About this information

This book contains information about (OCEP), which is a component of z/OS Integrated Security Services. Integrated Security Services works with the following components:
- z/OS Security Server Resource Access Facility (RACF)
- z/OS Firewall Technologies
- Lightweight Directory Access Protocol (LDAP) Server, which includes client and server function
- Open Cryptographic Enhanced Plug-ins

Purpose of this information

This information describes an overview of OCEP, the service provider modules that it provides, and how those modules work with Open Cryptographic Services Facility (OCSF) and Resource Access Control Facility (RACF) which comprises the Security Server component.

This information describes how to install and register the OCEP service provider modules for use with the OCSF Framework. In addition, it describes the application programming interfaces (APIs) that OCEP supports.

OCSF, which is a derivative of the IBM Keyworks technology, is an implementation of the Common Data Security Architecture (CDSA) for applications that run in the z/OS UNIX System Services (z/OS UNIX) environment.

Who should use this information

This information is written for programmers who have experience with writing and supporting security applications. Knowledge of the Open Cryptographic Services Facility (OCSF) Framework and the components of the z/OS Security Server is required. In addition, knowledge of the services provided by Integrated Cryptographic Service Facility (ICSF) is also helpful.

This information also provides guidance for system programmers to configure Open Cryptographic Enhanced Plug-ins (OCEP) for use on their z/OS systems. It describes how to install and register the OCEP service provider modules with the OCSF Framework.

In addition, this book should be used by application programmers who intend to use the functions and APIs supported by OCEP.

What this information contains

This information describes the Open Cryptographic Enhanced Plug-ins (OCEP) service provider modules and how they are intended to be used with the framework provided by OCSF. It also describes how these service provider modules enable applications to use, or an equivalent product, to provide security functions relating to digital certificates.
For detailed information about the OCSF Framework, see the following publications:

- z/OS Open Cryptographic Services Facility Application Programming
- z/OS Open Cryptographic Services Facility Service Provider Module Developer’s Guide and Reference

For information about RACF’s support for digital certificates and its interaction with OCEP, see the following publications:

- z/OS Security Server RACF Callable Services
- z/OS Security Server RACF Command Language Reference
- z/OS Security Server RACF Security Administrator’s Guide

For information about the publications that support the other elements of z/OS, see the z/OS Information Roadmap.
How to send your comments to IBM

We appreciate your input on this publication. Feel free to comment on the clarity, accuracy, and completeness of the information or provide any other feedback that you have.

Use one of the following methods to send your comments:

1. Send an email to mhvrcfs@us.ibm.com.
2. Send an email from the Contact us web page for z/OS (http://www.ibm.com/systems/z/os/zos/webqs.html).
3. Mail the comments to the following address:
   IBM Corporation
   Attention: MHVRCFS Reader Comments
   Department H6MA, Building 707
   2455 South Road
   Poughkeepsie, NY 12601-5400
   US
4. Fax the comments to us, as follows:
   From the United States and Canada: 1+845+432-9405
   From all other countries: Your international access code +1+845+432-9405

Include the following information:
- Your name and address.
- Your email address.
- Your telephone or fax number.
- The publication title and order number:
  z/OS Integrated Security Services Open Cryptographic Enhanced Plug-ins
  Application Programming
  SC14-7568-00
- The topic and page number that is related to your comment.
- The text of your comment.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute the comments in any way appropriate without incurring any obligation to you.

IBM or any other organizations use the personal information that you supply to contact you only about the issues that you submit.

If you have a technical problem

Do not use the feedback methods that are listed for sending comments. Instead, take one of the following actions:

- Contact your IBM service representative.
- Call IBM technical support.
- Visit the IBM Support Portal at z/OS support page (http://www.ibm.com/systems/z/support/)
Summary of changes

z/OS Version 2 Release 1

Refer to the following publications for specific enhancements for z/OS Version 2 Release 1:

- z/OS Summary of Message and Interface Changes
- z/OS Introduction and Release Guide
- z/OS Planning for Installation
- z/OS Migration
Chapter 1. Introducing OCEP

This section introduces the services that are provided by Open Cryptographic Enhanced Plug-ins (OCEP) and their relationship with Open Cryptographic Services Facility (OCSF) and z/OS Security Server RACF. (Any external security manager product that provides equivalent support may also be used.)

Overview

As Figure 1 on page 2 shows, OCEP consists of two service provider modules (which are also called “plug-ins”) that are intended to be used with the Open Cryptographic Services Facility (OCSF) Framework:

- Trust Policy
- Data Storage Library

These service provider modules enable applications to use z/OS Security Server (RACF), or equivalent product, to provide security functions for digital certificates and key rings.

The OCEP service provider modules implement a subset of the application programming interfaces (APIs) that are defined by OCSF. Applications can use these OCEP service provider modules, and their supported APIs, to retrieve and use digital certificates and private keys that are stored in the RACF database on a z/OS system.

In addition to the OCSF Framework, the OCEP service provider modules are intended to work with the OCSF Certificate Library and Cryptographic Service Provider modules. As Figure 1 on page 2 shows, the OCSF Framework itself manages the interactions between the service provider modules and the applications that use them.

For a detailed description of the OCSF application programming interfaces and the service provider modules that OCSF supports, see the following publications:

- z/OS Open Cryptographic Services Facility Application Programming
- z/OS Open Cryptographic Services Facility Service Provider Module Developer’s Guide and Reference
In the OCSF Framework, a trust policy (TP) service provider module implements policies that are defined by Certificate Authorities (CAs) and institutions. These policies define the level of trust that is required before certain actions can be performed. When a TP function has determined the trustworthiness of performing an action, the TP function may invoke other functions in a certificate library and a data storage library service provider module to carry out the mechanics of the approved action.

The OCEP Trust Policy service provider module implements the trust policy that is defined by a specific RACF key ring. (The OCEP Trust Policy service provider module, however, does not provide Certificate Revocation List support, as defined by OCSF.) It determines the validity of a certificate group (also called a “chain”) by checking if the chain originated from a trusted certificate authority or if the first entity in the chain is connected to the key ring as a SITE certificate. A SITE certificate is one that the RACF administrator has explicitly defined and added as a trusted certificate.
For each digital certificate in the chain, the OCEP Trust Policy service provider module checks the signatures and ensures that the certificate has not been marked as not trusted by RACF. When a certificate is defined, it is marked as being trusted or not trusted by specifying the TRUST or NOTRUST operand, respectively, on the RACDCERT command. When a certificate is trusted, it indicates that the certificate is valid for the user, site, or the issuing certificate authority. It also indicates that the private key to this certificate has not been compromised.

The chain must originate from a certificate authority that is trusted. You do not have to use the RACDCERT command to add each digital certificate in that chain to RACF. However, if an individual certificate has been added to RACF, it must be marked as trusted; if not, the verification will fail and RACF will not use it to map to a user ID.

The OCEP Trust Policy must use the OCEP Data Storage Library as its data library service provider module. In addition, the OCEP Trust Policy uses the IBM Certificate Library, Version 1 as its certificate library service provider. This module, which is provided with OCSF, verifies the syntax of the fields within the specific types of digital certificates. The OCEP Trust Policy also works with one of the cryptographic service providers that is supplied with OCSF. These service provider modules handle the cryptographic functions and policies that are associated with their specific cryptographic algorithms:

- IBM Software Cryptographic Service Provider, Version 1
- IBM Software Cryptographic Service Provider 2, Version 1
- IBM Weak Software Cryptographic Service Provider, Version 1
- IBM Weak Software Cryptographic Service Provider 2, Version 1

For more information about the OCEP Trust Policy service provider module and the supported API, see Chapter 3, “Using the Trust Policy services,” on page 13. For information about the certificate library and cryptographic service provider modules that are provided in OCSF, see [z/OS Open Cryptographic Services Facility Application Programming](#).

**OCEP data storage library**

Within the OCSF framework, a data storage library service provider module provides persistent storage of security-related objects, such as digital certificates and keys. The OCEP Data Storage Library service provider module is designed to give applications read-only access to key ring information that has been defined and stored in the RACF database.

When the proper authorizations are established, OCEP can access this information from the RACF database. As Table 1 shows, an application can use the OCEP Data Storage Library service provider module to query specific fields in the certificate record.

<p>| <strong>Table 1. Queriable Fields in the Certificate Record</strong> |</p>
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>The value that identifies the certificate; it must be unique within the certificate class and user ID.</td>
<td>1-32 characters (specified in RACF)</td>
</tr>
</tbody>
</table>

For example, the label “CA Cert” may be used for a certificate for an individual user and for a certificate authority’s certificate. Also, two different users may mark their private keys as “My Key”.

Chapter 1. Introducing OCEP 3
### Table 1. Queriable Fields in the Certificate Record (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject DN</td>
<td>The DER-encoded X.500 Subject's Distinguished Name; it is not unique to this certificate.</td>
<td>256 bytes or less</td>
</tr>
<tr>
<td>Default for Ring Attribute</td>
<td>A binary boolean field that indicates if a default is specified; the value is unique to this certificate:</td>
<td>4 bytes</td>
</tr>
<tr>
<td></td>
<td>Zero</td>
<td>Not default</td>
</tr>
<tr>
<td></td>
<td>Nonzero</td>
<td>Default</td>
</tr>
</tbody>
</table>

In response to a query, the following information about the certificate will be returned to the application:

- DER-encoded certificate
- Private key for a user certificate, if it exists and if the calling user ID owns this certificate
- RACF user ID that owns the certificate
- Label associated with this certificate
- Subject DN
- Key type
- Key size

This information is only returned for certificates that have been marked as trusted by RACF. If the certificate is not trusted, it will not be returned to the application.

For more information about the OCEP Data Library service provider module and the supported APIs, see Chapter 4, “Using data storage library services,” on page 21.

### z/OS Security Server (RACF) support

In addition to supporting profiles for digital certificates, the RACF database supports the following classes of certificates (in the OCSF Framework, this is known as “semantic information”). Users who have the proper authority can issue a series of RACDCERT commands to create the certificate and key pairs and populate the RACF database with this information:

- User (server) certificates with optional private keys stored under the owning user ID
- Certificate Authorities (no private keys) that are stored at the system level under a unique user ID
- Site certificates (no private keys) that are stored at the system level under another unique user ID

In addition, RACF supports the concept of “user-defined key rings” (in the OCSF Framework, these are known as “data stores”). A key ring is stored under the owning user ID and may contain any of the preceding types of certificates. Entries in a key ring point to certificate records and contain additional attributes, such as:

- Default certificate/key
- Ring usage for the certificate/key

For example, the user key may be marked as a trusted root. The certificate record would still exist at the user level but it would be treated as a certificate authority for this key ring only.
Developing security applications

The OCEP service provider modules are designed to plug into the OCSF Framework. As such, applications that wish to use these service provider modules must understand and follow the OCSF requirements and conventions. For example, OCSF provides a set of APIs to perform core services, such as:

- Installing and attaching service provider modules
  The calling application uses the OCSF CSSM_ModuleAttach function, for example, to attach the specified OCEP service provider modules. CSSM_ModuleAttach then returns a handle value that represents a unique pairing between the calling application and the specific OCEP service provider module. The calling routine must then specify this handle when it invokes an API that is supported by an OCEP service provider. See “Example Code Using the OCEP Trust Policy APIs” on page 16 for an example.
- Querying the OCSF registry of available service provider modules
- Enabling calls to other APIs
- Managing storage
- Managing errors

In addition, because service provider modules may implement the OCSF APIs differently, you should be aware of any differences between the parameters that are supported. For example, OCSF also provides trust policy and data storage library service provider modules. However, the way in which the APIs are implemented by these OCSF service provider modules support differs from the way they are implemented by OCEP. You should review your applications to ensure that they can correctly use the APIs, as they are supported by the OCEP service provider modules.

For more information about these OCSF requirements, see z/OS Open Cryptographic Services Facility Service Provider Module Developer’s Guide and Reference.
Chapter 2. Configuring and getting started

This chapter describes the procedures that you need to perform after you have completed the installation of the Open Cryptographic Enhanced Plug-ins (OCEP) code on your system. For information about these installation procedures, see z/OS Planning for Installation and z/OS Program Directory that is supplied with your product order.

Verifying the OCSF installation and configuration

Before you can run any applications that use the OCEP service provider modules, you must first ensure that several tasks have been completed for Open Cryptographic Services Facility (OCSF). The following items must be reviewed and completed:

• The OCSF code must be properly installed and configured on your system.
• Any necessary security authorizations must be granted and program controls must be established.
• The required RACF FACILITY class profiles (CDS.*) must be defined for OCSF.
• z/OS user identities must be authorized to access the CDS.* FACILITY class profiles.

For more information about the configuration requirements for OCSF, see the z/OS Open Cryptographic Services Facility Application Programming.

Configuring the OCEP installation

The following sections describe the actions that are required to configure OCEP for use on your system.

Authorizing daemon and user identities

IBM recommends that you assign unique z/OS and z/OS UNIX user identifiers (UIDs) to the daemons and applications that are authorized to use OCEP and OCSF services. This approach will maintain individual accountability for applications that are accessing cryptographic services on z/OS.

For example, assume that the following daemon application needs to use OCEP and OCSF services on z/OS. This daemon runs under the z/OS shell and the application is started by the daemon's profile.

<table>
<thead>
<tr>
<th>UID</th>
<th>RACF Identity (User ID)</th>
<th>Home Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>25</td>
<td>G092799</td>
<td>/u/apps/g092799</td>
</tr>
</tbody>
</table>

To create a RACF user profile with an OMVS segment, you would issue the following RACF ADDUSER command:

adduser g092799 omvs(uid(25) home('/u/apps/g092799') program('/bin/sh'))

For more information about how to define a RACF user ID, see the z/OS Security Server RACF Command Language Reference and the z/OS Security Server RACF Security Administrator’s Guide.
Getting Started

In addition, IBM recommends that the OCEP installation and verification scripts (see "Installing the OCEP code" on page 10 and "Verifying OCEP installation" on page 11) are run from a superuser; that is, a user ID that has been defined with a UID of 0.

For more information about how to define entities for daemons and applications on z/OS, see z/OS UNIX System Services Planning.

Granting access to RACF FACILITY class profiles

To use the services offered by OCEP, the user IDs that are associated with the daemon applications must be authorized to access RACF FACILITY class profiles. See Table 2 for a list of these FACILITY class profiles and the type of access that is required.

Table 2. Required FACILITY Class Profiles

<table>
<thead>
<tr>
<th>FACILITY Class Profile</th>
<th>Access</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>IRR.DIGTCERT.LIST</td>
<td>READ</td>
<td>Enables the caller to use the &quot;CSSM_TP_CertGroupVerify&quot; on page 14 function.</td>
</tr>
<tr>
<td>IRR.DIGTCERT.LISTRING</td>
<td>READ</td>
<td>Enables the caller to use the &quot;CSSM_DL_DataGetFirst&quot; on page 24 and the &quot;CSSM_TP_CertGroupVerify&quot; on page 14 functions to retrieve the contents of a key ring that is associated with the user's own user ID.</td>
</tr>
<tr>
<td></td>
<td>UPDATE</td>
<td>Enables the caller to use the &quot;CSSM_DL_DataGetFirst&quot; on page 24 and the &quot;CSSM_TP_CertGroupVerify&quot; on page 14 functions to retrieve the contents of a key ring that is associated with another user's user ID.</td>
</tr>
</tbody>
</table>

In addition, these user IDs must be authorized to access the CDS.* FACILITY class profiles that are required to access the OCSF Framework.

To define these FACILITY class profiles, you would issue the following RDEFINE commands:

```
rdefine facility irr.digtcert.list uacc (none)
rdefine facility irr.digtcert.lstring uacc (none)
```

Next, the user ID that is associated with the daemon or application that will call OCEP must be authorized to use the new FACILITY class profiles. For example, to permit the user ID G092799 to access these class profiles, you would issue the following RACF PERMIT commands:

```
permit irr.digtcert.list class(facility) id(g092799) acc(read)
permit irr.digtcert.lstring class(facility) id(g092799) acc(read)
```

Depending on the specific requirements of the application, you may also need to authorize the daemon user ID to access other class profiles.

For easier administration, you can also define a group for the user IDs that are associated with the applications that will use OCEP. This group can then be permitted to access the appropriate RACF FACILITY class profiles. Individual users can then be connected, as needed, to the group.
For more information about how to define RACF groups and grant access to the FACILITY class profiles, see the z/OS Security Server RACF Command Language Reference and the z/OS Security Server RACF Security Administrator’s Guide.

For more information about the class authorizations that are required for OCSF, see z/OS Open Cryptographic Services Facility Application Programming.

Establishing program control
Program control is the concept of having “trusted” applications. Your installation can define libraries to RACF where these trusted applications will reside. You can activate program control on your system by issuing the RACF command SETROPTS WHEN(PROGRAM). When program control is active, processes will be marked “dirty” if they attempt to load programs from libraries that are not trusted.

z/OS UNIX also has the concept of trusted applications. In the UNIX file system, executable files may be tagged with the program-controlled extended attribute. If a user issues a z/OS UNIX shell command or runs a program that does not have the program-controlled extended attribute, the process becomes “dirty”; in either case, the process is never “cleaned”. That is, the “dirty bit” remains on, which will cause certain services to fail as a result.

Establishing program control in RACF
By protecting individual load modules (programs) by creating a profile for the program in the RACF PROGRAM general resource class. A program that is protected by a profile in the PROGRAM class is called a controlled program. When RACF program control is activated on your system, OCEP also requires the following program libraries to be program-controlled:

- Language Environment, which includes the C/C++ run-time libraries
- Integrated Cryptographic Service Facility (ICSF), if it is used

For more information about RACF program control, see z/OS Security Server RACF Security Administrator’s Guide.

Establishing program control in HFS
You can mark programs and dynamically loaded libraries (DLLs) in the hierarchical file system (HFS) as being controlled (“trusted”). To do so, you must turn on the program-controlled extended attribute for the HFS file that contains the program or DLL. To turn on this extended attribute, issue the following z/OS UNIX shell command:

```
$ extattr +p filename
```

The OCSF dynamic link libraries and the files that comprise the OCEP service provider modules must have the program-controlled extended attribute. To check if a file has the program-controlled extended attribute, issue the shell command ls with the -E option. In the following example, this command is issued to verify that the program-controlled attribute is set for an OCEP file called ibmoceptp.so:

```
$ cd /usr/lpp/ocsf/addins
$ ls -E ibmoceptp.so
-rwxr-xr-x -p 2 ROOT SYS1 737280 Nov 3 22:07 ibmoceptp.so
```

The p flag in the command output indicates that this file has the program-controlled extended attribute. See z/OS UNIX System Services Command.
Reference and z/OS UNIX System Services Planning for more information about the z/OS UNIX shell commands and the program-controlled attribute.

Refreshing RACF data

After all of the z/OS Security Server (RACF) definitions have been made, the FACILITY class must be refreshed if it is RACLISTed. To do so, issue the following command:

```bash
setropts raclist(facility) refresh
```

If the FACILITY class is not active, you may activate it with the following command:

```bash
setropts classact(facility)
```

If you added members to the PROGRAM class profiles, program control for those members will not be in effect until you issue the following command:

```bash
setropts when(program) refresh
```

For more information about refreshing RACF data, see the z/OS Security Server RACF Security Administrator’s Guide. For complete command syntax information, see z/OS Security Server RACF Command Language Reference.

Installing the OCEP code

OCEP provides an installation script, called `ocep_install`, that installs the OCEP code and registers the service provider modules with the OCSF Framework. You must run the OCEP installation script from a z/OS UNIX shell session. IBM recommends that the script be run from a superuser, which is a user ID that has been defined with a UID of 0.

To install the OCEP service provider modules, perform the following steps:

1. Ensure that OCSF has been properly installed on your system by running the install verification procedure (IVP), `ocsf_baseivp`.
   For more information about installing OCSF and running the verification procedure, see z/OS Open Cryptographic Services Facility Application Programming.

2. Go to the directory where OCEP is installed, for example:
   ```bash
cd /usr/lpp/ocsf/bin
   ```

3. Run the OCEP installation script:
   ```bash
   ocep_install
   ```
   You will receive the following output:
   ```bash
   Installing IBMOCEPTP...
   Addin successfully installed.
   Installing IBMOCEPDL...
   Addin successfully installed.
   ```

Need more information about the installation script? See README.ocep_ivp file in the `/user/lpp/ocsf/ivp` directory for more information about this installation script.
Verifying OCEP installation

After you have completed the steps described in "Installing the OCEP code" on page 10, you must run `ocep_ivp`, the OCEP installation verification program, to ensure that the OCEP code is installed and configured correctly. As with the installation script, IBM recommends that this IVP be run from a superuser, which is a user ID that has been defined with a UID of 0.

To do so, perform the following steps:
1. Go to the directory that contains the IVP, for example:
   ```
   cd /usr/lpp/ocsf/ivp
   ```
2. Run the OCEP IVP program:
   ```
   ocep_ivp
   ```
   You will receive the following output:
   ```
   Starting OCEP IVP
   Initializing CSSM
   CSSM Initialized
   Attaching ibmocepdl
   Attach successful, Detaching ibmocepdl
   Detach of ibmocepdl successful
   Attaching ibmoceptp
   Attach successful, Detaching ibmoceptp
   Detach of ibmoceptp successful
   Completed OCEP IVP
   ```

   For more information about the installation verification procedure, see the README.ocep_ivp file in the /user/lpp/ocsf/ivp directory.

Uninstalling the OCEP Code

If you do not want to make OCEP available for use by applications, you can run the `ocep_uninstall` script, which is provided with OCEP. When you invoke this script, the OCEP service provider modules will no longer be registered to the OCSF Framework. IBM recommends that this script be run from a superuser.

To run this script, perform the following steps:
1. Go to the directory where OCEP is installed, for example:
   ```
   cd /usr/lpp/ocsf/bin
   ```
2. Run the OCEP script:
   ```
   ocep_uninstall
   ```
   You will receive the following output:
   ```
   Uninstalling IBMOCEPTP...
   Addin successfully uninstalled.
   Uninstalling IBMOCEPTP...
   Addin successfully uninstalled.
   ```
Chapter 3. Using the Trust Policy services

This section describes the OCEP Trust Policy service provider module. It also describes its implementation of the trust policy API, as defined in the OCSF Framework.

Using the trust policy module

After you complete the installation steps described in "Installing the OCEP code" on page 10, the following OCEP Trust Policy service provider files are available for use on your system.

<table>
<thead>
<tr>
<th>Function</th>
<th>Name</th>
<th>Directory Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header File</td>
<td>ibmoceptp.h</td>
<td>/user/lpp/ocsf/include</td>
</tr>
<tr>
<td>Executable Module</td>
<td>ibmoceptp.so</td>
<td>/user/lpp/ocsf/addins</td>
</tr>
</tbody>
</table>

To use the OCEP Trust Policy, an application must explicitly attach this service provider module. To do so, the application must use CSSM_ModuleAttach, which is an API provided by OCSF, to attach the specific GUID for the module. In turn, CSSM_ModuleAttach returns a handle that uniquely represents the pairing of the service provider module and the calling application.

The following GUID identifies the OCEP Trust Policy module; this GUID and other related constants are defined in the ibmoceptp.h header file:

```c
// {5e43b291-1c38-11d2-8688-0004ACF320BC}
static const CSSM_GUID IBMOCEPTP_GUID =
{ 0x5e43b291, 0x1c38, 0x11d2, { 0x86, 0x88, 0x0, 0x4, 0xac, 0xf3, 0x20, 0xbc } );
```

For more information about the CSSM_ModuleAttach function and developing security applications, see "z/OS Open Cryptographic Services Facility Programming".

Supported trust policy API

Table 3 summarizes the trust policy functions that are defined in the OCSF Framework and how they are supported by the OCEP Trust Policy service provider module.

<table>
<thead>
<tr>
<th>Function Name</th>
<th>Supported</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSSM_TP_ApplyCrlToDb</td>
<td>No</td>
<td></td>
</tr>
<tr>
<td>CSSM_TP_CertGroupConstruct</td>

### Trust Policy API

<table>
<thead>
<tr>
<th>Function Name</th>
<th>Supported</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSSM_TP_PassThrough</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The following section provides an overview of the API that is supported by the OCEP Trust Policy service provider module. Only the parameters and values that are unique to OCEP's implementation are described.

For a full description of the syntax and supporting parameters of the remaining APIs that are implemented in the OCSF Framework, see [z/OS Open Cryptographic Services Facility Application Programming](#).

### CSSM_TP_CertGroupVerify

**Description**

This function verifies a certificate chain, based on the Certificate Authorities and SITE certificates that are contained within the key ring.

**Format**

```c
CSSM_BOOL CSSM_API CSSM_TP_CertGroupVerify
(CSSM_TP_HANDLE TPHandle,
 CSSM_CL_HANDLE CLHandle,
 CSSM_DL_DB_LIST_PTR DBList,
 CSSM_CSP_HANDLE CSPHandle,
 const CSSM_FIELD_PTR PolicyIdentifiers,
 uint32 NumberOfPolicyIdentifiers,
 CSSM_TP_STOP_ON VerificationAbortOn,
 const CSSM_CERTGROUP_PTR CertToBeVerified,
 const CSSM_DATA_PTR AnchorCerts,
 uint32 NumberOfAnchorCerts,
 const CSSM_FIELD_PTR VerifyScope,
 uint32 ScopeSize,
 CSSM_TP_ACTION Action,
 const CSSM_DATA_PTR Data,
 CSSM_DATA_PTR *Evidence,
 uint32 *EvidenceSize)
```

**Parameters**

**TPHandle (input)**

the handle for this trust policy service provider module.

**CLHandle (input)**

specifies the handle to the required certificate library service provider module, IBM Certificate Library, Version 1. This service provider module is provided in OCSF and it must be attached by the calling application.

**DBList (input)**

identifies one DL and DB handle pair that represents a RACF key ring that was previously opened by a call to CSSM_DL_DbOpen. The DLHandle must be the handle that was returned by CSSM_ModuleAttach when the OCEP Data Storage Library service provider module was attached. This DLHandle is also specified on calls to the API [“CSSM_DL_DbOpen”](#) on page 23.

**CSPHandle (input)**

specifies the handle of one of the following cryptographic service provider
modules. These service provider modules are provided in OCSF; the selected service provider module must also be attached by the calling application:

- IBM Software Cryptographic Service Provider, Version 1
- IBM Software Cryptographic Service Provider 2, Version 1
- IBM Weak Software Cryptographic Service Provider, Version 1
- IBM Weak Software Cryptographic Service Provider 2, Version 1

**PolicyIdentifiers (input)**
this parameter is ignored and may be specified as NULL.

**NumberOfPolicyIdentifiers (input)**
this parameter is ignored and may be specified as 0.

**VerificationAbortOn (input)**
this parameter is ignored and may be specified as CSSM_TP_STOP_ON_POLICY.

**CertToBeVerified (input)**
a pointer to the CSSM_CERTGROUP structure containing a certificate that has at least one signed certificate for verification. An unsigned certificate template cannot be verified.

**AnchorCerts (input)**
this parameter is ignored and may be specified as NULL.

**NumberOfAnchorCerts (input)**
this parameter is ignored and may be specified as 0.

**VerifyScope (input)**
this parameter is ignored and may be specified as NULL.

**ScopeSize (input)**
this parameter is ignored and may be specified as 0.

**Action (input)**
this parameter is ignored and may be specified as 0.

**Data (input)**
this parameter is ignored and may be specified as NULL.

**Evidence (input)**
this parameter is ignored and may be specified as NULL.

**EvidenceSize (output)**
this parameter is ignored and may be specified as 0.

## Error Codes

Table 4 lists the error codes that are unique to OCEP’s support of the Trust Policy service provider module.

<table>
<thead>
<tr>
<th>Decimal Value</th>
<th>Error Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>8010</td>
<td>CA certificate not found in key ring</td>
</tr>
<tr>
<td>8011</td>
<td>Certificate chain not trusted</td>
</tr>
</tbody>
</table>

For information about the OCSF APIs that perform error reporting and recovery, plus a list of other OCSF-defined error codes, see [z/OS Open Cryptographic Services Facility Application Programming](#).
Trust Policy Example

"Example Code Using the OCEP Trust Policy APIs" shows a sample program that uses the trust policy API supported by OCEP. The *highlighted* entries demonstrate how to attach this service provider module and invoke the API; this sample also includes statements to attach the OCEP Data Storage Library service provider module.

**Example Code Using the OCEP Trust Policy APIs**

}
Chapter 4. Using data storage library services

This section describes the OCEP Data Storage Library service provider module. It also describes its implementation of the data library APIs that are defined in the OCSF Framework.

Using the data storage library services module

After you complete the installation steps described in “Installing the OCEP code” on page 10, the following OCEP Data Storage Library service provider files are available for use on your system.

<table>
<thead>
<tr>
<th>Function</th>
<th>Name</th>
<th>Directory Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header File</td>
<td>ibmocepdl.h</td>
<td>/user/lpp/ocsf/include</td>
</tr>
<tr>
<td>Executable Module</td>
<td>ibmocepdl.so</td>
<td>/user/lpp/ocsf/addins</td>
</tr>
</tbody>
</table>

To use the OCEP Data Storage Library Services, an application must explicitly attach this service provider module. To do so, the application must use CSSM_ModuleAttach, which is an API provided by OCSF, to attach the specific GUID for the service provider module. In turn, CSSM_ModuleAttach returns a handle that uniquely represents the pairing of the OCEP service provider module and the calling application.

The following GUID identifies the OCEP Data Storage Library service provider module; this GUID and other related constants are defined in the ibmocepdl.h header file:

```c
// {5E43B2A3-1C38-11d2-8688-0004ACF320BC}
static const CSSM_GUID IBMOCEPDL_GUID =
{ 0x5e43b2a3, 0x1c38, 0x11d2, { 0x86, 0x88, 0x0, 0x4, 0xac, 0xf3, 0x20, 0xbc } };```

For more information about the CSSM_ModuleAttach function and developing security applications, see the IBM z/OS Open Cryptographic Services Facility Application Programming.

Supported data library APIs

Table 5 summarizes the data library functions that are defined in the OCSF Framework and if they are supported by the OCEP Data Storage Library service provider module.

<table>
<thead>
<tr>
<th>Function Name</th>
<th>Supported</th>

</tr>
</tbody>
</table>

**Note:** The following sections provide an overview of the APIs that are supported by the OCEP Data Storage Library service provider modules. Only those parameters and values that are unique to OCEP's implementation are described.

For a full description of the syntax and supporting parameters of the remaining APIs that are implemented in the OCSF Framework, see [z/OS Open Cryptographic Services Facility Application Programming](#).

---

**CSSM_DL_AbortQuery**

**Description**

This function ends the query that was initiated by "CSSM_DL_DataGetFirst” on page 24 or "CSSM_DL_DataGetNext” on page 26. It releases the ResultsHandle that was returned by a previous query. The calling application must use this API to free the related storage that was obtained.

**Format**

```c
CSSM_RETURN CSSMAPI CSSM_DL_DataAbortQuery
   (CSSM_DL_DB_HANDLE DLDBHandle,
    CSSM_HANDLE ResultsHandle)
```

**Parameters**

- `DLDBHandle` *(input)*
  - specifies the RACF key ring handle; this is a required value.

- `ResultsHandle` *(input)*
  - is the handle returned by the function "CSSM_DL_DataGetFirst” on page 24.

---

**CSSM_DL_DbClose**

**Description**

This function closes an open key ring (data store). The calling application must use this API to free the related storage that was obtained.

**Format**

```c
CSSM_RETURN CSSMAPI CSSM_DL_DbClose
   (CSSM_DL_DB_HANDLE DLDBHandle)
```
Parameters

DLDBHandle (input)

specifies the RACF key ring handle; this is a required value.

CSSM_DL_DbOpen

Description

This function opens the specified key ring (data store).

Format

Parameters

DLHandle (input)

the handle that describes the data storage library module to be used to perform this function.

DbName (input)

a pointer to the string containing the logical name of the key ring (data store). This name has the following format:

userid/user-key ring

userid the 1-8 character user ID associated with this key ring; the user ID must be specified in uppercase characters.

user-key ring the case-sensitive ring name, which may contain up to 237 characters

AccessRequest (input)

indicates the requested access mode; this must be specified as READONLY.

UserAuthentication (input)

must be specified as NULL, as RACF access controls will be used to determine user authentication.

OpenParameters (input)

this parameter is ignored and must be specified as NULL.
CSSM_DL_DataGetFirst

CSSM_DL_DataGetFirst

Description

This function retrieves the first record in the key ring (data store) that matches the given selection criteria. Information is only returned for certificates that have been marked as trusted by RACF. If the certificate has not been marked as trusted, it is not returned to the application; that is, it is as if the certificate is not connected to the key ring.

The selection criteria is specified in the Query structure, which has specific characteristics when used with the OCEP Data Storage Library service provider module. The function returns a unique record identifier that is associated with the retrieved record. This identifier can then be used in other references to the retrieved data record. For example, it can be specified on calls to “CSSM_DL_FreeUniqueRecord” on page 27.

Note:
1. The calling application is responsible for freeing the storage that is acquired for the returned Data (including its sub-pieces CertData and PvtKeyData) and Attributes parameters. Also, the storage that was acquired for the CSSM_DB_UNIQUE_RECORD must be freed by calling “CSSM_DL_FreeUniqueRecord” on page 27. In addition, the storage that was acquired for the results handle must be freed by calling “CSSM_DL_AbortQuery” on page 22.

2. Because the private key data returned could be either an ICSF token label or a non-ICSF key, the application must attach the appropriate Cryptographic Service Provider (CSP) as identified by the CspId field in the CSSM_KEYHEADER.

Format

CSSM_DB_UNIQUE_RECORD_PTR CSSMAPI CSSM_DL_DataGetFirst
(CSSM_DL_DB_HANDLE DLDBHandle,
 const CSSM_QUERY_PTR Query,
 CSSM_HANDLE_PTR ResultsHandle,
 CSSM_BOOL *EndOfDataStore,
 CSSM_DB_RECORD_ATTRIBUTE_DATA_PTR Attributes,
 CSSM_DATA_PTR Data)

Parameters

DLDBHandle (input)
specifies the RACF key ring handle; this is a required value.

Query (input)
specifies the information that will be used to query the specified key ring; this is a required value and it must have the following structure:

RecordType
must be set to CSSM_DL_DB_RECORD_CERT.

Conjunctive
must be set to CSSM_DB_NONE.

NumSelectionPredicates
must be either 0 or 1. If set to 1, then SelectionPredicates must point to a CSSM_SELECTION_PREDICATE structure, which has the following format:
DbOperator
must be set to CSSM_DB_EQUAL

Attribute
one of the queriable attributes, coded as follows:

- Info.AttributeNameFormat, which must be set to
  CSSM_DB_ATTRIBUTE_NAME_AS_NUMBER
- Info.Label.AttributeNumber, which must be one the following
  values:
  - CSSM_DL_ATTRIBUTE_LABEL = 0x3 - Query on label
  - OCEP_DL_ATTRIBUTE_DEFAULT = 0x4 - Query on default
    flag (this constant is defined in the ibmocepdlh header file)
  - CSSM_DL_ATTRIBUTE_SUBJECT = 0x101 - Query on
    DER-encoded subject's name

ResultsHandle (output)
contains the key ring handle, which should be saved and used to retrieve
subsequent records that satisfied this query.

EndOfDataStore (output)
one of the following flags, which indicates if a record that satisfied this query
was available to be retrieved in the current operation:

- CSSM_FALSE
  a record was available and was retrieved, unless an error condition
  occurred.
- CSSM_TRUE
  all records satisfying the query have been previously retrieved and no
  record has been returned by this operation.

Attributes (output)
contains the attribute values of the retrieved record. This structure has the
following format:

SemanticInformation
a structure defined by CSSM_DB_CERTRECORD_SEMANTICS; the
following flags are supported:
- CSSM_DB_CERT_USE_TRUSTED, which indicates this is a Certificate
  Authority certificate.
- CSSM_DB_CERT_USE_OWNER, which indicates this is User/Server
  certificate, with a possible private key.

If neither bit is set, a SITE certificate is indicated. A SITE certificate is one
that the RACF administrator has explicitly defined and added as a trusted
certificate.

NumberOfAttributes
indicates the number of CSSM_DB_ATTRIBUTE_DATA structures that are
pointed to by Attributes. Each of these structures will be coded as the
Query attribute, as described above. In addition, the following
non-queriable attribute will also be present:
- CSSM_DL_ATTRIBUTE_ID = 0x101 - The RACF user ID that is
  associated with this certificate profile

Data (output)
is a pointer to a CSSM_DATA structure that contains the nonattribute record
data; for RACF, this is the certificate and an optional private key. Data->Data
will point to the following structure:
typedef struct ocep_cert_key_record {
    CSSM_DATA CertData; //DER encoded certificate
    CSSM_KEY PrvtKeyData; //Optional Private key,
    //KeyData.Length=KeyData.Data=NULL if not present
} OCEP_CERT_KEY_RECORD, *OCEP_CERT_KEY_RECORD_PTR

CSSM_DL_DataGetNext

Description

This function retrieves the next data record in the key ring that matches the
selection criteria (specified by the "CSSM_DL_DataGetFirst" on page 24 function).
Information is only returned for certificates that have been marked as trusted by
RACF; if the certificate has not been marked as trusted, it will not be returned to
the calling application.

Format

CSSM_DB_UNIQUE_RECORD_PTR CSSMAPI CSSM_DL_DataGetNext
(CSSM_DL_DB_HANDLE DLDBHandle,
CSSM_HANDLE ResultsHandle,
CSSM_BOOL *EndOfDataStore,
CSSM_DB_RECORD_ATTRIBUTE_DATA_PTR Attributes,
CSSM_DATA_PTR Data)

Parameters

DLDBHandle (input)
specifies the RACF key ring handle; this is a required value.

ResultsHandle (input)
this is the handle that is returned by the "CSSM_DL_DataGetFirst" on page 24
function.

EndOfDataStore (output)
one of the following flags, which indicates if a record that satisfied this query
was available to be retrieved in the current operation:

CSSM_FALSE
a record was available and was retrieved, unless an error condition
occurred.

CSSM_TRUE
all records satisfying the query have been previously retrieved and no
record has been returned by this operation.

Attributes (output)
contains the attribute values of the retrieved record. This structure has the
following format:

SemanticInformation
a structure defined by CSSM_DB_CERTRECORD_SEMANTICS; the
following flags are supported:
- CSSM_DB_CERT_USE_TRUSTED, which indicates this is a Certificate
Authority certificate.
- CSSM_DB_CERT_USE_OWNER, which indicates this is a User/Server
certificate, with a possible private key.

If neither bit is set, a SITE certificate is indicated. A SITE certificate is one
that the RACF administrator has explicitly defined and added as a trusted
certificate.
**NumberOfAttributes**

indicates the number of CSSM_DB_ATTRIBUTE_DATA structures that are pointed to by `Attributes`. Each of these structure will be coded as the `Query` attribute (as described in "CSSM_DL_DataGetFirst" on page 24). In addition, the following non-queriable attribute will also be present:

- **CSSM_DL_ATTRIBUTE_ID = 0x101** - The RACF user ID that is associated with this certificate profile.

**Data (output)**

is a pointer to a CSSM_DATA structure that contains the nonattribute record data; for RACF, this is the certificate and an optional private key. `Data->Data` will point to the following structure:

```c
typedef struct ocep_cert_key_record {
  CSSM_DATA CertData; //DER encoded certificate
  CSSM_KEY PrvtKeyData; //Optional Private key,
  //KeyData.Length=KeyData.Data=NULL if not present
} OCEP_CERT_KEY_RECORD, *OCEP_CERT_KEY_RECORD_PTR
```

**CSSM_DL_FreeUniqueRecord**

**Description**

Frees the pointer to the unique record ID that is returned by the "CSSM_DL_DataGetFirst" on page 24 or "CSSM_DL_DataGetNext" on page 26 functions. The record itself and the data it contains are unchanged. The calling application must use this API to free the related storage that was obtained.

**Format**

```c
CSSM_RETURN CSSMAPI CSSM_DL_FreeUniqueRecord
(CSSM_DL_DB_HANDLE DLDBHandle,
 CSSM_DB_UNIQUE_RECORD_PTR UniqueRecord)
```

**Parameters**

- **DLDBHandle (input)** specifies the RACF key ring handle; this is a required value.
- **UniqueRecord (input)** the unique record ID (CSSM_DB_UNIQUE_RECORD), which is returned by "CSSM_DL_DataGetFirst" on page 24 or "CSSM_DL_DataGetNext" on page 26.

**Error codes**

[Table 6] lists the error codes that are unique to OCEP’s support of the Data Storage Library Services APIs.

<table>
<thead>
<tr>
<th>Decimal Value</th>
<th>Error Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>6010</td>
<td>Number of selection predicates exceeded the maximum</td>
</tr>
<tr>
<td>6011</td>
<td>Incorrect attribute length was specified</td>
</tr>
<tr>
<td>6012</td>
<td>Incorrect <code>DBName</code> specified</td>
</tr>
<tr>
<td>6013</td>
<td>Incorrect user ID length specified</td>
</tr>
<tr>
<td>6014</td>
<td>Ring name is missing</td>
</tr>
<tr>
<td>6015</td>
<td>Unsupported access request type</td>
</tr>
<tr>
<td>6016</td>
<td>SAF service (IRRSDL00) not available</td>
</tr>
</tbody>
</table>
Table 6. OCEP Data Storage Library Error Codes (continued)

<table>
<thead>
<tr>
<th>Decimal Value</th>
<th>Error Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>6800 - 6899</td>
<td>Errors that are returned by the IRRSDL00 (R_datalib) callable service. The last two decimal digits represent the reason code returned from the service. See the z/OS Security Server RACF Callable Services book for more information about these error codes.</td>
</tr>
</tbody>
</table>

For information about the OCSF APIs that perform error reporting and recovery, plus a list of other OCSF-defined error codes, see z/OS Open Cryptographic Services Facility Application Programming.

Data storage library example

"Example Code Using the OCEP Data Storage Library Services APIs" shows excerpts from a sample program that uses the data storage library APIs that are supported by OCEP; this is not a complete program. For an example of how to attach the OCEP Data Storage Library service provider module, see the sample program in "Example Code Using the OCEP Trust Policy APIs" on page 16.

The highlighted entries demonstrate how you can use the supported APIs to extract the default certificate and private key from a key ring called “MyRing”. The key ring is owned by user ID WEBSRVR. This example also returns the DER-encoded subject’s distinguished name.

Example Code Using the OCEP Data Storage Library Services APIs

```c
#include "ibmocepdl.h"

/* Declare the key ring info */
CSSM_DL_DB_HANDLE Handles;
CSSM_DB_ACCESS_TYPE READONLY = { CSSM_TRUE, CSSM_FALSE, CSSM_FALSE, CSSM_FALSE };
char ringname[] = "WEBSRVR/MyRing";

/* Declare one attribute to search on, DEFAULT*/
CSSM_SELECTION_PREDICATE DefFlag;
CSSM_QUERY MyQuery;
int YES = 1;

/* Declare the output fields */
CSSM_DB_UNIQUE_RECORD_PTR Record_ID;
CSSM_HANDLE OutScanHandle;
CSSM_BDLO EData;
CSSM_DB_RECORD_ATTRIBUTE_DATA OutAttributes;
OCEP_CERT_KEY_RECORD *MyCertAndKey;
CSSM_DATA OutData, MyCert, MySubjectsName;
CSSM_KEY MyKey;

/* Declare misc */
CSSM_DB_ATTRIBUTE_DATA_PTR p;
int i;

/* Open the key ring. This assumes the OCEP DL has already been attached and Handles.DLHandle set */
Handles.DLHandle=
CSSM_DL_DbOpen(Handles.DLHandle, ringname, READONLY, NULL, NULL);

/* Setup the attribute value */
DefFlag.DbOperator= CSSM_DB_EQUAL;
DefFlag.Attribute.Value.Length=Size_Of(YES); // Length must be four bytes
DefFlag.Attribute.Value.Data= &YES;
DefFlag.Attribute.Info.AttributeNameFormat= CSSM_DB_ATTRIBUTE_NAME_AS_NUMBER;
DefFlagAttribute.Info.Label.AttributeNumber= OCEP_DL_ATTRIBUTE_DEFAULT;
```
/* Prepare the query */
MyQuery.RecordType= CSSM_DL_DB_RECORD_CERT;
MyQuery.Conjunctive= CSSM_DB_NONE;
MyQuery.NumSelectionPredicates= 1;
MyQuery.SelectionPredicate= &DefFlag;
Record_ID= CSSM_DL_DataGetFirst(Handles,MyQuery,&OutScanHandle,&EOData,&OutAttributes,&OutData);
if (!EOData && Record_ID) // If record returned
{
    /* Get the DER encoded certificate */
    MyCertAndKey= OutData.Data; // Data points to an OCEP_CERT_KEY_RECORD
    MyCert.Length= MyCertAndKey->CertData.Length; // Length of DER encoded certificate
    MyCert.Data= MyCertAndKey->CertData.Data; // DER encoded certificate
    if (MyCertAndKey->PrvtKeyData.KeyData.Length != 0) // Is a private key present?
    {
        /* Get the private key */
        MyKey.KeyData.Length= MyCertAndKey->PrvtKeyData.KeyData.Length;
        MyKey.KeyData.Data= MyCertAndKey->PrvtKeyData.KeyData.Data;
        memcpy(MyKey.KeyHeader,
        MyCertAndKey->PrvtKeyData.KeyHeader,sizeof(CSSM_KEYHEADER);
    }
    else
    {
        // perform some error action
    }
    /* Get the subject's DN */
    for (i=0,p=OutAttributes.AttributeData;i< OutAttributes.NumberOfAttributes ; i++,p++)
    {
        if (p->Info.Label.AttributeNumber == CSSM_DL_ATTRIBUTE_SUBJECT)
        {
            MySubjectsName.Length= p->Value.Length;
            MySubjectsName.Data= p->Value.Data;
        }
    }
    // Make use of the certificate/key/subject's name here
    //
    /* Clean up this record */
    free(MyCertAndKey->CertData.Data); // free certificate storage
    free(MyCertAndKey->PrvtKeyData.KeyData.Data); // Free key data storage
    free(MyCertAndKey); // Free OCEP_CERT_KEY_RECORD storage
    /* Now clean up the attributes */
    for (i=0,p=OutAttributes.AttributeData;i< OutAttributes.NumberOfAttributes ; i++,p++)
    {
        free(p->Value.Data); // Free individual attribute data
    }
    CSSM_DL_FreeUniqueRecord(Handles,Record_ID); // Free storage associated with the record ID
}
/* Cleanup this key ring scan */
CSSM_DL_AbortQuery(Handles,OutScanHandle);
/* Close the key ring */
CSSM_DL_DbClose(Handles);
Appendix. Accessibility

Accessible publications for this product are offered through the z/OS® Information Center, which is available at www.ibm.com/systems/z/os/zos/bkserv/.

If you experience difficulty with the accessibility of any z/OS information, please send a detailed message to mhvrclf@us.ibm.com or to the following mailing address:

IBM® Corporation
Attention: MHVRCS Reader Comments
Department H6MA, Building 707
2455 South Road
Poughkeepsie, NY 12601-5400
USA

Accessibility features

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully. The major accessibility features in z/OS enable users to:

• Use assistive technologies such as screen readers and screen magnifier software
• Operate specific or equivalent features using only the keyboard
• Customize display attributes such as color, contrast, and font size.

Using assistive technologies

Assistive technology products, such as screen readers, function with the user interfaces found in z/OS. Consult the assistive technology documentation for specific information when using such products to access z/OS interfaces.

Keyboard navigation of the user interface

Users can access z/OS user interfaces using TSO/E or ISPF. Refer to z/OS TSO/E Primer, z/OS TSO/E User’s Guide and z/OS ISPF User’s Guide Vol 1 for information about accessing TSO/E and ISPF interfaces. These guides describe how to use TSO/E and ISPF, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

Dotted decimal syntax diagrams

Syntax diagrams are provided in dotted decimal format for users accessing the z/OS Information Center using a screen reader. In dotted decimal format, each syntax element is written on a separate line. If two or more syntax elements are always present together (or always absent together), they can appear on the same line, because they can be considered as a single compound syntax element.

Each line starts with a dotted decimal number; for example, 3 or 3.1 or 3.1.1. To hear these numbers correctly, make sure that your screen reader is set to read out punctuation. All the syntax elements that have the same dotted decimal number (for example, all the syntax elements that have the number 3.1) are mutually
exclusive alternatives. If you hear the lines 3.1 USERID and 3.1 SYSTEMID, you
know that your syntax can include either USERID or SYSTEMID, but not both.

The dotted decimal numbering level denotes the level of nesting. For example, if a
syntax element with dotted decimal number 3 is followed by a series of syntax
elements with dotted decimal number 3.1, all the syntax elements numbered 3.1
are subordinate to the syntax element numbered 3.

Certain words and symbols are used next to the dotted decimal numbers to add
information about the syntax elements. Occasionally, these words and symbols
might occur at the beginning of the element itself. For ease of identification, if the
word or symbol is a part of the syntax element, it is preceded by the backslash (\)
character. The * symbol can be used next to a dotted decimal number to indicate
that the syntax element repeats. For example, syntax element *FILE with dotted
decimal number 3 is given the format 3 * FILE. Format 3* FILE indicates that
syntax element FILE repeats. Format 3* FILE indicates that syntax element *
FILE repeats.

Characters such as commas, which are used to separate a string of syntax
elements, are shown in the syntax just before the items they separate. These
characters can appear on the same line as each item, or on a separate line with the
same dotted decimal number as the relevant items. The line can also show another
symbol giving information about the syntax elements. For example, the lines 5.1*,
5.1 LASTRUN, and 5.1 DELETE mean that if you use more than one of the
LASTRUN and DELETE syntax elements, the elements must be separated by a
comma. If no separator is given, assume that you use a blank to separate each
syntax element.

If a syntax element is preceded by the % symbol, this indicates a reference that is
defined elsewhere. The string following the % symbol is the name of a syntax
fragment rather than a literal. For example, the line 2.1 %OP1 means that you
should refer to separate syntax fragment OP1.

The following words and symbols are used next to the dotted decimal numbers:
• ? means an optional syntax element. A dotted decimal number followed by the ?
symbol indicates that all the syntax elements with a corresponding dotted
decimal number, and any subordinate syntax elements, are optional. If there is
only one syntax element with a dotted decimal number, the ? symbol is
displayed on the same line as the syntax element, (for example 5? NOTIFY). If
there is more than one syntax element with a dotted decimal number, the ?
symbol is displayed on a line by itself, followed by the syntax elements that are
optional. For example, if you hear the lines 5 ?, 5 NOTIFY, and 5 UPDATE, you
know that syntax elements NOTIFY and UPDATE are optional; that is, you can
choose one or none of them. The ? symbol is equivalent to a bypass line in a
railroad diagram.
• ! means a default syntax element. A dotted decimal number followed by the !
symbol and a syntax element indicates that the syntax element is the default
option for all syntax elements that share the same dotted decimal number. Only
one of the syntax elements that share the same dotted decimal number can
specify a ! symbol. For example, if you hear the lines 2? FILE, 2.1! (KEEP), and
2.1 (DELETE), you know that (KEEP) is the default option for the FILE keyword.
In this example, if you include the FILE keyword but do not specify an option,
default option KEEP will be applied. A default option also applies to the next
higher dotted decimal number. In this example, if the FILE keyword is omitted,
default FILE(KEEP) is used. However, if you hear the lines 2? FILE, 2.1, 2.1.1!
(KEEP), and 2.1.1 (DELETE), the default option KEEP only applies to the next higher dotted decimal number, 2.1 (which does not have an associated keyword), and does not apply to 2? FILE. Nothing is used if the keyword FILE is omitted.

- * means a syntax element that can be repeated 0 or more times. A dotted decimal number followed by the * symbol indicates that this syntax element can be used zero or more times; that is, it is optional and can be repeated. For example, if you hear the line 5.1* data area, you know that you can include one data area, more than one data area, or no data area. If you hear the lines 3*, 3 HOST, and 3 STATE, you know that you can include HOST, STATE, both together, or nothing.

**Note:**
1. If a dotted decimal number has an asterisk (*) next to it and there is only one item with that dotted decimal number, you can repeat that same item more than once.
2. If a dotted decimal number has an asterisk next to it and several items have that dotted decimal number, you can use more than one item from the list, but you cannot use the items more than once each. In the previous example, you could write HOST STATE, but you could not write HOST HOST.
3. The * symbol is equivalent to a loop-back line in a railroad syntax diagram.

- + means a syntax element that must be included one or more times. A dotted decimal number followed by the + symbol indicates that this syntax element must be included one or more times; that is, it must be included at least once and can be repeated. For example, if you hear the line 6.1+ data area, you must include at least one data area. If you hear the lines 2+, 2 HOST, and 2 STATE, you know that you must include HOST, STATE, or both. Similar to the * symbol, the + symbol can only repeat a particular item if it is the only item with that dotted decimal number. The + symbol, like the * symbol, is equivalent to a loop-back line in a railroad syntax diagram.

Policy for unsupported hardware

Various z/OS elements, such as DFSMS, HCD, JES2, JES3, and MVS™, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted.
for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

Minimum supported hardware

The minimum supported hardware for z/OS releases identified in z/OS announcements can subsequently change when service for particular servers or devices is withdrawn. Likewise, the levels of other software products supported on a particular release of z/OS are subject to the service support lifecycle of those products. Therefore, z/OS and its product publications (for example, panels, samples, messages, and product documentation) can include references to hardware and software that is no longer supported.

- For information about software support lifecycle, see: IBM Lifecycle Support for z/OS (http://www.ibm.com/software/support/systemsz/lifecycle/)
- For information about currently-supported IBM hardware, contact your IBM representative.

Programming interface information

Programming interface information for Open Cryptographic Enhanced Plug-ins (OCEP)

This publication documents intended Programming Interfaces that allow customers to write programs to obtain services of Open Cryptographic Enhanced Plug-ins (OCEP).
