed and is in exited state.

Explanation: There are no unhooked tasks in the command context that you specified. When a task that has been unhooked completes, it changes from unhooked state to exited state. Once an unhooked task completes, it can no longer be hooked.

System action: Use the group list or tasks command to view the state of the tasks.

FOMOH2056 Task: number has already exited.

Explanation: You attempted to hook this task but the task had already completed processing and exited.

System action: None. This is an informational message.

FOMOH2057 No action was taken on group "string", because it is a group name reserved for use by the debugger.

Explanation: The group add or group change command was issued with a group name that the debugger uses.

System action: Specify a different group name on the group add or group change command.

FOMOH2058 The correct syntax is 'on context' or 'on context command', where command is the command you wish to execute on the specified context.

Explanation: An on command has been issued with incorrect syntax.

System action: Check syntax and re-issue the on command.

FOMOH2059 Group "string" not found. No action performed.

Explanation: You issued the on command with a group specified, but the group is not known to pdbx.

System action: Issue group list to display group names, then re-issue on command.

FOMOH2060 The correct syntax is: 'source filename'.

Explanation: The source command cannot be issued with zero or greater than one arguments.

System action: Re-issue the source command with only one argument.

FOMOH2061 Cannot open the command file that was specified on the source command.

Explanation: The source command has been issued with a filename that either does not exist or has no read permission.

System action: Make sure the file exists and has read permission.

FOMOH2062 The correct syntax is either 'status' or 'status all'.

Explanation: An argument other than all was specified on the status command.

System action: Re-issue status with no arguments or with all as the single argument.

FOMOH2063 All events (breakpoints or tracepoints) are in use for this task or group.

Explanation: The maximum number of events for this task or group has been exceeded. Each breakpoint or tracepoint that is set causes an event to be recorded.

System action: Use the delete command on any event(s) in this task or group to reduce the number of events, then re-issue the original command.

FOMOH2064 The task has experienced an error in communicating with pdbx.

Explanation: Events cannot be added to this task because there is a communication problem with this task.

System action: The debugger can continue after a task loses contact with the home node. Under certain circumstances, you might choose to continue debugging using the remaining tasks for some period of time.

FOMOH2065 You specified an invalid breakpoint or tracepoint. The command failed on task number - string.

Explanation: The breakpoint or tracepoint that you tried to create using the pdbx stop or trace command was not accepted by the remote dbx debugger.

System action: Check the pdbx stop or trace command syntax.

FOMOH2066 The correct syntax is: 'unhook' (without any arguments).

Explanation: You issued the unhook command with one or more arguments. The unhook does not take any arguments. unhook takes effect on the current command context or the temporary command context when used in combination with the on command.
System action: Re-issue the **unhook** command with no arguments.

**FOMOH2067 The correct syntax is: 'unalias alias_name'**.

Explanation: You specified zero or greater than one arguments with the **unalias** command.

System action: Check the **pdbx** syntax for **unalias** and re-issue the command.

**FOMOH2068 "string" is not aliased.**

Explanation: You attempted to **unalias** an unknown alias.

System action: To display the existing aliases, issue the **alias** command with no arguments. Issue the **unalias** command with one of the existing aliases to remove it.

**FOMOH2069 Reading command file "string".**

Explanation: The debugger has started reading the command file specified by the **-c** command line flag, the **source** command or as a result of having a .pdbxinit file in the current working directory or your home directory.

System action: None. This is an informational message.

**FOMOH2070 command file line number: "string"**

Explanation: The debugger displays each line of the command file as it is read showing the line number and the text.

System action: In the event one or more lines in the command file cause errors in the debugger, this message will show the line number and the text that needs to be corrected. Unless a severe error is encountered causing the debugger to terminate, a command file will generally be read in its entirety even if it contains multiple errors.

**FOMOH2071 No tasks were attached due to a badly formed task list.**

Explanation: Invalid syntax for the **attach** command.

System action: Specify the **attach** command followed by a space or comma-separated list of task numbers. Specify ranges of tasks using a dash or a colon. The command **attach all** may be used to attach to all the tasks of the poe application.

**FOMOH2072 Cannot send commands to task: number because it is executing.**

Explanation: It is not possible to send a **dbx** command to a task that is RUNNING.

System action: Issue the **group list** or **tasks** command to make sure the tasks are not RUNNING.

**FOMOH2073 Error creating temporary file 'string'.**

Explanation: When starting **pdbx** in attach mode, a temporary host.list file is created, consisting of only the tasks that you selected to attach to. This temporary host.list file is created in /tmp by default, unless you specify a different directory with the TMPDIR environment variable. The naming convention for this file is: </tmpdir>/pdbx.<poe-pid>.host.list where </tmpdir> is either /tmp, or the directory specified by the TMPDIR environment variable, if it has been defined, and where <poe-pid> is the process ID of the poe job to be attached to. The message that you received appears when the temporary host.list file cannot be opened, or when errors are detected while writing to the file.

System action: Verify that there is enough space available in the /tmp filesystem, or if you have specified a directory with the TMPDIR environment variable, check the filesystem that contains this directory for sufficient space. You may also want to check to be sure that a file of the same name does not already exist.

**FOMOH2074 "string": number - Unable to allocate number of bytes in "string".**

Explanation: Internal error: A memory allocation routine failed because there is not enough memory available. **pdbx** continues processing, but it is likely you will have subsequent problems.

System action: Start **pdbx** again and try the following:

- Debug your program with a subset of the tasks, or with smaller data segments.
- Contact your System Administrator to increase system resources, if possible.

If you continue to get this error message, gather information about the problem and follow local site procedures for reporting hardware and software problems.

**FOMOH2075 There are no tasks in DEBUG READY state (active).**

Explanation: The response to the **active** command is that there are no tasks that are ready to be debugged. This is to say that there are no tasks that are active with respect to the debugger.

System action: None. This is an informational message.

**FOMOH2076 Command "string" is not valid when using pdbx.**

Explanation: **pdbx** does not allow the use of this command.
FOMOH2079 pdbx help screen
Explanation: This is the pdbx help screen.
System action: None.

FOMOH2080 Could not not set breakpoint or tracepoint event.
Explanation: A stop or trace event could not be added in the current context.
System action: Check z/OS UNIX System Services Parallel Environment: Operation and Use for information on setting pdbx breakpoints and tracepoints.

FOMOH2081 Cannot set breakpoint or tracepoint event in different source files.
Explanation: pdbx will not attempt to set a breakpoint at a line number when in a group context if the group members (tasks) have different current source files.
System action: Either choose to set events for individual tasks or set the same source file for the whole group.

FOMOH2082 Could not find a task available for debugger commands in the current context.
Explanation: No tasks in DEBUG READY state were found in the current context. This action requires that a dbx command be issued to the remote node, and that the node is not RUNNING. If the task is RUNNING, it is not ready for debugger commands.
System action: Issue the group list or tasks to make sure that one or more tasks are ready to be debugged.

FOMOH2083 The correct syntax is: syntax listed
Explanation: You issued the stop command with the incorrect syntax.
System action: Re-issue the command using the correct syntax.

FOMOH2084 Missing argument to the -dbxpromptmod flag. For information on the correct syntax to use when invoking pdbx, type: pdbx -h
Explanation: The -dbxpromptmod flag requires a text string as an argument. This text string was missing.
System action: Specify a text string to be used to modify the dbx prompt so that it will not collide with your data or program.

FOMOH2085 The dbx prompt modifier is too long; the maximum length is number. For information on the correct syntax to use when invoking pdbx, type: pdbx -h
Explanation: The dbx prompt modifier string that you specified using the command line -dbxpromptmod flag or the MP_DBXPROMPTMOD environment variable was too long.
System action: Reset the MP_DBXPROMPTMOD environment variable or retry the pdbx command with a shorter string following the -dbxpromptmod flag.

FOMOH2086 Event: "number" cannot be deleted because it does not exist in the specified or current context.
Explanation: You issued the delete command with an event number that does not exist in the command context.
System action: Use the status or status all command to display the events that are associated with the command context. Re-issue the delete command with a valid event.

FOMOH2087 Task number was not deleted, because it is not a member of group "string".
Explanation: You issued a group delete group_name member_list command, but one of the tasks in the member_list was not in the group specified.
System action: To display members of a group issue group list group_name.

FOMOH2089 Cannot reestablish events that were generated from a pdbx "select" menu.
Explanation: You issued a group add command to an existing group or a hook command and one or more events in the group or task resulted from a pdbx "select" menu. These events cannot be recreated automatically by pdbx.
System action: You can manually recreate the events using the list in the message that follows this one.

FOMOH2091 The correct syntax is either 'halt' or 'halt all'.
Explanation: You issued the halt command with an incorrect argument. halt takes effect on the current command context or the temporary command context when used in combination with the on command. The halt command attempts to get RUNNING or hung programs under debugger control. This is done by sending interrupts to all tasks that are RUNNING in the current context. When halt all is specified, interrupts are sent to all RUNNING tasks, regardless of context.
**System action:** Re-issue the `halt` command with no arguments or with `all`.

**FOMOH2100** Specify a decimal number from 1 through `number`, or `<Ctrl-c>` to exit menu.

**Explanation:** Syntax that was supplied in response to the select menu is not recognized.

**System action:** A command has been issued where the symbol cannot be resolved. Reply to this menu with the correct syntax to further qualify which symbol is to be selected.

**FOMOH2101** Specify a list of space or comma-separated numbers and ranges or an asterisk. A number is a decimal number from 1 through `number`. A range is a dash (`-`) separated pair of numbers. An asterisk will select all choices in the menu. A `<Ctrl-c>` will exit the menu.

**Explanation:** The syntax that was supplied in response to the select menu was not recognized.

**System action:** A command has been issued where the symbol cannot be resolved. Reply to this menu with the correct syntax to further qualify which symbol is to be selected.

**FOMOH2102** The `sh` command with no arguments is not allowed.

**Explanation:** You issued the `sh` command with no arguments, which is not allowed.

**System action:** Issue the `sh` command with a specific executable name supplied. For example: `sh ls`.

**FOMOH2103** The requested command could not be executed on the specified context because at least one task in that context is currently RUNNING.

**Explanation:** You can only issue the `on context` command form of the `on` command when there are no tasks RUNNING in the specified context.

**System action:** Use the command `group list context` or `tasks` to check the tasks' states. To get all of the tasks in another context under debugger control, issue `on context`, then `<Ctrl-c>`, then `halt`.

**FOMOH2104** The following command: `"string"` is unrecognized at the `pdbx-subset` prompt.

**Explanation:** You issued a command from the `pdbx-subset` prompt that is not understood.

**System action:** Issue the `help` command at the `pdbx-subset` prompt for short descriptions or use `man pdbx` to find out which commands are available at the `pdbx-subset` prompt.

**FOMOH2105** The current context contains at least one RUNNING task. When these RUNNING task(s) reach a breakpoint or complete execution, a `pdbx` prompt is displayed.

**Explanation:** You issued the `back` or `halt` command from the `pdbx-subset` prompt. Some of the tasks in the current context are RUNNING. A `pdbx` prompt will appear when the RUNNING task(s) reach a breakpoint or complete execution.

**System action:** Either wait for the `pdbx` prompt or issue a `<Ctrl-c>` to get a `pdbx-subset` prompt. You can then issue the `tasks` or `group list` command to view the state of the tasks. The `on` command is available at the `pdbx-subset` prompt if the user wants to then switch to a different context.

**FOMOH2106 Switching to context: "string", where there is at least one RUNNING task. When these RUNNING task(s) reach a breakpoint or complete execution, a `pdbx` prompt is displayed.**

**Explanation:** You issued the command `on context`. The target context has some task(s) that are RUNNING. This is an informational message to let you know that a `pdbx` prompt will not be displayed immediately.

**System action:** If you want to switch to a context where all tasks are ready to be debugged, press `<Ctrl-c>` to obtain a `pdbx-subset` prompt. You can list the state of tasks using the `tasks` or `group list` command. The `on` command is available at the `pdbx-subset` prompt if you want to then switch to a different context.

**FOMOH2107** Could not attach to task `number`.

**Explanation:** An error occurred while attempting to attach to the task.

**System action:** Check the poe application and restart the debugger.

**FOMOH2108** The following RUNNING task(s): `"string"` have been interrupted.

**Explanation:** The task(s) listed were in RUNNING state. The `halt` command attempted to interrupt them so that a `pdbx` prompt will be issued for the current context.

**System action:** After the `pdbx` prompt is issued, further debugger commands can be issued.
FOMOH2109 No action taken on task(s): "string", because they have either been stopped by the debugger, finished executing, or have been unhooked.

Explanation: The tasks listed were not RUNNING. These tasks may already be under the control of the debugger because of a breakpoint or step command. They could also have finished execution or been unhooked.

System action: None. This is an informational message.

FOMOH2110 No action has been taken because you specified a task number that was not attached to.

Explanation: A task specified on the group or on command is not an acceptable value.

System action: Retry the command using only task numbers that you attached to. Use the tasks command to display a list of valid task numbers.

FOMOH2111 Task number has requested exit.

Explanation: The indicated task has attempted to exit. The program terminates when all tasks have requested exit.

System action: None. This is an informational message.

FOMOH2112 The syntax: "on context" is valid at the pdbx-subset prompt, but "on context command" is not.

Explanation: While at the pdbx-subset prompt, the on context command form of the on command was issued. The only valid form of the on command at the pdbx-subset prompt is on context.

System action: Retry the on command using syntax: on context.

FOMOH2113 The following are valid at the pdbx-subset prompt: commands listed

Explanation: pdbx help screen for commands available at the pdbx-subset prompt.

System action: None.

FOMOH2114 The correct syntax is: 'string'.

Explanation: You issued incorrect syntax, and the correct syntax is displayed as part of this message.

System action: Retype the command using the syntax displayed.

FOMOH2115 Switching to context: "string", where there is at least one RUNNING task. When these RUNNING task(s) reach a breakpoint or complete execution, a pdbx prompt is displayed.

Explanation: You issued the on context command at the pdbx-subset prompt. The target context has some tasks that are RUNNING. This is an informational message to let you know that a pdbx prompt will not be displayed immediately.

System action: Either wait for the pdbx prompt or issue a <Ctrl-c> to enter get a pdbx-subset prompt. You can then use the tasks or group list command to view the state of the tasks. The on command is available at the pdbx-subset prompt if you want to then switch to a different context.

FOMOH2116 Group "string" has been deleted, because it has no members.

Explanation: The group delete command has been issued. All of the members in the group were specified to be deleted, so the group itself was also deleted.

System action: None. This is an informational message.

FOMOH2117 Group "string" has been deleted.

Explanation: You issued the group delete command and the group has been successfully deleted.

System action: None. This is an informational message.

FOMOH2118 No action was taken because task(s): "string" are currently RUNNING, and because the specified group has breakpoints or tracepoints set for it. Only tasks in the DEBUG READY state can be added to a group which has group breakpoints or tracepoints set.

Explanation: You issued the group add command. This group had some group events (breakpoints or tracepoints) set. When adding a task to this group, the group events will be added for the new task. To add an event, the task must be able to send debugger commands to the remote debugger. In this case, the tasks listed were not in the DEBUG READY state so that remote debugger commands could be issued.

System action: Use the tasks and group list commands to view the state of the tasks. To change the state of tasks, use the halt command and <Ctrl-c> to bring up a pdbx-subset prompt.
FOMOH2119 No action was taken because task(s): "string" are currently RUNNING, and because the specified group has breakpoints or tracepoints set for it. Only tasks in the DEBUG READY state can be deleted from a group which has group breakpoints or tracepoints set.

Explanation: You issued the group delete command. This group had some group events (breakpoints or tracepoints) set. When deleting a task from this group, the group events will be deleted from the deleted task. To delete an event, the task must be able to send debugger commands to the remote debugger. In this case, the tasks listed were not in DEBUG READY state so that remote debugger commands could be issued.

System action: Use the tasks and group list commands to view the state of the tasks. To change the state of tasks, use the halt command and <Ctrl-c> to bring up a pdbx-subset prompt.

FOMOH2120 All attached tasks have exited. Type either "detach" or "quit" to exit the debugger, and then restart pdbx if you wish to continue debugging. Reminder: "quit" also causes the poe job to be terminated, while "detach" does not.

Explanation: All the tasks of the partition have exited.

System action: Issue the "quit" or "detach" pdbx command.

FOMOH2121 No action has been taken because the partition is already loaded.

Explanation: You issued the load command after the partition was already loaded.

System action: The load command is not valid after the partition has been loaded.

FOMOH2122 This event cannot be set because task: number is unhooked.

Explanation: You issued a trace or stop command against a task that is unhooked. This pdbx command requires that the task be in DEBUG READY state.

System action: You can use the hook command to regain debugger control of previously unhooked tasks. Issue the group list or tasks command to see which tasks are unhooked.

FOMOH2123 This event cannot be set because some task(s) in the group are unhooked.

Explanation: You issued a trace or stop command against a group which contains some task(s) that are unhooked.

System action: The hook command can be used to regain debugger control of previously unhooked tasks. You can create another group which does not contain any tasks that are in the unhooked state.

FOMOH2124 Could not add event to task: number, because it is in state: "string".

Explanation: You issued a trace or stop command against the task specified in the message. No action was taken on behalf of this task because the task was not in DEBUG READY state.

System action: If the task is unhooked, the hook command will bring the task to DEBUG READY state. If the task is RUNNING, the halt command will interrupt the task and bring it to DEBUG READY state. If the task has exited, events cannot be set.

FOMOH2125 Could not delete event: "number" from task: "number", because it is in state: "string".

Explanation: You issued the delete command with the task identified in the message as the current context, but the task was not in DEBUG READY state. The task must be in DEBUG READY state so that the remote debugger can record the fact that the event has been deleted. No action has been taken.

System action: If the task is unhooked, use the hook command to bring it to DEBUG READY state.

FOMOH2126 Could not delete event: "number" from task: number of this group on the remote node, because it is in state: "string".

Explanation: You issued the delete command against the current context which is a group. The task listed in the message is a member of this group. No events can be deleted from the task because the task is not in debug ready state. The group event has been deleted on the home node. If the task is unhooked, this event will not be reset when the task is again hooked.

System action: When the task is again in DEBUG READY state, issue the on taskid dbx status command to manually check the event's status on the remote debugger.

FOMOH2128 The correct syntax is: 'group list [ group_name ]'.

Explanation: You issued the group list with incorrect syntax.

System action: Re-issue the command specifying either group list to see the tasks and states which belong to all groups or group list followed by a group name to see the tasks and states that belong to a specific group.
FOMOH2129  No action was taken because the
group name contained
non-alphanumeric characters.

Explanation:  The group name specified was made up
of some character(s) that were neither alphabetic nor
numeric.

System action:  Provide a group name that is no
longer than 32 characters, which starts with an
alphabetic character, and is followed by any
alphanumeric combination.

FOMOH2130  No action was taken because the
group name specified was null.

Explanation:  You issued one of the group
commands, but no group name was provided.

System action:  Provide a group name that is no
longer than 32 characters, which starts with an
alphabetic character, and is followed by any
alphanumeric combination.

FOMOH2131  All tasks have exited. Issue quit then
restart the debugger if you wish to
continue debugging.

Explanation:  All the tasks of the partition have exited.

System action:  Issue the quit command to exit pdbx.

FOMOH2132  The help command failed because two
or more arguments were specified.
Issue help for a list of commands and
topics that have help. Issue 'help
command' or 'help topic' to view the
help text.

Explanation:  You issued the help command with
more than one argument.

System action:  Re-issuse the help command with one
argument. Issue help alone for a list of valid arguments.

FOMOH2133  The help command did not recognize
the command or topic specified. Issue
help for a list of commands and topics
that have help. Issue 'help command'
or 'help topic' to view the help text.

Explanation:  You issued the help command with an
unrecognized argument.

System action:  Re-issuse the help command with a
valid argument. Issue help alone for a list of valid
arguments.

FOMOH2134  To begin debugging in attach mode,
select a task or tasks to attach.

Explanation:  Informational message. Part of pdbx
attach tasks menu.

System action:  None.

FOMOH2135  Task IP Addr Node PID Program

Explanation:  Informational message. Part of pdbx
attach tasks menu.

System action:  None.

FOMOH2136  At the pdbx prompt enter the "attach"
command followed by a list of tasks or
"all". (ex. "attach 2 4 5-7" or "attach
all") You may also type "help" for more
information or "quit" to exit the
debugger without attaching.

Explanation:  Informational message. Part of pdbx
attach tasks menu.

System action:  None.

FOMOH9000  pdbx is terminating.

Explanation:  pdbx is terminating normally.

System action:  Have a nice day.

FOMOH9039  Cannot read attach configuration file.

Explanation:  pdbx could not read the attach
configuration file, which is created when the original
POE job was started, and is removed when the job
ends.

System action:
1. Make sure the correct POE process id was used
when invoking the debugger.
2. Check the /tmp directory for the existence of a
config file containing the POE process id. (For
eexample, check /tmp/.ppe.<poe pid>.attach.cfg).

FOMOH9040  Cannot open attach configuration file.

Explanation:  pdbx was unable to open the attach
configuration file.

System action:
1. Make sure that the correct POE process id was
used when invoking the debugger.
2. Check the /tmp directory for the existence of a
configuration file containing the POE process id.
(For example, check for /tmp/.ppe.34192.attach.cfg).
**z/OS Debugger messages**

**FDBX**

**FDBX0001 incompatible types**

**Explanation:** You tried to assign a value to a variable, but the type of the expression is not the same as the type of the variable, so the assignment was not performed.

**User response:** Reenter the `assign` subcommand where the type of the variable matches the type of the expression.

**FDBX0003 invalid signal number**

**Explanation:** The signal that you specified is not a known signal name or valid signal number. The subcommand is not performed.

**User response:** Reenter the subcommand and specify a valid signal number or name.

**FDBX0004 no valid modules were found in the load map.**

**Explanation:** The loadmap appears to be empty.

**User response:** If you are attempting to debug a sticky-bit program, you must place a "set $sticky_debug" statement in the .dbxsetup file and restart the dbx debugger.

**FDBX0005 string is not a block**

**Explanation:** You used a symbol that is not a block in a context where only a block is allowed.

**User response:** Reenter the subcommand and specify a "$bxxx"-type symbol.

**FDBX0006 expected a symbol, found string**

**Explanation:** You used an expression where only a symbol name is allowed.

**User response:** Reenter the subcommand and specify a symbol where it is expected.

**FDBX0007 string is not a procedure or function**

**Explanation:** You used a symbol that is not a subprogram name where only a subprogram name is allowed.

**User response:** Reenter the subcommand and specify a subprogram name where it is expected.

**FDBX0011 CEEEVDBG has not been loaded properly. The current dbx operation is cancelled.**

**Explanation:** When installed, CEEEVDBG provides additional functionality to the BPX1PTRA syscall that dbx uses to control the process/program being debugged. dbx has detected that LE did not load CEEEVDBG during user program initialization.

**User response:** Report the problem to the MVS system programmer. 'SYS1.SAMPLIB(CEEEVDBG)' contains sample HASM source for the CEEEVDBG module that dbx requires.

**FDBX0012 execv failure: string**

**Explanation:** dbx was unable to execute the desired debug target program.

**User response:** Ensure that you have specified the correct filename of the debug target, and that it has the proper permissions.

**FDBX0016 symbol not defined**

**Explanation:** The symbol is not known to dbx.

**User response:** Reenter the subcommand with a symbol that is defined in the program where the file has been compiled with -g. Not that symbols in DLLs are not known to dbx until the symbolics for the DLL have been read.

**FDBX0017 unexpected "at" or "in"**

**Explanation:** You used incorrect syntax for a `stop` or `trace` subcommand.

**User response:** Reenter the `stop` or `trace` subcommand and use the correct syntax.

**FDBX0018 Storage access failed,**

```
target=hex-number, source=hex-number, size=hex-number
```

**Explanation:** dbx attempted to access storage that it could not read or write to.

**User response:** Verify the source, target or size fields. Verify the symbol/value specified on the `dbx` subcommand that caused the error. Follow local procedures for reporting problems.

**FDBX0019 Program start spawn failure,**

```
attempting fork/exec; errno=number, errno2=hex-number: string
```

**Explanation:** dbx could not start the program using spawn for the given errno, errno2 reason. A fork/exec will now be attempted to start debugging the program.
FDBX0020 cannot trace expressions
Explanation: You specified an expression to be traced. Only variables can be traced.
User response: Reenter the trace subcommand and specify a variable to be traced.

FDBX0022 missing variable to watch
Explanation: The watch subcommand was specified without a variable to watch.
User response: Reenter the watch subcommand with the desired variable to watch.

FDBX0023 expected variable to watch, found string
Explanation: The watch subcommand was specified with an argument other than a program variable.
User response: Reenter the watch subcommand with the desired variable to watch.

FDBX0024 bad binary op type: string
Explanation: dbx encountered a bad binary operation type node while processing a binary operation.
User response: Follow local procedures for reporting problems.

FDBX0026 expected variable, found string
Explanation: The stop subcommand expected a variable name but found another type of symbol.
User response: Reenter the stop subcommand and specify a variable name.

FDBX0027 expected subprogram, found string
Explanation: You specified an expression for a stop subcommand in a position where only a subprogram name is allowed.
User response: Reenter the stop subcommand and specify a subprogram name.

FDBX0028 string is not a subprogram
Explanation: You used a symbol that is not a subprogram in a context where only a subprogram is allowed.
User response: Reenter the subcommand and specify a subprogram name.

FDBX0030 missing line
Explanation: You omitted the line number in a stop or trace subcommand.
User response: Reenter the stop or trace subcommand and specify a line number.

FDBX0031 expected source line number, found string
Explanation: The stop or trace dbx subcommand was expecting a source file line number.
User response: Reenter the dbx subcommand specifying a source file line number.

FDBX0032 missing address
Explanation: You omitted the address in a subcommand.
User response: Reenter the subcommand and specify an address.

FDBX0033 expected address, found string
Explanation: You specified the wrong address in a subcommand.
User response: Reenter the subcommand and specify the correct address.

FDBX0034 Found storage damage at hex-number with guard before, size=number, index=number
Explanation: dbx was running with internal storage checking on which detected storage damage.
User response: Follow local procedures for reporting problems.

FDBX0035 Found storage damage at hex-number with guard after, size=number, index=number
Explanation: dbx was running with internal storage checking on which detected storage damage.
User response: Follow local procedures for reporting problems.

FDBX0036 tracestorcnt overlow: number
Explanation: dbx was running with internal storage checking on which ran out of table space while attempting to add a new storage trace entry.
User response: Follow local procedures for reporting problems.
FDBX0039  Bad INSPECT subcode passed from LE: number
Explanation:  dbx received a bad INSPECT type sub-operation from the LE debugger exit. dbx ignores the bad sub-operation and continues processing.
User response:  Follow local procedures for reporting problems.

FDBX0042  fast next detected a loop after number retries
Explanation:  dbx next processing encountered a problem where it appears to be in an endless loop.
User response:  dbx should be able to step/next/cont from this stopping point. Follow local procedures for reporting problems.

FDBX0043  step detected a loop after number retries
Explanation:  dbx step processing encountered a problem where it appears to be in an endless loop.
User response:  dbx should be able to step/next/cont from this stopping point. Follow local procedures for reporting problems.

FDBX0044  catchfault called with number, pid=number
Explanation:  dbx received an unexpected signal during processing and will perform termination processing.
User response:  Follow local procedures for reporting problems.

FDBX0045  Unreadable data at hex-number
Explanation:  dbx was unable to read storage at the given address.
User response:  Retry the operation. If the failure persists, follow local procedures for reporting problems.

FDBX0048  Set an event like "st in main" then use "c" to start debugging.
Explanation:  dbx suggestion as to how to start debugging your program.
User response:  None.

FDBX0050  assertion failed at line number in file string
Explanation:  An internal dbx error occurred.
User response:  Follow local procedures for reporting problems.

FDBX0051  context includes more than one block
Explanation:  An internal dbx error occurred.
User response:  None.

FDBX0052  Cannot handle more than one block from whatblock()
Explanation:  An internal dbx error occurred.
User response:  None.

FDBX0053  SIGSEGV occurred during command line editing
Explanation:  An internal dbx error occurred.
User response:  None.

FDBX0054  eval: bad op number for redirectout
Explanation:  A redirection operation failed with an internal error
User response:  Follow local procedures for reporting problems.

FDBX0055  eval: bad op number for redirecterr
Explanation:  A dbx redirection operation experienced an internal error.
User response:  Follow local procedures for reporting problems.

FDBX0056  assign non-composite to composite
Explanation:  None.
User response:  None.

FDBX0057  Node op error at "string":number
Explanation:  None.
User response:  None.

FDBX0058  reference through null pointer at line number in file string
Explanation:  dbx attempted to dereference a null pointer.
User response:  Follow local procedures for reporting problems.

FDBX0059  Could not find low address of die
Explanation:  None.
User response:  None.
FDBX0060  Could not find high address of die

Explanation:  None.
User response:  None.

FDBX0062  subscript must be integer-compatible

Explanation:  An array subscript must be integer-compatible.
User response:  Reenter the dbx subcommand specifying an integer-compatible value for the expression for an array subscript.

FDBX0064  step detected a recursion after number retries

Explanation:  dbx step processing encountered a problem where it appears to be in an endless loop.
User response:  dbx should be able to step/next/cont from this stopping point. Follow local procedures for reporting problems.

FDBX0065  step detected a no-source to no-source program loop

Explanation:  dbx step processing encountered a problem where it appears to be in an endless loop.
User response:  dbx should be able to step/next/cont from this stopping point. Follow local procedures for reporting problems.

FDBX0067  "string" is not a valid selection

Explanation:  The user entered an invalid selection.
User response:  Reenter the dbx subcommand specifying a valid selection.

FDBX0068  Selection must be between number-number

Explanation:  The user entered an invalid selection.
User response:  Specify valid selection.

FDBX0069  Ambiguous file "filename"; arbitrarily choosing.

Explanation:  dbx encountered two files with the same name in different paths when trying to display a source line. Since it is not possible to determine which is the correct file, the first one located in the dbx "use" path is chosen. This may or may not be correct, depending on the circumstances.
User response:  Either ignore the error, and note that the source code as displayed may not match what dbx is actually running, or modify your program so that all of its files have unique names.

FDBX0071  Process finished unexpectedly

Explanation:  The process being debugged finished unexpectedly.
User response:  Restart the process via the "run" or "rerun" subcommands.

FDBX0072  Cannot change register - register is read-only.

Explanation:  You tried to change the value of a read-only register.
User response:  Specify a different register to write to.

FDBX0074  Unable to query kernel for process info

Explanation:  dbx attempted to call the kernel for information about the process being debugged, but the call failed.
User response:  Follow local procedures for reporting problems.

FDBX0075  dread passed zero length

Explanation:  The user process data read routine was called to read a zero length buffer.
User response:  Follow local procedures for reporting problems.

FDBX0076  could not call instruction decoder routine.

Explanation:  dbx tried to fetch() the address of the z/OS instruction decoder, and the fetch() failed. This will result in degraded assembler listings and the inability to decode instructions.
User response:  Follow local procedures for reporting problems.

FDBX0078  cannot find symbol for program counter ($pc)

Explanation:  This dbx internal error indicates that the internal symbol corresponding to the program counter of the program could not be located. This will cause some stop and trace subcommands to have unpredictable behavior.
User response:  Follow local procedures for reporting problems.

FDBX0082  string is not active

Explanation:  The program is not running, or there is no stack frame containing an instance of a variable in string.
User response:  Stop in a function where the variables in string are active, or use the run or rerun command.
subcommand to restart the program, or exit dbx with the quit subcommand.

FDBX0083 cannot evaluate a string
Explanation: You either specified a string that cannot be evaluated because there is no method to evaluate a string of this type, or you are attempting to typecast with the parameters specified incorrectly.
User response: Reenter the failing subcommand and specify a valid symbol type.

FDBX0086 invalid assignment
Explanation: You can only change the value of exit_status in thread type variables. Assignment to another other field in thread, mutex or condition variable type variables is not allowed.
User response: Reenter the subcommand and specify a different variable.

FDBX0087 double free detected! hex-number
Explanation: dbx tried to free storage that was already freed.
User response: Follow local procedures for reporting problems.

FDBX0088 error: division by 0
Explanation: You specified an expression containing a division by zero.
User response: Reenter the subcommand and specify a nonzero divisor.

FDBX0089 dbx for z/OS (with 64-bit support).
Explanation: The message tells you if dbx is compiled with support for 64-bit programs.
User response: None.

FDBX0090 cannot read string
Explanation: dbx couldn't read the named source file.
User response: Use the file subcommand to verify the name of the current source file. Check the permissions for the source file.

FDBX0091 Storage allocated by func should not be freed by func
Explanation: Storage allocated by safe_malloc31 should be freed by safe_free31. Mixing the routines with the default allocation ones can be hazardous.
User response: Follow local procedures for reporting problems.

FDBX0092 Zero-byte allocation detected!
Explanation: An internal dbx routine attempted to allocate zero-bytes of storage. This is most likely a bug.
User response: None.

FDBX0095 Symbols are not folded (mixed).
Explanation: dbx is not changing the case of user-typed symbol names.
User response: None.

FDBX0096 Symbols are folded to lower case.
Explanation: dbx is changing the case of user-typed symbol names to lowercase.
User response: None.

FDBX0097 Symbols are folded to upper case.
Explanation: dbx is changing the case of user-typed symbol names to uppercase.
User response: None.

FDBX0098 Symbols are folded based upon current language.
Explanation: dbx is changing the case of user-typed symbol names, depending on the programming language currently associated with your program.
User response: None.

FDBX0100 Type 'help' for help.
Explanation: This message explains how to get help information.
User response: None.

FDBX0101 no executable code at line lineNumber
Explanation: You tried to place a breakpoint at a source line number with no runnable code associated with it in the program. This line is followed by an interpretation of the specified source line.
User response: Specify the stop or trace subcommand with a valid source line number.

FDBX0103 Attempt to resolve "wildcards" in run or rerun failed.
Explanation: dbx couldn't interpret the parameters for a run or rerun subcommand.
User response: Reenter the subcommand and specify valid metacharacters.
FDBX0104  non-positive repetition count
Explanation: You specified a non-positive number of machine instructions to display.
User response: Reenter the subcommand with a positive count.

FDBX0105  too many arguments
Explanation: dbx couldn't pass all of the parameters to the program because there were too many. The limit is 1000 parameters.
User response: Specify the run or rerun subcommand with fewer parameters.

FDBX0107  unknown event number
Explanation: You specified a stop or trace event id that does not match any known stop or trace events.
User response: Reenter the subcommand and specify a valid event ID.

FDBX0109  multiple input redirects
Explanation: You specified more than one file to redirect input to the program. Only one is allowed, and only the first file will be used.
User response: Reenter the subcommand and specify only one redirect input.

FDBX0110  cannot continue execution
Explanation: dbx cannot continue running the program because it is not known to be in a stopped state.
User response: Check that your process is still active and that the program did not exit.

FDBX0111  source file string not found or not compiled with debug information.
Explanation: The source file was not compiled with the option to support symbolic debugging.
User response: You can perform only machine-level debug.

FDBX0112  bad print format string
Explanation: The format of the memory display was specified incorrectly.
User response: Reenter the display memory subcommand with the correct display format.

FDBX0113  Program terminated by signal number (signal description).
Explanation: The program ended because it received a signal number.
User response: Use the run or rerun subcommand to restart the program, or exit dbx with the quit subcommand.

FDBX0114  program exited
Explanation: The program terminated with a return code of zero.
User response: Use the run or rerun subcommand to restart the program, or exit dbx with the quit subcommand.

FDBX0115  program exited with code number
Explanation: The process being debugged completed with a nonzero return code.
User response: None.

FDBX0116  string(): nbytes=number is not valid
Explanation: The process being debugged completed with a nonzero return code.
User response: None.

FDBX0117  Stack entryid: number is larger than stack count: number
Explanation: Stack entryid should not be larger than stack count.
User response: None.

FDBX0124  Could not alter multi-processing mode.
Explanation: dbx encountered a system error while trying to change the multi-process debugging mode.
User response: Follow local procedures for reporting problems.

FDBX0125  Could not detach from process. Use quit.
Explanation: dbx encountered a system error while trying to detach from the user program.
User response: Use the quit subcommand to end the debugging session. Follow local procedures for reporting problems.
FDBX0126  eval: bad op number
Explanation: This is a dbx internal error. The dbx expression tree contains an operation that is unknown to dbx.
User response: Follow local procedures for reporting problems.

FDBX0127  source file file-name not found or not compiled with debug information;  
event id = [id]
Explanation: The file specified in the stop event was not found. A deferred breakpoint has been created instead.
User response: None.

FDBX0134  Unknown debug flag
Explanation: You used the debug subcommand with an incorrect argument.
User response: Reenter the debug subcommand with a different parameter.

FDBX0135  Unknown node operator
Explanation: An internal dbx error occurred
User response: Follow local procedures for reporting problems.

FDBX0136  func: bad op number
Explanation: This is a dbx internal error. The dbx expression tree contains an operation that is unknown to dbx.
User response: Follow local procedures for reporting problems.

FDBX0137  Couldn't set size of string
Explanation: dbx tried to set the size of a register, but was unsuccessful.
User response: Follow local procedures for reporting problems.

FDBX0138  string is an unusual operand for examining modification
Explanation: You are trying to trace modification to a memory location that is not normally modifiable, such as a subprogram entry point.
User response: Reenter the trace subcommand and specify a variable.

FDBX0141  no source lines for string
Explanation: You tried to list the source lines to a subprogram that has no associated line number information.
User response: Reenter the list subcommand after compiling the current subprogram with the -g option.

FDBX0142  Setting 'frame' is not supported.
Explanation: The 'frame' debugger variable cannot be modified.
User response: Issue a different subcommand.

FDBX0143  line numbers must be positive
Explanation: You specified a nonpositive line number to start listing lines from.
User response: Reenter the list subcommand with positive line numbers.

FDBX0144  second number must be greater than first
Explanation: The specified ending line number was smaller than the beginning line number.
User response: Reenter the subcommand and ensure the ending line number is larger than the beginning line number.

FDBX0145  No file to move within
Explanation: You issued the move subcommand when there is no current file.
User response: First enter the file subcommand to set the source file, then reissue the move subcommand.

FDBX0146  Line specified is not within range of string
Explanation: You tried to move the current line number to be listed to a line number that is outside of the range of the current source file.
User response: Reenter the move subcommand and specify a line number within the bounds of the current source file.

FDBX0147  Could not set stack frame register number.
Explanation: dbx tried to set the symbolic name of the register containing the stack pointer, but was unsuccessful.
User response: Follow local procedures for reporting problems.
FDBX0148  Note: dbx31 and dbx64 should not be invoked directly. Doing so may cause undefined behavior.

Explanation: The dbx debugger was invoked directly, rather than through the dbx front end. Running dbx in this manner is not supported.

User response: Start the dbx debugger via the dbx shell command.

FDBX0149  No assembly code for that source line number

Explanation: You tried to list the machine instructions for a source line number that has no associated machine instructions in your program.

User response: Reenter the listi subcommand with a valid source line number.

FDBX0150  Debug target is number-bit

Explanation: Informational message displaying the current amode of the process being debugged.

User response: None.

FDBX0151  first address larger than second

Explanation: You specified an incorrect range of memory to be displayed. The starting address was after the ending address.

User response: Reenter the display memory subcommand with the correct memory range.

FDBX0153  string is not active

Explanation: You specified a local variable that is defined within a unused subprogram. Such a variable has no address or value in that situation.

User response: Reenter the subcommand and specify a valid active variable.

FDBX0155  no place to return to

Explanation: The return subcommand couldn’t complete because dbx couldn’t find a return address for the named function.

User response: Issue the where subcommand to find the current called sequence. Then reissue the return subcommand and specify one of the active functions. You can perform only machine-level debug.

FDBX0156  Timeout waiting for kernel to service QUERY_MODE request for pid number.

Explanation: dbx stopped waiting for the kernel to service a request for the amode of the process, and cannot continue.

User response: Use local error reporting methods.

FDBX0163  Entering debugger...

Explanation: After you invoked dbx with the -r option, the program ended unexpectedly.

User response: Use dbx to determine why the program ended.

FDBX0171  string is not aliased

Explanation: The user tried to interact with an alias that does not exist.

User response: Reenter the alias command with an existing alias.

FDBX0172  string is a program symbol -- use assign

Explanation: You used the set subcommand to change a program variable.

User response: Use the assign subcommand instead of the set subcommand.

FDBX0175  no process to write to

Explanation: You are trying to alter the memory contents of a nonrunning program.

User response: The program process is no longer available. Enter the run or rerun subcommand to restart the program process.

FDBX0176  execution completed (exit code number)

Explanation: The program completed with a nonzero exit code.

User response: None.

FDBX0177  execution completed

Explanation: The program completed with an exit code of 0.

User response: None.

FDBX0180  string is not a procedure or function

Explanation: You tried to change the current function to a symbol that is not a subprogram.

User response: Reenter the func subcommand and specify a procedure or function name.
FDBX0181  program is not executable
Explanation:  You tried to change the program counter of a program that cannot be run.
User response:  None.

FDBX0182  Goto address is not within current function. (set $unsafegoto to override)
Explanation:  You specified that the program counter of your program be changed to an address that is outside of the current function. This is not allowed unless you have set the debugger variable $unsafegoto.
User response:  Either set $unsafegoto and reissue goto, or specify a safe goto address.

FDBX0185  hexints and octints are both set.
Explanation:  The hexints and octints internal variables are both enabled. This situation should never occur.
User response:  Follow local procedures for reporting problems.

FDBX0190  return detected a loop after number retries.
Explanation:  The return subcommand failed due to a non-terminating loop in the program being debugged.
User response:  Change the program being debugged so that the loop properly terminates.

FDBX0191  O_WHICH bad op: number
Explanation:  The evaluator detected a node that it was not designed to process during the evaluation of an O_WHICH node.
User response:  Follow local procedures for reporting problems.

FDBX0192  The 31bit DBX cannot debug a 64bit program.
Explanation:  When DBX run in -m4(amode=31), it cannot debug the 64bit debuggee program. If DBX encounter (run/attach/exec) a 64bit debuggee, it will terminate.
User response:  None

FDBX0210  string: file already exists, use ">!"
Explanation:  You tried to redirect output of a subcommand to a file that already exists without specifying that the existing file be overwritten.
User response:  Reenter the subcommand and specify a different file, or use the append file operator (>>).

FDBX0211  cannot create string
Explanation:  dbx encountered an error while trying to redirect the output subcommand to the user-specified output file.
User response:  Reenter the subcommand and specify a different file or directory path.

FDBX0212  standard out dup failed
Explanation:  dbx encountered an error while trying to restore standard output.
User response:  Follow local procedures for reporting problems.

FDBX0213  filename: file already exists, use "2>!"
Explanation:  You attempted to route error output from a dbx subcommand to a file that already exists.
User response:  Reenter the dbx command specifying "2>!" to the same file, or choose a different file name.

FDBX0214  standard err dup failed
Explanation:  dbx tried to do a dup() of stderr which failed.
User response:  Contact your system programmer.

FDBX0216  application forked, child pid=number, process stopped, awaiting input - use 'dbx -A number' on another terminal to establish a debug session for the child pid.
Explanation:  Heading produced for a user program that used a fork() system call while debugging in multiprocess debug mode.
User response:  Enter the specified subcommand on another terminal to start debugging the child of the fork() call.

FDBX0217  application forked, parent process (pid) stopped, awaiting input
Explanation:  Heading produced for a user program that used a fork() system call while debugging in multiprocess debug mode. dbx is now attached to the parent process.
User response:  Continue to debug the parent process.

FDBX0218  application forked, child process (pid) stopped, awaiting input
Explanation:  Heading produced for a user program that used a fork() system call while debugging in
multiprocess debug mode. dbx is now attached to the child process.

**User response:** Continue to debug the child process.

---

**FDBX0219** Could not open history log "filename" for appending.

**Explanation:** The dbx command history could not be written out to the history log file.

**User response:** Ensure that the history file is writable.

---

**FDBX0223** string is not set

**Explanation:** You tried to remove a debugger variable, but it was not set.

**User response:** Use the set subcommand to display a list of debugger variables.

---

**FDBX0242** application forked, but child process was killed. Following parent process (pid).

**Explanation:** Message produced for a user program that forked or spawned, but the child process was killed when in fork or spawn processing.

**User response:** Use local error reporting methods.

---

**FDBX0243** application spawned, child pid=number, process stopped, awaiting input - use 'dbx -A number' on another terminal to establish a debug session for the child pid.

**Explanation:** Message produced for a user program that used a spawn() system call while debugging in multiprocess debug mode.

**User response:** Enter the specified subcommand on another terminal to start debugging the child of the spawn() call.

---

**FDBX0244** Application spawned, following parent process (pid).

**Explanation:** Message produced for a user program that used a spawn() system call while debugging in multiprocess debug mode. dbx is now attached to the parent process.

**User response:** Continue to debug the parent process.

---

**FDBX0245** Application spawned, following child process (pid).

**Explanation:** Message produced for a user program that used a spawn() system call while debugging in multiprocess debug mode. dbx is now attached to the child process.

**User response:** Continue to debug the child process.

---

**FDBX0246** subscript out of range

**Explanation:** You specified a subscript to an array that is not compatible with the bounds of the array.

**User response:** Reenter the subcommand and specify the correct array bounds.

---

**FDBX0250** Attached location

**Explanation:** dbx successfully attached to a running process and displayed the name of the function (if any) that it is currently stopped in.

**User response:** None - informational only.

---

**FDBX0251** Could not determine the object file name.

**Explanation:** dbx couldn't determine the name of the object file associated with the specified running process.

**User response:** Reenter the object file name when prompted by dbx.

---

**FDBX0252** enter object file name (default is 'string', Control-D to exit):

**Explanation:** dbx couldn't access the specified user program. It then prompts you to submit another name for the program or to exit dbx by entering Control-D.

**User response:** Enter the object file name or control-D to exit.

---

**FDBX0254** Stack trace follows

**Explanation:** Message displayed before the stacktrace when attaching to a running program

**User response:** None - informational only.

---

**FDBX0255** cannot debug string; file not found.

**Explanation:** dbx was unable to read the named source file.

**User response:** Reenter the file subcommand and specify a source file name that exists in the current subdirectory or in the use path.

---

**FDBX0256** cannot debug string; file is a directory.

**Explanation:** dbx was instructed to debug a directory.

**User response:** Choose a valid executable file to debug, and restart dbx.
FDBX0258  unknown option character
Explanation: You specified an unknown option.
User response: Reenter the alias subcommand and specify the correct options.

FDBX0259  Option character is deprecated and will be ignored.
Explanation: You specified a legacy command line option that this version of dbx ignores. It is accepted for compatibility reasons.
User response: Do not specify the option in the future.

FDBX0265  program is not active
Explanation: The program has completed or has not begun.
User response: Use the run or rerun subcommands to start the program.

FDBX0267  File string does not have execute permissions.
Explanation: The file that dbx was instructed to debug does not have the execute permission bit set. This means that you may not be able to debug the program.
User response: Set the execute bit on the file and rerun dbx.

FDBX0268  ptrace(PT_LDINFO) failure
Explanation: The ptrace() function call returned a -1 with the errno stating the error.
User response: Retry the dbx command.

FDBX0269  Could not determine current function
Explanation: dbx couldn’t determine which function is currently active.
User response: Check that the program process is still active. Verify that you are setting $frame to the correct stack frame.

FDBX0271  no source file
Explanation: There is no current source file to print.

FDBX0272  could not read string
Explanation: dbx couldn’t read the named source file.
User response: Verify that the source file exists in the current directory in the path specified by the subcommand use, or in the -I dbx command line option.

FDBX0273  line number must be positive
Explanation: The specified line number was a negative number.
User response: Reenter the subcommand with a positive line number.

FDBX0274  alias expansion too large
Explanation: The expanded version of the aliased subcommand exceeds the length of the dbx command buffer (10240 characters).
User response: Use the alias subcommand to redefine the alias.

FDBX0275  dynamic call of a function is not supported
Explanation: Any reference to a function that must dynamically call the function is not supported.
User response: None.

FDBX0277  could not attach to pid number
Explanation: You were not allowed to debug the process running with process ID number.
User response: You must have kill authority to attach to the process. Contact your system programmer.

FDBX0278  Waiting to attach to process number...
Explanation: dbx is waiting for the system’s response to the request to debug the process running with process ID number.
User response: None.

FDBX0279  Attaching to process (pid) from exec...
Explanation: dbx is waiting for the system’s response to the request to debug the process that performed an exec() operation while multiprocess debug mode is enabled.
User response: None.

FDBX0280  cannot fork
Explanation: dbx tried to execute a fork() to prepare to debug your program and it failed.
User response: Contact your system programmer.

FDBX0281  Cannot execute string
Explanation: dbx was unable to run the program.
User response: Contact your system programmer.
FDBX0282  Commandline option missing an argument.
Explanation: You specified a commandline option to dbx that requires an argument, but the argument was omitted.
User response: Reinvoke dbx with the missing argument.

FDBX0283  cannot catch signal signal (signal name).
Explanation: MVS signal processing does not allow you to catch the specified signal.
User response: None.

FDBX0285  error number trying to continue process
Explanation: dbx couldn't continue the program due to a system error.
User response: Contact your system programmer.

FDBX0286  "string" does not have a value.
Explanation: The dbx keyword is missing a value. This is an internal error.
User response: Follow local procedures for reporting problems.

FDBX0287  multiple error redirects
Explanation: You specified more than one file to redirect stderr from your program.
User response: Reenter the subcommand and specify only one redirect for stderr.

FDBX0288  Internal error: could not detach from process.
Explanation: The debugged process issued the fork() system call. dbx tried to remove breakpoints in the new debugged process, which were inherited from the parent process. However, dbx could not detach from the child process.
User response: Follow local procedures for reporting problems.

FDBX0290  multiple output redirects
Explanation: You specified more than one file to redirect output from your program.
User response: Reenter the subcommand and specify only one redirected output.

FDBX0295  store: could not write data at hex-number
Explanation: dbx couldn't write data at address hexnum in the program.
User response: Reenter the subcommand and specify a valid address for the program's data.

FDBX0296  function not active.
Explanation: The function specified as an argument to the return subcommand is not currently active.
User response: Rerun the subcommand with a different function name, or run the program to a point where the specified function is active.

FDBX0297  signal "signal name" unknown.
Explanation: You entered an unknown signal name.
User response: Reissue the subcommand with a correct signal name.

FDBX0298  not that many levels
Explanation: You tried to traverse past the end of the stack.
User response: Reissue the up or down subcommand with a smaller count.

FDBX0301  [internal error] upper 32 bits not zero
Explanation: An internal dbx routine detected a parameter error.
User response: Follow local procedures for reporting problems.

FDBX0309  Cannot determine where to set a breakpoint. You must specify 'Procedure', 'SourceLine' or 'Address'.
Explanation: You are trying to execute TRACE without any parameters when the current function is not known.
User response: Reenter the trace subcommand with valid parameters.

FDBX0310  missing ')' in macro call
Explanation: You did not close the parameter list to an aliased subcommand with a ).
User response: Use the alias subcommand to redefine the alias.
FDBX0311 Next line that will be listed is line
Explanation: The next source line that will be displayed via the list subcommand.
User response: None - informational only.

FDBX0313 not enough parameters in macro call
Explanation: You did not specify enough parameters for an aliased subcommand.
User response: Enter the alias subcommand for the alias to view the current definition. Reenter the subcommand with the correct number of parameters.

FDBX0315 Keyword is not an address
Explanation: The keyword specified was not an address.
User response: Reenter the subcommand with an address.

FDBX0317 too many parameters in macro call
Explanation: You specified too many parameters for an aliased subcommand.
User response: Enter the alias subcommand for the alias to view the current definition. Reenter the subcommand with the correct number of parameters.

FDBX0318 missing actuals for macro
Explanation: You did not specify parameters for an aliased subcommand that requires parameters.
User response: Enter the alias subcommand for the alias to view the current definition. Reenter the subcommand with the correct number of parameters.

FDBX0327 string has only 1 line
Explanation: The specified line number was greater than the number of lines in the file.
User response: Reenter the subcommand and specify a line number within the bounds of the source file.

FDBX0328 string has only number lines
Explanation: The specified line number was greater than the number of lines in the file.
User response: Reenter the subcommand and specify a line number within the bounds of the source file.

FDBX0329 ^ unrecognized command
Explanation: You specified a command that is not a subcommand or user alias. The ^ must be at the beginning of the message.
User response: Use the help subcommand to list the valid subcommands.

FDBX0330 initially (at line line in file):
Explanation: Diagnostic message indicating where a traced variable was first found
User response: None

FDBX0331 after line line in file:
Explanation: Diagnostic message indicating that a traced variable has changed values.
User response: None

FDBX0332 Multi-procss debugging is status
Explanation: The message indicates the current value of the dbx multi-process setting.
User response: None - informational only.

FDBX0333 Multproc cannot be set when program is inactive.
Explanation: The multproc subcommand cannot alter the multproc setting if the debuggee is not currently active.
User response: Respecify the subcommand when the debuggee is active.

FDBX0334 ^ syntax error
Explanation: You used the wrong syntax for a subcommand or user alias. The diacritic (^) must be at the beginning of the message.
User response: Use the help subcommand to display the correct syntax for a subcommand.

FDBX0335 non-terminated string
Explanation: You did not close a character string with a quote character.
User response: Reenter the subcommand and close all strings with a single quote character or a double quote character.

FDBX0336 Bad target Amode
Explanation: dbx encountered a bad amode internally.
User response: Use local error reporting methods.

FDBX0337 cannot open string
Explanation: dbx couldn’t read a file that is supposed to contain subcommands.
User response: Check that the file exists and that you
have the correct permissions to read from it.

FDBX0338  goto/gotoi cannot be used when program is inactive.
Explanation:  The goto/gotoi subcommands cannot be used when the debuggee is not currently active.
User response:  Respecify the subcommand when the debuggee is active.

FDBX0339  unreasonable input nesting on string
Explanation:  The nesting of subcommand files exceeded the dbx limit of ten.
User response:  Change the subcommand files to have less subcommand source nesting.

FDBX0340  second number must be greater than first
Explanation:  You specified a larger beginning than ending line number to be listed.
User response:  Reenter the list subcommand with the ending line number larger than the starting line number.

FDBX0348  dbx wait() was interrupted by a signal.
Explanation:  dbx made a system call to wait() to obtain the status of the debuggee, and was interrupted by a signal. overwrite this file.
User response:  Use local procedures for error reporting.

FDBX0349  cannot write over running object file.
Explanation:  The specified file name on the dbx subcommand that is to be used for output is the currently running object file. dbx will not overwrite this file.
User response:  Reenter the dbx subcommand specifying a different file.

FDBX0351  cannot write filename
Explanation:  The specified file name on the dbx subcommand cannot be written by dbx.
User response:  Reenter the dbx subcommand specifying a file that you have write access to.

FDBX0352  cannot read filename
Explanation:  The specified file name on the dbx subcommand cannot be read by dbx.
User response:  Reenter the dbx subcommand specifying a file that you have read access to.

FDBX0353  no source for filename
Explanation:  The specified source file was not compiled to support symbolic debugging.
User response:  Reenter the edit subcommand on a file that was compiled with the -g option.

FDBX0356  no source file
Explanation:  You tried to search through a nonexistent file for a pattern.
User response:  Use the file subcommand to verify the name of the current source file.

FDBX0357  An error occurred while getting the sourceline
Explanation:  The a function used to get a sourceline out of the debug side file returned an error.
User response:  Internal error. Follow local procedures for reporting problems.

FDBX0358  invalid regular expression
Explanation:  You specified a pattern that could not be compiled into a regular expression.
User response:  Reenter the subcommand and use a valid regular expression.

FDBX0359  no match
Explanation:  You specified a pattern that did not match anything in the current source file.
User response:  Reenter the subcommand and use a different pattern.

FDBX0380  varname is not a pointer
Explanation:  You tried to use the de-reference variable on a variable that is not a pointer.
User response:  Use the whatis subcommand to determine the type of the variable. The * prefix or ^ postfix operators can only be used on pointers. Reenter the subcommand with a pointer variable.

FDBX0381  expected variable, found string
Explanation:  You specified an incorrect expression to a stop subcommand in a position where only a variable is allowed.
User response:  Reenter the stop subcommand and specify a variable name.
FDBX0383 cannot typecast var\texttt{type}_name to \texttt{type}_name

**Explanation:** You attempted an illegal typecast operation

**User response:** Use the \texttt{whatis} subcommand to determine the types of the operands. Typecasts are allowed only between base or pointer types. Reenter the subcommand with the correct typecast operation.

FDBX0384 unknown member class: \texttt{hex-number}

**Explanation:** The evaluator has received an unexpected tag.

**User response:** This is an internal error. Report this problem to IBM via the appropriate service channel.

FDBX0385 operation not defined on \texttt{string}

**Explanation:** You tried an arithmetic or logical operation on a symbol for which the operation is undefined.

**User response:** Arithmetic or logical operations can only be performed on expressions that result in a numeric value. Reenter the subcommand and specify a numeric expression.

FDBX0390 A kernel call took too long to complete.

**Explanation:** A system call to the USS kernel took too long to complete, and dbx's internal watchdog timer expired.

**User response:** Use local procedures for error reporting.

FDBX0391 Unable to set multiprocess mode via \texttt{ptrace}.

**Explanation:** dbx tried to set the multiprocess mode for the current process via a ptrace kernel call, but the call never succeeded. Multiprocess functionality may not work as expected.

**User response:** Use local procedures for error reporting.

FDBX0396 \texttt{symname} is not an array

**Explanation:** You specified dimensions for a symbol that is not an array or pointer.

**User response:** Use the \texttt{whatis} subcommand to determine the definition for the symbol.

FDBX0399 Compiled: \textit{date at time}

**Explanation:** Informational message.

**User response:** None.

FDBX0400 OS level

**Explanation:** Information message reporting the result of \texttt{uname -a}.

**User response:** None.

FDBX0402 Removing no longer valid event [id]

**Explanation:** A stop/trace event was removed because it is no longer valid.

**User response:** Resubmit the stop/trace event at a point where it is valid.

FDBX0403 A stop/trace attempted to set a breakpoint at \texttt{hex-number} which is not currently a R/W storage address in your program. Your stop/trace event may not operate properly.

**Explanation:** A stop/trace event tried to set a breakpoint in storage that is read-only.

**User response:** Reenter the stop/trace event so that it points to read-write storage, and ensure that the program being debugged is loaded in read-write storage.

FDBX0405 cannot step through protected code at \texttt{hexnum}

**Explanation:** You tried to single-step your program into a privileged address space.

**User response:** This may have occurred because the program took a wild branch. Verify the load point and size of the program using the \texttt{map} subcommand. Also verify the program pointer using the \texttt{registers} subcommand.

FDBX0407 cannot step through breakpoint at \texttt{hexnum}

**Explanation:** You tried to run your program in single-step mode through an instruction, which is the same as a breakpoint.

**User response:** You are probably trying to step into a data area of the program that contains the breakpoint instruction (SVC 144). This may have occurred because the program took a wild branch. Verify the load point and size of the program using the \texttt{map} subcommand. Also verify the program counter using the \texttt{registers} subcommand.
FDBX0408  A stop/trace event is attempting to set a breakpoint at read-only storage address address. The event may not operate properly. Do you want to continue? (Y/N):

Explanation: You tried to set a breakpoint into read-only storage.

User response: Enter Y or N. If you enter Y, the breakpoint will be created. If you select N, the breakpoint will not be created.

FDBX0409  Error number trying to step process

Explanation: A ptrace (PT_CONT) service call resulted in an error. The user program could not continue executing.

User response: Record the error number and follow local reporting procedures.

FDBX0414  Program exited with a return code of number.

Explanation: The program terminated with the indicated return code.

User response: Use the run or rerun subcommand to restart the program, or exit dbx with the quit subcommand.

FDBX0425  Cannot display evaluation tree for unknown operation number

Explanation: The operation to be evaluated is not a valid dbx operation.

User response: Record the unknown operation. Follow local procedures for reporting errors.

FDBX0437  No place on condition in condbp().

Explanation: A dbx breakpoint is malformed. This is an internal error.

User response: Follow local procedures for reporting problems.

FDBX0438  nsize found bad op: num

Explanation: An internal dbx error occurred.

User response: Record the error number and follow local reporting procedures.

FDBX0439  swwhatis found bad op: num

Explanation: An internal dbx error occurred.

User response: Record the error number and follow local reporting procedures.

FDBX0446  Internal buffer overflow detected

Explanation: dbx wrote off the end of an internal buffer. There is a possibility of heap damage.

User response: dbx may behave erratically, depending on what data was overwritten. Restart dbx and see if the error happens again. Use local procedures for reporting errors.

FDBX0447  too many arguments to type rename

Explanation: Too many operands were given for a type rename operation.

User response: Reenter the subcommand and specify the correct number of operands for the casting operation.

FDBX0479  (internal error: bad instruction size in printop)

Explanation: dbx encountered an internal error while determining the size of the current instruction.

User response: Follow local procedures for reporting errors.

FDBX0480  (internal error: bad tables in extmnem)

Explanation: dbx encountered an error while decoding an extended mnemonic.

User response: Follow local procedures for reporting errors.

FDBX0485  libGeneralOutput size=number, maximum size=number

Explanation: dbx encountered an fatal error while generating user output which caused an internal buffer to overflow.

User response: Follow local procedures for reporting errors.

FDBX0542  no breakpoints found at line

Explanation: You tried to remove all of the breakpoints at a source line where no breakpoints could be found. This message is followed by an interpretation of the specified source line.

User response: Reenter the clear subcommand and specify the correct source line.

FDBX0543  no breakpoints found at address

Explanation: You tried to remove all of the breakpoints at an address where no breakpoints could be found. This message is followed by an interpretation of the specified address.
**User response:** Reenter the `clear` subcommand and specify the correct address.

**FDBX0544** Directory containing `string` could not be determined. Apply `use` command to initialize source path.

**Explanation:** `dbx` couldn't determine the directory where the object file associated with a running process exists.

**User response:** Issue the `use` subcommand and specify the directory where the source files can be found.

**FDBX0551** Invalid floating point data size

**Explanation:** You tried to print out the floating point registers, but `dbx` received an invalid floating point data size. This may be due to an internal error in `dbx`. The floating point registers will not be printed.

**User response:** The floating point registers will not be printed for the current registers command. The user can ignore the error, or restart `dbx`.

**FDBX0552** unset `$noflregs` to view floating point registers

**Explanation:** Unset the `$noflregs` `dbx` variable to enable display of the floating point registers.

**User response:** Type 'unset `$noflregs' to enable display of the floating point registers. Ignore the message to continue supressing their display.

**FDBX0553** unset `$noflbregs` to view IEEE floating point registers

**Explanation:** Unset the `$noflbregs` `dbx` variable to enable display of the IEEE floating point registers.

**User response:** Type 'unset `$noflbregs' to enable display of the IEEE floating point registers. Ignore the message to continue supressing their display.

**FDBX0554** Usage: case { default | mixed | lower | upper }

**Explanation:** The argument passed to the `getcase` function was incorrect.

**User response:** Pass a valid case type to the `getcase` function.

**FDBX0555** Invalid register lookup request: `number`

**Explanation:** `dbx` tried to obtain the value of an nonexistent register.

**User response:** Use local procedures for error reporting.

**FDBX0556** Invalid general purpose register size.

**Explanation:** The precision of the general purpose registers (GPRs) is invalid. The currently supported precisions are 32 and 64 bits.

**User response:** None required.

**FDBX0557** unset `$noflbregs` to view decimal floating point registers

**Explanation:** Unset the `$noflbregs` `dbx` variable to enable display of the decimal floating point registers.

**User response:** Type 'unset `$noflbregs' to enable display of the decimal floating point registers. Ignore the message to continue supressing their display.

**FDBX0600** `ptrace(request, pid, addr, data, buff)`

**Explanation:** Informational message showing a `ptrace()` request call by `dbx`.

**User response:** None.

**FDBX0601** `ptrace(): addr, buff, r_val, errno, errno-jr`

**Explanation:** Informational message showing the results of a `ptrace()` request call by `dbx`.

**User response:** None.

**FDBX0602** `symbol-name` is not defined; event id = [id]

**Explanation:** `dbx` information message. Since the symbol specified on the `onload dbx` subcommand is not currently known to `dbx`, it was added to the event list to be searched for after the symbolics are processed for a new DLL.

**User response:** None.

**FDBX0610** object filename: "program"

**Explanation:** This displays the filename of the object being debugged.

**User response:** None - informational only.

**FDBX0614** `string` is not defined

**Explanation:** The specified symbol has not been defined in the program and is not a set variable.

**User response:** Reenter the command specifying a defined symbol.
FDBX0619  An input value is out of range - results may be incorrect.

Explanation: You specified a value that is out of range of what dbx can represent internally.

User response: Reenter the command with a smaller input value.

FDBX0620  string is not defined in

Explanation: You specified a symbol that does not exist in the specified block.

User response: Use the dump subcommand to determine which symbols are active in the current scope of the program.

FDBX0625  string is not a pointer to a member.

Explanation: The type of the symbol is not a member pointer.

User response: Reenter the command specifying a member pointer symbol.

FDBX0626  string does not point to a member of class string

Explanation: The specified symbol is not a pointer to the class.

User response: Reenter the command specifying a pointer to class.

FDBX0627  string is not a field in

Explanation: The symbol is not a field in the struct/union/class.

User response: Use the whatis dbx subcommand to see the members of the struct/union/class.

FDBX0646  Type help <command> or help <topic> for help on specific items.

Explanation: The user typed help with no arguments.

User response: Retype 'help' and specify a command or topic.

FDBX0651  Kernel function returned result=result, returnValue=returnValue, returnCode=returnCode, reasonCode=reasonCode

User response: Informational message showing the result of a kernel call by dbx.

FDBX0654  string is not a known help topic or command

User response: Reenter the help command with a valid topic or command.

FDBX0665  variable

Explanation: dbx has stopped execution of your program since a signal arrived that it was instructed to catch.

User response: Issue the cont subcommand to deliver the signal to the debuggee.

FDBX0710  run and rerun may be used only on originating process.

Explanation: You tried to restart a process that dbx cannot restart.

User response: Enter the subcommand only on the initial process.

FDBX0721  Operation not valid in dump processing mode.

Explanation: The dbx subcommand entered can only be used when a live program is running.

User response: None.

FDBX0722  BPXGMPTR ASID SET error: string, retc=number, retsn=hex-number

Explanation: dbx called the dump processing service BPXGMPTR or BPXGMPT4 to set an ASID which failed.

User response: Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

FDBX0723  BPXGMPTR ASID LIST error: string, retc=number, retsn=hex-number

Explanation: dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get a list of ASIDs in the dump which failed.

User response: Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains
the kernel service information. Follow local procedures for reporting problems.

FDBX0724 BPXGMPTR PID SET error: string, retc=number, retsn=hex-number
Explanation: dbx called the dump processing service BPXGMPTR or BPXGMPT4 to set a PID which failed.
User response: Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

FDBX0725 BPXGMPTR PID LIST error: string, retc=number, retsn=hex-number
Explanation: dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get a list of PIDs in the dump which failed.
User response: Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

FDBX0726 BPXGMPTR LDRINFO error: string, retc=number, retsn=hex-number
Explanation: dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get the load map in the dump which failed.
User response: Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

FDBX0727 BPXGMPTR CAPTURE error: number, retc=number, retsn=hex-number, addr=hex-number, nbytes=number
Explanation: dbx called the dump processing service BPXGMPTR or BPXGMPT4 to capture storage in the dump which then failed.
User response: Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

FDBX0729 BPXGMPTR READ_D error: number, retc=number, retsn=hex-number, addr=hex-number, nbytes=number
Explanation: dbx called the dump processing service BPXGMPTR or BPXGMPT4 to read storage in the dump which failed.
User response: Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

FDBX0730 Illegal use of subarrays.
Explanation: The index operator ".." cannot be used in this expression.
User response: Reenter the command specifying a correct array name.

FDBX0731 BPXGMPTR CONDINFO error: number, retc=number, retsn=hex-number
Explanation: dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get error information from the dump which failed.
User response: Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

FDBX0732 interrupt code=hex-number, abend code=hex-number, abend reason code=hex-number, instruction length=hex-number
Explanation: Informational message that lists some of the error information that dbx obtained from the dump.
User response: None.

FDBX0733 BPXGMPTR THREAD_LIST error: number, retc=number, retsn=hex-number
Explanation: dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get the thread list from the dump which failed.
User response: Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

FDBX0734 BPXGMPTR THREAD_CURRENT_SET error: number, retc=number, retsn=hex-number
Explanation: dbx called the dump processing service BPXGMPTR or BPXGMPT4 to set the current thread from the dump which failed.
User response: Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.
the kernel service information. Follow local procedures for reporting problems.

**FDBX0735 BPXGMPTR THREAD_CURRENT_SET**

*error: number, retc=number, retsn=hex-number retsn=hex-number*

**Explanation:** dbx called the dump processing service BPXGMPTR or BPXGMPT4 to set the current thread in the dump which failed.

**User response:** Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0736 BPXGMPTR GPR_LIST error: number, retc=number, retsn=hex-number**

**Explanation:** dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get the general registers in the dump which failed.

**User response:** Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0737 BPXGMPTR PSW error: number, retc=number, retsn=hex-number**

**Explanation:** dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get the PSW in the dump which failed.

**User response:** Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0738 BPXGMCD close failure: number**

**Explanation:** dbx called the dump processing service BPXGMCD or BPXGMCD4 to close the dump which failed.

**User response:** Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0739 BPXGMCD return buffer:**

**Explanation:** The following error messages came from the BPXGMCD or BPXGMCD4 dump service up to the next FDBXxxxx message.

**User response:** Record the error messages for problem determination.

**FDBX0740 BPXGMCD open error: ret1=2**

**Explanation:** dbx called the dump processing service BPXGMCD or BPXGMCD4 to open the dump which failed.

**User response:** Follow local procedures for reporting problems.

**FDBX0741 BPXGMCD open failure: rc=number, ret1=hex-number, ret2=hex-number, ret3=hex-number**

**Explanation:** dbx called the dump processing service BPXGMCD or BPXGMCD4 to open the dump which failed.

**User response:** Follow local procedures for reporting problems.

**FDBX0742 Interrupt during dump open. Do you want to continue? (Y/N):**

**Explanation:** The user pressed control-C while dbx was waiting for the BPXGMCD (or BPXGMCD4) OPEN request to complete.

**User response:** Enter Y to continue waiting for the OPEN to complete, or enter N to terminate dbx and return to the shell.

**FDBX0743 Cleaning up and exiting by user request**

**Explanation:** The user pressed control-c, then answered Y to the FDBX0742 message, so dbx is closing the dump service and will exit.

**User response:** None.

**FDBX0744 Thread information is not complete in this dump**

**Explanation:** The kernel service returned incomplete thread information from the dump. The display of thread information from the dump may have some incorrect values.

**User response:** Follow local procedures for reporting problems.

**FDBX0748 could not load BPXGMCD**

**Explanation:** dbx could not load the dump services initialization module.

**User response:** Follow local procedures for reporting problems.
FDBX0749  could not load BPXGMPTR
Explanation:  dbx could not load the dump services processing module.
User response:  Follow local procedures for reporting problems.

FDBX0750  Initializing dump dump-name. This may take a while...
Explanation:  dbx is calling the dump services routine to initialize the dump.
User response:  None.

FDBX0751  BPXMCDE token=hex-number, release=number, level=number
Explanation:  Informational message showing the version information of the dump processing service.
User response:  None.

FDBX0752  BPXMCDE Starting the TSO environment
Explanation:  Informational message showing the dump initialization progress.
User response:  None.

FDBX0753  BPXMCDE BPXITPCS started
Explanation:  Informational message showing the dump initialization progress.
User response:  None.

FDBX0754  BPXMCDE BPXITPCS allocating CLIST data set
Explanation:  Informational message showing the dump initialization progress.
User response:  None.

FDBX0755  BPXMCDE BPXITPCS allocating dump directory via BLSCDDIR
Explanation:  Informational message showing the dump initialization progress.
User response:  None.

FDBX0756  BPXMCDE BPXITPCS allocating the dump data set
Explanation:  Informational message showing the dump initialization progress.
User response:  None.

FDBX0757  BPXMCDE BPXITPCS invoking IPCS
Explanation:  Informational message showing the dump initialization progress.
User response:  None.

FDBX0758  BPXMCDE BPXITPC2 invoking VERBX
Explanation:  Informational message showing the dump initialization progress.
User response:  None.

FDBX0759  BPXMCDE Dump analysis started
Explanation:  Informational message showing the dump initialization progress.
User response:  None.

FDBX0760  BPXMCDE Dump analysis processing ASIDs: number of number
Explanation:  Informational message showing the dump initialization progress.
User response:  None.

FDBX0761  BPXMCDE BPXITPCS exiting
Explanation:  Informational message showing the dump initialization progress.
User response:  None.

FDBX0762  Using ASID=hex-number
Explanation:  Informational message showing the ASID where dump services found the program error.
User response:  None.

FDBX0763  Using PID=number
Explanation:  Informational message showing the PID where dump services found the program error.
User response:  None.

FDBX0765  BPXGMTR FPR_LIST error: number, retc=number, retsn=hex-number
Explanation:  dbx called the dump processing service BPXGMTR or BPXGMPT4 to get the floating point registers from the dump which failed.
User response:  Set the _DBX_GCORELOGDSN environment variable to point to an MVS data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.
FDBX0766 Abend ASID=hexnum not equal home ASID=hexnum

Explanation: The abend in the core file occurred in a different address space. We have to switch to the abend address space for continued processing.
User response: None.

FDBX0767 operation only valid in dump processing mode

Explanation: This operation is only valid when processing a core file.
User response: Specify a different operation, or restart dbx in core processing mode.

FDBX0768 fopen for IPCS print data set string failed

Explanation: dbx was unable to open the specified dataset.
User response: Specify the correct dataset.

FDBX0769 popen for system pager "string" failed

Explanation: dbx was unable to open the system pager for output processing.
User response: Ensure that the PAGER environment variable is set correctly.

FDBX0770 The execution registers are in ASID=hex-number and are not available

Explanation: No execution registers are available in the dump. dbx will only be able to display dump storage information.
User response: Proceed with dump analysis in this reduced mode, or replace the dump with one that contains the execution registers.

FDBX0771 BPXGMCDE BPXTIPCS is recalling a migrated MVS dataset. This may take a while

Explanation: A dataset needed by IPCS was migrated. The dataset must be recalled.
User response: Wait until IPCS finishes the recall operation.

FDBX0806 Usage: command { on | off | parent | child }

Explanation: You tried to use an option other than on, off, parent, or child for the subcommand.
User response: Reenter the subcommand and specify a valid option.

FDBX0810 open failure on recording file

Explanation: dbx could not open the file specified on the record subcommand.
User response: Reenter the record subcommand with a different file name. Follow local procedures for reporting problems.

FDBX0811 write failure on recording file

Explanation: dbx could not write to the file specified on the record subcommand.
User response: Verify permissions to the record file. Follow local procedures for reporting problems.

FDBX0813 recording already active

Explanation: dbx cannot process a new record filename until the current record is closed.
User response: Enter record to close the current record session, then reenter record with a filename to open the new record session.

FDBX0815 Argument count=number

Explanation: The argument count that will be passed to the user's program.
User response: None.

FDBX0816 Arguments

Explanation: The list of arguments follows that will be passed to the user's program.
User response: None.

FDBX0817 cannot unset "debugger_variable"

Explanation: The debugger variable listed in the message cannot be undefined.
User response: Specify a different subcommand.

FDBX0818 "debugger_variable" must be an integer.

Explanation: The debugger variable listed may only be assigned an integer value.
User response: Rerun the subcommand with an integer value.

FDBX0820 $fl_precision must be 4, 8, or 16

Explanation: The user tried to set the $fl_precision debugger variable to an invalid value.
User response: Retry the operation specifying a valid value.

</tbody>
</table>
suspend this notification message.

**FDBX0857**  Stopped due to program unload

**Explanation:**  dbx processing has stopped due to the debuggee unloading a DLL, and the $dll_loadstop debugger variable being set.

**User response:**  Continue the debugging session normally. Unset the $dll_loadstop debugger variable to suspend this notification message.

---

**FDBX0858**  Stopped due to exec with multiprocessing enabled.

**Explanation:**  dbx processing has stopped due to the debuggee exec'ing and multiproc being enabled.

**User response:**  Continue the debugging session normally. Disable the multiproc setting to suspend this notification message.

---

**FDBX0860**  number is not an existing condition variable.

**Explanation:**  The user has attempted to display a nonexistent condition variable.

**User response:**  Reenter the subcommand with an existing condition variable. Use the condition subcommand to display all condition variables.

---

**FDBX0861**  number is not an existing mutex.

**Explanation:**  The user has attempted to display a nonexistent mutex.

**User response:**  Reenter the subcommand with an existing mutex. Use the mutex subcommand to display all mutexes.

---

**FDBX0862**  event id removed because object no longer exists

**Explanation:**  A conditional breakpoint was set for a specific object that no longer exists. This event was removed from the event processing queue. The status subcommand will show the event is removed.

**User response:**  None.

---

**FDBX0863**  changed from string to string on event number

**Explanation:**  A conditional breakpoint was set for a specific object that has been changed. The status subcommand will show the event has been changed.

**User response:**  None.

---

**FDBX0864**  Usage: “thread current” takes zero or one id

**Explanation:**  Usage info for the thread subcommand.

**User response:**  None.

---

**FDBX0865**  Usage: “mutex { wait | nowait | lock | unlock }” takes no id

**Explanation:**  Usage info for the mutex subcommand.

**User response:**  None.

---

**FDBX0866**  Usage: “condition { wait | nowait }” takes no id

**Explanation:**  Usage info for the condition subcommand.

**User response:**  None.

---

**FDBX0868**  could not allocate storage, size was number

**Explanation:**  dbx could not obtain storage.

**User response:**  Increase the size of your address space.

---

**FDBX0869**  tv create, thid=thread-id, stack=number

**Explanation:**  dbx informational message that results from $tv_events trace events.

**User response:**  None.

---

**FDBX0938**  IPT create, thid=thread-id, stack=number

**Explanation:**  dbx informational message that results from $tv_events trace events.

**User response:**  None.

---

**FDBX0939**  IPT exit, thid=thread-id

**Explanation:**  dbx informational message that results from $tv_events trace events.

**User response:**  None.

---

**FDBX0940**  tv create, thid=thread-id, created

**Explanation:**  dbx informational message that results from $tv_events trace events.

**User response:**  None.

---

**FDBX0941**  tv created, thid=thread-id, stack=number

**Explanation:**  dbx informational message that results from $tv_events trace events.

**User response:**  None.
FDBX0942 tv exit, thid=thread-id
Explanation: dbx informational message that results from $tv_events trace events.
User response: None.

FDBX0943 tv wait, thid=thread-id, joining thid=thread-id
Explanation: dbx informational message that results from $tv_events trace events.
User response: None.

FDBX0944 tv unwait, thid=thread-id, joined thid=thread-id
Explanation: dbx informational message that results from $tv_events trace events.
User response: None.

FDBX0945 mv initialize, object=object-address
Explanation: dbx informational message that results from $mv_events trace events.
User response: None.

FDBX0946 mv destroy, object=object-address
Explanation: dbx informational message that results from $mv_events trace events.
User response: None.

FDBX0947 mv lock, object=object-address, thid=thread-id
Explanation: dbx informational message that results from $mv_events trace events.
User response: None.

FDBX0948 mv wait, object=object-address, this=thread-id
Explanation: dbx informational message that results from $mv_events trace events.
User response: None.

FDBX0949 mv unlock, object=object-address, thid=thread-id
Explanation: dbx informational message that results from $mv_events trace events.
User response: None.

FDBX0950 mv unwait, object=object-address, thid=thread-id
Explanation: dbx informational message that results from $mv_events trace events.
User response: None.

FDBX0951 mv relock, object=object-address, thid=thread-id
Explanation: dbx informational message that results from $mv_events trace events.
User response: None.

FDBX0952 mv unrelock, object=object-address, thid=thread-id
Explanation: dbx informational message that results from $mv_events trace events.
User response: None.

FDBX0953 cv initialize, object=object-address
Explanation: dbx informational message that results from $cv_events trace events.
User response: None.

FDBX0954 cv destroy, object=object-address
Explanation: dbx informational message that results from $cv_events trace events.
User response: None.

FDBX0955 cv wait, object=address, mutex=address, thid=thread-id
Explanation: dbx informational message that results from $cv_events trace events.
User response: None.

FDBX0956 cv wait, object=address, mutex=address, thid=thread-id
Explanation: dbx informational message that results from $cv_events trace events.
User response: None.

FDBX0957 Duplicate module-name found at hex-number and hex-number, ignoring version at hex-number
Explanation: dbx detected a more than one load module in the loadmap with the same name. For symbolic purposes, dbx uses the loadmodule with the lower address and ignores the others of the same name.
User response: Relink the DLL/load module specifying the reentrant attribute. Follow local procedures for reporting problems.

FDBX0960 Creating actual event from onload event [id]
Explanation: A line number or function specified as part of an onload event is now active due to a DLL load. 
dbx has created real stop/trace events from the onload event.
User response: None.

FDBX1001 Target $charset specification must be IBM-1047
Explanation: dbx currently only supports IBM-1047 for the target charset.
User response: Reenter the set $charset command specifying the target charset as IBM-1047.

FDBX1002 Invalid source $charset specification
Explanation: The _toCsid() returned an error with the source $charset codeset specification.
User response: Reenter the set $charset command specifying a correct source codeset specification.

FDBX1003 $charset returned to default "IBM-1047,IBM-1047"
Explanation: dbx set the $charset encoding back to the default.
User response: None

FDBX1018 Storage access failed, target=hex-number, target alet=hex-number, source=hex-number, source alet=hex-number, size=hex-number
Explanation: dbx attempted to access storage that it could not read or write to.
User response: Verify the source, target or size fields. Verify the symbol/value specified on the dbx subcommand that caused the error. Follow local procedures for reporting problems.

FDBX1055 rwl lock, object=object-address, thid=thread-id
Explanation: dbx informational message that results from $lv_events trace events.
User response: None.

FDBX1056 rwl wait, object=object-address, thid=thread-id
Explanation: dbx informational message that results from $lv_events trace events.
User response: None.

FDBX1057 rwl unlock, object=object-address, thid=thread-id
Explanation: dbx informational message that results from $lv_events trace events.
User response: None.

FDBX1058 rwl unwait, object=object-address, thid=thread-id
Explanation: dbx informational message that results from $lv_events trace events.
User response: None.

FDBX1059 rwl relock, object=object-address, thid=thread-id
Explanation: dbx informational message that results from $lv_events trace events.
User response: None.

FDBX1060 rwl unrelock, object=object-address, thid=thread-id
Explanation: dbx informational message that results from $lv_events trace events.
User response: None.

FDBX1063 rwl initialize, object=object-address
Explanation: dbx informational message that results from $lv_events trace events.
User response: None.

FDBX1064 rwl destroy, object=object-address
Explanation: dbx informational message that results from $lv_events trace events.
User response: None.

FDBX1065 Usage: "readwritelock { wait | nowait | lock | unlock | share }" takes no id
Explanation: Usage information for the readwritelock subcommand.
User response: None.
Chapter 1. Messages

403
FDBX1110  Plugin load of plugin failed: amode is number but dbx expects amode number.

Explanation:  dbx tried to load a plugin that has a different amode than it expected.  If using dbx64, the plugin must be compiled amode64; dbx31 requires amode31 plugins.

User response:  Recompile plugin so its amode matches dbx.

FDBX5000  Offset ofs exceeds buffer size buffer size.

Explanation:  An internal dbx read buffer error occurred.

User response:  Follow local procedures for reporting problems.

FDBX5001  Attempted to read datalen bytes but the buffer only contains datalen bytes.

Explanation:  An internal dbx read buffer error occurred.

User response:  Follow local procedures for reporting problems.

FDBX5002  Internal Error: RC=return code.

Explanation:  An internal dbx error occurred.

User response:  Follow local procedures for reporting problems.

FDBX5003  Internal Error: send(socket, *, length, 0) failed.

Explanation:  An internal dbx communications error occurred.

User response:  Follow local procedures for reporting problems.

FDBX5004  Unable to create socket stream.

Explanation:  An internal dbx communications error occurred.

User response:  Follow local procedures for reporting problems.

FDBX5005  The connection was refused.

Explanation:  dbx was unable to connect to the remote debugger.

User response:  Report the failure to your local administrator for the TCP/IP function.  Try the application again when the problem has been corrected.

FDBX5006  Interrupt during remote debugger processing.  Cleaning up and exiting dbx.

Explanation:  dbx received a SIGINT, so it will clean up and exit.

User response:  None.

FDBX5010  Fatal error in remote debugger processing: rc=return code.

Explanation:  A fatal error occurred in remote debugger processing.

User response:  Check command line parameters and network connections.  Try the application again when the problem has been corrected.

FDBX5011  Could not resolve network address 'address'.

Explanation:  The -p commandline option was specified, but a valid hostname or IP address to connect to was not supplied, or a valid hostname was supplied and the DNS server was unable to resolve it to an IP address.

User response:  Reenter the dbx command with a valid hostname or IP address as part of the -p option.

FDBX5012  No executable program specified.

Explanation:  The -p commandline option was specified but the name of the program to be debugged was not supplied.

User response:  Reenter the dbx command including the name of an executable file.

FDBX5013  Communications Error:

function-name-or-description;
errno=number: error-description

Explanation:  An error occurred during communications processing.

User response:  Follow local procedures for reporting problems.

FDBX5014  Received packet with indicated size of size - max size is max size.

Explanation:  dbx received a request packet with a potentially invalid size.

User response:  Follow local procedures for reporting problems.

Explanation: An internal dbx breakpoint error occurred.
User response: Follow local procedures for reporting problems.

FDBX5039  Internal Error: Breakpoint conditional expressions are not supported.
Explanation: An internal dbx breakpoint error occurred.
User response: Follow local procedures for reporting problems.

FDBX5040  Internal Error: Breakpoint thread filtering is not supported.
Explanation: An internal dbx breakpoint error occurred.
User response: Follow local procedures for reporting problems.

FDBX5041  Internal Error: Breakpoint replacement is not supported.
Explanation: An internal dbx breakpoint error occurred.
User response: Follow local procedures for reporting problems.

FDBX5042  Internal Error: Statement number breakpoints are not supported.
Explanation: An internal dbx breakpoint error occurred.
User response: Follow local procedures for reporting problems.

FDBX5043  Internal Error: Entry breakpoints must be case sensitive.
Explanation: An internal dbx breakpoint error occurred.
User response: Follow local procedures for reporting problems.

FDBX5044  Internal Error: Breakpoint for entry point could not be created.
Explanation: An internal dbx breakpoint error occurred.
User response: Follow local procedures for reporting problems.

FDBX5045  Internal Error: Missing entry information in request code.
Explanation: An internal dbx breakpoint error occurred.
User response: Follow local procedures for reporting problems.

FDBX5046  Internal Error: Invalid breakpoint request type.
Explanation: An internal dbx breakpoint error occurred.
User response: Follow local procedures for reporting problems.

FDBX5047  Internal Error: Breakpoint for line number could not be created.
Explanation: An internal dbx breakpoint error occurred.
User response: Follow local procedures for reporting problems.

FDBX5048  Internal Error: Invalid expression ID in request code.
Explanation: An internal dbx error occurred.
User response: Follow local procedures for reporting problems.

FDBX5049  Internal Error: Unable to modify expression value.
Explanation: The expression could not be set to the value entered.
User response: Check the value entered and ensure that the value is appropriate for the type of the expression, and that character and string values are
properly delimited with quotes or double quotes, respectively.

Chapter 1. Messages
FDBX5412  Internal Error: Invalid action action in request code request code.
Explanation: An internal dbx error occurred.
User response: Follow local procedures for reporting problems.

FDBX5413  Internal Error: Could not attach to process process_id
Explanation: An internal dbx error occurred.
User response: Follow local procedures for reporting problems.

FDBX5414  Expression not specific.
Explanation: The module name for a load breakpoint or the watch expression for a change address breakpoint is null.
User response: Follow local procedures for reporting problems.

FDBX5415  Internal Error: Breakpoint for address \"%s\" could not be created.
Explanation: Address breakpoint contains an invalid address.
User response: Specify a valid breakpoint address.

FDBX5416  Internal Error: Could not change the source file text for disassembly view.
Explanation: An internal dbx error occurred.
User response: Follow local procedures for reporting problems.

FDBX5417  Internal Error: Unknown program stop condition with LastExecutionValue [%d].
Explanation: An internal dbx error occurred.
User response: Follow local procedures for reporting problems.

FDBX5418  The length of value string is %d, which exceeds the limit(%d).
Explanation: The register value entered is longer than the maximum value length (900 characters).
User response: Enter a value string with less than 900 characters.

FDBX5419  Subcommand %s is not supported in socket mode and subsequent commands, if any, will not be executed.
Explanation: The subcommand entered is not supported for the debug console (command log) in socket mode.
User response: Enter a supported subcommand.

FDBX5500  dbx received a request code of request code which is not supported.
Explanation: The remote debugger sent dbx a request type that dbx does not support.
User response: Follow local procedures for reporting problems.

FDBX6400  Ddpi error: function-name-or-description: error-description
Explanation: An error occurred during Ddpi processing.
User response: Follow local procedures for reporting problems.

FDBX6401  Ddpi objects not initialized
Explanation: Internal Ddpi data structures are not in a state usable for processing
User response: Follow local procedures for reporting problems.

FDBX6402  Ddpi machinestate not valid
Explanation: An error occurred during Ddpi MachineState processing
User response: Follow local procedures for reporting problems.

FDBX6403  ASCII to EBCDIC conversion error: error-description
Explanation: An error occurred during iconv() conversion of ASCII text to EBCDIC
User response: Follow local procedures for reporting problems.

FDBX6404  Dwarf error: function-name-or-description: error-description
Explanation: An error occurred during Dwarf processing
User response: Follow local procedures for reporting problems.
Chapter 1. Messages

FDBX6405 Unable to open dwarf debug data file
file-name: error-description
Explanation: The specified file-name could not be opened
User response: Specify the correct debug data file

FDBX6406 Format overflows output buffer in function function-name
Explanation: An error occurred during internal file output processing
User response: Follow local procedures for reporting problems.

FDBX6407 Error - libelfdwarf DLL version mismatch! dbx requires libelfdwarf version number
The loaded DLL is version number
Explanation: The libelf DLL is backlevel and does not support the ELF API required by dbx.
User response: Install the current version of the libelf DLL.

FDBX6408 Unable to locate debug data
Explanation: No source of debug data was specified to dbx, or the source did not contain valid debug data.
User response: Specify a valid source of debug data

FDBX6409 Unable to find debug data file debug-data-filename
Explanation: The debug data file generated by the compiler could not be found in any of the source directories
User response: Regenerate the debug data file, or specify the source directory that contains it

FDBX6410 No debug data files match module module
Explanation: The debug data does not match the module, probably the module source code has changed, or been recompiled with a different compiler or compiler options since the .dbg file was generated.
User response: Regenerate the .dbg file(s) using the current .o file(s)

FDBX6411 File debug-data-pathname does not contain debug data.
Explanation: The contents of the file debug-data-pathname are not recognized by dbx as debug data.

FDBX6413 No debug data is available for pathname/filename
Explanation: No file containing debug data was found. Debugging continues but in a degraded mode with no symbol or source code information.
User response: If complete debugging information is required, generate a file containing debug information and make it available to dbx.

FDBX6414 Attempt to convert ISD debug data for file sourcefile unsuccessful
Explanation: Dwarf debug data is not available for the load module, and either no ISD debug data was found, or the ISD data could not be converted to Dwarf format.
User response: Recompile the source with the -g compiler option; optionally convert the ISD data in the .o files to .dbg side files. If the problem persists, follow local procedures for reporting problems.

FDBX6415 Converting ISD data to Dwarf format for sourcefilename
Explanation: Dwarf debug data was not available for sourcefilename, and ISD data was available; the ISD data was converted to Dwarf. Debugging continues with the converted data.
User response: None, information only.

FDBX6416 Cannot assign new value to bitfield
Explanation: An attempt to assign a new value to a bitfield object in the debugged process failed.
User response: If the failing expression is valid, follow local procedures for reporting problems.

FDBX6417 Node is not symbol when symbol is required
Explanation: this is an internal dbx error
User response: Follow local procedures for reporting problems.

FDBX6418 Cannot dereference pointer to value-type value
Explanation: An attempt to retrieve that value of an object from the debugged process failed.
User response: If the failing expression is valid, follow local procedures for reporting problems.
FDBX6419 Subarray low index number is greater than high index number
Explanation: A subarray expression in a print subcommand specifies indices that are invalid (for example, p array[1..0]).
User response: Reenter the print subcommand with a valid range of subarray indices.

FDBX6420 O_WHATIS, bad op: number
Explanation: An O_WHATIS node contained a bad operation.
User response: Follow local procedures for reporting problems.

FDBX6421 Loaded debug data from debug-data-pathname
Explanation: dbx had loaded debug data from the file debug-data-pathname
User response: None, information only

FDBX6422 Alet obtain failed, using ptrace I/O backup
Explanation: dbx attempted to get the Alet of the debuggee via the ptrace kernel service which failed. See the previous FDBX0601 for information on why the kernel service failed. To allow debugging to continue, dbx will use ptrace for storage requests from/to the debuggee. This will degrade debugging performance.
User response: Use local procedures for reporting errors.

FDBX6423 Could not resolve name of debug file for filename
Explanation: dbx could not discover the name of the debug side file.
User response: Ensure that the dbg side file is not corrupt.

FDBX6424 Attempt to convert ISD debug data failed
Explanation: The conversion attempt for the ISD debug data failed.

FDBX6426 Loaded debug data from an unknown file
Explanation: dbx had loaded debug data from a file that it does not know the name of
User response: None, information only

FDBX6427 Error - libddpi DLL version mismatch!
dbx requires libddpi version hex-number The loaded DLL is version hex-number
Explanation: The libddpi DLL is backlevel and does not support the DDPI API required by dbx.
User response: Install the current version of the libddpi DLL.

FDBX6428 string List count in Context has gone negative.
Explanation: An internal dbx error has occurred.
User response: Use local procedures for error reporting.

FDBX6429 Debug file filename does not match the debug target.
Explanation: The debug file mentioned could not be loaded since it does not match the debug target. This is due to the internal checksum of the debug file differing from the one stored in the debug target.
User response: Regenerate the debug file from the program source, or supply the correct file somewhere in the dbx "use" path.

FDBX6430 The current context has no blocks.
Explanation: The current context being processed has no blocks. This is a dbx internal error.
User response: Use local procedures for error reporting.

FDBX6431 Invalid debug data format.
Explanation: The debug format of a compile unit is invalid and cannot be loaded.
User response: Ensure that your object files contain debug data in either the ISD or CDA debug formats.

FDBX6432 Processing load module pathname/filename
Explanation: dbx is loading the debug data for the specified program object.
User response: None - informational message only.

FDBX6433 Evaluation error: error text
Explanation: dbx encountered an error while performing an evaluation operation. The error text describes the problem.
User response: Retry the evaluation operation with different parameters to avoid the error.
FDBX6434  fopen failed - dbx has too many files open.
Explanation:  dbx tried to fopen a file, and failed since the system rejected its request for a file descriptor.
User response:  Increase the number of file descriptors available via the OMVS MAXFILEPROC parameter. Example: From the MVS console, type the following command: setomvs MAXFILEPROC=2000

FDBX6435  Cannot determine Amode for process number
Explanation:  dbx queried the kernel for the amode of a given process, but the kernel returned an error code. This was probably due to the process failing to execute.
User response:  Use local procedures for error reporting.

FDBX6436  Attempt to determine amode for an invalid process ID number.
Explanation:  dbx queried the kernel for the amode of a given process, but the process ID was bad.
User response:  Use local procedures for error reporting.

FDBX6440  Could not find required library name
Explanation:  dbx was unable to load a required library.
User response:  Verify that dbx is installed correctly.

FDBX6441  Version API for library name not found.
Explanation:  dbx was unable to load a required library.
User response:  Verify that dbx is installed correctly.

FDBX6449  expression requires integral operands
Explanation:  You tried a shift or bit operation on a nonintegral operand. The operands must be integral.
User response:  Reenter the subcommand and specify integral values for the operands.

FDBX6492  pointer arithmetic expression error
Explanation:  You tried a pointer arithmetic expression that cannot be calculated.
User response:  Reenter the subcommand and specify a valid expression.

FDBX6493  member selection operand left-operand is not class, struct, or union
Explanation:  You tried a member selection operation (. or ->) in which the first operand is not a class, struct, or union type.
User response:  Reenter the subcommand and specify a valid expression.

FDBX6499  CDA levels: ELF=elf_build_version, DWARF=dwarf_build_version, DDPI=ddpi_build_version
Explanation:  At startup dbx displays the versions of the three debug data libraries
User response:  None, information only

FDBX7001  internal error: function(): node contains data of type type2 instead of type type1
Explanation:  function() was invoked to retrieve data of type type1 from the specified node, however, the basetype of the node is set to type2.
User response:  This is an internal error. Report this problem to IBM via the appropriate service channel.

FDBX7002  internal error: basetype of Node is not defined.
Explanation:  The basetype field of the specified node is not defined. This indicates that the nstackValue field for the node does not contain data.
User response:  This is an internal error. Report this problem to IBM via the appropriate service channel.

FDBX7004  internal error: DW_ATE basetype hex-number is not defined in function().
Explanation:  basetype value is not defined in function function().
User response:  This is an internal error. Report this problem to IBM via the appropriate service channel.

FDBX7005  internal error: DW_ATE IBM_user_type is not valid for function().
Explanation:  basetype value is not valid for function function().
User response:  This is an internal error. Report this
FDBX7006 internal error: dwarf basetype basetype not supported by function().

Explanation: The basetype basetype is not supported by the function function().

User response: This is an internal error. Report this problem to IBM via the appropriate service channel.

FDBX8001 Cannot exec 'string', errno=number, errno2=hex-number

Explanation: The dbx loader was not able to execute the dbx debugger engine.

User response: Check the error code to find out the reason the execution failed. Ensure that the dbx files are in their correct locations. Follow local procedures for reporting problems.

FDBX8002 Cannot run in 64-bit mode, as specified by '-m8' option.

Explanation: dbx is unable to run in 64-bit mode on this machine, as requested by the -m8 flag.

User response: Use local procedures for error reporting.

FDBX8003 Option '-mnumber' is not valid, specify '-m4', or '-m8'.

Explanation: The user specified an invalid dbx startup mode flag.

User response: Re-issue the dbx command with a valid startup flag.

FDBX8005 Warning: setlocale failed.

Explanation: An attempt to set the locale failed.

User response: Follow local procedures for reporting problems.

FDBX8006 More than one "-a" or "-A" options specified; exiting.

Explanation: The user specified more than one process ID for dbx to attach to.

User response: Reissue the dbx command with only one process ID specified.

FDBX8007 Could not set environment variable.

Explanation: dbx tried to set an environment variable, and the system reported that there was insufficient space in the environment.

User response: Follow local procedures for reporting problems.

FDBX8008 This is the dbx debugger.

Explanation: dbx displayed its help message since the user specified the -h switch on the command line.

User response: Read the help message, and rerun dbx without the -h switch. For more information, type "help" from within dbx or consult the z/OS UNIX System Services Programming Tools book for more information.

FDBX8009 Using dbx binary located at path

Explanation: The user specified a dbx executable at an alternate path.

User response: None - informational only.

FDBX9001 Not a terminal

Explanation: The user enabled the $commandedit feature and redirected the standard input stream. This prevents $commandedit from functioning properly.

User response: Rerun dbx with either $commandedit disabled or do not redirect the standard input stream.

FDBX9002 Unable to open file

Explanation: The fopen system call for the terminal device failed.

User response: Use local procedures for error reporting.

FDBX9003 tcgetattr error number

Explanation: The tcgetattr system call returned an error code.

User response: Use local procedures for error reporting.

FDBX9004 tcsetattr error number

Explanation: The tcsetattr system call returned an error code.

User response: Use local procedures for error reporting.

FDBX9997 The loaded module does not contain module map which may lead to bad performance. Suggest to use dbgld to create module map to the executable before debugging.

Explanation: Suggest user to use dbgld to generate module map to executable before debugging

User response: None - informational only.
FDBX9998  whereis local mode will only search
symbol symbol in current CU and
global lists. To list all symbol symbol,
please use whereis -exhaustive symbol,
but that will cause all debug data files
to be load and performance will be
degraded.

Explanation: Inform user whereis local mode will only
search current CU.

User response: None - informational only.
# Chapter 2. Return codes (errnos)

This section lists return codes by value and describes them. Return codes are also known as errnos.

There are other return codes that may be returned, but these are not listed in this documentation because they are internal to z/OS and subject to change.

<table>
<thead>
<tr>

Chapter 3. Reason codes (errnojrs)

Description and location information

This section describes reason codes, listing them by hexadecimal value and describing actions to correct the error. Reason codes are sometimes referred to as errnojrs or as errno2 values.

The reason code is made up of 4 bytes in the following format:

```
cccc  rrrr
```

cccc is a halfword reason code qualifier. Generally this is used to identify the issuing module and represents a module ID. rrrr is the halfword reason code described in this documentation. Only this part of the reason code is intended as an interface for programmers.

If the contents of the two high-order bytes are within the range of X'0000' – X'20FF' the error represented by the reason code is provided in this documentation. The two high-order bytes of the reason codes returned contain a value that is used to qualify the contents of the two low-order bytes.

If the contents of the two high-order bytes are outside the range, the error represented by the reason code is not a z/OS UNIX reason code and Table 2 should be used to determine where additional information on the reason code can be found.

Tip: For z/OS UNIX, zFS, TCP/IP and Language Environment reason codes, users may use either the TSO BPXMTEXT or the bpxmtext shell command to display a reason code’s meaning and recommended action. See z/OS UNIX System Services Command Reference for more information.

### Table 2. Location of return information

<td>A WLM service failed. See z/OS MVS Programming: Workload Management Services for an explanation of the reason code. The WLM reason code is in the form yyyyxxxx, where xxxx is the only significant value.</td>
</tr>
</tbody>
</table>

Setting slips to obtain new diagnostic data

If a z/OS UNIX reason code is obtained and additional diagnostics are required, the IBM Support Center personnel may ask that you set a slip to collect a dump or trace on a recreate of the problem. Included below are the general instructions on how to gather this documentation.

Reason codes issued by Physical File Systems such as zFS, HFS, TCPIP or NFS Client can also be trapped with this SLIP.

To obtain a dump on a specific reason code:

The following slip will produce a dump on the issuance of a specific reason code:

```
SLIP SET,IF,A=SYNCVCD,RANGE=(10?+BC?+F0?+1F4?),
   DATA=(13R?+1b0,EQ,xxxxxxxx),joblist=(OMVS),
   DSPNAME=('OMVS','-'),SDATA=(ALLNUC,PSA,CSA,LPA,TRT,SQA,RGN,SUM),
   j=jobname,END
```
where xxxxxxx = the 8 digit (4 byte) reason code that is to be trapped.
j=jobname is the optional jobname that is expected to issue the error (e.g. j=IBMUSER).

Note: In rare instances the above slip will not capture the requested reason code. Your IBM software support provider can check the specific reason code and determine if this is the reason the slip did not match.

To obtain a GTF trace dataset containing all reason codes issued:

In some instances your software support provider may say it is more beneficial to capture a GTF trace that will contain all the reason codes issued by a particular job or at the time of a failure. This is more likely if the reason code is not surfaced externally. If you choose to look at such a GTF trace, be aware that many reason codes are issued validly and do not represent actually errors (that is, reason codes that indicate file not found are usually quite valid). Prior to setting the slip below you would need to start GTF with options TRACE=SLIP. The slip that would be set is:

```
SLIP SET,IF,A=TRACE,RANGE=(10?+8C?+F0?+1f4?),TRDATA=(13R??+1B0,+B3),END
```

After recreating the problem, stop GTF and format the output using IPCS command GTFTRACE.

### z/OS UNIX reason codes

<table>
<thead>

</tr>
</tbody>
</table>
0014 JRAppcErrAlloc

An APPC/MVS Allocate Conversation error occurred.

Action: An error occurred in fork during the APPC Allocate Conversation call. The conversation was not allocated. The error may be caused by one or more of the following reasons:
- APPC is not operating.
- The APPC scheduler is not operating.
- The APPC scheduler is malfunctioning.
- APPC configuration work was not done correctly when OpenMVS was installed.

Ask the operator to:
- Verify that APPC/MVS is operating by entering a DISPLAY APPC command.
- Verify that the APPC scheduler is operating by entering a DISPLAY ASCH command.
- If the scheduler is operating, verify that it has been started correctly with the proper member name.

If the problem cannot be resolved by the operator, contact the system programmer.

0015 JRAppcErrSend

An APPC/MVS Send_Data error occurred.

Action: An error occurred in fork during the APPC Send_Data call. The data was not sent. The error may be caused by one or more of the following reasons:
- APPC is not operating.
- The APPC scheduler is not operating.
- APPC configuration work was not done correctly when OpenMVS was installed.

Ask the operator to:
- Verify that APPC/MVS is operating by entering a DISPLAY APPC command.
- Verify that the APPC scheduler is operating by entering a DISPLAY ASCH command.
- If the scheduler is operating, verify that it has been started correctly with the proper member name.

If the problem cannot be resolved by the operator, contact the system programmer.

0016 JRAppcErrRecv

An APPC/MVS Receive_and_Wait error occurred.

Action: An error occurred in fork during the APPC Receive_and_Wait call. The data was not received. The error may be caused by one or more of the following reasons:
- APPC is not operating.
- The APPC scheduler is not operating.
- APPC configuration work was not done correctly when OpenMVS was installed.
- The user security profile may not be correctly set up.

Ask the operator to:
- Verify that APPC/MVS is operating by entering a DISPLAY APPC command.
- Verify that the APPC scheduler is operating by entering a DISPLAY ASCH command.
- If the scheduler is operating, verify that it has been started correctly with the proper member name.

If the problem cannot be resolved by the operator, contact the system programmer.
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0017</td>
<td>JRAppcErrAccept</td>
</tr>
</tbody>
</table>

An APPC/MVS Accept_Conversation error occurred.

*Action:* An error occurred in fork during the APPC Accept_Conversation call. The conversation was not created. The error may be caused by one or more of the following reasons:
- APPC is not operating.
- The APPC scheduler is not operating.
- APPC configuration work was not done correctly when OpenMVS was installed.

Ask the operator to:
- Verify that APPC/MVS is operating by entering a DISPLAY APPC command.
- Verify that the APPC scheduler is operating by entering a DISPLAY ASCH command.
- If the scheduler is operating, verify that it has been started correctly with the proper member name.

If the problem cannot be resolved by the operator, contact the system programmer.

| 0019  | JRAleservErr |

The ALESERV macro failed.

*Action:* See your IBM service representative.

| 001A  | JRStgInUse |

The requested storage area has already been allocated (explicit STORAGE request).

*Action:* See your IBM service representative.

| 001B  | JRInitPgmErr |

The initialization (INIT) program failed.

*Action:* See your IBM service representative.

| 001C  | JRSyseventErr |

A SYSEVENT DONTSWAP/OKSWAP failure occurred.

*Action:* See your IBM service representative.

| 001D  | JREstaeErr |

The ESTAE macro failed.

*Action:* See your IBM service representative.

Vnode operation RDWR is not supported by this file system.

*Action:* Verify that the operation was performed on a physical file system that supports the operation.

| 0047  | JRLookup    |

Lookup is not supported by this file system.

*Action:* Verify that the operation was performed on a physical file system that supports the operation.

| 0048  | JRFCorkChildErr |

The fork child process returned an error code.

*Action:* See your IBM service representative.

| 0049  | JRVnodGet    |

A cell pool get for a vnode failed.

*Action:* See your IBM service representative.

| 004A  | JRApplcCheckState |

An APPC/MVS receive error occurred while the APPC/MVS status was being checked.

*Action:* An error occurred in fork during the APPC Receive_and_Wait call, which was issued after all the data had been received but before permission to send had been granted by APPC. The error may be caused by one or more of the following reasons:

- APPC is not operating.
- The APPC scheduler is not operating.
- APPC configuration work was not done correctly when OpenMVS was installed.

Ask the operator to:

- Verify that APPC/MVS is operating by entering a DISPLAY APPC command.
- Verify that the APPC scheduler is operating by entering a DISPLAY ASCH command.
- If the scheduler is operating, verify that it has been started correctly with the proper member name.

If the problem cannot be resolved by the operator, contact the system programmer.

| 004B  | JROpen       |

The open service is not supported because the file system is not locally mounted.

*Action:* Correct the owning system of the file system.

| 004C  | JRCreate     |

The create service is not supported by this file system.

*Action:* Verify that the operation was performed on a physical file system that supports the operation.

| 004D  | JRNoPath     |

The path length is not greater than 0.

*Action:* There must be a positive length passed for the pathname length.

| 009C  | JRTrOpenedRO | The `ftruncate` service was for a file opened in read-only mode.  
*Action:* In order to be able to truncate a file, open it for write. |
| 009D  | JRTrMountedRO | The `ftruncate` service was for a file on a file system mounted in read-only mode.  
*Action:* In order to truncate a file, it must not be on a file system that has been mounted in read-only mode. |
| 009F  | JRTrNegOffset | A negative offset was given to a file `truncate` service.  
*Action:* To truncate a file, specify a nonnegative `File_length`. |
| 00A0  | JROutOfLocks | The file system has run out of locks.  
*Action:* When a file system lock was requested, there were no more left in the system. Try again later. |
| 00A1  | JRMount | The mount service VFS operation is not supported.  
*Action:* Verify that the operation was performed on a physical file system that supports the operation. |
| 00A2  | JRUMount | The unmount service VFS operation is not supported.  
*Action:* Verify that the operation was performed on a physical file system that supports the operation. |
| 00A3  | JRSync | The Sync VFS operation is not supported.  
*Action:* Verify that the operation was performed on a physical file system that supports the operation. |
| 00A4  | JRRoot | The Root VFS operation is not supported.  
*Action:* See your IBM service representative. |
| 00A5  | JRStatFS | The StatFS VFS operation is not supported.  
*Action:* Verify that the operation was performed on a physical file system that supports the operation. |
| 00A6  | JRFID | The Get Fid VFS operation is not supported.  
*Action:* See your IBM service representative. |

</tr>
</tbody>
</table>
| 00A9    | **JRInvalidParms**<br>An incorrect combination of parameters was specified.<br><br>*Action:* The actual problem depends on the service.  
  * • For a w_getmntent service, the entire header area must be zeroed before the first call, and the contents of the header area should not be modified by the caller between calls to this callable service.  
  * • For a mount service, Mount_mode must not specify any values unrelated to a mount service.  
  * • For an unmount service, Flags must not specify any values unrelated to an unmount service, and must not specify mutually exclusive requests.  
  * • For an unquiesce service, UnquiesceParms must not specify any values unrelated to an unquiesce service.  
  * • For a quiesce service, File_System_Name must belong to a file system that is either mounted, or could be mounted.  
  * • For tcsetcp, either a reserved flag bit is set or one of the code page names is not null-terminated. |
<p>| 00AA    | <strong>JRFsParentFs</strong>&lt;br&gt;The file system has file systems mounted on it.&lt;br&gt;&lt;br&gt;<em>Action:</em> An unmount request can be honored only if there are no file systems mounted anywhere on the requested file system. Use the F BPXOINIT,FILESYS=DISPLAY,ALL command for a shared file system configuration or the D OMVS,FILE command for a non-shared file system configuration to determine which file systems are mounted on the requested file system. Unmount them before retrying this request. |
| 00AB    | <strong>JRFsUnmountInProgress</strong>&lt;br&gt;An unmount service is already in progress.&lt;br&gt;&lt;br&gt;<em>Action:</em> The file system named is being unmounted. |
| 00AC    | <strong>JRFsMustReset</strong>&lt;br&gt;An unmount service must specify reset when already unmounting.&lt;br&gt;&lt;br&gt;<em>Action:</em> In order to unmount immediately, the previous unmount with drain must be reset. |
| 00AD    | <strong>JRFsForceUmount</strong>&lt;br&gt;Reset fails when the file system is forced to unmount.&lt;br&gt;&lt;br&gt;<em>Action:</em> A reset unmount request will reset only a file system that was unmounting with the drain option. |</p>

<td>JRNoStorage</td>
</tr>
<tr>
<td></td>
<td>Insufficient storage to copy user parameters.</td>
</tr>
</tbody>
</table>
|         | *Action:* Storage cannot be obtained to make a copy of the passed user parameters. This can be caused by one of the following conditions:
|         |   - The user region is filled up and the ?STORAGE request cannot be satisfied. |
|         |   - There is an error in one of the passed user parameters, causing a ?STORAGE request for a huge amount of storage that cannot be satisfied. |
|         | Check for incorrect input parameters passed to the service. If the parameters are correct, consider increasing the user REGION size. |
| 00B9    | JRAActiveProcess                        |
|         | Multiple processes in the address space prevent the termination of the job step process. |
|         | *Action:* The BPX1MPC service was called from the job step thread while other processes were active in the address space. The request could not be satisfied. The caller should end or clean up all other processes in this address space prior to calling BPX1MPC from the job step thread. |
| 00BA    | JRPfsctl                                |
|         | The Pfsctl operation is not supported.   |
|         | *Action:* Verify that the operation was performed on a physical file system that supports the operation. |
| 00BB    | JRPfsInitFailed                         |
|         | The file system did not initialize.     |
|         | *Action:* Determine why the PFS was unable to initialize and then restart it. |
| 00BC    | JRSpawnNoCommonStg                      |
|         | Spawn cannot be completed because not enough common storage is available to complete the request. |
|         | *Action:* The system is probably experiencing a common storage shortage and the request cannot be satisfied until the shortage is corrected. |
| 00BD    | JRSpawnArgsTooBig                       |
|         | Spawn cannot be completed because the total length of arguments specified by the caller exceeds the system imposed limit of 1&.000; 000; bytes. |
|         | *Action:* The spawn service detected that the length of the argument lists specified by the caller is larger than the system-imposed maximum of 1 000; 000;bytes. Correct the argument length and resubmit the job. |
| 00BE    | JRFuncUndefined                         |
|         | The oe_env_np (BPX1ENV) service cannot be completed because the Function_code specified is undefined. |
|         | *Action:* Reissue the service with a defined Function_code. |
Value | Description
--- | ---
00BF | JRBadArgCount
The oe_env_np (BPX1ENV) service cannot be completed because the number of input or output arguments are incorrect for the Function_code specified.

Action: Reissue the service with the correct number of input and output arguments appropriate for the Function_code.

00C0 | JRBadInputValue
The oe_env_np (BPX1ENV) service cannot be completed because an input argument contained an undefined value.

Action: Reissue the service with input value(s) defined for the specified Function_code.

00C1 | JRNoUserExit
A pthread_quiesce (BPX1PTQ) service FREEZE_EXIT request cannot complete because no user exit has been registered with the oe_env_np (BPX1ENV) service.

Action: Use the oe_env_np (BPX1ENV) service, function code of Freeze_Exit to register a user exit, before using the pthread_quiesce service with a quiesce type of FREEZE_EXIT.

00C2 | JRPNoUserExit
A pthread_quiesce (BPX1PTQ) service FREEZE_EXIT request cannot complete because the process is not frozen.

Action: Use the pthread_quiesce service with a quiesce type of Freeze before using the pthread_quiesce service with a quiesce type of FREEZE_EXIT.

00C3 | JRFreezeExitTooSlow
A pthread_quiesce (BPX1PTQ) service FREEZE_EXIT request cannot complete because user exits did not return in the expected time.

Action: Examine the user exits to determine why they might hang. The user exits should not be issuing any syscalls or waits.

00C4 | JResrPortSpecified
During a Socket Bind request, a Reserved Port was incorrectly specified.

Action: Change the port requested in the Socket Bind request to a non-reserved port. The reserved ports are found in the NETWORK parmlib statement in the BPXPRMxx member.

00C5 | JResrPortNotAvail
All port zero, INADDR_ANY, reserved ports are in use.

Action: The system programmer must increase the number of ports that are available by specifying a larger number on the INADDRANYCOUNT parameter of the NETWORK parmlib statement in the BPXPRMxx member, and the appropriate parameter for each Transport Provider. An ipl will be required.

00C6 | JResrPortUsed
A sockets port assignment conflict exists between OMVS and a Transport Provider.

Action: The system programmer must make sure the same port numbers specified with the INADDRANYPORT and INADDRANYCOUNT parameters on the NETWORK parmlib statement in the BPXPRMxx member match the port numbers specified on the Transport Providers connected to OMVS. An ipl is required if any changes are made.

</table>
| 0126 JRQueueManPutFailed | The queue manager returned an incorrect return code. 
*Action:* See your IBM service representative. |
| 0127 JRQueueManGetFailed | The queue manager returned an incorrect return code. 
*Action:* See your IBM service representative. |
| 0128 JROpenforWriteNoReaders | Open for write was done before any open for read. 
*Action:* Open for write was requested while file flags indicated O_NONBLOCK and before any open for read. The request cannot be processed. An open for read request must precede an open for write request. |
| 0129 JRNoReaders | The service tried to write before any open for reads. 
*Action:* An open for read must be performed. |
| 012A JRInvParmLength | The parameter length is incorrect or negative. 
*Action:* Check for incorrect input parameters passed to the service. One of the following conditions may have occurred: 
- The specified length of a variable-length parameter is negative. (This error is applicable only to programs issuing callable services through the assembler interface.) The length of a variable-length parameter cannot be negative. Services with variable-length parameters normally specify them in pairs. The first of the pair specifies the length of the variable-length parameter that comes next. 
- The length of a fixed-length parameter exceeds the allowable value. The maximum length of any fixed-length parameter cannot exceed 5000 bytes. 
- The size of an input buffer to be used for holding an output variable length parameter is specified as more than 5000 bytes. The actual maximum size of the parameter is much less. This error is reported for performance reasons, to avoid inefficient usage of system resources, including storage and processing time. Specify a smaller size for the input buffer. |
| 012B JRForkAbend | The program abended in the fork module. 
*Action:* See your IBM service representative. |
| 012C JRForkExitAbend | An abend occurred in a fork exit. 
*Action:* See your IBM service representative. |
| 012D JRSyscallAbend | An abend occurred in a system call. 
*Action:* See your IBM service representative. |

<tr>
<td></td>
<td>The ptrace mode of target process is incorrect. Action: An attempt was made to use ptrace to start a debugging session with a target process. The ptrace mode (active or inactive) of the target process is inconsistent with the type of ptrace initiation request. The following are possible causes: 1. A PT_TRACE_ME or PT_ATTACH ptrace request was issued to start a new debugging session, but the target process is already being debugged. 2. A PT_REATTACH ptrace request was issued to restart an existing debugging session, or a process being debugged while in multiprocess debugging mode has created a new child with fork, and the child attempted to start a debugging session, but the target process or new child was not already in ptrace mode. 3. During initiation of a debugging session, resources that would indicate the process is already being debugged were detected. This could indicate incomplete cleanup of a previous debugging session. 4. A PT_TRACE_ME ptrace request was issued in the child process of a debugger program. 5. A process being debugged created a child using fork, and the child process tried to start a debugging session because ptrace multiprocess debugging is activated.</td>

</tbody>
</table>
| 0186  | JRExecParmErr  
An error occurred when copying parameters passed to the exec service.  
Action: An error occurred while copying parameters specified by the caller of the exec service. The probable causes are:  
- An incorrect address in the argument or environment length lists  
- An incorrect address in the argument or environment data lists  
- An incorrect argument or environment data length  
Correct any error conditions in the parameter data specified by the caller, and resubmit the job. |
| 0187  | JRChowntoPipe  
The fchown service was issued against a pipe.  
Action: This request cannot be performed against a pipe. Select a file descriptor that refers to a nonpipe file and reissue the request. |
| 0188  | JRChaudtoPipe  
The fchaudit service was issued against a pipe.  
Action: This request cannot be performed against a pipe. Select a file descriptor that refers to a nonpipe file and reissue the request. |
| 0189  | JRExecKernErr  
An error occurred in the exec call.  
Action: See your IBM service representative. |
| 018A  | JRBadRBState  
The caller’s request block state was incorrect.  
Action: A function was requested that requires the user to be running under the same request block that its thread was created under or from which it issued the signal setup service (BPX1MSS). The condition is probably the result of issuing a request block-sensitive service after a link was done. |
| 018B  | JRSignalError  
A signal error occurred.  
Action: See your IBM service representative. |
| 018C  | JRInvalidSigProc  
The mask address was incorrect.  
Action: The address of the signal mask passed to this function was not valid. Retry the function with a valid address pointing to the signal mask. |
| 018D  | JRBadAlet  
An incorrect ALET was given as input.  
Action: Do not specify an ALET of 1. Do not specify an ALET of 0 unless the secondary and home address spaces are the same. |

</table>
| 01BF  | JRReadUserStorageFailed  
A read error occurred on the user data area passed to the service.  
*Action:* The user data area passed was not addressable. Verify that the address passed was valid and reissue the request. |
| 01C0  | JRWriteUserStorageFailed  
A write error occurred on the user data area passed to the service.  
*Action:* The user data area passed was not addressable. Verify that the address passed was valid and reissue the request. |
| 01C2  | JRBrImAlreadyWaiting  
Request includes a range already being waited on.  
*Action:* The process is already waiting for a byte-range lock that intersects with the requested range. Wait until the first request is honored before issuing another. |
| 01C3  | JRBrImPromotePending  
Another user is waiting to promote the requested range.  
*Action:* Another user has already requested promotion of the requested range. That promotion will not be granted until all other users unlock their shared locks on that range. Unlock the range in conflict and issue a set-lock-wait request for the exclusive lock desired. |
| 01C4  | JRPtrNoPtryStorage  
There is not enough storage in the kernel address space.  
*Action:* This should be a transient condition. Reissue the service. If the problem persists, contact the system programmer or system administrator to diagnose the storage usage in the kernel address space. |
| 01C5  | JRBrImProcessBroken  
This process has been marked broken for byte locking.  
*Action:* The process cannot issue byte-range locking requests any more. |
| 01C6  | JRPtrConnectionInop  
The pseudo-TTY connection is inoperative.  
*Action:* An internal error occurred, causing this pseudo-TTY connection to be marked as inoperative. To clear this error condition, all file descriptors associated with this device minor number must be closed. |
| 01C8  | JRDtuErr  
An error occurred during process signal initialization.  
*Action:* See your IBM service representative. |
| 01C9  | JRBrImUnlockWhileWait  
The unlock service is not valid while the process is waiting for an intersecting lock.  
*Action:* The process is presently waiting for a lock. No unlock requests will be accepted for a range that intersects with the range being waited for. |

<tr>
<td></td>
<td><strong>Action</strong>: The Data_Area_Length field passed to the resource callable service does not match the length of the storage area to be returned. To avoid misinterpretation of returned data, the service fails. The Data_Area_Length field could be incorrect because of a coding error. Or, the length value required may have changed when your installation migrated to a new release. Correct the value and recompile your program.</td>
</tr>
</tbody>
</table>
01EF JRInvOption

Incorrect option specified on call to BPX1PTX.

Action: The option specified is either not a supported option or is a supported option that was specified in an unsupported environment. Examples of the latter error are:

- The PTGETNEWTHREAD option is specified from a thread that was not created through the BPX1PTC callable service. The PTEXITTHREAD option is supported only from this type of thread.
- The PTEXITTHREAD option is specified on the first invocation of BPX1PTX from the thread initialization routine. The first invocation of BPX1PTX must specify the PTGETNEWTHREAD option to obtain the first thread to process.

Reissue the BPX1PTX callable service with the corrected option value.

01F0 JRInitRtn

The initialization routine is not valid for the current environment.

Action: The initialization routine address specified on the BPX1PTC invocation does not match the initialization routine address supported in the current environment. The initial call to BPX1PTC within the current process image specified a different address. Only one initialization routine is supported for a given process image. Reissue the BPX1PTC callable service with the initialization routine address that is supported in the current process image.

01F1 JRPtatWeight

The pthread attribute area contains an incorrect weight value.

Action: The pthread weight attribute value must be set to PTATHEAVY or PTATMEDIUM. Use the BPXYPTAT mapping for the definition of this value. Reissue the BPX1PTC callable service with the corrected pthread weight attribute value.

01F2 JRPtatSyncType

The pthread attribute area contains an incorrect Sync Type value.

Action: The pthread sync type attribute value must be set to PTATSYNCHRONOUS. Use the BPXYPTAT mapping for the definition of this value. Reissue the BPX1PTC callable service with the corrected pthread sync type attribute value.

01F3 JRPtatDetachState

The pthread attribute area contains an incorrect detach state value.

Action: The pthread detach state attribute value must be set to PTATUNDETACHED or PTATDETACHED. Use the BPXYPTAT mapping for the definition of these values. Reissue the BPX1PTC callable service with the corrected pthread detach state attribute value.

01F4 JRNoSuchPid

The process ID is incorrect.

Action: Choose a process ID that is valid.

01F5 JRPidEQSessLeader

The process ID is a session leader.

Action: Choose a process ID that is not a session group leader.

</table>
| 0297  | JRMaxinetSockets  
  The number of active INET sockets is equal to the value specified on the MAXSOCKETS parmlib statement.  
  **Action:** Retry after some sockets have closed, or change the MAXSOCKETS value in parmlib, and re-ipl. |
| 0298  | JRECBerror  
  The last ECB pointer in the list of ECB pointers does not have the high order bit ('80000000;'x;) set on to indicate that it is the last ECB pointer in the list.  
  **Action:** Probable user programming error. Ensure that the service was called with the correct number of ECB pointers and that the last ECB pointer has the high order bit set on. |
| 0299  | JRECBListBad  
  An error occurred accessing the list of pointers to ECBs on a call to the MVSpauseInit service.  
  **Action:** Ensure that the ECB list is accessible in the caller's key and storage has been obtained for the ECB list. |
| 029A  | JRECBstateBad  
  An error occurred accessing one or more of the input ECBs on a call to the MVSpauseInit or MVSpause service.  
  **Action:** Ensure that the ECBs are accessible in the caller's key and storage has been obtained for the ECBs. |
| 029B  | JRECBListNotSetup  
  The MVSpause service was called but the MVSpauseInit service was never called to prepare for an MVSpause.  
  **Action:** Invoke the MVSpauseInit service to prepare for an MVSpause operation. Once MVSpauseInit completes successfully, the MVSpause service can be invoked. |
| 029C  | JRSocketTypeNotSupported  
  The requested socket type is not supported.  
  **Action:** The error could be one of the following:  
  • The address family specified on the sendmsg or sendto request was different from that specified when the socket was created.  
  • For AF_UNIX sockets, only stream or datagram sockets are supported - some other type was requested on the socket request.  
  • For AF_INET sockets, only stream, datagram and raw sockets are supported - some other type was requested on the socket request. |
| 029D  | JREcbWaitBitOn  
  The wait bit (the high order bit) was on in the specified event control block (ECB).  
  **Action:** Initialize the ECB to zero, then reissue the request. |

</table>
| 0428  | **JRTooManyIntf**  
  Too many configured interfaces already exist.  
  **Action:** The maximum number of interfaces (VTAM resources) have been configured. New interfaces cannot be configured unless some existing interfaces are unconfigured (detached). Retry the oeifconfig after removing some unneeded interfaces. |
| 0429  | **JRBadIpAddr**  
  An IP address in the configured interface is incorrect.  
  **Action:** An error was detected during the VTAM channel initialization process. One of the following occur:  
  - The partner IP address in the input USERDATA area does not match our local IP address.  
  - The Local IP address in the input USERDATA area does not match our remote partner IP address.  
  Ensure that the IP address specified in the oeifconfig command is correct for the intended remote partner. Retry the oeifconfig command after correcting the error. |
| 042A  | **JRDataNotAvail**  
  There are no elements to read on ESCON receive queue.  
  **Action:** Try later |
| 042B  | **JRRreqDenied**  
  The oeifconfig request is not accepted.  
  **Action:** The loop back interface (interface name of LO0) cannot be detached. It can only be deactivated. |
| 042C  | **JRBadMtuSize**  
  The specified MTU size for the interface is incorrect.  
  **Action:** An error was detected during the VTAM channel initialization process. One of the following errors occur:  
  - The communications partner specified a non-zero MTU size that does not match MVS' local MTU size. By default, MVS uses an MTU size of 32 768.;  
  - The partner specified a non-zero MTU size that is greater than the "maximum send size" or the "maximum receive size".  
  No MTU error checking is done if the specified MTU value is zero. Issue the oenetstat -i command on MVS and its equivalent command on the remote partner to display the MTU size being used. Retry the oeifconfig command after correcting the error. |
| 042D  | **JRN0tOsa**  
  Current interface is not an OSA adapter.  
  **Action:** An error was detected during the VTAM channel initialization process. The oeifconfig command specified the (remote partner) interface as an OSA adapter. However, the user data from the remote partner says otherwise. Correct the error and reissue the oeifconfig command. |
| 042E  | **JRBadOsaPort**  
  Incorrect OSA port number specified.  
  **Action:** The oeifconfig command specified an invalid OSA port number. Only port number 0 is currently supported. Correct the error and reissue the oeifconfig command. |

</tbody>
</table>
| 0471  | JRTooManyBytes  
The FILE_BYTES parameter specified on the SEND_FILE syscall is larger than the file size.  
*Action:* Correct FILE_BYTES and reissue the syscall. |
| 0472  | JRSocketNonBlock  
The socket descriptor specified on the SEND_FILE syscall is a non-blocking socket. SEND_FILE requires a blocking socket.  
*Action:* Change the state of the socket from non-blocking to blocking, then reissue the SEND_FILE syscall. |
| 0473  | JRLocalSpawnNotAllowed  
A request to spawn a local child process could not be completed.  
*Action:* Reissue the spawn request without any of the attributes that prevent the creation of a local child process. See the BPX1SPN callable service for a list of these attributes. |
| 0474  | JRInValidSFPLLen  
The SFPL_LENGTH parameter specified on the SEND_FILE syscall is not correct.  
*Action:* Correct SFPL_LENGTH and reissue the syscall. |
| 0475  | JRPtrnFPCWrite  
The value specified for writing into the Floating Point Control Register is not valid.  
*Action:* Reissue the PT_WRITE_FPR request with a valid value for the Floating Point Control Register. |
| 0476  | JRMaxAiocbEcb  
The maximum number of AIOCBs with user defined ECBs was exceeded on the requested function.  
*Action:* Reduce the number of AIOCBs with user defined ECBs. |
| 0477  | JRCertAlreadyDefined  
The certificate being registered/deregistered is already defined for another user.  
*Action:* See initACEE documentation. |
| 0478  | JrCertDoesNotMeetReq  
The certificate being registered/deregistered does not meet RACF requirements.  
*Action:* See initACEE documentation. |
| 0479  | JRLockFcnCode  
The value specified for the LockFcnCode parameter for the BPX1SLK service is not valid.  
*Action:* Reissue the BPX1SLK service call with a valid value for the LockFcnCode parameter. |
| 047A  | JRLockReqType  
The value specified for the LockReqType parameter for the BPX1SLK service is not valid.  
*Action:* Reissue the BPX1SLK service call with a valid value for the LockReqType parameter. |

</tbody>
</table>
### Value: 0484 JRLockMaxCntRecurs

The maximum number of recursive lock obtains for a given lock has been reached.

**Action:** Reissue the BPX1SLK service call at a later instance when the number of recursive shared memory lock obtains is not at the maximum.

---

### Value: 0485 JRLockShmRemoved

The specified lock cannot be obtained because it is in shared memory that has been removed.

**Action:** A shared memory remove was done for the shared memory segment in which the lock resides. Further obtain requests cannot be honored.

---

### Value: 0486 JRBadAioEcb

An Ecb represented by AioEcbPtr in one of the input Aiocbs was found to be bad.

**Action:** Find the offending Aiocb and correct the AioEcbPtr field to either contain zero or point to a valid ecb.

---

### Value: 0487 JRNoPtSecEnv

Only a thread level identity created with pthread_security_np (BPX1TLS) can be propagated over a socket.

**Action:** Insure calling thread has a task level identity created with pthread_security_np() (BPX1TLS) and retry the connect() operation.

---

### Value: 0488 JRMultiThreaded

The requested service cannot be performed in an address space with multiple user threads.

**Action:** The thread calling the service was not the JST (Job Step Task) or the JST has subtasks. Reissue the request from an address space with only a JST task.

---

### Value: 0489 JrActAcceptUserid

The active identity for the caller /process was propagated over a socket via accept(). The propagated identity must be cleaned up before another identity can be propagated.

**Action:** Clean up the propagated identity by closing (BPX1CLO) the socket descriptor that was return by the accept() that caused the identity to be propagated. See setsockopt() (BPX1OPT) for details.

---

### Value: 048A JRLockTokenAddr

The address specified in the LockTokenAddr parameter for the BPX1SLK service is not accessible.

**Action:** Reissue the BPX1SLK service call with an address of a lock token area that is accessible to the calling program.

---

### Value: 048B JREnclaveErr

While changing to an identity propagated by a socket an error occurred while attempting to join/leave the propagated enclave.

**Action:** See your IBM service representative.

</tbody>
</table>
Value | Description
-----|-----------------
0494 | JrMaxAsyncIO

The maximum number of outstanding async I/O requests has been exceeded by the invoking process.

*Action:* Ask the system programmer to increase the MAXQUEUEDSIGS or MAXFILEPROC parameters for the process. The Async I/O maximum is two times the sum of MAXQUEUEDSIGS, from the BPXPRMxx parmlib member, and the process's file limit, which comes from: the BPXPRMxx MAXFILEPROC value, or the user’s RACF profile’s OMVS segment FILEPROCMAX value, or a program specified RLIMIT_NOFILE value.

0495 | JRNNotPtCreated

Invoking task is not pthread created.

*Action:* The function must be run as a pthread-created thread. Reissue the function after correcting the error.

0496 | JRNNotPtSecurity

Current task security environment is not set up via pthread_security_np.

*Action:* The current task security environment must be set up via pthread_security_np. Reissue the function after correcting the error.

0497 | JRAAlreadyActive

Requested function is already active.

*Action:* The osenv_get/osenv_set request cannot be processed. A previous osenv_get/osenv_set is active. An osenv_unset must be issued before a new osenv_get/osenv_set can be issued again.

0498 | JRSecActive

Task level security environment already active.

*Action:* One of the following error conditions occur:

- The osenv_set request cannot be processed. The osenv_set request specified security environment and the current task already has task level security active.
- The pthread_security_np request cannot be processed. An osenv environment is already active with task level security specified.

0499 | JRinvOsenvTok

Input osenv token is incorrect.

*Action:* The input osenv token is invalid. Specify the same osenv token as returned on a osenv_get call. You may need to issue osenv_persist to ensure the osenv token stays valid.

049A | JRNNoPersist

Unpersist requested but persist count is 0.

*Action:* The osenv_unpersist request cannot be processed. Either no osenv_persist was issued or all prior osenv_persist requests have been matched by a corresponding osenv_unpersist.
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| 049B  | JROsenvWlmMismatch  
  osenv WLM Enclave membership does not match the current pthread WLM Enclave membership.  
  *Action:* The Osenv_set function cannot be processed. One of the following conditions occur:  
  1. The osenv_WLM attribute is requested, but the task already has a WLM Enclave membership established which is different than the osenv WLM Enclave membership.  
  2. The osenv_WLM attribute is not requested, but the task already has a WLM Enclave membership established. |
| 049C  | JROsenvWrongEnclave  
  Current task is not associated with the osenv WLM enclave.  
  *Action:* The Osenv_unset function cannot be processed. The task has changed WLM Enclave membership since the time osenv_set joined the WLM Enclave associated with the osenv. |
| 049D  | JROsenvBeginEnvOutstanding  
  Current task is operating under an outstanding WLM Begin environment. Enclave leave is not allowed.  
  *Action:* The Osenv_unset function cannot be processed. The current task is operating under an outstanding Begin environment. Osenv_unset must be issued before issuing IWMSTBGN. |
| 049E  | JROsenvNotEjoinedTcb  
  Current task did not issue WLM Enclave Join, but only inherited Enclave attribute from mother task.  
  *Action:* The Osenv_unset function cannot be processed. The current task cannot issue osenv_set/osenv_unset in this environemnt. |
| 049F  | JROsenvEnclaveSubTaskExists  
  Current task has residual subtasks propagated to the enclave which are still associated with the Enclave.  
  *Action:* The Osenv_unset function cannot be processed. Ensure the subtasks are ended before issuing the osenv_unset function. |
| 04A0  | JROsenvSecurityMismatch  
  Current security environment does not match the value specified in the osenv token.  
  *Action:* The Osenv_unset function cannot be processed. The security environment cannot be changed between osenv_set and osenv_unset. Ensure that the osenv token used was the one returned on the osenv_get. |
| 04A1  | JROsenvNotActive  
  Osenv environment is not active.  
  *Action:* The osenv_unset, osenv_persist, or osenv_unpersist functions cannot be processed. Osenv_get or osenv_set must be issued before the osenv_unset, osenv_persist or osenv_unpersist functions. Osenv_unpersist can be issued together with osenv_set. If issued alone, it must be issued before osenv_unset. |

The __Map function or sub-function code was not valid.  
*Action:* Specify a valid function code. |
| 04CB  | JRNNotAuthMAP  
__map_init call failed permission check for BPX.MAP facility class profile.  
*Action:* Caller must be given read permission to BPX.MAP facility class profile in order to use the __map service successfully. |
| 04CC  | JRBadBlkAddr  
__map service was passed a bad block address. The block address specified was not within the map area, or was not on a block boundary.  
*Action:* Ensure that block address are valid. |
| 04CD  | JRMapAlreadyActive  
__map_init requested for a process that already had an __map environment active.  
*Action:* Determine why the application attempted to initialize an __map environment when one was already active and correct it. |
| 04CE  | JRMapOutOfBlocks  
__map service, processing for a new block or connect request, was asked to select a map block that was not currently in use, but none was available as all blocks were currently in use.  
*Action:* Increase the number of blocks in the map area or disconnect from at least one map block. |
| 04CF  | JRMapNotActive  
__map service was requested but either no map environment is active or the current map environment is being shut down.  
*Action:* You must either start a map environment or wait for the current map environment to complete shut down and then start a new map environment prior to issuing more requests. |

Value Description

05F3 JRTokNotReg
The VNODE token does not specify a regular file.

Action: The service requested requires a regular file, but the VNODE token passed is not for a regular file. Correct the token and reissue the request.

05F4 JRUpgradeSet
A v_open request for upgrading share options was specified with an access mode or deny mode which is less restrictive than the current setting.

Action: A request to upgrade an existing open must specify an access mode or deny mode which has a greater value than the current settings. Correct the values in the VopnShrAccess and the VopnShrDeny fields and reissue the request.

05F5 JRDowngradeSet
A v_open request for downgrading share options was specified with an access mode or deny mode which is more restrictive than the current setting.

Action: A request to downgrade an existing open must specify an access mode or deny mode which has a lesser value than the current settings. Correct the values in the VopnShrAccess and the VopnShrDeny fields and reissue the request.

05F6 JRInvDeny
A share deny specified on a v_open has a value that is not supported.

Action: Refer to BPXYVOPN for valid Deny values and reissue the request with a supported value.

05F7 JRNotRegFile
The operation requested can only be performed on a regular file.

Action: Correct the pathname of the operation to that of a regular file and reissue the request.

05F8 JRWrtOverride
An attempt was made to write to a file with the override of share reservations requested.

Action: Overriding share reservations may only be done for reading from a file, not for writing.

05F9 JRBadTruncSize
An attempt was made to open an existing file with v_open and truncate the file to a non-zero offset.

Action: An existing file can only be truncated to zero when opening with v_open.

05FA JRAtrrNotSettable
An attempt was made to open create a file with v_open but the requested attributes for the new file could not be set.

Action: Ensure the appropriate privileges for the attributes specified.

05FB JRICSFMdNotFound
ICSF random number generate module not found It is needed to open /dev/random and /dev/urandom.

Action: Contact your system administrator to add the ICSF callable services library to the LINKLSTxx parmlib member and to check for availability of ICSF.

</thead>
</table>
| 05FC 05FD 05FE 05FF 0600 0601 0602 0603 0604 | JRICSFnotActive

**ICSF must be running to open/read from /dev/random or /dev/urandom.**

**Action:** Check the availability of ICSF with your system administrator.

JRICSFRACFfail

RACF failed your request to use the CSNBRNG service of ICSF Permission is needed to open/read from /dev/random and /dev/urandom.

**Action:** Contact your system administrator to get RACF permission to the CSFRNG profile in the CSFSERV security class.

JRICSFCardFail

While attempting to open/read from /dev/random or /dev/urandom the PCI Cryptographic Coprocessor or PCI X Cryptographic Coprocessor failed.

**Action:** Contact your system administrator.

JRICSFCardUnavailable

Could not open/read from /dev/random or /dev/urandom because the specific PCI Cryptographic Coprocessor or PCI X Cryptographic Coprocessor requested for service is temporarily unavailable.

**Action:** Contact your system administrator.

JRICSFCardnotActive

Could not open/read from /dev/random or /dev/urandom because the required PCI Cryptographic Coprocessor or PCI X Cryptographic Coprocessor was not active.

**Action:** Contact your system administrator.

JRICSFUnknownErr

An unknown ICSF error occurred while trying to open/read from /dev/random or /dev/urandom.

**Action:** Contact your system administrator. An OMVS CTrace has been taken with the return codes.

JrLockPurged

A Byte Range Lock request has been canceled while it was waiting.

**Action:** A waiting synchronous or a pending asynchronous lock request has been purged or canceled by a thread in the process, or the file has been closed. The lock request may be reissued if the file is still open.

JrBRLMAbend

An abend occurred in the Byte Range Lock Manager.

**Action:** See your IBM service representative.

JrTokMismatch

The OpenToken passed does not belong to the VnodToken that was passed.

**Action:** An OpenToken may only be used with the same VnodToken that was specified on the call to v_open that originally created the OpenToken. Insure that this rule is followed.

</table>
| 7275  | JRPvcLinkNotATM  
An ATMPVC was defined for an incorrect link type.  
*Action:* Correct the ATMPVC statement to point to an ATM link. |
| 7276  | JRLisInconsistent  
The LIS name is already defined with a different subnet value/mask.  
*Action:* Correct the ATMLIS statement to define the same subnet value and subnet mask. |
| 7277  | JRLisOptionsUpdated  
An ATMLIS redefinition caused the LIS options to be updated.  
*Action:* None required if this was the intended result. |
| 7278  | JRPvclnUseAsArpsv  
An attempt was made to delete an ATMPVC which is in use as an ATMARP server.  
*Action:* Stop the ATM device which is using this PVC as an ATMARP server. |
| 7279  | JRLinkHasPvcs  
An attempt was made to DELETE a LINK, but the LINK has at least one ATMPVC defined to it.  
*Action:* Delete the link(s) and then delete the ATMLIS. |
| 727A  | JRLisHasLinks  
An attempt was made to DELETE an ATMLIS, but the ATMLIS has at least one LINK defined to it.  
*Action:* Delete the link(s) and then delete the ATMLIS. |
| 727B  | JRLisHasArpsvs  
An attempt was made to DELETE an ATMLIS, but the ATMLIS has at least one ATMARPSV defined to it.  
*Action:* Delete the ATMARPSV(s) and then delete the ATMLIS. |
| 727C  | JRArpsvInUse  
An attempt was made to DELETE an ATMARPSV, but at least one ATM device is using the ATMARPSV.  
*Action:* Stop the device(s) currently using the ATMARP server and then delete the ATMARPSV. |
| 727D  | JRN0tInLis  
The IP address of a defined ATMARPSV is not in the specified LIS.  
*Action:* Correct the ATMARPSV statement to specify a consistent LIS name and IP address. |
| 727E  | JRTELSTATERR  
Attempt to update the telnet attributes when the connection is not yet established.  
*Action:* Verify the socket address of the telnet entry or try it later. |

</tbody>
</table>
|       | *Action:* The system is probably experiencing a common storage shortage. Retry the request. If the failure persists, contact the system programmer to diagnosis a common storage shortage.
Value | Description
--- | ---
7311 | JRZeroPortDVIPA
A port of zero was specified on a bind when the IP address was a distributed DVIPA and the local stack is a target stack.

Action: Specify a non-zero port on the bind().

7312 | JRTCPIPAlreadyInitialized
TCPIP has already initialized.

Action: The vfs_network call for AF_INET6 was rejected because TCPIP has already initialized. TCPIP will have to be recycled to process the AF_INET6 network statement.

7313 | JrIPv6NotEnabled
TCP/IP cannot process the IPv6 request because the TCP/IP stack is not currently IPv6 enabled.

Action: If IPv6 support is desired then the TCP/IP stack must be defined to UNIX System Services as being enabled for IPv6 support before the stack is started. See the IP Configuration Guide for information on how to define the stack as IPv6 enabled.

7314 | JRIInvalidValue
The value specified is not a valid value.

Action: The option value specified on setsockopt() or the value specified in the cmsg_data field of the ancillary data on sendmsg() is not valid. Ensure the value is within the allowable range of values. Re-issue the socket call with a valid value.

7315 | JRIInvalidOptLength
The option length specified is not valid.

Action: The value specified for the option length is not valid. Re-issue the socket call with a valid option length.

7316 | JRI_DefaultExceeded
The value specified exceeds the system default.

Action: One of the following has occurred for a setsockopt() or sendmsg() issued by a non-authorized application: - The IPV6_UNICAST_HOPS socket option was specified with an option value that exceeds the system defined default for hop limit. - The value specified on the IPV6_HOPLIMIT ancillary data object, for a unicast packet, exceeds the system defined default for hop limit. The application should issue a getsockopt() to determine the system default. The application can then re-issue the socket call with a value that is less than the system defined default.

7317 | JROptNotSupported
The option specified is not supported on this type of socket.

Action: Check the type of socket that was created and ensure that the option specified is valid for the socket.

7318 | JROPTNAIvAllow
The option name specified is not allowed on getsockopt().

Action: Check the option name provided. Re-issue the socket call with a option name that is valid for getsockopt().

| 7346  | **JRSockIPv6OnlyOption**  
The user is attempting to use an IPv4 mapped IPv6 address with an IPv6 only socket option.  
*Action:* If communication using IPv4 mapped IPv6 addresses is desired, the user should not set the IPV6_V6ONLY socket option. If an IPv6 socket option that does not support IPv4 mapped IPv6 addresses is being used, a IPv4 mapped IPv6 address cannot be used. |
| 7347  | **JRSRCIPDistDVIPA**  
The source IP address defined by a DESTINATION entry in a SRCIP configuration statement cannot be a distributed DVIPA.  
*Action:* Correct the SRCIP configuration statement. |
| 7348  | **JRDuplicateSmoAttach**  
The shared memory object is already attached.  
*Action:* Correct the application to issue SIOCSMOCTL Attach requests on only one socket and only from one process thread. |
| 7349  | **JRSmoNotAttached**  
The shared memory object is not attached.  
*Action:* Correct the application to issue SIOCSMOCTL Detach requests only for share memory objects that have been successfully attached. |
| 734A  | **JRIARV64Error**  
IARV64 encountered an error.  
*Action:* Use the IARV64 return and eason codes in the SIOCSMOCTL parameter list to determine the cause of the error. |
| 734B  | **JrNoRouteTable**  
Specified route table does not exist on the TCP/IP stack.  
*Action:* Specify a valid route table. |
| 734C  | **JrExpBndPortRangeConflict**  
An explicit bind to a port within the active EXPLICITBINDPORTRANGE is not allowed.  
*Action:* Specify a port that is not within the active EXPLICITBINDPORTRANGE or ask the system programmer or system administrator to change the range specified by GLOBALCONFIG EXPLICITBINDPORTRANGE. |
| 734D  | **JRMCPairNotFound**  
The specified multicast group and interface pair ARE NOT FOUND.  
*Action:* Specify correct multicast group or interface. |
| 734E  | **JRMCMixedOpt**  
The specified multicast option is mixed of any-source, source-specific or full-state APIs.  
*Action:* Sockets do not allow mix IPv4 protocol with protocol independent group membership APIs and within each API type may not mix delta based with full state options. Correct the usage of API type. |

## Hierarchical File System (HFS) reason codes

All HFS reason codes are one word (4 bytes) in length.

- The first byte is the **subcomponent ID**. For the HFS, this is X'5B'. For reason codes that do not contain the HFS Component ID X'5B' in the first byte, but do have one of the following patterns: 0Exxxxxx, 18xxxxxx, 1Exxxxxx, 22xxxxxx, 25xxxxxx, refer to [SSF global reason codes](https://www.ibm.com/support/docview.wss?uid=swg21501441) on page 622.

- The second byte is the **module ID**

- The third and fourth bytes are the **module-defined reason**.

To interpret a reason code that begins with X'5B', look at the reason (third and fourth bytes):

- **For reason codes in the range of 0100 - 09FF:**
  1. The second byte of the reason code is the module ID. Use that hex ID to determine the name of the module in [Module IDs](#) below.
  2. Next to the module name, you see the page where the module reason codes are presented. (Some modules do not issue reason codes.)
  3. Go to that page. Locate the reason (third and fourth bytes) in the list of errors defined for that module.

- **For reason codes outside of the range of 0100 - 09FF:**
  1. Find the reason code in [Global reason codes](https://www.ibm.com/support/docview.wss?uid=swg21501441) on page 603, ignoring the module ID value (the second byte).
  2. Then use the module ID to identify the page where the module’s local reason codes are presented. (Some modules do not issue reason codes.)
  3. Go to the page for the module, to determine whether there are any additional details about the global reason code in the module-specific description. (In some cases there are, in others there are not.)

## Module IDs

The second byte of all HFS reason codes is the module ID that identifies the HFS module which generated the error code. This is also usually the module which issued the abend if a dump was created.

The HFS module IDs are listed below in numerical order of module IDs for easy reference.

### HFS internal modules:

### Global reason codes

Some HFS errors can potentially occur in many of the HFS modules. For these errors, global reason codes were defined; the same code is used by all modules. These reason codes are grouped as follows:
The following reason codes are defined and only used by the hierarchical file system (HFS). These reason codes are in the range X'0001' - X'00FF' (1 - 255).

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0002</td>
<td>HFS_RS1N_Access_Denied</td>
</tr>
<tr>
<td></td>
<td>The current (requesting) process does not have the requested access authority to the file, or directory.</td>
</tr>
<tr>
<td></td>
<td><strong>Probable cause:</strong> A higher access authority is being requested for this file, or directory, than is defined for this user.</td>
</tr>
<tr>
<td></td>
<td><strong>Action:</strong> Verify that the correct access authority is being requested. If so, contact the file, or directory, owner and request that the access authority be changed.</td>
</tr>
<tr>
<td>0003</td>
<td>HFS_RS1N_RACF_Not_Installed</td>
</tr>
<tr>
<td></td>
<td>A system authorization security product (for example, RACF) is not installed on this system.</td>
</tr>
<tr>
<td></td>
<td>Therefore, the user's file access authority can not be validated.</td>
</tr>
<tr>
<td></td>
<td><strong>Probable cause:</strong> A system installation error.</td>
</tr>
<tr>
<td></td>
<td><strong>Action:</strong> Contact the system support programmer to correct the situation.</td>
</tr>
<tr>
<td>0004</td>
<td>HFS_RS1N_Invalid_Trunc_Offset</td>
</tr>
<tr>
<td></td>
<td>The truncation offset requested is either a negative file size (file_length) or larger than the maximum supported file size. Only a positive file size value less than, or equal to, the maximum supported file size (for example, X'7FFFFFFF000') can be specified.</td>
</tr>
<tr>
<td></td>
<td><strong>Probable cause:</strong> The user requested an truncation to an invalid file size.</td>
</tr>
<tr>
<td></td>
<td><strong>Action:</strong> Make sure the offset specified is valid. Double check the binary format of the offset (number of bits, signed, and so forth).</td>
</tr>
<tr>
<td>0005</td>
<td>HFS_RS1N_Negative_Time_Error</td>
</tr>
<tr>
<td></td>
<td>An HFS operation received a negative time value for atime, ctime, mtime, or reftime.</td>
</tr>
<tr>
<td></td>
<td><strong>Probable cause:</strong> The user supplied a negative time.</td>
</tr>
<tr>
<td></td>
<td><strong>Action:</strong> Correct the time value and retry the request.</td>
</tr>
<tr>
<td>0006</td>
<td>HFS_RS1N_Invalid_File_Type</td>
</tr>
<tr>
<td></td>
<td>An incorrect type of file was specified for the operation. For example, a Directory was specified for a Data file operation.</td>
</tr>
<tr>
<td></td>
<td><strong>Probable cause:</strong> The user specified an incorrect type of file for the operation.</td>
</tr>
<tr>
<td></td>
<td><strong>Action:</strong> Make sure the correct type of file is specified for the requested operation.</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>0008</td>
<td>HFS_Percolated_Error</td>
</tr>
<tr>
<td></td>
<td>Local recovery routine was invoked without an appropriate (nonzero) return code, and was percolated to.</td>
</tr>
<tr>
<td></td>
<td><strong>Probable cause:</strong> Probable programming error.</td>
</tr>
<tr>
<td></td>
<td><strong>Action:</strong> Contact the system support programmer to correct the situation.</td>
</tr>
<tr>
<td>0009</td>
<td>HFS_Invalid_User_Buffer_Addr</td>
</tr>
<tr>
<td></td>
<td>HFS executed an MVCK (move character with key) instruction to move data from an HFS buffer to a user buffer or from a user buffer to an HFS buffer. The data movement failed.</td>
</tr>
<tr>
<td></td>
<td><strong>Probable cause:</strong> Program error or system error. Possibly, the UIO control block buffer address field, uio.u_buffaddr, contains an address that is not in addressable storage.</td>
</tr>
<tr>
<td></td>
<td><strong>Action:</strong> Correct the uio.u_buffaddr field and retry the request. If the problem persists, contact your IBM Support Center.</td>
</tr>
<tr>
<td>000A</td>
<td>HFS_RSN_Invalid_Byte_Xfer_Amt</td>
</tr>
<tr>
<td></td>
<td>The number of bytes requested for this operation is invalid (for example, a negative value, too large, and so forth).</td>
</tr>
<tr>
<td></td>
<td><strong>Probable cause:</strong> The user specified a number of bytes for this operation which is invalid.</td>
</tr>
<tr>
<td></td>
<td><strong>Action:</strong> Make sure a valid number of bytes is requested for the given operation.</td>
</tr>
<tr>
<td>000B</td>
<td>HFS_Sync_Internal_Error</td>
</tr>
<tr>
<td></td>
<td>There was an abend during the previous sync. The HFS can not be accessed.</td>
</tr>
<tr>
<td></td>
<td><strong>Probable cause:</strong> It is caused by an abend during the previous sync.</td>
</tr>
<tr>
<td></td>
<td><strong>Action:</strong> Check the logrec entry for 0F4 dump and verify that the dump is not suppressed by DAE. To recreate or reuse the HFS, unmount the HFS and mount it again.</td>
</tr>
<tr>
<td>000C</td>
<td>HFS_Sync_IO_Error</td>
</tr>
<tr>
<td></td>
<td>There was an abend during the previous sync. The HFS can not be accessed.</td>
</tr>
<tr>
<td></td>
<td><strong>Probable cause:</strong> It is caused by an abend during the previous sync. The abend is related to I/O during the sync.</td>
</tr>
<tr>
<td></td>
<td><strong>Action:</strong> Check the logrec entry for 0F4 dump and verify that the dump is not suppressed by DAE. To recreate or reuse the HFS, unmount the HFS and mount it again.</td>
</tr>
<tr>
<td>000D</td>
<td>HFS_RSN_Sync_Write_Protect_Error</td>
</tr>
<tr>
<td></td>
<td>The Write_Protect field in the first VDF page on disk doesn't match the field that was filled in the HFS file system control block at the mount time.</td>
</tr>
<tr>
<td></td>
<td><strong>Probable cause:</strong> This is caused by mounting the HFS as R/W on another system that is not in the same GRS ring.</td>
</tr>
<tr>
<td></td>
<td><strong>Action:</strong> Contact the system administrator to verify that the HFS is not mounted as R/W on another system.</td>
</tr>
</tbody>
</table>
000E  HFS_RSN_VMAX_Below_Minimum

The value specified for the maximum virtual storage limit for HFS data and metadata buffers was less than 32 megabytes, but the minimum value that can be specified is 32 megabytes. The maximum virtual storage limit was set to a default value of 32 megabytes.

Probable cause: User error or system installation error. One of the following was set to contain a value less than 32:
1. The PARM parameter, VIRTUAL(max) in BPXPRMxx parmlib member.
2. The confighfs shell command confighfs -v n.
3. The PIsctl callable service, BPX1PCT, changebufferlimits command, PCTL.PCTL_BL_VMAX_VAL field.

Action: If this default value is not satisfactory, it can be changed dynamically by issuing the confighfs shell command. If this reason code is a result of item 1 above, you may contact your system programmer. For further information, refer to z/OS MVS Initialization and Tuning Reference, for the topic Statements and Parameters for BPXPRMxx or z/OS UNIX System Services Command Reference for the confighfs command, or z/OS DFSMSdfp Advanced Services for the topic BPX1PCT for HFS.

000F  HFS_RSN_FMIN_Exceeded_VMAX

The value specified for the fixed virtual storage for HFS data and metadata buffers exceeds the value of the maximum virtual storage limit for HFS data and metadata buffers. The fixed virtual storage limit was set to a default value of 50% of real storage available.

Probable cause: User error or system installation error. One of the following was set to contain a value that exceeds the value of the maximum virtual storage limit value for HFS data and metadata buffers:
1. The PARM parameter, FIXED(min) in BPXPRMxx parmlib member.
2. The confighfs shell command confighfs -f n.
3. The PIsctl callable service, BPX1PCT, changebufferlimits command, PCTL.PCTL_BL_FMIN_VAL field.

The FIXED(min) value must be less than or equal to VIRTUAL(max).

Action: If this default value is not satisfactory, it can be changed dynamically by issuing the confighfs shell command. If this reason code is a result of item 1 above, you may contact your system programmer. For further information, refer to z/OS MVS Initialization and Tuning Reference, for the topic Statements and Parameters for BPXPRMxx or z/OS UNIX System Services Command Reference for the confighfs command, or z/OS DFSMSdfp Advanced Services for the topic BPX1PCT for HFS.

*Probable cause:* Hardware problem.  
*Action:* Close the file. Before performing further operations against the file, the system must be allowed to recycle the cache for this file which should take a few minutes. |
| 0048  | HFS_RSN_RNODE_Write_IO_Error  
A module has received an I/O error when hardening file data buffers to disk. In a sysplex environment, the I/O error can be on a file residing on the server.  
*Probable cause:* Hardware problem.  
*Action:* Close the file locally and/or on the server. Before performing further operations against the file, the system must be allowed to recycle the cache for this file which should take a few minutes. |
| 0049  | HFS_RSN_FS_Read_Only  
An update operation was attempted, but the File System was mounted read-only.  
*Probable cause:* User error.  
*Action:* Remount the file system read-write and try again. |
Value | Description
--- | ---
0E37 | **HFS\_Out\_of\_Disk\_Space**

There is not enough disk space left for HFS to use.

*Probable cause:*
1. The volume that the HFS resides on runs out of space.
2. The HFS has extended 255 times.
3. The HFS does not have secondary allocation and has used all the primary allocation.

*Action:* Get more space for the HFS.

**Storage and DADSM global reason codes**
The following reason codes are defined by SSF for Storage and DADSM errors. When the HFS receives one of these error codes from SSF, the HFS will return this reason code.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| C001 | **RSNS\_Out\_Of\_Data\_Space\_Stg**

An attempt to obtain storage in an HFS Data Space failed.

*Probable cause:* There was no data space storage available of sufficient quantity to satisfy the caller’s requested size.

*Action:* Review the overall HFS workload. It may be necessary to decrease some of the HFS workload activity.

| C002 | **RSNS\_Out\_Of\_ECSA\_Stg**

An attempt to obtain storage in the Extended Common Storage Area (ECSA) failed.

*Probable cause:* There was no space in Extended Common Storage Area of sufficient quantity to satisfy the caller’s requested size.

*Action:* Contact your System Programmer to perform one of the following actions:
1. Increase the amount of virtual storage that is allocated to ECSA.
2. Review the overall HFS workload. If ECSA storage can’t be increased, then decrease some of the HFS workload activity.

| C003 | **RSNS\_Out\_Of\_User\_Private\_Stg**

An attempt to obtain storage in the Extended User Private Storage failed.

*Probable cause:* There was no space in Extended Private Storage of sufficient quantity to satisfy the caller’s requested size.

*Action:* Review the overall HFS workload, it may be necessary to decrease some of the HFS workload activity.

| C004 | **RSNS\_Out\_Of\_DREFD\_Autodata**

An attempt to obtain DREFD storage in the Extended Common System Queue Area (ESQA) failed.

*Probable cause:* There was no space in Extended Common System Queue Area of sufficient quantity to satisfy the callers’s requested size.

*Action:* Contact your System Programmer to perform one of the following actions:
1. Increase the amount of virtual storage that is allocated to ESQA.
2. Review the overall HFS workload. If ESQA storage can’t be increased, then decrease some of the HFS workload activity.

<td>A41B</td>
<td>IMF_Try_Previous</td>
</tr>
</tbody>
</table>
|        | An index page scan should be attempted on the page that precedes the current one on the same level.  
|        | **Probable cause:** The index was searched using a key supplied by the caller. This is an internal reason code that is passed from the index page search routine to its caller. This is not considered an error.  
|        | **Action:** Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support. |
| A41C   | IMF_Try_Next                     |
|        | An index page scan should be attempted on the page that follows the current one on the same level.  
|        | **Probable cause:** The index was searched using a key supplied by the caller. This is an internal reason code that is passed from the index page search routine to its caller. This is not considered an error.  
|        | **Action:** Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support. |
| A41D   | IMF_Insert_End_of_Page           |
|        | An insert into a full page has been attempted. The insert tried to put a record at the end of the page. If the page has already been split as part of a related request, then the insert can be attempted in next page on the same level and this page does not need to be changed.  
|        | **Probable cause:** This is a normal condition that occurs during an index page record insert operation. This is an internal reason code that is passed from the index page record insert routine to its caller.  
|        | **Action:** Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support. |
| A41E   | IMF_Split_On_Reseg               |
|        | An resegment operation has has been attempted. It was not able to be performed because the resulting resegmented page would not fit in the existing page. A split must be done on the page.  
|        | **Probable cause:** The index page was too full before the resegment operation was attempted. This is an error in the Index Manager program because each index page should have a sufficient amount of reserved space to accommodate the index page resegment operation.  
|        | **Action:** Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support. |
| A41F   | IMF_Delete_Page_Full             |
|        | An attempt was made to delete a record from a compressed format page. The following record was front compressed relative to the to-be-deleted-record. The expanded key of the next record requires more space than is available in the page. A split must be performed.  
|        | **Probable cause:** The index page was too full before the recompress operation was attempted. This is an error in the Index Manager program because each index page should have a sufficient amount of reserved space to accommodate the index page recompress operation.  
|        | **Action:** Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support. |
### IMF_Insert_Key_Out_Of_Order

**Value**: A420

**Description**: IMF_Insert_Key_Out_Of_Order

Attempt to insert record with key smaller than previous record.

**Probable cause**: This is a programming logic error by the Index Manager. If the index was constructed correctly, then the index search and scan operation should create the positioning information to allow a record insert in the correct record sequence.

**Action**: Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support.

### IMF_Split_End_Of_Page

**Value**: A7F7

**Description**: IMF_Split_End_Of_Page

A split occurred at the end of the full page. The full page is unchanged and does not need to be written. The new page has been initialized and contains no records.

**Probable cause**: This is a normal condition that occurs during an index page record split operation. This is an internal reason code that is passed from the index page record split routine to its caller.

**Action**: Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support.

### SSF global reason codes

The following reason codes are defined by System Service Facilities (SSF) for various errors. When the HFS receives one of these error codes from SSF, the HFS will return this reason code to the caller.

**Note**: These reason codes do not follow the normal HFS reason code naming convention in that they do not have X'5B' as their subcomponent ID.

Local reason codes for modules

Most HFS errors are local to specific modules. For these errors, local reason codes were defined within
the individual modules. The values for these codes are above 256 (X'0100'). Because these values are
reused by all modules, it is essential to select the value definitions based on the Module ID in the second
byte of the 4-byte reason code. See "Module IDs" on page 600 for the module ID mappings.

GFUADMPH: Dump Help Routine

The component identifier is RSN_ADMPH. The module ID halfword is X'5BF7'.

Global reason codes: None

Local reason codes:

### RSN_FRER: FRER_FPM_Error

**Value**: RSN_FRER +x'108'

**Description**: RSN_FRER_Free_FPM_Error

An attempt to free FPMs associated with an RNODE failed. A dump should have been created.

*Probable cause*: Internal logic error.

*Action*: Send the problem to IBM Support. There is no known customer workaround for this problem other than to temporarily not try to remove this file or directory.

### RSN_FRER: FRER_DOPL_Error

**Value**: RSN_FRER +x'109'

**Description**: RSN_FRER_Free_DOPL_Error

An attempt to free a DOPL block associated with an RNODE failed. A dump should have been created.

*Probable cause*: Internal logic error.

*Action*: Send the problem to IBM Support. There is no known customer workaround for this problem other than to temporarily not try to remove this file or directory.

**GFUALLOC: HFS Page Space Allocation**

The component identifier is **RSN_ALLOC**. The module ID halfword is **X'5B0A'**.

**Global reason codes:** None

**Local reason codes:**
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| RSN_ALLOC + X'101' | RSN_ALLOC_Add_Rcvy_Failed  
The recovery environment could not be stacked.  
*Probable cause:* Too many levels of recovery in the stack.  
*Action:* Contact IBM Support. |
| RSN_ALLOC + X'102' | RSN_ALLOC_Latch_Obtain_Fail  
The File System latch could not be obtained.  
*Probable cause:* Internal error (for example, deadlock), since we should have waited for the latch if it was not available.  
*Action:* Contact IBM Support. |
| RSN_ALLOC + X'103' | RSN_ALLOC_Internal_Error  
An error was found and cleanup was executed, but no explicit reason code was set.  
*Probable cause:* An internal error occurred that did not set a reason code.  
*Action:* Contact IBM Support. |
| RSN_ALLOC + X'105' | RSN_ALLOC_Latch_Release_Fail  
The File System latch could not be released.  
*Probable cause:* This is an internal error (for example, latch was not actually obtained, token was incorrect, and so forth).  
*Action:* Contact IBM Support. |
| RSN_ALLOC + X'106' | RSN_ALLOC_FAP_Failed  
The call to XP_FIND_AVAIL_PAGES (GFUPFAP) failed.  
*Probable cause:* See the reason codes in "GFUPFAP – Internal Page Allocation Procedures" on page 751 for a list of probable causes.  
*Action:* Review the list of reason codes in "GFUPFAP – Internal Page Allocation Procedures" on page 751 for possible actions, or contact IBM Support. |
| RSN_ALLOC + X'107' | RSN_ALLOC_Add_FPM_Failed  
The call to XP_ADD_FPM_PAGES (GFUPFPM) failed.  
*Probable cause:* An internal error occurred.  
*Action:* Contact IBM Support. |
| RSN_ALLOC + X'108' | RSN_ALLOC_Sync_Failed  
The File System sync process failed.  
*Probable cause:* See "GFUARQUE: Internal Request Queue" on page 638 or "GFUBSYNC: Sync File System" on page 655 for a list of probable causes.  
*Action:* See "GFUARQUE: Internal Request Queue" on page 638 or "GFUBSYNC: Sync File System" on page 655 for a list of possible actions. |
### RSN_ALLOC + X'109' RSN_ALLOC_Extend_Failed

An error occurred while an extent was being requested.

**Probable cause:** See [GFUARQUE: Internal Request Queue] for a list of probable causes. This reason code means that something failed abnormally. This reason code would not be returned for a normal out-of-extents condition.

**Action:** Contact IBM Support.

### RSN_ALLOC + X'110' RSN_ALLOC_No_Extend_RsnCode

Enough extents could not be taken, and the Alloc request could not be satisfied.

**Probable cause:** Not enough extents are available to the HFS file system.

**Action:** Make sure enough extents are available to the HFS file system.

### RSN_ALLOC + X'115' RSN_ALLOC_BAD_API

The API chain is corrupted.

**Probable cause:** Internal logic error.

**Action:** Send the problem to IBM Support.

---

</table>
Value Description

RSN_BCNFS + X'139' RSN_BCNFS_Ck_Bad_Seg_Num
The number of segments in the page is bad.

Probable cause: Internal logic error.

Action: Send the problem to IBM Support.

RSN_BCNFS + X'13B' RSN_BCNFS_Sync_Interrupted
The last time that this file system was mounted, the update of the data on
disk was interrupted in the middle of being written. The integrity of the file
system's index structure is consequently questionable.

Probable cause: The system was not brought down softly the last time that
this file system was mounted. It either crashed or was IPLed in the middle
of the operation.

Action: Recreate the file system from a known good backup, or mount this
file system in read only mode and copy whatever possible from the current
file system to the new one. Validate the integrity of any data copied from
the old file system.

GFUBDCFS: Disconnect File System
The component identifier is RSN_BDCFS. The module halfword identifier is X'5B21'.

Global reason codes: None

Local reason codes:

<table>

### Value Description

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| RSN_EXTD + X'118' | RSN_EXTD_CVAFDIR_Failed1  
CVAFDIR, to initialize the CVAF buffer list header and 1 entry, was unsuccessful.  

*Probable cause:* Possible programming error.  
*Action:* Send the problem to IBM Support. |
| RSN_EXTD + X'119' | RSN_EXTD_Catalog_Call_Failed  
Catalog call was unsuccessful.  

*Probable cause:* Possible programming error.  
*Action:* Send the problem to IBM Support. |
| RSN_EXTD + X'11A' | RSN_EXTD_Zero_Extend_Amount  
An explicit extend was requested, but the amount specified was zero.  

*Probable cause:* User error.  
*Action:* Correct the error and try again. |
| RSN_EXTD + X'11B' | RSN_EXTD_HFS_Greater_Than_251_Ext  
Attempt to extend a HFS dataset was unsuccessful.  

*Probable cause:* Attempt was made to extend a HFS dataset beyond 251 extents.  

*Action:* Check the current allocated extents. If the current number of extents is less, reduce the size in the confighfs command. Check the current allocated extents. If the current number of extents is less, reduce the size in the confighfs command. If the HFS has already reached 251 extents, then this is the maximum number of extents possible. You may not be able to extend it anymore. If the HFS has already reached 251 extents, then this is the maximum number of extents possible. You may not be able to extend it anymore. |

*Action:* Collect the dump or error information and send the problem to IBM Support. |
| RSN_BSYNC + X'141' | RSN_BSYNC_FPM_Item_Mismatch_RPN  
The FPM record key item number does not match the expected value based on the first RPN of the FPMB for the file.  
*Probable cause:* Internal logic error.  
*Action:* Collect the dump or error information and send the problem to IBM Support. |
| RSN_BSYNC + X'142' | RSN_BSYNC_FPMB_RPN_Mismatch_Prev_HiRPN  
The first RPN of an FPMB does not match the expected value based on the High RPN of the previous FPMB.  
*Probable cause:* Internal logic error.  
*Action:* Collect the dump or error information and send the problem to IBM Support. |
| RSN_BSYNC + X'143' | RSN_BSYNC.Sync_Tasks_Contention  
A sync process, which forces all modified data to be saved to disk, found that another sync process was in progress for the same file system.  
*Probable cause:* Unix System Services synchronization problem, Global Resource Serialization latch problem, HFS internal logic error or an I/O error. If a sync process is in progress, then a subsequent sync process will not begin until the current sync process is complete. If the first sync process is not actually in progress but was interrupted by an abnormal condition, the HFS could have been damaged due to the sync process interruption.  
*Action:* If the first sync process completed successfully, then there was no damage done to the HFS. If the first sync did not complete successfully, attempt to locate the abnormal condition that caused the sync process interruption, and if possible, correct the situation. An unmount and remount of the HFS may correct the symptom. |
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| RSN_BSYNC + X'144'  | **RSN_BSYNC_Write_ACL_Error**  
An access control list (ACL) could not be written to disk.  
*Probable cause:* I/O Error or internal logic error.  
*Action:* Make sure the I/O subsystem is working properly or contact IBM Support. |
| RSN_BSYNC + X'145'  | **RSN_BSYNC_Delete_ACL_Error**  
An ACL could not be deleted from disk.  
*Probable cause:* I/O Error or internal logic error.  
*Action:* Make sure the I/O subsystem is working properly or contact IBM Support. |
| RSN_BSYNC + X'146'  | **RSN_BSYNC_Excessive_RNODE_Errors**  
During Sync processing, this file system encountered numerous RNODE errors. Due to the number of errors encountered, the integrity of the file system is in question and the RNODE error condition was upgraded to a file system level error.  
*Probable cause:* I/O Error or internal logic error.  
*Action:* Send the problem to IBM Support. If the cause of the errors was fixed, unmounting and remounting the HFS in question will clear the file system level error. |
| RSN_BSYNC + X'147'  | **RSN_BSYNC_Lock_Release_Failure**  
The local lock could not be released.  
*Probable cause:* Internal logic or MVS Error.  
*Action:* Send the problem to IBM Support. |
| RSN_BSYNC + X'148'  | **RSN_BSYNC_Invalid_Write_BDE**  
During write processing, a BDE was encountered with an invalid write_map of zeros.  
*Probable cause:* Possible programming error.  
*Action:* Contact IBM Support. |

</table>
RSN_PCTL + X’106’  |  RSN_PCTL_Unsupported_Extend_Unit
--- | ---
The ExtendFS function for the HFS pfsctl service was called with an invalid PCTL_EXT_UNIT parameter.

*Probable Cause:* Program error or system error. Possibly the pfsctl callable service, BPX1PCT, was coded with an invalid PCTL_EXT_UNIT value or the logical file system has called the HFS pfsctl module with an invalid PCTL_EXT_UNIT value.

*Action:* If possible, correct the PCTL_EXT_UNIT value and retry the request. If the problem persists, contact the IBM Support Center. For valid values, refer to the topic in [z/OS DFSMS Using Data Sets] that describes using BPX1PCT callable service for Hierarchical File System.

RSN_PCTL + X’107’  |  RSN_PCTL_Unauthorized Caller
--- | ---
The HFS pfsctl service ChangeBufferLimits or ExtendFS function was called by an unauthorized caller.

*Probable Cause:* Program error. The caller is not authorized to use the HFS pfsctl ChangeBufferLimits or ExtendFS commands.

*Action:* The caller of the ChangeBuffer and ExtendFS functions must be an authorized caller. Refer to the topic in [z/OS DFSMS Using Data Sets] that describes using BPX1PCT callable service for Hierarchical File System.

RSN_PCTL + X’108’  |  RSN_PCTL_Zero_Extend_Amount
--- | ---
The HFS pfsctl ExtendFS function was called with an extend value of zero.

*Probable Cause:* Program or system error. Possibly the pfsctl callable service, BPX1PCT, was coded an invalid PCTL_EXT_AMT of zero or the logical file system has called HFS pfsctl service extend function with an invalid PCTL_EXT_AMT of zero.

*Action:* If possible, correct the PCTL_EXT_AMT value and retry the request. If the problem persists, contact the IBM Support Center. Refer to the topic in [z/OS DFSMS Using Data Sets] that describes using BPX1PCT callable service for Hierarchical File System.
RSN_PCTL + X'109'  RSN_PCTL_FS_Sync_Failed
The HFS pfsctl service ExtendFS function experienced an out of disk space condition during HFS file system sync processing.

Probable Cause:
- There is not enough space in the primary allocation and no secondary allocation exists.
- An extend was attempted but the maximum number of extents, 255, has been reached.
- There was no free space on the volume; subsequently the HFS was unable to be extended.
- The HFS is single volume; HFS have a multivolume limit of 59.
- The HFS is single volume and has secondary allocation, but the volume where the HFS resides does not contain enough free space for the HFS to extend.
- The HFS is multivolume and has secondary allocation, but there are no candidate volumes that contain enough free space for the HFS to extend.

Action: If the allocation needs to be larger, take the appropriate action. Possibly scratch unneeded data sets from the volume, or run an access method ALTER command to add more candidate volumes to the Catalog entry for the data set.

RSN_PCTL + X'10B'  RSN_PCTL_XMSG_Missing_Hdrblob
An XMSG Message blob was not a header blob when it was supposed to be.

Probable Cause: Internal logic error.

Action: Send the problem to IBM Support.

RSN_PCTL + X'10C'  RSN_PCTL_XMSG_Missing_RFS
The XMSG Message header blob indicates that the XMSG does not contain the RFS.

Probable Cause: Internal logic error.

Action: Send the problem to IBM Support.

RSN_PCTL + X'10E'  RSN_PCTL_File_System_Move
The OSI XMSG call to transmit message to server to process DisplayFSStats or ExtendFS returned EAGAIN before attempting a latch.

Probable Cause: Internal logic error.

Action: Send the problem to IBM Support.

GFUDUMNT: vfs_unmount() — Unmount File System
The component identifier is RSN_DUMN. The module ID halfword is X'5B34'.

*Action:* Verify SAF authorization for check file owner. If the problem persists, contact the security administrator or the IBM Support Center. |
| **RSN_GASE + X'106'** | **RSN_GASE_Access_Error** | The check access SAF authorization check returned an error during a HFS VN_SETATTR operation. The HFS VN_SETATTR operation did not complete.  
*Probable cause:* Program or system error.  
*Action:* Check your authorization status to perform HFS VN_SETATTR for the file. If the problem persists, contact the security administrator or the IBM Support Center. |
| **RSN_GASE + X'107'** | **RSN_GASE_Internal_Error** | An error was found and the HFS VN_SETATTR cleanup routine was executed, but there was no explicit reason code set.  
*Probable cause:* An HFS internal error occurred that did not set the reason code.  
*Action:* Contact the IBM Support Center. |
| **RSN_GASE + X'108'** | **RSN_GASE_Trunc_File_Error** | An error occurred on truncate of the file during an HFS VN_SETATTR operation.  
*Probable cause:* System error.  
*Action:* Contact the IBM Support Center. |
| **RSN_GASE + X'109'** | **RSN_GASE_Removed_File** | The link to the file was removed prior to the HFS VN_SETATTR operation. The file no longer exists.  
*Probable cause:* A user removed the file.  
*Action:* Determine if removed file status is acceptable. If not, restore the file from backup. |
| **RSN_GASE + X'10A'** | **RSN_GASE_RNODE_In_Use** | The specified file in the HFS VN_SETATTR operation is not available. When attempting to access the file, an EBUSY returned from internal function.  
*Probable cause:* The specified file is being used by another process and the wait has timed out.  
*Action:* If possible, locate the process that is accessing the file. Retry the request. |
### Global reason codes:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSN_GASE + X'10B'</td>
<td>RSN_GASE_WAITX.Fail</td>
</tr>
</tbody>
</table>

Call to XP_WAITFOR_RNODE is returning a non-successful return code.

*Probable cause:* System error.

*Action:* Contact the IBM Support Center.

---

### GFUGAUDT: vn_audit() — Audit Specified Function

The component identifier is RSN_GAUD. The module ID halfword is X'5B43'.

**Global reason codes:**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSN_GAUD +</td>
<td>RSN_GAUD_Access_Denied</td>
</tr>
</tbody>
</table>

The current (requesting) process does not have the requested access authority to the file, or directory.

*Cause:* A higher access authority is being requested for this file, or directory, than is defined for this user.

*Action:* Verify that the correct access authority is being requested. If so, contact the file, or directory, owner and request that the access authority be changed.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSN_GAUD +</td>
<td>RSN_GAUD_RACF_Not_Installed</td>
</tr>
</tbody>
</table>

No SAF (Security Authorization Facility – for example, RACF) is installed on this system. Therefore, the user’s file access authority can not be validated.

*Cause:* Probably a system installation error.

*Action:* Contact the system support programmer to correct the situation.

**Local reason codes:** None

---

### GFUGCLOS: vn_close() — Close File

The component identifier is RSN_GCLO. The module ID halfword is X'5B44'.

**Global reason codes:** None

**Local reason codes:**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSN_GCLO + X'101'</td>
<td>RSN_GCLO_File_Has_Not_Opened</td>
</tr>
</tbody>
</table>

GFUGCLOS is called with an RNODE which has an open count of 0.

*Probable cause:* LFS closes a file more times than it is opened.

*Action:* This should not cause any data loss, but determination of problem is necessary because it points to a logic problem.
GFUGCREA: vn_create() — Create File
The component identifier is RSN_GCRE. The module ID halfword is X'5B45'.

<tr>
<td>HFS_Invalid_User_Buffer_Addr (X'0009')</td>
<td>Invalid buffer address.</td>
</tr>
</tbody>
</table>

Probable cause: The caller passed an invalid buffer address to READ/ WRITE or READV/ WRITEV. Probable program error.

Action: Send the problem to IBM Support.

Local reason codes: None

GFUGREMV: vn_remove() — Remove File or Link
The component identifier is RSN_GREM. The module ID halfword is X'5B51'.

Global reason codes:
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSN_GREM +</td>
<td>RSN_GREM_Access_Denied</td>
</tr>
</tbody>
</table>

**HFS_RSN_Access_Denied (X'0002')**

The current (requesting) process does not have the requested access authority to the file, or directory.

*Probable cause:* A higher access authority is being requested for this file, or directory, than is defined for this user.

*Action:* Verify that the correct access authority is being requested. If so, contact the owner of the file, or directory, and request that the access authority be changed.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSN_GREM +</td>
<td>RSN_GREM_RACF_Not_Installed</td>
</tr>
</tbody>
</table>

**HFS_RSN_RACF_Not_Installed (X'0003')**

No SAF (Security Authorization Facility – for example, RACF) is installed on this system. Therefore, the user’s file access authority can not be validated.

*Probable cause:* A system installation error.

*Action:* Contact the system support programmer to correct the situation.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSN_GREM +</td>
<td>RSN_GREM_Lookup_Error</td>
</tr>
</tbody>
</table>

**HFS_RSN_Lookup_Error (X'0045')**

Refer to “HFS global reason codes” on page 604.

**HFS_RSN_Find_Rnode_Error (X'0046')**

Refer to “HFS global reason codes” on page 604.

**Local reason codes:**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSN_GREM + X'101'</td>
<td>RSN_GREM_Add_Rcvy_Failed</td>
</tr>
</tbody>
</table>

Stacking a local recovery environment to the SSF Recovery stack was unsuccessful.

*Probable cause:* Possible programming error.

*Action:* Send the problem to IBM Support.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSN_GREM + X'102'</td>
<td>RSN_GREM_Parent_Not_Dir</td>
</tr>
</tbody>
</table>

Parent directory of file to be removed is not a directory.

*Probable cause:* An invalid parameter was passed into the call.

*Action:* Send the problem to IBM Support.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSN_GREM + X'103'</td>
<td>RSN_GREM_Internal_Error</td>
</tr>
</tbody>
</table>

The module is in recovery and the reason code was not set prior to entry into cleanup.

*Probable cause:* Internal logic error.

*Action:* Send the problem to IBM Support.
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| RSN_GREM + X'104'       | RSN_GREM_Remove_ReadOnly  
The HFS is marked for read-only.  

_Probable cause:_ A remove operation is performed on a read-only HFS.  

_Action:_ Mount the HFS with read-write permission. |
| RSN_GREM + X'107'       | RSN_GREM_File_Not_Found  
The file to be removed is not in the parent directory.  

_Probable cause:_ The file was removed by another process.  

_Action:_ If file was not removed by another process, send the problem to IBM Support. Otherwise it is a normal path. |
| RSN_GREM + X'109'       | RSN_GREM_RNODE_In_Use  
Parent directory is locked.  

_Probable cause:_ Other processes are utilizing the parent directory.  

_Action:_ Processes using the parent directory should release this resource. If no processes are using the parent directory, send the problem to IBM Support. |
| RSN_GREM + X'110'       | RSN_GREM_WAITX_Fail  
The call has timed out, trying to acquire the lock for the parent directory.  

_Probable cause:_ Other processes are utilizing the parent directory.  

_Action:_ Processes using the parent directory should release this resource. If no processes are using the parent directory, send the problem to IBM Support. |
| RSN_GREM + X'111'       | RSN_GREM_Missing_Obj_Ptr  
The pointer for the file to be removed is zero.  

_Probable cause:_ An invalid parameter was passed into the call.  

_Action:_ Send the problem to IBM Support. |

**GFUGRENM: vn_rename() — Rename Object**  
The component identifier is **RSN_GREN**. The module ID halfword is X'5B52'.

Value Description

RSN_RWNE + RSN_RWNE_Invalid_Byte_Xfer_Amt
HFS_RSN_Invalid_Byte_Xfer_Amt (X'000A')

The number of bytes requested for this operation (read or write) is a negative value.

*Probable cause:* A negative number of bytes were requested to be read or written. This could be caused by the LFS.

*Action:* Make sure a non-negative number of bytes is requested; or contact IBM Support.

RSN_RWNE + RSN_RWNE_Invalid_PFAR

</tr>
</tbody>
</table>
Value | Description
--- | ---
RSN_IARPN + X’108’ | **RSN_IARPN_Dup_RPNs_On_FSL**
| As part of the Attribute Directory processing, GFUIARP make a validity check of the root index page’s free space list (FSL). In this case duplicate RPNs were found to be in the free space list. This is an error.
| *Probable cause:* This is a logic error within the GFUIARP. It should not free a page twice.
| *Action:* Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support.

RSN_IARPN + X’109’ | **RSN_IARPN_Dup_RPNs_On_FADS**
| As part of the Attribute Directory processing, GFUIARP will call GFUAFADS to free any index pages that are no longer required. Before passing the list of freed pages to GFUADS, GFUIARP will make a validity check of the list of RPNs in the parameter list. In this case, duplicate RPNs were found in the parameter list. This is an error.
| *Probable cause:* This is a logic error within the GFUIARP. It should not free a page twice.
| *Action:* Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support.

RSN_IARPN + X’10A’ | **RSN_IARPN_Dup_RPN_Assigned**
| As part of the Attribute Directory processing, GFUIARP will assign a new index page, represented by a RPN, to any changed or new page within the Attributes Directory. GFUIARP will check the hash table to ensure that a newly assigned RPN is not already assigned to the directory.
| *Probable cause:* This is a logic error within the GFUIARP. Index pages cannot have duplicate assignments.
| *Action:* Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support.

RSN_IARPN + X’10C’ | **RSN_IARPN_Sync_And_Read_IBLK**
| As part of Attribute Directory processing, GFUIARP will check the validity of the sync flags. An IBlock had both a read flag and a sync flag turned on. This is an error condition and should not occur.
| *Probable cause:* The index page’s IBlock will be updated during normal file change processing. Any IBlock that is marked as a read page should not be sync’d to disk. Therefore, if a read IBlock is marked sync processing, a logic error has occurred.
| *Action:* Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support.

**GFUICPDL – Delete a Compressed Format Record**
The component identifier is **RSN_ICPDL**. The module ID halfword is **X’5B82’**.

**Global reason codes:**
RSN_ICPDL +

IMF_Delete_Page_Full (X'A41F')

The page was full.

Probable cause: The key right after the key that is to be deleted was front compressed and the expansion of the key requires more space than the space to be deleted. So a split is needed to perform delete.

Action: The caller of the Index Manager should be aware of the reason code that is returned.

RSN_ICPDL +

IMF_Empty_Page (X'A415')

The page is empty.

Probable cause: The page was already empty.

Action: The caller of the Index Manager should be aware of the reason code that is returned.

Local reason codes: None

GFUICPEX – Extract a Compressed Format Record

The component identifier is RSN_ICPEX. The module ID halfword is X'5B80'.

Global reason codes:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSN_ICPEX +</td>
<td>RSN_ICPEX_Page_End</td>
</tr>
<tr>
<td>IMF_At_End_Of_Page (X'A419')</td>
<td>This is the end of the page.</td>
</tr>
<tr>
<td></td>
<td>Probable cause: Last extract request has extracted the last record in the page.</td>
</tr>
<tr>
<td></td>
<td>Action: The caller of the Index Manager should be aware of the reason code that is returned.</td>
</tr>
</tbody>
</table>

| RSN_ICPEX +                   | RSN_ICPEX_Fdbk_Full              |
| IMF_FeedBack_Full (X'A418')   | The feedback area passed from caller is full. |
|                               | Probable cause: The feedback is filled up by extract. |
|                               | Action: The caller of the Index Manager should be aware of the reason code that is returned. |

Local reason codes: None

GFUICPIN – Insert a Compressed Format Record

**GFUICPJN – Join Index Pages**

The component identifier is RSN_ICPJN. The module ID halfword is X’5B98’.

**Global reason codes:**
### Local reason codes:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RSN_ICPJN +</strong> X'100'</td>
<td><strong>RSN_ICPJN_Internal_Logic_Error</strong></td>
</tr>
<tr>
<td>The key in the high page which is the greatest page is less than the low key.</td>
<td></td>
</tr>
<tr>
<td><em>Probable cause:</em> The index page is corrupted.</td>
<td></td>
</tr>
<tr>
<td><em>Action:</em> Collect the dump information and contact IBM Support.</td>
<td></td>
</tr>
</tbody>
</table>

| **RSN_ICPJN +** X'101'       | **RSN_ICPJN_Empty_High_Page**        |
| High page is empty.         |
| *Probable cause:* Caller does not have to know two pages are empty or not. This is a normal. |
| *Action:* Caller will get a RC_INFO. |

| **RSN_ICPJN +** X'102'       | **RSN_ICPJN_Insufficient_Space**     |
| The low page does not have space left. |
| *Probable cause:* The records in the high page exceed the free space in the low page. |
| *Action:* Collect the dump information and contact IBM Support. |

| **RSN_ICPJN +** X'103'       | **RSN_ICPJN_Invalid_Join_Call**      |
| The page is the greatest page. |
| *Probable cause:* The caller passed in the wrong page or a middle page has greatest flag on. |
| *Action:* Collect the dump information and contact IBM Support. |

<p>| <strong>RSN_ICPJN +</strong> X'104'       | <strong>RSN_ICPJN_Invalid_IBLK_Ptr</strong>       |
| The IBlock pointer (IBLK) is nonzero. |
| <em>Probable cause:</em> This check is at the beginning of the page. IBlock pointers should be zero. If not, there may be a serialization problem. |
| <em>Action:</em> Collect the dump information and contact IBM Support. |</p>
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| RSN_ICPJN + X'105' | RSN_ICPJN_Buffer_Swap_Error  
The BDE in the IBlock is wrong.  
*Probable cause:* The new BDE is not swapped into the low IBlock.  
*Action:* Collect the dump information and contact IBM Support. |
| RSN_ICPJN + X'106' | RSN_ICPJN_Record_Count_Error  
The record count in the low page is wrong.  
*Probable cause:* Move did not perform correctly.  
*Action:* Collect the dump information and contact IBM Support. |
| RSN_ICPJN + X'107' | RSN_ICPJN_Invalid_Target  
The control structure describing the target page is in an invalid state. The target page is a read copy.  
*Probable cause:* Internal logic error.  
*Action:* Collect the dump information and contact IBM Support. |
| RSN_ICPJN + X'108' | RSN_ICPJN_Invalid_Parent  
The control structure describing the parent page is in an invalid state. The parent page is a read copy.  
*Probable cause:* Internal logic error.  
*Action:* Collect the dump information and contact IBM Support. |
| RSN_ICPJN + X'109' | RSN_ICPJN_Index_Damage  
The parent page is expected to be the root, but flags indicate otherwise.  
*Probable cause:* Internal logic error.  
*Action:* Collect the dump information and contact IBM Support. |

GFUICPSC – Scan a Compressed Format Page  
The component identifier is RSN_ICPSC. The module ID halfword is X'5B83'.

**Global reason codes:**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>

**GFUISYNC – Create Index Page BDE Chain for Hardening**

The component identifier is **RSN_ISYNC**. The module ID halfword is **X’5B8E’**.

Global reason codes:
### RSN_ISYNC + IMF_Root_Is_Damaged (X’A076’)

While processing the directory IBlocks for file system sync, a check is made to ensure that the index page is structurally sound. It is better to abend here than to write the index page to disk.

**Probable cause:** This is a logic error in somewhere in the HFS.

**Action:** Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support.

</table>
RSN_ISYNC + X'113' RSN_ISYNC_Invalid_Down_Delete1
This is a check in Free RPN processing. If the IBlock is marked for deletion, then GFUISYNC will free the RPN for reuse. This abend occurred because GFUISYNC detected that the parent of the deleted page had an index level of one. This would indicate that the parent page was a sequence set page.

*Probable cause:* This is a logic error in GFUISYNC.

*Action:* Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support.

RSN_ISYNC + X'114' RSN_ISYNC_Invalid_Parent_IBLK
This is a check in Free RPN processing. If the IBlock is marked for deletion, then GFUISYNC will free the RPN for reuse. This abend occurred because GFUISYNC detected that the parent of the deleted page did not need to be sync'd. This is an error because when a low level page needs to be sync'd, then the parent should be updated and marked as needing sync also.

*Probable cause:* This is a logic error in GFUISYNC.

*Action:* Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support.

**GFUNCNDS: vn_cnds()– Create New I/O Buffer Data Space**

## GFUPFDM: Internal File Data Manager (FDM) Functions

The component identifier is **RSN_PFDM**. The module ID halfword is **X'5B15'**.

### Global reason codes: None

### Local reason codes:
Value | Description
--- | ---
RSN_PFDM + X'101' | RSN_PFDM_HFRFN_Latch_Held
The latch to serialize the High Formatted page of the HFS is still held at a point where it should have been released.

Probable cause: An internal error occurred.
Action: Unmounting and remounting the HFS should release the latch.

RSN_PFDM + X'102' | RSN_PFDM_ZWrite_IO_Error
The HFS I/O routine reported an I/O error while trying to flush file data buffers to disk.

Probable cause: The client does not have access to an extent reported by the server.
Action: Make sure that all the volumes used by this HFS are online and accessible to this client.

RSN_PFDM + X'103' | RSN_PFDM_ZWrite_Error
The HFS I/O routine reported an error while trying to flush file data buffers to disk.

Probable cause: I/O error or internal error.
Action: Make sure that all the volumes used by this HFS are online and accessible.

GFUPFPM – Internal File Page Manager Procedures
The component identifier is RSN_PFPM. The module ID halfword is X'5B0F'.

Global reason codes:
Value | Description
--- | ---
RSN_PFPM + | RSN_PFPM_Out_Of_Memory
HFS_RSN_Out_Of_Memory (X'0016') | A GETBLOCK from the FPMB pool failed during XP_Read_FPM or XP_Add_FPM_Pages.

Probable cause: The FPMB pool is full and cannot be extended.
Action: Make sure there is enough memory for HFS cell pools to be extended.

Local reason codes:
Value | Description
--- | ---
RSN_PFPM + X'101' | RSN_PFPM_Realloc_Same_RPN_Error
The same RPN is being reallocated (not a sparse entry).

Probable cause: HFS corruption or internal error.
Action: Make sure the HFS is not corrupted or contact IBM Support.
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>

</tbody>
</table>

**GFUPFSCK – Internal File System Check Procedures**

The component identifier is **RSN_PFSCK**. The module ID halfword is **X'5B13'**.

**Global reason codes:** None

**Local reason codes:**
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| RSN_PFSCK + X'101' | **RSN_PFSCK_Duplicate_VDF_VPTVFN**  
The same index page is being pointed to by multiple VDF entries. This HFS is corrupted.  
*Probable cause:* Internal error. An index page was doubly allocated.  
*Action:* Send the problem to IBM Support. The only known customer workaround to this problem is to rebuild the HFS. |
| RSN_PFSCK + X'102' | **RSN_PFSCK_FPM_Item_Mismatch_Prev_HIRPN**  
The FPM record key item number does not match the expected value based on the last relative page number (RPN) of the previous FPM for the file.  
*Probable cause:* Internal error. It is probably an indication of a residual FPM which was not properly deleted.  
*Action:* Send the problem to IBM Support. The only known customer workaround to this problem is to rebuild the HFS. |
| RSN_PFSCK + X'103' | **RSN_PFSCK_FPMB_NextRPN_Mismatch_PrevRPN**  
The relative page number (RPN) of an FPMB entry does not match the expected value based on the RPN of the previous entry.  
*Probable cause:* Internal logic error.  
*Action:* Contact IBM Support. The only known customer workaround to this problem is to rebuild the HFS. |
| RSN_PFSCK + X'104' | **RSN_PFSCK_Contiguous_Sparse_Entries**  
Multiple contiguous sparse page entries were detected in the File's FPMB (space maps).  
*Probable cause:* Internal logic error.  
*Action:* Contact IBM Support. The only known customer workaround to this problem is to rebuild the HFS. |
| RSN_PFSCK + X'105' | **RSN_PFSCK_HIRPN_Mismatch_RPN**  
The file's high relative page number (RPN) does not match the expected value based on the last RPN in the FPMBs.  
*Probable cause:* Internal logic error.  
*Action:* Contact IBM Support. The only known customer workaround to this problem is to rebuild the HFS. |
| RSN_PFSCK + X'106' | **RSN_PFSCK_FPM_Count_Error**  
The file's FPM List Count exceeds the maximum valid value.  
*Probable cause:* Internal logic error.  
*Action:* Contact IBM Support. The only known customer workaround to this problem is to rebuild the HFS. |

| RSN_PISRV + IMF_Invalid_Cursor (X'A04D') | RSN_PISRV_IMF_Invalid_Cursor The cursor does not have a valid eyecatcher.  
Probable cause: The caller of the Index Manager failed to provide a valid cursor. This is required on all index generic-read operations.  
Action: Check input parameters used on the GFUISERV macro call to the HFS Index Manager. Ensure that the cursor that was supplied is initialized correctly on all IMF read operations. |
| RSN_PISRV + IMF_Invalid_Search_Mode (X'A04E') | RSN_PISRV_IMF_Invalid_Search_Mode Invalid search mode has been specified.  
Probable cause: The caller of the Index Manager failed to provide a search mode that is consistent with the type of index operation requested.  
Action: Check input parameters used on the GFUISERV macro call to the HFS Index Manager. If the caller supplied index search mode values, ensure that they are compatible with the type of index request. |
| RSN_PISRV + IMF_Inv_Gen_Search_Mode (X'A054') | RSN_PISRV_IMF_Inv_Gen_Search_Mode Invalid search mode has been specified with GENERIC keyword.  
Probable cause: The caller of the Index Manager failed to provide a search mode that is consistent with the type of index operation requested.  
Action: Check input parameters used on the GFUISERV macro call to the HFS Index Manager. If the caller supplied index search mode values, ensure that they are compatible with the type of index request. |
| RSN_PISRV + IMF_Zero_Feedback_Addr (X'A04C') | RSN_PISRV_IMF_Zero_Feedback_Addr The address of the feedback area was found to be zero.  
Probable cause: The caller of the Index Manager failed to provide a feedback area. This is required on all index read operations.  
Action: Check input parameters used on the GFUISERV macro call to the HFS Index Manager. Ensure that the feedback area address is supplied on all IMF read operations. |

### Local reason codes:

Chapter 3. Reason codes (errnojr) 759
Value Description

RSN_PISRV + X'100' RSN_PISRV_IMF_Bad_IXB
The IXB supplied by the caller does not have a valid eyecatcher.

*Probable cause:* The caller of the Index Manager failed to provide a valid IXB control block. The IXB is required on all calls to the Index Manager.

*Action:* Check input parameters used on the GFUISERV macro call to the HFS Index Manager. Ensure that the IXB that was supplied is initialized correctly.

RSN_PISRV + X'101' RSN_PISRV_IMF_Bad_IUW_SIR_Len
On an insert, update, or write call the length value within the SIR was invalid.

*Probable cause:* The caller of the Index Manager must set the SIR length within the SIR record.

*Action:* Check input parameters used on the GFUISERV macro call to the HFS Index Manager.

RSN_PISRV + X'103' RSN_PISRV_Bad_GEN_Del_Key_Len
On a Generic Read call, the generic key length was an invalid value.

*Probable cause:* The caller of the Index Manager must supply a generic key length that is less than or equal to the directories’ key length.

*Action:* Check input parameters used on the GFUISERV macro call to the HFS Index Manager.

RSN_PISRV + X'104' RSN_PISRV_Bad_GEN_Read_Key_Len
On a Generic Read call, the generic key length was an invalid value.

*Probable cause:* The caller of the Index Manager must supply a generic key length that is less than or equal to the directories’ key length.

*Action:* Check input parameters used on the GFUISERV macro call to the HFS Index Manager.

**GFUPLAD – Internal Locate AD Index Page Procedure**
The component identifier is RSN_PLAD. The module ID halfword is X'5B0D'.

**Global reason codes:** None

**Local reason codes:**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| RSN_PLAD + X'101'  | RSN_PLAD_Ran_Off_VDB_Chain
Locate_AD_page came to the end of the VDF chain, while searching the VDF chain for the target VDF page.

*Probable cause:* This is a structure error in the chain of VDF pages. The HFS data set is damaged.

*Action:* Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support.
Value Description
---
RSN_PLAD + X'102' RSN_PLAD_Bad_VDF_ID

While searching the VDF page chain, Locate_AD_page found that a VDF page was not valid.

*Probable cause:* This is a structure error in the chain of VDF pages. The HFS data set is damaged.

*Action:* Save the output from the failing job, the SVC dump, and any logrec data set records for the error. Contact IBM Support.

**GFUPPCTL – Process vfs_pfsctl file system functions on the Server in behalf of a Client.**
The component identifier is **RSN_PPCTL**. The module ID halfword is **X'5B16'**

**Global reason codes:**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSN_PPCTL +</td>
<td>RSN_GRMD_Lookup_Error</td>
</tr>
<tr>
<td>HFS_RSN_Missing_Hdr_Blob (X'002C')</td>

**Local reason codes:**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSN_PPCTL + X'103'</td>
<td>RSN_PPCTL_FS_Sync_Failed</td>
</tr>
</tbody>
</table>

The HFS pfsctl service ExtendFS function in the client to extend a filesystem on the server experienced an out of disk space condition during HFS file system sync processing.

*Probable cause:*
- There is not enough space in the primary allocation and no secondary allocation exists.
- An extend was attempted but the maximum number of extents, 255, has been reached.
- There was no free space on the volume; subsequently the HFS was unable to be extended.
- The HFS is single volume; HFS have a multivolume limit of 59.
- There is no free space on the volume where the HFS resides does not contain enough free space for the HFS to extend.
- The HFS is multivolume and has secondary allocation, but there are no candidate volumes that contain enough free space for the HFS to extend.

*Action:* If the allocation needs to be larger, take the appropriate action. Possibly scratch unneeded data sets from the volume, or run an access method ALTER command to add more candidate volumes to the Catalog entry for the data set.
GFUPRUP – Internal Free FPM Pages Procedure
The component identifier is RSN_PRUP. The module ID halfword is X'5B10'.

Global reason codes:

GFUPVDF – Internal VDF Management Procedures
The component identifier is RSN_PVDF. The module ID halfword is X'5B11'.

Global reason codes:
Value | Description
--- | ---
RSN_PVDF + | RSN_PVDF_Out_Of_Memory
HFS_RSN_Out_Of_Memory (X'0016') | Out of memory was encountered when getblocking a new VDB.

Probable cause: Either the system resources are being over utilized, or some function is not releasing storage when no longer required.

Action: Turn off functions, users, and so forth to reduce the system resource requirements and see if that alleviates the problem. If not, contact IBM Support.

Local reason codes:

Value | Description
--- | ---
RSN_PVDF + X'101' | RSN_PVDF_Invalid_VDF_Page
The VDF is invalid.

Probable cause: The VDF was freed or not initialized properly.

Action: Send the problem to IBM Support. There is no known customer workaround for this problem other than reconstructing a valid VDF.

GFUZINIT: I/O Manager Global Initialization
The component identifier is RSN_ZINI. The module ID halfword is X'5BC0'.

Global reason codes: None

Local reason codes:

Value | Description
--- | ---
RSN_ZINI+ X'101' | RSN_ZINI_1MMRE_Pool_CRE8_Failed
Attempt to create a cell pool via IGWFVSTR failed.

Probable cause: Possible programming error.

Action: Contact IBM Support.

RSN_ZINI + X'102' | RSN_ZINI_64MMRE_Pool_CRE8_Failed
Attempt to create a cell pool via IGWFVSTR failed.

Probable cause: Possible programming error.

Action: Contact IBM Support.

RSN_ZINI + X'103' | RSN_ZINI_NullBfr_GETMAIN_Failed
Attempt to GETMAIN storage via IGWFVSTR failed.

Probable cause: Possible programming error.

Action: Contact IBM Support.
### RSN_ZINI + X'104' RSN_ZINI_Load_DADSM_Ext_Routine_Failed
Attempt to load DADSM module IGG0553I failed.

**Probable cause:** Possible programming error.

**Action:** Contact IBM Support.

### RSN_ZINI + X'105' RSN_ZINI_Load_IORESUME_Routine_Failed
Attempt to load IOM module GFUZRSME failed.

**Probable cause:** Possible programming error.

**Action:** Contact IBM Support.

### RSN_ZINI + X'106' RSN_ZINI_Load_IOCOMP_Routine_Failed
Attempt to load IOM module GFUZIOTE failed.

**Probable cause:** Possible programming error.

**Action:** Contact IBM Support.

### RSN_ZINI + X'107' RSN_ZINI_Load_IOERR_Routine_Failed
Attempt to load IOM module GFUZIOER failed.

**Probable cause:** Possible programming error.

**Action:** Contact IBM Support.

<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| RSN_RDWR+X'126'        | **RSN_RDWR_Invalid_HFRFN**  
  An attempt was made to invalidly update DMIB_HFRFN with an RFN which is less than the value currently found in the DMIB.  
  **Probable cause:** Module internal logic error.  
  **Action:** Contact IBM Support. |
| RSN_RDWR+X'127'        | **RSN_RDWR_Fmt_Wrt_On_Client**  
  A format write was requested in a client system; only the server can perform format writes.  
  **Probable cause:** Internal logic error.  
  **Action:** Send the problem to IBM Support. |
| RSN_RDWR+X'128'        | **RSN_RDWR_CExtend_Failed**  
  This client tried to refresh the extent list, but the operation failed.  
  **Probable cause:** I/O error.  
  **Action:** Make sure that all the volumes used by this HFS are accessible to this client. |
| RSN_RDWR+X'129'        | **RSN_RDWR_Unavailable_Extents**  
  This client tried to refresh the extent list, but the operation failed.  
  **Probable cause:** The client does not have access to an extent reported by the server.  
  **Action:** Make sure that all the volumes used by this HFS are online and accessible to this client. |

### GFUZRSME – I/O Manager SRB Routine

The component identifier is **RSN_RSME**. The module ID halfword is **X'5BC3'**.

zSeries File System Reason Codes
Reason codes beginning with EF (as in EFxxrrrr) are documented in [z/OS Distributed File Service Messages and Codes](#).
Chapter 4. Exit Status Codes for /usr/sbin/init

This section lists the exit status codes for the ETCINIT job, /usr/sbin/init. For a discussion of the program itself, see [z/OS UNIX System Services Planning](#).

If /usr/sbin/init does not detect an error and the shell returns normally after executing the initialization script, /usr/sbin/init exits with status code 00.

If /usr/sbin/init detects an error or if the shell abnormally terminates, /usr/sbin/init exits with a two-digit, nonzero, hexadecimal status code, z/OS UNIX displays the nonzero /usr/sbin/init exit status on the operator console with the following message:

BPXI027I THE ETCINIT JOB ENDED IN ERROR, EXIT STATUS 0000ss00

**Note:** If the exit status shown is NOT of the form 0000ss00, but is of the form 000000xx, then the exit status was not set by the /usr/sbin/init process. See [z/OS UNIX System Services Programming](#) for a list of the signal numbers. If the status is 00000009, for example, the /usr/sbin/init process was ended by a SIGKILL signal. The SIGKILL signal may be the result of an abend.

Even if /usr/sbin/init exits with status 00, the shell may not have successfully executed the initialization script. To find out if it did, look at the /etc/log file, which contains standard output and error messages written by /usr/sbin/init, the shell, and initialization script commands.

**Note:** Even if /usr/sbin/init exits before invoking the shell or if the shell does not successfully execute the initialization script, z/OS UNIX makes the system available to all batch and interactive users when /usr/sbin/init exits.

Table 3 lists the exit status codes, ss, set by /usr/sbin/init when it exits due to an error.

**Table 3. Exit Status Codes for /usr/sbin/init (in hexadecimal)**

<table>

Appendix. Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully. The major accessibility features in z/OS enable users to:

- Use assistive technologies such as screen readers and screen magnifier software
- Operate specific or equivalent features using only the keyboard
- Customize display attributes such as color, contrast, and font size

Using assistive technologies

Assistive technology products, such as screen readers, function with the user interfaces found in z/OS. Consult the assistive technology documentation for specific information when using such products to access z/OS interfaces.

Keyboard navigation of the user interface

Users can access z/OS user interfaces using TSO/E or ISPF. Refer to z/OS TSO/E Primer, z/OS TSO/E User’s Guide and z/OS ISPF User’s Guide Vol I for information about accessing TSO/E and ISPF interfaces. These guides describe how to use TSO/E and ISPF, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

z/OS information

z/OS information is accessible using screen readers with the BookServer/Library Server versions of z/OS books in the Internet library at:

http://www.ibm.com/systems/z/os/zos/bkserv/

### Policy for unsupported hardware

Various z/OS elements, such as DFSMS™, HCD, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

### Trademarks
