Summary of changes ................................................ xxxvii
  Changes made in z/OS Version 1 Release 13 .................... xxxvii
  Changes made in z/OS Version 1 Release 12 .................... xxxix
  Changes made in z/OS Version 1 Release 11 ..................... xlii

Part 1. IBM CCA Programming .................................... 1

Chapter 1. Introducing Programming for the IBM CCA .......... 3
  ICSF Callable Services Naming Conventions .................... 3
  Callable Service Syntax ........................................ 3
    Callable Services with ALET Parameters .......................... 4
    Rules for Defining Parameters and Attributes .................... 5
  Parameter Definitions .......................................... 6
  Invocation Requirements ......................................... 9
  Security Considerations ......................................... 9
  Performance Considerations ..................................... 10
  Special Secure Mode ........................................... 10
  Using the Callable Services .................................... 11
    When the Call Succeeds ....................................... 11
    When the Call Does Not Succeed ............................... 12
  Linking a Program with the ICSF Callable Services .............. 12

Chapter 2. Introducing Symmetric Key Cryptography and Using Symmetric Key Callable Services ....................... 15
  Functions of the Symmetric Cryptographic Keys ................. 15
    Key Separation ............................................... 16
  Master Key Variant for Fixed-length Tokens ..................... 16
  Transport Key Variant for Fixed-length Tokens .................. 16
  Key Forms ................................................... 17
  Key Token .................................................. 17
  Key Wrapping ................................................ 19
  Control Vector for DES Keys ................................... 19
  Types of Keys ............................................... 19
  Generating and Managing Symmetric Keys ....................... 25
    Key Generator Utility Program ................................ 25
    Common Cryptographic Architecture DES Key Management Services 25
    Common Cryptographic Architecture AES Key Management Services 29
    Common Cryptographic Architecture HMAC Key Management Services 31
  ECC Diffie-Hellman Key Agreement Models ...................... 32
  Improved remote key distribution ............................... 32

Diversifying keys ........................................ 46
Callable Services for Dynamic CKDS Update .......... 46
Callable Services that Support Secure Sockets Layer (SSL) ..... 48
System Encryption Algorithm .......................... 49
ANSI X9.17 Key Management Services ................. 50
Enciphering and Deciphering Data ........................ 52
Encoding and Decoding Data (CSNBECO, CSNEECO, CSNBDCO, and CSNEDCO) ............. 53
Translating Ciphertext (CSNBCTT or CSNBCTT1 and CSNECTT or CSNECTT1) ......................... 53
Managing Data Integrity and Message Authentication ....... 53
  Message Authentication Code Processing .............. 53
  Hashing Functions ................................ 55
Managing Personal Authentication ....................... 56
  Verifying Credit Card Data .......................... 57
ANSI TR-31 key block support .......................... 59
  TR-31 Export Callable Service (CSNB31X and CSNET31X) .. 59
  TR-31 Import Callable Service (CSNB31I and CSNET31I) 59
  TR-31 Parse Callable Service (CSNB31P and CSNET31P) .. 60
  TR-31 Optional Data Read Callable Service (CSNB31R and CSNET31R) 60
  TR-31 Optional Data Build Callable Service (CSNB31O and CSNET31O) 60
Secure Messaging ....................................... 60
Trusted Key Entry (TKE) Support ....................... 60
Utilities ............................................ 61
  Character/Nibble Conversion Callable Services (CSNBXBC and CSNBXCB) 61
  Code Conversion Callable Services (CSNBXEA and CSNBXAE) ........ 61
  X.9.9 Data Editing Callable Service (CSNB9ED) ........ 61
  ICSF Query Algorithm Callable Service (CSFIQA) ........ 61
  ICSF Query Facility Callable Service (CSFIQF) .......... 61
Typical Sequences of ICSF Callable Services .............. 62
Key Forms and Types Used in the Key Generate Callable Service .......... 63
  Generating an Operational Key ...................... 63
  Generating an Importable Key ...................... 63
  Generating an Exportable Key ...................... 63
  Examples of Single-Length Keys in One Form Only .... 63
  Examples of OPIM Single-Length, Double-Length, and Triple-Length Keys in Two Forms .......... 64
  Examples of OPEX Single-Length, Double-Length, and Triple-Length Keys in Two Forms .......... 64
  Examples of IMEX Single-Length and Double-Length Keys in Two Forms .......... 65
  Examples of EXEX Single-Length and Double-Length Keys in Two Forms .......... 65
  Generating AKEKs ................................ 65
Using the Ciphertext Translate Callable Service ........... 66
Summary of Callable Services .......................... 67

Chapter 3. Introducing PKA Cryptography and Using PKA Callable Services ............................... 79
PKA Key Algorithms ................................... 79
PKA Master Keys ..................................... 79
  Operational private keys ........................... 80
PKA Callable Services .................................. 81
  Callable Services Supporting Digital Signatures ........ 81
  Callable Services for PKA Key Management .............. 82
  Callable Services to Update the Public Key Data Set (PKDS) .... 83
  Callable Services for Working with Retained Private Keys .......... 84
  Callable Services for SET Secure Electronic Transaction .... 85
Chapter 4. Introducing PKCS #11 and using PKCS #11 callable services

PKCS #11 Management Services .................................................. 93
Attribute List ................................................................. 93
Handles ................................................................. 94

Part 2. CCA Callable Services .................................................. 97

Chapter 5. Managing Symmetric Cryptographic Keys .............................................. 99
Clear Key Import (CSNBCKI and CSNECKI) ........................................ 100
  Format ..................................................................... 100
  Parameters ................................................................. 100
  Usage Notes .................................................................. 101
Control Vector Generate (CSNBCVG and CSNECVG) ........................................ 102
  Format ..................................................................... 102
  Parameters ................................................................. 102
  Usage Notes .................................................................. 105
Control Vector Translate (CSNBCVT and CSNECVT) ........................................... 105
  Format ..................................................................... 105
  Parameters ................................................................. 106
  Restrictions ................................................................. 108
  Usage Notes .................................................................. 108
Cryptographic Variable Encipher (CSNBCVE and CSNECVE) ......................... 109
  Format ..................................................................... 109
  Parameters ................................................................. 109
  Restrictions ................................................................. 111
  Usage Notes .................................................................. 111
Data Key Export (CSNBDKX and CSNEDKX) ............................................. 111
  Format ..................................................................... 112
  Parameters ................................................................. 112
  Restrictions ................................................................. 113
  Usage Notes .................................................................. 113
Data Key Import (CSNBDM and CSNEDK) .......................................................... 114
  Format ..................................................................... 114
  Parameters ................................................................. 114
  Restrictions ................................................................. 116
  Usage Notes .................................................................. 116
Diversified Key Generate (CSNBDKG and CSNEDKG) ........................................ 117
  Format ..................................................................... 117
  Parameters ................................................................. 118
  Restrictions ................................................................. 121
  Usage Notes .................................................................. 121
ECC Diffie-Hellman (CSNDEDH and CSNFEDH) .................................................. 123
  Format ..................................................................... 124
  Parameters ................................................................. 124
  Restrictions ................................................................. 128
  Usage Notes .................................................................. 129
Key Export (CSNBKEX and CSNEKEX) ............................................................ 130
<p>| Usage Notes | 199 |
| Key Translate2 (CSNBKTR2 and CSNEKTR2) | 199 |
| Format | 200 |
| Parameters | 200 |
| Restrictions | 204 |
| Usage Notes | 204 |
| Multiple Clear Key Import (CSNBCKM and CSNECKM) | 205 |
| Format | 206 |
| Parameters | 206 |
| Usage Notes | 208 |
| Multiple Secure Key Import (CSNBSKM and CSNESKM) | 209 |
| Format | 210 |
| Parameters | 210 |
| Usage Notes | 213 |
| PKA Decrypt (CSNDPKD and CSNFPKD) | 215 |
| Format | 216 |
| Parameters | 216 |
| Restrictions | 218 |
| Usage Notes | 218 |
| PKA Encrypt (CSNDPKE and CSNFPKE) | 220 |
| Format | 221 |
| Parameters | 221 |
| Restrictions | 223 |
| Usage Notes | 223 |
| Prohibit Export (CSNBPEX and CSNEPEX) | 225 |
| Format | 225 |
| Parameters | 225 |
| Usage Notes | 226 |
| Prohibit Export Extended (CSNBPEXX and CSNEPEXX) | 226 |
| Format | 227 |
| Parameters | 227 |
| Restrictions | 228 |
| Usage Notes | 228 |
| Random Number Generate (CSNBRNG, CSNERNG, CSNBRNGL and CSNERNGL) | 228 |
| Format | 229 |
| Parameters | 229 |
| Usage Notes | 231 |
| Remote Key Export (CSNDRKX and CSNFRKX) | 232 |
| Format | 232 |
| Parameters | 232 |
| Usage Notes | 238 |
| Restrict Key Attribute (CSNBRKA and CSNERKA) | 239 |
| Format | 239 |
| Parameters | 239 |
| Usage Notes | 243 |
| Secure Key Import (CSNBSKI and CSNESKI) | 243 |
| Format | 244 |
| Parameters | 244 |
| Usage Notes | 246 |
| Secure Key Import2 (CSNBSKI2 and CSNESKI2) | 247 |
| Format | 248 |
| Parameters | 248 |
| Usage Notes | 251 |
| Symmetric Key Export (CSNDSYX and CSNFSYX) | 251 |
| Format | 252 |</p>

# Chapter 6. Protecting Data

Modes of Operation ........................................... 325
- Electronic Code Book (ECB) Mode ................... 325
- Cipher Block Chaining (CBC) Mode .................. 326
- Cipher Feedback (CFB) Mode ......................... 326
- Output Feedback (OFB) Mode ......................... 326
- Galois/Counter Mode (GCM) ......................... 327
- Triple DES Encryption ................................. 327

Ciphertext Translate (CSNBCTT or CSNBCTT1 and CSNECTT or CSNECTT1) 328
  Choosing Between CSNBCTT and CSNBCTT1 ........... 328
  Format .................................................. 329
  Parameters ............................................. 329
  Restrictions .......................................... 331
  Usage Notes ........................................... 331

Decipher (CSNBDEC or CSNBDEC1 and CSNEDEC or CSNEDEC1) ..... 331
  Choosing Between CSNBDEC and CSNBDEC1 ......... 333
  Format .................................................. 333
  Parameters ............................................. 333
  Restrictions .......................................... 337
  Usage Notes ........................................... 337
  Related Information .................................. 337

Decode (CSNBDCO and CSNEDCO) ................................ 338
  Considerations ........................................ 338
  Format .................................................. 338
  Parameters ............................................. 339
  Restrictions .......................................... 339
  Usage Notes ........................................... 339

Encipher (CSNBENC or CSNBENC1 and CSNEENC or CSNEENC1) .... 340
  Choosing between CSNBENC and CSNBENC1 ........... 342
  Format .................................................. 342
  Parameters ............................................. 342
  Restrictions .......................................... 346
  Usage Notes ........................................... 346
  Related Information .................................. 347

Encode (CSNBECO and CSNEECO) ................................ 348
  Considerations ........................................ 348
  Format .................................................. 348
  Parameters ............................................. 348
  Restrictions .......................................... 349
  Usage Notes ........................................... 349

Symmetric Algorithm Decipher (CSNBSAD or CSNBSAD1 and CSNESAD or CSNESAD1) .......................... 350
  Choosing Between CSNBSAD and CSNBSAD1 or CSNESAD and CSNESAD1 .................................. 350
  Format .................................................. 350
  Parameters ............................................. 351
  Usage Notes ........................................... 351

Symmetric Algorithm Encipher (CSNBSAE or CSNBSAE1 and CSNESAE or CSNESAE1) .......................... 356
  Choosing between CSNBSAE and CSNBSAE1 or CSNESAE and CSNESAE1 .................................. 356
  Format .................................................. 356
  Parameters ............................................. 357
  Usage Notes ........................................... 361

Symmetric Key Decipher (CSNBSYD or CSNBSYD1 and CSNESYD or CSNESYD1) .................................. 362
Choosing Between CSNBSYD and CSNBSYD1 .................................. 364
Format ............................................................................. 364
Parameters ...................................................................... 365
Usage Notes ...................................................................... 370
Related Information ......................................................... 371

Symmetric Key Encipher (CSNBSYE or CSNBSYE1 and CSNESYE or
CSNESYE1) ................................................................. 371
Choosing between CSNBSYE and CSNBSYE1 ..................... 373
Format ............................................................................. 374
Parameters ...................................................................... 374
Usage Notes ...................................................................... 379
Related Information ......................................................... 380

Chapter 7. Verifying Data Integrity and Authenticating Messages ........ 383
How MACs are Used ......................................................... 383
How Hashing Functions Are Used ................................. 384
How MDCs Are Used ......................................................... 384

HMAC Generate (CSNBHMG or CSNBHMG1 and CSNEHMG or CSNEHMG1) 385
Choosing Between CSNBHMG and CSNBHMG1 ............. 385
Format ............................................................................. 386
Parameters ...................................................................... 386
Usage Notes ...................................................................... 389

HMAC Verify (CSNBHMV or CSNBHMV1 and CSNEHMV or CSNEHMV1) 389
Choosing Between CSNBHMV and CSNBHMV1 ............... 389
Format ............................................................................. 390
Parameters ...................................................................... 390
Usage Notes ...................................................................... 393

MAC Generate (CSNBMGN or CSNBMGN1 and CSNEMGN or CSNEMGN1) 393
Choosing Between CSNBMGN and CSNBMGN1 ............ 393
Format ............................................................................. 394
Parameters ...................................................................... 394
Usage Notes ...................................................................... 397
Related Information ......................................................... 398

MAC Verify (CSNBMVR or CSNBMVR1 and CSNEMVR or CSNEMVR1) 398
Choosing Between CSNBMVR and CSNBMVR1 ............. 399
Format ............................................................................. 399
Parameters ...................................................................... 400
Usage Notes ...................................................................... 403
Related Information ......................................................... 404

MDC Generate (CSNBMDG or CSNBMDG1 and CSNEMDG or CSNEMDG1) 404
Choosing Between CSNBMDG and CSNBMDG1 .......... 404
Format ............................................................................. 405
Parameters ...................................................................... 405
Usage Notes ...................................................................... 407

One-Way Hash Generate (CSNBOWH or CSNBOWH1 and CSNEOWH or
CSNEOWH1) ................................................................. 408
Format ............................................................................. 409
Parameters ...................................................................... 409
Usage Notes ...................................................................... 412

Symmetric MAC Generate (CSNBSMG or CSNBSMG1 and CSNESMG or
CSNESMG1) ................................................................. 413
Choosing Between CSNBSMG and CSNBSMG1 or CSNESMG and
CSNESMG1 ................................................................. 413
Format ............................................................................. 413
Parameters ...................................................................... 414
Usage Notes ...................................................................... 417
Symmetric MAC Verify (CSNBSMV or CSNBSMV1 and CSNESMV or CSNESMV1) ........................................ 417
Choosing Between CSNBSMV and CSNBSMV1 or CSNESMV and CSNESMV1. ........................................ 417
Format ........................................................................ 418
Parameters ................................................................... 418
Usage Notes ................................................................... 421

Chapter 8. Financial Services ........................................ 423
How Personal Identification Numbers (PINs) are Used ................................................................. 423
How VISA Card Verification Values Are Used ............................................................................. 423
Translating Data and PINs in Networks ......................................................................................... 424
Working with Europay–MasterCard–Visa smart cards ............................................................. 424
PIN Callable Services ...................................................... 425
  Generating a PIN ........................................................... 425
  Encrypting a PIN .......................................................... 425
  Generating a PIN Validation Value from an Encrypted PIN Block ........................................ 425
  Verifying a PIN ............................................................. 425
  Translating a PIN .......................................................... 425
  Algorithms for Generating and Verifying a PIN ................................................................. 425
Using PINs on Different Systems .............................................................................................. 426
PIN-Encrypting Keys ......................................................... 426
ANSI X9.8 PIN Restrictions ................................................ 427
  ANSI X9.8 PIN - Enforce PIN block restrictions .................................................................... 427
  ANSI X9.8 PIN - Allow modification of PAN ......................................................................... 428
  ANSI X9.8 PIN - Allow only ANSI PIN blocks ....................................................................... 428
  ANSI X9.8 PIN – Use stored decimalization tables only ......................................................... 428
The PIN Profile ................................................................. 429
  PIN Block Format ........................................................... 429
  Enhanced PIN Security Mode .................................................................................................. 431
  Format Control ............................................................... 432
  Pad Digit .......................................................................... 432
  Current Key Serial Number ................................................ 433
  Decimalization Tables ......................................................... 434
Clear PIN Encrypt (CSNBCPE and CSNECPE) .......................................................... 434
  Format .......................................................................... 435
  Parameters ...................................................................... 435
  Restrictions .................................................................... 437
  Usage Notes ..................................................................... 437
Clear PIN Generate (CSNBPGN and CSNEPGN) .................................................. 438
  Format .......................................................................... 438
  Parameters ...................................................................... 438
  Restrictions .................................................................... 441
  Usage Notes ..................................................................... 441
  Related Information .......................................................... 442
Clear PIN Generate Alternate (CSNBCPA and CSNECPA) .................................................. 442
  Format .......................................................................... 443
  Parameters ...................................................................... 443
  Restrictions .................................................................... 446
  Usage Notes ..................................................................... 447
CVV Key Combine (CSNBCKC and CSNECKC) .......................................................... 448
  Format .......................................................................... 449
  Parameters ...................................................................... 449
  Restrictions .................................................................... 451
  Usage Notes ..................................................................... 451
Encrypted PIN Generate (CSNBEPG and CSNEEPG) .................................................. 453
  Contents ... xi
Chapter 9. Using Digital Signatures

Digital Signature Generate (CSNDDSG and CSNFDSG) .............................................. 511
Format .................................................................................................................. 512
Parameters ......................................................................................................... 512
Restrictions............................................. 515
Usage Notes........................................... 515
Digital Signature Verify (CSNDDSV and CSNFDSV).................. 518
Format................................................... 519
Parameters............................................. 519
Restrictions........................................... 521
Usage Notes........................................... 522

Chapter 10. Managing PKA Cryptographic Keys............................. 525
PKA Key Generate (CSNDPKG and CSNFPKG).......................... 525
Format .................................................. 526
Parameters............................................. 526
Restrictions........................................... 530
Usage Notes........................................... 530
PKA Key Import (CSNDPKI and CSNFPKI).............................. 531
Format .................................................. 532
Parameters............................................. 532
Restrictions........................................... 534
Usage Notes........................................... 534
PKA Key Token Build (CSNDPKB and CSNFPKB)......................... 535
Format .................................................. 536
Parameters............................................. 537
Usage Notes........................................... 547
PKA Key Token Change (CSNDKTC and CSNFKTC)....................... 548
Format .................................................. 548
Parameters............................................. 548
Usage Notes........................................... 550
PKA Key Translate (CSNDPKT and CSNFPKT)............................ 551
Format .................................................. 552
Parameters............................................. 552
Restrictions........................................... 554
Usage Notes........................................... 554
PKA Public Key Extract (CSNDPKX and CSNFPKX)....................... 555
Format .................................................. 556
Parameters............................................. 556
Usage Notes........................................... 557
Retained Key Delete (CSNDRKD and CSNFRKD)......................... 558
Format .................................................. 558
Parameters............................................. 558
Usage Notes........................................... 559
Retained Key List (CSNDRKL and CSNFRKL)............................. 560
Format .................................................. 561
Parameters............................................. 561
Usage Notes........................................... 563

Chapter 11. Key Data Set Management......................................... 565
CKDS Key Record Create (CSNBKRC and CSNEKRC)..................... 565
Format .................................................. 565
Parameters............................................. 565
Restrictions........................................... 566
Usage Notes........................................... 566
CKDS Key Record Create2 (CSNBKRC2 and CSNEKRC2)................ 567
Format .................................................. 567
Parameters............................................. 567
Usage Notes........................................... 568
CKDS Key Record Delete (CSNBKRD and CSNEKRD).................... 569

About this information

This information supports z/OS (5694-A01). It describes how to use the callable services provided by the Integrated Cryptographic Service Facility (ICSF). The z/OS Cryptographic Services includes these components:

- z/OS Integrated Cryptographic Service Facility (ICSF)
- z/OS Open Cryptographic Services Facility (OCSF)
- z/OS System Secure Socket Level Programming (SSL)
- z/OS Public Key Infrastructure Services (PKI)

ICSF is a software element of z/OS that works with the hardware cryptographic feature and the Security Server RACF to provide secure, high-speed cryptographic services. ICSF provides the application programming interfaces by which applications request the cryptographic services.

Note: References to the IBM @server zSeries 800 (z800) do not appear in this information. Be aware that the documented notes and restrictions for the IBM @server zSeries 900 (z900) also apply to the z800. References to the IBM zEnterprise 114 (z114) do not appear in this information. Be aware that the documented notes and restrictions for the IBM zEnterprise 196 (z196) also apply to the z114.

Who should use this information

This information is intended for application programmers who:

- Are responsible for writing application programs that use the security application programming interface (API) to access cryptographic functions.
- Want to use ICSF callable services in high-level languages such as C, COBOL, FORTRAN, and PL/I, as well as in assembler.

How to use this information

ICSF includes Advanced Encryption Standard (AES), Data Encryption Standard (DES) and public key cryptography. These are very different cryptographic systems.

These topics focus on IBM CCA programming and include:

- Chapter 1, "Introducing Programming for the IBM CCA" describes the programming considerations for using the ICSF callable services. It also explains the syntax and parameter definitions used in callable services.
- Chapter 2, "Introducing Symmetric Key Cryptography and Using Symmetric Key Callable Services" gives an overview of AES and DES cryptography and provides general guidance information on how the callable services use different key types and key forms. It also discusses how to write your own callable services called installation-defined callable services and provides suggestions on what to do if there is a problem.
- Chapter 3, "Introducing PKA Cryptography and Using PKA Callable Services" introduces Public Key Algorithm (PKA) support and describes programming considerations for using the ICSF PKA callable services, such as the PKA key token structure and key management.
- Chapter 4, "Introducing PKCS #11 and using PKCS #11 callable services" gives an overview of PKCS #11 support and management services.
These topics focus on CCA callable services and include:

- **Chapter 5, “Managing Symmetric Cryptographic Keys”** describes the callable services for generating and maintaining cryptographic keys and the random number generate callable service. It also presents utilities to build AES and DES tokens and generate and translate control vectors and describes the PKA callable services that support AES and DES key distribution.

- **Chapter 6, “Protecting Data”** describes the callable services for deciphering ciphertext from one key and enciphering it under another key. It also describes enciphering and deciphering data with encrypted keys and encoding and decoding data with clear keys.

- **Chapter 7, “Verifying Data Integrity and Authenticating Messages”** describes the callable services for generating and verifying message authentication codes (MACs), generating modification detection codes (MDCs) and generating hashes (SHA-1, SHA-2, MD5, RIPEMD-160).

- **Chapter 8, “Financial Services”** describes the callable services for generating, verifying, and translating personal identification numbers (PINs). It also describes the callable services that support the Secure Electronic Transaction (SET) protocol and those that generate and verify VISA card verification values and American Express card security codes.

- **Chapter 9, “Using Digital Signatures”** describes the PKA callable services that support using digital signatures to authenticate messages.

- **Chapter 10, “Managing PKA Cryptographic Keys”** describes the PKA callable services that generate and manage PKA keys.

- **Chapter 11, “Key Data Set Management,” on page 565** describes the callable services that manage key tokens in the Cryptographic Key Data Set (CKDS) and the PKA Key Data Set (PKDS).

- **Chapter 12, “Utilities”** describes callable services that convert data between EBCDIC and ASCII format, convert between binary strings and character strings, and query ICSF services and algorithms.

- **Chapter 13, “Trusted Key Entry Workstation Interfaces”** describes the PCI interface (PCI) and the Public Key Secure Cable (PKSC) interface that supports Trusted Key Entry (TKE), an optional feature available with ICSF.

- **Chapter 14, “Managing Keys According to the ANSI X9.17 Standard”** describes the callable services that support the ANSI X9.17 key management standard 1, which defines a process for protecting and exchanging DES keys.

- **Chapter 15, “Using PKCS #11 Tokens and Objects”** describes the callable services for managing the PKCS #11 tokens and objects in the TKDS.

The appendixes include this information:

- **Appendix A, “ICSF and TSS Return and Reason Codes”** explains the return and reason codes returned by the callable services.

- **Appendix B, “Key Token Formats”** describes the formats for AES key tokens, DES internal, external, and null key tokens and for PKA public, private external, and private internal key tokens containing either Rivest-Shamir-Adleman (RSA) or Digital Signature Standard (DSS) information. This appendix also describes the PKA null key token.

- **Appendix C, “Control Vectors and Changing Control Vectors with the CVT Callable Service,” on page 827** contains a table of the default control vector values that are associated with each key type and describes the control vectors.

---

1. ANSI X9.17-1985: Financial Institution Key Management (Wholesale)
information for testing control vectors, mask array preparation, selecting the
key-half processing mode, and an example of Control Vector Translate.

- Appendix D, “Coding Examples” provides examples for COBOL, assembler, and
  PL/1.
- Appendix E, “Using ICSF with BSAFE” explains how to access ICSF services
  from applications written using RSA’s BSAFE cryptographic toolkit.
- Appendix F, “Cryptographic Algorithms and Processes,” on page 863 describes
  the PIN formats and algorithms, cipher processing and segmenting rules, multiple
  encipherment and decipherment and their equations, the PKA92 encryption
  process, partial notarization of an ANSI key-encrypting key (AKEK), and the
  algorithm for transforming a Commercial Data Masking Facility (CDMF) key.
- Appendix G, “EBCDIC and ASCII Default Conversion Tables” presents EBCDIC
  to ASCII and ASCII to EBCDIC conversion tables.
- Appendix H, “Access Control Points and Callable Services” lists which access
  control points correspond to which callable services.
- Appendix I, “Accessibility,” on page 909 contains information on accessibility
  features in z/OS.
- Notices contains notices, programming interface information, and trademarks.

How to send your comments to IBM

We appreciate your input on this publication. Feel free to comment on the clarity, accuracy, and completeness of the information or give us any other feedback that you might have.

Use one of the following methods to send us your comments:
1. Send an e-mail to mhvrdfs@us.ibm.com
2. Visit the [Contact z/OS Web page at](http://www.ibm.com/servers/eserver/zseries/osal/webqs.html)
3. Mail the comments to the following address:
   IBM Corporation
   Attention: MHVRCFS Reader Comments
   Department H6MA, Mail Station P181
   2455 South Road
   Poughkeepsie, NY 12601-5400
   U.S.A.
4. Fax the comments to us as follows:
   From the United States and Canada: 1+845+432-9405
   From all other countries: Your international access code +1+845+432-9405

Include the following information:
• Your name and address
• Your e-mail address
• Your telephone or fax number
• The publication title and order number:
  z/OS Cryptographic Services Application Programmer's Guide
  SA22-7522-15
• The topic and page number related to your comment
• The text of your comment.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you.

IBM or any other organizations will only use the personal information that you supply to contact you about the issues that you submit.

If you have a technical problem

Do not use the feedback methods listed above. Instead, do one of the following:
• Contact your IBM service representative
• Call IBM technical support
• Visit the [IBM zSeries support Web page at](http://www.ibm.com/servers/eserver/support/zseries/)

Summary of changes

Changes made in z/OS Version 1 Release 13

This document contains information previously presented in z/OS ICSF Application Programmer's Guide, SA22-7522-14, which supports z/OS Version 1 Release 12.

This document is for ICSF FMID HCR7790. This release of ICSF runs on z/OS V1R11, z/OS V1R12, and z/OS V1R13 and only on zSeries hardware.

New information:

• Added support for the TR-31 key block format defined by the American National Standards Institute (ANSI). ICSF enables applications to convert a CCA token to a TR-31 key block for export to another party, and to convert an imported TR-31 key block to a CCA token. This enables you to securely exchange keys and their attributes with non-CCA systems. The following callable services have been added to provide this support:
  – TR-31 Export (CSNBT31X and CSNET31X)
  – TR-31 Import (CSNBT31I and CSNET31I) TR-31
  – TR-31 Parse (CSNBT31P and CSNET31P) TR-31
  – TR-31 Optional Data Read (CSNBT31R and CSNET31R)
  – TR-31 Optional Data Build (CSNBT31O and CSNET31O)

• Added new callable service, CVV key combine (CSNBCKC and CSNECKC). This callable service combines 2 single-length CCA internal key tokens into 1 double-length CCA key token containing a CVVKEY-A key type for use with the VISA CVV Service Generate or VISA CVV Service Verify callable services. This combined double-length key satisfies current VISA requirements and eases translation between TR-31 and CCA formats for CVV keys. See "CVV Key Combine (CSNBCKC and CSNECKC)" on page 448 for more information.

• Added support for coordinated and dynamic update of a CKDS. The new callable service Coordinated KDS Administration (CSFCRC and CSFCRC6) which performs a CKDS refresh or reencipher operation while allowing applications to update the CKDS. In a sysplex environment, this callable service enables an application to perform a coordinated sysplex-wide refresh or reencipher operation from a single ICSF instance.

• Added new callable service ECC Diffie-Hellman (CSNDEDH and CSNFEDH), which applications can use to create symmetric key material from a pair of ECC keys using the Elliptic Curve Diffie-Hellman protocol and the static unified model key agreement scheme.

• A new health check, ICSFMIG_DEPRECATED_SERV_WARNINGS, has been added to the Health Checker to detect the use of services that will not be supported in subsequent releases: The deprecated services checked in this release are listed below. These are not supported on post zSeries 900 hardware, and will not be supported in subsequent releases of ICSF.
  – ANSI X9.17 EDC Generate
  – ANSI X9.17 Key Export
  – ANSI X9.17 Key Import
  – ANSI X9.17 Key Translate
  – ANSI X9.17 Transport Key Partial Notarize
  – Ciphertext Translate
  – Ciphertext Translate with ALET
You should use the ICSFMIg_DEPRECATED_SERV_WARNINGS check to determine if these services are being used. For more information on this health check, refer to **z/OS Cryptographic Services ICSF Administrator's Guide**.

### Changed information:
- CKDS Key Record Write2 (CSNBKRW2 and CSNEKRW2)
- Clear PIN Generate (CSNBPGN and CSNEPGN)
- Clear PIN Generate Alternate (CSNBCPA and CSNECPA)
- Control Vector Generate (CSNBCVG and CSNECVG)
- Digital Signature Verify (CSNDDSV and CSNFDSV)
- Encrypted PIN Generate (CSNBEPG and CSNEEPG)
- Encrypted PIN Verify (CSNBVPVR and CSNEVPVR)
- ICSF Query Facility (CSFQF and CSFQF6)
- Key Generate2 (CSNBKGN2 and CSNEKGN2)
- Key Part Import2 (CSNBKPI2 and CSNEKPI2)
- Key Test2 (CSNBKTYT2 and CSNEKTYT2)
- Key Token Build (CSNBKTB and CSNEKTB)
- Key Token Build2 (CSNBKTB2 and CSNEKTB2)
- Key Translate2 (CSNBKTR2 and CSNEKTR2)
- PKDS Key Record Create (CSNDKRC and CSNFKRC)
- PKDS Key Record Delete (CSNDKRD and CSNFKRD)
- PKDS Key Record Read (CSNDKRR and CSNFKRR)
- PKDS Key Record Write (CSNDKRW and CSNFKRW)
- PKA Decrypt (CSNDPKD and CSNFPKD)
- PKA Encrypt (CSNDPKE and CSNFPKE)
- PKA Key Generate (CSNDPKG and CSNFPKG)
- PKA Key Import (CSNDPKI and CSNFPKI)
- PKA Key Token Change (CSNDKTC and CSNFKTC)
- Restrict Key Attribute (CSNBRKA and CSNERKA)
- Secure Key Import2 (CSNBSKI2 and CSNESKI2)
- Symmetric Algorithm Decipher (CSNBSAD or CSNBSAD1 and CSNESAD or CSNESAD1)
- Symmetric Algorithm Encipher (CSNBSAE or CSNBSAE1 and CSNESAE or CSNESAE1)
- Symmetric Key Import2 (CSNSYI2 and CSNFSYI2)
- Symmetric Key Generate (CSNSYSG and CSNFSYG)
- Symmetric Key Import (CSNSYI and CSNFSYI)
- Symmetric Key Export (CSNSYX and CSNFSYX)
- VISA CVV Service Generate (CSNBCSG and CSNECSG)
- VISA CVV Service Verify (CSNBCSV and CSNECSV)

For clarity:
Changes made in z/OS Version 1 Release 12

This document contains information previously presented in z/OS ICSF Application Programmer's Guide, SA22-7522-13, which supports z/OS Version 1 Release 11.

This document is for ICSF FMID HCR7780. This release of ICSF runs on z/OS V1R10, z/OS V1R11, and z/OS V1R12 and only on zSeries hardware.

New information:

- All ICSF callable services now support invocation in AMODE(64). Previously, only certain callable services had this support. Applications that are written for AMODE(64) operation must be linked with the ICSF 64-bit service stubs.
- Added information for HMAC key support. This support is to be enabled with the PTF for APAR OA33260, planned for February 2011 availability.
  - Added the following services to support CCA key management of HMAC keys:
    - Key Generate2 (CSNBKGN2 and CSNEKGN2)
    - Key Part Import2 (CSNBKPI2 and CSNEKPI2)
    - Key Test2 (CSNBKYT2 and CSNEKYT2)
    - Key Token Build2 (CSNBKT2 and CSNEKT2)
    - Restrict Key Attribute (CSNBRKA and CSNERKA)
    - Secure Key Import2 (CSNBSKI2 and CSNESKI2)
    - Symmetric Key Import2 (CSNDSYI2 and CSNFSYI2)
The following services for Dynamic CKDS update were added for use with HMAC tokens. These services must be used with HMAC tokens, but also support existing DES and AES tokens.

- Key Record Create2 (CSNBKRC2 and CSNEKRC2)
- Key Record Read2 (CSNBKRR2 and CSNEKRR2)
- Key Record Write2 (CSNBKRW2 and CSNEKRW2)

Added the following services to support the generation and verification of MACs using keyed-HMAC algorithm:

- HMAC Generate (CSNBHMG or CSNBHMG1 and CSNEHMG or CSNEHMG1)
- HMAC Verify (CSNBHMV or CSNBHMV1 and CSNEHMV or CSNEHMV1)

- Added the following modes of operation for protecting data to the Symmetric Key Encipher and Symmetric Key Decipher callable services:
  - Cipher Block Chaining with Ciphertext Stealing (CBC-CS) Mode
  - Cipher Feedback (CFB) Mode
  - Output Feedback (OFB) Mode
  - Galois/Counter Mode (GCM)

- Added an enhanced method of key wrapping that is ANSI X9.24 compliant. See "Key Wrapping" on page 19 for more information.

- Added Elliptic Curve Cryptography (ECC) support to the following callable services:
  - Digital Signature Generate (CSNDDSG and CSNFDSG)
  - Digital Signature Verify (CSNDDSv and CSNFDSV)
  - PKA Key Generate (CSNDPKG and CSNFPKG)
  - PKA Key Import (CSNDPKI and CSNFPKI)
  - PKA Key Token Build (CSNDPKB and CSNFPKB)
  - PKA Key Token Change (CSNDKTC and CSNFKTC)
  - PKA Public Key Extract (CSNDPKX and CSNFPKX)
  - PKDS Record Create (CSNDKRC and CSNFKRC)
  - PKDS Record Delete (CSNDKRD and CSNFKRD)
  - PKDS Record Read (CSNDKRR and CSNFKRR)
  - PKDS Record Write (CSNDKRW and CSNFKRW)

**Changed information**

- ANSI X9.17 EDC Generate - CSNGE GN
- ANSI X9.17 Key Export - CSNGKE X
- ANSI X9.17 Key Import - CSNGKIM
- ANSI X9.17 Key Translate - CSNGKTR
- ANSI X9.17 Transport Key Partial Notarize - CSNGTKN
- Ciphertext Translate - CSNECTT and CSNECTT1
- Clear PIN Encrypt - CSNECPE
- Clear PIN Generate - CSNEP GN
- Clear PIN Generate Alternate - CSNECP A
- Control Vector Generate - CSNECVG
- Control Vector Translate - CSNECVT
- Cryptographic Veriable Encipher - CSNECVE
- Data Key Export - CSNEDK X
- Data Key Import - CSNEDKM
- Decipher - CSNEDEC and CSNEDEC1
- Decode - CSNEDCO
- Diversified Key Generate - CSNEDKG
- Encipher - CSNEENC and CSNEENC1
- Encode - CSNEECO
- Encrypted PIN Generate - CSNEEPG
- Encrypted PIN Translate - CSNEPTR
- Encrypted PIN Verify - CSNEPVR
- HMAC Generate - CSNEHMG and CSFEHMG1
- HMAC Verify - CSNEHMV and CSFEHMV1
- Key Export - CSNEKEX
- Key Generate2 - CSNEKGN2
- Key Import - CSNEKIM
- Key Part Import - CSNEKPI
- Key Part Import2 - CSNEKPI2
- Key Record Create - CSNEKRC
- Key Record Create2 - CSNEKRC2
- Key Record Delete - CSNEKRD
- Key Record Read - CSNEKRR
- Key Record Read2 - CSNEKRR2
- Key Record Write - CSNEKRW
- Key Record Write2 - CSNEKRW2
- Key Test - CSNEKYT
- Key Test2 - CSNEKYT2
- Key Test Extended - CSNEKYTX
- Key Token Build - CSNEKTB
- Key Token Build2 - CSNEKTB2
- Key Translate - CSNEKTR
- MAC Generate - CSNEMGN and CSNEMGN1
- MAC Verify - CSNEMVR and CSNEMVR1
- MDC Generate - CSNEMDG and CSNEMDG1
- Multiple Secure Key Import - CSNESKM
- PCI Interface - CSFPCI and CSFPCI6
- PIN Change/Unblock - CSNEPCU
- PKA Key Token Change - CSNDKTC
- PKDS Record Read - CSNFKRR
- PKDS Record Write - CSNFKRW
- Prohibit Export - CSNEPEX
- Prohibit Export Extended - CSNEPEXX
- Remote Key Export - CSNFRKX
- Restrict Key Attribute - CSNBRKA and CSNERKA
- Secure Key Import - CSNESKI
- Secure Key Import2 - CSNESKI2
- Secure Messaging for Keys - CSNESKY
Changes made in z/OS Version 1 Release 11

This document contains information previously presented in z/OS ICSF Application Programmer’s Guide, SA22-7522-12, which supports z/OS Version 1 Release 10.

This document is for ICSF FMID HCR7770. This release of ICSF runs on z/OS V1R9 and z/OS V1R10 and only on zSeries hardware.

New information:
- Added new callable service PKA Key Translate (CSNDPKT and CSNFPKT). Using this callable service, applications can translate a source CCA RSA key token into a target external smart card key token.
- Added new callable services for managing PKCS #11 tokens and objects. These additional services are:
  - PKCS #11 Derive key (CSFPDVK)
  - PKCS #11 Derive multiple keys (CSFPDMK)
  - PKCS #11 Generate HMAC (CSFPHMG)
  - PKCS #11 Generate key pair (CSFPGKP)
  - PKCS #11 Generate secret key (CSFPGSK)
  - PKCS #11 One-way hash generate (CSFPOWH)
  - PKCS #11 Private key sign (CSFPPKS)
  - PKCS #11 Pseudo-random function (CSFPPRF)
  - PKCS #11 Public key verify (CSFPPKV)
  - PKCS #11 Secret key decrypt (CSFPSKD)
  - PKCS #11 Secret key encrypt (CSFPSKE)
  - PKCS #11 Unwrap key (CSFUWK)
  - PKCS #11 Verify HMAC (CSFPHMV)
  - PKCS #11 Wrap key (CSFPWPK)
- Added information for the Crypto Express3 Coprocessor.

Changed information:
- The Symmetric Key Export and Symmetric Key Import callable services now support invocation in AMODE(64).
The Symmetric Key Encipher and Symmetric Key Decipher callable services now support an encrypted key in the CKDS. This enables applications to leverage the performance capabilities of CPACF when enciphering/deciphering data using encrypted symmetric keys.

- The ICSF Query Algorithm (CSFIQA and CSFIQA6) utility and ICSF Query Facility (CSFIQF and CSFIQF6) updated to return additional data.

This document contains terminology, maintenance, and editorial changes. Technical changes or additions to the text and illustrations are indicated by a vertical line to the left of the change.
Part 1. IBM CCA Programming

IBM CCA Programming introduces programming for the IBM CCA, AES cryptography, DES cryptography and PKA cryptography. It explains how to use DES, AES and PKA callable services.

Note: References to the IBM zSeries 800 (z800) do not appear in this information. Be aware that the documented notes and restrictions for the IBM zSeries 900 (z900) also apply to the z800. References to the IBM zEnterprise 114 (z114) do not appear in this information. Be aware that the documented notes and restrictions for the IBM zEnterprise 196 (z196) also apply to the z114.
Chapter 1. Introducing Programming for the IBM CCA

ICSF provides access to cryptographic functions through callable services, which are also known as verbs. A callable service is a routine that receives control using a CALL statement in an application language.

Prior to invoking callable services in an application program, you must link them into the application program. See "Linking a Program with the ICSF Callable Services" on page 12.

To invoke the callable service, the application program must include a procedure call statement that has the entry point name and parameters for the callable service. The parameters that are associated with a callable service provide the only communication between the application program and ICSF.

ICSF Callable Services Naming Conventions

The ICSF callable services generally follow the naming conventions outlined in the following table.

There are five exceptions where the CSFzzz names would collide and in those cases, the CSFzzz alias is CSFPzzz instead: PKDS Key Record Create (CSFPKRC), PKDS Key Record Delete (CSFPKRD), PKDS Key Record Read (CSFPKRR), PKDS Key Record Write (CSFPKRW), PKA Key Token Change (CSFPKTC).

In the following table, zzz is a 3- or 4-letter service name, such as ENC for the Encipher service or PKG for the PKA Key Generate service. Not all CSNBzzz/CSNEzzz services have ALET-qualified entry points (where certain parameters can be in a dataspace or an address space other than the caller’s). See each specific service for details.

<table>

Callable Service Syntax

This publication uses a general call format to show the name of the ICSF callable service and its parameters. An example of that format is shown here:
CALL CSNBxxx (return_code,
    reason_code,
    exit_data_length,
    exit_data,
    parameter_5,
    parameter_6,
    ...
    parameter_N)

where CSNBxxx is the name of the callable service. The return code, reason code,
exit data length, exit data, parameter 5 through parameter N represent the
parameter list. The call generates a fixed length parameter list. You must supply the
parameters in the order shown in the syntax diagrams. "Parameter Definitions" on
page 6 describes the parameters in more detail.

ICSF callable services can be called from application programs written in a number
of high-level languages as well as assembler. The high-level languages are:
  • C
  • COBOL
  • FORTRAN
  • PL/I

The ICSF callable services comply with the IBM Common Cryptographic
Architecture: Cryptographic Application Programming Interface. The services can be
invoked using the generic format, CSNBxxx. Use the generic format if you want
your application to work with more than one cryptographic product. The format
CSFxxxx can be used in place of CSNBxxx. Otherwise, use the CSFxxxx format.

Specific formats for the languages that can invoke ICSF callable services are as
follows:
  C
  CSNBxxx (return_code,reason_code,exit_data_length,exit_data,
    parameter_5,...parameter_N)

  COBOL
  CALL 'CSNBxxx' USING return_code,reason_code,exit_data_length,
     exit_data,parameter_5,...parameter_N

  FORTRAN
  CALL CSNBxxx (return_code,reason_code,exit_data_length,exit_data,
    parameter_5,...parameter_N)

  PL/I
  DCL CSNBxxx ENTRY OPTIONS(ASM);
  CALL CSNBxxx return_code,reason_code,exit_data_length,exit_data,
    parameter_5,...parameter_N;

Assembler language programs must use standard linkage conventions when
invoking ICSF callable services. An example of how an assembler language
program can invoke a callable service is shown as follows:

  CALL CSNBxxx,(return_code,reason_code,exit_data_length,exit_data,
    parameter_5,...parameter_N)

Coding examples using the high-level languages are shown in Appendix D, “Coding
Examples.”

Callable Services with ALET Parameters

Some callable services have an alternate entry point (with ALET parameters—for
data that resides in data spaces). They are in the format of CSNBxxx1 as shown in
the following table. For the associated 64-bit versions of the callable services (CSNExxx), the ALET-qualified versions are in the format CSNExxx1.

When choosing which service to use, consider the fact that:

- Callable services that do not have an ALET parameter require data to reside in the caller's primary address space. A program using these services adheres to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface.
- Callable services that have an ALET parameter allow data to reside either in the caller's primary address space or in a data space. This can allow you to encipher more data with one call. However, a program using these services does not adhere to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface, and may need to be modified prior to running with other cryptographic products that follow this programming interface.

**Rules for Defining Parameters and Attributes**

These rules apply to the callable services:

- Parameters are required and positional.
- Each parameter list has a fixed number of parameters.
- Each parameter is defined as an integer or a character string. Null pointers are not acceptable for any parameter.
- Keywords passed to the callable services, such as TOKEN, CUSP, and FIRST can be in lower, upper, or mixed case. The callable services fold them to uppercase prior to using them.

Each callable service defines its own list of parameters. The entire list must be supplied on every call. If you do not use a specific parameter, you must supply that parameter with hexadecimal zeros or binary zeros.
Parameters are passed to the callable service. All information that is exchanged between the application program and the callable service is through parameters passed on the call.

Each parameter definition begins with the direction that the data flows and the attributes that the parameter must possess (called “type”). This describes the direction.

### Direction | Meaning
--- | ---
**Input** | The application sends (supplies) the parameter to the callable service. The callable service does not change the value of the parameter.

**Output** | The callable service returns the parameter to the application program. The callable service may have changed the value of the parameter on return.

**Input/Output** | The application sends (supplies) the parameter to the callable service. The callable service may have changed the value of the parameter on return.

This describes the attributes or type.

### Type | Meaning
--- | ---
**Integer (I)** | A 4-byte (32-bit), twos complement, binary number that has sign significance.

**String** | A series of bytes where the sequence of the bytes must be maintained. Each byte can take on any bit configuration. The string consists only of data bytes. No string terminators, field-length values, or type-casting parameters are included. The maximum size of a string is X'7FFFFFFF' or 2 gigabytes. In some of the callable services, the length of some string data has an upper bound defined by the installation. The upper bound of a string can also be defined by the service.

**Alphanumeric character string** | A string of bytes in which each byte represents characters from this set:

<table>
<thead>
<tr>
<th>Character</th>
<th>EBCDIC Value</th>
<th>Character</th>
<th>EBCDIC Value</th>
<th>Character</th>
<th>EBCDIC Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>A-Z</td>
<td>(</td>
<td>X'4D'</td>
<td>/</td>
<td>X'61'</td>
<td></td>
</tr>
<tr>
<td>a-z</td>
<td>)</td>
<td>X'5D'</td>
<td>,</td>
<td>X'6B'</td>
<td></td>
</tr>
<tr>
<td>0-9</td>
<td>+</td>
<td>X'4E'</td>
<td>%</td>
<td>X'6C'</td>
<td></td>
</tr>
<tr>
<td>Blank</td>
<td>X'40' &amp;</td>
<td>X'50'</td>
<td>?</td>
<td>X'6F'</td>
<td></td>
</tr>
<tr>
<td>*</td>

<td>X'60'</td>
<td>'</td>
<td>X'7D'</td>
<td></td>
</tr>
</tbody>
</table>

**Parameter Definitions**

This topic describes these parameters, which are used by most of the callable services:

- `Return_code`
- `Reason_code`
- `Exit_data_length`
- `Exit_data`
- `Key_identifier`
Note: The return_code parameter, the reason_code parameter, the exit_data_length parameter, and the exit_data parameter are required with every callable service.

Return and Reason Codes
Return_code and reason_code parameters return integer values upon completion of the call.

Return_code
The return code parameter contains the general results of processing as an integer. Table 2 shows the standard return code values that the callable services return. A complete list of return codes is shown in Appendix A, “ICSF and TSS Return and Reason Codes.”

<table>
<thead>
<tr>
<th>Value Hex (Decimal)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00 (00)</td>
<td>Successful. Normal return.</td>
</tr>
<tr>
<td>04 (04)</td>
<td>A warning. Execution was completed with a minor, unusual event encountered.</td>
</tr>
<tr>
<td>08 (08)</td>
<td>An application error occurred. The callable service was stopped due to an error in the parameters. Or, another condition was encountered that needs to be investigated.</td>
</tr>
<tr>
<td>0C (12)</td>
<td>Error. ICSF is not active or an environment error was detected.</td>
</tr>
<tr>
<td>10 (16)</td>
<td>System error. The callable service was stopped due to a processing error within the software or hardware.</td>
</tr>
</tbody>
</table>

Generally, PCF macros will receive identical error return codes if they execute on PCF or on ICSF. A single exception has been noted: if a key is installed on the ICSF CKDS with the correct label but with the wrong key type, PCF issues a return code of 8, indicating that the key type was incorrect. ICSF issues a return code of 12, indicating that the key could not be found.

Reason_code
The reason code parameter contains the results of processing as an integer. You can specify which set of reason codes (ICSF or TSS) are returned from callable services. The default value is ICSF. For more information about the REASONCODES installation option, see z/OS Cryptographic Services ICSF System Programmer's Guide. Different results are assigned to unique reason code values under a return code.

A list of reason codes is shown in Appendix A, “ICSF and TSS Return and Reason Codes.”

Exit Data Length and Exit Data
The exit_data_length and exit_data parameters are described here. The parameters are input to all callable services. Although all services require these parameters, several services ignore them.

Exit_data_length
The integer that has the string length of the data passed to the exit. The data is identified in the exit_data parameter.

Exit_data
The installation exit data string that is passed to the callable service’s preprocessing exit. The installation exit can use the data for its own processing.
ICSF provides two installation exits for each callable service. The preprocessing exit is invoked when an application program calls a callable service, but prior to when the callable service starts processing. For example, this exit is used to check or change parameters passed on the call or to stop the call. It can also be used to perform additional security checks.

The post-processing exit is invoked when the callable service has completed processing, but prior to when the callable service returns control to the application program. For example, this exit can be used to check and change return codes from the callable service or perform clean-up processing.

For more information about the exits, see [z/OS Cryptographic Services ICSF System Programmer's Guide](#).

**Key Identifier for Key Token**

A **key identifier** for a key token is an area that contains one of these:

- **Key label** identifies keys that are in the CKDS or PKDS. Ask your ICSF administrator for the key labels that you can use.

- **Key token** can be either an internal key token, an external key token, or a null key token. Key tokens are generated by an application (for example, using the key generate callable service), or received from another system that can produce external key tokens.

  - **An internal key token** can be used only on ICSF because the master key encrypts the key value. Internal key tokens contain keys in operational form only.
  
  - **An external key token** can be exchanged with other systems because a transport key that is shared with the other system encrypts the key value. External key tokens contain keys in either exportable or importable form.

  - **A null key token** can be used to import a key from a system that cannot produce external key tokens. A null key token contains a key encrypted under an importer key-encrypting key but does not contain the other information present in an external key token.

The term **key identifier** is used to indicate that different inputs are possible for a parameter. One or more of the previously described items may be accepted by the callable service.

**Key Label:** If the first byte of the key identifier is greater than X'40', the field is considered to be holding a **key label**. The contents of a key label are interpreted as a pointer to a CKDS or PKDS key entry. The key label is an indirect reference to an internal key token.

A key label is specified on callable services with the **key_identifier** parameter as a 64-byte character string, left-justified, and padded on the right with blanks. In most cases, the callable service does not check the syntax of the key label beyond the first byte. One exception is the CKDS key record create callable service which enforces the KGUP rules for key labels unless syntax checking is bypassed by a preprocessing exit.

A key label has this form:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Length</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>00-63</td>
<td>64</td>
<td>Key label name</td>
</tr>
</tbody>
</table>

There are some general rules for creating labels for CKDS key records.
Each label can consist of up to 64 characters. The first character must be alphabetic or a national character (#, $, @). The remaining characters can be alphanumeric, a national character (#, $, @), or a period (.).

All alphabetic characters must be upper case (A-Z). All labels in the key data sets are created with upper case characters.

Labels must be unique for DATA, DATAXLAT, MAC, MACVER, DATAM, and DATAMV keys.

For compatibility with Version 1 Release 1 function, transport and PIN keys can have duplicate labels for different key types. Keys that use the dynamic CKDS update services to create or update, however, must have unique key labels.

Labels must be unique for any key record, including transport and PIN keys, created or updated using the dynamic CKDS update services.

**Invocation Requirements**

Applications that use ICSF callable services must meet these invocation requirements:

- All output parameters must be in storage that the caller is allowed to modify in their execution key.
- All input parameters must be in storage that the caller is allowed to read in their execution key.
- Data can be located higher or lower than 16Mb but must be 31-bit addressable.
- Data can be located above 2Gb if the service is invoked in AMODE(64)
- Problem or supervisor state
- Any PSW key
- Task mode or Service Request Block (SRB) mode
- No mode restrictions
- Enabled for interrupts
- No locks held

The exceptions to this list are documented with the individual callable services.

All ICSF callable services support invocation in AMODE(64). Applications which are written for AMODE(64) operation must be linked with the ICSF 64-bit service stubs, and must invoke the service with the appropriate service name. (Refer to the description of the individual callable service to determine the service name to be used.)

**Security Considerations**

Your installation can use the Security Server RACF or an equivalent product to control who can use ICSF callable services or key labels. Prior to using an ICSF callable service or a key label, ask your security administrator to ensure that you have the necessary authorization. For more information, see [z/OS Security Server RACF Security Administrator's Guide](https://www.ibm.com/support/knowledgecenter/SS42A8_7.3.0/com.ibm.zos.security.racf.doc/racfguides.htm).

RACF does not control all services. The usage notes topic in the callable service description will highlight those services which are not controlled.
Performance Considerations

In most cases, the z/OS operating system dispatcher provides optimum performance. However, if your application makes extensive use of ICSF functions, you should consider using one or both of these:

- **CCF Systems Only**: If your application runs in SRB mode, use the SCHEDULE macro or IEAAFFN callable service. You should consider scheduling an SRB to run on a processor with the cryptographic feature installed (using the FEATURE=CRYPTO keyword on the SCHEDULE macro). For more information on the SCHEDULE macro, refer to [z/OS MVS Programming: Authorized Assembler Services Reference LLA-SDU](#).

  **Restriction**: The FEATURE=CRYPTO keyword should not be specified when running on an IBM @server zSeries 990.

- Use the IEAAFFN callable service (processor affinity) to avoid system overhead in selecting which processor your program (specifically, a particular TCB in the application) runs in. Note that you do **not** have to use the IEAAFFN service to ensure that the system runs a program on a processor with a cryptographic feature; the system ensures that automatically. However, you can avoid some of the system overhead involved in the selection process by using the IEAAFFN service, thus improving the program’s performance. For more information on using the IEAAFFN callable service, refer to [z/OS MVS Programming: Callable Services for High-Level Languages](#).

IBM recommends that you run applications first without using these options. Consider these options when you are tuning your application for performance. Use these options only if they improve the performance of your application.

Special Secure Mode

Special secure mode is a special processing mode in which:

- The Secure Key Import, Secure Key Import2, and Multiple Secure Key Import callable services, which work with clear keys, can be used.
- The Clear PIN Generate callable service, which works with clear PINs, can be used.
- The Symmetric Key Generate callable service with the "IM" keyword (the DES enciphered key is enciphered by an IMPORTER key) can be used (CCF Systems Only).
- The key generator utility program (KGUP) can be used to enter clear keys into the CKDS.

To use special secure mode, several conditions must be met.

- The installation options data set must specify YES for the SSM installation option.

  For information about specifying installation options, see [z/OS Cryptographic Services ICSF System Programmer’s Guide](#).

  This is required for all systems.

- The environmental control mask (ECM) must be configured to permit special secure mode.

  The ECM is a 32-bit mask defined for each cryptographic domain during hardware installation. The second bit in this mask must have been turned on to enable special secure mode. The default is to have this bit turned on in the ECM. The bit can only be turned off/on through the optional TKE Workstation.

  This is required for systems with the Cryptographic Coprocessor Feature.
• If you are running in LPAR mode, special secure mode must be enabled.

On the IBM *zSeries* 900, you enable special secure mode during activation using the Crypto page of the Customize Activation Profiles task. When activated, you can enable or disable special secure mode on the Change LPAR Crypto task. Both of these tasks can be accessed from the Hardware Management Console.

This is required for systems with the Cryptographic Coprocessor Feature.

For the IBM *zSeries* 900 with TKE, TKE can disable/enable special secure mode.

### Using the Callable Services

This topic discusses how ICSF callable services use the different key types and key forms. It also provides suggestions on what to do if there is a problem.

ICSF provides callable services that perform cryptographic functions. You call and pass parameters to a callable service from an application program. Besides the callable services ICSF provides, you can write your own callable services called *installation-defined callable services*. **Note that only an experienced system programmer should attempt to write an installation-defined callable service.**

To write an installation-defined callable service, you must first write the callable service and link-edit it into a load module. Then define the service in the installation options data set.

You must also write a service stub. To execute an installation-defined callable service, you call a service stub from your application program. In the service stub, you specify the service number that identifies the callable service.

For more information about installation-defined callable services, see [z/OS Cryptographic Services ICSF System Programmer’s Guide](#).

### When the Call Succeeds

If the return code is 0, ICSF has successfully completed the call. If a reason code other than 0 is included, refer to [Appendix A, “ICSF and TSS Return and Reason Codes,” on page 725](#) for additional information. For instance, reason code 10000 indicates the key in the key identifier (or more than one key identifier, for services that use two internal key identifiers) has been reenciphered from encipherment under the old master key to encipherment under the current master key. Keys in external tokens are not affected by this processing because they contain keys enciphered under keys other than the host master key. If you manage your key identifiers on disk, then reason code 10000 should be a “trigger” to store these updated key identifiers back on disk.

Your program can now continue providing its function, but you may want to communicate the key that you used to another enterprise. This process is exporting a key.

If you want to communicate the key that you are using to a cryptographic partner, there are several methods to use:

• For DATA keys only, call the data key export callable service. You now have a DATA key type in exportable form.
Call the key export callable service. You now have the key type in exportable form.

When you use the key generate callable service to create your operational or importable key form, you can create an exportable form, at the same time, and you now have the key type, in exportable form, at the same time as you get the operational or importable form.

**When the Call Does Not Succeed**

Now you have planned your use of the ICSF callable services, made the call, but the service has completed with a return and reason codes other than zero.

If the return code is 4, there was a minor problem. For example, reason code 8004 indicates the trial MAC that was supplied does not match the message text provided.

If the return code is 8, there was a problem with one of your parameters. Check the meaning of the reason code value, correct the parameter, and call the service again. You may go through this process several times prior to succeeding.

If the return code is 12, ICSF is not active, or has no access to cryptographic units, or has an environmental problem. Check with your ICSF administrator.

If the return code is 16, the service has a serious problem that needs the help of your system programmer.

There are several reason codes that can occur when you have already fully debugged and tested your program. For example:

- Reason code 10004 indicates that you provided a key identifier that holds a key enciphered under a host master key. The host master key is not installed in the cryptographic unit. If this happens, you have to go back and import your importable key form again and call the service again. You need to build this flow into your program logic.
- Reason code 10012 indicates a key corresponding to the label that you specified is not in the CKDS or PKDS. Check with your ICSF administrator to see if the label is correct.
- Reason code 3063 indicates RACF failed your request to use a token.
- Reason code 16000 indicates RACF failed your request to use a service.
- Reason code 16004 indicates RACF failed your request to use the key label.

Examine your CSFKEYS profiles and key store policies for possible errors.

Return and reason codes are described in Appendix A, “ICSF and TSS Return and Reason Codes,” on page 725.

**Linking a Program with the ICSF Callable Services**

To link the ICSF callable services into an application program, you can use these sample JCL statements. In the SYSLIB concatenation, include the CSF-SCSFMOD0 module in the link edit step. This provides the application program access to all ICSF callable services (those that can be invoked in AMODE(24)/AMODE(31) as well as those that can be invoked in AMODE(64)).

```plaintext
//LKEDECN   JOB
//*---------------------------------------------------------------*
//*        ***  The JCL links the ICSF encipher callable service, CSNBENC,  *
```
into an application called ENCIPHER.

*------------------------------------------------------------------*
//LINK    EXEC PGM=IEWL,
//        PARM='XREF,LIST,LET'
//SYSUT1   DD UNIT=SYSDA,SPACE=(CYL,(10,10))
//SYSPRINT DD SYSOUT=*  
//SYSLIB   DD DSN=CSF.SCSFMOD0,DISP=SHR   * SERVICES ARE IN HERE
//SYSLMOD  DD DSN=MYAPPL.LOAD,DISP=SHR    * MY APPLICATION LIBRARY
//SYSLIN   DD DSN=MYAPPL.ENCIPHER.OBJ,DISP=SHR * MY ENCIPHER PROGRAM
//DD *
//ENTRY ENCIPHER
//NAME ENCIPHER(R)

/*
Chapter 2. Introducing Symmetric Key Cryptography and Using Symmetric Key Callable Services

The Integrated Cryptographic Service Facility protects data from unauthorized disclosure or modification. ICSF protects data stored within a system, stored in a file off a system on magnetic tape, and sent between systems. ICSF also authenticates the identity of customers in the financial industry and authenticates messages from originator to receiver. It uses cryptography to accomplish these functions.

ICSF provides access to cryptographic functions through callable services. A callable service is a routine that receives control using a CALL statement in an application language. Each callable service performs one or more cryptographic functions, including:

- Generating and managing cryptographic keys
- Enciphering and deciphering data with encrypted keys using the U.S. National Institute of Standards and Technology (NIST) Data Encryption Standard (DES), Advanced Encryption Standard (AES) or the Commercial Data Masking Facility (CDMF)
- Enciphering and deciphering data with clear keys using either the NIST Data Encryption Standard (DES), or Advanced Encryption Standard (AES)
- Transforming a CDMF DATA key to a transformed shortened DES key
- Reenciphering text from encryption under one key to encryption under another key
- Encoding and decoding data with clear keys
- Generating random numbers
- Ensuring data integrity and verifying message authentication
- Generating, verifying, and translating personal identification numbers (PINs) that identify a customer on a financial system

This topic provides an overview of the symmetric key cryptographic functions provided in ICSF, explains the functions of the cryptographic keys, and introduces the topic of building key tokens. Many services have hardware requirements. See each service for details.

Functions of the Symmetric Cryptographic Keys

ICSF provides functions to create, import, and export AES, DES, and HMAC keys. This topic gives an overview of these cryptographic keys. Detailed information about how ICSF organizes and protects keys is in z/OS Cryptographic Services ICSF Administrator's Guide.

ICSF supports two types of symmetric key tokens: fixed-length and variable-length. In fixed-length key tokens, key type and usage are defined by the control vector. In variable-length key tokens, the key type and usage are defined in the associated data section. The control vector and associated data section are cryptographically bound to the encrypted key value in the token.
Key Separation

The cryptographic feature controls the use of keys by separating them into unique types, allowing you to use a specific type of key only for its intended purpose. For example, a key used to protect data cannot be used to protect a key.

An ICSF system has only one DES master key and one AES master key. However, to provide for key separation, the cryptographic feature automatically encrypts each type of key in a fixed-length token under a unique variation of the master key. Each variation of the master key encrypts a different type of key. Although you enter only one master key, you have a unique master key to encrypt all other keys of a certain type.

Note: In PCF, key separation applies only to keys enciphered under the master key (keys in operational form). In ICSF, key separation also applies to keys enciphered under transport keys (keys in importable or exportable form). This allows the creator of a key to transmit the key to another system and to enforce its use at the other system.

Master Key Variant for Fixed-length Tokens

Whenever the master key is used to encipher a key, the cryptographic coprocessor produces a variation of the master key according to the type of key the master key will encipher. These variations are called master key variants. The cryptographic coprocessor creates a master key variant by exclusive ORing a fixed pattern, called a control vector, onto the master key. A unique control vector is associated with each type of key. For example, all the different types of data-encrypting, PIN, MAC, and transport keys each use a unique control vector which is exclusive ORed with the master key in order to produce the variant. The different key types are described in "Types of Keys" on page 19.

Each master key variant protects a different type of key. It is similar to having a unique master key protect all the keys of a certain type.

The master key, in the form of master key variants, protects keys operating on the system. A key can be used in a cryptographic function only when it is enciphered under a master key. When systems want to share keys, transport keys are used to protect keys sent outside of systems. When a key is enciphered under a transport key, the key cannot be used in a cryptographic function. It must first be brought on to a system and enciphered under the system's master key, or exported to another system where it will then be enciphered under that system's master key.

Transport Key Variant for Fixed-length Tokens

Like the master key, ICSF creates variations of a transport key to encrypt a key according to its type. This allows for key separation when a key is transported off the system. A transport key variant, also called key-encrypting key variant, is created the same way a master key variant is created. The transport key's clear value is exclusive ORed with a control vector associated with the key type of the key it protects.

Note: To exchange keys with systems that do not recognize transport key variants, ICSF allows you to encrypt selected keys under a transport key itself, not under the transport key variant. For more information, see the 'Transport keys (or key-encrypting keys)' list item in "Types of Keys" on page 19.
Key Forms

A key that is protected under the master key is in operational form, which means ICSF can use it in cryptographic functions on the system.

When you store a key with a file or send it to another system, the key is enciphered under a transport key rather than the master key because, for security reasons, the key should no longer be active on the system. When ICSF enciphers a key under a transport key, the key is not in operational form and cannot be used to perform cryptographic functions.

When a key is enciphered under a transport key, the sending system considers the key in exportable form. The receiving system considers the key in importable form. When a key is reenciphered from under a transport key to under a system's master key, it is in operational form again.

Enciphered keys appear in three forms. The form you need depends on how and when you use a key.

- **Operational** key form is used at the local system. Many callable services can use an operational key form.
  
  The key token build, key generate, key import, data key import, clear key import, multiple clear key import, secure key import, and multiple secure key import callable services can create an operational key form.

- **Exportable** key form is transported to another cryptographic system. It can only be passed to another system. The ICSF callable services cannot use it for cryptographic functions. The key generate, data key export, and key export callable services produce the exportable key form.

- **Importable** key form can be transformed into operational form on the local system. The key import callable service (CSNBKIM) and the Data key import callable service (CSNBDKM) can use an importable key form. Only the key generate callable service (CSNBKGN) can create an importable key form. The secure key import (CSNBSKI) and multiple secure key import (CSNBSKM) callable services can convert a clear key into an importable key form.

For more information about the key types, see either “Functions of the Symmetric Cryptographic Keys” on page 15 or the [z/OS Cryptographic Services ICSF Administrator's Guide](https://www.ibm.com/support/knowledgecenter/SSECG2_8.1.0/com.ibm.zos.v2r1.zosbfss.doc/iscf_adm.pdf). See “Key Forms and Types Used in the Key Generate Callable Service” on page 63 for more information about key form.

DES Key Flow

The conversion from one key to another is considered to be a one-way flow. An operational key form cannot be turned back into an importable key form. An exportable key form cannot be turned back into an operational or importable key form. The flow of ICSF key forms can only be in one direction:

IMPORTABLE → OPERATIONAL → EXPORTABLE

Key Token

ICSF supports two types of symmetric key tokens: fixed-length and variable-length. The fixed-length token is a 64-byte field composed of a key value and control information in the control vector. The variable-length token is composed of a key value and control information in the associated data section of the token. The control information is assigned to the key when ICSF creates the key. The key token can be either an internal key token, an external key token, or a null key token. Through the use of key tokens, ICSF can:

- Support continuous operation across a master key change
Control use of keys in cryptographic services

If the first byte of the key identifier is X'01', the key identifier is interpreted as an **internal key token**. An internal key token is a token that can be used only on the ICSF system that created it (or another ICSF system with the same host master key). It contains a key that is encrypted under the master key.

An application obtains an internal key token by using one of the callable services such as those listed here. The callable services are described in detail in Chapter 5, "Managing Symmetric Cryptographic Keys."

- CKDS Key record read and CKDS key record read2
- Clear key import
- Data key import
- Key generate and Key generate2
- Key import
- Key part import and Key part import2
- Key token build and Key token build2
- Multiple secure key import
- Multiple clear key import
- Secure key import and secure key import2
- Symmetric key import2

The master key may be dynamically changed between the time that you invoke a service, such as the key import callable service to obtain a key token, and the time that you pass the key token to the encipher callable service. When a change to the master key occurs, ICSF reenciphers the caller's key from under the old master key to under the new master key. A Return Code of 0 with a reason code of 10000 notifies you that ICSF reenciphered the key. For information on reenciphering the CKDS or the PKDS, see z/OS Cryptographic Services ICSF Administrator's Guide.

**Attention:** If an internal key token held in user storage is not used while the master key is changed twice, the internal key token is no longer usable. (See "Other Considerations" on page 22 for additional information.)

For debugging information, see Appendix B, “Key Token Formats” for the format of an internal key token.

If the first byte of the key identifier is X'02', the key identifier is interpreted as an **external key token**. By using the external key token, you can exchange keys between systems. It contains a key that is encrypted under a key-encrypting key.

An external key token contains an encrypted key and control information to allow compatible cryptographic systems to:
- Have a standard method of exchanging keys
- Control the use of keys through the control vector
- Merge the key with other information needed to use the key

An application obtains the external key token by using one of the callable services such as these listed. They are described in detail in Chapter 5, "Managing Symmetric Cryptographic Keys."

- Key generate
- Key export
- Data key export
- Symmetric key export
For debugging information, see Appendix B, “Key Token Formats” for the format of an external key token.

If the first byte of the key identifier is X'00', the key identifier is interpreted as a **null key token**. Use the null key token to import a key from a system that cannot produce external key tokens. That is, if you have an 8- to 16-byte key that has been encrypted under an importer key, but is not imbedded within a token, place the encrypted key in a null key token and then invoke the key import callable service to get the key in operational form.

For debugging information, see Appendix B, “Key Token Formats” for the format of a null key token.

**Key Wrapping**

ICSF supports two methods of wrapping the key value in a fixed-length symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method which is ANSI X9.24 compliant.

The key value in a symmetric key token may be wrapped in two ways. The original method has been used by ICSF since it was first released. The key value in DES key tokens are encrypted using triple DES encryption and key parts are encrypted separately. The key value in AES tokens are encrypted using AES encryption and cipher block chaining mode.

The enhanced method of key wrapping, introduced in HCR7780, is ANSI X9.24 compliant. The key value of all keys are bundled with other token data and encrypted using triple DES or AES encryption and cipher block chaining mode. The enhanced method requires a z196 with a CEX3C.

Your installation's system programmer can, while customizing installation options data set as described in the [z/OS Cryptographic Services ICSF System Programmer's Guide](https://www.ibm.com), use the DEFAULTWRAP parameter to specify the default key wrapping for symmetric keys. Application programs can override this default method using the WRAP-ENH (use enhanced method) and WRAP-ECB (use original ECB key-wrapping method) rule array keywords.

**Note:** Variable-length tokens are wrapped using the AESKW wrapping method defined in ANSI X9.102 and are not affected by the DEFAULTWRAP setting.

**Control Vector for DES Keys**

For DES keys, a unique control vector exists for each type of key the master key enciphers. The cryptographic feature exclusive ORs the master key with the control vector associated with the type of key the master key will encipher. The control vector ensures that an operational key is only used in cryptographic functions for which it is intended. For example, the control vector for an input PIN-encrypting key ensures that such a key can be used only in the Encrypted PIN translate and Encrypted PIN verify functions.

**Types of Keys**

The cryptographic keys are grouped into these categories based on the functions they perform.

- **DES master key.** The DES master key is a double-length (128 bits) key used only to encrypt other keys. The ICSF administrator installs and changes the DES master key (see [z/OS Cryptographic Services ICSF Administrator's Guide](https://www.ibm.com)) for
The administrator does this by using the Master Key Entry panels or the optional Trusted Key Entry (TKE) workstation.

The master key always remains in a secure area in the cryptographic facility. It is used only to encipher and decipher keys. Other keys also encipher and decipher keys and are mostly used to protect cryptographic keys you transmit on external links. These keys, while on the system, are also encrypted under the master key.

- **AES master key.** The AES master key is a 32-byte (256 bits) key used only to encrypt other keys. The ICSF administrator installs and changes the AES master key (see [z/OS Cryptographic Services ICSF Administrator’s Guide](https://www.ibm.com/support/docviewlandingpage?req_locale=en_US&rs=1036&uid=swg21870636) for details). The administrator does this by using the Master Key Entry panels or the optional Trusted Key Entry (TKE) workstation (TKE V5.3).

  The master key always remains in a secure area in the cryptographic facility. It is used only to encipher and decipher keys. Other keys also encipher and decipher keys and are mostly used to protect cryptographic keys you transmit on external links. These keys, while on the system, are also encrypted under the master key.

- **AES Data-encrypting keys.** The AES data-encrypting keys are 128-, 192- and 256-bit keys that protect data privacy. If you intend to use a data-encrypting key for an extended period, you can store it in the CKDS so that it will be reenciphered if the master key is changed.

- **AES Cipher keys.** The AES cipher keys are 128-, 192- and 256-bit keys that protect data privacy. If you intend to use a cipher key for an extended period, you can store it in the CKDS so that it will be reenciphered if the master key is changed.

- **DES Data-encrypting keys.** The DES data-encrypting keys are single-length (64-bit), double-length (128-bit), or triple-length (192-bit) keys that protect data privacy. Single-length data-encrypting keys can also be used to encode and decode data and authenticate data sent in messages. If you intend to use a data-encrypting key for an extended period, you can store it in the CKDS so that it will be reenciphered if the master key is changed.

  You can use single-length data-encrypting keys in the encipher, decipher, encode, and decode callable services to manage data and also in the MAC generation and MAC verification callable services. Double-length and triple-length data-encrypting keys can be used in the encipher and decipher callable services for more secure data privacy. DATAAC is also a double-length data-encrypting key. Single-length data-encrypting keys can be exported and imported using the ANSI X9.17 key management callable services.

- **Data-translation keys.** The data-translation keys are single-length (64 bits) keys used for the ciphertext translate callable service as either the input or the output data-transport key.

  **Restriction:** Data-translation keys are only supported on the IBM @server zSeries 900.

- **CIPHER keys.** These consist of CIPHER, ENCIPHER and DECIPHER keys. They are single and double length keys for enciphering and deciphering data.

  **Note:** Double-length CIPHER, ENCIPHER and DECIPHER keys are only supported on the IBM @server zSeries 900, IBM @server zSeries 890, z9 EC, z9 BC, z10 EC and z10 BC with a PCIXCC, CEX2C, or CEX3C.

- **HMAC keys.** HMAC keys are variable-length (80 - 2048 bits) keys used to generate and verify MACs using the key-hash MAC algorithm.
• **MAC keys.** The MAC keys are single- and double-length (64 and 128 bits) keys used for the callable services that generate and verify MACs.

  With a PCIXCC, CEX2C, or CEX3C, MAC and MACVER can be single or double length keys.

• **PIN keys.** The personal identification number (PIN) is a basis for verifying the identity of a customer across financial industry networks. PIN keys are used in cryptographic functions to generate, translate, and verify PINs, and protect PIN blocks. They are all double-length (128 bits) keys. PIN keys are used in the Clear PIN generate, Encrypted PIN verify, and Encrypted PIN translate callable services.

  For installations that do not support double-length 128-bit keys, effective single-length keys are provided. For a single-length key, the left key half of the key equals the right key half.

  [“Managing Personal Authentication” on page 56](#) gives an overview of the PIN algorithms you need to know to write your own application programs.

• **AES Transport keys (or key-encrypting keys).** Transport keys are also known as key-encrypting keys. They are used to protect AES and HMAC keys when you distribute them from one system to another.

  There are two types of AES transport keys:

  – Exporter key-encrypting key protects keys of any type that are sent from your system to another system. The exporter key at the originator is the same key as the importer key of the receiver.

  – Importer key-encrypting key protects keys of any type that are sent from another system to your system. It also protects keys that you store externally in a file that you can import to your system at another time. The importer key at the receiver is the same key as the exporter key at the originator.

  **Note:** A key-encrypting key should be as strong or stronger than the key it is wrapping.

• **DES Transport keys (or key-encrypting keys).** Transport keys are also known as key-encrypting keys. They are double-length (128 bits) DES keys used to protect keys when you distribute them from one system to another.

  There are several types of transport keys:

  – Exporter or OKEYXLAT key-encrypting key protects keys of any type that are sent from your system to another system. The exporter key at the originator is the same key as the importer key of the receiver.

  – Importer or IKEYXLAT key-encrypting key protects keys of any type that are sent from another system to your system. It also protects keys that you store externally in a file that you can import to your system at another time. The importer key at the receiver is the same key as the exporter key at the originator.

  – NOCV Importers and Exporters are key-encrypting keys used to transport keys with systems that do not recognize key-encrypting key variants. There are some requirements and restrictions for the use of NOCV key-encrypting keys:

    - On CCF systems, installation of NOCV enablement keys on the CKDS is required.

    - On PCIXCC, CEX2C, and CEX3C systems, use of NOCV IMPORTERs and EXPORTERs is controlled by access control points.
- Only programs in system or supervisor state can use the NOCV key-encrypting key in the form of tokens in callable services. Any problem program may use NOCV key-encrypting key with labelnames from the CKDS.
- NOCV key-encrypting key on the CKDS should be protected by RACF.
- NOCV key-encrypting key can be used to encrypt single or double length keys with standard CVs for key types DATA, DATAC, DATAM, DATAMV, DATAXLAT, EXPORTER, IKEYXLAT, IMPORTER, IPINENC, single-length MAC, single-length MACVER, OKEYXLAT, OPINENC, PINGEN and PINVER.
- With PCIXCCs, CEX2Cs, and CEX3Cs, NOCV key-encrypting keys can be used with triple length DATA keys. Since DATA keys have 0 CVs, processing will be the same as if the key-encrypting keys are standard key-encrypting keys (not the NOCV key-encrypting key).

**Note:** Transport keys replace local, remote, and cross keys used by PCF.
You use key-encrypting keys to protect keys that are transported using any of these services: data key export, key export, key import, clear key import, multiple clear key import, secure key import, multiple secure key import, key generate, and key translate.
For installations that do not support double-length key-encrypting keys, effective single-length keys are provided. For an effective single-length key, the clear key value of the left key half equals the clear key value of the right key half.

- **ANSI X9.17 key-encrypting keys.** These bidirectional key-encrypting keys are used exclusively in ANSI X9.17 key management. They are either single-length (64 bits) or double-length (128 bits) keys used to protect keys when you distribute them from one system to another according to the ANSI X9.17 protocol.

**Note:** ANSI X9.17 keys are only supported on the IBM @server zSeries 900.

- **Key-Generating Keys.** Key-generating keys are double-length keys used to derive unique-key-per-transaction keys.

**Other Considerations**
These are considerations for keys held in the cryptographic key data set (CKDS) or by applications.
- ICSF ensures that keys held in the CKDS are reenciphered during the master key change. Keys with a long life span (more than one master key change) should be stored in the CKDS.
- Keys enciphered under the host DES master key and held by applications are automatically reenciphered under a new master key as they are used. Keys with a short life span (for example, VTAM SLE data keys) do not need to be stored in the CKDS. However, if you have keys with a long life span and you do not store them in the CKDS, they should be enciphered under the importer key-encrypting key. The importer key-encrypting key itself should be stored in the CKDS.

Table 3 on page 23 describes the key types.

You can build, generate, import, or export key types DECIPHER, ENCIPHER, CIPHER, CVARDEC, and CVARPINE on a CCF system, but they are not usable on CCF systems. They will be usable by ICSF if running on a z990, z890, z9 EC, z9 BC, z10 EC and z10 BC with a PCIXCC, CEX2C, or CEX3C.
### Table 3. Descriptions of Key Types

<table>
<thead>
<tr>
<th>Key Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>AESDATA</td>
<td>Data encrypting key. Use the AES 128-, 192- or 256-bit key to encipher and decipher data.</td>
</tr>
<tr>
<td>AESTOKEN</td>
<td>May contain an AES key.</td>
</tr>
<tr>
<td>AKEK</td>
<td>Single-length or double-length, bidirectional key-encrypting key used for the ANSI X9.17 key management callable services. AKEK keys are only supported on the IBM @server zSeries 900.</td>
</tr>
</tbody>
</table>
| CIPHER     | • **DES**: This single or double-length key is used to encrypt or decrypt data. It can be used in the Encipher and Decipher callable services.  
|            | **z900 only**: This is a single-length key and cannot be used in the Encipher and Decipher services.  
|            | • **AES**: This 128-, 192- or 256-bit key is used to encrypt or decrypt data. It can be used in the Symmetric Algorithm Decipher and Symmetric Algorithm Encipher callable services. |
| CLRAES     | Data encrypting key. The key value is not encrypted. Use this AES 128-, 192- or 256-bit key to encipher and decipher data. |
| CLRDES     | Data encrypting key. The key value is not encrypted. Use this DES single-length, double-length, or triple-length key to encipher and decipher data. |
| CVARDEC    | The TSS Cryptographic variable decipher verb uses a CVARDEC key to decrypt plaintext by using the Cipher Block Chaining (CBC) method. This is a single-length key. |
| CVARENC    | Cryptographic variable encipher service uses a CVARENC key to encrypt plaintext by using the Cipher Block Chaining (CBC) method. This is a single-length key. |
| CVARPINE   | Used to encrypt a PIN value for decryption in a PIN-printing application. This is a single-length key. |
| CVARXCVL   | Used to encrypt special control values in DES key management. This is a single-length key.        |
| CVARXCVR   | Used to encrypt special control values in DES key management. This is a single-length key.        |
| DATA       | Data encrypting key. Use this DES single-length, double-length, or triple-length key to encipher and decipher data. Use the AES 128-, 192- or 256-bit key to encipher and decipher data. |
| DATAC      | Used to specify a DATA-class key that will perform in the Encipher and Decipher callable services, but not in the MAC Generate or MAC Verify callable services. This is a double-length key. Only available with a PCIIXCC/CEX2C/CEX3C. |
| DATAM      | Double-length MAC generation key. Used to generate a message authentication code.                 |
| DATAMV     | Double-length MAC verification key. Used to verify a message authentication code.                 |
| DATAXLAT   | Data translation key. Use this single-length key to reencipher text from one DATA key to another. DATAXLAT keys are only supported on the IBM @server zSeries 900. |
| DECIPHER   | This single or double-length DES key is used to decrypt data. It can be used in the Decipher callable service.  
|            | **z900 only**: This is a single-length key and cannot be used in the Decipher service.             |
Table 3. Descriptions of Key Types (continued)

<table>
<thead>
<tr>
<th>Key Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DGYGENKY</td>
<td>Used to generate a diversified key based on the key-generating key. This is a double-length key.</td>
</tr>
<tr>
<td>ENCIPHER</td>
<td>This single or double-length DES key is used to encrypt data. It can be used in the Encipher callable service.</td>
</tr>
<tr>
<td></td>
<td><strong>z900 only:</strong> This is a single-length key and cannot be used in the Encipher service.</td>
</tr>
<tr>
<td>EXPORTER</td>
<td>Exporter key-encrypting key. Use this double-length DES key or 128-, 192-, or 256-bit AES key to convert a key from the operational form into exportable form.</td>

<tr>
<td>OKEYXLAT</td>
<td>Used to encrypt an output key in the Key Translate callable service. This is a double-length key.</td>
</tr>
<tr>
<td>OPINENC</td>
<td>Output PIN-encrypting key. Use this double-length output key to translate PINs. The output PIN blocks from the Encrypted PIN translate, Encrypted PIN generate, and Clear PIN generate alternate callable services are encrypted under this type of key. If an encrypted PIN block is contained in the output of the SET Block Decompose service, it may be encrypted by an OPINENC key.</td>
</tr>
<tr>
<td>PINGEN</td>
<td>PIN generation key. Use this double-length key to generate PINs.</td>
</tr>
<tr>
<td>PINVER</td>
<td>PIN verification key. Use this double-length key to verify PINs.</td>
</tr>
<tr>
<td>SECMSG</td>
<td>Used to encrypt PINs or keys in a secure message. This is a double-length key.</td>
</tr>
<tr>
<td>TOKEN</td>
<td>A key token that may contain a key.</td>
</tr>
</tbody>
</table>

**Clear Keys**

A clear key is the base value of a key, and is not encrypted under another key. Encrypted keys are keys whose base value has been encrypted under another key.
There are four callable services you can use to convert a clear key to an encrypted key:

- To convert a clear key to an encrypted data key in operational form, use either the Clear Key Import callable service or the Multiple Clear Key Import callable service.

- To convert a clear key to an encrypted key of any type, in operational or importable form, use either the Secure Key Import callable service or the Multiple Secure Key Import callable service.

**Note:** The Secure Key Import and Multiple Secure Key Import callable services can only execute in special secure mode.

Clear key DATA tokens can be stored in the CKDS. These tokens can only be used by symmetric key decipher and symmetric key encipher callable services for the DES and AES algorithms.

---

### Generating and Managing Symmetric Keys

Using ICSF, you can generate keys using either the **key generator utility program** or the **key generate callable service**. The dynamic CKDS update callable services allow applications to directly manipulate the CKDS. ICSF provides callable services that support DES and AES key management as defined by the IBM Common Cryptographic Architecture (CCA) and by the ANSI X9.17 standard.

The next few topics describe the key generating and management options ICSF provides.

### Key Generator Utility Program

The key generator utility program generates data, data-translation, MAC, PIN, and key-encrypting keys, and enciphers each type of key under a specific master key variant. When the KGUP generates a key, it stores it in the cryptographic key data set (CKDS).

**Note:** If you specify CLEAR, KGUP uses the random number generate and secure key import callable services rather than the key generate service.

You can access KGUP using ICSF panels. The KGUP path of these panels helps you create the JCL control statements to control the key generator utility program. When you want to generate a key, you can enter the ADD control statement and information, such as the key type on the panels. For a detailed description of the key generator utility program and how to use it to generate keys, see [z/OS Cryptographic Services ICSF Administrator's Guide](https://www.ibm.com/support/knowledgecenter/SS127U_1.3.0/com.ibm.zos.v1r3.icsf.adm_toc.html).

### Common Cryptographic Architecture DES Key Management Services

ICSF provides callable services that support CCA key management for DES keys.

#### Clear Key Import Callable Service (CSNBCKI and CSNECKI)

This service imports a clear DATA key that is used to encipher or decipher data. It accepts a clear key and enciphers the key under the host master key, returning an encrypted DATA key in operational form in an internal key token.

#### Control Vector Generate Callable Service (CSNCVGV and CSNECVGV)

The control vector generate callable service builds a control vector from keywords specified by the **key_type** and **rule_array** parameters.
Control Vector Translate Callable Service (CSNBCVT and CSNECVT)
The control vector translate callable service changes the control vector used to
encipher an external key. Use of this service requires the optional PCI
Cryptographic Coprocessor.

Cryptographic Variable Encipher Callable Service (CSNBCVE and CSNECVE)
The cryptographic variable encipher callable service uses a CVARENC key to
encrypt plaintext by using the Cipher Block Chaining (CBC) method. You can use
this service to prepare a mask array for the control vector translate service. The
plaintext must be a multiple of eight bytes in length.

Data Key Export Callable Service (CSNBDKX and CSNEDKX)
This service reenciphers a DATA key from encryption under the master key to
encryption under an exporter key-encrypting key, making it suitable for export to
another system.

Data Key Import Callable Service (CSNBDKM and CSNEDKM)
This service imports an encrypted source DES DATA key and creates or updates a
target internal key token with the master key enciphered source key.

Diversified Key Generate Callable Service (CSNBDKG and CSNEDKG)
The diversified key generate service generates a key based on the key-generating
key, the processing method, and the parameter supplied. The control vector of the
key-generating key also determines the type of target key that can be generated.

Key Export Callable Service (CSNBKEX and CSNEKEX)
This service reenciphers any type of key (except an AKEK or IMP-PKA key) from
encryption under a master key variant to encryption under the same variant of an
exporter key-encrypting key, making it suitable for export to another system.

Key Generate Callable Service (CSNBKGN and CSNEKGN)
The key generate callable service generates data, data-translation, MAC, PIN, and
key-encrypting keys. It generates a single key or a pair of keys. Unlike the key
generator utility program, the key generate service does not store the keys in the
CKDS where they can be saved and maintained. The key generate callable service
returns the key to the application program that called it. The application program
can then use a dynamic CKDS update service to store the key in the CKDS.

When you call the key generate callable service, include parameters specifying
information about the key you want generated. Because the form of the key restricts
its use, you need to choose the form you want the generated key to have. You can
use the key_form parameter to specify the form. The possible forms are:

- **Operational**, if the key is used for cryptographic operations on the local system.
  Operational keys are protected by master key variants and can be stored in the
  CKDS or held by applications in internal key tokens.
- **Importable**, if the key is stored with a file or sent to another system. Importable
  keys are protected by importer key-encrypting keys.
- **Exportable**, if the key is transported or exported to another system and imported
  there for use. Exportable keys are protected by exporter key-encrypting keys and
cannot be used by ICSF callable service.

Importable and exportable keys are contained in external key tokens. For more
information on key tokens, refer to "Key Token" on page 17.
**Key Import Callable Service (CSNBKIM and CSNEKIM)**
This service reenciphers a key (except an AKEK) from encryption under an importer key-encrypting key to encryption under the master key. The reenciphered key is in the operational form.

**Key Part Import Callable Service (CSNBKPI and CSNEKPI)**
This service combines clear key parts of any key type and returns the combined key value either in an internal token or as an update to the CKDS.

**Key Test Callable Service (CSNBKYT, CSNEKYT, CSNBKYTX, and CSNEKYTX)**
This service generates or verifies a secure cryptographic verification pattern for keys. A parameter indicates the action you want to perform.

The key to test can be in the clear or encrypted under a master key. The key test extended callable service works on keys encrypted under a KEK.

For generating a verification pattern, the service creates and returns a random number with the verification pattern. For verifying a pattern, you supply the random number from the call to the service that generated the pattern.

**Key Token Build Callable Service (CSNBKTB and CSNEKTB)**
The key token build callable service is a utility you can use to create skeleton key tokens for AKEKs as input to the key generate or key part import callable service. You can also use this service to build CCA key tokens for all key types ICSF supports. You can also use this service to build CCA key tokens for all key types ICSF supports.

**Key Translate Callable Service (CSNBKTR and CSNEKTR)**
This service uses one key-encrypting key to decipher an input key and then enciphers this key using another key-encrypting key within the secure environment.

**Key Translate2 Callable Service (CSNBKTR2 and CSNEKTR2)**
This service uses one key-encrypting key to decipher an input key and then enciphers this key using another key-encrypting key within the secure environment.

**Multiple Clear Key Import Callable Service (CSNBCKM and CSNECKM)**
This service imports a single-length, double-length, or triple-length clear DATA key that is used to encipher or decipher data. It accepts a clear key and enciphers the key under the host master key, returning an encrypted DATA key in operational form in an internal key token.

**Multiple Secure Key Import Callable Service (CSNBSKM and CSNESKM)**
This service enciphers a single-length, double-length, or triple-length clear key under the host master key or under an importer key-encrypting key. The clear key can then be imported as any of the possible key types. Triple-length keys can only be imported as DATA keys. This service can be used only when ICSF is in special secure mode and does not allow the import of an AKEK.

**Prohibit Export Callable Service (CSNBPEX and CSNEPEX)**
This service modifies an operational key so that it cannot be exported. This callable service does not support NOCV key-encrypting keys, DATA, MAC, or MACVER keys with standard control vectors (for example, control vectors supported by the Cryptographic Coprocessor Feature).
Prohibit Export Extended Callable Service (CSNBPEXX and CSNEPEXX)
This service updates the control vector in the external token of a key in exportable form so that the receiver node can import the key but not export it. When the key import callable service imports such a token, it marks the token as non-exportable. The key export callable service does not allow export of this token.

Random Number Generate Callable Service (CSNBRNG, CSNERNG, CSNBRNGL, and CSNERNGL)
The random number generate callable service creates a random number value to use in generating a key. The callable service uses cryptographic hardware to generate a random number for use in encryption.

Remote Key Export Callable Service (CSNDRKX and CSNFRKX)
The remote key export callable service uses the trusted block to generate or export DES keys for local use and for distribution to an ATM or other remote device.

Restrict Key Attribute Callable Service (CSNBRKA and CSNERKA)
This service modifies an AES operational key so that it cannot be exported.

Secure Key Import Callable Service (CSNBSKI and CSNESKI)
This service enciphers a clear key under the host master key or under an importer key-encrypting key. The clear key can then be imported as any of the possible key types. This service can be used only when ICSF is in special secure mode and does not allow the import of an AKEK.

Note: The PKA encrypt, PKA decrypt, symmetric key generate, symmetric key import, and symmetric key export callable services provide a way of distributing DES DATA keys protected under a PKA key. See [Chapter 3, “Introducing PKA Cryptography and Using PKA Callable Services,” on page 79] for additional information.

Symmetric Key Export Callable Service (CSNDSYX and CSNFSYX)
This service transfers an application-supplied symmetric key (a DATA key) from encryption under the DES host master key to encryption under an application-supplied RSA public key. (There are two types of PKA public key tokens: RSA and DSS. This callable service can use only the RSA type.) The application-supplied DATA key must be an ICSF DES internal key token or the label of such a token in the CKDS. The symmetric key import callable service can import the PKA-encrypted form at the receiving node.

Symmetric Key Generate Callable Service (CSNDSYG and CSNFSYG)
This service generates a symmetric key (that is, a DATA key) and returns it encrypted using DES and encrypted under an RSA public key token. (There are two types of PKA public key tokens: RSA and DSS. This callable service can use only the RSA type.)

The DES-encrypted key can be an internal token encrypted under a host DES master key, or an external form encrypted under a KEK. (You can use the symmetric key import callable service to import the PKA-encrypted form.)
Symmetric Key Import Callable Service (CSNSYI and CSNFSYI)
This service imports a symmetric (DES) DATA key enciphered under an RSA public key. (There are two types of PKA private key tokens: RSA and DSS. This callable service can use only the RSA type.) This service returns the key in operational form, enciphered under the DES master key.

Transform CDMF Key Callable Service (CSNBTC and CSNETBC)
Restriction: This service is only available on the IBM @server zSeries 900.

It changes a CDMF DATA key in an internal or external token to a transformed shortened DES key. It ignores the input internal DES token markings and marks the output internal token for use in the DES. You need to use this service only if you have a CDMF or DES-CDMF system that needs to send CDMF-encrypted data to a DES-only system. The CDMF or DES-CDMF system must generate the key, shorten it, and pass it to the DES-only system.

If the input DATA key is in an external token, the operational KEK must be marked as DES or SYS-ENC. The service fails for an external DATA key encrypted under a KEK that is marked as CDMF.

Trusted Block Create Callable Service (CSNDTBC and CSNFTBC)
This service creates and activates a trusted block under two step process.

User Derived Key Callable Service (CSFUDK and CSFUDK6)
Restriction: This service is only available on the IBM @server zSeries 900.

This service generates a single-length or double-length MAC key, or updates an existing user-derived key. A single-length MAC key can be used to compute a Message Authentication Code (MAC) following the ANSI X9.9, ANSI X9.19, or the Europay, MasterCard, Visa (EMV) Specification MAC processing rules. A double-length MAC key can be used to compute a MAC following the ANSI X9.19 optional double MAC processing rule or the EMV rules.

Common Cryptographic Architecture AES Key Management Services
ICSF provides callable services that support CCA key management for AES keys.

Key Generate Callable Service (CSNBKGN and CSNEKGN)
The key generate callable service generates AES data keys. It generates a single operational key. Unlike the key generator utility program, the key generate service does not store the keys in the CKDS where they can be saved and maintained. The key generate callable service returns the key to the application program that called it. The application program can then use a dynamic CKDS update service to store the key in the CKDS.

Key Generate2 Callable Service (CSNBKGN2 and CSNEKGN2)
The service generates AES keys. It generates one operational key or an operational key pair. The key generate callable service returns the key to the application program that called it. The application program can then use a dynamic CKDS update service to store the key in the CKDS.

Key Part Import2 Callable Service (CSNBKPI2 and CSNEKPI2)
This service combines clear key parts of any AES key type and returns the combined key value either in an internal token or as an update to the CKDS.
Key Test2 Callable Service (CSNBKYT2 and CSNEKYT2)
This service generates or verifies a secure cryptographic verification pattern for AES keys. A parameter indicates the action you want to perform.

Key Token Build Callable Service (CSNkBKTB and CSNEKTB)
The key token build callable service is a utility you can use to create clear AES key tokens, secure AES key tokens and skeleton secure AES key tokens for use with other callable services. You can also use this service to build CCA key tokens for all key types ICSF supports. You can also use this service to build CCA key tokens for all key types ICSF supports.

Multiple Clear Key Import Callable Service (CSNBCKM and CSNECKM)
This service imports a 128-, 192- or 256-bit clear DATA key that is used to encipher or decipher data. It accepts a clear key and enciphers the key under the host master key, returning an encrypted DATA key in operational form in an internal key token.

Multiple Secure Key Import Callable Service (CSNBSKM and CSNESKM)
This service enciphers 128-, 192- or 256-bit clear DATA key under the host master key. This service can be used only when ICSF is in special secure mode.

Restrict Key Attribute Callable Service (CSNBRKA and CSNERKA)
This service modifies an AES operational key so that it cannot be exported.

Secure Key Import2 Callable Service (CSNBSKI2 and CSNESKI2)
This service enciphers a variable length clear AES key under the host master key. This service can be used only when ICSF is in special secure mode.

Symmetric Key Export Callable Service (CSNDSYX and CSNFSYX)
Use the symmetric key export callable service to transfer an application-supplied AES DATA key from encryption under a master key to encryption under an application-supplied RSA public key or AES EXPORTER key. The application-supplied key must be an ICSF AES internal key token or the label of such a token in the CKDS. The Symmetric Key Import or Symmetric Key Import2 callable services can import the key encrypted under the RSA public key or AES EXPORTER at the receiving node.

Symmetric Key Generate Callable Service (CSNDSYG and CSNFSYG)
This service generates a symmetric DATA key and returns it encrypted under the host AES master key and encrypted under an RSA public key token. (There are two types of PKA public key tokens: RSA and DSS. This callable service can use only the RSA type.)

The AES-encrypted key can only be an internal token encrypted under a host AES master key. You can use the symmetric key import callable service to import the PKA-encrypted form.

Symmetric Key Import Callable Service (CSNDSYI and CSNFSYI)
This service imports a symmetric (AES) DATA key enciphered under an RSA public key. (There are two types of PKA private key tokens: RSA and DSS. This callable
service can use only the RSA type.) This service returns the key in operational form, enciphered under the AES master key.

**Symmetric Key Import2 Callable Service (CSNDSYI2 and CSNFSYI2)**
This service imports an AES key enciphered under an RSA public key. (There are two types of PKA private key tokens: RSA and DSS. This callable service can use only the RSA type.) This service returns the key in operational form, enciphered under the AES master key.

**Common Cryptographic Architecture HMAC Key Management Services**
ICSF provides callable services that support CCA key management for HMAC keys. HMAC keys are stored in the cryptographic key data set (CKDS).

**Key Generate2 callable service (CSNBKGN2 and CSNEKGN2)**
The service generates HMAC keys. It generates operational key or operational key pair. The key generate callable service returns the key to the application program that called it. The application program can then use a dynamic CKDS update service to store the key in the CKDS.

**Key Part Import2 callable service (CSNBKPI2 and CSNEKPI2)**
This service combines clear key parts of any HMAC key type and returns the combined key value either in an internal token or as an update to the CKDS.

**Key Test2 callable service (CSNBKTY2 and CSNEKTY2)**
This service generates or verifies a secure cryptographic verification pattern for HMAC keys. A parameter indicates the action you want to perform.

**Key Token Build2 callable service (CSNBKTB2 and CSNEKTB2)**
This service is a utility you can use to create skeleton HMAC key tokens for use with other callable services.

**Restrict Key Attribute callable service (CSNBRKA and CSNERKA)**
This service modifies an HMAC operational key so that it cannot be exported.

**Secure Key Import2 callable service (CSNBSKI2 and CSNESKI2)**
This service enciphers a variable length clear HMAC key under the host master key. This service can be used only when ICSF is in special secure mode.

**Symmetric Key Export Callable Service (CSNDSYX and CSNFSYX)**
This service transfers an application-supplied symmetric key (HMAC key) from encryption under the AES host master key to encryption under an application-supplied RSA public key. (There are two types of PKA public key tokens: RSA and DSS. This callable service can use only the RSA type.) The application-supplied key must be an ICSF internal key token or the label of such a token in the CKDS. The symmetric key import callable service can import the PKA-encrypted form at the receiving node.

**Symmetric Key Import2 Callable Service (CSNDSYI2 and CSNFSYI2)**
This service imports an HMAC key enciphered under an RSA public key. (There are two types of PKA private key tokens: RSA and DSS. This callable service can use only the RSA type.) This service returns the key in operational form, enciphered under the AES master key.
ECC Diffie-Hellman Key Agreement Models

Token Agreement Scheme

The caller must have both the required key tokens and both Parties identifiers including a randomly generated nonce. Combine the exchanged nonce and Party Info into the party identifier. (Both parties must combine this information in the same format.) Then call the ECC Diffie-Hellman callable service. Specify a skeleton token or the label of a skeleton token as the output key identifier as a container for the computed symmetric key material. Note, both parties must specify the same key type in their skeleton key tokens.

- Specify rule array keyword DERIV01 to denote the Static Unified Model key agreement scheme.
- Specify an ECC token as the private key identifier containing this party's ECC public-private key pair.
- Optionally specify a private KEK key identifier, if the key pair is in an external key token.
- Specify an ECC token as the public key identifier containing other party's ECC public key part.
- Specify a skeleton token as the output key identifier as a container for the computed symmetric key material.
- Optionally specify an output KEK key identifier, if the output key is to be in an external key token.
- Specify the combined party info (including nonce) as the party identifier.
- Specify the desired size of the key to be derived (in bits) as the key bit length.

Obtaining the Raw “Z” value

To use a key agreement scheme that differs from the above, one may obtain the raw shared secret "Z" and skip the key derivation step. The caller must then derive the final key material using a method of their choice. Do not specify any party info.
- Specify rule array keyword "PASSTHRU" to denote no key agreement scheme.
- Specify an ECC token as the private key identifier containing this party's ECC public-private key pair.
- Optionally specify a private KEK key identifier, if the key pair is in an external key token.
- Specify an ECC token as the public key identifier containing other party's ECC public key part.
- The output key identifier be populated with the resulting shared secret material.

Improved remote key distribution

Note: This improved remote key distribute support is only available on the z9 EC, z9 BC, z10 EC and z10 BC servers.

New methods have been added for securely transferring symmetric encryption keys to remote devices, such as Automated Teller Machines (ATMs), PIN-entry devices, and point of sale terminals. These methods can also be used to transfer symmetric keys to another cryptographic system of any type, such as a different kind of Hardware Security Module (HSM) in an IBM or non-IBM computer server. This change is especially important to banks, since it replaces expensive human operations with network transactions that can be processed quickly and inexpensively. This method supports a variety of requirements, fulfilling the new
needs of the banking community while simultaneously making significant interoperability improvements to related cryptographic key-management functions.

For the purposes of this description, the ATM scenario will be used to illustrate operation of the new methods. Other uses of this method are also valuable.

Remote Key Loading
Remote key loading refers to the process of installing symmetric encryption keys into a remotely located device from a central administrative site. This encompasses two phases of key distributions.

- Distribution of initial key encrypting keys (KEKs) to a newly installed device. A KEK is a type of symmetric encryption key that is used to encrypt other keys so they can be securely transmitted over unprotected paths.

- Distribution of operational keys or replacement KEKs, enciphered under a KEK currently installed in the device.

**Old remote key loading example:** Use an ATM as an example of the remote key loading process. A new ATM has none of the bank's keys installed when it is delivered from the manufacturer. The process of getting the first key securely loaded is difficult. This has typically been done by loading the first KEK into each ATM manually, in multiple cleartext key parts. Using dual control for key parts, two separate people must carry key part values to the ATM, then load each key part manually. Once inside the ATM, the key parts are combined to form the actual KEK. In this manner, neither of the two people has the entire key, protecting the key value from disclosure or misuse. This method is labor-intensive and error-prone, making it expensive for the banks.

**New remote key loading methods:** New remote key loading methods have been developed to overcome some of the shortcomings of the old manual key loading methods. These new methods define acceptable techniques using public key cryptography to load keys remotely. Using these new methods, banks will be able to load the initial KEKs without sending people to the remote device. This will reduce labor costs, be more reliable, and be much less expensive to install and change keys. The new cryptographic features added provide new methods for the creation and use of the special key forms needed for remote key distribution of this type. In addition, they provide ways to solve long-standing barriers to secure key exchange with non-IBM cryptographic systems.

Once an ATM is in operation, the bank can install new keys as needed by sending them enciphered under a KEK installed previously. This is straightforward in concept, but the cryptographic architecture in ATMs is often different from that of the host system sending the keys, and it is difficult to export the keys in a form understood by the ATM. For example, cryptographic architectures often enforce key-usage restrictions in which a key is bound to data describing limitations on how it can be used - for encrypting data, for encrypting keys, for operating on message authentication codes (MACs), and so forth. The encoding of these restrictions and the method used to bind them to the key itself differs among cryptographic architectures, and it is often necessary to translate the format to that understood by the target device prior to a key being transmitted. It is difficult to do this without reducing security in the system; typically it is done by making it possible to arbitrarily change key-usage restrictions. The methods described here provide a mechanism through which the system owner can securely control these translations, preventing the majority of attacks that could be mounted by modifying usage restrictions.
A new data structure called a trusted block is defined to facilitate the remote key loading methods. The trusted block is the primary vehicle supporting these new methods.

**Trusted block**

The trusted block is the central data structure to support all remote key loading functions. It provides great power and flexibility, but this means that it must be designed and used with care in order to have a secure system. This security is provided through several features of the design.

- A two step process is used to create a trusted block.
- The trusted block includes cryptographic protection that prevents any modification when it is created.
- A number of fields in the rules of a trusted block offer the ability to limit how the block is used, reducing the risk of it being used in unintended ways or with unintended keys.

The trusted block is the enabler which requires secure approval for its creation, then enables the export or generation of DES and TDES keys in a wide variety of forms as approved by the administrators who created the trusted block. For added security, the trusted blocks themselves can be created on a separate system, such as an xSeries server with an IBM 4764 Cryptographic Coprocessor, locked in a secure room. The trusted block can subsequently be imported into the zSeries server where they will be used to support applications.

There are two CCA callable services to manage and use trusted blocks: Trusted Block Create (CSNDTBC and CSNETBC) and Remote Key Export (CSNDRKX and CSNFRKX). The Trusted Block Create service creates a trusted block, and the Remote Key Export service uses a trusted block to generate or export DES keys according to the parameters in the trusted block. The trusted block consists of a header followed by several sections. Some elements are required, while others are optional.

[Figure 1 on page 35](#) shows the contents of a trusted block. The elements shown in the table give an overview of the structure and do not provide all of the details of a trusted block.
Here is a brief description of the elements that are depicted.

**Structure version information** - This identifies the version of the trusted block structure. It is included so that code can differentiate between this trusted block layout and others that may be developed in the future.

**Public key** - This contains the RSA public key and its attributes. For distribution of keys to a remote ATM, this will be the root certification key for the ATM vendor, and it will be used to verify the signature on public-key certificates for specific individual ATMs. In this case, the Trusted Block will also contain Rules that will be used to generate or export symmetric keys for the ATMs. It is also possible for the Trusted Block to be used simply as a trusted public key container, and in this case the Public Key in the block will be used in general-purpose cryptographic functions such as digital signature verification. The public key attributes contain information on key usage restrictions. This is used to securely control what operations will be permitted to use the public key. If desired, the public key can be restricted to use for only digital signature operations, or for only key management operations.

**Trusted block protection information** - This topic contains information that is used to protect the Trusted Block contents against modification. According to the method in ISO 16609, a CBC-mode MAC is calculated over the Trusted Block using a randomly-generated triple-DES (TDES) key, and the MAC key itself is encrypted
and embedded in the block. For the internal form of the block, the MAC key is
encrypted with a randomly chosen fixed-value variant of the PKA master key. For
the external form, the MAC key is encrypted with a fixed variant of a key-encrypting
key. The MKVP field contains the master key verification pattern for the PKA master
key that was used, and is filled with binary zeros if the trusted block is in external
format. Various flag fields contain these boolean flags.

- **Active flag** - Contained within the flags field of the required trusted block
  information section, this flag indicates whether the trusted block is active and
  ready for use by other callable services. Combined with the use of two separate
  access control points, the active flag is used to enforce dual control over creation
  of the block. A person whose active role is authorized to create a trusted block in
  inactive form creates the block and defines its parameters. An inactive trusted
  block can only be used to make it active. A person whose active role is
  authorized to activate an inactive trusted block must approve the block by
  changing its status to active. See Figure 3 on page 39. The Remote_Key_Export
callable service can only use an internal active trusted block to generate or
export DES keys according to the parameters defined in the trusted block.

- **Date checking flag** - Contained within the optional activation and expiration date
  subsection of the required trusted block information subsection, this flag indicates
  whether the coprocessor checks the activation and expiration dates for the
  trusted block. If the date checking flag is on, the coprocessor compares the
  activation and expiration dates in the optional subsection to the coprocessor
  internal real time clock, and processing terminates if either date is out of range. If
  this flag is off or the activation and expiration dates subsection is not defined, the
  device does no date checking. If this flag is off and the activation and expiration
dates subsection is defined, date checking can still be performed outside of the
device if required. The date checking flag enables use of the trusted block in
systems where the coprocessor clock is not set.

**Trusted block name** - This field optionally contains a text string that is a name (key
label) for the trusted block. It is included in the block for use by an external system
such as a host computer, and not by the card itself. In the zSeries system, the label
can be checked by RACF to determine if use of the block is authorized. It is
possible to disable use of trusted blocks that have been compromised or need to be
removed from use for other reasons by publishing a revocation list containing the
key names for the blocks that must not be used. Code in the host system could
check each trusted block prior to it being used in the cryptographic coprocessor, to
ensure that the name from that block is not in the revocation list.

**Expiration date and activation dates** - The trusted block can optionally contain an
expiration date and an activation date. The activation date is the first day on which
the block can be used, and the expiration date is the last day when the block can
be used. If these dates are present, the date checking flag in the trusted block will
indicate whether the coprocessor should check the dates using its internal real-time
clock. In the case of a system that does set the coprocessor clock, checking would
have to be performed by an application program prior to using the trusted block.
This is not quite as secure, but it is still valuable, and storing the dates in the block
itself is preferable to making the application store it somewhere else and maintain
the association between the separate trusted block and activation and expiration
dates.

**Application-defined data** - The trusted block can hold data defined and
understood only by the host application program. This data is included in the
protected contents of the trusted block, but it is not used or examined in any way by
the coprocessor. By including its own data in the trusted block, an application can guarantee that the data is not changed in any way, since it is protected in the same way as the other trusted block contents.

**Rules** - A variable number of rules can be included in the block. Each rule contains information on how to generate or export a symmetric key, including values for variants to be used in order to provide keys in the formats expected by systems with differing cryptographic architectures. Use of the rules are described in the topics covering key generation and export using the RKX function. This table summarizes the required and optional values of each rule.

<table>
<thead>
<tr>
<th>Field name</th>
<th>Required field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule ID</td>
<td>Yes</td>
<td>Specifies the 8-character name of the rule</td>
</tr>
<tr>
<td>Operation</td>
<td>Yes</td>
<td>Indicates whether this rule generates a new key or exports an existing key</td>
</tr>
<tr>
<td>Generated key length</td>
<td>Yes</td>
<td>Specifies the length of the key to be generated</td>
</tr>
<tr>
<td>Key-check algorithm ID</td>
<td>Yes</td>
<td>Specifies which algorithm to use to compute the optional key-check value (KCV). Options are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- No KCV</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Encrypt zeros with the key</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Compute MDC-2 hash of the key</td>
</tr>
<tr>
<td>Symmetric-encrypted output format</td>
<td>Yes</td>
<td>Specifies the format of the required symmetric-encrypted key output. Options are:</td>
</tr>
<tr>

</tr>
<tr>
<td>Export key CV</td>
<td>No</td>
<td>Specifies the CCA CV to apply to the transport key prior to it being used to encrypt the key being generated or exported. The CV defines permitted uses for the exported key.</td>
</tr>
<tr>
<td>Export key length limits</td>
<td>No</td>
<td>Defines the minimum and maximum lengths of the key that can be exported with this rule.</td>
</tr>
<tr>
<td>Output key variant</td>
<td>No</td>
<td>Specifies the variant to apply to the generated or exported key prior to it being encrypted.</td>
</tr>
<tr>
<td>Export-key rule reference</td>
<td>No</td>
<td>Specifies the rule ID for the rule that must have been used to generate the key being exported, if that key is an RKX key token.</td>
</tr>
<tr>
<td>Export-key CV restrictions</td>
<td>No</td>
<td>Defines masks and templates to use to restrict the possible CV values that a source key can have when being exported with RKX. Only applies if the key is a CCA key token. This can control the types of CCA keys that can be processed using the rule.</td>
</tr>
<tr>
<td>Field name</td>
<td>Required field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Export-key label template</td>
<td>No</td>
<td>Specifies the <em>key label</em> of the key token that contains the source key to be exported. A key label is a name used to identify a key. The rule can optionally contain a key label template, which will be matched against the host-supplied key label, using a wildcard (*) so that the template can match a set of related key labels. The operation will only be accepted if the supplied label matches the wildcard template in the rule.</td>
</tr>
</tbody>
</table>

**Changes to the CCA API**

These changes have been made to the CCA API to support remote key loading using trusted blocks:

- A new Trusted Block Create (CSNDTBC and CSNETBC) callable service has been developed to securely create trusted blocks under dual control.
- A new Remote Key Export (CSNDRKX and CSNFRLX) callable service has been developed to generate or export DES and TDES keys under control of the rules contained in a trusted block.
- The Digital Signature Verify (CSNDDSV) callable service has been enhanced so that, in addition to verifying ordinary CCA RSA keys, it can use the RSA public key contained in a trusted block to verify digital signatures.
- The PKA Key Import (CSNDPKI) callable service has been enhanced so it can import an RSA key into the CCA domain. In addition, the verb can import an external format trusted block into an internal format trusted block, ready to be used in the local system.
- The PKA Key Token Change (CSNDKTC and CSNFKTC) callable service has been enhanced so that it can update trusted blocks to the current PKA master key when the master key is changed. A trusted block contains an embedded MAC key enciphered under the PKA master key. When the PKA master key is changed, the outdated MAC key and the trusted block itself need to be updated to reflect the current PKA master key.
- The MAC Generate (CSNBGMGN) and MAC Verify (CSNBVMVR) callable services have been enhanced to add ISO 16609 TDES MAC support in which the text will be CBC-TDES encrypted using a double-length key and the MAC will be extracted from the last block.
- The PKA key storage callable services support trusted blocks.

**The RKX key token**

CCA normally uses key tokens that are designed solely for the purposes of protecting the key value and carrying metadata associated with the key to control its use by CCA cryptographic functions. The remote key loading design introduces a new type of key token called an RKX key token. The purpose of this token is somewhat different, and its use is connected directly with the Remote Key Export callable service added to CCA of the remote key loading design.

The RKX key token uses a special structure that binds the token to a specific trusted block, and allows sequences of Remote Key Export calls to be bound together as if they were an atomic operation. This allows a series of related key-management operations to be performed using the Remote Key Export callable service. These capabilities are made possible by incorporating these three features into the RKX key token structure:
- The key is enciphered using a variant of the MAC key that is in the trusted block. A fixed, randomly-derived variant is applied to the key prior to it being used. As a result, the enciphered key is protected against disclosure since the trusted block MAC key is itself protected at all times.

- The structure includes the rule ID contained in the trusted block rule that was used to create the key. A subsequent call to the Remote Key Export callable service can use this key with a trusted block rule that references this rule ID, effectively chaining use of the two rules together securely.

- A MAC is computed over the encrypted key and the rule ID, using the same MAC key that is used to protect the trusted block itself. This MAC guarantees that the key and the rule ID cannot be modified without detection, providing integrity and binding the rule ID to the key itself. In addition, the MAC will only verify if the RKX key token is used with the same trusted block that created the token, thus binding the key to that specific trusted block.

This figure shows a simplified conceptual view of the RKX key token structure.

![Figure 2. Simplified RKX key-token structure](image)

**Using trusted blocks**
These examples illustrate how trusted blocks are used with the new and enhanced CCA callable services.

*Creating a trusted block:* This figure illustrates the steps used to create a trusted block.

![Figure 3. Trusted block creation](image)
A two step process is used to create a trusted block. Trusted blocks are structures that could be abused to circumvent security if an attacker could create them with undesirable settings, and the requirement for two separate and properly authorized people makes it impossible for a single dishonest employee to create such a block. A trusted block cannot be used for any operations until it is in the active state. Any number of trusted blocks can be created in order to meet different needs of application programs.

**Exporting keys with Remote_Key_Export:** This figure shows the process for using a trusted block in order to export a DES or TDES key. This representation is at a very high level in order to illustrate the basic flow.

![Diagram of Exporting keys using a trusted block](image.png)

*Note: Importer key is only used if source key is an external CCA token.*

**Figure 4. Exporting keys using a trusted block**
The Remote Key Export callable service is called with these main parameters:

- A trusted block, in the active state, defines how the export operation is to be processed. It includes values to be used for things such as variants to apply to the keys.
- The key to be exported, which is shown previously as the source key. The source key takes one of two forms:
  1. A CCA DES key token
  2. An RKX key token
- A key-encrypting key, which is shown in the figure as the importer key. This is only used if the source key is an external CCA DES key token, encrypted under a KEK. In this case, the KEK is the key needed to obtain the cleartext value of the source key.
- A transport key, either an exporter KEK or an RKX key token, used to encrypt the key being exported.
- An optional public key certificate which, if included, contains the certified public key for a specific ATM. The certificate is signed with the ATM vendor's private key, and its corresponding public key must be contained in the trusted block so that this certificate can be validated. The public key contained in the certificate can be used to encrypt the exported key.

The processing steps are simple at a high level, but there are many options and significant complexity in the details.

- The trusted block itself is validated. This includes several types of validation.
  - Cryptographic validation using the MAC that is embedded in the block, in which the MAC key is decrypted using the coprocessor's master key, and the MAC is then verified using that key. This verifies the block has not been corrupted or tampered with, and it also verifies that the block is for use with this coprocessor since it will only succeed if the master key is correct.
  - Consistency checking and field validation, in which the validity of the structure itself is checked, and all values are verified to be within defined ranges.
  - Fields in the trusted block are checked to see if all requirements are met for use of this trusted block. One check which is always required is to ensure that the trusted block is in the active state prior to continuing. Another check, which is optional based on the contents of the trusted block, is to ensure the operation is currently allowed by comparing the date of the coprocessor real-time clock to the activation and expiration dates defined in the trusted block.

- Input parameters to the Remote Key Export callable service are validated against rules defined for them within the trusted block. For example:
  - The rule can restrict the length of the key to be exported.
  - The rule can restrict the control vector values for the key to be exported, so only certain key types can be exported with that rule.

- When the export key is decrypted, the rules embedded in the trusted block are used to modify that key to produce the desired output key value. For example, the trusted block can contain a variant to be exclusive-ORed with the source key prior to when that key is encrypted. Many non-IBM cryptographic systems use variants to provide key separation to restrict a key from improper use.

- A key check value (KCV) can be optionally computed for the source key. If the KCV is computed, the trusted block allows for one of two key check algorithms to
be used: (1) encrypting binary zeros with the key, or (2) computing an MDC-2 hash of the key. The KCV is returned as output from the Remote Key Export function.

- The export key, which could possibly be modified with a variant according to the rules in the trusted block, is enciphered with the transport key. The rules can specify that the key be created in one of two formats: (1) a CCA key token, or (2) the new RKX key token, described previously. With proper selection of rule options, the CCA key token can create keys that can be used in non-CCA systems. The key value can be extracted from the CCA key token resulting in a generic encrypted key, with variants and other options as defined in the rule. Two optional fields in the trusted block may modify the transport key prior to it being used to encrypt the source key:
  - The trusted block can contain a CCA control vector (CV) to be exclusive-ORed with the transport key prior to it being used to encrypt the export key. This exclusive-OR process is the standard way CCA applies a CV to a key.
  - In addition to the CV described previously, the trusted block can also contain a variant to be exclusive-ORed with the transport key prior to its use.

If a variant and CV are both present in the trusted block, the variant is applied first, then the CV.

- The export key can optionally be encrypted with the RSA public key identified by the certificate parameter of the Remote Key Export callable service, in addition to encrypting it with the transport key as described previously. These two encrypted versions of the export key are provided as separate outputs of the Remote Key Export callable service. The trusted block allows a choice of encrypting the key in either PKCS1.2 format or PKCSOAEP format.

**Generating keys with Remote_Key_Export:** This figure shows the process for using a trusted block to generate a new DES or TDES key. This representation is at a very high level in order to illustrate the basic flow.
For key generation, the Remote Key Export callable service is called with these main parameters:

- A trusted block, in the internal active state, which defines how the key generation operation is to be processed, including values to be used for things such as variants to apply to the keys. The generated key is encrypted by a variant of the MAC key contained in a trusted block.

- An optional public key certificate which, if included, contains the certified public key for a specific ATM. The certificate is signed with the ATM vendor's private key, and its corresponding public key must be contained in the trusted block so that this certificate can be validated. The public key contained in the certificate can be used to encrypt the generated key.
The processing steps are simple at a high level, but there are many options and significant complexity in the details. Most of the processing steps are the same as those described previously for key export. Therefore, only those processing steps that differ are described here in detail.

- Validation of the trusted block and input parameters is done as described for export previously.
- The DES or TDES key to be returned by the Remote Key Export callable service is randomly generated. The trusted block indicates the length for the generated key.
- The output key value is optionally modified by a variant as described previously for export, and then encrypted in the same way as for export using the Transport key and optionally the public key in the certificate parameter.
- The key check value (KCV) is optionally computed for the generated key using the same method as for an exported key.

**Remote key distribution scenario**

The new and modified CCA functions for remote key loading are used together to create trusted blocks, and then generate or export keys under the control of those trusted blocks. This figure summarizes the flow of the CCA functions to show how they are used:

![Diagram of key distribution scenario]
Usage example: The scenario described shows how these functions might be combined in a real-life application to distribute a key to an ATM and keep a copy for local use. Some of the terminology used reflects typical terms used in ATM networks. The example illustrates a fairly complex real-world key distribution scenario, in which these values are produced.

- A TMK (Terminal Master Key), which is the root KEK used by the ATM to exchange other keys, is produced in two forms: (1) encrypted under the ATM public key, so it can be sent to the ATM, and (2) as an RKX key token that will be used in subsequent calls to the Remote Key Export callable service to produce other keys.
- A key-encrypting key KEK1 that is encrypted under the TMK in a form that can be understood by the ATM.
- A PIN-encrypting key PINKEY be used by the ATM to encrypt customer-entered PINs and by the host to verify those PINs. The PINKEY is produced in two forms: (1) encrypted under KEK1 in a form that can be understood by the ATM, and (2) as a CCA internal DES key token with the proper PIN-key CV, encrypted under the CCA DES master key and suitable for use with the coprocessor.

It takes seven steps to produce these keys using the Remote Key Export callable service. These steps use a combination of five rules contained in a single trusted block. The rules in this example are referred to as GENERAT1, GENERAT2, EXPORT1, EXPORT2, and EXPORT3.

1. Use the Remote Key Export callable service with rule ID "GENERAT1" to generate a TMK for use with the ATM. The key will be output in two forms:
   a. $e_{Pu}(TMK)$: Encrypted under the ATM public key, supplied in the certificate parameter, CERT
   b. RKX(TMK): As an RKX key token, suitable for subsequent input to the CSNDRKX callable service
2. Use the Remote Key Export callable service with rule ID "GENERAT2" to generate a key-encrypting key (KEK1) as an RKX key token, RKX(KEK1)
3. Use the Remote Key Export callable service with rule ID "GENERAT2" to generate a PIN key (PINKEY) as an RKX key token: RKX(PINKEY).
4. Use the Remote Key Export callable service with rule ID "EXPORT1 " to export KEK1 encrypted under the TMK as a CCA DES key token using a variant of zeros applied to the TMK. This produces $e_{TMK}(KEK1)$.
5. Use the Remote Key Export callable service with rule ID "EXPORT2 " to export PINKEY encrypted under KEK1 as a CCA token using a variant of zeros applied to KEK1. This produces $e_{KEK1}(PINKEY)$.
6. Use the Remote Key Export callable service with rule ID "EXPORT3 " to export PINKEY under KEK2, an existing CCA key-encrypting key on the local server. This produces $e_{KEK2}(PINKEY)$, with the CCA control vector for a PIN key.
7. Use the Key Import callable service to import the PINKEY produced in step 6 into the local system as an operational key. This produces $e_{MK}(PINKEY)$, a copy of the key encrypted under the local DES master key (MK) and ready for use by CCA PIN API functions.

Remote key distribution benefits
CCA support for remote key loading solves one new problem, and one long-standing problem. This support allows the distribution of initial keys to ATMs and other remote devices securely using public-key techniques, in a flexible way that can support a wide variety of different cryptographic architectures. They also make it far easier and far more secure to send keys to non-CCA systems when
those keys are encrypted with a triple-DES key-encrypting key. These changes make it easier for customers to develop more secure systems.

Diversifying keys

CCA supports several methods for diversifying a key using the diversified key generate callable service. Key-diversification is a technique often used in working with smart cards. In order to secure interactions with a population of cards, a "key-generating key" is used with some data unique to a card to derive ("diversify") keys for use with that card. The data is often the card serial number or other quantity stored on the card. The data is often public, and therefore it is very important to handle the key-generating key with a high degree of security lest the interactions with the whole population of cards be placed in jeopardy.

In the current implementation, several methods of diversifying a key are supported: CLR8-ENC, TDES-ENC, TDES-DEC, SESS-XOR, TDES-XOR, TDESEMV2 and TDESEMV4. The first two methods triple-encrypt data using the generating_key to form the diversified key. The diversified key is then multiply-enciphered by the master key modified by the control vector for the output key. The TDES-DEC method is similar except that the data is triple-decrypted.

The SESS-XOR method provides a means for modifying an existing DATA, DATAC, MAC, DATAM, or MACVER, DATAMV single- or double-length key. The provided data is exclusive-ORed into the clear value of the key. This form of key diversification is specified by several of the credit card associations.

The TDES-ENC and TDES-DEC methods permit the production of either another key-generating key, or a final key. Control-vector bits 19 – 22 associated with the key-generating key specify the permissible type of final key. (See DKYGENKY in Figure 11 on page 832) Control-vector bits 12 – 14 associated with the key-generating key specify if the diversified key is a final key or another in a series of key-generating keys. Bits 12 – 14 specify a counter that is decreased by one each time the diversified key generate service is used to produce another key-generating key. For example, if the key-generating key that you specify has this counter set to B'010', then you must specify the control vector for the generated_key with a DKYGENKY key type having the counter bits set to B'001' and specifying the same final key type in bits 19 – 22. Use of a generating_key with bits 12 – 14 set to B'000' results in the creation of the final key. Thus you can control both the number of diversifications required to reach a final key, and you can closely control the type of the final key.

The TDESEMV2, TDESEMV4, and TDES-XOR methods also derive a key by encrypting supplied data including a transaction counter value received from an EMV smart card. The processes are described in detail at "Visa and EMV-related smart card formats and processes" on page 887. Refer to "Working with Europay–MasterCard–Visa smart cards" on page 424 to understand the various verbs you can use to operate with EMV smart cards.

Callable Services for Dynamic CKDS Update

ICSF provides the dynamic CKDS update services that allow applications to directly manipulate both the DASD copy and in-storage copy of the current CKDS.

Note: Applications using the dynamic CKDS update callable services can run concurrently with other operations that affect the CKDS, such as KGUP, CKDS conversion, REFRESH, and dynamic master key change. An operation can fail if it needs exclusive or shared access to the same DASD
copy of the CKDS that is held shared or exclusive by another operation. ICSF provides serialization to prevent data loss from attempts at concurrent access, but your installation is responsible for the effective management of concurrent use of competing operations. Consult your system administrator or system programmer for your installation guidelines.

The syntax of the CKDS key record create, CKDS key record read, and CKDS key record write services is identical with the same services provided by the Transaction Security System security application programming interface. Key management applications that use these common interface verbs can run on both systems without change.

Additional versions of CKDS key record create, CKDS key record read, and CKDS key record write (introduced in HCR7780) must be used for variable-length key tokens. These are the CKDS Key Record Create2, CKDS Key Record Read2, and CKDS Key Record Write2 callable services. These services also support existing DES and AES tokens.

**CKDS Key Record Create Callable Service (CSNBKRC and CSNEKRC)**

This service accepts a key label and creates a null key record in both the DASD copy and in-storage copy of the CKDS. The record contains a key token set to binary zeros and is identified by the key label passed in the call statement. The key label must be unique.

Prior to updating a key record using either the dynamic CKDS update services or KGUP, that record must already exist in the CKDS. You can use either the CKDS key record create service, KGUP, or your key entry hardware to create the initial record in the CKDS.

**CKDS Key Record Create2 Callable Service (CSNBKRC2 and CSNEKRC2)**

This service accepts a key label and optionally, a symmetric key token, and creates a key record in both the DASD copy and in-storage copy of the CKDS. The record contains the supplied key token or a null key token and is identified by the key label passed in the call statement. The key label must be unique.

This service must be used with variable-length key tokens. This service supports existing DES and AES key tokens.

**CKDS Key Record Delete Callable Service (CSNBKRD and CSNEKRD)**

This service accepts a unique key label and deletes the associated key record from both the in-storage and DASD copies of the CKDS. This service deletes the entire record, including the key label from the CKDS.

**CKDS Key Record Read Callable Service (CSNBKRR and CSNEKRR)**

This service copies an internal key token from the in-storage CKDS to the application storage, where it may be used directly in other cryptographic services. Key labels specified with this service must be unique.
CKDS Key Record Read2 Callable Service (CSNBKRR2 and CSNEKRR2)
This service copies an internal key token from the in-storage CKDS to the application storage, where it may be used directly in other cryptographic services. Key labels specified with this service must be unique.

This service must be used with variable-length key tokens. This service supports existing DES and AES key tokens.

CKDS Key Record Write Callable Service (CSNBKRW and CSNEKRW)
This service accepts an internal key token and a label and writes the key token to the CKDS record identified by the key label. The key label must be unique. Application calls to this service write the key token to both the DASD copy and in-storage copy of the CKDS, so the record must already exist in both copies of the CKDS.

CKDS Key Record Write2 Callable Service (CSNBKRW2 and CSNEKRW2)
This service accepts an internal key token and a label and writes the key token to the CKDS record identified by the key label. The key label must be unique. Application calls to this service write the key token to both the DASD copy and in-storage copy of the CKDS, so the record must already exist in both copies of the CKDS.

This service must be used with variable-length key tokens. This service supports existing DES and AES key tokens.

Coordinated KDS Administration Callable Service (CSFCRC and CSFCRC6)
This service performs a dynamic CKDS refresh or a dynamic CKDS reencipher operation. This callable service performs the refresh or reencipher operation while allowing applications to update the CKDS. In a sysplex environment, this callable service enables an application to perform a coordinated sysplex-wide refresh or reencipher operation from a single ICSF instance.

Callable Services that Support Secure Sockets Layer (SSL)
The Secure Sockets Layer (SSL) protocol, developed by Netscape Development Corporation, provides communications privacy over the Internet. Client/server applications can use the SSL protocol to provide secure communications and prevent eavesdropping, tampering, or message forgery.

ICSF provides callable services that support the RSA-encryption and RSA-decryption of PKCS 1.2-formatted symmetric key data to produce symmetric session keys. These session keys can then be used to establish an SSL session between the sender and receiver.

PKA Decrypt Callable Service (CSNDPKD)
The PKA decrypt callable service uses the corresponding private RSA key to unwrap the RSA-encrypted key and deformat the key value. This service then returns the clear key value to the application.

PKA Encrypt Callable Service (CSNDPKE)
The PKA encrypt callable service encrypts a supplied clear key value under an RSA public key. Currently, the supplied key can be formatted using the PKCS 1.2 or ZERO-PAD methods prior to encryption.
System Encryption Algorithm

**Note**: This topic only applies to systems with the Cryptographic Coprocessor Feature.

ICSF uses either the DES or AES algorithm or the Commercial Data Masking Facility (CDMF) to encipher and decipher data. The CDMF defines a scrambling technique for data confidentiality. It is a substitute for those customers prohibited from receiving IBM products that support DES data confidentiality services. The CDMF data confidentiality algorithm is composed of two processes: a key shortening process and a standard DES process to encipher and decipher data.

Your system can be one of these:
- DES
- CDMF
- DES-CDMF

A DES system protects data using a single-length, double-length, or triple-length DES data-encrypting key and the DES algorithm.

A CDMF system protects data using a single-length DES data-encrypting key and the CDMF. You input a standard single-length data-encrypting key to the encipher (CSNBENC) and decipher (CSNBDEC) callable services. The single-length data-encrypting key that is intended to be passed to the CDMF is called a CDMF key. Cryptographically, it is indistinguishable from a DES data-encrypting key. Prior to the key being used to encipher or decipher data, however, the Cryptographic Coprocessor Feature hardware cryptographically shortens the key of the CDMF process. This transformed, shortened data-encrypting key can be used only in the DES. (It must never be used in the CDMF; this would result in a double shortening of the key.) When used with the DES, a transformed, shortened data-encrypting key produces results identical to those that the CDMF would produce using the original single-length key.

A DES-CDMF system protects data using either the DES or the CDMF. The default is DES.

ICSF provides functions to mark internal IMPORTER, EXPORTER, and DATA key tokens with **data encryption algorithm bits**. IMPORTER and EXPORTER KEKs are marked when they are installed in operational form in ICSF. Your cryptographic key administrator does this. (See [z/OS Cryptographic Services ICSF Administrator's Guide](https://www.ibm.com/support/knowledgecenter/SSSUGP_1.4.3/com.ibm.zos.bksa/zosicssfz/guide/zzicsshf/guides.html) for details.) Whenever a DATA key is imported or generated in concert with a marked KEK, this marking is transferred to the DATA key token, unless the token copying function of the callable service is used to override the KEK marking with the marking of the key token passed. These data encryption algorithm bits internally drive the DES or CDMF for the ICSF encryption services. External key tokens are not marked with these data encryption algorithm bits.

IMPORTER and EXPORTER KEKs can have data encryption algorithm bit markings of CDMF (X'80'), DES (X'40'), or SYS-ENC (X'00'). DATA keys generated or imported with marked KEKs will also be marked. A CDMF-marked KEK will transfer a data encryption algorithm bit marking of CDMF (X'80') to the DATA key token. A DES-marked KEK will transfer a data encryption algorithm bit marking of DES (X'00') to the DATA key token. A SYS-ENC-marked KEK will transfer a CDMF (X'80') marking to the DATA key token on a CDMF system, and a DES (X'00') marking to the DATA key token on DES-CDMF and DES systems.
To accomplish token copying of data encryption algorithm marks, a valid internal token of the same key type must be provided in the target key identifier field of the service. The token must have the proper token mark to be copied.

**Notes:**

1. For the multiple secure key import callable service the token markings on the KEK are ignored. In this case, the algorithm choice specified in the rule array determines the markings on the DATA key.
2. Propagation of data encryption algorithm bits and token copying are only performed when the ICSF callable service is performed on the Cryptographic Coprocessor Feature. The PCI Cryptographic Coprocessor, PCI X Cryptographic Coprocessor, Crypto Express2 Coprocessor, and Crypto Express3 Coprocessor do not perform these functions.

Table 4 summarizes the data encryption algorithm bits by key type, and the algorithm they drive in the ICSF encryption services.

<table>
<thead>
<tr>

For PCF users, your system programmer specifies a default encryption mode of DES or CDMF when installing ICSF. (See [z/OS Cryptographic Services ICSF System Programmer's Guide](z/OS V1R13 ICSF Application Programmer's Guide) for details.)

**ANSI X9.17 Key Management Services**

**Restriction:** ANSI X9.17 keys and ANSI key management services are only supported on the IBM @server zSeries 900.

The ANSI X9.17 key management standard defines a process for protecting and exchanging DES keys. The ANSI X9.17 standard defines methods for generating, exchanging, using, storing, and destroying these keys. ANSI X9.17 keys are protected by the processes of notarization and offsetting, instead of control vectors. In addition to providing services to support these processes, ICSF also defines and uses an optional process of partial notarization.

Offsetting involves exclusive-ORing a key-encrypting key with a counter. The counter, a 56-bit binary number that is associated with a key-encrypting key and contained in certain ANSI X9.17 messages, prevents either a replay or an out-of-sequence transmission of a message. When the associated AKEK is first used, the application initializes the counter. With each additional use, the application increments the counter.

Notarization associates the identities of a pair of communicating parties with a cryptographic key. The notarization process cryptographically combines a key with two 16-byte quantities, the origin identifier and the destination identifier, to produce a notarized key. The notarization process is completed by offsetting the AKEK with a counter.
ICSF makes it possible to divide the AKEK notarization process into two steps. In the first step, partial notarization, the AKEK is cryptographically combined with the origin and destination identifiers and returned in a form that can be stored in the CKDS or application storage. In the second step, the partially notarized AKEK is exclusive OR-ed with a binary counter to complete the notarization process. Partial notarization improves performance when you use an AKEK for many cryptographic service messages, each with a different counter. For details of the partial notarization calculations, refer to "ANSI X9.17 Partial Notarization Method" on page 883.

ICSF provides these callable services to support the ANSI X9.17 key management standard. Except where noted, these callable services have the identical syntax as the Transaction Security System verbs of the same name. With few exceptions, key management applications that use these common callable services, or verbs, can be executed on either system without change. Internal tokens cannot be interchanged; external tokens can be.

**Key Generate Callable Service Used to Generate an AKEK (CSNBKGN)**

The key generate callable service, described in "Key Generate Callable Service (CSNBKGN and CSNEKGN)" on page 26, can also be used to generate an AKEK in the operational form. It generates either an 8-byte or 16-byte AKEK and places it in a skeleton key token created by the key token build callable service. The length of the AKEK is determined by the key length keyword specified when building the key token.

**ANSI X9.17 EDC Generate Callable Service (CSNAEGN and CSNGEGN)**

This service generates an ANSI X9.17 error detection code on an arbitrary length string.

**ANSI X9.17 Key Export Callable Service (CSNAKEX and CSNGKEX)**

This service uses the ANSI X9.17 protocol to export a DATA key or a pair of DATA keys, with or without an AKEK. It also provides the ability to convert a single supplied DATA key or combine two supplied DATA keys into a MAC key.

**ANSI X9.17 Key Import Callable Service (CSNAKIM and CSNGKIM)**

This service uses the ANSI X9.17 protocol to import a DATA key or a pair of DATA keys, with or without an AKEK. It also provides the ability to convert a single supplied DATA key or combine two supplied DATA keys into a MAC key. The syntax is identical to the Transaction Security System verb, with these exceptions:

- Keys cannot be imported directly into the CKDS.

**ANSI X9.17 Key Translate Callable Service (CSNAKTR and CSNGKTR)**

This service translates one or two DATA keys or an AKEK from encryption under one AKEK to encryption under another AKEK, using the ANSI X9.17 protocol.

**ANSI X9.17 Transport Key Partial Notarize Callable Service (CSNATKN and CSNGTKN)**

This service preprocesses or partially notarizes an AKEK with origin and destination identifiers. The partially notarized key is supplied to the ANSI X9.17 key export,
ANSI X9.17 key import, or ANSI X9.17 key translate callable service to complete
the notarization process. The syntax is identical to the Transaction Security System
verb except that:
- The callable service does not update the CKDS.

### Enciphering and Deciphering Data

The encipher and decipher callable services protect data off the host. ICSF protects
sensitive data from disclosure to people who do not have authority to access it.
Using algorithms that make it difficult and expensive for an unauthorized user to
derive the original clear data within a practical time period assures privacy.

To protect data, ICSF can use the Data Encryption Standard (DES) algorithm to
encipher or decipher data or keys. The algorithm is documented in the Federal
Information Processing Standard #46. On z900 systems, ICSF also supports the
CDMF encryption mode. See "System Encryption Algorithm" on page 47 for more
information. The Advanced Encryption Standard (AES) algorithm can also be used
to encipher or decipher data or keys. The algorithm is documented in the Federal
Information Processing Standard #192.

These services can be used to protect data.

- **Decipher Callable Service (CSNBDEC, CSNBDEC1, CSNEDEC and**
  **CSNEDEC1)**
  The decipher callable service uses encrypted DES data-encrypting keys to
decipher data.

- **Encipher Callable Service (CSNBENC, CSNBENC1, CSNEENC and**
  **CSNEENC1)**
  The encipher callable service uses encrypted DES data-encrypting keys to
encipher data.

- **Symmetric Algorithm Decipher Callable Service (CSNBSAD, CSNBSAD1,**
  **CSNESAD and CSNESAD1)**
  The symmetric algorithm decipher callable service uses encrypted AES
data-encrypting keys to decipher data.

- **Symmetric Algorithm Encipher Callable Service (CSNBSAE, CSNBSAE1,**
  **CSNESAE and CSNESAE1)**
  The symmetric algorithm Encipher callable service uses encrypted AES
data-encrypting keys to encipher data.

- **Symmetric Key Decipher Callable Service (CSNBSYD, CSNBSYD1, CSNESYD**
  **and CSNESYD1)**
  The symmetric key decipher callable service uses clear and encrypted AES and
DES data-encrypting keys to decipher data.

- **Symmetric Key Encipher Callable Service (CSNBSYE, CSNBSYE1, CSNESYE**
  **and CSNESYE1)**
  The symmetric key encipher callable service uses clear and encrypted AES and
DES data-encrypting keys to encipher data.
Encoding and Decoding Data (CSNBECO, CSNEECO, CSNBDCO, and CSNEDCO)

The encode and decode callable services perform functions with clear keys. Encode enciphers 8 bytes of data using the electronic code book (ECB) mode of the DES and a clear key. Decode does the inverse of the encode service. These services are available only on a DES-capable system. (See "System Encryption Algorithm" on page 49 for more information.)

Translating Ciphertext (CSNBCTT or CSNBCTT1 and CSNECTT or CSNECTT1)

Restriction: These services are only available on the IBM @server zSeries 900.

ICSF also provides a ciphertext translate callable service. It deciphers encrypted data (ciphertext) under one encryption key and reenciphers it under another key without having the data appear in the clear outside the cryptographic feature. Such a function is useful in a multiple node network, where sensitive data is passed through multiple nodes prior to it reaching its final destination. Different nodes use different keys in the process. For more information about different nodes, see "Using the Ciphertext Translate Callable Service" on page 66.

The keys cannot be used for the encipher and decipher callable services. (See "System Encryption Algorithm" on page 49 for more information.)

Managing Data Integrity and Message Authentication

To ensure the integrity of transmitted messages and stored data, ICSF provides:

- Message authentication code (MAC)
- Several hashing functions, including modification detection code (MDC), SHA-1, SHA-224, SHA-256, SHA-384, SHA-512, RIPEMD-160 and MD5.

(See Chapter 9, “Using Digital Signatures,” on page 511 for an alternate method of message authentication using digital signatures.)

The choice of callable service depends on the security requirements of the environment in which you are operating. If you need to ensure the authenticity of the sender and also the integrity of the data, consider message authentication code processing. If you need to ensure the integrity of transmitted data in an environment where it is not possible for the sender and the receiver to share a secret cryptographic key, consider hashing functions, such as the modification detection code process.

Message Authentication Code Processing

The process of verifying the integrity and authenticity of transmitted messages is called message authentication. Message authentication code (MAC) processing allows you to verify that a message was not altered or a message was not fraudulently introduced onto the system. You can check that a message you have received is the same one sent by the message originator. The message itself may be in clear or encrypted form. The comparison is performed within the cryptographic feature. Since both the sender and receiver share a secret cryptographic key used in the MAC calculation, the MAC comparison also ensures the authenticity of the message.
In a similar manner, MACs can be used to ensure the integrity of data stored on the system or on removable media, such as tape.

ICSF provides support for both single-length and double-length MAC generation and MAC verification keys. With the ANSI X9.9-1 single key algorithm, use the single-length MAC and MACVER keys.

ICSF provides support for the use of data-encrypting keys in the MAC generation and verification callable services, and also the use of a MAC generation key in the MAC verification callable service. This support permits ICSF MAC services to interface more smoothly with non-CCA key distribution systems, including those implementing the ANSI X9.17 protocol.

**HMAC Generation Callable Service (CSNBHMG or CSNBHMG1 and CSNEHMG or CSNEHMG1)**

When a message is sent, an application program can generate an authentication code for it using the HMAC generation callable service. The callable service computes the message authentication code using FIPS-198 Keyed-Hash Message Authentication Code method.

**HMAC Verification Callable Service (CSNBHMV or CSNBHMV1 and CSNEHMV or CSNEHMV1)**

When the receiver gets the message, an application program calls the HMAC verification callable service. The callable service verifies a MAC by generating another MAC and comparing it with the MAC received with the message. If the two codes are the same, the message sent was the same one received. A return code indicates whether the MACs are the same.

The MAC verification callable service can use FIPS-198 Keyed-Hash Message Authentication Code method.

**MAC Generation Callable Service (CSNBMGN or CSNBMGN1 and CSNEMGN or CSNEMGN1)**

When a message is sent, an application program can generate an authentication code for it using the MAC generation callable service. The callable service computes the message authentication code using one of these methods:

- Using the ANSI X9.9-1 single key algorithm, a single-length MAC generation key or data-encrypting key, and the message text.
- Using the ANSI X9.19 optional double key algorithm, a double-length MAC generation key and the message text.
- Using Europay, MasterCard and Visa (EMV) padding rules with a single-length MAC key or double-length MAC key and the message text.
- Using ISO 16609 algorithm with a double-length MAC or a double-length DATA key and the message text.

ICSF allows a MAC to be the leftmost 32 or 48 bits of the last block of the ciphertext or the entire last block (64 bits) of the ciphertext. The originator of the message sends the message authentication code with the message text.

**MAC Verification Callable Service (CSNBMVR or CSNBMVR1 and CSNEMVR or CSNEMVR1)**

When the receiver gets the message, an application program calls the MAC verification callable service. The callable service verifies a MAC by generating another MAC and comparing it with the MAC received with the message. If the two
codes are the same, the message sent was the same one received. A return code indicates whether the MACs are the same.

The MAC verification callable service can use either of these methods to generate the MAC for authentication:

- The ANSI X9.9-1 single key algorithm, a single-length MAC verification or MAC generation key (or a data-encrypting key), and the message text.
- The ANSI X9.19 optional double key algorithm, a double-length MAC verification or MAC generation key and the message text.
- Using Europay, MasterCard and Visa (EMV) padding rules with a single-length MAC key or double-length MAC key and the message text.
- Using ISO 16609 algorithm with a double-length MAC or a double-length DATA key and the message text.

The method used to verify the MAC should correspond with the method used to generate the MAC.

**Symmetric MAC Generate Callable Service (CSNBSMG, CSNBSMG1, CSNESMG and CSNESMG1)**

This service supports generating a MAC using a clear AES key. The algorithms supported are CBC-MAC and XCBC-MAC (AES-XCBC-MAC-96 and AES-XCBC-PRF-128)

**Symmetric MAC Verify Callable Service (CSNBSMV, CSNBSMV1, CSNESMV and CSNESMV1)**

This service supports verifying a MAC using a clear AES key. The algorithms supported are CBC-MAC and XCBC-MAC (AES-XCBC-MAC-96 and AES-XCBC-PRF-128)

### Hashing Functions

Hashing functions include one-way hash generation and modification detection code (MDC) processing.

**One-Way Hash Generate Callable Service (CSNBOWH or CSNBOWH1 and CSNEOWH or CSNEOWH1)**

This service hashes a supplied message. Supported hashing methods include:

- SHA-1
- SHA-224
- SHA-256
- SHA-384
- SHA-512
- RIPEMD-160
- MD5

**MDC Generation Callable Service (CSNBMDG or CSNBMDG1 and CSNEMDG or CSNEMDG1)**

The modification detection code (MDC) provides a form of support for data integrity. The MDC allows you to verify that data was not altered during transmission or while in storage. The originator of the data ensures that the MDC is transmitted with integrity to the intended receiver of the data. For instance, the MDC could be published in a reliable source of public information. When the receiver gets the

---

2. The Secure Hash Algorithm (SHA) is also called the Secure Hash Standard (SHS), which Federal Information Processing Standard (FIPS) Publication 180 defines.
data, an application program can generate an MDC, and compare it with the
original MDC value. If the MDC values are equal, the data is accepted as unaltered.
If the MDC values differ the data is assumed to be bogus.

Supported hashing methods through the MDC generation callable service are:
- MDC-2
- MDC-4
- PADMDC-2
- PADMDC-4

In a similar manner, MDCs can be used to ensure the integrity of data stored on the
system or on removable media, such as tape.

When data is sent, an application program can generate a modification detection
code for it using the MDC generation callable service. The callable service
computes the modification detection code by encrypting the data using a
publicly-known cryptographic one-way function. The MDC is a 128-bit value that is
easy to compute for specific data, yet it is hard to find data that will result in a given
MDC.

Once an MDC has been established for a file, the MDC generate service can be
run at any other time on the file. The resulting MDC can then be compared with the
previously established MDC to detect deliberate or inadvertent modification.

Managing Personal Authentication

The process of validating personal identities in a financial transaction system is
called personal authentication. The personal identification number (PIN) is the basis
for verifying the identity of a customer across the financial industry networks. ICSF
checks a customer-supplied PIN by verifying it using an algorithm. The financial
industry needs functions to generate, translate, and verify PINs. These functions
prevent unauthorized disclosures when organizations handle personal identification
numbers.

ICSF supports these algorithms for generating and verifying personal identification
numbers:
- IBM 3624
- IBM 3624 PIN offset
- IBM German Bank Pool
- IBM German Bank Pool PIN Offset (GBP-PINO)
- VISA PIN validation value
- Interbank

With ICSF, you can translate PIN blocks from one format to another. ICSF supports
these formats:
- ANSI X9.8
- ISO formats 0, 1, 2, 3
- VISA formats 1, 2, 3, 4
- IBM 4704 Encrypting PINPAD format
- IBM 3624 formats
- IBM 3621 formats
- ECI formats 1, 2, 3

With the capability to translate personal identification numbers into different PIN
block formats, you can use personal identification numbers on different systems.
Verifying Credit Card Data

The Visa International Service Association (VISA) and MasterCard International, Incorporated have specified a cryptographic method to calculate a value that relates to the personal account number (PAN), the card expiration date, and the service code. The VISA card-verification value (CVV) and the MasterCard card-verification code (CVC) can be encoded on either track 1 or track 2 of a magnetic striped card and are used to detect forged cards. Because most online transactions use track-2, the ICSF callable services generate and verify the CVV3 by the track-2 method.

The VISA CVV generate callable service calculates a 1- to 5-byte value through the DES-encryption of the PAN, the card expiration date, and the service code using two data-encrypting keys or two MAC keys. The VISA CVV service verify callable service calculates the CVV by the same method, compares it to the CVV supplied by the application (which reads the credit card’s magnetic stripe) in the CVV_value, and issues a return code that indicates whether the card is authentic.

Clear PIN Encrypt Callable Service (CSNBCPE and CSNECPE)

To format a PIN into a PIN block format and encrypt the results, use the Clear PIN Encrypt callable service. You can also use this service to create an encrypted PIN block for transmission. With the RANDOM keyword, you can have the service generate random PIN numbers. Use of this service requires the optional PCIXCC, CEX2C, or CEX3C. An enhanced PIN security mode, on PCICC, PCIXCC, CEX2C, and CEX3C, is available for formatting an encrypted PIN block into IBM 3621 format or IBM 3624 format. See "Clear PIN Encrypt (CSNBCPE and CSNECPE)" on page 434 for more information.

Clear PIN Generate Alternate Callable Service (CSNBCPA and CSNECPA)

To generate a clear VISA PIN validation value from an encrypted PIN block, call the clear PIN generate alternate callable service. This service also supports the IBM-PINO algorithm to produce a 3624 offset from a customer selected encrypted PIN.

An enhanced PIN security mode is available for extracting PINs from encrypted PIN blocks. This mode only applies on PCICC, PCIXCC, CEX2C, or CEX3C, when specifying a PIN-extraction method for an IBM 3621 or an IBM 3624 PIN-block. See "Clear PIN Generate Alternate (CSNBCPA and CSNECPA)" on page 442 for more information.

Note: The PIN block must be encrypted under either an input PIN-encrypting key (IPINENC) or output PIN-encrypting key (OPINENC). Using an IPINENC key requires NOCV keys to be enabled in the CKDS. Functions other than VISA PIN validation value generation require the optional PCICC, PCIXCC, CEX2C, or CEX3C.

Clear PIN Generate Callable Service (CSNBPGN and CSNEPGN)

To generate personal identification numbers, call the Clear PIN generate callable service. Using a PIN generation algorithm, data used in the algorithm, and the PIN generation key, the callable service generates a clear PIN, a PIN verification value, or an offset. The callable service can only execute in special secure mode, which is described in "Special Secure Mode" on page 10.

---

3. The VISA CVV and the MasterCard CVC refer to the same value. CVV is used here to mean both CVV and CVC.
CVV Key Combine Callable Service (CSNBECKC and CSNECKC)

This callable service combines 2 single-length CCA internal key tokens into 1 double-length CCA key token containing a CVVKEY-A key type. This combined double-length key satisfies current VISA requirements and eases translation between TR-31 and CCA formats for CVV keys.

The callable service name for AMODE(64) is CSNECKC.

Encrypted PIN Generate Callable Service (CSNEBEPG and CSNNEEPG)

To generate personal identification numbers, call the Encrypted PIN generation callable service. Using a PIN generation algorithm, data used in the algorithm, and the PIN generation key, the callable service generates a PIN and using a PIN block format and the PIN encrypting key, formats and encrypts the PIN. Use of this service requires the optional PCICC, PCIXCC, CEX2C, or CEX3C. An enhanced PIN security mode, on PCICC, PCIXCC, CEX2C, and CEX3C, is available for formatting an encrypted PIN block into IBM 3621 format or IBM 3624 format. See "Encrypted PIN Generate (CSNEBEPG and CSNNEEPG)" on page 453 for more information.

Encrypted PIN Translate Callable Service (CSNBPTR and CSNEPTR)

To translate a PIN from one PIN-encrypting key to another or from one PIN block format to another or both, call the Encrypted PIN translation callable service. You must identify the input PIN-encrypting key that originally enciphers the PIN. You also need to specify the output PIN-encrypting key that you want the callable service to use to encipher the PIN. If you want to change the PIN block format, specify a different output PIN block format from the input PIN block format. An enhanced PIN security mode, on PCICC, PCIXCC, CEX2C, and CEX3C, is available for formatting an encrypted PIN block into IBM 3621 format or IBM 3624 format. The enhanced security mode is also available for extracting PINs from encrypted PIN blocks. This mode only applies when specifying a PIN-extraction method for an IBM 3621 or an IBM 3624 PIN-block. See "Encrypted PIN Translate (CSNBPTR and CSNEPTR)" on page 458 for more information.

Encrypted PIN Verify Callable Service (CSNPBPVR and CSNPEPVR)

To verify a supplied PIN, call the Encrypted PIN verify callable service. You need to specify the supplied enciphered PIN, the PIN-encrypting key that enciphers it, and other relevant data. You must also specify the PIN verification key and PIN verification algorithm. It compares the two personal identification numbers; if they are the same, it verifies the supplied PIN. See Chapter 8, "Financial Services," on page 423 for additional information.

An enhanced PIN security mode, on PCICC, PCIXCC, CEX2C, and CEX3C, is available for extracting PINs from encrypted PIN blocks. This mode only applies when specifying a PIN-extraction method for an IBM 3621 or an IBM 3624 PIN-block. See "Encrypted PIN Verify (CSNPBPVR and CSNPEPVR)" on page 466 for more information.

PIN Change/Unblock Callable Service (CSNBPCU and CSNEPCU)

To support PIN change algorithms specified in the VISA Integrated Circuit Card Specification, call the PIN change/unblock callable service. The service can be executed on z890/z990 and later machines.

An enhanced PIN security mode, on PCICC, PCIXCC, CEX2C, and CEX3C, is available for extracting PINs from encrypted PIN blocks. This mode only applies
when specifying a PIN-extraction method for an IBM 3621 or an IBM 3624 PIN-block. See “PIN Change/Unblock (CSNBPCU and CSNEPCU)” on page 473 for more information.

Transaction Validation Callable Service (CSNBTRV and CSNETRV)
To support generation and validation of American Express card security codes, call the transaction validation callable service. The service can be executed on z890/z990 and later machines.

ANSI TR-31 key block support
A TR-31 key block is a format defined by the American National Standards Institute (ANSI) to support the interchange of keys in a secure manner with key attributes included in the exchanged data. The TR-31 key block format has a set of defined key attributes that are securely bound to the key so that they can be transported together between any two systems that both understand the TR-31 format. ICSF enables applications to convert a CCA token to a TR-31 key block for export to another party, and to convert an imported TR-31 key block to a CCA token. This enables you to securely exchange keys and their attributes with non-CCA systems.

Although there is often a one-to-one correspondence between TR-31 key attributes and the attributes defined by CCA, there are also cases where the correspondence is many-to-one or one-to-many. Because there is not always a one-to-one mapping between the key attributes defined by TR-31 and those defined by CCA, the TR-31 Export callable service and the TR-31 Import callable service provide rule array keywords that enable an application to specify the attributes to attach to the exported or imported key.

The TR-31 key block format defines a header section. The header contains metadata about the key, including its usage attributes. The header can also be extended with optional blocks, which can either have standardized content or proprietary information. Callable services are also provided for retrieving standard header or optional block information from a TR-31 key block without importing the key and for building an optional block.

The TR-31 key block support requires a z196 with a CEX3C and the the Sept. 2011 or later LIC. Only DES/TDES keys can be transported in TR-31 key blocks. There is no support for transporting AES keys.

TR-31 Export Callable Service (CSNBTR31X and CSNET31X)
The TR-31 Export callable service converts a CCA token to TR-31 format for export to another party. Since there is not always a one-to-one mapping between the key attributes defined by TR-31 and those defined by CCA, the caller may need to specify the attributes to attach to the exported key through the rule array.

TR-31 Import Callable Service (CSNBTR31I and CSNET31I)
The TR-31 Import callable service converts a TR-31 key block to a CCA token. Since there is not always a one-to-one mapping between the key attributes defined by TR-31 and those defined by CCA, the caller may need to specify the attributes to attach to the imported key through the rule array.
TR-31 Parse Callable Service (CSNBT31P and CSNET31P)

The TR-31 Parse callable service retrieves standard header information from a TR-31 key block without importing the key. This callable service can be used with the TR-31 Optional Data Read callable service to obtain both the standard header fields and any optional data blocks from the key block.

TR-31 Optional Data Read Callable Service (CSNBT31R and CSNET31R)

A TR-31 key block can hold optional fields which are securely bound to the key block using the integrated MAC. The optional blocks may either contain information defined in the TR-31 standard, or they may contain proprietary data. A separate range of optional block identifiers is reserved for use with proprietary blocks. Applications can call the TR-31 Optional Data Read callable service to obtain lists of the optional block identifiers and optional block lengths, and to obtain the data for a particular optional block. This callable service is often used in conjunction with the TR-31 Parse Callable Service which can be used to determine the number of optional blocks in the TR-31 token.

TR-31 Optional Data Build Callable Service (CSNBT31O and CSNET31O)

The TR-31 Optional Data Build callable service constructs the optional block data structure for a TR-31 key block. It builds the structure by adding one optional block with each call, until your entire set of optional blocks have been added. With each call, the application program provides a single optional block by specifying its ID, its length, and its data. Each subsequent call appends the current optional block to any pre-existing blocks.

Secure Messaging

These services will assist applications in encrypting secret information such as clear keys and PIN blocks in a secure message. These services will execute within the secure boundary of the PCICC, PCIXCC, CEX2C, or CEX3C.

The Secure Messaging for Keys callable service encrypts a text block, including a clear key value decrypted from an internal or external DES token.

The Secure Messaging for PINs callable service encrypts a text block, including a clear PIN block recovered from an encrypted PIN block.

Trusted Key Entry (TKE) Support

The Trusted Key Entry (TKE) workstation is an optional feature. It offers an alternative to clear key entry. You can use the TKE workstation to load:

- DES master key, AES master key, PKA master keys, and operational keys in a secure way. CCF only supports Operational Transport and PIN keys. On the PCIXCC/CEX2C, all operational keys may be loaded with TKE V4.1 or higher. AES master key and AES operational keys may be loaded with TKE V5.3. On the CEX3C, all operational keys may be loaded with TKE 6.0 or later.
- DES-MK and ASYM-MK master keys on the PCICC, PCIXCC, CEX2C, or CEX3C.
- AES master keys are only on z9 and z10 systems running with the Nov. 2008 or later licensed internal code (LIC).
You can load keys remotely and for multiple PCICCs, PCIXCCs, CEX2Cs, or CEX3Cs. The TKE workstation eases the administration for using one Cryptographic Coprocessor Feature or PCIXCC/CEX2C/CEX3C as a production machine and as a test machine at the same time, while maintaining security and reliability.

The TKE workstation can be used for enabling/disabling access control points for callable services executed on PCICCs, PCIXCCs, CEX2Cs, and CEX3Cs. See Appendix H, “Access Control Points and Callable Services,” on page 893 for additional information.

For complete details about the TKE workstation see z/OS Cryptographic Services ICSF TKE Workstation User’s Guide.

TKE Version 4.0 or higher is required if using a PCIXCC/CEX2C.

TKE Version 6.0 or higher is required using a CEX3C.

On z890, z990 z9 EC, z9 BC, z10 EC and z10 BC systems running with May 2004 or higher version of Licensed Internal Code or an z9 EC, z9 BC, z10 EC and z10 BC with MCL 029 Stream J12220 or higher of Licensed Internal Code, you must enable TKE commands for each PCIXCC/CEX2C/CEX3C card from the Support Element. This is true for new TKE users and those upgrading from TKE V4.0 to V4.1, V4.2 or V5.x when the new LIC is installed. See z/OS Cryptographic Services ICSF TKE Workstation User’s Guide, SA23-2211 for more information.

Utilities

ICSF provides these utilities.

Character/Nibble Conversion Callable Services (CSNBXBC and CSNBXCB)

The character/nibble conversion callable services are utilities that convert a binary string to a character string and vice versa.

Code Conversion Callable Services (CSNBXEA and CSNBXAE)

The code conversion callable services are utilities that convert EBCDIC data to ASCII data and vice versa.

X9.9 Data Editing Callable Service (CSNB9ED)

The data editing callable service is a utility that edits an ASCII text string according to the editing rules of ANSI X9.9-4.

ICSF Query Algorithm Callable Service (CSFIQA)

The callable service provides information regarding the cryptographic and hash algorithms available.

ICSF Query Facility Callable Service (CSFIQF)

The callable service provides ICSF status information, as well as PCICC, PCIXCC, CEX2C, and CEX3C information.
## Typical Sequences of ICSF Callable Services

Sample sequences in which the ICSF callable services might be called are shown in Table 5.

### Table 5. Combinations of the Callable Services

<table>
<thead>
<tr>

<td>4. Any service (passing label of the key just generated)</td>
</tr>
</tbody>
</table>

**Combination I**

1. Key token build to create key token skeleton
2. Key generate to OP form of AKEK using key token skeleton
3. Use AKEK in any ANSI X9.17 service

### Notes:
1. An example of “any service” is CSNBENC.
2. These combinations exclude services that can be used on their own; for example, key export or encode, or using key generate to generate an exportable key.
3. These combinations do not show key communication, or the transmission of any output from an ICSF callable service.
4. Combination I is not available on the IBM server zSeries 990.

The key forms are described in "Key Generate (CSNBKGN and CSNEKGN)" on page 135.
Key Forms and Types Used in the Key Generate Callable Service

The key generate callable service is the most complex of all the ICSF callable services. This topic provides examples of the key forms and key types used in the key generate callable service.

Generating an Operational Key

To generate an operational key, choose one of these methods:

- **For operational keys**, call the key generate callable service (CSNBKGN). Table 33 on page 144 and Table 34 on page 144 show the key type and key form combinations for a single key and for a key pair.

- **For operational keys**, call the random number generate callable service (CSNBRNG) and specify the form parameter as RANDOM. Specify ODD parity for a random number you intend to use as a key. Then pass the generated value to the secure key import callable service (CSNBSKI) with a required key type. The required key type is now in operational form.

  This method requires a cryptographic unit to be in special secure mode. For more information about special secure mode, see "Special Secure Mode" on page 10.

- **For data-encrypting keys**, call the random number generate callable service (CSNBRNG) and specify the form parameter as ODD. Then pass the generated value to the clear key import callable service (CSNBCKI) or the multiple clear key import callable service (CSNBCKM). The DATA key type is now in operational form.

  You cannot generate a PIN verification (PINVER) key in operational form because the originator of the PIN generation (PINGEN) key generates the PINVER key in exportable form, which is sent to you to be imported.

Generating an Importable Key

To generate an importable key form, call the key generate callable service (CSNBKGN).

If you want a DATA, MAC, PINGEN, DATAM, or DATAC key type in importable form, obtain it directly by generating a single key. If you want any other key type in importable form, request a key pair where either the first or second key type is importable (IM). Discard the generated key form that you do not need.

Generating an Exportable Key

To generate an exportable key form, call the key generate callable service (CSNBKGN).

If you want a DATA, MAC, PINGEN, DATAM, or DATAC key type in exportable form, obtain it directly by generating a single key. If you want any other key type in exportable form, request a key pair where either the first or second key type is exportable (EX). Discard the generated key form that you do not need.

Examples of Single-Length Keys in One Form Only

<table>
<thead>
<tr>
<th>Key Form 1</th>
<th>Key Form 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP DATA</td>
<td>Encipher or decipher data. Use data key export or key export to send encrypted key to another cryptographic partner. Then communicate the ciphertext.</td>
</tr>
</tbody>
</table>
OP  MAC  MAC generate. Because no MACVER key exists, there is no secure communication of the MAC with another cryptographic partner.

IM  DATA  Key Import, and then encipher or decipher. Then key export to communicate ciphertext and key with another cryptographic partner.

EX  DATA  You can send this key to a cryptographic partner, but you can do nothing with it directly. Use it for the key distribution service. The partner could then use key import to get it in operational form, and use it as in OP DATA above.

Examples of OPIM Single-Length, Double-Length, and Triple-Length Keys in Two Forms

The first two letters of the key form indicate the form that key type 1 parameter is in, and the second two letters indicate the form that key type 2 parameter is in.

<table>
<thead>
<tr>
<th>Key Type</th>
<th>Type</th>
<th>Form 1</th>
<th>Form 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPIM</td>
<td>DATA</td>
<td>Use the OP form in encipher. Use key export with the OP form to communicate ciphertext and key with another cryptographic partner. Use key import at a later time to use encipher or decipher with the same key again.</td>
<td></td>
</tr>
<tr>
<td>OPIM</td>
<td>MAC</td>
<td>Single-length MAC generation key. Use the OP form in MAC generation. You have no corresponding MACVER key, but you can call the MAC verification service with the MAC key directly. Use the key import callable service and then compute the MAC again using the MAC verification callable service, which compares the MAC it generates with the MAC supplied with the message and issues a return code indicating whether they compare.</td>
<td></td>
</tr>
</tbody>
</table>

Examples of OPEX Single-Length, Double-Length, and Triple-Length Keys in Two Forms

<table>
<thead>
<tr>
<th>Key Type</th>
<th>Type</th>
<th>Form 1</th>
<th>Form 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPEX</td>
<td>DATA</td>
<td>Use the OP form in encipher. Send the EX form and the ciphertext to another cryptographic partner.</td>
<td></td>
</tr>
<tr>
<td>OPEX</td>
<td>MAC</td>
<td>Single-length MAC generation key. Use the OP form in MAC generation and MAC verification. Send the EX form to a cryptographic partner to be used in the MAC generation or MAC verification services.</td>
<td></td>
</tr>
<tr>
<td>OPEX</td>
<td>MACVER</td>
<td>Single-length MAC generation and MAC verification keys. Use the OP form in MAC generation. Send the EX form to a cryptographic partner where it will be put into key import, and then MAC verification, with the message and MAC that you have also transmitted.</td>
<td></td>
</tr>
<tr>
<td>OPEX</td>
<td>PINGEN PINVER</td>
<td>Use the OP form in Clear PIN generate. Send the EX form to a cryptographic partner where it is put into key import, and then Encrypted PIN verify, along with an IPINENC key.</td>
<td></td>
</tr>
<tr>
<td>OPEX</td>
<td>IMPORTER EXPORTER</td>
<td>Use the OP form in key import, key generate, or secure key import. Send the EX form to a cryptographic partner where it is used in key export, data key export, or key generate, or put in the CKDS.</td>
<td></td>
</tr>
<tr>
<td>OPEX</td>
<td>EXPORTER IMPORTER</td>
<td>Use the OP form in key export, data key export,</td>
<td></td>
</tr>
</tbody>
</table>
or key generate. Send the EX form to a cryptographic
partner where it is put into the CKDS or used in key
import, key generate or secure key import.

When you and your partner have the OPEX IMPORTER EXPORTER, OPEX
EXPORTER IMPORTER pairs of keys in “Examples of OPEX Single-Length,
Double-Length, and Triple-Length Keys in Two Forms” on page 64 installed, you
can start key and data exchange.

Examples of IMEX Single-Length and Double-Length Keys in Two
Forms

<table>
<thead>
<tr>
<th>Key Type</th>
<th>Form 1</th>
<th>Form 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMEX DATA</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IMEX MAC</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IMEX IMPORTER EXPORTER</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IMEX PINGLEN PINVER</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Use the key import callable service to import
IM form and use the OP form in encipher. Send
the EX form to a cryptographic partner.

Use the key import callable service to import
IM form and use the OP form in MAC
generate. Send the EX form to a cryptographic
partner who can verify the MAC.

Use the key import callable service to import
IM form and send the EX form to a
cryptographic partner. This establishes a new
IMPORTER/EXPORTER key between you and your
partner.

Use the key import callable service to import
IM form and send the EX form to a
cryptographic partner. This establishes a new
PINGLEN/PINVER key between you and your partner.

Examples of EXEX Single-Length and Double-Length Keys in Two
Forms

For the keys shown in this list, you are providing key distribution services for other
nodes in your network, or other cryptographic partners. Neither key type can be
used in your installation.

<table>
<thead>
<tr>
<th>Key Type</th>
<th>Form 1</th>
<th>Form 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXEX DATA</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EXEX MAC</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EXEX IMPORTER EXPORTER</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EXEX OPINENC PINENC</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Send the first EX form to a cryptographic
partner with the corresponding IMPORTER and
send the second EX form to another
cryptographic partner with the corresponding
IMPORTER. This exchange establishes a key
between two partners.

Generating AKEKs

Restriction: AKEKs are only supported on the IBM server zSeries 800 and the
IBM server zSeries 900.

AKEKs are bidirectional and are OP-form-only keys that can be used in both import
and export. Prior to using the key generate callable service to create an AKEK, you
need to use the key token build callable service to create a key token for receiving
the AKEK. The steps involved in this process are:

1. Use the key token build callable service with these parameter values:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
</table>

Chapter 2. Introducing Symmetric Key Cryptography and Using Symmetric Key Callable Services
Key_type: AKEK
Rule_array: INTERNAL NO-KEY (SINGLE or DOUBLE-O)

2. Use the key generate callable service with these parameter values:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key_form</td>
<td>OP</td>
</tr>
<tr>
<td>Key_type_1</td>
<td>TOKEN</td>
</tr>
<tr>
<td>Generated_key_identifier_1</td>
<td>The skeleton key token created in step 1</td>
</tr>
</tbody>
</table>

Using the Ciphertext Translate Callable Service

Restriction: The ciphertext translate callable service does not work in CDMF-only systems (see “System Encryption Algorithm” on page 49). The ciphertext translate callable service does not work on the PCI X Cryptographic Coprocessor, Crypto Express2 Coprocessor, or Crypto Express3 Coprocessor.

This topic describes a scenario using the encipher, ciphertext translate, and decipher callable services with four network nodes: A, B, C, and D. You want to send data from your network node A to a destination node D. You cannot communicate directly with node D, and nodes B and C are situated between you. You do not want nodes B and C to decipher your data.

At node A, you use the Encipher callable service. Node D uses the Decipher callable service.

Node B and C will use the ciphertext translate callable service. Consider the keys that are needed to support this process:

1. At your node, generate one key in two forms: OPEX DATA DATA\text{LAT}
2. Send the exportable DATA\text{LAT} key to node B.
3. Node B and C need to share a DATA\text{LAT} key, so generate a different key in two forms: EXEX DATA\text{LAT} DATA\text{LAT}.
4. Send the first exportable DATA\text{LAT} key to node B.
5. Send the second exportable DATA\text{LAT} key to node C.
6. Node C and node D need to share a DATA\text{LAT} key and a DATA key. Node D can generate one key in two forms: OPEX DATA DATA\text{LAT}.
7. Node D sends the exportable DATA\text{LAT} key to node C.

The communication process is shown as:

Node: A B C D
Callable Service: Encipher Ciphertext Translate Ciphertext Translate Decipher
Keys: DATA DATA\text{LAT} DATA\text{LAT} DATA\text{LAT} DATA\text{LAT} DATA

Key Pairs: | = | = |

Therefore, you need three keys, each in two different forms. You can generate two of the keys at node A, and node D can generate the third key. Note that the key used in the decipher callable service at node D is not the same key used in the encipher callable service at node A.
Table 6 lists the callable services described in this publication, and their corresponding verbs. The figure also references the topic that describes the callable service.

Table 6. Summary of ICSF Callable Services

<table>
<thead>
<tr>
<th>Verb</th>

**Chapter 6, “Protecting Data”**

CSNBCTT
CSNECTT
CSNBCTT1
CSNECTT1

Ciphertext translate

Translates the user-supplied ciphertext from one key and enciphers the ciphertext to another key. (This is for DES encryption only.)

CSNBCTT and CSNECTT require the ciphertext to reside in the caller's primary address space.

CSNBCTT1 and CSNECTT1 allow the ciphertext to reside in the caller's primary address space or in a z/OS data space.

Chapter 3. Introducing PKA Cryptography and Using PKA Callable Services

The preceding topic focused on DES cryptography or secret-key cryptography. This is symmetric—senders and receivers use the same key (which must be exchanged securely in advance) to encipher and decipher data.

Public key cryptography does not require exchanging a secret key. It is asymmetric—the sender and receiver each have a pair of keys, a public key and a different but corresponding private key.

You can use PKA support to exchange symmetric secret keys securely and to compute digital signatures for authenticating messages to users. You can also use public key cryptography in support of secure electronic transactions over open networks, using SET protocols.

PKA Key Algorithms

Public key cryptography uses a key pair consisting of a public key and a private key. The PKA public key uses one of the following algorithms:

- **Rivest-Shamir-Adleman (RSA)**
  The RSA algorithm is the most widely used and accepted of the public key algorithms. It uses three quantities to encrypt and decrypt text: a public exponent (PU), a private exponent (PR), and a modulus (M). Given these three and some cleartext data, the algorithm generates ciphertext as follows:
  \[ \text{ciphertext} = \text{cleartext}^{PU} \pmod{M} \]
  Similarly, this operation recovers cleartext from ciphertext:
  \[ \text{cleartext} = \text{ciphertext}^{PR} \pmod{M} \]
  An RSA key consists of an exponent and a modulus. The private exponent must be secret, but the public exponent and modulus need not be secret.

- **Digital Signature Standard (DSS)**
  The U.S. National Institute of Standards and Technology (NIST) defines DSS in Federal Information Processing Standard (FIPS) Publication 186.

- **Elliptic Curve Digital Signature Algorithm (ECDSA)**
  The ECDSA algorithm uses elliptic curve cryptography (an encryption system based on the properties of elliptic curves) to provide a variant of the Digital Signature Algorithm.

PKA Master Keys

PKA master keys protect private keys.

- On the Cryptographic Coprocessor Feature, there are two PKA master keys: the Signature Master Key (SMK) and the RSA Key Management Master Key (KMMK). The SMK protects PKA private keys used only in digital signature services. The KMMK protects PKA private keys used in digital signature services and in the DES DATA key distribution functions.
- On the PCI Cryptographic Coprocessor, PKA keys are protected by the Asymmetric-Keys Master Key (ASYM-MK). The ASYM-MK is a triple-length DES key used to protect PKA keys.
In order for the PCI Cryptographic Coprocessor to function, the hash pattern of the ASYM-MK must match the hash pattern of the SMK on the Cryptographic Coprocessor Feature. The ICSF administrator installs the PKA master keys on the Cryptographic Coprocessor Feature and the ASYM-MK on the PCI Cryptographic Coprocessor by using either the pass phrase initialization routine, the Clear Master Key Entry panels, or the optional Trusted Key Entry (TKE) workstation.

Prior to PKA services being enabled on the PCI Cryptographic Coprocessor, these conditions must be met:

- The Symmetric-Keys Master Key (SYM-MK) must be installed on the PCI Cryptographic Coprocessor. It must match the Cryptographic Coprocessor Feature DES master key and match the master key that the CKDS was enciphered with.
- The PKA master keys (SMK and KMMK) on the Cryptographic Coprocessor Feature must be installed and valid.
- The ASYM-MK PKA master key on the PCI Cryptographic Coprocessor must be installed and valid.
- The hash pattern of the ASYM-MK on the PCI Cryptographic Coprocessor must match the hash pattern of the SMK on the Cryptographic Coprocessor Feature.
- The PKDS must be initialized with the PKA master keys installed on the Cryptographic Coprocessor Feature.

- On the PCI X Cryptographic Coprocessor, Crypto Express2 Coprocessor, or Crypto Express3 Coprocessor, PKA keys are protected by the Asymmetric-Keys Master Key (ASYM-MK). The ASYM-MK is a triple-length DES key used to protect PKA private keys. On the PCIXCC, CEX2C and CEX3C, the ASYM-MK protects RSA private keys. On the z196 with a CEX3C, there are two PKA master keys: RSA and ECC. The RSA master key is the same as the ASYM-MK. The ECC master key is a 256-bit AES key used to protect ECC private keys.
- In order for PKA services to function on the PCIXCC, CEX2C, or CEX3C, the Asymmetric-Keys/RSA and/or ECC master keys must be installed. The ICSF administrator installs the master keys on the PCIXCC, CEX2C, or CEX3C by using either the pass phrase initialization routine, the Clear Master Key Entry panels, or the optional Trusted Key Entry (TKE) workstation.

Prior to PKA services being enabled on the PCIXCC, CEX2C, or CEX3C, these conditions must be met:

- The ASYM-MK/RSA and/or ECC master keys on the PCIXCC, CEX2C, or CEX3C must be installed.
- The PKDS must be initialized with the ASYM-MK/RSA and/or ECC master keys installed on the PCIXCC, CEX2C, or CEX3C.

**Operational private keys**

RSA and DSS operational private keys are protected under two layers of DES encryption. They are encrypted under an Object Protection Key (OPK) that in turn is encrypted under the SMK/ASYM-MK/RSA or KMMK. ECC operational private keys are protected under two layers of AES encryption. They are encrypted under an AES OPK that in turn is encrypted under the ECC master key. You dynamically generate the OPK for each private key at import time or when the private key is generated on a PCI Cryptographic Coprocessor, PCI X Cryptographic Coprocessor, Crypto Express2 Coprocessor, or Crypto Express3 Coprocessor. ICSF provides a public key data set (PKDS) for the storage of application PKA keys.
On systems with the Cryptographic Coprocessor Feature, the PKA master keys can't be changed dynamically. The PKA callable services control must be disabled when the master keys are changed. Systems with the PCI Cryptographic Coprocessor can change the SMK/ASMY-MK by loading the new master key and using the PKDS Reencipher utility to reencrypt private keys encrypted to the new master key. Private tokens encrypted under the KMMK will only be reencrypted if the KMMK was equal to the SMK. When the reencrypted PKDS is refreshed to become the active PKDS, the PKA callable services control can be enabled.

On systems with the PCI X Cryptographic Coprocessor, Crypto Express2 Coprocessor, or Crypto Express3 Coprocessor, changing the Asymmetric-keys/RSA master key requires that the PKA callable services control be disabled. The new master key value is loaded, the PKDS is reencrypted and the Change Asymmetric Master Key utility makes the reencrypted PKDS the active PKDS. The PKA callable services control will be enabled automatically.

On systems with the Crypto Express3 Coprocessor, the ECC master key is changed in the same manner as the DES and AES master keys. On systems with the Crypto Express3 Coprocessor with the September 2011 licensed internal code, the RSA master key is changed in the same manner as the DES, AES and ECC master keys.

**PKA Callable Services**

The Cryptographic Coprocessor Feature available on the IBM @server zSeries 900, provides RSA and DSS digital signature functions, key management functions, and DES key distribution functions.

The IBM @server zSeries 900 provides the ability to generate RSA keys on the PCI Cryptographic Coprocessor. ICSF provides application programming interfaces to these functions through callable services.

The PCIXCC (available on the z890 and z990), the CEX2C (available on the z9 EC, z9 BC, z10 EC and z10 BC), and the CEX3C (available on the z10 EC and z10 BC) provide RSA digital signature functions, key management functions, and DES key distribution functions, PIN, MAC and data encryption functions, and application programming interfaces to these functions through callable services. You can also generate RSA keys on the PCIXCC/CEX2C/CEX3C.

The CEX3C on the z196 provides support for ECC. Specifically, it provides ECDSA digital signature functions, ECC key management functions, and application programming interfaces to these functions through callable services.

**Callable Services Supporting Digital Signatures**

ICSF provides these services that support digital signatures.

**Restrictions:**

- DSS is only supported on the IBM @server zSeries 900.
- ECDSA is only supported through the CEX3C cryptographic hardware on the z196.

**Digital Signature Generate Callable Service (CSNDDSG and CSNFDSG)**

This service generates a digital signature using an RSA, DSS, or ECC private key. It supports these methods of signature generation:
Callable Services for PKA Key Management

ICSF provides these services for PKA key management.

**PKA Key Generate Callable Service (CSNDPKG and CSNFPKG)**
This service generates a PKA internal token for use with the DSS algorithm in digital signature services. You can then use the PKA public key extract callable service to extract a DSS public key token from the internal key token. This service also supports the generation of RSA keys (on the PCICC, PCIXCC, CEX2C, or CEX3C), and ECC keys (on the CEX3C).

Input to the PKA key generate callable service is either a skeleton key token created by the PKA key token build callable service or a valid key token. Upon examination of the input skeleton key token, the PKA key generate service routes the key generation request as follows:

- If the skeleton is for a DSS key token, ICSF routes the request to a Cryptographic Coprocessor Feature.
- If the skeleton is for an RSA key, ICSF routes the request to any available PCICC, PCIXCC, CEX2C, or CEX3C.
- If the skeleton is for a retained RSA key, ICSF routes the request to a PCICC, PCIXCC, CEX2C, or CEX3C where the key is generated and retained for additional security.
- If the skeleton is for an ECC key, ICSF routes the request to any available CEX3C.

**PKA Key Import Callable Service (CSNDPKI and CSNFPKI)**
This service imports a PKA private key, which may be RSA or DSS.

The key token to import can be in the clear or encrypted. The PKA key token build utility creates a clear PKA key token. The PKA key generate callable service generates either a clear or an encrypted PKA key token.
PKA Key Token Build Callable Service (CSNDPKB and CSNFPKB)
The PKA key token build callable service is a utility you can use to create an external PKA key token containing an unenciphered private RSA or DSS key. You can supply this token as input to the PKA key import callable service to obtain an operational internal token containing an enciphered private key. You can also use this service to input a clear unenciphered public ECC, RSA, or DSS key and return the public key in a token format that other PKA services can use directly.

Use this service to build skeleton key tokens for input to the PKA key generate callable service for creation of RSA keys (on the PCICC, PCIXCC, CEX2C, or CEX3C), or ECC keys (on the CEX3C).

PKA Key Token Change Callable Service (CSNDKTC and CSNFKTC)
This service changes PKA key tokens (RSA, DSS, and ECC) or trusted block key tokens, from encipherment under the cryptographic coprocessor's old RSA master key or ECC master key to encipherment under the current cryptographic coprocessor's RSA master key or ECC master key. This callable service only changes private internal tokens. An active PCICC, PCIXCC, CEX2C, or CEX3C is required.

PKA Key Translate (CSNDPKT and CSNFPKT)
This service translates a CCA RSA key token to an external smart card key token. An active CEX2C or CEX3C is required.

PKA Public Key Extract Callable Service (CSNDPKX and CSNFPKX)
This service extracts a PKA public key token from a PKA internal (operational) or external (importable) private key token. It performs no cryptographic verification of the PKA private key token.

Callable Services to Update the Public Key Data Set (PKDS)
The Public Key Data Set (PKDS) is a repository for DSS, ECC, and RSA public and private keys and trusted blocks. An application can store keys in the PKDS and refer to them by label when using any of the callable services which accept public key tokens as input. The PKDS update callable services provide support for creating and writing records to the PKDS and reading and deleting records from the PKDS.

PKDS Key Record Create Callable Service (CSNDKRC and CSNFKRC)
This service accepts an RSA, DSS, or ECC private key token in either external or internal format, or an RSA, DSS, or ECC public key token or trusted blocks and writes a new record to the PKDS. An application can create a null token in the PKDS by specifying a token length of zero. The key label must be unique.

PKDS Key Record Delete Callable Service (CSNDKRD and CSNFKRD)
This service deletes a record from the PKDS. An application can specify that the entire record be deleted, or that only the contents of the record be deleted. If only the contents of the record are deleted, the record will still exist in the PKDS but will contain only binary zeros. The key label must be unique.
Callable Services for Working with Retained Private Keys

Private keys can be generated, retained, and used within the secure boundary of a PCICC, PCIXCC, CEX2C, or CEX3C. Retained keys are generated by the PKA Key Generate (CSNDPKG) callable service. The private key values of retained keys never appear in any form outside the secure boundary. All retained keys have an entry in the PKDS that identifies the PCICC, PCIXCC, CEX2C, or CEX3C where the retained private key is stored. ICSF provides these callable services to list and delete retained private keys.

Retained Key Delete Callable Service (CSNDRKD and CSNFRKD)
The retained key delete callable service deletes a key that has been retained within a PCICC, PCIXCC, CEX2C, or CEX3C and also deletes the record containing the key token from the PKDS.

Retained Key List Callable Service (CSNDRKL and CSNFKRL)
The retained key list callable service lists the key labels of private keys that are retained within the boundaries of PCICC, PCIXCC, CEX2C, or CEX3C installed on your server.

Clearing the retained keys on a coprocessor
The retained keys on a PCICC, PCIXCC, CEX2C, or CEX3C may be cleared. These are the conditions under which the retained key will be lost:

- If the PCICC, PCIXCC, CEX2C, or CEX3C detects tampering (the intrusion latch is tripped), ALL installation data is cleared: master keys, retained keys for all domains, as well as roles and profiles.
- If the PCICC, PCIXCC, CEX2C, or CEX3C detects tampering (the secure boundary of the card is compromised), it self-destructs and can no longer be used.
- If you issue a command from the TKE workstation to zeroize a domain
  This command zeroizes the data specific to a domain: master keys and retained keys.
- If you issue a command from the Support Element panels to zeroize all domains.
This command zeroizes ALL installation data: master keys, retained keys and access control roles and profiles.

Callable Services for SET Secure Electronic Transaction

SET is an industry-wide open standard for securing bankcard transactions over open networks. The SET protocol addresses the payment phase of a transaction from the individual, to the merchant, to the acquirer (the merchant's current bankcard processor). It can be used to help ensure the privacy and integrity of real time bankcard payments over the Internet. In addition, with SET in place, everyone in the payment process knows who everyone else is. The card holder, the merchant, and the acquirer can be fully authenticated because the core protocol of SET is based on digital certificates. Each participant in the payment transaction holds a certificate that validates his or her identity. The public key infrastructure allows these digital certificates to be exchanged, checked, and validated for every transaction made over the Internet. The mechanics of this operation are transparent to the application.

Under the SET protocol, every online purchase must be accompanied by a digital certificate which identifies the card-holder to the merchant. The buyer's digital certificate serves as an electronic representation of the buyer's credit card but does not actually show the credit card number to the merchant. Once the merchant's SET application authenticates the buyer's identity, it then decrypts the order information, processes the order, and forwards the still-encrypted payment information to the acquirer for processing. The acquirer's SET application authenticates the buyer's credit card information, identifies the merchant, and arranges settlement. With SET, the Internet becomes a safer, more secure environment for the use of payment cards.

ICSF provides these callable services that can be used in developing SET applications that make use of the S/390 and IBM zSeries cryptographic hardware at the merchant and acquirer payment gateway.

SET Block Compose Callable Service (CSNDSBC and CSNFSBC)

The SET Block Compose callable service performs DES encryption of data, OAEP-formatting through a series of SHA-1 hashing operations, and the RSA-encryption of the Optimal Asymmetric Encryption Padding (OAEP) block.

SET Block Decompose Callable Service (CSNDSBD and CSNFSBD)

The SET Block Decompose callable service decrypts both the RSA-encrypted and the DES-encrypted data.

PKA Key Tokens

PKA key tokens contain RSA, DSS or ECC private or public keys. PKA tokens are variable length because they contain either RSA, DSS, or ECC key values, which are variable in length. Consequently, length parameters precede all PKA token parameters. The maximum allowed size is 3500 bytes. PKA key tokens consist of a token header, any required sections, and any optional sections. Optional sections depend on the token type. PKA key tokens can be public or private, and private key tokens can be internal or external. Therefore, there are three basic types of tokens, each of which can contain either RSA, DSS, or ECC information:

- A public key token
- A private external key token
- A private internal key token
Public key tokens contain only the public key. Private key tokens contain the public and private key pair. Table 7 summarizes the sections in each type of token.

Table 7. Summary of PKA Key Token Sections

<table>
<thead>
<tr>
<th>Section</th>
<th>Public External Key Token</th>
<th>Private External Key Token</th>
<th>Private Internal Key Token</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>RSA, DSS, or ECC private key information</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>RSA, DSS, or ECC public key information</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>Key name (optional)</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>Internal information</td>
<td></td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

As with DES and AES key tokens, the first byte of a PKA key token contains the token identifier which indicates the type of token.

A first byte of X‘1E’ indicates an external token with a cleartext public key and optionally a private key that is either in cleartext or enciphered by a transport key-encrypting key. An external key token is in importable key form. It can be sent on the link.

A first byte of X‘1F’ indicates an internal token with a cleartext public key and a private key that is enciphered by the PKA master key and ready for internal use. An internal key token is in operational key form. A PKA private key token must be in operational form for ICSF to use it. (PKA public key tokens are used directly in the external form.)

Formats for public and private external and internal RSA, DSS, and ECC key tokens begin in “RSA Public Key Token” on page 793.

PKA Key Management

You can also generate PKA keys in several ways.

- Using the ICSF PKA key generate callable service.
- Using the Transaction Security System PKA key generate verb, or a comparable product from another vendor.
With a PCI X Cryptographic Coprocessor, Crypto Express2 Coprocessor, or Crypto Express3 Coprocessor, you can use the ICSF PKA key generate callable service to generate internal and external PKA tokens. You can also generate RSA keys on another system. To input a clear RSA key to ICSF, create the token with the PKA key token build callable service and import it using the PKA key import callable service. To input an encrypted RSA key, generate the key on the Transaction Security System and import it using the PKA key import callable service.

In either case, use the PKA key token build callable service to create a skeleton key token as input (see "PKA Key Token Build (CSNDPKB and CSNFPKB)" on page 535).

You can generate DSS keys on another system or on ICSF. You need to supply DSS network quantities to the PKA key generate callable service. If you generate DSS keys on another system, you can import them the same way as RSA keys. If you generate a DSS key on ICSF, you can never export it. You can use it on another ICSF host only if the same PKA master keys are installed on both systems.

The PKA key import callable service uses the clear token from the PKA key token build service or a clear or encrypted token from the Transaction Security System to securely import the key token into operational form for ICSF to use. ICSF does not permit the export of the imported PKA key.

The PKA public key extract callable service builds a public key token from a private key token.

Application RSA, DSS, and ECC public and private keys can be stored in the public key data set (PKDS), a VSAM data set.

---

### Security and Integrity of the Token

PKA private key tokens may optionally have a 64-byte `private_key_name` field. If `private_key_name` exists, ICSF uses RACROUTE REQUEST=AUTH to verify it prior to using the token in a callable service. For additional security, the processor also validates the entire private key token.
Key Identifier for PKA Key Token

A key identifier for a PKA key token is a variable length (maximum allowed size is 3500 bytes) area that contains one of these:

- **Key label** identifies keys that are in the PKDS. Ask your ICSF administrator for the key labels that you can use.
- **Key token** can be either an internal key token, an external key token, or a null key token. Key tokens are generated by an application (for example, using the PKA key generate callable service), or received from another system that can produce external key tokens.

An **internal key token** can be used only on ICSF, because a PKA master key encrypts the key value. Internal key tokens contain keys in operational form only.

An **external key token** can be exchanged with other systems because a transport key that is shared with the other system encrypts the key value. External key tokens contain keys in either exportable or importable form.

A **null key token** consists of 8 bytes of binary zeros. The PKDS Key Record Create service can be used to write a null token to the PKDS. This PKDS record can subsequently be identified as the target token for the PKA key import or PKA key generate service.

The term *key identifier* is used when a parameter could be one of the previously discussed items and to indicate that different inputs are possible. For example, you may want to specify a specific parameter as either an internal key token or a key label. The key label is, in effect, an indirect reference to a stored internal key token.

Key Label

If the first byte of the key identifier is greater than X'40', the field is considered to be holding a **key label**. The contents of a key label are interpreted as a pointer to a public key data set (PKDS) key entry. The key label is an indirect reference to an internal key token.

A key label is specified on callable services with the *key_identifier* parameter as a 64-byte character string, left-justified, and padded on the right with blanks. In most cases, the callable service does not check the syntax of the key label beyond the first byte. One exception is the CKDS key record create callable service which enforces the KGUP rules for key labels unless syntax checking is bypassed by a preprocessing exit.

A key label has this form:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Length</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>00-63</td>
<td>64</td>
<td>Key label name</td>
</tr>
</tbody>
</table>

Key Token

A key token is a variable length (maximum allowed size is 3500 bytes) field composed of key value and control information. PKA keys can be either public or private RSA, DSS, or ECC keys. Each key token can be either an internal key token (the first byte of the key identifier is X'1F'), an external key token (the first byte of the key identifier is X'1E'), or a null private key token (the first byte of the key identifier is X'00'). For the format of each token type, refer to Appendix B, “Key Token Formats,” on page 777.
An internal key token is a token that can be used only on the ICSF system that created it (or another ICSF system with the same PKA master key). It contains a key that is encrypted under the PKA master key.

An application obtains an internal key token by using one of the callable services such as those listed. The callable services are described in detail in Chapter 10, "Managing PKA Cryptographic Keys."

- PKA key generate
- PKA key import

The PKA Key Token Change callable service can reencipher private internal tokens from encryption under the old ASYM-MK to encryption under the current ASYM-MK. PKDS Reencipher/Activate options are available to reencipher RSA, DSS and ECC internal tokens in the PKDS when the SMK/ASYM-MK keys are changed.

PKA master keys may not be changed dynamically.

For debugging information, see Appendix B, "Key Token Formats" for the format of an internal key token.

If the first byte of the key identifier is X'1E', the key identifier is interpreted as an external key token. An external PKA key token contains key (possibly encrypted) and control information. By using the external key token, you can exchange keys between systems.

An application obtains the external key token by using one of the callable services such as those listed. They are described in detail in Chapter 10, "Managing PKA Cryptographic Keys."

- PKA public key extract
- PKA key token build
- PKA key generate

For debugging information, see Appendix B, "Key Token Formats" for the format of an external key token.

If the first byte of the key identifier is X'00', the key identifier is interpreted as a null key token.

For debugging information, see Appendix B, "Key Token Formats" for the format of a null key token.

The Transaction Security System and ICSF Portability

The Transaction Security System PKA verbs from releases prior to 1996 can run only on the Transaction Security System. The PKA96 release of the Transaction Security System PKA verbs generally runs on ICSF without change. As with DES cryptography, you cannot interchange internal PKA tokens but can interchange external tokens.

Summary of the PKA Callable Services

Table 8 on page 90 lists the PKA callable services, described in this publication, and their corresponding verbs. (The PKA services start with CSNDxxx and have corresponding CSFx xxx names.) This table also references the topic that describes the callable service.

Chapter 4. Introducing PKCS #11 and using PKCS #11 callable services

The Integrated Cryptographic Service Facility has implemented callable service in support of PKCS #11. A callable service is a routine that receives control using a CALL statement in an application language. Each callable service performs one or more functions, including:

- initializing and deleting PKCS11 tokens
- creating, reading, updating and deleting PKCS11 objects

Many services have hardware requirements. See each service for details. All new callable services will be invocable in AMODE(24), AMODE(31), or AMODE(64).

For more information about PKCS #11 see z/OS Cryptographic Services ICSF Writing PKCS #11 Applications.

PKCS #11 Management Services

ICSF provides callable services that support PKCS #11 token and object management. The following table summarizes these callable services. For complete syntax and reference information, refer to Part 3, “PKCS #11 Callable Services,” on page 653.

Table 9. Summary of PKCS #11 callable services

<tr>
<td>CSFPWPK</td>
<td>PKCS #11 Wrap key</td>
<td>Wrap a key with another key</td>
</tr>
</tbody>
</table>

**Attribute List**

The attributes of an object can be the input and the output of a service. The format of the attributes is shown here and applies to all PKCS #11 callable services. For the token record list service, the search_template has the same format as an attribute list. The lengths in the attribute list and attribute structures are unsigned integers.

An attribute list is a structure in this format:

<table>
<thead>
<tr>
<th>Number of attributes</th>
<th>Attribute</th>
<th>Attribute</th>
<th>...</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 bytes</td>
<td>4 + 2 + length of value bytes</td>
<td>4 + 2 + length of value bytes</td>
<td>...</td>
</tr>
</tbody>
</table>

Each attribute is a structure in this format:
<table>
<thead>
<tr>
<th>Attribute name</th>
<th>Length of value ($n$)</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>4 bytes</td>
<td>2 bytes</td>
<td>$n$ bytes</td>
</tr>
</tbody>
</table>

## Handles

A handle is a 44-byte identifier for a token or an object. The format of the handle is as follows:

<table>
<thead>
<tr>
<th>Name of token or object</th>
<th>Sequence number</th>
<th>ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>32 bytes</td>
<td>8 bytes</td>
<td>4 bytes</td>
</tr>
</tbody>
</table>

The token name in the first 32 bytes of the handle is provided by the PKCS #11 application when the token or object is created. The first character of the name must be alphabetic or a national character ("#", "$", or "@"). Each of the remaining characters can be alphanumeric, a national character ("#", "$", or "@"), or a period (".").

The sequence number is a hexadecimal number stored as the EBCDIC representation of 8 hexadecimal numbers. The sequence number field in a token is EBCDIC blanks. The token record contains a last-used sequence number field, which is incremented each time an object associated with the token is created. This sequence number value is placed in the handle of the newly-created object.

The ID field is 4 characters. The first character contains an EBCDIC “T” if the handle belongs to a token object, “S” if the handle belongs to a session object, or blank if the handle belongs to a token. The last three characters must be EBCDIC blanks.
Part 2. CCA Callable Services

This publication introduces DES, AES and PKA callable services.

Note: References to the IBM zSeries 800 (z800) do not appear in this information. Be aware that the documented notes and restrictions for the IBM zSeries 900 (z900) also apply to the z800. References to the IBM zEnterprise 114 (z114) do not appear in this information. Be aware that the documented notes and restrictions for the IBM zEnterprise 196 (z196) also apply to the z114.
Chapter 5. Managing Symmetric Cryptographic Keys

This topic describes the callable services that generate and maintain cryptographic keys.

Using ICSF, you can generate keys using either the key generator utility program or the key generate callable service. ICSF provides a number of callable services to assist you in managing and distributing keys and maintaining the cryptographic key data set (CKDS).

This topic describes these callable services:

- "Clear Key Import (CSNBCKI and CSNECKI)" on page 100
- "Control Vector Generate (CSNBCVG and CSNECVG)" on page 102
- "Control Vector Translate (CSNBCVT and CSNECVT)" on page 105
- "Cryptographic Variable Encipher (CSNBCVE and CSNECVE)" on page 109
- "Data Key Export (CSNBDRX and CSNEDRX)" on page 111
- "Data Key Import (CSNBDKMI and CSNEDKMI)" on page 114
- "Diversified Key Generate (CSNBDKG and CSNEDKG)" on page 117
- "ECC Diffie-Hellman (CSNDEDH and CSNFEDH)" on page 123

Clear Key Import (CSNBCKI and CSNECKI)

Use the clear key import callable service to import a clear DATA key that is to be used to encipher or decipher data. This callable service can import only DATA keys. Clear key import accepts an 8-byte clear DATA key, enciphers it under the master key, and returns the encrypted DATA key in operational form in an internal key token.

If the clear key value does not have odd parity in the low-order bit of each byte, the service returns a warning value in the reason_code parameter. The callable service does not adjust the parity of the key.

Note: To import 16-byte or 24-byte DATA keys, use the multiple clear key import callable service that is described in "Multiple Clear Key Import (CSNBCKM and CSNECKM)" on page 205. The multiple clear key import service supports AES DATA keys.

The callable service name for AMODE(64) invocation is CSNECKI.

Format

CALL CSNBCKI(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    clear_key,
    key_identifier )

Parameters

return_code
Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that are assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.
Clear Key Import

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

clear_key
Direction: Input Type: String

The clear_key specifies the 8-byte clear key value to import.

key_identifier
Direction: Input/Output Type: String

A 64-byte string that is to receive the internal key token. "Key Identifier for Key Token" on page 8 describes the internal key token.

Usage Notes

These usage notes only apply to CCF systems.

This service produces an internal DATA token with a control vector which is usable on the Cryptographic Coprocessor Feature. If a valid internal token is supplied as input to the service in the key_identifier field, that token's control vector will not be used in the encryption of the clear key value.

This service marks this internal key token CDMF or DES, according to the system's default encryption algorithm, unless token copying overrides this. The service marks this internal key token CDMF or DES, according to the system's default encryption algorithm, unless token copying overrides this. See "System Encryption Algorithm" on page 49 for details.

The Clear Key Import/Multiple Clear Key Import - DES access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Control Vector Generate (CSNBCVG and CSNECVG)

The Control Vector Generate callable service builds a control vector from keywords specified by the key_type and rule_array parameters.

The callable service name for AMODE(64) is CSNECVG.

Format

```
CALL CSNBCVG(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_type,
    rule_array_count,
    rule_array,
    reserved,
    control_vector)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Ignored  
Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

**exit_data**

Control Vector Generate

Direction: Ignored Type: String

This field is ignored.

directory: Input Type: String

A string variable containing a keyword for the key type. The keyword is 8 bytes
in length, left justified, and padded on the right with space characters. It is taken
from this list:

- CIPHER
- DATAM
- IKEYXLAT
- OPINENC
- CVARDEC
- DATAMV
- IMPORTER
- PINGEN
- CVARENC
- DECIPHER
- IPINENC
- PINVER
- CVARPINE
- DKYGENKY
- KEYGENKY
- SECMSG
- CVARXCVL
- ENCIPHER
- MAC
- CVARXCVR
- EXPORTER
- MACVER
- DATA
- OKEYXLAT

rule_array_count

Direction: Input Type: Integer

The number of keywords you are supplying in the rule_array parameter.

rule_array

Direction: Input Type: Character String

Keywords that provide control information to the callable service. Each keyword
is left justified in 8-byte fields, and padded on the right with blanks. All keywords
must be in contiguous storage. *Control Vector Generate and Key Token Build callable services*
illustrates the key type and key usage keywords that can be
combined in the Control Vector Generate and Key Token Build callable services
to create a control vector. The rule array keywords are:

- AMEX-CSC
- ANSIX9.9
- ANY
- ANY-MAC
- CLR8-ENC
- CPINENC
- CPINGEN
- CPINGENA
- CVVKEY-A
- CVVKEY-B
- DALL
- DATA
- DDATA
- DEXP
- DIMP
- DKYL0
- DKYL1
- DKYL2
Control Vector Generate

- DKYL3
- DKYL4
- DKYL5
- DKYL6
- DKYL7
- DMAC
- DMKEY
- DMPIN
- DMV
- DOUBLE
- DPVR
- ENH-ONLY
- EPINGEN
- EPINGENA
- EPINVER
- EXEX
- EXPORT
- GBP-PIN
- GBP-PINO
- IBM-PIN
- IBM-PINO
- IMEX
- IMIM
- IMPORT
- INBK-PIN
- KEY-PART
- KEYLN8
- KEYLN16
- LMID-KEK
- MIXED
- NO-SPEC
- NO-XPORT
- NON-KEK
- NOOFFSET
- NOT31XPT
- OPEX
- OPIM
- REFORMAT
- SINGLE
- SMKEY
- SMPIN
- T31XPTOK
- TRANSLAT
- UKPT
- VISA-PVV
Control Vector Generate

- XLATE
- XPORT-OK

**Note:** CLR8-ENC or UKPT must be coded in `rule_array` when the KEYGENKY key type is coded. When the SECMSG `key_type` is coded, either SMKEY or SMPIN must be specified in the `rule_array`. ENH-ONLY is not supported with key type DATA.

**reserved**

Direction: Input  
Type: String

The `reserved` parameter must be a variable of 8 bytes of X'00'.

**control_vector**

Direction: Output  
Type: String

A 16-byte string variable in application storage where the service returns the generated control vector.

**Usage Notes**

See Table 61 on page 188 for an illustration of key type and key usage keywords that can be combined in the Control Vector Generate and Key Token Build callable services to create a control vector.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

*Table 11. Control vector generate required hardware*

Control Vector Translate (CSNBCVT and CSNECVT)

The Control Vector Translate callable service changes the control vector used to encipher an external key.

See "Changing Control Vectors with the Control Vector Translate Callable Service" on page 837 for additional information about this service.
Control Vector Translate

The callable service name for AMODE(64) invocation is CSNECVT.

Format

```
CALL CSNBCVT(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    KEK_key_identifier,
    source_key_token,
    array_key_left,
    mask_array_left,
    array_key_right,
    mask_array_right,
    rule_array_count,
    rule_array,
    target_key_token )
```

Parameters

**return_code**

Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFFFF' (2 gigabytes). The data is defined in the exit_data parameter.

**exit_data**

Direction: Input/Output  Type: String

The data that is passed to the installation exit.

**KEK_key_identifier**

Direction: Input/Output  Type: String

The 64-byte string variable containing an internal key token or the key label of an internal key token record containing the key-encrypting key. The control vector in the internal key token must specify the key type of IMPORTER, EXPORTER, IKEYXLAT, or OKEYXLAT.
**Control Vector Translate**

**source_key_token**
Direction: Input  
Type: String

A 64-byte string variable containing the external key token with the key and control vector to be processed.

**array_key_left**
Direction: Input/Output  
Type: String

A 64-byte string variable containing an internal key token or a key label of an internal key token record that deciphers the left mask array. The internal key token must contain a control vector specifying a CVARXCVL key type.

**mask_array_left**
Direction: Input  
Type: String

A string of seven 8-byte elements containing the mask array enciphered under the left array key.

**array_key_right**
Direction: Input/Output  
Type: String

A 64-byte string variable containing an internal key token or a key label of an internal key token record that deciphers the right mask array. The internal key token must contain a control vector specifying a CVARXCVR key type.

**mask_array_right**
Direction: Input  
Type: String

A string of seven 8-byte elements containing the mask array enciphered under the right array key.

**rule_array_count**
Direction: Input  
Type: Integer

An integer containing the number of elements in the rule array. The value of the `rule_array_count` must be 0, 1, or 2 for this service. If the `rule_array_count` is 0, the default keywords are used.

**rule_array**
Direction: Input  
Type: Character String

The `rule_array` parameter is an array of keywords. The keywords must be 8 bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks. The rule_array keywords are:

*Table 12. Keywords for Control Vector Translate*

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parity Adjustment Rule (optional)</td>
<td></td>
</tr>
</tbody>
</table>
Control Vector Translate

Table 12. Keywords for Control Vector Translate (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADJUST</td>
<td>Ensures that all target key bytes have odd parity. This is the default.</td>
</tr>
<tr>
<td>NOADJUST</td>
<td>Prevents the parity of the target being altered.</td>
</tr>
</tbody>
</table>

Key-portion Rule (optional)

| BOTH      | Causes both halves of a 16-byte source key to be processed with the result placed into corresponding halves of the target key. When you use the BOTH keyword, the mask array must be able to validate the translation of both halves. |
| LEFT      | Causes an 8-byte source key, or the left half of a 16-byte source key, to be processed with the result placed into both halves of the target key. This is the default. |
| RIGHT     | Causes the right half of a 16-byte source key to be processed with the result placed into the right half of the target key. The left half is copied unchanged (still enciphered) from the source key. |
| SINGLE    | Causes the left half of the source key to be processed with the result placed into the left half of the target key token. The right half of the target key is unchanged. |

**target_key_token**

Direction: Input/Output  
Type: String

A 64-byte string variable containing an external key token with the new control vector. This key token contains the key halves with the new control vector.

ICSF supports two methods of wrapping the key value in a symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method which is ANSI X9.24 compliant. The output target_key_token will be wrapped in the same manner as the input source_key_token.

**Restrictions**

This callable service does not support version X'10' external DES key tokens (RKX key tokens).

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

If KEK_key_identifier is a label of an IMPORTER or EXPORTER key, the label must be unique in the CKDS.

The Control Vector Translate access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

### Cryptographic Variable Encipher (CSNBCVE and CSNECVE)

The Cryptographic Variable Encipher callable service uses a CVARENC key to encrypt plaintext by using the Cipher Block Chaining (CBC) method. You can use this service to prepare a mask array for the Control Vector Translate service. The plaintext must be a multiple of eight bytes in length.

The callable service name for AMODE(64) invocation is CSNECVE.

#### Format

```call
CALL CSNBCVE(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    c-variable_encrypting_key_identifier,
    text_length,
    plaintext,
    initialization_vector,
    ciphertext )
```

#### Parameters

- **return_code**
  - Direction: Output
  - Type: Integer
  - The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the return codes.

- **reason_code**
  - Direction: Output
  - Type: Integer
Cryptographic Variable Encipher

The reason code specifies the result of the callable service that is returned to
the application program. Each return code has different reason codes that
indicate specific processing problems. Appendix A, "ICSF and TSS Return and
Reason Codes" lists the reason codes.

**exit_data_length**
- Direction: Input/Output
- Type: Integer

The length of the data that is passed to the installation exit. The length can be
from X'00000000' to X'7FFFFFFFFF' (2 gigabytes). The data is defined in the
exit_data parameter.

**exit_data**
- Direction: Input/Output
- Type: String

The data that is passed to the installation exit.

**c-variable_encrypting_key_identifier**
- Direction: Input/Output
- Type: String

The 64-byte string variable containing an internal key or a key label of an
internal key token record in the CKDS. The internal key must contain a control
vector that specifies a CVARENC key type.

**text_length**
- Direction: Input
- Type: Integer

An integer variable containing the length of the plaintext and the returned
ciphertext.

**plaintext**
- Direction: Input
- Type: String

A string of length 8 to 256 bytes which contains the plaintext. The data must be
a multiple of 8 bytes.

**initialization_vector**
- Direction: Input
- Type: String

A string variable containing the 8-byte initialization vector that the service uses
in encrypting the plaintext.

**ciphertext**
- Direction: Output
- Type: String

The field which receives the ciphertext. The length of this field is the same as
the length of the plaintext.
Cryptographic Variable Encipher

Restrictions

- The text length must be a multiple of 8 bytes.
- The maximum length of text that the security server can process is 256 bytes.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The Cryptographic Variable Encipher access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Data Key Export (CSNBKDX and CSNEDKX)

Use the data key export callable service to reencipher a data-encrypting key (key type of DATA only) from encryption under the master key to encryption under an exporter key-encrypting key. The reenciphered key is in a form suitable for export to another system.

The data key export service generates a key token with the same key length as the input token's key.

The callable service name for AMODE(64) invocation is CSNEDKX.
Data Key Export

Format

```
CALL CSNBDKX(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    source_key_identifier,
    exporter_key_identifier,
    target_key_identifier )
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**source_key_identifier**

Direction: Input/Output  
Type: String

A 64-byte string for an internal key token or label that contains a data-encrypting key to be reenciphered. The data-encrypting key is encrypted under the master key.

**exporter_key_identifier**

Direction: Input/Output  
Type: String

A 64-byte string for an internal key token or key label that contains the exporter key_encrypting key. The data-encrypting key previously discussed will be encrypted under this exporter key_encrypting key.
Data Key Export

**target_key_identifier**

direction: Input/Output

type: String

A 64-byte field that is to receive the external key token, which contains the reenciphered key that has been exported. The reenciphered key can now be exchanged with another cryptographic system.

ICSF supports two methods of wrapping the key value in a symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method which is ANSI X9.24 compliant. The output target_key_identifier will be wrapped in the same manner as the source_key_identifier.

**Restrictions**

For existing TKE V3.1 (or higher) users, you may have to explicitly enable new access control points. Current applications will fail if they use an equal key halves exporter to export a key with unequal key halves. You must have access control point 'Data Key Export - Unrestricted' explicitly enabled.

This callable service does not support version X'10' external DES key tokens (RXX token).

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

When the service is processed on the CCF, ICSF examines the data encryption algorithm bits on the exporter key-encrypting key and DATA key for consistency. It does not export a CDMF key under a DES-marked key-encrypting key or a DES key under a CDMF-marked key-encrypting key. ICSF does not propagate the data encryption marking on the operational key to the external token.

Token marking for DES/CDMF on DATA and key-encrypting keys is ignored on a PCICC, PCIXCC, CEX2C, or CEX3C.

The following table shows the access control points in the ICSF role that control the function of this service.

*Table 15. Required access control points for Data key export*

<table>
<thead>
<tr>
<th>Access Control Point</th>
<th>Restrictions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Key Export - Unrestricted</td>
<td>None</td>
</tr>
<tr>
<td>Data Key Export</td>
<td>Key-encrypting key may not have equal key halves</td>
</tr>
</tbody>
</table>

To use a NOCV key-encrypting key with the data key export service, the **NOCV KEK usage for export-related functions** access control point must be enabled in addition to one or both of the access control points listed.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

## Data Key Import (CSNBDMK and CSNEDKM)

Use the data key import callable service to import an encrypted source DES single-length, double-length or triple-length DATA key and create or update a target internal key token with the master key enciphered source key.

The callable service name for AMODE(64) invocation is CSNEDKM.

### Format

```
CALL CSNBDMK(  
    return_code,  
    reason_code,  
    exit_data_length,  
    exit_data,  
    source_key_token,  
    importer_key_identifier,  
    target_key_identifier)
```

### Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.
Data Key Import

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

source_key_token
Direction: Input Type: String

64-byte string variable containing the source key to be imported. The source key must be an external token or null token. The external key token must indicate that a control vector is present; however, the control vector is usually valued at zero. A double-length key that should result in a default DATA control vector must be specified in a version X'01' external key token. Otherwise, both single and double-length keys are presented in a version X'00' key token. For the null token, the service will process this token format as a DATA key encrypted by the importer key and a null (all zero) control vector.

importer_key_identifier
Direction: Input/Output Type: String

A 64-byte string variable containing the (IMPORTER) transport key or key label of the transport key used to decipher the source key.

target_key_identifier
Direction: Input/Output Type: String

A 64-byte string variable containing a null key token or an internal key token. The key token receives the imported key.

ICSF supports two methods of wrapping the key value in a symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method which is ANSI X9.24 compliant. If a skeleton key token is provided as input to this parameter, the wrapping method in the skeleton token will be used. Otherwise, the system default key wrapping method will be used to wrap the token.
Data Key Import

Restrictions

For existing TKE V3.1 (or higher) users, you may have to explicitly enable new access control points. Current applications will fail if they use an equal key halves importer to import a key with unequal key halves. You must have access control point 'Data Key Import - Unrestricted' explicitly enabled.

This callable service does not support version 'X'10' external DES key tokens (RKX key tokens).

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

This service does not adjust the key parity of the source key.

CDMF/DES token markings will be ignored.

The following table shows the access control points in the ICSF role that control the function of this service.

<table>
<thead>
<tr>
<th>Access Control Point</th>
<th>Restrictions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Key Import - Unrestricted</td>
<td>None</td>
</tr>
<tr>
<td>Data Key Import</td>
<td>Key-encrypting key may not have equal key halves</td>
</tr>
</tbody>
</table>

To use a NOCV key-encrypting key with the data key import service, the NOCV KEK usage for import-related functions access control point must be enabled in addition to one or both of the access control points listed.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Diversified Key Generate (CSNBDKG and CSNEDKG)

Use the diversified key generate service to generate a key based on the key-generating key, the processing method, and the parameter supplied. The control vector of the key-generating key also determines the type of target key that can be generated.

To use this service, specify:

- The rule array keyword to select the diversification process.
- The operational key-generating key from which the diversified keys are generated. The control vector associated with this key restricts the use of this key to the key generation process. This control vector also restricts the type of key that can be generated.
- The data and length of data used in the diversification process.
- The generated-key may be an internal token or a skeleton token containing the desired CV of the generated-key. The generated key CV must be one that is permitted by the processing method and the key-generating key. The generated-key will be returned in this parameter.
- A key generation method keyword. Some keywords require Requires May 2004 or later version of Licensed Internal Code (LIC) or a z890.

This service generates diversified keys as follows:

- Determines if it can support the process specified in rule array.
- Recovers the key-generating key and checks the key-generating key class and the specified usage of the key-generating key.
- Determines that the control vector in the generated-key token is permissible for the specified processing method.
- Determines that the control vector in the generated-key token is permissible by the control vector of the key-generating key.
- Determines the required data length from the processing method and the generated-key CV. Validates the data_length.
- Generates the key appropriate to the specific processing method. Adjusts parity of the key to odd. Creates the internal token and returns the generated diversified key.

The callable service name for AMODE(64) invocation is CSNEDKG.

Format

```call csnbdkg(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    generating_key_identifier,
    data_length,
    data,
    key_identifier,
    generated_key_identifier)
```
Diversified Key Generate

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. The only valid value is 1, 2, or 3.

rule_array
Direction: Input Type: String

Keywords that provide control information to the callable service. The processing method is the algorithm used to create the generated key. The keywords must be 8 bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks.

Table 19. Rule Array Keywords for Diversified Key Generate

### Diversified Key Generate

**Table 19. Rule Array Keywords for Diversified Key Generate (continued)**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| CLR8-ENC    | Specifies that 8-bytes of clear data shall be multiply encrypted with the generating key. The *generating_key_identifier* must be a KEYGENKY key type with bit 19 of the control vector set to 1. The control vector in *generated_key_identifier* must specify a single-length key. The key type may be DATA, MAC, or MACVER.  
**Note:** CIPHER class keys are not supported. |
| SESS-XOR    | Modifies an existing DATA, DATAC, MAC, DATAM, or MACVER, DATAMV single- or double-length key. Specifies the VISA method for session key generation. Data supplied may be 8 or 16 bytes of data depending on whether the *generating_key_identifier* is a single or double length key. The 8 or 16 bytes of data is XORed with the clear value of the *generating_key_identifier*. The *generated_key_identifier* has the same control vector as the *generating_key_identifier*. The *generating_key_identifier* may be DATA/DATAC, MAC/DATAM or MACVER/DATAMV key types. |
| TDES-DEC    | Data supplied may be 8 or 16 bytes of clear data. If the *generated_key_identifier* specifies a single length key, then 8-bytes of data is TDES decrypted under the *generating_key_identifier*. If the *generated_key_identifier* specifies a double length key, then 16-bytes of data is TDES ECB mode decrypted under the *generating_key_identifier*. No formatting of data is done prior to encryption. The *generating_key_identifier* must be a DKYGENKY key type, with appropriate usage bits for the desired generated key. |
| TDES-ENC    | Data supplied may be 8 or 16 bytes of clear data. If the *generated_key_identifier* specifies a single length key, then 8-bytes of data is TDES encrypted under the *generating_key_identifier*. If the *generated_key_identifier* specifies a double length key, then 16-bytes of data is TDES ECB mode encrypted under the *generating_key_identifier*. No formatting of data is done prior to encryption. The *generating_key_identifier* must be a DKYGENKY key type, with appropriate usage bits for the desired generated key. The *generated_key_identifier* may be a single or double length key with a CV that is permitted by the *generating_key_identifier*. |
| TDES-XOR    | Requires Requires May 2004 or later version of Licensed Internal Code (LIC). It combines the function of the existing TDES-ENC and SESS-XOR into one step.  
The generating key must be a level 0 DKYGENKY and cannot have replicated halves. The session key generated must be double length and the allowed key types are DATA, DATAC, MAC, MACVER, DATAM, DATAMV, SMPIN and SMKEY. Key type must be allowed by the generating key control vector. |
### Diversified Key Generate

#### Table 19. Rule Array Keywords for Diversified Key Generate (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDESEMV2</td>
<td>Requires Requires May 2004 or later version of Licensed Internal Code (LIC): supports generation of a session key by the EMV 2000 algorithm (This EMV2000 algorithm uses a branch factor of 2). The generating key must be a level 0 DKYGENKY and cannot have replicated halves. The session key generated must be double length and the allowed key types are DATA, DATAC, MAC, MACVER, DATAM, DATAMV, SMPIN and SMKEY. Key type must be allowed by the generating key control vector.</td>
</tr>
<tr>
<td>TDESEMV4</td>
<td>Requires Requires May 2004 or later version of Licensed Internal Code (LIC): supports generation of a session key by the EMV 2000 algorithm (This EMV2000 algorithm uses a branch factor of 4). The generating key must be a level 0 DKYGENKY and cannot have replicated halves. The session key generated must be double length and the allowed key types are DATA, DATAC, MAC, MACVER, DATAM, DATAMV, SMPIN and SMKEY. Key type must be allowed by the generating key control vector.</td>
</tr>
</tbody>
</table>

#### Key Wrapping Method (optional)

<table>
<thead>
<tr>
<th>Key Wrapping Method (optional)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USECONFG</td>
<td>Specifies that the system default configuration should be used to determine the wrapping method. This is the default keyword.</td>
</tr>
<tr>
<td>WRAP-ENH</td>
<td>Use enhanced key wrapping method, which is compliant with the ANSI X9.24 standard.</td>
</tr>
<tr>
<td>WRAP-ECB</td>
<td>Use original key wrapping method, which uses ECB wrapping for DES key tokens and CBC wrapping for AES key tokens.</td>
</tr>
</tbody>
</table>

#### Translation Control (optional)

<table>
<thead>
<tr>
<th>Translation Control (optional)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENH-ONLY</td>
<td>Restrict rewrapping of the generated_key_identifier token. Once the token has been wrapped with the enhanced method, it cannot be rewrapped using the original method.</td>
</tr>
</tbody>
</table>

**generating_key_identifier**

- **Direction:** Input/Output
- **Type:** String

The label or internal 64 byte token of a key that is a DKYLO, DKYGENKY or a subtype appropriate to the session key to be derived. The type of key-generating key depends on the processing method.

**data_length**

- **Direction:** Input
- **Type:** Integer

The label or internal 64 byte token of a key that is a DKYLO, DKYGENKY or a subtype appropriate to the session key to be derived. The type of key-generating key depends on the processing method.
Diversified Key Generate

The length of the data parameter that follows. Length depends on the processing method and the generated key. The data length for TDESEMV4 or TDESEMV2 is either 18 or 34.

data
Direction: Input
Type: String

Data input to the diversified key or session key generation process. Data depends on the processing method and the generated_key_identifier.

For TDESEMV4 or TDESEMV2 the data is either 18 bytes (36 digits) or 34 bytes (68 digits) or data comprised of:

- 16 bytes (32 digits) of card specific data used to create the card specific intermediate key (UDK) as per the TDES-ENC method. This will typically be the PAN and PAN Sequence number as per the EMV specifications
- 2 bytes (4 digits) of ATC (Application Transaction Count)
- (optional) 16 bytes (32 digits) of IV (Initial Value) used in the EMV

key_identifier
Direction: Input/Output
Type: String

This parameter is currently not used. It must be a 64-byte null token.

generated_key_identifier
Direction: Input/Output
Type: String

The internal token of an operational key, a skeleton token containing the control vector of the key to be generated, or a null token. A null token can be supplied if the generated_key_identifier will be a DKYGENKY with a CV derived from the generating_key_identifier. A skeleton token or internal token is required when generated_key_identifier will not be a DKYGENKY key type or the processing method is not SESS-XOR. For SESS-XOR, this must be a null token. On output, this parameter contains the generated key.

ICSF supports two methods of wrapping the key value in a symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method which is ANSI X9.24 compliant. The output generated_key_token will use the default method unless a rule array keyword overriding the default is specified.

Restrictions

This callable service does not support version X’10’ external DES key tokens (RKX key tokens).

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

Refer to Appendix C, “Control Vectors and Changing Control Vectors with the CVT Callable Service,” on page 827 for information on the control vector bits for the DKG key generating key.

For Session key algorithm (EMV Smartcard specific), an MDK can be used in two ways:
**Diversified Key Generate**

- To calculate the Card Specific Key (or UDK) in the personalization process, call this service with the TDES-ENC method using an output token that has been primed with the CV of the final session key, for instance, if the MDK is a DMPIN, the token should have the CV of an SMPIN key; DMAC; a double length MAC; DDATA, a double length DATA key, etc.

  The result would then be exported in the personalization file. This key is not usable in this form for any other calculations.

- To use the session key, call this service with the TDESEMV4 method. Provide, for input, the same card data that was used to create the UDK as well as the ATC and optionally the IV value. This is the key that will be used in EMV related Smartcard processing.

  This same processing applies to those API's the generate the session key on your behalf, like CSNBPCU.

The following table shows the access control points in the ICSF role that control the function of this service.

*Table 20. Required access control points for Diversified Key Generate*

<table>
<thead>
<tr>
<th>Rule array keyword</th>
<th>Access control point</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLR8-ENC</td>
<td>Diversified Key Generate - CLR8-ENC</td>
</tr>
<tr>
<td>SESS-XOR</td>
<td>Diversified Key Generate - SESS-XOR</td>
</tr>
<tr>
<td>TDES-DEC</td>
<td>Diversified Key Generate - TDES-DEC</td>
</tr>
<tr>
<td>TDES-ENC</td>
<td>Diversified Key Generate - TDES-ENC</td>
</tr>
<tr>
<td>TDES-XOR</td>
<td>Diversified Key Generate - TDES-XOR</td>
</tr>
<tr>
<td>TDESEMV2 or TDESEMV4</td>
<td>Diversified Key Generate - TDESEMV2/TDESEMV4</td>
</tr>
<tr>
<td>WRAP-ECB or WRAP-ENH and default key-wrapping method setting does not match the keyword</td>
<td>Diversified Key Generate - Allow wrapping override keywords</td>
</tr>
</tbody>
</table>

When a key-generating key of key type DKYGENKY is specified with control vector bits (19 – 22) of B’1111’, the Diversified Key Generate - DKYGENKY – DALL access control point must also be enabled in the ICSF role.

When using the TDES-ENC or TDES-DEC modes, you can specifically enable generation of a single-length key or a double-length key with equal key-halves by enabling the Diversified Key Generate - Single length or same halves access control point.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

### ECC Diffie-Hellman (CSNDEDH and CSNFEDH)

Use the ECC Diffie-Hellman callable service to create:

- Symmetric key material from a pair of ECC keys using the Elliptic Curve Diffie-Hellman protocol and the static unified model key agreement scheme.
- “Z” – The “secret” material output from D-H process.

Output may be one of the following forms:

- Internal CCA Token (DES or AES): AES keys are in the "Variable-length Symmetric Key Token" format. DES keys are in the "DES Internal Key Token" format.
- External CCA Token (DES or AES): AES keys are in the "Variable-length Symmetric Key Token" format. DES keys are in the "DES External Key Token" format.
- “Z” – The “secret” material output from D-H process.
ECC Diffie-Hellman

Format

)

Parameters

return_code

Direction: Output
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code

Direction: Output
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length

Direction: Input/Output
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data

124  z/OS V1R13 ICSF Application Programmer's Guide
ECC Diffie-Hellman

Direction: Input/Output  Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input  Type: Integer

The number of keywords you supplied in the rule_array parameter. Valid values are between 1 and 5.

rule_array
Direction: Input  Type: String

The rule_array parameter is an array of keywords. The keywords must be 8 bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks. The rule_array keywords are:

Table 22. Keywords for ECC Diffie-Hellman

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key agreement (one required)</td>
<td></td>
</tr>
<tr>
<td>DERIV01</td>
<td>Use the static unified model key agreement scheme.</td>
</tr>
<tr>
<td>PASSTHRU</td>
<td>Skip Key derivation step and return raw &quot;Z&quot; material.</td>

<tr>
<td>ENH-ONLY</td>
<td>Specify this keyword to indicate that the key once wrapped with the enhanced method cannot be wrapped with the original method. This restricts translation to the original method. If the keyword is not specified translation to the original method will be allowed. This turns on bit 56 (ENH ONLY) in the control vector. This keyword is not valid if processing a zero CV data key.</td>
</tr>
</tbody>
</table>

private_key_identifier_length
Direction: Input  Type: Integer

The length of the private_key_identifier parameter.

private_key_identifier
ECC Diffie-Hellman

**private_key_identifier_length**

Direction: Input
Type: Integer

The length of the `private_key_identifier` in bytes. The maximum value is 900. If the `private_key_identifier` contains an internal ECC token this value must be a zero.

**private_key_identifier**

Direction: Input
Type: String

The `private_key_identifier` must contain an internal or an external token or a label of an internal or external ECC key. The ECC key token must contain a public-private key pair. Clear keys will be accepted.

**private_KEK_key_identifier_length**

Direction: Input
Type: Integer

The length of the `private_KEK_key_identifier` in bytes. Valid values are 0, or between 8 and 64. The `private_KEK_key_identifier_length` must be 0 when the PASSTHRU rule array keyword is specified.

**private_KEK_key_identifier**

Direction: Input
Type: String

The `private_KEK_key_identifier` must contain a KEK key token, the label of a KEK key token, or a null token. The KEK key token must be present if the `private_key_identifier` contains an external ECC token.

**public_key_identifier_length**

Direction: Input
Type: Integer

The length of the `public_key_identifier`.

**public_key_identifier**

Direction: Input
Type: String

The `public_key_identifier` parameter must contain an ECC public token or the label of an ECC Public token. The `public_key_identifier` specifies the other party's ECC public key which is enabled for key management functions. If the `public_key_identifier` identifies a token containing a public-private key pair, no attempt to decrypt the private part will be made.

**chaining_vector_length**

Direction: Input/Output
Type: Integer

The `chaining_vector_length` parameter must be zero.

**chaining_vector**

Direction: Input/Output
Type: String

The `chaining_vector` parameter is ignored.

**party_identifier_length**

Direction: Input/Output
Type: Integer

The length of the `party_identifier` parameter. Valid values are 0, or between 8 and 64. The `party_identifier_length` must be 0 when the PASSTHRU rule array keyword is specified.

**party_identifier**

Direction: Input/Output
Type: String

The `party_identifier` parameter contains the entity identifier information. This information should contain the both entities data according to NIST SP800-56A Section 5.8 when the DERIV01 rule array keyword is specified.
ECC Diffie-Hellman

**key_bit_length**
Direction: Input/Output  Type: Integer

The key bit length parameter contains the number of bits of key material to
derive and place in the provided key token. The value must be 0 if the
PASSTHRU rule array keyword was specified. Otherwise it must be 64 - 2048.

**reserved_length**
Direction: Input/Output  Type: Integer

The `reserved_length` parameter must be zero.

**reserved**
Direction: Input/Output  Type: String

This parameter is ignored.

**reserved2_length**
Direction: Input/Output  Type: Integer

The `reserved2_length` parameter must be zero.

**reserved2**
Direction: Input/Output  Type: String

This parameter is ignored.

**reserved3_length**
Direction: Input/Output  Type: Integer

The `reserved3_length` parameter must be zero.

**reserved3**
Direction: Input/Output  Type: String

This parameter is ignored.

**reserved4_length**
Direction: Input/Output  Type: Integer

The `reserved4_length` parameter must be zero.

**reserved4**
Direction: Input/Output  Type: String

This parameter is ignored.

**reserved5_length**
Direction: Input/Output  Type: Integer

The `reserved5_length` parameter must be zero.

**reserved5**
Direction: Input/Output  Type: String

This parameter is ignored.
**ECC Diffie-Hellman**

**output KEK_key_identifier_length**

*Direction: Input*  
*Type: Integer*

The length of the `output KEK_key_identifier`. The maximum value is 900. The `output KEK_key_identifier_length` must be zero if `output_key_identifier` will contain an internal token or if the PASSTHRU rule array keyword was specified.

**output KEK_key_identifier**

*Direction: Input*  
*Type: String*

The `output KEK_key_identifier` contains a KEK key token or the label of a KEK key if the `output_key_identifier` will contain an external ECC token. Otherwise this field is ignored.

If the output KEK key identifier identifies a DES KEK, then it must be an IMPORTER or an EXPORTER key type, and have the export bit set. The XLATE bit is not checked. If the output KEK key identifier identifies an AES KEK, then it must be either an IMPORTER or an EXPORTER key type and have the export/import bit set in key usage field 1 and the derivation bit set in key usage field 4.

**output_key_identifier_length**

*Direction: Input/Output*  
*Type: Integer*

The length of the `output_key_identifier`. The service checks the field to ensure it is at least equal to the size of the token to return. On return from this service, this field is updated with the exact length of the key token created. The maximum allowed value is 900 bytes.

**output_key_identifier**

*Direction: Output*  
*Type: String*

On input, the `output_key_identifier` must contain a skeleton token or a null token.

On output, the `output_key_identifier` will contain:

- An internal or an external key token containing the generated symmetric key material.
- “Z” data (in the clear) if the PASSTHRU rule array keyword was specified.

If this variable specifies an external DES key token then the output KEK key identifier must identify a DES KEK key token. If this specifies an external key token other than a DES key token then the output KEK key identifier must identify an AES KEK key token.

**Restrictions**

The NIST security strength requirements will be enforced, with respect to ECC Curve type (input) and derived key length.

Only the following key types will be generated, skeleton key tokens of any other type will fail.

- DES: (Legacy DES token)
  - CIPHER
  - DECIPHER
  - ENCIPHER
ECC Diffie-Hellman

- IMPORTER
- EXPORTER
- IMP-PKA
- AES
  - DATA (Legacy AES token)
  - CIPHER (Variable-length symmetric key-token)
  - KEK (Variable-length symmetric key-token)
  - IMPORTER (Variable-length symmetric key-token)
  - EXPORTER (Variable-length symmetric key-token)

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The ECC Diffie-Hellman callable service requires the ECC Diffie-Hellman Callable Service access control point to be enabled in the active role.

Specifying the PASSTHRU rule array keyword requires that the ECC Diffie-Hellman – Allow PASSTHRU access control point be enabled in the active role.

If the output_key_identifier parameter references a DES key token and the wrapping method specified in not the default method, then the ECC Diffie-Hellman – Allow key wrap override access control point must be enabled in the active role.

This table lists the valid key bit lengths and the minimum curve size required for each of the supported output key types.

<table>
<thead>
<tr>
<th>Output Key ID type</th>

Key Export (CSNBKEX and CSNEKEX)

Use the key export callable service to reencipher any type of key (except an AKEK or an IMP-PKA) from encryption under a master key variant to encryption under the same variant of an exporter key-encrypting key. The reenciphered key can be exported to another system.

If the key to be exported is a DATA key, the key export service generates a key token with the same key length as the input token's key.

This service supports the no-export bit that the prohibit export service sets in the internal token.

The callable service name for AMODE(64) invocation is CSNEKEX.
Key Export

Format

CALL CSNBKEX(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_type,
    source_key_identifier,
    exporter_key_identifier,
    target_key_identifier )

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

key_type
Direction: Input Type: Character string

The parameter is an 8-byte field that contains either a key type value or the keyword TOKEN. The keyword is left-justified and padded on the right with blanks.

If the key type is TOKEN, ICSF determines the key type from the control vector (CV) field in the internal key token provided in the source_key_identifier parameter. If the control vector is invalid on the Cryptographic Coprocessor Feature, the key export request will be routed to the PCI Cryptographic Coprocessor.
Key Export

Key type values for the Key Export callable service are: CIPHER, DATA, DATAC, DATAM, DATAMV, DATA XLAT, DECIPHER, ENCIPHER, EXPORTER, IKEYXLAT, IMPORTER, IPINENC, MAC, MACD, MACVER, OKEYXLAT, OPINENC, PINGEN and PINVER. For information on the meaning of the key types, see Table 3 on page 23.

**source_key_identifier**

Direction: Input  Type: String

A 64-byte string of the internal key token that contains the key to be reenciphered. This parameter must identify an internal key token in application storage, or a label of an existing key in the cryptographic key data set.

If you supply TOKEN for the key_type parameter, ICSF looks at the control vector in the internal key token and determines the key type from this information. If you supply TOKEN for the key_type parameter and supply a label for this parameter, the label must be unique in the cryptographic key data set.

**exporter_key_identifier**

Direction: Input/Output  Type: String

A 64-byte string of the internal key token or key label that contains the exporter key-encrypting key. This parameter must identify an internal key token in application storage, or a label of an existing key in the cryptographic key data set.

If the NOCV bit is on in the internal key token containing the key-encrypting key, the key-encrypting key itself (not the key-encrypting key variant) is used to encipher the generated key. For example, the key has been installed in the cryptographic key data set through the key generator utility program or the key entry hardware using the NOCV parameter; or you are passing the key-encrypting key in the internal key token with the NOCV bit on and your program is running in supervisor state or in key 0-7.

Control vectors are explained in "Control Vector for DES Keys" on page 19 and the NOCV bit is shown in Table 335 on page 778.

**target_key_identifier**

Direction: Output  Type: String

The 64-byte field external key token that contains the reenciphered key. The reenciphered key can be exchanged with another cryptographic system.

ICSF supports two methods of wrapping the key value in a symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method which is ANSI X9.24 compliant. The output target_key_identifier will be wrapped in the same manner as the source_key_identifier.

**Restrictions**

For existing TKE V3.1 (or higher) users, you may have to explicitly enable new access control points. Current applications will fail if they use an equal key halves exporter to export a key with unequal key halves. You must have access control point 'Key Export - Unrestricted' explicitly enabled.
This service cannot be used to export AKEKs. Refer to "ANSI X9.17 Key Export (CSNAKEX and CSNGKEX)" on page 635 for information on exporting AKEKs.

This callable service does not support version X'10' external DES key tokens (RKX key tokens).

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

For key export, you can use these combinations of parameters:

- A valid key type in the `key_type` parameter and an internal key token in the `source_key_identifier` parameter. The key type must be equivalent to the control vector specified in the internal key token.
- A `key_type` parameter of TOKEN and an internal key token in the `source_key_identifier` parameter. The `source_key_identifier` can be a label with TOKEN only if the labelname is unique on the CKDS. The key type is extracted from the control vector contained in the internal key token.
- A valid key type in the `key_type` parameter, and a label in the `source_key_identifier` parameter.

If internal key tokens are supplied in the `source_key_identifier` or `exporter_key_identifier` parameters, the key in one or both tokens can be reenciphered. This occurs if the master key was changed since the internal key token was last used. The return and reason codes that indicate this do not indicate which key was reenciphered. Therefore, assume both keys have been reenciphered.

**Systems with the Cryptographic Coprocessor Feature.**

ICSF examines the data encryption algorithm bits on the exporter key-encrypting key and the key being exported for consistency. It does not export a CDMF key under a DES-marked key-encrypting key or a DES key under a CDMF-marked key-encrypting key. ICSF does not propagate the data encryption marking on the operational key to the external token.

If the key type is MACD, the control vectors of the input keys must be the standard control vectors supported by the Cryptographic Coprocessor Feature, since the key export service will be processed on the Cryptographic Coprocessor Feature in this case.

To use NOCV key-encrypting keys or to export double-length DATAM and DATAMV keys, the NOCV-enablement keys must be installed in the CKDS. NOCV-enablement keys are only needed with the Cryptographic Coprocessor Feature.

For a double-length MAC key with a key type of DATAM, the service uses the data compatibility control vector to create an external token. For a double-length MAC key with a key type of MACD, the service uses the single-length control vector for both the left and right half of the key to create an external token (MAC||MAC). For a table of control vectors, refer to Control Vector Table.

Key Export operations which specify a NOCV key-encrypting key as the exporter key and also specify a source or key-encrypting key which contains a control vector not supported by the Cryptographic Coprocessor Feature will fail.
Key Export

To export a double-length MAC generation or MAC verification key, it is recommended that a key type of TOKEN be used.

**Systems with a PCI X Cryptographic Coprocessor, Crypto Express2 Coprocessor, or Crypto Express3 Coprocessor**

If running with a PCIXCC, CEX2C, or CEX3C, existing internal tokens created with key type MACD must be exported with either a TOKEN or DATAM key type. The external CV will be DATAM CV. The MACD key type is not supported.

To export a double-length MAC generation or MAC verification key, it is recommended that a key type of TOKEN be used.

The following table shows the access control points in the ICSF role that control the function of this service.

*Table 25. Required access control points for Key Export*

<table>
<thead>
<tr>
<th>Access Control Point</th>
<th>Restrictions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key Export - Unrestricted</td>
<td>None</td>
</tr>
<tr>
<td>Key Export</td>
<td>Key-encrypting key may not have equal key halves</td>
</tr>
</tbody>
</table>

To use a NOCV key-encrypting key with the key export service, the NOCV KEK usage for export-related functions access control point must be enabled in addition to one or both of the access control points listed.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

</tr>
</tbody>
</table>

Key Generate (CSNBKGN and CSNEKGN)

Use the key generate callable service to generate either one or two odd parity DES keys of any type. The keys can be single-length (8 bytes), double-length (16 bytes), or, in the case of DATA keys, triple-length (24 bytes). The callable service does not produce keys in clear form and all keys are returned in encrypted form. When two keys are generated, each key has the same clear value, although this clear value is not exposed outside the secure cryptographic feature.

Use the key generate callable service to generate an AES key of DATA type. The callable service does not produce AES keys in clear form and all AES keys are returned in encrypted form. Only one AES key is generated. Its clear value is not exposed outside the secure cryptographic feature.

The callable service name for AMODE (64) invocation is CSNEKGN.

Format

```
CALL CSNBKGN(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_form,
    key_length,
    key_type_1,
    key_type_2,
    KEK_key_identifier_1,
    KEK_key_identifier_2,
    generated_key_identifier_1,
    generated_key_identifier_2
)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A: ICSF and TSS Return and Reason Codes](#) lists the return codes.

**reason_code**
Key Generate

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to
the application program. Each return code has different reason codes that
indicate specific processing problems. Appendix A, "ICSF and TSS Return and
Reason Codes" lists the reason codes.

exit_data_length

Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be
from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the
exit_data parameter.

exit_data

Direction: Input/Output  Type: String

The data that is passed to the installation exit.

key_form

Direction: Input  Type: Character string

A 4-byte keyword that defines the type of key(s) you want to generate. This
parameter also specifies if each key should be returned for either operational,
importable, or exportable use. The keyword must be in a 4-byte field,
left-justified, and padded with blanks.

The first two characters refer to key_type_1. The next two characters refer to
key_type_2.

These keywords are allowed: OP, IM, EX, OPIM, OPEX, IMEX, EXEX, OPOP,
and IMIM. See Table 27 for their meanings.

If the key_form is OP, EX or IM, the KEK_key_identifier_2,
generated_key_identifier_1 and generated_key_identifier_2 should be set to
NULL.

Table 27. Key Form Values for the Key Generate Callable Service

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>EX</td>
<td>One key that can be sent to another system.</td>
</tr>
<tr>
<td>EXEX</td>
<td>A key pair; both keys to be sent elsewhere, possibly for exporting to two different systems. The key pair has the same clear value.</td>
</tr>
<tr>
<td>IM</td>
<td>One key that can be locally imported. The key can be imported onto this system to make it operational at another time.</td>
</tr>
<tr>
<td>IMEX</td>
<td>A key pair to be imported; one key to be imported locally and one key to be sent elsewhere. Both keys have the same clear value.</td>
</tr>
<tr>
<td>IMIM</td>
<td>A key pair to be imported; both keys to be imported locally at another time.</td>
</tr>
<tr>
<td>OP</td>
<td>One operational key. The key is returned to the caller in the key token format. Specify the OP key form when generating AKEKs and AES keys.</td>
</tr>
</tbody>
</table>
Key Generate

Table 27. Key Form Values for the Key Generate Callable Service (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPEX</td>
<td>A key pair; one key that is operational and one key to be sent from this system. Both keys have the same clear value.</td>
</tr>
<tr>
<td>OPIM</td>
<td>A key pair; one key that is operational and one key to be imported to the local system. Both keys have the same clear value. On the other system, the external key token can be imported to make it operational.</td>
</tr>
<tr>
<td>OPOP</td>
<td>A key pair; normally with different control vector values.</td>
</tr>
</tbody>
</table>

The key forms are defined as follows:

**Operational (OP)**

The key value is enciphered under a master key. The result is placed into an internal key token. The key is then operational at the local system. For AKEKs, the result is placed in a skeleton token created by the key token build callable service. AES AKEKs are not supported.

**Importable (IM)**

The key value is enciphered under an importer key-encrypting key. The result is placed into an external key token.

**Exportable (EX)**

The key value is enciphered under an exporter key-encrypting key. The result is placed into an external key token. The key can then be transported or exported to another system and imported there for use. This key form cannot be used by any ICSF callable service.

The keys are placed into tokens that the generated_key_identifier_1 and generated_key_identifier_2 parameters identify.

Valid key type combinations depend on the key form. See Table 34 for valid key combinations.

**key_length**

Direction: Input Type: Character string

An 8-byte value that defines the length of the key. The keyword must be left-justified and padded on the right with blanks. You must supply one of the key length values in the key_length parameter.

Table 28. Key Length Values for the Key Generate Callable Service

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
<th>Algorithm</th>
</tr>
</thead>
<tbody>
<tr>
<td>SINGLE, SINGLE-R or KEYLN8</td>
<td>The key should be a single length (8-byte or 64-bit) key.</td>
<td>DES</td>
</tr>
<tr>
<td>DOUBLE or KEYLN16</td>
<td>The key should be a double length (16-byte or 128-bit) key</td>
<td>AES or DES</td>
</tr>
<tr>
<td>KEYLN24</td>
<td>The key should be a 24-byte (192-bit) key.</td>
<td>AES or DES</td>
</tr>
<tr>
<td>KEYLN32</td>
<td>The key should be a 32-byte (256-bit) key.</td>
<td>AES</td>
</tr>
</tbody>
</table>

**DES Keys**: Double-length (16-byte) keys have an 8-byte left half and an 8-byte right half. Both halves can have identical clear values or not. If you want the
Key Generate

same value to be used in both key halves (refered to as replicated key values), specify key_length as SINGLE, SINGLE-R or KEYLN8. If you want different values to be the basis of each key half, specify key_length as DOUBLE or KEYLN16.

Triple-length (24-byte) keys have three 8-byte key parts. This key length is valid for DATA keys only. To generate a triple-length DATA key with three different values to be the basis of each key part, specify key_length as KEYLN24.

Use SINGLE/SINGLE-R if you want to create a DES transport key that you would use to exchange DATA keys with a PCF system. Because PCF does not use double-length transport keys, specify SINGLE so that the effects of multiple encipherment are nullified. When generating an AKEK, the key_length parameter is ignored. The AKEK key length (8-byte or 16-byte) is determined by the skeleton token created by the key token build callable service and provided in the generated_key_identifier_1 parameter.

Note: SINGLE-R is not supported on IBM @server zSeries 900 servers.

AES Keys: AES only allows KEYLN16, KEYLN24, KEYLN32. To generate a 128-bit AES key, specify key_length as KEYLN16. For 192-bit AES keys specify key_length as KEYLN24. A 256-bit AES key requires a key_length of KEYLN32. All AES keys are DATA keys.

Systems with CCFs (with or without PCICCs): This table shows the valid key lengths for each key type supported by DES keys. An X indicates that a key length is permitted for a key type. A Y indicates that the key generated will be a double-length key with replicated key values.

Note: When generating a double-length key with replicated key values and the key_form parameter as IMEX, the KEK_key_identifier_1 parameter must contain a NOCV IMPORTER key-encrypting key either as a key label or an internal key token. Also the CKDS must contain NOCV enablement keys.

Table 29. Key lengths for DES keys - CCF systems

<td>AESTOKEN</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>AESDATA</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

**key_type_1**

**Direction:** Input  **Type:** Character string

Use the `key_type_1` parameter for the first, or only key, that you want generated. The keyword must be left-justified and padded with blanks. Valid type combinations depend on the key form.

The 8-byte keyword for the `key_type_1` parameter can be one of the following:
- AESDATA, AESTOKEN, CIPHER, DATA, DATAC, DATAM, DATAMV, DATAXLAT, DECIPHER, ENCIPHER, EXPORTER, IKEYXLAT, IMPORTER, IPINENC, MAC, MACVER, OKEYXLAT, OPINENC, PINGEN and PINVER
- or the keyword TOKEN

For information on the meaning of the key types, see *Table 3 on page 23*. If `key_type_1` is TOKEN, ICSF examines the control vector (CV) field in the `generated_key_identifier_1` parameter to derive the key type. When `key_type_1` is TOKEN, ICSF does not check for the length of the key for DATA keys. Instead, ICSF uses the `key_length` parameter to determine the length of the key.

To generate a DES AKEK, specify a `key_type_1` of TOKEN. The `generated_key_identifier_1` parameter must be a skeleton token of an AKEK created by the Key Token Build callable service. The token cannot be a partially notarized AKEK or an AKEK key part.

If `key_type_1` is AESDATA or AESTOKEN, the key generated will be an AES key of type DATA. When `key_type_1` is AESTOKEN, ICSF uses the `key_length` parameter to determine the length of the key.

See *Table 33* and *Table 34* for valid key type and key form combinations.

**key_type_2**

**Direction:** Input  **Type:** Character string

Use the `key_type_2` parameter for a key pair, which is shown in *Table 34 on page 144*. The keyword must be left-justified and padded with blanks. Valid type combinations depend on the key form. `key_type_2` is only used when DES keys are generated.

`key_type_2` is only use when DES keys are generated. The 8-byte keyword for the `key_type_2` parameter can be one of the following:
- CIPHER, DATA, DATAC, DATAM, DATAMV, DATAXLAT, DECIPHER, ENCIPHER, EXPORTER, IKEYXLAT, IMPORTER, IPINENC, MAC, MACVER, OKEYXLAT, OPINENC, PINGEN and PINVER
- or the keyword TOKEN

For information on the meaning of the key types, see *Description of Key Types, Table 3 on page 23*. If `key_type_2` is TOKEN, ICSF examines the control vector (CV) field in the `generated_key_identifier_2` parameter to derive the key type. When `key_type_2`
is TOKEN, ICSF does not check for the length of the key for DATA keys. Instead, ICSF uses the key_length parameter to determine the length of the key.

If only one key is to be generated, key_type_2 and KEK_key_identifier_2 are ignored.

See Table 33 on page 144 and Table 34 on page 144 for valid key type and key form combinations.

**KEK_key_identifier_1**

*Direction: Input/Output  Type: String*

A 64-byte string of a DES internal key token containing the importer or exporter key-encrypting key, or a key label. If you supply a key label that is less than 64-bytes, it must be left-justified and padded with blanks. KEK_key_identifier_1 is required for a key_form of IM, EX, IMEX, EXEX, or IMIM.

When key_form OP is used, parameters KEK_key_identifier_1 and KEK_key_identifier_2 are ignored. In this case, it is recommended that the parameters are initialized to 64-bytes of X'00'.

If the NOCV bit is on in the internal key token containing the key-encrypting key, the key-encrypting key itself (not the key-encrypting key variant) is used to encipher the generated key. For example, the key has been installed in the cryptographic key data set through the key generator utility program or the key entry hardware using the NOCV parameter; or you are passing the key-encrypting key in the internal key token with the NOCV bit on and your program is running in supervisor state or key 0-7.

Control vectors are explained in "Control Vector for DES Keys" on page 19 and the NOCV bit is shown in Table 335 on page 778.

KEK_key_identifier_1 cannot be an AES key token or label.

**KEK_key_identifier_2**

*Direction: Input/Output  Type: String*

A 64-byte string of a DES internal key token containing the importer or exporter key-encrypting key, or a key label of an internal token. If you supply a key label that is less than 64-bytes, it must be left-justified and padded with blanks. KEK_key_identifier_2 is required for a key_form of OPIM, OPEX, IMEX, IMIM, or EXEX. This field is ignored for key_form keywords OP, IM and EX. When key_form OP is used, parameter KEK_key_identifier_2 is ignored. In this case, it is recommended that the parameter is initialized to 64-bytes of X'00'.

If the NOCV bit is on in the internal key token containing the key-encrypting key, the key-encrypting key itself (not the key-encrypting key variant) is used to encipher the generated key. For example, the key has been installed in the cryptographic key data set through the key generator utility program or the key entry hardware using the NOCV parameter; or you are passing the key-encrypting key in the internal key token with the NOCV bit on and your program is running in supervisor state or in key 0-7.

Control vectors are explained in "Control Vector for DES Keys" on page 19 and the NOCV bit is shown in Table 335 on page 778.

KEK_key_identifier_2 cannot be an AES key token or label.

**generated_key_identifier_1**
Key Generate

This parameter specifies either a generated:

- Internal DES or AES key token for an operational key form, or
- External DES key tokens containing a key enciphered under the KEK_key_identifier_1 parameter.

If you specify a key_type_1 of TOKEN, then this field contains a valid DES token of the key type you want to generate. Otherwise, on input, this parameter must be binary zeros. See key_type_1 for a list of valid key types.

If you specify a key_type_1 of IMPORTER or EXPORTER and a key_form of OPEX, and if the generated_key_identifier_1 parameter contains a valid DES internal token of the SAME type, the NOCV bit, if on, is propagated to the generated key token.

When generating an AKEK, specify the skeleton key token created by the Key Token Build callable service as input for this parameter.

When key_type_1 parameter is AESDATA, then generated_key_identifier_1 is ignored. In this case, it is recommended that the parameter be initialized to 64-bytes of X'00'. If you specify a key_type_1 of AESTOKEN, the generated_key_identifier_1 parameter must be an internal AES key token or a clear AES key token. Information in this token can be used to determine the key type:

- The key_type_1 parameter overrides the type in the token.
- The key_length parameter overrides the length value in the generated key token.

ICSF supports two methods of wrapping the key value in a symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method which is ANSI X9.24 compliant. The output generated_key_identifier_1 will use the default wrapping method unless a skeleton token is supplied as input. If a skeleton token is supplied as input, the wrapping method in the skeleton token will be used.

generated_key_identifier_2

This parameter specifies a generated external key token containing a key enciphered under the KEK_key_identifier_2 parameter.

When key_type_1 parameter is AESDATA or AESTOKEN, then generated_key_identifier_2 is ignored. In this case, it is recommended that the parameters are initialized to 64-bytes of X'00'.

If you specify a key_type_2 of TOKEN, then this field contains a valid token of the key type you want to generate. Otherwise, on input, this parameter must be binary zeros. See key_type_1 for a list of valid key types.

The token can be an internal or external token.

ICSF supports two methods of wrapping the key value in a symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method which is ANSI X9.24 compliant. The output generated_key_identifier_2 will use the default wrapping method unless a skeleton token is supplied as input. If a skeleton token is supplied as input, the wrapping method in the skeleton token will be used.
Restrictions

This callable service does not support version X'10' external DES key tokens (RKX key tokens).

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

System Encryption Algorithm Marks (CCF systems only)

This applies to requests processed on a system with CCFs and only if the request is processed by the CCF. Processing on a PCICC does not cause tokens to be marked.

Internal DATA, IMPORTER and EXPORTER tokens are marked with the system encryption algorithm. No external tokens generated by this service are marked.

When the key form is OP, the token is marked with the system default algorithm. This marking can be overridden by specifying a valid token in the generated_key_identifier_1 parameter with the marking required.

When the key form is OPEX or OPIM, the operational token is marked with the markings of the key-encrypting key (KEK_key_identifier_2). This marking can be overridden by specifying a valid token in the generated_key_identifier_1 parameter with the marking required.

It is possible to generate an operational DES-marked DATA key on a CDMF-only system or a CDMF-marked DATA key on a DES-only system. However, the Encipher and Decipher callable services fail when you use these keys on the systems where they were generated unless overridden by keyword.

The following table shows the access control points in the ICSF role that control the function of this service.

<table>
<thead>
<tr>
<th>Usage</th>
<th>Access Control Point</th>
</tr>
</thead>
<tbody>
<tr>
<td>The key-form and key-type combinations shown with an 'X' in the Key_Form OP column in Table 33 on page 144</td>

<tbody>
<tr>
<td>The SINGLE-R key-length keyword is specified</td>
<td>Key Generate - SINGLE-R</td>
</tr>
</tbody>
</table>

To use a NOCV IMPORTER key-encrypting key with the key generate service, the **NOCV KEK usage for import-related functions** access control point must be enabled in addition to one or both of the access control points listed.

To use a NOCV EXPORTER key-encrypting key with the key generate service, the **NOCV KEK usage for export-related functions** access control point must be enabled in addition to one or both of the access control points listed.

**Key type and key form combinations**

Table 33 shows the valid key type and key form combinations for a single DES or AES key. Key types marked with an "*" must be requested through the specification of a proper control vector in a key token and through the use of the TOKEN keyword.

**Note:** Not all keytypes are valid on all hardware. See Table 3 on page 23.

</table>

If you are running with the Cryptographic Coprocessor Feature and the key_form is IMEX, the key_length is SINGLE, and key_type_1 is IPINENC, OPINENC, PINGEN, IMPORTER, or EXPORTER, you must specify the KEK_key_identifier_1 parameter as NOCV IMPORTER.

If you are running with the Cryptographic Coprocessor Feature and need to use NOCV key-encrypting keys, NOCV-enablement keys must be installed in the CKDS. If you running with the PCI X Cryptographic Coprocessor, Crypto Express2.
Key Generate

Coprocessor, or Crypto Express3 Coprocessor and need to use NOCV key-encrypting keys, you need to enable NOCV IMPORTER and NOCV EXPORTER access control points.

If you are running with the Cryptographic Coprocessor Feature and need to generate DATAM and DATAMV keys in the importable form, the ANSI system keys must be installed in the CKDS.

Table 35 lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Table 35. Key generate required hardware

<table>

Key Generate2 (CSNBKGN2 and CSNEKGN2)

Use the Key Generate2 callable service to generate either one or two keys of any type. This callable service does not produce keys in clear form and all keys are returned in encrypted form. When two keys are generated, each key has the same clear value, although this clear value is not exposed outside the secure cryptographic feature.

This service returns variable-length CCA key tokens and uses the AESKW wrapping method.

This service supports HMAC and AES keys. Operational keys will be encrypted under the AES master key.

The callable service name for AMODE(64) is CSNEKGN2.
Key Generate2

Format

```
CALL CSNBKG2(  
  return_code,  
  reason_code,  
  exit_data_length,  
  exit_data,  
  rule_array_count,  
  rule_array,  
  clear_key_bit_length,  
  key_type_1,  
  key_type_2,  
  key_name_1_length,  
  key_name_1,  
  key_name_2_length,  
  key_name_2,  
  user_associated_data_1_length,  
  user_associated_data_1,  
  user_associated_data_2_length,  
  user_associated_data_2,  
  key_encrypting_key_identifier_1_length,  
  key_encrypting_key_identifier_1,  
  key_encrypting_key_identifier_2_length,  
  key_encrypting_key_identifier_2,  
  generated_key_identifier_1_length,  
  generated_key_identifier_1,  
  generated_key_identifier_2_length,  
  generated_key_identifier_2)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X’00000000’ to X’7FFFFFFF’ (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.
Key Generate2

**rule_array_count**
Direction: Input  Type: Integer

The number of keywords you supplied in the *rule_array* parameter. The value must be 2.

**rule_array**
Direction: Input  Type: String

The *rule_array* contains keywords that provide control information to the callable service. The keywords must be in contiguous storage with each of the keywords left-justified in its own 8-byte location and padded on the right with blanks.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Token algorithm (required)</strong></td>
<td></td>
</tr>
<tr>
<td>HMAC</td>
<td>Specifies to generate an HMAC key token.</td>

<tr>
<td>AES</td>
<td>Specifies to generate an AES key token.</td>
</tr>
<tr>
<td><strong>Key Form (required)</strong></td>
<td></td>
</tr>
<tr>
<td>The first two characters refer to <em>key_type_1</em>. The next two characters refer to <em>key_type_2</em>. See the Usage Notes section for further details.</td>
<td></td>
</tr>
<tr>
<td>EX</td>
<td>One key that can be sent to another system.</td>
</tr>
<tr>
<td>EXEX</td>
<td>A key pair; both keys to be sent elsewhere, possibly for exporting to two different systems. Both keys have the same clear value.</td>
</tr>
<tr>
<td>IM</td>
<td>One key that can be locally imported. The key can be imported onto this system to make it operational at another time.</td>
</tr>
<tr>
<td>IMEX</td>
<td>A key pair to be imported; one key to be imported locally and one key to be sent elsewhere. Both keys have the same clear value.</td>
</tr>
<tr>
<td>IMIM</td>
<td>A key pair to be imported; both keys to be imported locally at another time. Both keys have the same clear value.</td>
</tr>
<tr>
<td>OP</td>
<td>One operational key. The key is returned to the caller in operational form to be used locally.</td>
</tr>
<tr>
<td>OPEX</td>
<td>A key pair; one key that is operational and one key to be sent elsewhere. Both keys have the same clear value.</td>
</tr>
<tr>
<td>OPIM</td>
<td>A key pair; one key that is operational and one key to be imported locally at another time. Both keys have the same clear value.</td>
</tr>
<tr>
<td>OPOP</td>
<td>A key pair; either with the same key type with different associated data or complementary key types. Both keys have the same clear value.</td>
</tr>
</tbody>
</table>

**clear_key_bit_length**
Direction: Input  Type: Integer

The size (in bits) of the key to be generated.
- For the HMAC algorithm, this is a value between 80 and 2048, inclusive.
**Key Generate2**

- For the AES algorithm, this is a value of 128, 192, or 256.

When `key_type_1` or `key_type_2` is TOKEN, this value overrides the key length contained in `generated_key_identifier_1` or `generated_key_identifier_2`, respectively.

**key_type_1**

**Direction:** Input  
**Type:** String

Use the `key_type_1` parameter for the first, or only, key that you want generated. The keyword must be left-justified and padded with blanks. Valid type combinations depend on the key form, and are documented in Table 39 on page 154 and Table 40 on page 154.

The 8-byte keyword for the `key_type_1` parameter can be one of the following:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Algorithm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cipher</td>
<td>AES</td>
</tr>
<tr>
<td>Exporter</td>
<td>AES</td>
</tr>
<tr>
<td>Importer</td>
<td>AES</td>
</tr>
<tr>
<td>MAC</td>
<td>HMAC</td>
</tr>
<tr>
<td>MACVER</td>
<td>HMAC</td>
</tr>
</tbody>
</table>

Specify the keyword TOKEN when supplying a key token in the `generated_key_identifier_1` parameter.

If `key_type_1` is TOKEN, the associated data in the `generated_key_identifier_1` parameter is examined to derive the key type.

**key_type_2**

**Direction:** Input  
**Type:** String

Use the `key_type_2` parameter for a key pair, which is shown in Table 40 on page 154. The keyword must be left-justified and padded with blanks. Valid type combinations depend on the key form.

The 8-byte keyword for the `key_type_2` parameter can be one of the following:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Algorithm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cipher</td>
<td>AES</td>
</tr>
<tr>
<td>Exporter</td>
<td>AES</td>
</tr>
<tr>
<td>Importer</td>
<td>AES</td>
</tr>
<tr>
<td>MAC</td>
<td>HMAC</td>
</tr>
<tr>
<td>MACVER</td>
<td>HMAC</td>
</tr>
</tbody>
</table>

Specify the keyword TOKEN when supplying a key token in the `generated_key_identifier_2` parameter.

If `key_type_2` is TOKEN, the associated data in the `generated_key_identifier_2` parameter is examined to derive the key type.

When only one key is being generated, this parameter is ignored.
**Key Generate2**

**key_name_1_length**

Direction: Input  Type: Integer

The length of the *key_name* parameter for *generated_key_identifier_1*. Valid values are 0 and 64 bytes.

**key_name_1**

Direction: Input  Type: String

A 64-byte key store label to be stored in the associated data structure of *generated_key_identifier_1*.

When only one key is being generated, this parameter is ignored.

**key_name_2_length**

Direction: Input  Type: Integer

The length of the *key_name* parameter for *generated_key_identifier_2*. Valid values are 0 and 64 bytes.

When only one key is being generated, this parameter is ignored.

**key_name_2**

Direction: Input  Type: String

A 64-byte key store label to be stored in the associated data structure of *generated_key_identifier_2*.

When only one key is being generated, this parameter is ignored.

**user_associated_data_1_length**

Direction: Input  Type: Integer

The length of the user-associated data parameter for *generated_key_identifier_1*. The valid values are 0 to 255 bytes.

**user_associated_data_1**

Direction: Input  Type: String

User-associated data to be stored in the associated data structure for *generated_key_identifier_1*.

**user_associated_data_2_length**

Direction: Input  Type: Integer

The length of the user-associated data parameter for *generated_key_identifier_2*. The valid values are 0 to 255 bytes.

When only one key is being generated, this parameter is ignored.

**user_associated_data_2**

Direction: Input  Type: String
Key Generate2

User associated data to be stored in the associated data structure for
\textit{generated_key_identifier}_2.

When only one key is being generated, this parameter is ignored.

\textbf{key_encrypting_key_identifier}_1\_length

Direction: Input \hspace{1cm} Type: Integer

The length of the buffer for \textit{key_encrypting_key_identifier}_1 in bytes. When the
Key Form rule is OP, OPOP, OPIM, or OPEX, this length must be zero. When
the Key Form rule is EX, EXEX, IM, IMEX, or IMIM, the value must be between
the actual length of the token and 725 bytes when
\textit{key_encrypting_key_identifier}_1 is a token.

The value must be 64 bytes when \textit{key_encrypting_key_identifier}_1 is a label.

\textbf{key_encrypting_key_identifier}_1

Direction: Input/Output \hspace{1cm} Type: String

When \textit{key_encrypting_key_identifier}_1\_length is zero, this parameter is ignored.
Otherwise, \textit{key_encrypting_key_identifier}_1 contains an internal key token
containing the AES importer or exporter key-encrypting key, or a key label.

If the token supplied was encrypted under the old master key, the token will be
returned encrypted under the current master key.

\textbf{key_encrypting_key_identifier}_2\_length

Direction: Input \hspace{1cm} Type: Integer

The length of the buffer for \textit{key_encrypting_key_identifier}_2 in bytes. When the
Key Form rule is OPOP, this length must be zero. When the Key Form rule is
EXEX, IMEX, IMIM, OPIM, or OPEX, the value must be between the actual
length of the token and 725 when \textit{key_encrypting_key_identifier}_2 is a token.

The value must be 64 when \textit{key_encrypting_key_identifier}_2 is a label.

When only one key is being generated, this parameter is ignored.

\textbf{key_encrypting_key_identifier}_2

Direction: Input/Output \hspace{1cm} Type: String

When \textit{key_encrypting_key_identifier}_2\_length is zero, this parameter is ignored.
Otherwise, \textit{key_encrypting_key_identifier}_2 contains an internal key token
containing the AES importer or exporter key-encrypting key, or a key label.

If the token supplied was encrypted under the old master key, the token will be
returned encrypted under the current master key.

When only one key is being generated, this parameter is ignored.

\textbf{generated_key_identifier}_1\_length

Direction: Input/Output \hspace{1cm} Type: Integer

On input, the length of the buffer for the \textit{generated_key_identifier}_1 parameter
in bytes. The maximum value is 900 bytes.

On output, the parameter will hold the actual length of the
\textit{generated_key_identifier}_1.
Key Generate2

generated_key_identifier_1
Direction: Input/Output  Type: String

The buffer for the first generated key token.

On input, if you specify a key_type_1 of TOKEN, then the buffer contains a valid key token of the key type you want to generate. The key token must be left justified in the buffer. See key_type_1 for a list of valid key types.

On output, the buffer contains the generated key token.

generated_key_identifier_2_length
Direction: Input/Output  Type: Integer

On input, the length of the buffer for the generated_key_identifier_2 in bytes.
The maximum value is 900 bytes.
On output, the parameter will hold the actual length of the generated_key_identifier_2.
When only one key is being generated, this parameter is ignored.

generated_key_identifier_2
Direction: Input/Output  Type: String

The buffer for the second generated key token.

On input, if you specify a key_type_2 of TOKEN, then the buffer contains a valid key token of the key type you want to generate. The key token must be left justified in the buffer. See key_type_2 for a list of valid key types.

On output, the buffer contains the generated key token.
When only one key is being generated, this parameter is ignored.

Usage Notes

The key forms are defined as follows:

Operational (OP)
The key value is enciphered under a master key. The result is placed into an internal key token. The key is then operational at the local system.

Importable (IM)
The key value is enciphered under an importer key-encrypting key. The result is placed into an external key token. The corresponding key_encrypting_key_identifier_x parameter must contain an AES IMPORTER key token or label.

Exportable (EX)
The key value is enciphered under an exporter key-encrypting key. The result is placed into an external key token. The corresponding key_encrypting_key_identifier_x parameter must contain an AES EXPORTER key token or label.

These tables list the valid key type and key form combinations.

If an AES KEK is used, the strength of the KEK expected by Key Generate2 depends on the attributes of the key being generated. The resulting return code and reason code when using a KEK that is weaker depends on the “Variable-length Symmetric Token - disallow weak wrap” and “Variable-length Symmetric Token - warn when weak wrap” access control points:

- If the “disallow” access control point is disabled (the default), the key strength requirement will not be enforced. Using a weaker key will result in return code 0 with a non-zero reason code if the “warn” access control point is enabled. Otherwise, a reason code of zero will be returned.
- If the “disallow” access control point is enabled (using TKE), the key strength requirement will be enforced, and attempting to use a weaker key will result in return code 8.

For AES keys, the AES KEK must be at least as strong as the key being generated to be considered sufficient strength.

For HMAC keys, the AES KEK must be sufficient strength as described in the following table.

Table 41. AES KEK strength required for generating an HMAC key under an AES KEK

<table>
<thead>
<tr>
<th>Key-usage field 2 in the HMAC key contains</th>

**Key Import (CSNBKIM and CSNEKIM)**

Use the key import callable service to reencipher a key (except an AKEK) from encryption under an importer key-encrypting key to encryption under the master key. The reenciphered key is in operational form.

Choose one of these options:

- Specify the `key_type` parameter as `TOKEN` and specify the external key token in the `source_key_identifier` parameter. The key type information is determined from the control vector in the external key token.
- Specify a key type in the `key_type` parameter and specify an external key token in the `source_key_identifier` parameter. The specified key type must be compatible with the control vector in the external key token.
Key Import

- Specify a valid key type in the key_type parameter and a null key token in the source_key_identifier parameter. The default control vector for the key_type specified will be used to process the key.

For DATA keys, this service generates a key of the same length as that contained in the input token.

The callable service name for AMODE(64) invocation is CSNEKIM.

Format

```
CALL CSNBKIM(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_type,
    source_key_identifier,
    importer_key_identifier,
    target_key_identifier )
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**key_type**

Direction: Input  
Type: Character string
Key Import

The type of key you want to reencipher under the master key. Specify an 8-byte keyword or the keyword TOKEN. The keyword must be left-justified and padded on the right with blanks.

If the key type is TOKEN, ICSF determines the key type from the control vector (CV) field in the external key token provided in the source_key_identifier parameter.

TOKEN is never allowed when the importer_key_identifier is NOCV.

Supported key_type values are CIPHER, DATA, DATAM, DATAMV, DATAXLAT, DECIPHER, ENCIPHER, EXPORTER, IKEYXLAT, IMPORTER, IPINENC, MAC, MACVER, OKEXLAT, OPINENC, PINGEN and PINVER. Use key_type TOKEN for all other key types.

For information on the meaning of the key types, see Table 3 on page 23.

We recommend using key type of TOKEN when importing double-length MAC and MACVER keys.

source_key_identifier

Direction: Input Type: String

The key you want to reencipher under the master key. The parameter is a 64-byte field for the enciphered key to be imported containing either an external key token or a null key token. If you specify a null token, the token is all binary zeros, except for a key in bytes 16-23 or 16-31, or in bytes 16-31 and 48-55 for triple-length DATA keys. Refer to Table 338 on page 782.

If key type is TOKEN, this field may not specify a null token.

This service supports the no-export function in the CV.

importer_key_identifier

Direction: Input/Output Type: String

The importer key-encrypting key that the key is currently encrypted under. The parameter is a 64-byte area containing either the key label of the key in the cryptographic key data set or the internal key token for the key. If you supply a key label that is less than 64-bytes, it must be left-justified and padded with blanks.

Note: If you specify a NOCV importer in the importer_key_identifier parameter, the key to be imported must be enciphered under the importer key itself.

target_key_identifier

Direction: Input/Output Type: String

This parameter is the generated reenciphered key. The parameter is a 64-byte area that receives the internal key token for the imported key.

If the imported key TYPE is IMPORTER or EXPORTER and the token key TYPE is the same, the target_key_identifier parameter changes direction to both input and output. If the application passes a valid internal key token for an IMPORTER or EXPORTER key in this parameter, the NOCV bit is propagated to the imported key token.
Key Import

**Note:** Propagation of the NOCV bit is performed only if the service is processed on a Cryptographic Coprocessor Feature or on a PCIXCC, CEX2C, or CEX3C.

ICSF supports two methods of wrapping the key value in a symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method which is ANSI X9.24 compliant. The output target_key_identifier will use the default wrapping method unless a skeleton token is supplied as input. If a skeleton token is supplied as input, the wrapping method in the skeleton token will be used.

Restrictions

For existing TKE V3.1 (or higher) users, you may have to explicitly enable new access control points. Current applications will fail if they use an equal key halves importer to import a key with unequal key halves. You must have access control point 'Key Import - Unrestricted' explicitly enabled.

This callable service does not support version X’10’ external DES key tokens (RKX key tokens).

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

Use of NOCV keys are controlled by an access control point in the PCIXCC. Creation of NOCV key-encrypting keys is only available for standard IMPORTERs and EXPORTERs.

**Systems with the Cryptographic Coprocessor Feature**

The key import callable service cannot be used to import ANSI key-encrypting keys. For information on importing these types of keys, refer to [ANSI X9.17 Key Import](#) on page 640. To use NOCV key-encrypting keys or to import DATAM or DATAMV keys, NOCV-enablement keys must be installed in the CKDS.

This service will mark an imported KEK as a NOCV-KEK by supplying a valid IMPORTER or EXPORTER token in the target_key_identifier field with the NOCV-KEK flag enabled. The type of the token must match the key type of the imported key.

This service will mark DATA and key-encrypting key tokens with the system encryption algorithm if the request is processed on the CCF. The service propagates the data encryption algorithm mark on the operational KEK unless token copying overrides this:

- The imported token is marked with the DES or CDMF encryption algorithm marks of the KEK token
- The imported token is marked with the system's default encryption algorithm when the KEK is marked SYS-ENC
- To override the encryption algorithm marks of the KEK, supply a valid token in the target_key_identifier field of the same key type being imported. The mark of the target_key_identifier token are used to mark the imported key token.
Key Import

Key Import operations which specify a NOCV key-encrypting key as either the importer key or the target and also specify a source or key-encrypting key which contains a control vector not supported by the Cryptographic Coprocessor Feature will fail.

**Systems with the PCI X Cryptographic Coprocessor, Crypto Express2 Coprocessor, or Crypto Express3 Coprocessor**

Use of NOCV keys are controlled by an access control point in the PCIXCC, CEX2C, or CEX3C.

This service will mark an imported KEK as a NOCV-KEK:

- If a token is supplied in the target token field, it must be a valid importer or exporter token. If the token fails token validation, processing continues, but the NOCV flag will not be copied.
- The source token (key to be imported) must be a importer or exporter with the default control vector.
- If the target token is valid and the NOCV flag is on and the source token is valid and the control vector of the target token is exactly the same as the source token, the imported token will have the NOCV flag set on.
- If the target token is valid and the NOCV flag is on and the source token is valid and the control vector of the target token is NOT exactly the same as the source token, a return code will be given.
- All other scenarios will complete successfully, but the NOCV flag will not be copied.

The software bit used to mark the imported token with export prohibited is not supported on a PCIXCC, CEX2C, or CEX3C. The internal token for an export prohibited key will have the appropriate control vector that prohibits export.

The following table shows the access control points in the ICSF role that control the function of this service.

<table>
<thead>
<tr>
<th>Access Control Point</th>
<th>Restrictions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key Import - Unrestricted</td>
<td>None</td>
</tr>
<tr>
<td>Key Import</td>
<td>Key-encrypting key may not have equal key halves</td>
</tr>
</tbody>
</table>

To use a NOCV key-encrypting key with the key import service, the NOCV KEK usage for import-related functions access control point must be enabled in addition to one or both of the access control points listed.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

</table>

### Key Part Import (CSNBKPI and CSNEKPI)

Use the key part import callable service to combine, by exclusive ORing, the clear key parts of any key type and return the combined key value either in an internal token or as an update to the CKDS.
Prior to using the key part import service for the first key part, you must use the key token build service to create the internal key token into which the key will be imported. Subsequent key parts are combined with the first part in internal token form or as a label from the CKDS.

The preferred way to specify key parts is FIRST, ADD-PART, and COMPLETE in the rule_array. Only when the combined key parts have been marked as COMPLETE can the key token be used in any other service. Key parts can also be specified as FIRST, MIDDLE, or LAST in the rule_array. ADD-PART or MIDDLE can be executed multiple times for as many key parts as necessary. Only when the LAST part has been combined can the key token be used in any other service.

New applications should employ the ADD-PART and COMPLETE keywords in lieu of the MIDDLE and LAST keywords in order to ensure a separation of responsibilities between someone who can add key-part information and someone who can declare that appropriate information has been accumulated in a key.

The key part import callable service can also be used to import a key without using key parts. Call the key part import service FIRST with key part value X'0000...' then call the key part import service LAST with the complete value.

Keys created via this service have odd parity. The FIRST key part is adjusted to odd parity. All subsequent key parts are adjusted to even parity prior to being combined.

The callable service name for AMODE(64) invocation is CSNEKPI.

**Format**

```call
CALL CSNBKPI(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_part,
    key_identifier)
```

**Parameters**

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”] lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”] lists the reason codes.
Key Part Import

**exit_data_length**

*Direction: Input/Output*  
*Type: Integer*

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the *exit_data* parameter.

**exit_data**

*Direction: Input/Output*  
*Type: String*

The data that is passed to the installation exit.

**rule_array_count**

*Direction: Input*  
*Type: Integer*

The number of keywords you supplied in the *rule_array* parameter. The value must be 1 or 2.

**rule_array**

*Direction: Input*  
*Type: String*

Keywords that provide control information to the callable service. The keywords must be 8 bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks.

*Table 46. Keywords for Key Part Import Control Information*

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Key Part (Required)</strong></td>
<td></td>
</tr>
<tr>
<td>FIRST</td>
<td>This keyword specifies that an initial key part is being entered. The callable service returns this key-part encrypted by the master key in the key token that you supplied.</td>
</tr>
<tr>
<td>ADD-PART</td>
<td>This keyword specifies that additional key-part information is provided.</td>
</tr>
<tr>
<td>COMPLETE</td>
<td>This keyword specifies that the key-part bit shall be turned off in the control vector of the key rendering the key fully operational. Note that no key-part information is added to the key with this keyword.</td>
</tr>
<tr>
<td>MIDDLE</td>
<td>This keyword specifies that an intermediate key part, which is neither the first key part nor the last key part, is being entered. Note that the command control point for this keyword is the same as that for the LAST keyword and different from that for the ADD-PART keyword.</td>
</tr>
<tr>
<td>LAST</td>
<td>This keyword specifies that the last key part is being entered. The key-part bit is turned off in the control vector.</td>
</tr>
</tbody>
</table>

*Key Wrapping Method (optional)*
### Key Part Import

**Table 46. Keywords for Key Part Import Control Information (continued)**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>USECONFG</td>
<td>Specifies that the system default configuration should be used to determine the wrapping method. This is the default keyword.</td>
</tr>
<tr>
<td></td>
<td>The system default key wrapping method can be specified using the DEFAULTWRAP parameter in the installation options data set. See the <a href="https://www.ibm.com/support/knowledgecenter/SSG5G2_ICSF/ICSF/SYSMGRG.html">ICSF System Programmer's Guide</a>.</td>
</tr>
<tr>
<td>WRAP-ENH</td>
<td>Use enhanced key wrapping method, which is compliant with the ANSI X9.24 standard.</td>
</tr>
<tr>
<td>WRAP-ECB</td>
<td>Use original key wrapping method, which uses ECB wrapping for DES key tokens and CBC wrapping for AES key tokens.</td>
</tr>
</tbody>
</table>

**key_part**

Direction: Input  
Type: String

A 16-byte field containing the clear key part to be entered. If the key is a single-length key, the key part must be left-justified and padded on the right with zeros. This field is ignored if COMPLETE is specified.

**key_identifier**

Direction: Input/Output  
Type: String

A 64-byte field containing an internal token or a label of an existing CKDS record. If `rule_array` is FIRST, this field is the skeleton of an internal token of a single- or double-length key with the KEY-PART marking. If `rule_array` is MIDDLE or LAST, this is an internal token or the label of a CKDS record of a partially combined key. Depending on the input format, the accumulated partial or complete key is returned as an internal token or as an updated CKDS record. The returned `key_identifier` will be encrypted under the current master key.

ICSF supports two methods of wrapping the key value in a symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method which is ANSI X9.24 compliant. The output `key_identifier` will use the default method unless a rule array keyword overriding the default for the FIRST key part is specified. When the `key_identifier` is an existing token, the same wrapping method as the existing token will be used.

**Restrictions**

If a label is specified on `key_identifier`, the label must be unique. If more than one record is found, the service fails.

For existing TKE V3.1 (or higher) users, you may have to explicitly enable new access control points. You must have access control point 'Key Part Import - Unrestricted' explicitly enabled. Otherwise, current applications will fail with either of these conditions:

- the first 8 bytes of key identifier is different than the second 8 bytes AND the first 8 bytes of the combined key are the same as the last second 8 bytes
Key Part Import

- the first 8 bytes of key identifier is the same as the second 8 bytes AND the first 8 bytes of the combined key are different than the second 8 bytes.

This callable service does not support version X'10' external DES key tokens (RKX key tokens).

Usage Notes

If you are running with the Cryptographic Coprocessor Feature, this service requires that the ANSI system keys be installed on the CKDS.

The following table shows the access control points in the ICSF role that control the function of this service.

Table 47. Required access control points for Key Part Import

<table>
<thead>
<tr>
<th>Rule array keyword</th>
<th>Access control point</th>
</tr>
</thead>
<tbody>
<tr>
<td>FIRST</td>
<td>Key Part Import - first key part</td>
</tr>
<tr>
<td>MIDDLE or LAST</td>
<td>Key Part Import - middle and last</td>
</tr>
<tr>
<td>ADD-PART</td>
<td>Key Part Import - ADD-PART</td>
</tr>
<tr>
<td>COMPLETE</td>
<td>Key Part Import - COMPLETE</td>
</tr>
<tr>
<td>WRAP-ECB or WRAP-ENH and default key-wrapping method setting does not match keyword</td>
<td>Key Part Import - Allow wrapping override keywords</td>
</tr>
</tbody>
</table>

A “replicated key halves” key (both cleartext halves of a double-length key are equal) is not as secure as a double-length key with key halves that are not the same. The key part import service verb enforces the key-halves restriction documented above when the **Key Part Import - Unrestricted** access control point is disabled in the ICSF role.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Related Information

This service is consistent with the Transaction Security System key part import verb.

Key Part Import2 (CSNBKPI2 and CSNEKPI2)

Use the Key Part Import2 callable service to combine, by exclusive ORing, the clear key parts of any key type and return the combined key value either in a variable-length internal token or as an update to the CKDS.

Prior to using the key part import2 service for the first key part, you must use the Key Token Build2 service to create the internal key token into which the key will be imported. Subsequent key parts are combined with the first part in internal token form or as a label from the CKDS.

On each call to Key Part Import2 (except with the COMPLETE keyword), specify the number of bits to use for the clear key part. Place the clear key part in the key_part parameter, and specify the number of bits using the key_part_length variable. Any extraneous bits of key_part data will be ignored.

Consider using the Key Test2 callable service to ensure a correct key value has been accumulated prior to using the COMPLETE option to mark the key as fully operational.

The callable service name for AMODE(64) is CSNEKPI2.
Key Part Import2

Format

```c
CALL CSNBKP12(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_part_bit_length,
    key_part,
    key_identifier_length,
    key_identifier)
```

Parameters

**return_code**
- **Direction:** Output
- **Type:** Integer

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

**reason_code**
- **Direction:** Output
- **Type:** Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

**exit_data_length**
- **Direction:** Input/Output
- **Type:** Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**
- **Direction:** Input/Output
- **Type:** String

The data that is passed to the installation exit.

**rule_array_count**
- **Direction:** Input
- **Type:** Integer

The number of keywords you supplied in the `rule_array` parameter. The value may be 2 or 3.

**rule_array**
- **Direction:** Input
- **Type:** Integer
The rule_array contains keywords that provide control information to the callable service. The keywords must be in contiguous storage with each of the keywords left-justified in its own 8-byte location and padded on the right with blanks.

Table 49. Keywords for Key Part Import2 Control Information

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Token Algorithm (Required)</strong></td>

</tr>
<tr>
<td><strong>Key Part (One required)</strong></td>
<td></td>
</tr>
<tr>
<td>FIRST</td>
<td>This keyword specifies that an initial key part is being entered. The callable service returns this key-part encrypted by the master key in the key token that you supplied.</td>
</tr>
<tr>
<td>ADD-PART</td>
<td>This keyword specifies that additional key-part information is provided.</td>
</tr>
<tr>
<td>COMPLETE</td>
<td>This keyword specifies that the key-part bit shall be turned off in the control vector of the key rendering the key fully operational. Note that no key-part information is added to the key with this keyword.</td>
</tr>
<tr>
<td><strong>Split Knowledge (One required). Use only with FIRST keyword.</strong></td>
<td></td>
</tr>
<tr>
<td>MIN3PART</td>
<td>Specifies that the key must be entered in at least three parts.</td>
</tr>
<tr>
<td>MIN2PART</td>
<td>Specifies that the key must be entered in at least two parts.</td>
</tr>
<tr>
<td>MIN1PART</td>
<td>Specifies that the key must be entered in at least one part.</td>
</tr>
</tbody>
</table>

**key_part_bit_length**

Direction: Input  
Type: Integer

The length of the clear key in bits. This indicates the bit length of the key supplied in the key_part field. For FIRST and ADD-PART keywords, valid values are 80 to 2048 for HMAC keys or 128, 192, or 256 for AES keys. The value must be 0 for the COMPLETE keyword.

**key_part**

Direction: Input  
Type: String

This parameter is the clear key value to be applied. The key part must be left-justified. This parameter is ignored if COMPLETE is specified.

**key_identifier_length**

Direction: Input/Output  
Type: Integer

On input, the length of the buffer for the key_identifier parameter. For labels, the value is 64 bytes. The key_identifier must be left justified in the buffer. The buffer must be large enough to receive the updated token. The maximum value is 725 bytes. The output token will be longer when the first key part is imported.
Key Part Import2

On output, the actual length of the token returned to the caller. For labels, the value will be 64.

**key_identifier**

Direction: Input/Output  
Type: String

The parameter containing an internal token or a 64-byte label of an existing CKDS record. If the Key Part rule is FIRST, the key is a skeleton token. If the Key Part rule is ADD-PART, this is an internal token or the label of a CKDS record of a partially combined key. Depending on the input format, the accumulated partial or complete key is returned as an internal token or as an updated CKDS record. The returned *key_identifier* will be encrypted under the current master key.

**Usage Notes**

On each call to Key Part Import2, also specify a rule-array keyword to define the service action: FIRST, ADD-PART, or COMPLETE.

- With the FIRST keyword, the input key-token must be a skeleton token (no key material). Use of the FIRST keyword requires that the Load First Key Part2 access control point be enabled in the default role.
- With the ADD-PART keyword, the service exclusive-ORs the clear key-part with the key value in the input key-token. Use of the ADD-PART keyword requires that an Add Key Part2 access control point be enabled in the default role. The key remains incomplete in the updated key token returned from the service.
- With the COMPLETE keyword, the KEY-PART bit is set off in the updated key token that is returned from the service. Use of the COMPLETE keyword requires that the Complete Key Part2 access control point be enabled in the default role. The *key_part_bit_length* parameter must be set to zero.

The following table shows the access control points in the default role that control the function of this service.

**Table 50. Required access control points for Key Part Import2**

<table>
<thead>
<tr>

Key Test (CSNBKYT and CSNEKYT)

Use the key test callable service to generate or verify a secure, cryptographic verification pattern for keys. The key to test can be in the clear or encrypted under the master key. Keywords in the rule_array specify whether the callable service generates or verifies a verification pattern.

DES keys use the algorithm defined in "DES Algorithm (single- and double-length keys)" on page 889 as the default algorithm (except for triple-length DATA keys).

When generating a verification pattern, the service generates a random number and calculates the verification pattern. The random number and verification pattern are returned to the caller. When verifying a key, the random number and key are used to verify the verification pattern.

AES keys use the SHA-256 algorithm as the default algorithm. An 8-byte verification pattern is generated for the key specified. The random number parameter is not used.

The optional ENC-ZERO algorithm can be used with any key. A 4-byte verification pattern is generated. The random number parameter is not used.

CSNBKYT is consistent with the Transaction Security System verb of the same name. If you generate a key on the Transaction Security System, you can verify it on ICSF and vice versa.

See "Key Test Extended (CSNBKYTX and CSNEKTX)" on page 178 to verify the value of a DES key encrypted using a KEK.

The callable service name for AMODE(64) invocation is CSNEKYT.
Format

```c
CALL CSNBKYT(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_identifier,
    random_number,
    verification_pattern)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from 'X'00000000' to 'X'7FFFFFFF' (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  
Type: Integer

The number of keywords you supplied in the `rule_array` parameter. The value can be 2, 3 or 4.

**rule_array**

Direction: Input  
Type: String
Keywords provide control information to the callable service. Table 52 lists the keywords. The keywords must be in contiguous storage with each of the keywords left-justified in its own 8-byte location and padded on the right with blanks.

Table 52. Keywords for Key Test Control Information

</tr>
<tr>
<td><strong>Verification Process Rule (optional)</strong></td>
<td></td>
</tr>
<tr>
<td>ENC-ZERO</td>
<td>ENC-ZERO can be used with any of the rules. It is not supported on systems with CCFs.</td>
</tr>
<tr>
<td>SHA-256</td>
<td>Use the ‘SHA-256’ method. Use with CLR-A128, CLR-A192, CLR-A256, and TOKEN. SHA-256 is also the default for the AES rules.</td>
</tr>
</tbody>
</table>

**key_identifier**

Direction: Input/Output  
Type: String

The key for which to generate or verify the verification pattern. The parameter is a 64-byte string of an internal token, key label, or a clear key value left-justified.

**Note:** If you supply a key label for this parameter, it must be unique on the CKDS.

**random_number**
Key Test

**random_number**
Direction: Input/Output
Type: String

This is an 8-byte field that contains a random number supplied as input for the test pattern verification process and returned as output with the test pattern generation process. *random_number* is only used with the default algorithm for DES operational keys.

**verification_pattern**
Direction: Input/Output
Type: String

This is an 8-byte field that contains a verification pattern supplied as input for the test pattern verification process and returned as output with the test pattern generation process.

Restrictions

This callable service does not support version X'10' external DES key tokens (RXX key tokens).

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

You can generate the verification pattern for a key when you generate the key. You can distribute the pattern with the key and it can be verified at the receiving node. In this way, users can ensure using the same key at the sending and receiving locations. You can generate and verify keys of any combination of key forms, that is, clear, operational or external.

The parity of the key is not tested.

With a PCI-XCC, CEX2C, or CEX3C, there is support for the generation and verification of single, double and triple-length keys for the ENC-ZERO verification process. For triple-length keys, use KEY-ENC or KEY-ENCD with ENC-ZERO. Clear triple-length keys are not supported.

In the Transaction Security System, KEY-ENC and KEY-ENCD both support enciphered single-length and double-length keys. They use the key-form bits in byte 5 of CV to determine the length of the key. To be consistent, in ICSF, both KEY-ENC and KEY-ENCD handle single- and double-length keys. Both products effectively ignore the keywords, which are supplied only for compatibility reasons.

The access control point in the ICSF role that controls the function of this service is **Key Test and Key Test 2**. This access control point cannot be disabled. It is required for ICSF master key validation.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

#### Key Test2 (CSNBKYT2 and CSNEKYT2)

Use this callable service to generate or verify a secure, cryptographic verification pattern for keys. The key to test can be in the clear, encrypted under the master key, or encrypted under a key-encrypting key. Keywords in the `rule_array` specify whether the callable service generates or verifies a verification pattern.

The callable service name for AMODE(64) invocation is CSNEKYT2.
Key Test2

Format

CALL CSNBKYT2(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_identifier_length,
    key_identifier,
    key_encrypting_key_identifier_length,
    key_encrypting_key_identifier,
    reserved_length,
    reserved,
    verification_pattern_length,
    verification_pattern )

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. The value must be 2, 3, 4, or 5.

rule_array
The `rule_array` contains keywords that provide control information to the callable service. The keywords must be in contiguous storage with each of the keywords left-justified in its own 8-byte location and padded on the right with blanks.

**Table 54. Keywords for Key Test2 Control Information**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Token algorithm (Required)</strong></td>
<td></td>
</tr>
<tr>
<td>AES</td>
<td>Specifies the key token is an AES key token.</td>
</tr>
<tr>
<td>DES</td>
<td>Specifies the key token is a DES token. CCA internal, CCA external, and TR-31 token types are supported. Clear keys are not supported for this rule.</td>
</tr>
<tr>
<td>HMAC</td>
<td>Specifies the key token is an HMAC key token.</td>
</tr>
<tr>
<td><strong>Process rule (One required)</strong></td>
<td></td>
</tr>
<tr>
<td>GENERATE</td>
<td>Generate a verification pattern for the specified key.</td>
</tr>
<tr>
<td>VERIFY</td>
<td>Verify that a verification pattern matches the specified key.</td>
</tr>
<tr>
<td><strong>Verification pattern calculation algorithm (Optional)</strong></td>
<td></td>
</tr>
<tr>
<td>ENC-ZERO</td>
<td>Verification pattern for AES and DES keys calculated by encrypting a data block filled with 0x00 bytes. This is the default and only method available for DES. This method is only available for AES if Access Control Point &quot;Key Test2 - AES, ENC-ZERO&quot; is enabled.</td>
</tr>
<tr>
<td>SHA-256</td>
<td>Verification pattern will be calculated for an AES token using the same method as the Key Test service with the SHA-256 rule. This rule can be used to verify that the same key value is present in a version 4 DATA token and version 5 AES CIPHER token or to verify that the same key value is present in a version 5 AES IMPORTER/EXPORTER pair.</td>
</tr>
<tr>
<td>SHA2VP1</td>
<td>Specifies to use the SHA-256 based verification pattern calculation algorithm. For more information, see &quot;SHAVP1 Algorithm&quot; on page 889. This is the default and only method available for HMAC.</td>
</tr>
<tr>
<td><strong>Token type rule (Required if TR-31 token passed and Token algorithm DES is specified; not valid otherwise)</strong></td>
<td></td>
</tr>
<tr>
<td>TR-31</td>
<td>Specifies that <code>key_identifier</code> contains a TR-31 key block.</td>
</tr>
<tr>
<td><strong>KEK identifier rules (Optional - see defaults)</strong></td>
<td></td>
</tr>
<tr>
<td>IKEK-AES</td>
<td>The wrapping KEK for the key to test is an AES KEK. This is the default for AES and HMAC Token algorithms, and is not allowed with DES.</td>
</tr>
<tr>
<td>IKEK-DES</td>
<td>The wrapping KEK for the key to test is a DES KEK. This is the default for DES Token algorithm, and is only allowed with DES Token algorithm.</td>
</tr>
<tr>
<td>IKEK-PKA</td>
<td>The wrapping KEK for the key to test is an RSA or (other key stored in PKA key storage.) This is not the default for any Token algorithm and must be specified if an RSA KEK is used. This rule is not allowed with DES Token algorithm.</td>
</tr>
</tbody>
</table>
Key Test2

**key_identifier_length**
Direction: Input  Type: Integer

The length of the key_identifier in bytes. The maximum value is 9992.

**key_identifier**
Direction: Input  Type: String

The key for which to generate or verify the verification pattern. This is an internal or external token or the 64-byte label of a key in the CKDS. This token may be a DES internal or external token, AES internal version ‘04’X token, internal or external variable-length symmetric token, or a TR-31 key block.

Clear DES tokens are not supported.

If an internal token was supplied and was encrypted under the old master key, the token will be returned encrypted under the current master key.

**key_encrypting_key_identifier_length**
Direction: Input  Type: Integer

The length of the key_encrypting_key_identifier parameter. When key_identifier is an internal token, the value must be zero.

If key_encrypting_key_identifier is a label for either the CKDS (IKEK-AES or IKEK-DES rules) or PKDS (IKEK-PKA rule), the value must be 64. If key_encrypting_key_identifier is an AES KEK, the value must be between the actual length of the token and 725. If key_encrypting_key_identifier is a DES KEK, the value must be 64. If key_encrypting_key_identifier is an RSA KEK, the maximum length is 3500.

**key_encrypting_key_identifier**
Direction: Input/Output  Type: String

When key_encrypting_key_identifier_length is non-zero, key_encrypting_key_identifier contains an internal key token containing the key-encrypting key, or a key label.

If the key identifier supplied was an AES or DES token encrypted under the old master key, the token will be returned encrypted under the current master key.

**reserved_length**
Direction: Input  Type: Integer

The length of the reserved parameter. The value must be zero.

**reserved**
Direction: Input/Output  Type: String

This parameter is ignored.

**verification_pattern_length**
Direction: Input/Output  Type: Integer
Key Test2

The length of the verification_pattern parameter.

On input: For GENERATE, the length must be at least 8 bytes; For VERIFY, the length must be 8 bytes.

On output for GENERATE, the length of the verification pattern returned.

verification_pattern

Direction: Input/Output  Type: String

For GENERATE, the verification pattern generated for the key.

For VERIFY, the supplied verification pattern to be verified.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS.

You can generate the verification pattern for a key when you generate the key. You can distribute the pattern with the key and it can be verified at the receiving node. In this way, users can ensure using the same key at the sending and receiving locations. You can generate and verify keys of any combination of key forms: clear, operational or external.

The access control point in the ICSF role that controls the function of this service is **Key Test and Key Test 2**. This access control point cannot be disabled. It is required for ICSF master key validation.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Key Test Extended

Key Test Extended (CSNBKYTX and CSNEKTX)

Use the key test extended service to generate or verify a secure, cryptographic verification pattern for keys. The key to test can be in the clear or encrypted under the master key. The callable service also supports keys encrypted under a key-encrypting key (KEK). AES keys are not supported by this service. Keywords in the rule array specify whether the callable service generates or verifies a verification pattern.

This algorithm is supported for encrypted single and double length keys. Single, double and triple length keys are also supported with the ENC-ZERO algorithm.

When the service generates a verification pattern, it creates and cryptographically processes a random number. The service returns the random number with the verification pattern.

When the service tests a verification pattern against a key, you must supply the random number and the verification pattern from a previous call to key test extended. The service returns the verification result in the return and reason codes.

The callable service name for AMODE(64) invocation is CSNEKTX.

Format

CALL CSNBKYTX(
   return_code,
   reason_code,
   exit_data_length,
   exit_data,
   rule_array_count,
   rule_array,
   key_identifier,
   random_number,
   verification_pattern,
   KEK_key_identifier)

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer
Key Test Extended

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output    Type: String
The data that is passed to the installation exit.

rule_array_count
Direction: Input    Type: Integer
The number of keywords you supplied in the rule_array parameter. The value can be 2, 3 or 4.

rule_array
Direction: Input    Type: String
Two or three keywords that provide control information to the callable service. Table 56 lists the keywords. The keywords must be in 16 or 24 bytes of contiguous storage with each of the keywords left-justified in its own 8-byte location and padded on the right with blanks.

Table 56. Keywords for Key Test Extended Control Information

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Key Rule (required)</strong></td>
<td></td>
</tr>
<tr>
<td>KEY-ENC</td>
<td>Specifies the key supplied in key_identifier is a single-length encrypted DES key.</td>
</tr>
<tr>
<td>KEY-ENCD</td>
<td>Specifies the key supplied in key_identifier is a double-length encrypted DES key.</td>
</tr>
<tr>
<td><strong>Process Rule (required)</strong></td>
<td></td>
</tr>
<tr>
<td>GENERATE</td>
<td>Generate a verification pattern for the key supplied in key_identifier.</td>
</tr>
<tr>
<td>VERIFY</td>
<td>Verify a verification pattern for the key supplied in key_identifier.</td>
</tr>
<tr>
<td><strong>Parity Adjustment (optional)</strong></td>
<td></td>
</tr>
<tr>
<td>ADJUST</td>
<td>Adjust the parity of test key to odd prior to generating or verifying the verification pattern. The key_identifier field itself is not adjusted.</td>
</tr>
<tr>
<td>NOADJUST</td>
<td>Do not adjust the parity of test key to odd prior to generating or verifying the verification pattern. This is the default.</td>
</tr>
<tr>
<td><strong>Verification Process Rule (optional)</strong></td>
<td></td>
</tr>
<tr>
<td>ENC-ZERO</td>
<td>Specifies use of the &quot;encrypted zeros&quot; method.</td>
</tr>
</tbody>
</table>

key_identifier
Direction: Input/Output    Type: String
The key for which to generate or verify the verification pattern. The parameter is a 64-byte string of an internal token or key label that is left-justified.
Key Test Extended

**Note:** If you supply a key label for this parameter, it must be unique on the CKDS.

**random_number**

*Direction: Input/Output*  
*Type: String*

This is an 8-byte field that contains a random number supplied as input for the test pattern verification process and returned as output with the test pattern generation process.

**verification_pattern**

*Direction: Input/Output*  
*Type: String*

This is an 8-byte field that contains a verification pattern supplied as input for the test pattern verification process and returned as output with the test pattern generation process.

**KEK_key_identifier**

*Direction: Input/Output*  
*Type: String*

If `key_identifier` is an external token, then this is a 64-byte string of an internal token or a key label of an IMPORTER or EXPORTER used to encrypt the test key. If `key_identifier` is an internal token, then the parameter is ignored.

**Note:** If you supply a key label for this parameter, it must be unique on the CKDS.

**Restrictions**

This callable service does not support version X'10' external DES key tokens (RKX key tokens).

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

You can generate the verification pattern for a key when you generate the key. You can distribute the pattern with the key and it can be verified at the receiving node. In this way, users can ensure using the same key at the sending and receiving locations. You can generate and verify keys of any combination of key forms, that is, clear, operational or external.

The parity of the key is not tested.

With a PCIXCC, CEX2C, or CEX3C and using the ENC-ZERO verification rule, there is support for enciphered single and double-length DES keys. There is no support for systems with CCF’s.

The access control point in the ICSF role that controls the function of this service is **Key Test and Key Test 2**. This access control point cannot be disabled. It is required for ICSF master key validation.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Key Token Build (CSNBKTB and CSNEKTB)

Use the key token build callable service to build an external or internal key token from information which you supply. The token can be used as input for the key generate and key part import callable services. You can specify a control vector or the service can build a control vector based upon the key type you specify and the control vector-related keywords in the rule array. ICSF supports the building of an internal key token with the key encrypted under a master key other than the current master key and building internal clear AES and DES tokens.

The callable service name for AMODE(64) invocation is CSNEKTB.
Key Token Build

Format

```sql
CALL CSNBTB(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_token,
    key_type,
    rule_array_count,
    rule_array,
    key_value,
    master_key_version_number,
    key_register_number,
    token_data_1,
    control_vector,
    initialization_vector,
    pad_character,
    cryptographic_period_start,
    master_key_verification_pattern)
```

Parameters

**return_code**

Direction: Output  Type: Integer

The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the return codes.

**reason_code**

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the reason codes.

**exit_data_length**

Direction: Ignored  Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

**exit_data**

Direction: Ignored  Type: String

This field is ignored.

**key_token**

Direction: Input/Output  Type: String

If the key_type parameter is TOKEN, then this is a 64-byte internal token that is updated as specified in the rule_array. The internal token must be a DATA, IMPORTER or EXPORTER key type. Otherwise this field is an output-only field.

**key_type**
### Key Token Build

**Direction:** Input  
**Type:** String

An 8-byte field that specifies the type of key you want to build or the keyword TOKEN for updating a supplied token. The key types are:

**Table 58. Key type keywords for key token build**

<table>
<thead>
<tr>
<th>Key type</th>
<th>Description</th>
<th>Algorithm</th>
</tr>
</thead>
<tbody>
<tr>
<td>AKEK</td>
<td>See Table 3 on page 23</td>
<td>DES</td>
</tr>
<tr>
<td>CIPHER</td>
<td>See Table 3 on page 23</td>
<td>DES</td>
</tr>
<tr>
<td>CLRAES</td>
<td>The key_token parameter is a clear AES token. The rule_array must contain the keyword INTERNAL and one of the optional keywords: KEYN16, KEYN24 or KEYN32. A key value parameter must also be provided.</td>
<td>AES</td>
</tr>
<tr>
<td>CLRDES</td>
<td>The key_token parameter is a clear DES token. The rule_array must contain the keyword INTERNAL and one of the optional keywords: KEYN8, KEYN16 or KEYN24. A key value parameter must also be provided.</td>
<td>DES</td>
</tr>
<tr>
<td>CVARDEC, CVARENC, CVARPINE, CVARXCVL, CVARXCVR</td>
<td>See Table 3 on page 23</td>
<td>DES</td>
</tr>
<tr>
<td>DATA</td>
<td>Valid for AES and DES keys and must be specified with the rule_array keyword AES to build an encrypted AES key token.</td>
<td>AES and DES</td>
</tr>
<tr>
<td>DATAC, DATAM, DATAMV, DATAXLAT, DECIPHER, DKYGENKY, ENCIPHER</td>
<td>See Table 3 on page 23</td>
<td>DES</td>
</tr>
<tr>
<td>EXPORTER</td>
<td>If the key_type parameter is TOKEN, then this is a 64-byte internal token that is updated as specified in the rule_array.</td>
<td>DES</td>
</tr>
<tr>
<td>IKEYXLAT</td>
<td>See Table 3 on page 23</td>

<td>DES</td>
</tr>
<tr>
<td>SECMSG</td>
<td>SMKEY or SMPIN must be specified in the rule_array parameter.</td>
<td>DES</td>
</tr>
</tbody>
</table>

If **key_type** is TOKEN, then the key_token field must contain a single-length DATA key or an IMPORTER or EXPORTER key with the standard control.
Key Token Build

vector. The valid keywords for TOKEN are EXTERNAL, INTERNAL, DES and SYS-ENC. The service will set the system encryption bits in the token (byte 59, bits 0 and 1) to zero and return the token.

Key type USE-CV is used when a user-supplied control vector is specified. The USE-CV key type specifies that the key type should be obtained from the control vector specified in the control_vector parameter. The CV rule array keyword should be specified if USE-CV is specified.

For information on the meaning of the key types, see Table 3 on page 23.

**rule_array_count**

Direction: Input   Type: Integer

The number of keywords you supplied in the `rule_array` parameter.

**rule_array**

Direction: Input   Type: String

The `rule_array` contains keywords that provide control information to the callable service. See Table 59 for a list. The keywords must be in contiguous storage with each of the keywords left-justified in its own 8-byte location and padded on the right with blanks. For any key type, there are no more than four valid `rule_array` values.

</tbody>
</table>

**Key Part Indicator (optional) — not valid for CLRDES**

| KEY-PART | This token is to be used as input to the key part import service. | DES       |

**Control vector (CV) source (optional - zero or one of these keywords is permitted)**

| CV       | This specifies that the key token should be built using the control_vector supplied in the control_vector parameter. | DES       |
| NO-CV    | This specifies that the key token should be built using a control vector that is based on the supplied key type control vector related rule array keywords. It is the default. | DES       |

**Control vector on the link specification (optional) — valid only for IMPORTER and EXPORTER.**

| CV-KEK   | This keyword indicates marking the KEK as a CV KEK. The control vector is applied to the KEK prior to using it in encrypting other keys. This is the default. | DES       |
| NOCV-KEK | This keyword indicates marking the KEK as a NOCV KEK. The control vector is not applied to the KEK prior to its use in encrypting other keys. | DES       |

**Control vector keywords (optional - zero or more of these keywords are permitted)**

See Table 61 on page 188 for the key-usage keywords that can be specified for a given key type. **DES**

**Master Key Verification Pattern (optional) — not valid for CLRDES or CLRAES keywords**
Table 59. Keywords for Key Token Build Control Information (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
<th>Algorithm</th>
</tr>
</thead>
<tbody>
<tr>
<td>MKVP</td>
<td>This keyword indicates that the <code>key_value</code> is enciphered under the master key which corresponds to the master key verification pattern specified in the <code>master_key_verification_pattern</code> parameter. If this keyword is not specified, the key contained in the <code>key_value</code> field must be enciphered under the current master key.</td>
<td>AES and DES</td>
</tr>
</tbody>
</table>

**Key Wrapping Method (optional)**

| WRAP-ENH | Use enhanced key wrapping method, which is compliant with the ANSI X9.24 standard. | DES |
| WRAP-ECB | Use original key wrapping method, which uses ECB wrapping for DES key tokens and CBC wrapping for AES key tokens. This is the default. | DES |

**Translation Control (optional)**

| ENH-ONLY | Restrict rewrapping of the token. Once the token has been wrapped with the enhanced method, it cannot be rewrapped using the original method. Can only be specified with WRAP-ENH. | DES |

`key_value`

Direction: Input  
Type: String

If you use the KEY keyword, this parameter is a 16-byte string that contains the encrypted key value. Single-length keys must be left-justified in the field and padded on the right with 'X'00'. If you are building a triple-length DATA key, this parameter is a 24-byte string containing the encrypted key value. If you supply an encrypted key value and also specify INTERNAL, the service will check for the presence of the MKVP keyword. If MKVP is present, the service will assume the `key_value` is enciphered under the master key which corresponds to the master key verification pattern specified in the `master_key_verification_pattern` parameter, and will place the key into the internal token along with the verification pattern from the `master_key_verification_pattern` parameter. If MKVP is not specified, ICSF assumes the key is enciphered under the current host master key and places the key into an internal token along with the verification pattern for the current master key. In this case, the application must ensure that the master key has not changed since the key was generated or imported to this system. Otherwise, use of this parameter is not recommended.

For `key_type` CLRDES and CLRAES, this field is required to contain the clear key value. For KEYLN8, this is an 8-byte field. For KEYLN16, this is a 16-byte field. For KEYLN24, this a 24-byte field. For KEYLN32, this is a 32-byte field.

</tr>
<tr>
<td>AES-128, AES-192, AES-256 encrypted key</td>
<td>32-bytes</td>
</tr>
</tbody>
</table>

master_key_version_number
Direction: Input, Type: Integer

This field is examined only if the KEY keyword is specified, in which case, this field must be zero.

key_register_number
Direction: Input, Type: Integer

This field is ignored.

token_data_1
Direction: Input, Type: String

This parameter is ignored for DES keys.

This parameter is the LRC value for AES keys. For clear AES keys it is 8-bytes of X'00' indicating to the service that it must compute the LRC field value. For encrypted AES keys, you provide a 1-byte area containing the LRC value for the key passed in the key_value parameter. The service copies it into the LRC field of the key token.

control_vector
Direction: Input, Type: String

A pointer to a 16 byte string variable. When the CV rule array keyword is used, this parameter must point to a control vector which is copied into the key token. This parameter is ignored for AES keys.

initialization_vector
Direction: Input, Type: String

This field is ignored.

pad_character
Direction: Input, Type: Integer

The only allowed value for key types MAC and MACVER is 0. This field is ignored for all other key types.

cryptographic_period_start
Direction: Input, Type: String

This field is ignored.
Key Token Build

master_key_verification_pattern

Direction: Input                     Type: String

8-byte verification pattern of the master key used to encrypt the key value. It is used when the KEY and INTERNAL rule_array keywords are specified. The value is inserted into the master key verification pattern field of the key token. If the KEY and INTERNAL keywords are specified in rule_array, the service will check for the existence of the MKVP rule array keyword. This parameter is ignored for any other rule_array keyword combinations.

Restrictions

This callable service does not support version X'10' external DES key tokens (RKX key tokens).

Usage Notes

No pre- or post-processing or security exits are enabled for this service. No RACF checking is done, and no calls to RACF are issued when this service is used.

You can use this service to create skeleton key tokens with the desired data encryption algorithm bits for use in some key management services to override the default system specifications.

- If you are running with the Cryptographic Coprocessor Feature and need to generate operational AKEKs, use key_type of TOKEN and provide a skeleton AKEK key token as the generated_key_identifier_1 into the key generate service.
- If you are running with the Cryptographic Coprocessor Feature, the KEY-PART AKEK key token can also be used as input to key part import service.
- To create an internal token with a specified KEY value, ICSF needs to supply a valid master key verification pattern (MKVP).

NOCV keyword is only supported for the standard IMPORTERs and EXPORTERs with the default CVs.

This illustrates the key type and key usage keywords that can be combined in the Control Vector Generate and Key Token Build callable services to create a control vector.

Notes: Default keys are indicated in bold.

* All keywords in the list are defaults unless one or more keywords in the list are specified
** The NOOFFSET keyword is only valid if NO-SPEC, IBM-PIN, GBP-PIN, or the default (NO-SPEC) is specified.
A key usage keyword is required for the KEYGENKY and SECMSG key types.
- CLR8-ENC and/or UKPT must be specified for the KEYGENKY key type
- SMKEY or SMPIN must be specified for the SECMSG key type

Related Information

Attention: CDMF is no longer supported.

The ICSF key token build callable service provides a subset of the parameters and keywords available with the Transaction Security System key token build verb.

These key types are not supported: ADATA, AMAC, CIPHERXI, CIPHERXL, CIPHERXO, UKPTBASE.

These rule array keywords are not supported: ACTIVE, ADAPTER, CARD, CBC, CLEAR-IV, CUSP, INACTIVE, IPS, KEY-REF, MACLEN4, MACLEN6, MACLEN8, NO-IV, READER, X9.2, X9.9-1.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Key Token Build2 (CSNBKTB2 and CSNEKTB2)

Use the Key Token Build2 callable service to build a variable-length CCA symmetric key token in application storage from information that you supply. A clear key token built by this service can be used as input for the Key Test2 callable service. A skeleton token built by this service can be used as input for the Key Generate2 and Key Part Import2 callable services.

This service will build internal or external HMAC and AES tokens, both as clear key tokens and as skeleton tokens containing no key.

The callable service name for AMODE(64) is CSNEKTB2.

Format

```call csnbktb2{
  return_code,
  reason_code,
  exit_data_length,
  exit_data,
  rule_array_count,
  rule_array,
  clear_key_bit_length,
  clear_key_value,
  key_name_length,
  key_name,
  user_associated_data_length,
  user_associated_data,
  token_data_length,
  token_data,
  reserved_length,
  reserved
  target_key_token_length,
  target_key_token
}
```

Parameters

**return_code**

Direction: Output
Type: Integer
Key Token Build2

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data
Direction: Ignored Type: String

This field is ignored.

rule_array_count
Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. The minimum value is 3, and the maximum value is 33.

rule_array
Direction: Input Type: Integer

The rule_array contains keywords that provide control information to the callable service. The keywords must be in contiguous storage with each of the keywords left-justified in its own 8-byte location and padded on the right with blanks.

#### Key-management related keywords

- **Symmetric-key export control (one, optional)**
  - Key-management field 1 for all algorithms and key types.
  - NOEX-SYM: Prohibits the export of the key with a symmetric key.
  - XPRT-SYM: Permits the export of the key with a symmetric key. This is the default.

- **Unauthenticated asymmetric-key export control (one, optional)**
  - Key-management field 1 for all algorithms and key types.
  - NOEXUASY: Prohibits the export of the key with an unauthenticated asymmetric key.
  - XPRTUASY: Permits the export of the key with an unauthenticated asymmetric key. This is the default.

- **Authenticated asymmetric-key export control (one, optional)**
  - Key-management field 1 for all algorithms and key types.
  - NOEXAASY: Prohibits the export of the key with an authenticated asymmetric key.
  - XPRTAASY: Permits the export of the key with an authenticated asymmetric key. This is the default.

- **RAW-format export control (one, optional)**
  - Key-management field 1 for all algorithms and key types.
  - NOEX-RAW: Prohibits the export of the key in RAW format. This is the default.
  - XPRT-RAW: Permits the export of the key in RAW format.

- **DES-key export control (one, optional)**
  - Key-management field 1 for all algorithms, all key types.
  - NOEX-DES: Prohibits the export of the key using DES key.
  - XPRT-DES: Permits the export of the key using DES key. This is the default.

- **AES-key export control (one, optional)**
  - Key-management field 1 for all algorithms, all key types.
  - NOEX-AES: Prohibits the export of the key using AES key.
  - XPRT-AES: Permits the export of the key using AES key. This is the default.

- **RSA-key export control (one, optional)**
  - Key-management field 1 for all algorithms, all key types.
  - NOEX-RSA: Prohibits the export of the key using RSA key.
  - XPRT-RSA: Permits the export of the key using RSA key. This is the default.

#### Key-usage keywords (these are specific to the key type specified)

- **Generate control (one required)**
  - Key-usage field 1 for HMAC algorithm, MAC key type.
  - GENERATE: Specifies that this key can be used to generate a MAC. A key that can generate a MAC can also verify a MAC.
### Key Token Build2

</tbody>
</table>

| clear_key_value  |
| Direction: Input | Type: String |
Key Token Build2

This parameter is used when the KEY-CLR keyword is specified. This parameter is the clear key value to be put into the token being built.

**key_name_length**
Direction: Input  Type: Integer

The length of the *key_name* parameter. Valid values are 0 and 64.

**key_name**
Direction: Input  Type: String

A 64-byte key store label to be stored in the associated data structure of the token.

**user_associated_data_length**
Direction: Input  Type: Integer

The length of the user-associated data. The valid values are 0 to 255 bytes.

**user_associated_data**
Direction: Input  Type: String

User-associated data to be stored in the associated data structure.

**token_data_length**
Direction: Input  Type: Integer

This parameter is reserved. The value must be zero.

**token_data**
Direction: Ignored  Type: String

This parameter is ignored.

**reserved_length**
Direction: Input  Type: Integer

This parameter is reserved. The value must be zero.

**reserved**
Direction: Ignored  Type: String

This parameter is ignored because *reserved_length* must be zero.

**target_key_token_length**
Direction: Input/Output  Type: Integer

On input, the length of the *target_key_token* parameter supplied to receive the token. On output, the actual length of the token returned to the caller. Maximum length is 725 bytes.
**Key Token Build2**

**target_key_token**

Direction: Output  
Type: String

The key token built by this service.

**Usage Notes**

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

**Key Translate (CSNBKTR and CSNEKTR)**

The Key Translate callable service uses one key-encrypting key to decipher an input key and then enciphers this key using another key-encrypting key within the secure environment.

**Note:** All key labels must be unique.

The callable service name for AMODE(64) invocation is CSNEKTR.

**Format**

```call CSBKTR(  
    return_code,  
    reason_code,  
    exit_data_length,  
    exit_data,  
    input_key_token,  
    input_KEK_key_identifier,  
    output_KEK_key_identifier,  
    output_key_token )```
Key Translate

Parameters

return_code
Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output  Type: String

The data that is passed to the installation exit.

input_key_token
Direction: Input  Type: String

A 64-byte string variable containing an external key token. The external key token contains the key to be re-enciphered (translated).

input_KEK_key_identifier
Direction: Input/Output  Type: String

A 64-byte string variable containing the internal key token or the key label of an internal key token record in the CKDS. The internal key token contains the key-encrypting key used to decipher the key. The internal key token must contain a control vector that specifies an importer or IKEYXLAT key type. The control vector for an importer key must have the XLATE bit set to 1.

output_KEK_key_identifier
Direction: Input/Output  Type: String

A 64-byte string variable containing the internal key token or the key label of an internal key token record in the CKDS. The internal key token contains the key-encrypting key used to encipher the key. The internal key token must contain a control vector that specifies an exporter or OKEYXLAT key type. The control vector for an exporter key must have the XLATE bit set to 1.
Key Translate

output_key_token

Direction: Output  Type: String

A 64-byte string variable containing an external key token. The external key
token contains the re-enciphered key.

ICSF supports two methods of wrapping the key value in a symmetric key
token: the original ECB wrapping and an enhanced CBC wrapping method
which is ANSI X9.24 compliant. The output_key_token will be wrapped in the
same manner as the input_key_token.

Restrictions

Triple length DATA key tokens are not supported.

This callable service does not support version X’10’ external DES key tokens (RKX
key tokens).

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service,
the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The Key Translate access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and
describes restrictions for this callable service.

Key Translate2 (CSNBKTR2 and CSNEKTR2)

The Key Translate2 callable service translates the input_key_token parameter in
one of several ways:
Key Translate2

- Changes an external DES or variable-length symmetric key token from encipherment under one key-encrypting key to another
- Changes the wrapping method of an external DES key token
- Converts an operational AES DATA token (version X'04') to an operational AES CIPHER token (version X'05') or converts an operational AES CIPHER token (version X'05') to an operational AES DATA token (version X'04')

To reencrypt a key token, specify the TRANSLAT rule array keyword (the default), the external key token, and the input and output key-encrypting keys. If the input_key_token is a DES key token, you can also specify which key wrapping method to use. If no wrapping method is specified, the system default wrapping method will be used.

To change the wrapping method of an external DES key token, specify the REFORMAT rule array keyword, the Key Wrapping Method to use, the external key token and the input key-encrypting key. If no wrapping method is specified, the system default wrapping method will be used. Note that the output_KEYK_identifier will be ignored.

To convert an operational AES DATA token (version X'04') to an operational AES CIPHER token (version X'05') or vice versa, specify the REFORMAT rule array keyword, the operational key token as input_key_token, and either a NULL token or skeleton token as output_key_token. Note that both the input_KEYK_identifier and the output_KEYK_identifier will be ignored as the corresponding lengths must be zero.

Note: All key labels must be unique.

Format

CALL CSNBKTR2(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    input_key_length,
    input_key_token,
    input_KEYK_length,
    input_KEYK_identifier,
    output_KEYK_length,
    output_KEYK_identifier,
    output_key_length,
    output_key_token )

Parameters

return_code

Direction: Output
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Key Translate2

**Direction:** Output  **Type:** Integer

The reason code specifies the result of the callable service that is returned to
the application program. Each return code has different reason codes that
indicate specific processing problems. Appendix A, “ICSF and TSS Return and
Reason Codes” lists the reason codes.

**exit_data_length**

**Direction:** Input/Output  **Type:** Integer

The length of the data that is passed to the installation exit. The length can be
from X'00000000' to X'7FFFFFFFFF' (2 gigabytes). The data is defined in the
**exit_data** parameter.

**exit_data**

**Direction:** Input/Output  **Type:** String

The data that is passed to the installation exit.

**rule_array_count**

**Direction:** Input  **Type:** Integer

The number of keywords you supplied in the **rule_array** parameter. The count
must be between 0 and 4, inclusive.

**rule_array**

**Direction:** Input  **Type:** String

Keywords that provide control information to the callable service. The keywords
must be 8 bytes of contiguous storage with the keyword left-justified in its
8-byte location and padded on the right with blanks.

</tr>
</thead>
<tbody>
<tr>
<td>USECONFG</td>
<td>Specifies that the system default configuration should be used to determine the wrapping method. This is the default. The system default key wrapping method can be specified using the DEFAULTWRAP parameter in the installation options data set. See the <a href="https://www.ibm.com/support/knowledgecenter/SSECG2_1.3.0/com.ibm.cics.doc/icsf/installation_options_data_set.htm">z/OS Cryptographic Services ICSF System Programmer's Guide</a>.</td>
</tr>
<tr>
<td>WRAP-ENH</td>
<td>Use enhanced key wrapping method, which is compliant with the ANSI X9.24 standard.</td>
</tr>
<tr>
<td>WRAP-ECB</td>
<td>Use original key wrapping method, which uses ECB wrapping for DES key tokens.</td>
</tr>
</tbody>
</table>

**Translation Control (optional, valid only with WRAP-ENH)**

| ENH-ONLY    | Restrict rewrapping of the output_key_token. Once the token has been wrapped with the enhanced method, it cannot be rewrapped using the original method. |

**Algorithm (optional)**

| AES         | Specifies that the input key is an AES key. Where used, the key-encrypting keys will be AES transport keys. |
| DES         | Specifies that the input key is a DES key. Where used, the key-encrypting keys will be DES transport keys. This is the default. |
| HMAC        | Specifies that the input key is an HMAC key. Where used, the key-encrypting keys will be AES transport keys. |

**input_key_length**

- **Direction:** Input
- **Type:** Integer

The length of the input_key_token in bytes. The maximum value allowed is 900.

**input_key_token**

- **Direction:** Input/Output
- **Type:** String

A variable length string variable containing the key token to be translated or reformatted.

If the REFORMAT keyword is specified and the input_key_token is an AES CIPHER key (version X'05'), the key must have the following characteristics:

- Key-usage field 1 allows the key to be used for encryption and decryption and has no UDX bits set (UDX bits are not supported in version '04'X AES tokens)
- Key-usage field 2 allows the key to be used for Cipher Block Chaining (CBC) mode or Electronic Code Book (ECB) mode
- Key-management field 1 allows export using symmetric, unauthenticated asymmetric, and authenticated asymmetric transport keys, and allows export using DES, AES, and RSA transport keys
- Key-management field 2 indicates that the key is complete

If the REFORMAT and AES keywords are specified and input_key_token was encrypted under the old master key, the token will be returned encrypted under the current master key.
input KEK_length

Direction: Input  
Type: Integer

The length of the input KEK_identifier in bytes. When the input KEK_identifier is a token, the value must be between the actual length of the token and 725. When the input KEK_identifier is a label, the value must be 64.

If the REFORMAT keyword is specified, and input_key_token is an AES key token, this parameter must be zero.

input KEK_identifier

Direction: Input/Output  
Type: String

A variable length string variable containing the internal key token or the key label of an internal key token record in the CKDS. The internal key token contains the key-encrypting key used to decipher the key.

If input KEK_length is zero, this parameter is ignored.

If the TRANSLAT keyword is specified and the input_key_token is an external DES key, the input KEK_identifier must be an internal DES token that contains a control vector that specifies an IMPORTER or IKEYXLAT key type. The control vector for an IMPORTER key must have the XLATE bit set to 1.

If the TRANSLAT keyword is specified and the input_key_token is an external variable-length key token, the input KEK_identifier must be an internal variable-length key token containing an IMPORTER key-encrypting key. The IMPORTER key must have the TRANSLAT bit on in key-usage field 1 of the token.

If the REFORMAT keyword is specified and input_key_token is an external DES key token, this parameter may be an IMPORTER, IKEYXLAT, EXPORTER, or OKEYXLAT key type.

If an internal token was supplied and was encrypted under the old master key, the token will be returned encrypted under the current master key.

output KEK_length

Direction: Input  
Type: Integer

The length of the output KEK_identifier in bytes. When the output KEK_identifier is a token, the value must be between the actual length of the token and 725. When the output KEK_identifier is a label, the value must be 64.

If the REFORMAT keyword is specified, this value must be zero.

output KEK_identifier

Direction: Input/Output  
Type: String

A variable length string variable containing the internal key token or the key label of an internal key token record in the CKDS. The internal key token contains the key-encrypting key used to encipher the key.

If output KEK_length is zero, this parameter is ignored.
If the `output_key_token` is an external DES key, the `output_KEY_identifier` must be an internal DES token that contains a control vector that specifies an EXPORTER or OKEYXLAT key type. The control vector for an EXPORTER key must have the XLATE bit set to 1.

If the `input_key_token` is an external variable-length key token, the `output_KEY_identifier` must be an internal variable-length key token containing an EXPORTER key-encrypting key. The EXPORTER key must have the TRANSLAT bit on in key-usage field 1 of the token.

If an internal token was supplied and was encrypted under the old master key, the token will be returned encrypted under the current master key.

**output_key_length**

Direction: Input/Output Type: Integer

On input, the length of the output area provided for the `output_key_token`. This must be between 64 and 900 bytes and provide sufficient space for the output key. On output, the parameter is updated with the length of the token copied to the `output_key_token`.

**output_key_token**

Direction: Input/Output Type: String

If the REFORMAT keyword is specified and the `input_key_token` is an AES DATA key (version X'04'), `output_key_token` must contain an AES CIPHER key (version X'05') on input. This token must have the following characteristics:

- Algorithm is AES
- Key type CIPHER
- Key-usage field 2 either allows the key to be used for Cipher Block Chaining (CBC) mode or allows the key to be used for Electronic Code Book (ECB) mode

Otherwise, this field is ignored on input.

On output, a variable length string variable containing the key token that was translated or reformatted.

If the REFORMAT keyword is specified and the `input_key_token` is an AES DATA key (version X'04'), on output, `output_key_token` will be updated with the following characteristics:

- Key-usage field 1 allows the key to be used for encryption and decryption
- Key-management field 1 allows export using symmetric, unauthenticated asymmetric, and authenticated asymmetric transport keys, and allows export using DES, AES, and RSA transport keys
- Key-management field 2 indicates that the key is complete

**Restrictions**

This callable service does not support version X'10' external DES key tokens (RDX key tokens).

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS.
Key Translate2

This table lists the access control points in the ICSF default role that control the function for this service.

Table 66. Key Translate2 Access Control Points

Multiple Clear Key Import (CSNBCKM and CSNECKM)

The multiple clear key import callable service imports a clear AES or DES key, enciphers the key under the corresponding master key, and returns the enciphered key in an internal key token. The enciphered key's type is DATA. The enciphered key is in operational form.

The callable service name for AMODE(64) invocation is CSNECKM.
Multiple Clear Key Import

Format

```
CALL CSNBCKM(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    clear_key_length,
    clear_key,
    key_identifier_length,
    key_identifier)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that are assigned to it that indicate specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  
Type: Integer

The number of keywords you are supplying in the `rule_array` parameter. The `rule_array_count` parameter must be 0, 1, 2, or 3. If the `rule_array_count` is 0, the default keywords are used.

**rule_array**

Direction: Input  
Type: String
Multiple Clear Key Import

Keywords that supply control information to the callable service. The keywords must be 8 bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks. Refer to Table 68 for a list of keywords.

Table 68. Keywords for Multiple Clear Key Import Rule Array Control Information

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Algorithm (optional)</strong></td>
<td></td>
</tr>
<tr>
<td>CDMF</td>
<td>The output key identifier is to be a CDMF token. For a DATA key of length 16 or 24, you may not specify CDMF. CDMF is only supported on CCF systems.</td>
</tr>
<tr>
<td>AES</td>
<td>The output key identifier is to be an AES token.</td>
</tr>
<tr>
<td>DES</td>
<td>The output key identifier is to be a DES token. This is the default.</td>
</tr>
<tr>
<td><strong>Key Wrapping Method (optional)</strong></td>
<td></td>
</tr>
<tr>
<td>USECONF</td>
<td>Specifies that the system default configuration should be used to determine the wrapping method. This is the default keyword. The system default key wrapping method can be specified using the DEFAULTWRAP parameter in the installation options data set. See the z/OS Cryptographic Services ICSF System Programmer's Guide.</td>
</tr>
<tr>
<td>WRAP-ENH</td>
<td>Use enhanced key wrapping method, which is compliant with the ANSI X9.24 standard.</td>
</tr>
<tr>
<td>WRAP-ECB</td>
<td>Use original key wrapping method, which uses ECB wrapping for DES key tokens and CBC wrapping for AES key tokens.</td>
</tr>
<tr>
<td><strong>Translation Control (optional)</strong></td>
<td></td>
</tr>
<tr>
<td>ENH-ONLY</td>
<td>Restrict rewrapping of the key_identifier token. Once the token has been wrapped with the enhanced method, it cannot be rewrapped using the original method.</td>
</tr>
</tbody>
</table>

clear_key_length
Direction: Input
Type: Integer

The `clear_key_length` specifies the length of the clear key value to import in bytes. For DES keys, this length must be 8-, 16-, or 24-bytes. For AES keys, this length must be 16-, 24-, or 32-bytes.

clear_key
Direction: Input
Type: String

The `clear_key` specifies the clear key value to import.

key_identifier_length
Direction: Input/Output
Type: Integer

The byte length of the `key_identifier` parameter. This must be exactly 64 bytes.

key_identifier
**Multiple Clear Key Import**

Direction: Input/Output  
Type: String

A 64-byte string that is to receive an internal AES or DES key token.

ICSF supports two methods of wrapping the key value in a symmetric key
token: the original ECB wrapping and an enhanced CBC wrapping method
which is ANSI X9.24 compliant. The output key_identifier will use the default
method unless a rule array keyword overriding the default is specified.

**Usage Notes**

This service produces an internal DES DATA token with a control vector which is
usable on the Cryptographic Coprocessor Feature. If a valid internal DES token is
supplied as input to the service in the key_identifier field, that token's control vector
will not be used in the encryption of the clear key value.

The following table shows the access control points in the ICSF role that control the
function of this service.

*Table 69. Required access control points for Multiple Clear Key Import*

<table>
<thead>
<tr>
<th>Key algorithm</th>
<th>Access control point</th>

</thead>
<tbody>
<tr>
<td>DES</td>
<td>Clear Key Import/Multiple Clear Key Import – DES</td>
</tr>
<tr>
<td>AES</td>
<td>Multiple Clear Key Import/Multiple Secure Key Import – AES</td>
</tr>
</tbody>
</table>

When the WRAP-ECB or WRAP-ENH keywords are specified and default
key-wrapping method setting does not match the keyword, the **Multiple Clear Key
Import - Allow wrapping override keywords** access control point must be
enabled.

This table lists the required cryptographic hardware for each server type and
describes restrictions for this callable service.

Multiple Secure Key Import (CSNBSKMK and CSNESKMK)

Use this service to encipher a single-length, double-length, or triple-length DES key under the system master key or an importer key-encrypting key. The clear DES key can then be imported as any of the possible key types.

In addition to DES keys, this service imports a clear AES key, enciphers the AES key under the AES master key, and returns the enciphered key in an internal token. The enciphered key’s type is DATA. The enciphered key is in operational form.

The callable service can execute only when ICSF is in special secure mode, which is described in “Special Secure Mode” on page 10.

The callable service name for AMODE(64) invocation is CSNESKMK.
Multiple Secure Key Import

Format

```
CALL CSNBSKM(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    clear_key_length,
    clear_key,
    key_type,
    key_form,
    key_encrypting_key_identifier,
    imported_key_identifier_length,
    imported_key_identifier )
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  
Type: Integer

The number of keywords you are supplying in the `rule_array` parameter. The `rule_array_count` parameter must be 0, 1, 2, 3, or 4. If the `rule_array_count` is 0, the default keywords are used.
Multiple Secure Key Import

Zero, one or two keywords that supply control information to the callable service. The keywords must be 8 bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks. The keywords are shown in Table 71.

The first keyword is the algorithm. If no algorithm is specified, the system default algorithm is used. If no algorithm is specified on a CDMF only system and either a double- or triple-length DATA key is specified, the token is marked DES. The algorithm keyword applies only when the desired output token is of key form OP and key type IMPORTER, EXPORTER, or DATA. For key form IM or any other key type, specifying DES or CDMF causes an error.

The second keyword is optional and specifies that the output key token be marked as an NOCV-KEK.

The third keyword is optional, and specifies whether the original key wrapping method or the enhanced key wrapping method (which is compliant with the ANSI X9.24 standard) should be used.

The fourth keyword enables an application to specify that the imported_key_identifier output token can not be rewrapped using the original wrapping method after it has been wrapped using the enhanced method.

Table 71. Keywords for Multiple Secure Key Import Rule Array Control Information

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Algorithm (optional)</td>
<td></td>
</tr>
<tr>
<td>CDMF</td>
<td>The output key identifier is to be a CDMF token. For a DATA key of length 16 or 24, you may not specify CDMF. CDMF is only supported on CCF systems.</td>
</tr>
<tr>
<td>AES</td>
<td>The output key identifier is to be a AES token.</td>
</tr>
<tr>
<td>DES</td>
<td>The output key identifier is to be a DES token. This is the default.</td>
</tr>
</tbody>
</table>

NOCV Choice (optional)

| NOCV-KEK         | The output token is to be marked as an NOCV-KEK. This keyword only applies if key form is OP and key type is IMPORTER, EXPORTER or IMP-PKA. For key form IM or any other key type, specifying NOCV-KEK causes an error. |

Key Wrapping Method (optional)

| USECONFG         | Specifies that the system default configuration should be used to determine the wrapping method. This is the default keyword. The system default key wrapping method can be specified using the DEFAULTWRAP parameter in the installation options data set. See the z/OS Cryptographic Services ICSF System Programmer’s Guide. |
| WRAP-ENH         | Use enhanced key wrapping method, which is compliant with the ANSI X9.24 standard.                                                                                                                     |
| WRAP-ECB         | Use original key wrapping method, which uses ECB wrapping for DES key tokens and CBC wrapping for AES key tokens.                                                                                         |

Translation Control (optional)

Chapter 5. Managing Symmetric Cryptographic Keys 211
### Table 71. Keywords for Multiple Secure Key Import Rule Array Control Information (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENH-ONLY</td>
<td>Restrict rewrapping of the imported_key_identifier token. Once the token has been wrapped with the enhanced method, it cannot be rewrapped using the original method.</td>
</tr>
</tbody>
</table>

#### clear_key_length

**Direction:** Input  
**Type:** Integer

The `clear_key_length` specifies the length of the clear key value to import in bytes. For AES keys, this length must be 16-, 24-, or 32-bytes. For DES keys, this length must be 8-, 16- or 24-bytes.

#### clear_key

**Direction:** Input  
**Type:** String

The `clear_key` specifies the AES or DES clear key value to import.

#### key_type

**Direction:** Input  
**Type:** 8 Character String

The type of key you want to encipher under the master key or an importer key. Specify an 8-byte field that must contain a keyword from this list or the keyword TOKEN. For types with fewer than 8 characters, the type should be padded on the right with blanks. If the key type is TOKEN, ICSF determines the key type from the control vector (CV) field in the internal key token provided in the `imported_key_identifier` parameter. When `key_type` is TOKEN, ICSF does not check for the length of the key but uses the `clear_key_length` parameter to determine the length of the key.

Key type values for the Multiple Secure Key Import callable service are: CIPHER, CVARDEC, CVARENC, CVARPINE, CVARXCVL, CVARXCVR, DATA, DATAM, DATAMV, DATAVAL, DECIPHER, ENCIPHER, EXPORTER, IKEYXLAT, IMPORTER, IMP-PKA, IPINENC, MAC, MACVER, OKEYXLAT, OPINENC, PINGEN and PINVER. For information on the meaning of the key types, see [Table 3 on page 23](#).

#### key_form

**Direction:** Input  
**Type:** 4 Character String

The key form you want to generate. Enter a 4-byte keyword specifying whether the key should be enciphered under the master key (OP) or the importer key-encrypting key (IM). The keyword must be left-justified and padded with blanks. Valid DES keyword values are OP for encryption under the master key or IM for encryption under the importer key-encrypting key. If you specify IM, you must specify an importer key-encrypting key in the `key_encrypting_key_identifier` parameter. For a `key_type` of IMP-PKA, this service supports only the OP `key_form`.

The only valid AES keyword value is OP.

#### key_encrypting_key_identifier

...
Multiple Secure Key Import

Direction: Input/Output  Type: String

A 64-byte string internal key token or key label of a DES importer
key-encrypting key. This parameter is ignored for AES secure keys.

imported_key_identifier_length

Direction: Input/Output  Type: Integer

The byte length of the imported_key_identifier parameter. This must be at least
64.

imported_key_identifier

Direction: Input/Output  Type: String

A 64-byte string that is to receive the output key token. If OP is specified in the
key_form parameter, the service returns an internal key token. If IM is specified
in the key_form parameter, the service returns an external key token. On input,
this parameter is ignored except when the key_type is TOKEN. If you specify a
key_type of TOKEN, then this field contains a valid token of the key_type you
want to encipher. See key_type for a list of valid key types. Appendix B, “Key
Token Formats,” on page 777 describes the key tokens.

Note that for a DATA key of length 16 or 24, no reference will be made to the
data encryption algorithm bits or to the system's default algorithm; the token will
be marked DES.

ICSF supports two methods of wrapping the key value in a symmetric key
token: the original ECB wrapping and an enhanced CBC wrapping method
which is ANSI X9.24 compliant. The output imported_key_identifier will use the
default method unless a rule array keyword overriding the default is specified.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service,
the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

On CCF systems, to generate double-length DATAM and DATAMV keys in the
importable form, the ANSI system keys must be installed in the CKDS.

CDMF is only supported on CCF systems.

With a PCIXCC, CEX2C, or CEX3C, creation of a DES NOCV key-encrypting key is
only available for standard IMPORTERs and EXPORTERs.

On an IBM @server zSeries 990, if key_form of the DES key is IM and the
key_encrypting_key_identifier is a NOCV KEK, then the NOCV IMPORTER access
control point must be enabled in the PCIXCC to use the function.

The following table shows the access control points in the ICSF role that control the
function of this service.

Table 72. Required access control points for Multiple Secure Key Import

<table>
<thead>
<tr>
<th>Key Algorithm and Key Form</th>
<th>Access control point</th>
</tr>
</thead>
<tbody>
<tr>
<td>DES OP</td>
<td>Secure Key Import - DES, OP</td>
</tr>
<tr>
<td>DES IM</td>
<td>Secure Key Import - DES, IM</td>
</tr>
</tbody>
</table>
Multiple Secure Key Import

Table 72. Required access control points for Multiple Secure Key Import (continued)

<table>
<thead>
<tr>
<th>Key Algorithm and Key Form</th>
<th>Access control point</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES OP</td>
<td>Multiple Clear Key Import/Multiple Secure Key Import – AES</td>
</tr>
</tbody>
</table>

To use a NOCV key-encrypting key with the Multiple Secure Key Import service, the **NOCV KEK usage for import-related functions** access control point must be enabled in addition to one or both of the access control points listed.

When the WRAP-ECB or WRAP-ENH keywords are specified and default key-wrapping method setting does not match the keyword, the **Multiple Secure Key Import - Allow wrapping override** keywords access control point must be enabled.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

**PKA Decrypt (CSNDPKD and CSNFPKD)**

Use this service to decrypt (unwrap) a formatted key value. The service unwraps the key, deformats it, and returns the deformatted value to the application in the clear. PKCS 1.2 and ZERO-PAD formatting is supported. For PKCS 1.2, the decrypted data is examined to ensure it meets RSA DSI PKCS #1 block type 2 format specifications. ZERO-PAD is only supported for external RSA clear private keys.

This service allows the use of clear or encrypted RSA private keys. If an external clear key token is used, the master keys are not required to be installed in any cryptographic coprocessor and PKA callable services does not have to be enabled. Requests are routed to a PCICA if available when a clear key token is used.
PKA Decrypt

The callable service name for AMODE(64) invocation is CSNFPKD.

Format

```c
CALL CSNDPKD(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    PKA_enciphered_keyvalue_length,
    PKA_enciphered_keyvalue,
    data_structure_length,
    data_structure,
    PKA_key_identifier_length,
    PKA_key_identifier,
    target_keyvalue_length,
    target_keyvalue)
```

Parameters

**return_code**

Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that are assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. This value must be 1.
PKA Decrypt

**rule_array**

Direction: Input Type: String

The keyword that provides control information to the callable service. The keyword is left-justified in an 8-byte field and padded on the right with blanks.

*Table 74. Keywords for PKA Decrypt*

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recovery Method (required)</td>
<td>specifies the method to use to recover the key value.</td>
</tr>
<tr>
<td>PKCS-1.2</td>
<td>RSA DSI PKCS #1 block type 02 will be used to recover the key value.</td>
</tr>
<tr>
<td>ZERO-PAD</td>
<td>The input PKA_enciphered_keyvalue is decrypted using the RSA private key. The entire result (including leading zeros) will be returned in the target_keyvalue field. The PKA_key_identifier must be an external RSA token or the labelname of a external token. This keyword requires requires May 2004 or later version of Licensed Internal Code (LIC) or a z890. This support on the PCICA does not require LIC code updates.</td>
</tr>
</tbody>
</table>

**PKA_enciphered_keyvalue_length**

Direction: Input Type: Integer

The length of the PKA_enciphered_keyvalue parameter in bytes. The maximum size that you can specify is 512 bytes. The length should be the same as the modulus length of the PKA_key_identifier.

**PKA_enciphered_keyvalue**

Direction: Input Type: String

This field contains the key value protected under an RSA public key. This byte-length string is left-justified within the PKA_enciphered_keyvalue parameter.

**data_structure_length**

Direction: Input Type: Integer

The value must be 0.

**data_structure**

Direction: Input Type: String

This field is currently ignored.

**PKA_key_identifier_length**

Direction: Input Type: Integer
PKA Decrypt

The length of the *PKA_key_identifier* parameter. When the *PKA_key_identifier* is a key label, this field specifies the length of the label. The maximum size that you can specify is 3500 bytes.

**PKA_key_identifier**

Direction: Input  
Type: String

An internal RSA private key token, the label of an internal RSA private key token, or an external RSA private key token containing a clear RSA private key in modulus-exponent or Chinese Remainder format. The corresponding public key was used to wrap the key value.

**target_keyvalue_length**

Direction: Input/Output  
Type: Integer

The length of the *target_keyvalue* parameter. The maximum size that you can specify is 512 bytes. On return, this field is updated with the actual length of *target_keyvalue*.

If ZERO-PAD is specified, this length will be the same as the *PKA_enciphered_keyvalue_length* which is equal to the RSA modulus byte length.

**target_keyvalue**

Direction: Output  
Type: String

This field will contain the decrypted, deformatted key value. If ZERO-PAD is specified, the decrypted key value, including leading zeros, will be returned.

**Restrictions**

The exponent of the RSA public key must be odd.

Access control checking will not be performed in the PCI Cryptographic Coprocessor when a clear external key token is supplied.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The RSA private key must be enabled for key management functions.

The hardware configuration sets the limit on the modulus size of keys for key management; thus, this service will fail if the RSA key modulus bit length exceeds this limit.

**Routing of requests to coprocessors for systems with CCFs:** This service examines the RSA key specified in the *PKA_key_identifier* parameter to determine how to route the request.

- If the modulus bit length is less than 512 bits, or if the key is a X'02' form modulus-exponent private key, ICSF routes the request to the Cryptographic Coprocessor Feature.
- If the key is a X'08' form CRT private key or a retained private key, the service routes the request to a PCI Cryptographic Coprocessor.
PKA Decrypt

- In the case of a retained key, the service routes the request to the specific PCI Cryptographic Coprocessor in which the key is retained.
- If the key is a modulus-exponent form private key with a private section ID of X'06', then the service routes the request as follows:
  - Since the key must be a key-management key, if the KMMK is equal to the SMK on the Cryptographic Coprocessor Feature, the PKA decrypt service uses load balancing to route the request to either a Cryptographic Coprocessor Feature or to an available PCI Cryptographic Coprocessor.
  - If the KMMK is not equal to the SMK on the Cryptographic Coprocessor Feature, the request must be processed on a PCI Cryptographic Coprocessor.
    If there is no PCI Cryptographic Coprocessor online, the request will fail.
- If the key is an external clear key, the request is routed in this order of preference.
  - PCICA
  - PCICC
  - CCF

The PKA Decrypt access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

---

**PKA Encrypt (CSNDPKE and CSNFPKE)**

This callable service encrypts a supplied clear key value under an RSA public key. The rule array keyword specifies the format of the key prior to encryption.

On the z900 and if the ZERO-PAD or MRP keyword is specified, this service is routed to a PCI Cryptographic Accelerator.
PKA Encrypt

The callable service name for AMODE(64) invocation is CSNFPKE.

Format

CALL CSNDPKE(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,

    PKA_key_identifier_length,
    PKA_key_identifier,
    PKA_enciphered_keyvalue_length,
    PKA_enciphered_keyvalue)

Parameters

return_code
Direction: Output Type: Integer
The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer
The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that are assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer
The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String
The data that is passed to the installation exit.

rule_array_count
Direction: Input Type: Integer
The number of keywords you supplied in the rule_array parameter. This value can be 1 or 2.

rule_array
PKA Encrypt

Direction: Input  Type: String

A keyword that provides control information to the callable service. The keyword is left-justified in an 8-byte field and padded on the right with blanks.

Table 76. Keywords for PKA Encrypt

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Formatting Method (required)</td>
<td>specifies the method to use to format the key value prior to encryption.</td>
</tr>
<tr>
<td>PKCS-1.2</td>
<td>RSA DSI PKCS #1 block type 02 format will be used to format the supplied key value.</td>
</tr>
<tr>
<td>ZERO-PAD</td>
<td>The key value will be padded on the left with binary zeros to the length of the PKA key modulus. The exponent of the public key must be odd.</td>
</tr>
<tr>
<td>MRP</td>
<td>The key value will be padded on the left with binary zeros to the length of the PKA key modulus. The RSA public key may have an even or odd exponent. This keyword requires May 2004 or later version of Licensed Internal Code (LIC) or a z890. For PCICAs, the LIC code update is not required.</td>
</tr>
</tbody>
</table>

Key Rule (Optional)

| KEYIDENT | This indicates that the value in the keyvalue field is the label of clear tokens in the CKDS. The keyvalue_length must be 64. |

keyvalue_length

Direction: Input  Type: Integer

The length of the keyvalue parameter. The maximum field size is 512 bytes. The actual maximum size depends on the modulus length of PKA_key_identifier and the formatting method you specify in the rule_array parameter. When key rule KEYIDENT is specified, then the keyvalue_length parameter is required to be 64 bytes.

keyvalue

Direction: Input  Type: String

This field contains the supplied clear key value to be encrypted under the PKA_key_identifier. When key rule KEYIDENT is specified, the keyvalue parameter is assumed to contain a label for a valid CKDS clear key token.

data_structure_length

Direction: Input  Type: Integer

This value must be 0.

data_structure

Direction: Input  Type: String

This field is currently ignored.

PKA_key_identifier_length
The length of the `PKA_key_identifier` parameter. When the `PKA_key_identifier` is a key label, this field specifies the length of the label. The maximum size that you can specify is 3500 bytes.

**PKA_key_identifier**

Direction: Input  Type: String

The RSA public or private key token or the label of the RSA public or private key to be used to encrypt the supplied key value.

**PKA_enciphered_keyvalue_length**

Direction: Input/Output  Type: integer

The length of the `PKA_enciphered_keyvalue` parameter in bytes. The maximum size that you can specify is 512 bytes. On return, this field is updated with the actual length of `PKA_enciphered_keyvalue`.

This length should be the same as the modulus length of the `PKA_key_identifier`.

**PKA_enciphered_keyvalue**

Direction: Output  Type: String

This field contains the key value protected under an RSA public key. This byte-length string is left-justified within the `PKA_enciphered_keyvalue` parameter.

**Restrictions**

The exponent for RSA public keys must be odd. When the modulus is greater than 2048, the public key exponent must be 3 or 65537.

**Usage Notes**

- SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.
- For RSA DSI PKCS #1 formatting, the key value length must be at least 11 bytes less than the modulus length of the RSA key.
- The hardware configuration sets the limit on the modulus size of keys for key management; thus, this service will fail if the RSA key modulus bit length exceeds this limit.
- The key value to be encrypted must be smaller than the modulus in the `PKA_key_identifier`.

The **PKA Encrypt** access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

</tbody>
</table>
Prohibit Export (CSNBPEX and CSNEPEX)

Use this service to modify an exportable internal DES key token so that it cannot be exported.

The callable service name for AMODE(64) invocation is CSNEPEX.

Format

```
CALL CSNBPEX(  
    return_code,  
    reason_code,  
    exit_data_length,  
    exit_data,  
    key_identifier)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**key_identifier**

Direction: Input/Output  
Type: String

A 64-byte string variable containing the internal key token to be modified. The returned key_identifier will be encrypted under the current master key.

ICSF supports two methods of wrapping the key value in a symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method.
Prohibit Export

which is ANSI X9.24 compliant. The output key_identifier will be wrapped in the same manner as the input key_identifier.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The Prohibit Export access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

<table>
<thead>
<tr>

</tbody>
</table>

Prohibit Export Extended (CSNBPEXX and CSNEPEXX)

Use the prohibit export extended callable service to change the external token of a cryptographic key in exportable DES key token form so that it can be imported at the receiver node and is non-exportable from that node. You cannot prohibit export of DATA keys.

The inputs are an external token of the key to change in the source_key_token parameter and the label or internal token of the exporter key-encrypting key in the KEK_key_identifier parameter.

This service is a variation of the Prohibit Export service (CSNBPEX and CSNEPEX), which supports changing an internal token.

The callable service name for AMODE(64) invocation is CSNEPEXX.
Prohibit Export Extended

Format

CALL CSNBPEXX(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    source_key_token,
    KEK_key_identifier)

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

source_key_token
Direction: Input/Output Type: String

A 64-byte string of an external token of a key to change. It is in exportable form.

ICSF supports two methods of wrapping the key value in a symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method which is ANSI X9.24 compliant. The output source_key_token will be wrapped in the same manner as the input source_key_token.

KEK_key_identifier
Direction: Input/Output Type: String
Prohibit Export Extended

A 64-byte string of an internal token or label of the exporter KEK used to encrypt the key contained in the external token specified in the previous parameter.

Restrictions

This callable service does not support version X'10' external DES key tokens (RKX key tokens).

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The Prohibit Export Extended access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

<table>
<thead>
<tr>

</tbody>
</table>

Random Number Generate (CSNBRNG, CSNERNG, CSNBRNGL and CSNERNGL)

The callable service uses the cryptographic feature to generate a random number. The foundation for the random number generator is a time variant input with a very low probability of recycling.

There are two forms of the Random Number Generate callable service. One version returns an 8-byte random number. The second version allows the caller to specify the length of the random number.

Note: Random Number Generate on a z900 server requires the symmetric-keys master key to be set prior to using the service.
Random Number Generate

The callable service names for AMODE(64) invocation are CSNERNG and CSNERNGL.

Format

CALL CSNERNG(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    form,
    random_number )

CALL CSNERNGL(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    reserved,
    reserved,
    random_number_length,
    random_number )

Parameters

return_code
Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output  Type: String

The data that is passed to the installation exit.

form
Random Number Generate

Direction: Input Type: Character string

The 8-byte keyword that defines the characteristics of the random number should be left-justified and pad on the right with blanks. The keywords are listed in Table 80.

Table 80. Keywords for the Form Parameter

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVEN</td>
<td>Generate a 64-bit random number with even parity in each byte.</td>
</tr>
<tr>
<td>ODD</td>
<td>Generate a 64-bit random number with odd parity in each byte.</td>
</tr>
<tr>
<td>RANDOM</td>
<td>Generate a 64-bit random number.</td>
</tr>
</tbody>
</table>

Parity is calculated on the 7 high-order bits in each byte and is presented in the low-order bit in the byte.

rule_array_count

Direction: Input Type: Integer

The number of keywords you are supplying in the rule_array parameter. The value must be one.

rule_array

Direction: Input Type: String

The keyword that provides control information to the callable service. The recovery method is the method to use to recover the symmetric key. The keyword is left-justified in an 8-byte field and padded on the right with blanks. All keywords must be in contiguous storage.

Table 81. Keywords for Random Number Generate Control Information

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parity of the random number bytes (required)</td>
<td>Generate a random number with even parity in each byte. Its length is the random_number_length.</td>
</tr>
<tr>
<td>EVEN</td>
<td>Generate a random number with odd parity in each byte. Its length is the random_number_length.</td>
</tr>
<tr>
<td>RANDOM</td>
<td>Generate a random number. Its length is the random_number_length.</td>
</tr>
</tbody>
</table>

reserved_length

Direction: Input Type: Integer

This parameter must be zero.

reserved

Direction: Input Type: Integer

This parameter is ignored.
Random Number Generate

**random_number_length**

*Direction: Input/Output*  
*Type: Integer*

This parameter contains the desired length of the *random_number* that is returned by the CSNBRNG callable service. The minimum value is 1 byte; the maximum value is 8192 bytes.

**random_number**

*Direction: Output*  
*Type: String*

The generated number returned by the CSNBRNG callable service is stored in an 8-byte variable.

The generated number returned by the CSNBRNGL callable service is stored in a variable that is at least *random_number_length* bytes long.

**Usage Notes**

The CSNBRNGL callable service returns a value under the following conditions:

- The server has the cryptographic coprocessor that supports CSNBRNGL and the coprocessor creates the random number with the desired length. This requires a CEX2C or CEX3C with a version of the licensed internal code (LIC) that supports the RNGL verb.
- The server has the cryptographic coprocessor that processes CSNBRNG requests. In this case, the CSNBRNGL callable service calls the processor to create the random number with the desired length, 8 bytes at a time.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

*Table 82. Random number generate required hardware*

Remote Key Export

Remote Key Export (CSNDRKX and CSNFRKX)

This callable service uses the trusted block to generate or export DES keys for local use and for distribution to an ATM or other remote device. RKX uses a special structure to hold encrypted symmetric keys in a way that binds them to the trusted block and allows sequences of RKX calls to be bound together as if they were an atomic operation.

The callable service name for AMODE(64) invocation is CSNFRKX.

Format

```
CALL CSNDRKX(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    trusted_block_length,
    trusted_block_identifier,
    certificate_length,
    certificate,
    certificate_parms_length,
    certificate_parms,
    transport_key_length,
    transport_key_identifier,
    rule_id_length,
    rule_id,
    importer_key_length,
    importer_key_identifier,
    source_key_length,
    source_key_identifier,
    asym_encrypted_key_length,
    asym_encrypted_key,
    sym_encrypted_key_length,
    sym_encrypted_key,
    extra_data_length,
    extra_data,
    key_check_parameters_length,
    key_check_parameters,
    key_check_length,
    key_check_value)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the specific results of processing. Each return code has different reason codes that indicate specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the reason codes.
Remote Key Export

**exit_data_length**
Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**
Direction: Input/Output  Type: String

The data that is passed to the installation exit.

**rule_array_count**
Direction: Input  Type: Integer

The number of keywords you are supplying in the rule_array parameter. This number must be 0.

**rule_array**
Direction: Input  Type: String

Specifies a string variable containing an array of keywords. Currently no rule_array keywords are defined for this service, but you must still specify this parameter.

**trusted_block_length**
Direction: Input  Type: Integer

Specifies the number of bytes in the trusted_block_identifier parameter. The maximum length is 3500 bytes.

**trusted_block_identifier**
Direction: Input  Type: String

Specifies a trusted block label or trusted block token of an internal/complete trusted block constructed by the service, which is used to validate the public key certificate (certificate) and to define the rules for key generation and export.

**certificate_length**
Direction: Input  Type: Integer

Specifies the number of bytes in the certificate parameter. The maximum is 5000 bytes.

If the certificate_length is zero and the trusted block's Asymmetric Encrypted Output Key Format indicates no asymmetric key output, this service will not attempt to use or validate the certificate in any way. Consequently, the output parameter asym_encrypted_key_length will contain zero and output parameter asym_encrypted_key will not be changed from its input content.

If the certificate length is zero and the trusted block's Asymmetric Encrypted Output Key Format indicates PKCS1.2 output format or RSAOAEP output format, this service will exit with an error.
Remote Key Export

If the certificate_length is non-zero and the trusted block's Asymmetric Encrypted Output Key Format indicates no asymmetric key output, this service will fail.

certificate

Direction: Input  Type: String

Contains a public-key certificate. The certificate must contain the public key modulus and exponent in binary_form, as well as a digital signature. The signature in the certificate will be verified using the root public key that is in the trusted block supplied in trusted_block_identifier parameter.

certificate_parms_length

Direction: Input  Type: Integer

Contains the number of bytes in the certificate_parms parameter. The length must be 36 bytes.

certificate_parms

Direction: Input  Type: String

Contains a structure provided by the caller used for identifying the location and length of values within the certificate in parameter certificate. For each of the values used by RKX, the structure contains offsets from the start of the certificate and length in bytes. It is the responsibility of the calling application program to provide these values. This method gives the greatest flexibility to support different certificate formats. The structure has this layout:

Table 83. Structure of values used by RKX

<table>
<thead>
<tr>
<th>Offset (bytes)</th>
<th>Length (bytes)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

<tr>
<td>0x03</td>
<td>RIPEMD-160</td>
</tr>
</tbody>
</table>

transport_key_length

Direction: Input  Type: Integer

Contains the number of bytes in the transport_key_identifier parameter.

transport_key_identifier

Direction: Input  Type: String

Contains a label of an internal key token, or an RKX token for a Key Encrypting Key (KEK) that is used to encrypt a key exported by the RKX service. A transport key will not be used to encrypt a generated key.

For flag bit0=1 (export existing key) within Rule section and parameter rule_id = Rule section ruleID, the transport_key_identifier encrypts the exported version of the key received in parameter source_key_identifier. The service can distinguish between the internal key token or RKX key token by virtue of the version number at offset 0x04 contained in the key token and the flag value at offset 0x00 as follows:

Table 85. Transport_key_identifier used by RKX

<table>
<thead>
<tr>
<th>Flag Byte Offset 00</th>
<th>Version Number Offset 04</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x01</td>

<td>0x02</td>
<td>0x10</td>
<td>RKX Key token (Flag byte 0x02 indicates external key token)</td>
</tr>
</tbody>
</table>

rule_id_length

Direction: Input  Type: Integer

Contains the number of bytes in the rule_id parameter. The value must be 8.

rule_id

Direction: Input  Type: String

Specifies the rule in the trusted block that will be used to control key generation or export. The trusted block can contain multiple rules, each of which is identified by a rule ID value.
Remote Key Export

importer_key_length
Direction: Input Type: Integer
Contains the number of bytes in the importer_key_identifier parameter. It must be zero if the Generate/Export flag in the rule section (section 0x12) of the Trusted Block is a zero, indicating a new key is to be generated.

importer_key_identifier
Direction: Input Type: String
Contains a key token or key label for the IMPORTER key-encrypting key that is used to decipher the key passed in parameter source_key_identifier. It is unused if either RKX is being used to generate a key, or if the source_key_identifier is an RKX key token.

source_key_length
Direction: Input Type: Integer
Contains the number of bytes in the source_key_identifier parameter. The parameter must be 0 if the trusted block Rule section ruleID = rule_id parameter and the flag bit0 = 0 (Generate new key).
The parameter must be 64 if the trusted block Rule section has a flag bit0 = 1 (Export existing key).

source_key_identifier
Direction: Input Type: String
Contains a label of a single or double length external or internal key token or an RKX key token for a key to be exported. It must be empty (source_key_length=0) if RKX is used to generate a new key. The service examines the key token to determine which form has been provided. This parameter is known as the source_key_identifier in other callable services.

<table>
<thead>
<tr>
<th>Flag Byte Offset 00</th>
<th>Version Number Offset 04</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0X01</td>
<td>0X00</td>

<td>External DES key token version 1</td>
</tr>
<tr>
<td>0X02</td>
<td>0X10</td>
<td>RKX Key token (Flag byte 0x02 indicates external key token)</td>
</tr>
</tbody>
</table>

asym_encrypted_key_length
Direction: Input/Output Type: Integer
The length of the asym_encrypted_key parameter. On input, it is the length of the storage to receive the output. On output, it is the length of the data returned in the asym_encrypted_key parameter. The maximum length is 512 bytes.

asym_encrypted_key
Remote Key Export

Direction: Output Type: String

The contents of this field is ignored on input. A string buffer RKX will use to return a generated or exported key that is encrypted under the public (asymmetric) key passed in parameter certificate. An error will be returned if the caller’s buffer is too small to hold the value that would be returned.

**sym_encrypted_key_length**

Direction: Input/Output Type: Integer

On input, the `sym_encrypted_key_length` parameter is an integer variable containing the number of bytes in the `sym_encrypted_key` field. On output, that value in `sym_encrypted_key_length` is replaced with the length of the key returned in `sym_encrypted_key` field.

**sym_encrypted_key**

Direction: Output Type: String

`Sym_encrypted_key` is the string buffer RKX uses to return a generated or exported key that is encrypted under the transport_key_identifier parameter. The value returned will be 64 bytes. An error will be returned if the caller's buffer is smaller than 64 bytes, and so too small to hold the value that would be returned. The `sym_encrypted_key` may be an RKX key token or a key token depending upon the value of the Symmetric Encrypted Output Key Format value of the Rule section within the trusted_block_identifier parameter.

ICSF supports two methods of wrapping the key value in a symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method which is ANSI X9.24 compliant. The `sym_encrypted_key` will be wrapped in the same manner as the `source_key_identifier`.

**extra_data_length**

Direction: Input Type: Integer

Contains the number of bytes of data in the `extra_data` parameter. It must be zero if the output format for the RSA-encrypted key returned in `sym_encrypted_key` is anything but RSAOAEP. The maximum size is 1024 bytes.

**extra_data**

Direction: Input Type: String

Can be used in the OAEP key wrapping process. `Extra_data` is optional and is only applicable when the output format for the RSA-encrypted key returned in `sym_encrypted_key` is RSAOAEP.

**Note:** RSAOAEP format is specified in the rule in the trusted block.

**key_check_parameters_length**

Direction: Input Type: Integer
Remote Key Export

Contains the number of bytes in the key_check_parameters parameter. Currently, none of the defined key check algorithms require any key check parameters, so this field must specify 0.

**key_check_parameters**

**Direction:** Input  **Type:** String

Contains parameters that are required to calculate a key check value parameter, which will be returned in key_check_value. Currently, none of the defined key check algorithms require any key check parameters, but you must still specify this parameter.

**key_check_length**

**Direction:** Input/Output  **Type:** Integer

On input this parameter contains the number of bytes in the key_check_value parameter. On output, the value is replaced with the length of the key check value returned in the key_check_value parameter. The length depends on the key-check algorithm identifier. See Table 362 on page 816.

**key_check_value**

**Direction:** Output  **Type:** String

Used by RKX to return a key check value that calculates on the generated or exported key. Values in the rule specified with rule_id can specify a key check algorithm that should be used to calculate this output value.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The Remote Key Export - Gen or export a non-CCA node Key access control point controls the function of this service.

To use a NOCV IMPORTER key-encrypting key with the remote key export service, the NOCV KEK usage for import-related functions access control point must be enabled in addition to one or both of the access control points listed.

To use a NOCV EXPORTER key-encrypting key with the remote key export service, the NOCV KEK usage for export-related functions access control point must be enabled in addition to one or both of the access control points listed.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Restrict Key Attribute (CSNBRKA and CSNERKA)

Use the Restrict Key Attribute callable service to modify an exportable internal or external CCA symmetric key-token so that its key can no longer be exported.

The callable service name for AMODE(64) is CSNERKA.

Format

```plaintext
CALL CSNBRKA(
     return_code,
     reason_code,
     exit_data_length,
     exit_data,
     rule_array_count,
     rule_array,
     key_identifier_length,
     key_identifier,
     key_encrypting_key_identifier_length,
     key_encrypting_key_identifier,
     opt_parameter1_length,
     opt_parameter1,
     opt_parameter2_length,
     opt_parameter2)
```

Parameters

**return_code**

Direction: Output
Type: Integer
Restrict Key Attribute

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. The value must be between 1 and 10, inclusive.

rule_array
Direction: Input Type: String

The rule_array contains keywords that provide control information to the callable service. The keywords must be in contiguous storage with each of the keywords left-justified in its own 8-byte location and padded on the right with blanks.

Table 88. Keywords for Restrict Key Attribute Control Information

<td>Prohibits the key from being exported using an authenticated asymmetric key (for example, an RSA key in a trusted block token). This rule is not valid for Token Type DES.</td>
</tr>
<tr>
<td>NOEXUASY</td>
<td>Prohibits the key from being exported using an unauthenticated asymmetric key. This rule is not valid for Token Type DES.</td>
</tr>
<tr>
<td>NOT31XPT</td>
<td>For DES internal tokens, set bit 57 of the CV to 1 to prohibit TR-31 export of the key. This rule is only valid for Token Type DES.</td>
</tr>
</tbody>
</table>

**Input Transport Key (Optional)**

| IKEK-AES     | Specifies the KEK is an AES transport key. This is the default for Token Types AES and HMAC, and is not allowed with Token Type DES.                                                              |
| IKEK-DES     | Specifies the KEK is a DES transport key This is the default for Token Type DES.                                                                                                               |
| IKEK-PKA     | Specifies the KEK is a PKA transport key. This is not allowed with Token Type DES.                                                                                                             |

**key_identifier_length**

- **Direction:** Input/Output
- **Type:** Integer

The length of the `key_identifier` parameter in bytes. The maximum value is 900.

**key_identifier**

- **Direction:** Input/Output
- **Type:** String
Restrict Key Attribute

The key for which the export control is to be updated. The parameter contains
an internal or external token or the 64-byte CKDS label of an internal token. If a
label is specified, the key token will be updated in the CKDS and not returned
by this service.

If the key identifier supplied was an AES or DES token encrypted under the old
master key, the token will be returned encrypted under the current master key.

key_encrypting_key_identifier_length

Direction: Input Type: Integer

The length of the key_encrypting_key_identifier parameter. When key_identifier
is an internal token, the value must be zero.
- If key_encrypting_key_identifier is a label for either the CKDS (IKEK-AES or
  IKEK-DES rules) or PKDS (IKEK-PKA rule), the value must be 64.
- If key_encrypting_key_identifier is an AES KEK, the value must be between
  the actual length of the token and 725.
- If key_encrypting_key_identifier is a DES KEK, the value must be 64.
- If key_encrypting_key_identifier is an RSA KEK, the maximum length is 3500.

key_encrypting_key_identifier

Direction: Input/Output Type: String

When key_encrypting_key_identifier_length is non-zero,
key_encrypting_key_identifier contains an internal key token containing a
key-encrypting key, or a key label.

If the key identifier supplied was an AES or DES token encrypted under the old
master key, the token will be returned encrypted under the current master key.

opt_parameter1_length

Direction: Input Type: Integer

The byte length of the opt_parameter1 parameter. The value must be zero.

opt_parameter1

Direction: Input Type: String

This parameter is ignored.

opt_parameter2_length

Direction: Input Type: Integer

The byte length of the opt_parameter2 parameter. The value must be zero.

opt_parameter2

Direction: Input Type: String

This parameter is ignored.
Usage Notes

The access control points in the ICSF role that control the function of this service are:

- Restrict Key Attribute - Export Control
- Restrict Key Attribute - Permit setting the TR-31 export bit

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

</table>

Secure Key Import (CSNBSKI and CSNESKI)

Use the secure key import callable service to encipher a single-length or double-length clear key under the system master key (DES or SYM-MK) or under an importer key-encrypting key. The clear key can then be imported as any of the possible key types. This service does not adjust key parity.

The callable service can execute only when ICSF is in special secure mode, which is described in "Special Secure Mode" on page 10.

To import double-length and triple-length DATA keys, or double-length MAC, MACVER, CIPHER, DECIPHER and ENCIPHER keys, use the Multiple Secure Key Import callable service. See "Multiple Secure Key Import (CSNBSKM and CSNESKM)" on page 209.

To import AES DATA keys, use the multiple secure key import service "Multiple Secure Key Import (CSNBSKM and CSNESKM)" on page 209.

The callable service name for AMODE(64) invocation is CSNESKI.
Secure Key Import

Format

CALL CSNBSKI(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    clear_key,
    key_type,
    key_form,
    importer_key_identifier,
    key_identifier )

Parameters

return_code
Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output  Type: String

The data that is passed to the installation exit.

clear_key
Direction: Input  Type: String

The clear key to be enciphered. Specify a 16-byte string (clear key value). For single-length keys, the value must be left-justified and padded with zeros. For effective single-length keys, the value of the right half must equal the value of the left half. For double-length keys, specify the left and right key values.

Note: For key types that can be single or double-length, a single length encrypted key will be generated if a clear_key value of zeros is supplied.

key_type
Secure Key Import

**Direction:** Input  
**Type:** Character string

The type of key you want to encipher under the master key or an importer key. Specify an 8-byte field that must contain a keyword from this list or the keyword TOKEN. If the key type is TOKEN, ICSF determines the key type from the CV in the `key_identifier` parameter.

Key type values for the Secure Key Import callable service are: CIPHER, CVARDEC, CVARENC, CVARPINE, CVARXCVL, CVARXCVR, DATA, DATAXLAT, DECIPHER, ENCIPHER, EXPORTER, IKEYXLAT, IMPORTER, IMP-PKA, IPINENC, MAC, MACVER, OKEYXLAT, OPINENC, PINGEN and PINVER. For information on the meaning of the key types, see Table 3 on page 23.

**key_form**

**Direction:** Input  
**Type:** Character string

The key form you want to generate. Enter a 4-byte keyword specifying whether the key should be enciphered under the master key (OP) or the importer key-encrypting key (IM). The keyword must be left-justified and padded with blanks. Valid keyword values are OP for encryption under the master key or IM for encryption under the importer key-encrypting key. If you specify IM, you must specify an importer key-encrypting key in the `importer_key_identifier` parameter. For a `key_type` of IMP-PKA, this service supports only the OP `key_form`.

**importer_key_identifier**

**Direction:** Input/Output  
**Type:** String

The importer key-encrypting key under which you want to encrypt the clear key. Specify either a 64-byte string of the internal key format or a key label. If you specify IM for the `key_form` parameter, the `importer_key_identifier` parameter is required.

**key_identifier**

**Direction:** Input/Output  
**Type:** String

The generated encrypted key. The parameter is a 64-byte string. The callable service returns either an internal key token if you encrypted the clear key under the master key (`key_form` was OP); or an external key token if you encrypted the clear key under the importer key-encrypting key (`key_form` was IM).

If the imported key_type is IMPORTER or EXPORTER and the `key_form` is OP, the `key_identifier` parameter changes direction to both input and output. If the application passes a valid internal key token for an IMPORTER or EXPORTER key in this parameter, the NOCV bit is propagated to the imported key token.

**Note:** Propagation of the NOCV bit is not performed if the service is processed on the PCI Cryptographic Coprocessor.

The secure key import service does not adjust key parity.

ICSF supports two methods of wrapping the key value in a symmetric key token: the original ECB wrapping and an enhanced CBC wrapping method which is ANSI X9.24 compliant. The output `key_identifier` will use the default
Secure Key Import

wrapping method unless a skeleton token is supplied as input. If a skeleton token is supplied as input, the wrapping method in the skeleton token will be used.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS.

Systems with the Cryptographic Coprocessor Feature: To generate double-length MAC and MACVER keys in the importable form, the ANSI system keys must be installed in the CKDS.

This service will mark DATA, IMPORTER and EXPORTER key tokens with the system encryption algorithm.

- This service marks the imported DATA key token according to the system's default encryption algorithm, unless token copying overrides this.
- KEKs are marked SYS-ENC unless token copying overrides this.
- To override the default mark, supply a valid internal token of the same key type in the key_identifier field. The service will copy the marks of the supplied token to the imported token.

Systems with the PCI X Cryptographic Coprocessor, Crypto Express2 Coprocessor, or Crypto Express3 Coprocessor: If key_form is IM and the importer_key_identifier is NOCV KEK, the NOCV IMPORTER access control point must be enabled.

The following table shows the access control points in the ICSF role that control the function of this service.

<table>
<thead>
<tr>
<th>Key Form</th>
<th>Access control point</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP</td>
<td>Secure Key Import - DES, OP</td>
</tr>
<tr>
<td>IM</td>
<td>Secure Key Import - DES, IM</td>
</tr>
</tbody>
</table>

To use a NOCV key-encrypting key with the secure key import service, the NOCV KEK usage for import-related functions access control point must be enabled in addition to one or both of the access control points listed.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

### Secure Key Import2 (CSNBSKI2 and CSNESKI2)

Use this service to encipher a variable-length symmetric key under the system master key or an AES IMPORTER KEK, depending on the Key Form rule provided.

This service supports variable-length symmetric keys.

This service returns variable-length CCA key tokens and uses the AESKW wrapping method.

The callable service can execute only when ICSF is in special secure mode, which is described in ["Special Secure Mode" on page 10](#).

The callable service name for AMODE(64) is CSNESKI2.
CALL CSNSKI2(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    clear_key_bit_length,
    clear_key,
    key_name_length,
    key_name,
    user_associated_data_length,
    user_associated_data,
    key_encrypting_key_identifier_length,
    key_encrypting_key_identifier,
    target_key_identifier_length,
    target_key_identifier)

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. The value must be 3.

rule_array
Secure Key Import2

The rule_array contains keywords that provide control information to the callable service. The keywords must be in contiguous storage with each of the keywords left-justified in its own 8-byte location and padded on the right with blanks.

<tr>
<td>TOKEN</td>
<td>The key type will be determined from the key token supplied in the target_key_identifier parameter. ICSF does not check for the length of the key but uses the clear_key_bit_length parameter to determine the length of the key.</td>
</tr>
</tbody>
</table>

**clear_key_bit_length**

The length of the value supplied in the clear_key parameter in bits. Valid lengths are 80 to 2048 for HMAC keys, and 128, 192, or 256 for AES keys.

**clear_key**

The value of the key to be imported. The value should be left justified and padded on the right with zeros to a byte boundary if the clear_key_bit_length is not a multiple of 8.

**key_name_length**

The length of the key_name parameter. Valid values are 0 and 64.

**key_name**
Secure Key Import2

Direction: Input  Type: String

A 64-byte key store label to be stored in the associated data structure of the

token.

user_associated_data_length

Direction: Input Type: Integer

The length of the user-associated data. The valid values are 0 to 255 bytes.

user_associated_data

Direction: Input Type: String

User-associated data to be stored in the associated data structure.

key_encrypting_key_identifier_length

Direction: Input Type: Integer

The byte length of the key_encrypting_key_identifier parameter. When Key

Form is OP, the value must be zero. When Key Form is IM, the value must be

between the actual length of the token and 725 when

key_encrypting_key_identifier is a token. The value must be 64 when

key_encrypting_key_identifier is a label.

key_encrypting_key_identifier

Direction: Input/Output Type: String

When the Key Form rule is OP, key_encrypting_key_identifier is ignored. When

the Key Form rule is IM, key_encrypting_key_identifier contains an internal key

token containing the AES importer key-encrypting key or a key label.

If the token supplied was encrypted under the old master key, the token will be

returned encrypted under the current master key.

target_key_identifier_length

Direction: Input/Output Type: Integer

On input, the byte length of the buffer for the target_key_identifier parameter.
The buffer must be large enough to receive the target key token. The maximum
value is 900 bytes.

On output, the parameter will hold the actual length of the target key token.

target_key_identifier

Direction: Input/Output Type: String

The output key token. On input, this parameter is ignored except when the Key

Type keyword is TOKEN. If you specify the TOKEN keyword, then this field

contains a valid token of the key type you want to import. On output, when Key

Form is OP, this will be an internal variable-length symmetric token. When Key

Form is IM, this will be an external variable-length symmetric token. See

rule_array for a list of valid key types.
**Secure Key Import2**

**Usage Notes**

The following table shows the access control points in the ICSF role that control the function of this service.

<table>
<thead>
<tr>
<th>Key Form</th>
<th>Access control point</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP</td>
<td>Secure Key Import2 – OP</td>
</tr>
<tr>
<td>IM</td>
<td>Secure Key Import2 – IM</td>
</tr>
</tbody>
</table>

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

</tbody>
</table>

**Symmetric Key Export (CSNDSYX and CSNFSYX)**

Use the symmetric key export callable service to transfer an application-supplied AES DATA (version X’04’), DES DATA, or variable-length symmetric key token key from encryption under a master key to encryption under an application-supplied RSA public key or AES EXPORTER key. The application-supplied key must be an ICSF AES, DES, or HMAC internal key token or the label of such a token in the CKDS. The Symmetric Key Import or Symmetric Key Import2 callable services can import the key encrypted under the RSA public key or AES EXPORTER at the receiving node.

The callable service name for AMODE(64) is CSNFSYX.
Symmetric Key Export

Format

```assembly
call csndsyx(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    source_key_identifier_length,
    source_key_identifier,
    transporter_key_identifier_length,
    transporter_key_identifier,
    enciphered_key_length,
    enciphered_key)
```

Parameters

**return_code**

Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from 'X'00000000' to 'X'7FFFFFFF' (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**

Direction: Input/Output Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input Type: Integer

The number of keywords you are supplying in the `rule_array` parameter. Value may be 1, 2, or 3.

**rule_array**

Direction: Input Type: String
Keywords that provide control information to the callable service. Table 95 lists the keywords. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

Table 95. Keywords for Symmetric Key Export Control Information

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Algorithm (One keyword, optional)</strong></td>
<td></td>
</tr>
<tr>
<td>AES</td>
<td>The key being exported is an AES key. If source_key_identifier is a variable-length symmetric key token or label, only the PKOAEP2 and AESKW key formatting methods are supported.</td>
</tr>
<tr>
<td>DES</td>
<td>The key being exported is a DES key. This is the default.</td>
</tr>
<tr>
<td>HMAC</td>
<td>The key being exported is an HMAC key. Only the PKOAEP2 and AESKW key formatting methods are supported.</td>
</tr>
<tr>
<td><strong>Key Formatting method (One required)</strong></td>
<td></td>
</tr>
<tr>
<td>AESKW</td>
<td>Specifies that the key is to be formatted using AESKW and placed in an external variable length CCA token. The transport_key_identifier must be an AES EXPORTER. This rule is not valid with the DES Algorithm keyword or with AES DATA (version X'04') keys.</td>
</tr>
<tr>
<td>PKCSOAEP</td>
<td>Specifies to format the key according to the method in RSA DSI PKCS #1v2 OAEP. The default hash method is SHA-1. Use the SHA-256 keyword for the SHA-256 hash method.</td>
</tr>
<tr>
<td>PKCS–1.2</td>
<td>Specifies to format the key according to the method found in RSA DSI PKCS #1 block type 02 to recover the symmetric key.</td>
</tr>
<tr>
<td>PKOAEP2</td>
<td>Specifies to format the key according to the method found in RSA DSI PKCS #1 v2.1 RSAES-OAEP documentation. Not valid with DES algorithm or with AES DATA (version X'04') keys. A hash method is required.</td>
</tr>
<tr>
<td>ZERO-PAD</td>
<td>The clear key is right-justified in the field provided, and the field is padded to the left with zeros up to the size of the RSA encryption block (which is the modulus length).</td>
</tr>
<tr>
<td><strong>Hash Method (One, optional for PKCSOAEP, required for PKOAEP2. Not valid with any other Key Formatting method)</strong></td>
<td></td>
</tr>
<tr>
<td>SHA-1</td>
<td>Specifies to use the SHA-1 hash method to calculate the OAEP message hash. This is the default for PKCSOAEP.</td>
</tr>
<tr>
<td>SHA-256</td>
<td>Specifies to use the SHA-256 hash method to calculate the OAEP message hash.</td>
</tr>
<tr>
<td>SHA-384</td>
<td>Specifies to use the SHA-384 hash method to calculate the OAEP message hash. Not valid with PKCSOAEP.</td>
</tr>
<tr>
<td>SHA-512</td>
<td>Specifies to use the SHA-512 hash method to calculate the OAEP message hash. Not valid with PKCSOAEP.</td>
</tr>
</tbody>
</table>

**source_key_identifier_length**

Direction: Input  
Type: Integer

The length of the source_key_identifier parameter. The minimum size is 64 bytes. The maximum size is 725 bytes.
Symmetric Key Export

**source_key_identifier**

Direction: Input/Output   Type: String

The label or internal token of a secure AES DATA (version X'04'), DES DATA, or variable-length symmetric key token to encrypt under the supplied RSA public key or AES EXPORTER key. The key in the key identifier must match the algorithm in the `rule_array`. DES is the default algorithm.

**transporter_key_identifier_length**

Direction: Input   Type: Integer

The length of the `transporter_key_identifier` parameter. The maximum size is 3500 bytes for an RSA key token or 725 for an AES EXPORTER key token. The length must be 64 if `transporter_key_identifier` is a label.

**transporter_key_identifier**

Direction: Input   Type: String

An RSA public key token, AES EXPORTER token, or label of the key to protect the exported symmetric key.

When the AESKW Key Formatting method is specified, this parameter must be an AES EXPORTER key token or label with the EXPORT bit on in the key-usage field. Otherwise, this parameter must be an RSA public key token or label.

**enciphered_key_length**

Direction: Input/Output   Type: Integer

The length of the `enciphered_key` parameter. This is updated with the actual length of the `enciphered_key` generated. The maximum size you can specify in this parameter is 900 bytes, although the actual key length may be further restricted by your hardware configuration (as shown in Table 100 on page 257).

**enciphered_key**

Direction: Output   Type: String

This field contains the exported key, protected by the RSA public or AES EXPORTER key specified in the `transporter_key_identifier` field.

**Restrictions**

If you are running with the Cryptographic Coprocessor Feature, the enhanced system keys must be present in the CKDS.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

If an RSA public key is specified as the `transporter_key_identifier`, the hardware configuration sets the limit on the modulus size of keys for key management; thus, this service will fail if the RSA key modulus bit length exceeds this limit.
The strength of the exporter key expected by Symmetric Key Export depends on the attributes of the key being exported. The resulting return code and reason code when using an exporter KEK that is weaker depends on the “Variable-length Symmetric Token - disallow weak wrap” and “Variable-length Symmetric Token - warn when weak wrap” access control points:

- If the “Variable-length Symmetric Token - disallow weak wrap” access control point is disabled (the default), the key strength requirement will not be enforced. Using a weaker key will result in return code 0 with a non-zero reason code if the “Variable-length Symmetric Token - warn when weak wrap” access control point is enabled. Otherwise, a reason code of zero will be returned.
- If the “disallow” access control point is enabled (using TKE), the key strength requirement will be enforced, and attempting to use a weaker key will result in return code 8.

For AES DATA and AES CIPHER keys, the AES EXPORTER key must be at least as long as the key being exported to be considered sufficient strength.

For HMAC keys, the AES EXPORTER must be sufficient strength as described in the following table.

Table 96. AES EXPORTER strength required for exporting an HMAC key under an AES EXPORTER

<table>
<thead>
<tr>
<th>Key-usage field 2 in the HMAC key contains:</th>
<th>Minimum strength of AES EXPORTER to adequately protect the HMAC key:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHA-256, SHA-384, SHA-512</td>
<td>256 bits</td>
</tr>
<tr>
<td>SHA-224</td>
<td>192 bits</td>
</tr>
<tr>
<td>SHA-1</td>
<td>128 bits</td>
</tr>
</tbody>
</table>

If an RSA public key is specified as the transporter_key_identifier, the RSA key used must have a modulus size greater than or equal to the total PKOAEP2 message bit length (key size + total overhead):

Table 97. Minimum RSA modulus strength required to contain a PKOAEP2 block when exporting an AES key

<table>
<thead>
<tr>
<th>AES key size</th>
<th>Total message sizes (and therefore minimum RSA key size) when the Hash Method is:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>SHA-1</td>
</tr>
<tr>
<td>128 bits</td>
<td>736 bits</td>
</tr>
<tr>
<td>192 bits</td>
<td>800 bits</td>
</tr>
<tr>
<td>256 bits</td>
<td>800 bits</td>
</tr>
</tbody>
</table>

Table 98. Minimum RSA modulus length to adequately protect an AES key

<table>
<thead>
<tr>
<th>AES key to be exported:</th>
<th>Minimum strength of RSA wrapping key to adequately protect the AES key:</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td>3072</td>
</tr>
<tr>
<td>AES 192</td>
<td>7860</td>
</tr>
<tr>
<td>AES 256</td>
<td>15360</td>
</tr>
</tbody>
</table>
Symmetric Key Export

Note that wrapping an AES 192-bit key or an AES 256-bit key with any RSA key will always be considered a weak wrap.

The following table shows the access control points in the ICSF role that control the function of this service.

Table 99. Required access control points for Symmetric Key Export

<table>
<thead>

</tbody>
</table>

Symmetric Key Generate (CSNDSYG and CSNFSYG)

Use the symmetric key generate callable service to generate an AES or DES DATA key and return the key in two forms: enciphered under the master key and encrypted under an RSA public key.

You can import the RSA public key encrypted form by using the symmetric key import service at the receiving node.

Also use the symmetric key generate callable service to generate any DES importer or exporter key-encrypting key encrypted under a RSA public key according to the PKA92 formatting structure. See "PKA92 Key Format and Encryption Process" on page 881 for more details about PKA92 formatting.

The callable service name for AMODE(64) invocation is CSNFSYG.
Symmetric Key Generate

Format

CALL CSNDSYG(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_encrypting_key_identifier,
    RSA_public_key_identifier_length,
    RSA_public_key_identifier,
    local_enciphered_key_token_length,
    local_enciphered_key_token,
    RSA_enciphered_key_length,
    RSA_enciphered_key)

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. The value must be 1, 2, 3, 4, 5, 6, or 7.

rule_array
Direction: Input Type: String
Keywords that provide control information to the callable service. Table 101 lists the keywords. The keywords must be 8 bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks.

Table 101. Keywords for Symmetric Key Generate Control Information

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
<th>Algorithm</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Algorithm (one keyword, optional)</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>AES</td>
<td>The key being generated is a secure AES key.</td>
<td>AES</td>

<td>Specifies the key-encrypting key is to be encrypted under a PKA96 RSA public key according to the PKA92 formatting structure.</td>
<td>DES</td>
</tr>
<tr>
<td>PKCSOAEP</td>
<td>Specifies using the method found in RSA DSI PKCS #1V2 OAEP. The default hash method is SHA-1. Use the SHA-256 keyword for the SHA-256 hash method.</td>
<td>AES or DES</td>
</tr>
<tr>
<td>PKCS-1.2</td>
<td>Specifies the method found in RSA DSI PKCS #1 block type 02.</td>
<td>AES or DES</td>
</tr>
<tr>
<td>ZERO-PAD</td>
<td>The clear key is right-justified in the field provided, and the field is padded to the left with zeros up to the size of the RSA encryption block (which is the modulus length).</td>
<td>AES or DES</td>
</tr>
</tbody>
</table>

**Key Length (optional - for use with PKA92)**

| SINGLE-R | For key-encrypting keys, this specifies that the left half and right half of the generated key will have identical values. This makes the key operate identically to a single-length key with the same value. Without this keyword, the left and right halves of the key-encrypting key will each be generated randomly and independently. | DES |

**Key Length (optional - for use with PKCSOAEP, PKCS-1.2, or ZERO-PAD)**

| SINGLE, KEYLN8 | Specifies that the generated key should be 8 bytes in length. | DES |
| DOUBLE | Specifies that the generated key should be 16 bytes in length. | DES |
| KEYLN16 | Specifies that the generated key should be 16 bytes in length. | AES or DES |
| KEYLN24 | Specifies that the generated key should be 24 bytes in length. | AES or DES |
| KEYLN32 | Specifies that the generated key should be 32 bytes in length. | AES |

Encipherment method for the local enciphered copy of the key (optional - for use with PKCSOAEP, PKCS-1.2, or ZERO-PAD)
### Table 101. Keywords for Symmetric Key Generate Control Information (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
<th>Algorithm</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP</td>
<td>Enciphers the key with the master key. The DES master key is used with DES keys and the AES master key is used with AES keys.</td>
<td>AES or DES</td>
</tr>
<tr>
<td>EX</td>
<td>Enciphers the key with the EXPORTER key that is provided through the <code>key_encrypting_key_identifier</code> parameter.</td>
<td>DES</td>
</tr>
<tr>
<td>IM</td>
<td>Enciphers the key with the IMPORTER key-encrypting key specified with the <code>key_encrypting_key_identifier</code> parameter.</td>
<td>DES</td>
</tr>
</tbody>
</table>

### Key Wrapping Method (optional)

| USECONFG | Specifies that the system default configuration should be used to determine the wrapping method. This is the default keyword. The system default key wrapping method can be specified using the `DEFAULTWRAP` parameter in the installation options data set. See the [z/OS Cryptographic Services ICSF System Programmer's Guide](https://www.ibm.com). | AES and DES |
| WRAP-ENH | Use enhanced key wrapping method, which is compliant with the ANSI X9.24 standard. | DES |
| WRAP-ECB | Use original key wrapping method, which uses ECB wrapping for DES key tokens and CBC wrapping for AES key tokens. | AES or DES |

### Translation Control (optional)

| ENH-ONLY | Restrict rewrapping of the `target_key_identifier` token. Once the token has been wrapped with the enhanced method, it cannot be rewrapped using the original method. | DES |

### Hash Method (optional - only valid with PKCSOAEP)

| SHA-1 | Specifies to use the SHA-1 hash method to calculate the OAEP message hash. This is the default. | AES or DES |
| SHA-256 | Specifies to use the SHA-256 hash method to calculate the OAEP message hash. | AES or DES |

---

key_encrypting_key_identifier

Direction: Input/Output  
Type: String
Symmetric Key Generate

The label or internal token of a key-encrypting key. If the `rule_array` specifies IM, this DES key must be an IMPORTER. If the `rule_array` specifies EX, this DES key must be an EXPORTER. Otherwise, the parameter is ignored.

**RSA_public_key_identifier_length**

Direction: Input  Type: Integer

The length of the `RSA_public_key_identifier` parameter. If the `RSA_public_key_identifier` parameter is a label, this parameter specifies the length of the label. The maximum size is 3500 bytes.

**RSA_public_key_identifier**

Direction: Input  Type: String

The token, or label, of the RSA public key to be used for protecting the generated symmetric key.

**local_enciphered_key_token_length (was DES_enciphered_key_token_length)**

Direction: Input/Output  Type: Integer

The length in bytes of the `local_enciphered_key_token`. This field is updated with the actual length of the token that is generated. The minimum length is 64-bytes and the maximum length is 128 bytes.

**local_enciphered_key_token (was DES_enciphered_key_token)**

Direction: Input/Output  Type: String

This parameter contains the generated DATA key in the form of an internal or external token, depending on `rule_array` specification. If you specify PKA92, on input specify an internal (operational) key token of an Importer or Exporter Key.

**RSA_enciphered_key_length**

Direction: Input/Output  Type: Integer

The length of the `RSA_enciphered_key` parameter. This service updates this field with the actual length of the `RSA_enciphered_key` it generates. The maximum size is 512 bytes.

**RSA_enciphered_key**

Direction: Input/Output  Type: String

This field contains the RSA enciphered key, which is protected by the public key specified in the `RSA_public_key_identifier` field.

**Restrictions**

If the service is executed on the Cryptographic Coprocessor Feature, and you specify IM in the `rule_array`, you must enable Special Secure Mode.

Use of PKA92 or PKCSOAEP requires a PCICC, PCIXCC, CEX2C, or CEX3C.
Symmetric Key Generate

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

If the service is executed on the Cryptographic Coprocessor Feature, the generated internal DATA key token is marked according to the system default algorithm.

The hardware configuration sets the limit on the modulus size of keys for key management; thus, this service will fail if the RSA key modulus bit length exceeds this limit.

Specification of PKA92 with an input NOCV key-encrypting key token is not supported.

Use the PKA92 key-formatting method to generate a key-encrypting key. The service enciphers one key copy using the key encipherment technique employed in the IBM Transaction Security System (TSS) 4753, 4755, and AS/400 cryptographic product PKA92 implementations (see "PKA92 Key Format and Encryption Process" on page 881). The control vector for the RSA-enciphered copy of the key is taken from an internal (operational) DES key token that must be present on input in the RSA_enciphered_key variable. Only key-encrypting keys that conform to the rules for an OPEX case under the key generate service are permitted. The control vector for the local key is taken from a DES key token that must be present on input in the local_enciphered_key_token variable. The control vector for one key copy must be from the EXPORTER class while the control vector for the other key copy must be from the IMPORTER class.

The following table shows the access control points in the ICSF role that control the function of this service.

<table>
<thead>
<tr>
<th>Key algorithm</th>
<th>Key formatting rule</th>
<th>Access control point</th>
</tr>
</thead>
<tbody>
<tr>
<td>DES</td>

Symmetric Key Import

Symmetric Key Import (CSNDSYI and CSNFSYI)

Use the symmetric key import callable service to import a symmetric AES DATA or DES DATA key enciphered under an RSA public key. It returns the key in operational form, enciphered under the master key.

This service also supports import of a PKA92-formatted DES key-encrypting key under a PKA96 RSA public key.

The callable service name for AMODE(64) is CSNFSYI.

Format

```call csndsyi(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    rsa_enciphered_key_length,
    rsa_enciphered_key,
    rsa_private_key_identifier_length,
    rsa_private_key_identifier,
    target_key_identifier_length,
    target_key_identifier)
```

Parameters

- **return_code**
  - Direction: Output
  - Type: Integer
  - The return code specifies the general result of the callable service. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the return codes.

- **reason_code**
  - Direction: Output
  - Type: Integer
  - The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the reason codes.

- **exit_data_length**
  - Direction: Input/Output
  - Type: Integer
  - The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

- **exit_data**
  - Direction: Input/Output
  - Type: String
  - The data that is passed to the installation exit.
Symmetric Key Import

rule_array_count
Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. The value may be 1, 2, 3, 4, or 5.

rule_array
Direction: Input Type: String

The keywords that provide control information to the callable service. Table 104 provides a list. The recovery method is the method to use to recover the symmetric key. The keywords must be 8 bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks.

Table 104. Keywords for Symmetric Key Import Control Information

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Algorithm (one keyword, optional)</strong></td>
<td></td>
</tr>
<tr>
<td>AES</td>
<td>The key being imported is an AES key.</td>
</tr>
<tr>
<td>DES</td>
<td>The key being imported is a DES key. This is the default.</td>
</tr>
<tr>
<td><strong>Recovery Method (required)</strong></td>
<td></td>
</tr>
<tr>
<td>PKA92</td>
<td>Supported by the DES algorithm. Specifies the key-encrypting key is encrypted under a PKA96 RSA public key according to the PKA92 formatting structure.</td>
</tr>
<tr>
<td>PKCSOAEP</td>
<td>Specifies to use the method found in RSA DSI PKCS #1V2 OAEP. Supported by the DES and AES algorithms. The default hash method is SHA-1. Use the SHA-256 keyword for the SHA-256 hash method.</td>
</tr>
<tr>
<td>PKCS-1.2</td>
<td>Specifies to use the method found in RSA DSI PKCS #1 block type 02. Supported by the DES and AES algorithms.</td>
</tr>
<tr>
<td>ZERO-PAD</td>
<td>The clear key is right-justified in the field provided, and the field is padded to the left with zeros up to the size of the RSA encryption block (which is the modulus length). Supported by the DES and AES algorithms.</td>
</tr>
<tr>
<td><strong>Key Wrapping Method (optional)</strong></td>
<td></td>
</tr>
<tr>
<td>USECONFIG</td>
<td>Specifies that the system default configuration should be used to determine the wrapping method. This is the default keyword. The system default key wrapping method can be specified using the DEFAULTWRAP parameter in the installation options data set. See the z/OS Cryptographic Services ICSF System Programmer’s Guide.</td>
</tr>
<tr>
<td>WRAP-ENH</td>
<td>Use enhanced key wrapping method, which is compliant with the ANSI X9.24 standard.</td>
</tr>
<tr>
<td>WRAP-ECB</td>
<td>Use original key wrapping method, which uses ECB wrapping for DES key tokens and CBC wrapping for AES key tokens.</td>
</tr>
<tr>
<td><strong>Translation Control (optional)</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Keywords for Symmetric Key Import Control Information (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENH-ONLY</td>
<td>Restrict rewrapping of the \texttt{target_key_identifier} token. Once the token has been wrapped with the enhanced method, it cannot be rewrapped using the original method.</td>
</tr>
</tbody>
</table>

**Hash Method (optional - only valid with PKCSOAEP)**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHA-1</td>
<td>Specifies to use the SHA-1 hash method to calculate the OAEP message hash. This is the default.</td>
</tr>
<tr>
<td>SHA-256</td>
<td>Specifies to use the SHA-256 hash method to calculate the OAEP message hash.</td>
</tr>
</tbody>
</table>

**RSA\textunderscore enciphered\textunderscore key\_length**

Direction: Input  
Type: integer

The length of the \texttt{RSA\_enciphered\_key} parameter. The maximum size is 512 bytes.

**RSA\textunderscore enciphered\textunderscore key**

Direction: Input  
Type: String

The key to import, protected under an RSA public key. The encrypted key is in the low-order bits (right-justified) of a string whose length is the minimum number of bytes that can contain the encrypted key. This string is left-justified within the \texttt{RSA\_enciphered\_key} parameter.

**RSA\textunderscore private\textunderscore key\_identifier\_length**

Direction: Input  
Type: Integer

The length of the \texttt{RSA\_private\_key\_identifier} parameter. When the \texttt{RSA\_private\_key\_identifier} parameter is a key label, this field specifies the length of the label. The maximum size is 3500 bytes.

**RSA\textunderscore private\textunderscore key\_identifier**

Direction: Input  
Type: String

An internal RSA private key token or label whose corresponding public key protects the symmetric key.

**target\textunderscore key\_identifier\_length**

Direction: Input/Output  
Type: Integer

The length of the \texttt{target\_key\_identifier} parameter. This field is updated with the actual length of the \texttt{target\_key\_identifier} that is generated. The size must be 64 bytes.

**target\textunderscore key\_identifier**

Direction: Input/Output  
Type: String
Symmetric Key Import

This field contains the internal token of the imported symmetric key. Except for PKA92 processing, this service produces a DATA key token with a key of the same length as that contained in the imported token.

Restrictions

The exponent of the RSA public key must be odd.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

If the service is executed on the Cryptographic Coprocessor Feature, the generated internal DATA key token is marked according to the default system encryption algorithm unless token copying overrides this. Token copying is accomplished by supplying a valid DATA token with the desired algorithm marks in the target_key_identifier field.

The hardware configuration sets the limit on the modulus size of keys for key management; thus, this service will fail if the RSA key modulus bit length exceeds this limit. The service will fail with return code 12 and reason code 11020.

Specification of PKA92 with an input NOCV key-encrypting key token is not supported.

During initialization of a PCICC, PCIXCC, CEX2C, or CEX3C, an Environment Identification, or EID, of zero will be set in the coprocessor. This will be interpreted by the PKA Symmetric Key Import service to mean that environment identification checking is to be bypassed. Thus it is possible on a OS/390 system for a key-encrypting key RSA-enciphered at a node (EID) to be imported at the same node.

The following table shows the access control points in the ICSF role that control the function of this service.

<table>
<thead>
<tr>
<th>Key algorithm</th>
<th>Key formatting rule</th>
<th>Access control point</th>
</tr>
</thead>
<tbody>
<tr>
<td>DES</td>
<td>PKCS-1.2</td>
<td>Symmetric Key Import - DES, PKCS-1.2</td>
</tr>
<tr>
<td>DES</td>
<td>PKA92 KEK</td>
<td>Symmetric Key Import - DES, PKA92 KEK</td>
</tr>
<tr>
<td>DES</td>
<td>ZERO-PAD</td>
<td>Symmetric Key Import - DES, ZERO-PAD</td>
</tr>
<tr>
<td>AES</td>
<td>PKCSOAEP, PKCS-1.2</td>
<td>Symmetric Key Import - AES, PKCSOAEP, PKCS-1.2</td>
</tr>
<tr>
<td>AES</td>
<td>ZERO-PAD</td>
<td>Symmetric Key Import - AES, ZERO-PAD</td>
</tr>
</tbody>
</table>

When the WRAP-ECB or WRAP-ENH keywords are specified and the default key-wrapping method setting does not match the keyword, the **Symmetric Key Import - Allow wrapping override keywords** access control point must be enabled.
Symmetric Key Import

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

**Symmetric Key Import2 (CSNDSYI2 and CSNFSYI2)**

Use the Symmetric Key Import2 callable service to import an HMAC or AES key enciphered under an RSA public key or AES EXPORTER key. It returns the key in operational form, enciphered under the master key.
Symmetric Key Import2

This service returns a variable-length CCA key token and uses the AESKW wrapping method.

The callable service name for AMODE(64) is CSNFSYI2.

Format

```c
CALL CSNDSYI2(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    enciphered_key_length,
    enciphered_key,
    transport_key_identifier_length,
    transport_key_identifier,
    key_name_length,
    key_name,
    target_key_identifier_length,
    target_key_identifier
)
```

Parameters

**return_code**

Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the *exit_data* parameter.

**exit_data**

Direction: Input/Output Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input Type: Integer

| Symmetric Key Import2 | Chapter 5. Managing Symmetric Cryptographic Keys | 273 |
The number of keywords you supplied in the `rule_array` parameter. The value must be 2.

**rule_array**

Direction: Input  Type: String

The keywords that provide control information to the callable service. The following table provides a list. The recovery method is the method to use to recover the symmetric key. The keywords must be 8 bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Algorithm (One required)</strong></td>
<td></td>
</tr>
<tr>
<td>AES</td>
<td>The key being imported is an AES key.</td>
</tr>
<tr>
<td>HMAC</td>
<td>The key being imported is an HMAC key.</td>
</tr>
<tr>
<td><strong>Recovery Method (Required)</strong></td>
<td></td>
</tr>
<tr>
<td>AESKW</td>
<td>Specifies the enciphered key has been wrapped with the AESKW formatting method.</td>
</tr>
<tr>
<td>PKOAEP2</td>
<td>Specifies to use the method found in RSA DSI PKCS #1V2 OAEP.</td>
</tr>
</tbody>
</table>

**enciphered_key_length**

Direction: Input  Type: integer

The length of the `enciphered_key` parameter. The maximum size is 900 bytes.

**enciphered_key**

Direction: Input  Type: String

The key to import, protected under either an RSA public key or an AES KEK. If the Recovery Method is PKOAEP2, the encrypted key is in the low-order bits (right-justified) of a string whose length is the minimum number of bytes that can contain the encrypted key. If the Recovery Method is AESKW, the encrypted key is an AES key or HMAC key in the external variable length key token.

**transport_key_identifier_length**

Direction: Input  Type: Integer

The length of the `transport_key_identifier` parameter. When the `transport_key_identifier` parameter is a key label, this field must be 64. The maximum size is 3500 bytes for an RSA private key or 725 bytes for an AES IMPORTER KEK.

**transport_key_identifier**

Direction: Input  Type: String
Symmetric Key Import2

An internal RSA private key token, internal AES IMPORTER KEK, or the 64-byte label of a key token whose corresponding key protects the symmetric key.

When the AESKW Key Formatting method is specified, this parameter must be an AES IMPORTER with the IMPORT bit on in the key-usage field. Otherwise, this parameter must be an RSA private key.

**key_name_length**

Direction: Input  Type: Integer

The length of the `key_name` parameter for `target_key_identifier`. Valid values are 0 and 64.

**key_name**

Direction: Input  Type: String

A 64-byte key store label to be stored in the associated data structure of `target_key_identifier`.

**target_key_identifier_length**

Direction: Input/Output  Type: Integer

On input, the byte length of the buffer for the `target_key_identifier` parameter. The buffer must be large enough to receive the target key token. The maximum value is 725 bytes.

On output, the parameter will hold the actual length of the target key token.

**target_key_identifier**

Direction: Output  Type: String

This parameter contains the internal token of the imported symmetric key.

**Restrictions**

The exponent of the RSA public key must be odd.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

This is the message layout used to encode the key material exported with the new PKOAEP2 formatting method.

<table>
<thead>
<tr>
<th>Field</th>
<th>Size</th>

</tr>
<tr>
<td>Key Material</td>
<td>Byte length of the key material (rounded up to the nearest byte)</td>
<td>variable</td>
</tr>
</tbody>
</table>
Symmetric Key Import2

Hash field
The associated data for the HMAC variable length token is hashed using SHA-256. Specifically referring to vartoken.h, this is the "VarAssocData_t AD" section of the VarKeyTkn_t structure, for the full length indicated in the 'SectLn' field of the VarAssocData_t.

Key Bit Length
A 2 Byte key bit length field.

Key Material
The key material is padded to the nearest byte with '0' bits.

This table lists the access control points in the ICSF role that control the function for this service.

Table 109. Symmetric Key Import2 Access Control Points

<table>
<thead>
<tr>
<th>Key formatting method</th>

</tr>
</tbody>
</table>

When the **Symmetric Key Import2 - disallow weak import** access control point is enabled, a key token wrapped with a weaker key will not be imported. When the **Variable-length Symmetric Token - warn when weak wrap** access control point is enabled, the reason code will indicate when the wrapping key is weaker than the key being imported.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

**Transform CDMF Key (CSNBTC and CSNETCK)**

This callable service is only supported on an IBM @server zSeries 900.

Use the transform CDMF key callable service to change a CDMF DATA key in an internal or external token to a transformed shortened DES key. You can also use the key label of a CKDS record as input.

The Cryptographic Coprocessor Feature on IBM @server zSeries 900, S/390 Enterprise Servers and S/390 Multiprise is configured as either CDMF or DES-CDMF. This callable service ignores the input internal DATA token markings, and it marks the output internal token for use in the DES.

If the input DATA key is in an external token, the operational KEK must be marked as DES or SYS-ENC. The service fails for an external DATA key encrypted under a KEK that is marked as CDMF.

The callable service name for AMODE(64) invocation is CSNETCK.

**Format**

```call
CALL CSNBTCK(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    source_key_identifier,
    kek_key_identifier,
    target_key_identifier
)
```

**Parameters**

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the return codes.

**reason_code**

Direction: Output  
Type: Integer
Transform CDMF Key

The reason code specifies the result of the callable service that is returned to
the application program. Each return code has different reason codes that
indicate specific processing problems. Appendix A, “ICSF and TSS Return and
Reason Codes” lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be
from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the
exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input Type: Integer

The number of keywords you are supplying in the rule_array parameter. This
number must be 0.

rule_array
Direction: Input Type: String

Currently no rule_array keywords are defined for this service, but you still must
specify this parameter.

source_key_identifier
Direction: Input/Output Type: String

A 64-byte string of the internal token, external token or key label that contains
the DATA key to transform. Token markings on this key token are ignored.

kek_key_identifier
Direction: Input/Output Type: String

A 64-byte string of the internal token or a key label of a key encrypting key
under which the source_key_identifier is encrypted.

Note: If you supply a label for this parameter, the label must be unique in the
CKDS.

target_key_identifier
Direction: Output Type: String

A 64-byte string where the internal token or external token of the transformed
shortened DES key is returned. The internal token is marked as DES.
Restrictions

This service is available on S/390 Enterprise Servers and S/390 Multiprise with Cryptographic Coprocessor Features. These systems may be configured as either CDMF or DES-CDMF.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

This service transforms a CDMF DATA key to a transformed shortened DES DATA key to allow interoperability to a DES-only capable system. The algorithm is described in Transform CDMF Key Algorithm.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Trusted Block Create (CSNDTBC and CSNFTBC)

This callable service is used to create a trusted block in a two step process. The block will be in external form, encrypted under an IMP-PKA transport key. This means that the MAC key contained within the trusted block will be encrypted under the IMP-PKA key.

The callable service name for AMODE(64) invocation is CSNFTBC.
Trusted Block Create

Format

```c
CALL CSNDTBC(
    return_code,
    reason_code
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    input_block_length
    input_block_identifier
    transport_key_identifier,
    trusted_block_length,
    trusted_block_identifier
);
```

Parameters

**return_code**

Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, ICSF and TSS Return and Reason Codes lists the return codes.

**reason_code**

Direction: Output  Type: Integer

The reason code specifies the specific results of processing. Each return code has different reason codes that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

**exit_data_length**

Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from `X'00000000'` to `X'7FFFFFFF'` (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**

Direction: Input/Output  Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  Type: Integer

The number of keywords you are supplying in the `rule_array` parameter. This number must be 1.

**rule_array**

Direction: Input  Type: String

Specifies a string variable containing an array of keywords. The keywords are 8 bytes long and must be left-justified and right padded with blanks.
This table lists the rule_array keywords for this callable service.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INACTIVE</td>
<td>Create the trusted block, but in inactive form. The MAC key is randomly generated, encrypted with the transport key, and inserted into the block. The ACTIVE flag is set to False (0), and the MAC is calculated over the block and inserted in the appropriate field. The resulting block is fully formed and protected, but it is not usable in any other CCA services. Use of the INACTIVE keyword is authorized by the 0x030F access control point.</td>
</tr>
<tr>
<td>ACTIVATE</td>
<td>This makes the trusted block usable in CCA services. Use of the ACTIVATE keyword is authorized by the 0x0310 access control point.</td>
</tr>
</tbody>
</table>

**input_block_length**

Direction: Input/Output  
Type: String

Specifies the number of bytes of data in the input_block_identifier parameter. The maximum length is 3500 bytes.

**input_block_identifier**

Direction: Input  
Type: String

Specifies a trusted block label or complete trusted block token, which will be updated by the service and returned in trusted_block_identifier. The length is indicated by input_block_length. Its content depends on the rule array keywords supplied to the service.

When rule_array is INACTIVE the block is complete but typically does not have MAC protection. If MAC protection is present due to recycling an existing trusted block, then the MAC key and MAC value will be overlaid by the new MAC key and MAC value. The input_block_identifier includes all fields of the trusted block token, but the MAC key and MAC will be filled in by the service. The Active flag will be set to False (0) in the block returned in trusted_block_identifier.

When the rule_array is ACTIVATE the block is complete, including the MAC protection which is validated during execution of the service. The Active flag must be False (0) on input. On output, the block will be returned in trusted_block_identifier provided the identifier is a token, with the Active flag changed to True (1), and the MAC value recalculated using the same MAC key. If the trusted_block_identifier is a label, the block will be written to the PKDS.

**transport_key_identifier**

Direction: Input  
Type: String

Specifies a key label or key token for an IMP-PKA key that is used to protect the trusted block.

**trusted_block_length**

Direction: Input/Output  
Type: Integer
**Trusted Block Create**

Specifies the number of bytes of data in trusted_block_identifier parameter. The maximum length is 3500 bytes.

**trusted_block_identifier**

Direction: Output  Type: String

Specifies a trusted block label or trusted block token for the trusted block constructed by the service. On input, the trusted_block_length contains the size of this buffer. On output, the trusted_block_length is updated with the actual byte length of the trusted block written to the buffer if the trusted_block_identifier is a token. The trusted block consists of the data supplied in input_block_identifier, but with the MAC protection and Active flag updated according to the rule array keyword that is provided. See Table 112 on page 281 for details on the actions. If the trusted_block_identifier is a label identifying a key record in key storage, the returned trusted block token will be written to the PKDS.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The following table shows the access control points in the ICSF role that control the function of this service.

**Table 113. Required access control points for Trusted Block Create**

## TR-31 Export (CSNBT31X and CSNET31X)

Use the TR-31 Export callable service to convert a CCA token to TR-31 format for export to another party. Since there is not always a one-to-one mapping between the key attributes defined by TR-31 and those defined by CCA, the caller may need to specify the attributes to attach to the exported key through the rule array.

The callable service name for AMODE(64) is CSNET31X.

### Format

```c
CALL CSNBT31X(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_version_number,
    key_field_length,
    source_key_identifier_length,
    source_key_identifier,
    unwrap_kek_identifier_length,
    unwrap_kek_identifier,
    wrap_kek_identifier_length,
    wrap_kek_identifier,
    opt_blks_length,
    opt_blocks,
    tr31_key_block_length,
    tr31_key_block)
```

### Parameters

**return_code**
- Direction: Output
- Type: Integer

The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the return codes.

**reason_code**
- Direction: Output
- Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the reason codes.

**exit_data_length**
### TR-31 Export

**Direction:** Input/Output  
**Type:** Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**

**Direction:** Input/Output  
**Type:** String

The data that is passed to the installation exit.

**rule_array_count**

**Direction:** Input  
**Type:** Integer

The number of keywords you are supplying in the `rule_array` parameter. The `rule_array_count` parameter must be 3, 4, or 5.

**rule_array**

**Direction:** Input  
**Type:** String

The `rule_array` contains keywords that provide control information to the callable service. The keywords are 8 bytes in length and must be left-aligned and padded on the right with space characters. The `rule_array` keywords for this callable service are shown in the following table. See [Table 116 on page 289](#) for valid combinations of Usage and Mode.

**TR-31 modes of key use – one required**

**Note:** If ATTR-CV is specified from the Control Vector Transport group, then mode keyword must not be specified. The proprietary mode ‘1’ will be used.

| ENCDEC        | Encrypt and decrypt – (B)                                              |
| DEC-ONLY      | Decrypt only – (D)                                                    |
| ENC-ONLY      | Encrypt only – (E)                                                    |
| GENVER        | MAC or PIN generate and verify – (C)                                  |
| GEN-ONLY      | MAC or PIN generate only – (G)                                        |
| VER-ONLY      | MAC or PIN verify only – (V)                                           |
| DERIVE        | Key Derivation(for ‘B’ and ‘C’ TR-31 Key Block Version IDs only) – (X) |
| ANY           | Any mode allowed – (N)                                                |

**Export control to set export field in TR-31 key block – optional**

| EXP-ANY       | Export allowed using any key-encrypting key. This is the default.     |
| EXP-TRST      | Export allowed using a trusted key-encrypting key, as defined in TR-31. |
| EXP-NONE      | Export prohibited                                                    |

**Control vector transport control – optional**

**Note:** If no keyword from this group is supplied, the CV in the source_key_identifier is still verified to agree with the ‘key usage’ and ‘mode of use’ keywords specified from the groups above.

| INCL-CV       | Include the CCA Control Vector as an optional field in the TR-31 key block header. The TR-31 usage and mode of use fields will indicate the key attributes, and those attributes (derived from the keywords passed from the above groups) will be verified by the callable service to be compatible with the ones in the included control vector. |
Table 115. Keywords for TR-31 Export Rule Array Control Information (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTR-CV</td>
<td>Include the CCA Control Vector as an optional field in the TR-31 key block header. The TR-31 usage will be set to the proprietary ASCII value “10” (‘3130’x) to indicate usage information is specified in the included CV, and the mode of use will be set to the proprietary ASCII value “1” (‘31’x) to indicate that mode is likewise specified in the CV. <strong>Note:</strong> If this keyword is specified, then usage and mode keywords from the preceding groups must not be specified. The proprietary values will be used.</td>
</tr>
</tbody>
</table>

**key_version_number**

Direction: Input  Type: String

The two bytes from this parameter are copied into the Key Version Number field of the output TR-31 key block. If no key version number is needed, the value must be 0x3030 (“00”). If the CCA key in parameter `source_key_identifier` is a key part (CV bit 44 is 1) then the key version number in the TR-31 key block is set to “c0” (0x6330) according to the TR-31 standard, which indicates that the TR-31 block contains a key part. In this case, the value passed to the callable service in the `key_version_number` parameter is ignored.

**key_field_length**

Direction: Input  Type: Integer

This parameter specifies the length of the key field which is encrypted in the TR-31 block. The length must be a multiple of 8, the DES cipher block size, and it must be greater than or equal to the length of the cleartext key passed with parameter `source_key_identifier` plus the length of the 2-byte key length that precedes this key in the TR-31 block. For example, if the source key is a double-length TDES key of length 16 bytes, then the key field length must be greater than or equal to (16+2) bytes, and must also be a multiple of 8. This means that the minimum `key_field_length` in this case would be 24. TR-31 allows a variable number of padding bytes to follow the cleartext key, and the caller may choose to pad with more than the minimum number of bytes needed to form a block that is a multiple of 8. This is generally done to hide the length of the cleartext key from those who cannot decipher that key. Most often, all keys — single, double, or triple length — are padded to the same length so that it is not possible to determine which length is carried in the TR-31 block by examining the encrypted block.

Note that this parameter is not expected to allow for ASCII encoding of the encrypted data stored in the key field according to the TR-31 specification. For example when the user passes a value of 24 here, following the minimum example above, the length of the final ASCII-encoded encrypted data in the key field in the output TR-31 key block will be 48 Bytes.

**source_key_identifier_length**

Direction: Input  Type: Integer

This parameter specifies the length of the `source_key_identifier` parameter, in bytes. The value in this parameter must currently be 64, since only CCA key tokens are supported for the source key parameter.

**source_key_identifier**

Direction: Input/Output  Type: String
This parameter contains either the label or the key token for the key that is to be exported. The key must be a CCA internal or external token. If the source key is an external token, an identifier for the KEK that wraps the source key must be passed in the `unwrap_kek_identifier` parameter. Only DES/TDES keys are supported. If a key token is passed which is wrapped under the old master key, it will be updated on output so that it is wrapped under the current master key.

**unwrap_kek_identifier_length**

Direction: Input  Type: Integer

This parameter specifies the length of the `unwrap_kek_identifier` parameter, in bytes. If the `source_key_identifier` is an external CCA token, then this parameter must be 64. Otherwise, this parameter must be 0.

**unwrap_kek_identifier**

Direction: Input/Output  Type: String

When the `source_key_identifier` is an external CCA token, this parameter contains either the label or the key token for the KEK which the `source_key_identifier` is currently wrapped under. It must be a CCA internal DES KEK token of type EXPORTER or OKEYXLAT. If the `source_key_identifier` is not an external CCA token, this parameter is ignored. If a key token is passed which is wrapped under the old master key, it will be updated on output so that it is wrapped under the current master key.

**wrap_kek_identifier_length**

Direction: Input  Type: Integer

This parameter specifies the length of the `wrap_kek_identifier` parameter, in bytes. If the `unwrap_kek_identifier` is also to be used to wrap the output TR-31 key block, specify 0 for this parameter. Otherwise, this parameter must be 64.

**wrap_kek_identifier**

Direction: Input/Output  Type: String

When `wrap_kek_identifier_length` is 0, this parameter is ignored and the `unwrap_kek_identifier` is also to be used to wrap the output TR-31 key block. Otherwise, this parameter contains either the label or the key token for the KEK to use for wrapping the output TR-31 key block. It must be a CCA internal token for a KEK EXPORTER or OKEYXLAT type and must have the same clear key as the `unwrap_kek_identifier`. If a key token is passed which is wrapped under the old master key, it will be updated on output so that it is wrapped under the current master key.

**Note:** ECB-mode wrapped DES keys (CCA legacy wrap mode) cannot be used to wrap/unwrap TR-31 version 'B'/C' key blocks that have/will have 'E' exportability, because ECB-mode does not comply with ANSI X9.24 Part 1.

This parameter exists to allow for KEK separation, it is possible that KEKs will be restricted as to what they can wrap, such that a KEK for wrapping CCA external keys may not be usable for wrapping TR-31 external keys, or vice versa.

**opt_blks_length**

Direction: Input  Type: Integer
TR-31 Export

This parameter specifies the length of parameter opt_blocks in bytes. If no optional data is to be included in the TR-31 key block, this parameter must be set to zero.

**opt_blocks**

*Direction: Input*  
*Type: String*

This parameter contains optional block data which is to be included in the output TR-31 key block. The optional block data is prepared using the TR-31 Optional Data Build callable service, and must be in ASCII. This parameter is ignored if opt_blks_length is zero.

**TR31_key_block_length**

*Direction: Input/Output*  
*Type: Integer*

This parameter specifies the length of the TR31_key_block parameter, in bytes. On input, it must specify the size of the buffer available for the output TR-31 key block, and on return it is updated to contain the actual length of that returned key block. If the provided buffer is not large enough for the output TR-31 key block an error is returned. The maximum size of the output TR-31 key block is 9992 bytes.

**TR31_key_block**

*Direction: Output*  
*Type: String*

This parameter specifies the location of the exported TR-31 key block wrapped with the export key provided in the wrap_kek_identifier parameter.

**Restrictions**

This callable service only exports DES and TDES keys.

Proprietary values for the TR-31 header fields are not supported by this callable service with the exception of the proprietary values used by IBM CCA when carrying a control vector in an optional block in the header.

**Usage Notes**

Unless otherwise noted, all String parameters that are either written to, or read from, a TR-31 key block will be in EBCDIC format. Input parameters are converted to ASCII before being written to the TR-31 key block and output parameters are converted to EBCDIC before being returned (see Appendix G, "EBCDIC and ASCII Default Conversion Tables," on page 891). TR-31 key blocks themselves are always in printable ASCII format as required by the ANSI TR-31 specification.

If keyword INCL-CV or ATTR-CV is specified, the service inserts the CCA control vector from the source key into an optional data field in the TR-31 header. The TR-31 Import callable service can extract this CV and use it as the CV for the CCA key it creates when importing the TR-31 block. This provides a way to use TR-31 for transport of CCA keys and to make the CCA key have identical control vectors on the sending and receiving nodes. The difference between INCL-CV and ATTR-CV is that INCL-CV is a normal TR-31 export in which the TR-31 key attributes are set based on the supplied rule array keywords but the CV is also included in the TR-31 block to provide additional detail. In contrast, the ATTR-CV causes the service to include the CV but to set both the TR-31 usage and mode of use fields to proprietary values which indicate that the usage and mode information are specified in the CV and not in the TR-31 header. For option INCL-CV, the export operation is still subject to the restrictions imposed by the settings of the
relevant access control points. For option ATTR CV, those access control points are not checked and any CCA key can be exported as long as the export control fields in the CV permit it.

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS.

Note that the optional data, if present, must not already contain a padding Block, ID “PB”. A Padding Block of the appropriate size, if needed, will be added when building the TR-31 key block. If this callable service encounters a padding block in the optional block data, an error will occur.

The access control points in the ICSF role that control the general function of this service are:

- TR31 Export – Permit version A TR-31 key blocks
- TR31 Export – Permit version B TR-31 key blocks
- TR31 Export – Permit version C TR-31 key blocks

The following table lists the valid attribute translations for export of CCA keys to TR-31 key blocks along with the access control points which govern those translations. Any translation not listed here will result in an error. If an individual cell is blank, it represents the value of the cell immediately above it.

**Table 116. Valid CCA to TR-31 Export Translations and Required Access Control Points (ACPs)**

<table>
<thead>
<tr>
<th>Export CCA Type (CSNBCVG keywords)</th>

</tr>
</thead>
<tbody>
<tr>
<td>Any Exportable Key</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Permit export of any CCA key (for allowable export scenarios as defined by this table) as long as the TR-31 key block will have the CCA Control Vector (CV) included as an optional block (the INCL-CV keyword was supplied on the callable service).

Normally export of CCA keys to TR-31 key blocks is controlled by ACPs specific to the translation or a small set of translations, to give fine control. This ACP allows any allowable export to occur as long as the CV is included, thus overriding the specific ACPs.

**Notes:**
1. Some target systems, produced by other vendors may not accept TR-31 key blocks with the proprietary optional CV block.
2. The ATTR-CV keyword does not require any ACPs.

**DUKPT Base Derivation Keys**

</tr>
</tbody>
</table>

Notes:
1. Keys for computing or verifying (against supplied value) a card verification code with the CVV, CVC, CVC2 and CVV2 algorithms. In CCA, this corresponds to keys used with two different APIs.
   - Visa CVV and MasterCard CVC codes are computed with CVV_Generate and verified with CVV_Verify. Keys must be DATA or MAC with sub-type (in bits 0-3) “ANY-MAC”, “CVVKEY-A” or “CVVKEY-B”. The GEN bit (20) or VER bit (21) must be set appropriately.
   - American Express CSC codes are generated and verified with the Transaction_Verify verb. The key must be a MAC or MACVER key with sub-type “ANY-MAC” or “AMEX-CSC”. The GEN bit (20) or VER bit (21) must be set appropriately.
2. CCA and TR-31 represent CVV keys incompatibly. CCA represents the “A” and “B” keys as two 8 B keys, while TR-31 represents these as one 16 B key. The CVV generate and verify verbs now accept a 16 B CVV key, using left and right parts as A and B. Current Visa standards require this.
3. Import and export of the 8 B CVVKEY-A and CVVKEY-B types will only be allowed using the proprietary TR-31 usage+mode values to indicate encapsulation of the IBM CV in an optional block, since the 8 B CVVKEY-A is meaningless / useless as a TR-31 C0 usage key of any mode.
4. It is possible to convert a CCA CVV key into a CSC key or vice-versa, since the translation from TR 31 usage “C0” is controlled by rule array keywords on the import verb. This can be restricted by using ACPs, but if both of translation types are required they cannot be disabled and control is up to the development, deployment, and execution of the applications themselves.

Data Encryption Keys

<table>
<thead>
<tr>
<th>ENCIPHER (none)</th>
<th>ENC + ENC-ONLY</th>
<th>D0</th>
<th>A,B,C</th>
<th>E</th>
<th>D, T</th>
</tr>
</thead>
<tbody>
<tr>
<td>DECIPHER (none)</td>
<td>ENC + DEC-ONLY</td>
<td>A,B,C</td>
<td>D, T</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CIPHER (none)</td>
<td>ENC + ENCDEC</td>
<td>A,B,C</td>
<td>B, D, T</td>
<td></td>
<td></td>
</tr>
<tr>
<td>DATA</td>
<td>enc bit(18)=1, dec bit(19)=1 or zeroCV</td>
<td>ENC + ENCDEC</td>
<td>A,B,C</td>
<td>B, D, T</td>
<td></td>
</tr>
</tbody>
</table>

Note: There is asymmetry in the TR-31 to CCA and CCA to TR-31 translation. CCA keys can be exported to TR-31 ‘D0’ keys from CCA type ENCIPHER, DECIPHER, or CIPHER, or type DATA with proper Encipher and Decipher CV bits on. A TR-31 ‘D0’ key can only be imported to CCA types ENCIPHER, DECIPHER, or CIPHER, not the lower security DATA key type. This eliminates conversion to the lower security DATA type by export / re-import.

<th>T31 Alg'm</th>
<th>Required “TR31 Export” ACP</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Notes:</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1. To be exported a KEK must have either the EXPORTER/IMPORTER bit or the XLAT bit on in the CV. A KEK with only the Key Generate bits on will not be exportable.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2. ‘K1’ keys are not distinguished from ‘K0’ keys within CCA. The ‘K1’ key is a particular KEK for deriving keys used in the ‘B’ or ‘C’ version wrapping of TR-31 key blocks. CCA does not distinguish between targeted protocols currently and so there is no good way to represent the difference; also note that most wrapping mechanisms now involve derivation or key variation steps.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3. The CCA KEK to TR-31 K0-B transition for export will not be allowed for security reasons, even with ACP control this gives an immediate path to turn a CCA EXPORTER to an IMPORTER and vice versa. Export of NO-CV KEKs will be allowed, exporter keys become ‘E’ mode normal K0 keys, importer keys become ‘D’ mode K0 keys. A user can turn any KEK to a NO-CV KEK by setting the flag bit and recalculating the TVV, the flag is not bound to the key like the CV is.</td>

</tr>
<tr>
<td>PINVER</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>PINGEN</td>
</tr>
</tbody>
</table>

Notes:
1. M0 and M1 are identical (ISO 16609 based on ISO 9797) normal DES/TDES (CBC) MAC computation, except M1 allows 8 byte and 16 byte keys while M0 allows only 16 byte keys. Mode M3 is the X9.19 style triple-DES MAC.
2. CCA does not support M2, M4, or M5.
3. Although export of DATAM/DATAMV keys to TR-31 M0/M1/M3 key types is allowed, import to DATAM/DATAMV CCA types is not allowed since they are obsolete types.
<table>
<thead>
<tr>
<th>Export CCA Type (CSNBCVG keywords)</th>

<td>VISAPVV + PINGEN</td>
<td>A,B,C C</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Permit PINGEN:NO-SPEC/VISA-PVV to V2</td>
</tr>
</tbody>
</table>

**Note:** There is a subtle difference between TR-31 V0 mode and CCA 'NO-SPEC' subtype. V0 mode restricts keys from 3224 or PVV methods, while CCA 'NO-SPEC' allows any method.

Turning on the ACP(s) controlling export of PINVER to usage:mode V*:N and import of V*:N to PINGEN at the same time will allow changing PINVER keys to PINGEN keys. This is not recommended. This is possible because legacy (TR-31 2005-based) implementations used the same mode ‘N’ for PINGEN as well as PINVER keys.

**Note:** EMV Chip Card Master Keys are used by the chip cards to perform cryptographic operations, or in some cases to derive keys used to perform operations. In CCA, these are:

- Key Gen Keys of level DKYL0 or DYL1 allowing derivation of operational keys, or
- operational keys.

EMV support in CCA is significantly different from TR-31. CCA key types do not match TR-31 types.

TR-31 Import (CSNB31I and CSNET31I)

Use the TR-31 Import callable service to convert a TR-31 key block to a CCA token. Since there is not always a one-to-one mapping between the key attributes defined by TR-31 and those defined by CCA, the caller may need to specify the attributes to attach to the imported key through the rule array.

The callable service name for AMODE(64) is CSNET31I.

Format

```
CALL CSNB31I(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    TR31_key_block_length,
    TR31_key_block,
    unwrap_kek_identifier_length,
    unwrap_kek_identifier,
    wrap_kek_identifier_length,
    wrap_kek_identifier,
    output_key_identifier_length,
    output_key_identifier,
    num_opt_blks,
    cv_source,
    protection_method )
```

Parameters

**return_code**

Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from 'X'00000000' to 'X'7FFFFFFF' (2 gigabytes). The data is identified in the **exit_data** parameter.

**exit_data**

Direction: Input/Output Type: String
TR-31 Import

The data that is passed to the installation exit.

`rule_array_count`

Direction: Input Type: Integer

The number of keywords you are supplying in the `rule_array` parameter. The `rule_array_count` parameter must be 1, 2, 3, 4, or 5.

`rule_array`

Direction: Input Type: String

The `rule_array` contains keywords that provide control information to the callable service. The keywords are 8 bytes in length and must be left-aligned and padded on the right with space characters. The `rule_array` keywords for this callable service are shown in the following table. One keyword from one CCA output key usage subgroup shown in the following table is required based on TR-31 input key usage, unless the CV is included in the TR-31 key block as an optional block. If the CV is included in the TR-31 key block as an optional block, the included CV will be used in the output key block as long as it does not conflict with the TR-31 header data.

See Table 120 on page 305 for valid combinations of Usage and Mode.

Table 118. Keywords for TR-31 Import Rule Array Control Information

</tr>
</tbody>
</table>
### Table 118. Keywords for TR-31 Import Rule Array Control Information (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Key Wrapping Method (Optional)</strong></td>
<td></td>
</tr>
<tr>
<td>Note: Conflicts between wrapping keywords used and a CV passed in an optional data block of the TR-31 token will result in errors being returned. The main example of this is a CV that indicates 'enhanced-only' in bit 56 when the user or configured default specifies ECB for key wrapping.</td>
<td></td>
</tr>
<tr>
<td>USECONFIG</td>
<td>Specifies that the configuration setting for the default wrapping method is to be used to wrap the key. This is the default.</td>
</tr>
<tr>
<td>WRAP-ENH</td>
<td>Specifies that the new enhanced wrapping method is to be used to wrap the key.</td>
</tr>
<tr>
<td>WRAP-ECB</td>
<td>Specifies that the original wrapping method is to be used.</td>
</tr>
<tr>
<td><strong>Translation Control (One Optional)</strong></td>
<td></td>
</tr>
<tr>
<td>ENH-ONLY</td>
<td>Specify this keyword to indicate that the key once wrapped with the enhanced method cannot be wrapped with the original method. This restricts translation to the original method. If the keyword is not specified translation to the original method will be allowed. This turns on bit 56 in the control vector. This keyword is not valid if processing a zero CV data key.</td>
</tr>
</tbody>
</table>

**Notes:**

1. If the TR-31 block contains a CV in the optional data block that does not have bit 56 turned on, bit 56 will be turned on in the output token, since with this keyword the user is asking for this behavior. The exception to this is for CVs of all 0x00 bytes, for this case no error will be generated but the CV will remain all 0x00 bytes.

2. Conflicts between wrapping keywords used and a CV passed in an optional data block of the TR-31 token will result in errors being returned. The main example of this is a CV that indicates 'enhanced-only' in bit 56 when the user or configured default specifies ECB for key wrapping. If the default wrapping method is ECB mode, but the enhanced mode and the ENH-ONLY restriction are desired for a particular key token, combine the ENH-ONLY keyword with the WRAP-ENH keyword.

---

**TR31_key_block_length**

*Direction:* Input  
*Type:* Integer

This parameter specifies the length of the TR31_key_block parameter, in bytes. The length field in the TR-31 block is a 4-digit decimal number, so the maximum acceptable length is 9992 bytes.

**TR31_key_block**

*Direction:* Input  
*Type:* String

This parameter contains the TR-31 key block that is to be imported. The key block is protected with the key passed in parameter `unwrap_kek_identifier`.

**unwrap_kek_identifier_length**

*Direction:* Input  
*Type:* Integer

This parameter specifies the length of the `unwrap_kek_identifier` parameter, in
bytes. The value in this parameter must currently be 64, since only CCA internal key tokens are supported for the `unwrap_kek_identifier` parameter.

**unwrap_kek_identifier**

Direction: Input/Output  
Type: String

This parameter contains either the label or the key token for the key that is used to unwrap and check integrity of the imported key passed in the TR31_key_block parameter. The key must be a CCA internal token for a KEK IMPORTER or IKEYXLAT type. If a key token is passed which is wrapped under the old master key, it will be updated on output so that it is wrapped under the current master key.

**Note:** ECB-mode wrapped DES keys (CCA legacy wrap mode) cannot be used to wrap/unwrap TR-31 version 'B'/C' key blocks that have, or will have, 'E' exportability. This is because ECB-mode does not comply with ANSI X9.24 Part 1.

**wrap_kek_identifier_length**

Direction: Input  
Type: Integer

This parameter specifies the length of the `wrap_kek_identifier` parameter, in bytes. If the `unwrap_kek_identifier` is also to be used to wrap the output CCA token, specify 0 for this parameter. Otherwise, this parameter must be 64.

**wrap_kek_identifier**

Direction: Input/Output  
Type: String

When `wrap_kek_identifier_length` is 0, this parameter is ignored and the `unwrap_kek_identifier` is also to be used to wrap the output CCA token. Otherwise, this parameter contains either the label or the key token for the KEK to use for wrapping the output CCA token. It must be a CCA internal token for a KEK EXPORTER or OKEYXLAT type and must have the same clear key as the `unwrap_kek_identifier`. If a key token is passed which is wrapped under the old master key, it will be updated on output so that it is wrapped under the current master key.

**Note:** ECB-mode wrapped DES keys (CCA legacy wrap mode) cannot be used to wrap/unwrap TR-31 version 'B'/C' key blocks that have/will have 'E' exportability. This is because ECB-mode does not comply with ANSI X9.24 Part 1.

**output_key_identifier_length**

Direction: Input/Output  
Type: Integer

This parameter specifies the length of the `output_key_identifier` parameter, in bytes. On input, it specifies the length of the buffer represented by the `output_key_identifier` parameter and must be at least 64 bytes long. On output, it contains the length of the token returned in the `output_key_identifier` parameter.

**output_key_identifier**

Direction: Output  
Type: String

This parameter contains the key token that is to receive the imported key. The output token will be a CCA internal or external key token containing the key received in the TR-31 key block.
num_opt_blocks
Direction: Output Type: Integer
This parameter contains the number of optional blocks that are present in the TR-31 key block.

cv_source
Direction: Output Type: String
This parameter contains information about how the control vector in the output key token was created. It can be one of the following three values:

0x00 No CV was present in an optional block, and the output CV was created by the callable service based on input parameters and on the attributes in the TR-31 key block header.

0x01 A CV was obtained from an optional block in the TR-31 key block, and the key usage and mode of use were also specified in the TR-31 header. The callable service verified compatibility of the header values with the CV and then used that CV in the output key token.

0x02 A CV was obtained from an optional block in the TR-31 key block, and the key usage and mode of use in the TR-31 header held the proprietary values indicating that key use and mode should be obtained from the included CV. The CV from the TR-31 token was used as the CV for the output key token.

Any value other than these are reserved for future use and are currently invalid.

protection_method
Direction: Output Type: String
This parameter contains information about what method was used to protect the input TR-31 key block. It can have one of the following values:

0x00 The TR-31 key block was protected using the variant method as identified by a Key Block Version ID value of “A” (0x41).

0x01 The TR-31 key block was protected using the derived key method as identified by a Key Block Version ID value of “B” (0x42).

0x02 The TR-31 key block was protected using the variant method as identified by a Key Block Version ID value of “C” (0x43). Functionally this method is the same as ‘A’, but to maintain consistency a different value will be returned here for ‘C’.

Any value other than these are reserved for future use and are currently invalid.

Restrictions
This callable service only imports DES and TDES keys.

Proprietary values for the TR-31 header fields are not supported by this callable service with the exception of the proprietary values used by IBM CCA when carrying a control vector in an optional block in the header.

Usage Notes
Unless otherwise noted, all String parameters that are either written to, or read from, a TR-31 key block will be in EBCDIC format. Input parameters are converted
to ASCII before being written to the TR-31 key block and output parameters are
converted to EBCDIC before being returned (see Appendix G, “EBCDIC and ASCII
Default Conversion Tables,” on page 891). TR-31 key blocks themselves are always
in printable ASCII format as required by the ANSI TR-31 specification.

If the TR-31 key block is marked as a key component, the resulting CCA key will
have the Key Part bit (bit 44) in the control vector set to 1.

The exportability attributes of the imported CCA token are set based on attributes in
the TR-31 key block as described in the following table.

Table 119. Export attributes of an imported CCA token

<table>
<thead>
<tr>
<th>TR-31 export attribute value</th>
<th>CCA action on import</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non-exportable (&quot;N&quot;)</td>
<td>CCA imports the key to an internal CCA key token. CV bit 17 (export) is set to zero to indicate that the key is not exportable. CV bit 57 (TR-31 export) is set to one to indicate that the key is not exportable to TR-31.</td>
</tr>
<tr>
<td>Exportable under trusted key (&quot;E&quot;)</td>
<td>If the TR-31 token is wrapped with a CCA KEK in the old ECB format, the request is rejected because that KEK is not a trusted key. If the CCA KEK is in a newer X9.24 compliant CCA key block, then the TR-31 key is imported to CCA in exactly the same way as described below for keys that are exportable under any key.</td>
</tr>
<tr>
<td>Exportable under any key (&quot;S&quot;)</td>
<td>CCA imports the key to an internal CCA key token. CV bit 17 (export) is set to one to indicate that the key is exportable. CV bit 57 (TR-31 export) is set to zero to indicate that the key is also exportable to TR-31.</td>
</tr>
</tbody>
</table>

If necessary, use the Prohibit Export, Prohibit Exported Extended, or Restrict Key Attribute callable service to alter the export attributes of the CCA token after import.

If the TR-31 key block contains an optional block with a CCA CV of
‘00007D00030000000000000000000000’ for a single length key or
‘00007D00034100000000000000000000000000007D0003210000000000000000000000’
for a double length key, the resulting CCA token will be a zero CV DATA token.

The TR-31 key block can contain a CCA control vector in an optional data field in
the header. If the CV is present, the service will check that CV for compatibility with
the TR-31 key attributes to ensure the CV is valid for the key and if there are no problems it will use that CV in the CCA key token that is output by the service. If a CV is received, the import operation is not subject to any ACP controlling the importation of specific key types. The CV may be present in the TR-31 key block in two different ways, depending on options used when creating that block.

- If the TR-31 Export callable service was called with option INCL-CV, the control vector is included in the TR-31 key block and the TR-31 key usage and mode of use fields contain attributes from the set defined in the TR-31 standard. The TR-31 Import callable service checks that those TR-31 attributes are compatible with the CV included in the block. It also verifies that no rule array keywords conflict with the CV contained in the TR-31 block.
- If the TR-31 Export callable service was called with option ATTR-CV, the control vector is included in the TR-31 key block and the TR-31 key usage and mode of use fields contain proprietary values (ASCII “10” and “1”, respectively) to indicate that the usage and mode information is contained in the included control vector.
In this case, the TR-31 Import service uses the included CV as the control vector for the CCA key token it produces. It also verifies that the CV does not conflict with rule array keywords passed.

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS.

The access control points in the ICSF role that control the general function of this service are:

- TR31 Import – Permit version A TR-31 key blocks
- TR31 Import – Permit version B TR-31 key blocks
- TR31 Import – Permit version C TR-31 key blocks
- TR31 Import – Permit override of default wrapping method

The following table lists the valid attribute translations for import of TR-31 key blocks to CCA keys along with the access control points which govern those translations. Any translation not listed here will result in an error. If an individual cell is blank, it represents the value of the cell immediately above it.

**Note:** In order to import a TR-31 key block to a CCA key, the appropriate key block version ACP needs to be enabled in addition to any required translation specific ACPs from below.

</thead>
<tbody>
<tr>
<td>The card verification keys are keys for computing or verifying (against supplied value) a card verification code with the CVV, CVC, CVC2 and CVV2 algorithms.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Notes:**
1. In CCA, this corresponds to keys used with two different APIs.
   - Visa CVV and MasterCard CVC codes are computed with CVV_Generate and verified with CVV_Verify. Keys must be DATA or MAC with sub-type (in bits 0-3) “ANY-MAC”, “CVVKEY-A” or “CVVKEY-B”. The GEN bit (20) or VER bit (21) must be set appropriately.
   - American Express CSC codes are generated and verified with the Transaction.Validate verb. The key must be a MAC or MACVER key with sub-type “ANY-MAC” or “AMEX-CSC”. The GEN bit (20) or VER bit (21) must be set appropriately.
2. CCA and TR-31 represent CVV keys incompatibly. CCA represents the “A” and “B” keys as two 8 B keys, while TR-31 represents these as one 16 B key. The CVV generate and verify verbs now accept a 16 B CVV key, using left and right parts as A and B. Current Visa standards require this.
3. Import and export of the 8 B CVVKEY-A and CVVKEY-B types will only be allowed using the proprietary TR-31 usage+mode values to indicate encapsulation of the IBM CV in an optional block, since the 8 B CVVKEY-A is meaningless / useless as a TR-31 C0 usage key of any mode.
4. Import of a TR-31 key of usage C0 to CCA key type ‘ANY-MAC’ will not be allowed, although the ANY-MAC key is also usable for card verification purposes.
5. It is possible to convert a CCA CVV key into a CSC key or vice-versa, since the translation from TR-31 usage “C0” is controlled by rule array keywords on the import verb. This can be restricted by using ACPs, but if both of translation types are required they cannot be disabled and control is up to the development, deployment, and execution of the applications themselves.

CCA does not have a ‘MAC GEN ONLY’ key type, so TR-31 usage of G will translate to a full MAC key.

### Data Encryption Keys

<table>
<thead>
<tr>
<th>Usage</th>
<th>A,B,C</th>
<th>E</th>
<th>D, T</th>
<th>ENCIPHER</th>
<th>(none)</th>
<th>(none)</th>
</tr>
</thead>
<tbody>
<tr>
<td>D0</td>
<td>A,B,C</td>
<td>E</td>
<td>D, T</td>
<td>ENCIPHER</td>
<td>(none)</td>
<td>(none)</td>
</tr>
<tr>
<td></td>
<td>A,B,C</td>
<td>D</td>
<td>D, T</td>
<td>DECIPHER</td>
<td>(none)</td>
<td>(none)</td>
</tr>
<tr>
<td></td>
<td>A,B,C</td>
<td>B</td>
<td>D, T</td>
<td>CIPHER</td>
<td>(none)</td>
<td>(none)</td>
</tr>
</tbody>
</table>

**Notes:**
1. There is asymmetry in the TR-31 to CCA and CCA to TR-31 translation. CCA keys can be exported to TR-31 ‘D0’ keys from CCA type ENCIPHER, DECIPHER, or CIPHER, or type DATA with proper Encipher and Decipher CV bits on. A TR-31 ‘D0’ key can only be imported to CCA types ENCIPHER, DECIPHER, or CIPHER, not the lower security DATA key type. This eliminates conversion to the lower security DATA type by export / re-import.
2. There are no ACPs controlling import since the intent of the TR-31 key’s control is not interpreted, just directly translated to CCA control.

<td>IKEYXLAT</td>
<td></td>
<td>IKEYXLAT</td>
<td>IKEYXLAT</td>
<td>(none)</td>
<td>Permit K1:B to IMPORTER/IKEYXLAT</td>
</tr>
</tbody>
</table>

**Notes:**
1. K1 keys are not distinguished from ‘K0’ keys within CCA. The ‘K1’ key is a particular KEK for deriving keys used in the ‘B’ or ‘C’ version wrapping of TR-31 key blocks. CCA does not distinguish between targeted protocols currently and so there is no good way to represent the difference; also note that most wrapping mechanisms now involve derivation or key variation steps.
2. It is possible to convert a CCA EXPORTER key to an OKEYXLAT, or to convert an IMPORTER to an IKEYXLAT by export/re-import. This can be restricted by using ACPs, but if both translations are required they cannot be disabled and control is up to the development, deployment, and execution of the applications themselves.
3. It will not be possible to export a CCA key to TR-31 type K0-B, in order to avoid the ability to translate a CCA EXPORTER to a CCA IMPORTER via export/import to the TR-31 token type. When a TR-31 key block does not have an included CV as an optional block, the default CV will be used to construct the output token. For IMPORTER / EXPORTER keys this means that the Key Generate bits will also be on in the KEK.

#### MAC Keys

<table>
<thead>
<tr>
<th>M0</th>
<th>A,B,C</th>
<th>G,C</th>
<th>T</th>
<th>(none)</th>
<th>MAC</th>
<th>ANY-MAC</th>
<th>Permit M0/M1/M3 to MAC/MACVER:ANY-MAC</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>A,B,C</td>
<td>V</td>
<td>T</td>
<td>(none)</td>
<td>MACVER</td>
<td>ANY-MAC</td>
<td></td>
</tr>
<tr>
<td>M1</td>
<td>A,B,C</td>
<td>G,C</td>
<td>D, T</td>
<td>(none)</td>
<td>MAC</td>
<td>ANY-MAC</td>
<td></td>
</tr>
<tr>
<td></td>
<td>A,B,C</td>
<td>V</td>
<td>D, T</td>
<td>(none)</td>
<td>MACVER</td>
<td>ANY-MAC</td>
<td></td>
</tr>
<tr>
<td>M3</td>
<td>A,B,C</td>
<td>G,C</td>
<td>D, T</td>
<td>(none)</td>
<td>MAC</td>
<td>ANY-MAC</td>
<td></td>
</tr>
<tr>
<td></td>
<td>A,B,C</td>
<td>V</td>
<td>D, T</td>
<td>(none)</td>
<td>MACVER</td>
<td>ANY-MAC</td>
<td></td>
</tr>
</tbody>
</table>

**Notes:**
1. M0 and M1 are identical (ISO 16609 based on ISO 9797) normal DES/TDES (CBC) MAC computation, except M1 allows 8 byte and 16 byte keys while M0 allows only 16 byte keys. Mode M3 is the X9.19 style triple-DES MAC.
2. CCA does not support M2, M4, or M5.
3. Although export of DATAM/DATAMV keys to TR-31 M0/M1/M3 key types is allowed, import to DATAM/DATAMV CCA types is not allowed since they are obsolete types

<tr>
<td></td>
<td>A,B,C</td>
<td>V</td>
<td>PINVER</td>
<td>VISA-PVV</td>
<td>PINVER</td>
<td>Permit V2 to PINGEN:VISA-PVV</td>
</tr>
</tbody>
</table>

**Notes:**
1. NOOFFSET keyword may be passed to specify resultant CCA key to have NOOFFSET bit (bit 37) on in CV. However this will be automatic if CV is included and has NOOFFSET bit set.
2. NOOFFSET keyword is not supported for V2 usage since VISA-PVV algorithm does not support that concept.
3. There is a subtle difference between TR-31 V0 mode and CCA ‘NO-SPEC’ subtype. V0 mode restricts keys from 3224 or PVV methods, while CCA ‘NO-SPEC’ allows any method.
4. Turning on the ACP(s) controlling export of PINVER to usage:mode V*:N and import of V*:N to PINGEN at the same time will allow changing PINVER keys to PINGEN keys. This is not recommended. This is possible because legacy (TR-31 2005-based) implementations used the same mode ‘N’ for PINGEN as well as PINVER keys.

Note: EMV Chip Card Master Keys are used by the chip cards to perform cryptographic operations, or in some cases to derive keys used to perform operations. In CCA, these are:
- Key Gen Keys of level DKYL0 or DKYL1 allowing derivation of operational keys, or
- operational keys.

EMV support in CCA is significantly different. CCA key types do not match TR-31 types.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

---

**TR-31 Optional Data Build (CSNBT31O and CSNET31O)**

A TR-31 key block can hold optional fields which are securely bound to the key block using the integrated MAC. The optional blocks may either contain information defined in the TR-31 standard, or they may contain proprietary data.

Use the TR-31 Optional Data Build callable service to construct the optional block data structure for a TR-31 key block. It builds the structure by adding one optional block with each call, until your entire set of optional blocks have been added.

With each call, the application program provides a single optional block by specifying its ID, its length, and its data in parameters `opt_block_id`, `opt_block_length`, and `opt_block_data` respectively. Each subsequent call appends the current optional block to any preexisting blocks in the `opt_blocks` parameter. On the first call to the callable service, `opt_blocks` is typically empty.

The callable service name for AMODE(64) is CSNET31O.

**Format**

```
CSNBT31O(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    opt_blocks_bfr_length,
    opt_blocks_length,
    opt_blocks,
    num_opt_blocks,
    opt_block_id,
    opt_block_data_length,
    opt_block_data)
```

**Parameters**

- `return_code`
  
  Direction: Output  
  Type: Integer

  The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

- `reason_code`
TR-31 Optional Data Build

- **exit_data_length**
  - Direction: Ignored
  - Type: Integer
  - This field is ignored. It is recommended to specify 0 for this parameter.

- **exit_data**
  - Direction: Ignored
  - Type: String
  - This field is ignored.

- **rule_array_count**
  - Direction: Input
  - Type: Integer
  - The number of keywords you are supplying in the `rule_array` parameter. The `rule_array_count` parameter must be 0 since no keywords are currently defined for this callable service.

- **rule_array**
  - Direction: Input
  - Type: String
  - The `rule_array` contains keywords that provide control information to the callable service. There are no `rule_array` keywords currently defined for this callable service.

- **opt_blocks_bfr_length**
  - Direction: Input
  - Type: Integer
  - This parameter specifies the length of the buffer passed with the `opt_blocks` parameter. This length is used to determine if it would overflow the buffer size when adding a new optional block to the current contents of the buffer.

- **opt_blocks_length**
  - Direction: Input/Output
  - Type: Integer
  - This parameter specifies the actual length of the set of optional blocks currently contained in the `opt_blocks` buffer. On output, it is updated with the length after the callable service has added the new optional block.

- **opt_blocks**
  - Direction: Input/Output
  - Type: String
  - This parameter specifies a buffer containing the set of optional blocks being built. In the first call, it will generally be empty. The callable service will append one optional block to the buffer with each call. Parameter `opt_blocks_bfr_length`
specifies the total length of this buffer, and an error will be returned if this length
would be exceeded by adding the optional block in parameter opt_block_data to
the current contents. This parameter is encoded in ASCII on both input and
output.

num_opt_blocks

Direction: Output   Type: Integer

This parameter contains the number of optional blocks contained in the
structure returned in parameter opt_blocks. This is provided as an output
parameter so that it can subsequently be used as an input to the TR-31 Export
callable service.

opt_block_id

Direction: Input   Type: String

This parameter specifies a two-byte value which is the identifier (ID) of the
optional block passed in parameter opt_block_data.

opt_block_data_length

Direction: Input   Type: Integer

This parameter specifies the length of the data passed in parameter
opt_block_data. Note that it is valid for this length to be zero; an optional block
can have an ID and a length, but no data.

opt_block_data

Direction: Input   Type: String

This parameter specifies a buffer where the application passes the data for the
optional block that is to be added to those already in the buffer in parameter
opt_blocks. The length of this data is specified in parameter
opt_block_data_length.

Restrictions

None.

Usage Notes

Unless otherwise noted, all String parameters that are either written to, or read
from, a TR-31 key block will be in EBCDIC format. Input parameters are converted
to ASCII before being written to the TR-31 key block and output parameters are
converted to EBCDIC before being returned (see Appendix G, “EBCDIC and ASCII
Default Conversion Tables,” on page 891). TR-31 key blocks themselves are always
in printable ASCII format as required by the ANSI TR-31 specification.

Note that the Padding Block, ID “PB” is not allowed to be added by the user. A
Padding Block of the appropriate size, if needed, will be added when building the
TR-31 key block in TR-31 Export. If the TR-31 Export callable service encounters a
padding block in the optional block data, an error will occur.

This table lists the required cryptographic hardware for each server type and
describes restrictions for this callable service.

**TR-31 Optional Data Read (CSNBT31R and CSNET31R)**

A TR-31 key block can hold optional fields which are securely bound to the key block using the integrated MAC. The optional blocks may either contain information defined in the TR-31 standard, or they may contain proprietary data. A separate range of optional block identifiers is reserved for use with proprietary blocks.

Note that some of the parameters are only used with keyword INFO and others are only used with keyword DATA.

The callable service name for AMODE(64) is CSNET31R.

**Format**

```c
CSNBT31R( 
    return_code, 
    reason_code, 
    exit_data_length, 
    exit_data, 
    rule_array_count, 
    rule_array, 
    TR31_key_block_length, 
    TR31_key_block, 
    opt_block_id, 
    num_opt_blocks, 
    opt_block_ids, 
    opt_block_lengths, 
    opt_block_data_length, 
    opt_block_data )
```

**Parameters**

- `return_code`  
  Direction: Output  
  Type: Integer
TR-31 Optional Data Read

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length

Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data

Direction: Ignored Type: String

This field is ignored.

rule_array_count

Direction: Input Type: Integer

The number of keywords you are supplying in the rule_array parameter. The rule_array_count parameter must be 1.

rule_array

Direction: Input Type: String

The rule_array contains keywords that provide control information to the callable service. The keywords are 8 bytes in length and must be left-aligned and padded on the right with space characters. The rule_array keywords for this callable service are shown in the following table.

Table 123. Keywords for TR-31 Optional Data Read Rule Array Control Information

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Operation – one required</strong></td>
<td></td>
</tr>
<tr>
<td>INFO</td>
<td>Return information about the optional blocks in the TR-31 key block.</td>
</tr>
<tr>
<td>DATA</td>
<td>Return the data contained in a specified optional block in the TR-31 key block.</td>
</tr>
</tbody>
</table>

TR31_key_block_length

Direction: Input Type: Integer

This parameter specifies the length of the TR31_key_block parameter, in bytes. The parameter may specify a length that is greater than the size of the key block however it can never be greater than the size of the buffer where the key block resides. This value must be between 16 and 9992 inclusive.

TR31_key_block
TR-31 Optional Data Read

- **opt_block_id**
  - Direction: Input
  - Type: String
  - This parameter is only used with option DATA. It is ignored for others. It specifies a 2-byte string which contains the identifier of the block from which the application is requesting data. The callable service will locate this optional block within the TR-31 structure and copy the data from that optional block into the returned `opt_block_data` buffer. If the specified optional block is not found in the TR-31 key block, an error will occur.

- **num_opt_blocks**
  - Direction: Input
  - Type: Integer
  - This parameter specifies the number of optional blocks in the TR-31 key block. The value is compared to the corresponding value in the TR-31 block header and if they do not match the callable service fails with an error. This parameter is only used for option INFO and is not examined for any other options.

- **opt_block_ids**
  - Direction: Output
  - Type: String Array
  - This parameter contains an array of two-byte string values. Each of these values is the identifier (ID) of one of the optional blocks contained in the TR-31 key block. The callable service returns a list containing the ID of each optional block that is in the TR-31 block, and the list is in the order that the optional blocks appear in the TR-31 header. The total length of the returned list will be two times the number of optional blocks, and the caller must supply a buffer with a length at least twice the value it passes in parameter `num_opt_blocks`. This parameter is only used for option INFO and is not examined for any other options.

- **opt_block_lengths**
  - Direction: Output
  - Type: Integer Array
  - This parameter contains an array of integer values. Each of these values is the length in bytes of one of the optional blocks contained in the TR-31 key block. The callable service returns a list containing the length of each optional block that is in the TR-31 block, and the list is in the order that the optional blocks appear in the TR-31 header. The total length of the returned list will be four times the number of optional blocks and the application program must supply a buffer with a length at least four times the value it passes in parameter `num_opt_blocks`. This parameter is only used for option INFO and is not examined or altered for any other options.

- **opt_block_data_length**
  - Direction: Input/Output
  - Type: Integer
  - This parameter specifies the length for parameter `opt_block_data`. On input it must be set to the length of the buffer provided by the application program, and on output it is updated to contain the length of the returned optional block data, in bytes. It is only used for option DATA.

- **opt_block_data**
  - Direction: Input/Output
  - Type: String Array
  - This parameter contains the TR-31 key block that is to be parsed. The length of the TR-31 block is specified using parameter `TR31_key_block_length`. This parameter is only used for option DATA.
TR-31 Optional Data Read

Direction: Output  Type: String

This parameter contains a buffer where the callable service stores the data it reads from the specified optional block. The buffer must have enough space for the data, as indicated by the input value of parameter opt_block_data_length. If not an error occurs and no changes are made to the contents of the buffer. If the size of the buffer is sufficient, the data is copied to the buffer and its length is stored in parameter opt_block_data_length. It is only used for option DATA and is not examined or altered for any other options.

Restrictions

None

Usage Notes

Unless otherwise noted, all String parameters that are either written to, or read from, a TR-31 key block will be in EBCDIC format. Input parameters are converted to ASCII before being written to the TR-31 key block and output parameters are converted to EBCDIC before being returned (see Appendix G, “EBCDIC and ASCII Default Conversion Tables,” on page 891). TR-31 key blocks themselves are always in printable ASCII format as required by the ANSI TR-31 specification.

The TR-31 Optional Data Read callable service (CSNBT31R and CSNET31R) can be used in conjunction with the TR-31 Parse callable service (CSNBT31P and CSNET31P) to obtain both the standard header fields and any optional data blocks from the key block. This is generally a three-step process.

1. Use the TR-31 Parse callable service to determine how many optional blocks are in the TR-31 token. This is returned in the num_opt_blocks parameter.

2. Use keyword INFO with the TR-31 Optional Data Read callable service to obtain lists of the optional block identifiers and optional block lengths. Your buffers must be large enough to hold the returned data, but the required size can be determined from the number of blocks obtained in the step above.

3. Use keyword DATA with the TR-31 Optional Data Read callable service to obtain the data for a particular optional block, specified by the block identifier.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

TR-31 Parse (CSNBT31P and CSNET31P)

Use the TR-31 Parse callable service to retrieve standard header information from a TR-31 key block without importing the key.

The callable service name for AMODE(64) is CSNET31P.

Format

CALL CSNBT31P(
return_code,
reason_code,
exit_data_length,
exit_data,
rule_array_count,
rule_array,
TR31_key_block_length,
TR3I_key_block,
key_block_version,
key_block_length,
key_usage,
major,
minor,
key_version_number,
exportability,
num_opt_blocks )

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.
exit_data

Direction: Ignored Type: String

This field is ignored.

rule_array_count

Direction: Input Type: Integer

The number of keywords you are supplying in the rule_array parameter. The rule_array_count parameter must be 0 because no keywords are currently defined for this callable service.

rule_array

Direction: Input Type: String

A rule_array contains keywords that provide control information to the callable service. No rule array keywords are currently defined for this callable service.

TR31_key_block_length

Direction: Input Type: Integer

This parameter specifies the length of the TR31_key_block parameter, in bytes. The parameter may specify a length that is greater than the size of the key block (however it can never be greater than the size of the buffer where the key block resides). This value must be between 16 and 9992 inclusive.

TR31_key_block

Direction: Input Type: String

This parameter contains the TR-31 key block that is to be parsed.

key_block_version

Direction: Output Type: String

This parameter contains a one-byte character value that indicates the version of the TR-31 key block, parsed from the block itself. CCA only supports versions "A", "B", and "C" key blocks.

key_block_length

Direction: Output Type: Integer

This parameter contains the length of the key block as obtained from the TR-31 key block header. Note that this may be different from the input value in parameter TR31_key_block_length, if the application program specifies a length that is greater than the actual length of the key block.

key_usage

Direction: Output Type: String

This parameter contains a 2-byte string value indicating the TR-31 key usage value for the key contained in the block. The value is obtained from the TR-31
key block header. The usage defines the type of function this key can be used
with, such as data encryption, PIN encryption, or key wrapping.

algorithm

Direction: Output Type: String

This parameter contains a one-byte string identifying the cryptographic
algorithm the wrapped key is to be used with. The value is read from the TR-31
key block header. CCA only supports "D" for a Single-DES key and "T" for a
Triple-DES key.

mode

Direction: Output Type: String

This parameter contains a one-byte string indicating the TR-31 mode of use for
the key contained in the block. The value is obtained from the TR-31 key block
header. The mode of use describes what operations the key can perform, within
the limitations specified with the key usage value. For example, a key with
usage for data encryption can have a mode to indicate it may be used for
encryption only, decryption only, or both encryption and decryption.

key_version_number

Direction: Output Type: String

This parameter contains a two-byte string obtained from the TR-31 key block
header which represents versioning information about the key contained in the
block.

exportability

Direction: Output Type: String

This parameter contains a one-byte string indicating the key exportability value
from the TR-31 key block header. This value indicates whether the key can be
exported from this system, and if so it specifies conditions under which export is
permitted.

num_opt_blocks

Direction: Output Type: Integer

This parameter contains the number of optional blocks that are part of the
TR-31 key block.

Restrictions

None

Usage Notes

Unless otherwise noted, all String parameters that are either written to, or read
from, a TR-31 key block will be in EBCDIC format. Input parameters are converted
to ASCII before being written to the TR-31 key block and output parameters are
converted to EBCDIC before being returned (see Appendix G, "EBCDIC and ASCII
Default Conversion Tables," on page 891). TR-31 key blocks themselves are always
in printable ASCII format as required by the ANSI TR-31 specification.
The TR-31 Optional Data Read callable service (CSNBTR31R and CSNET31R) can be used in conjunction with the TR-31 Parse callable service (CSNBTR31P and CSNET31P) to obtain both the standard header fields and any optional data blocks from the key block. This is generally a three-step process.

1. Use the TR-31 Parse callable service to determine how many optional blocks are in the TR-31 token. This is returned in the num_opt_blocks parameter.
2. Use keyword INFO with the TR-31 Optional Data Read callable service to obtain lists of the optional block identifiers and optional block lengths. Your buffers must be large enough to hold the returned data, but the required size can be determined from the number of blocks obtained in the step above.
3. Use keyword DATA with the TR-31 Optional Data Read callable service to obtain the data for a particular optional block, specified by the block identifier.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

User Derived Key (CSFUDK and CSFUDK6)

This callable service is not supported on an IBM @server zSeries 990, IBM @server zSeries 890, z9 EC and z9 BC, z10 EC and z10 BC. Diversified key generate callable service can be used to perform this processing.

Use the user derived key callable service to generate a single-length or double-length MAC key or to update an existing user derived key. A single-length MAC key can be used to compute a MAC following the ANSI X9.9, ANSI X9.19, or the Europay, MasterCard and VISA (EMV) Specification MAC processing rules. A double-length MAC key can be used to compute a MAC following either the ANSI X9.19 optional double MAC processing rule or the EMV Specification MAC processing rule.

This service updates an existing user derived key by XORing it with data you supply in the data_array parameter. This is called SESSION MAC key generation by VISA.
User Derived Key

This service adjusts the user derived key or SESSION MAC key to odd parity. The parity of the supplied derivation key is not tested.

The callable service name for AMODE(64) invocation is CSFUDK6.

Format

```plaintext
CALL CSFUDK(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_type,
    rule_array_count,
    rule_array,
    derivation_key_identifier,
    source_key_identifier,
    data_array,
    generated_key_identifier)
```

Parameters

**return_code**

Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  Type: String

The data that is passed to the installation exit.

**key_type**

Direction: Input  Type: String

The 8-byte keyword of 'MAC ' or 'MACD ' that specifies the key type to be generated. The keyword must be left-justified and padded on the right with blanks. MAC specifies an 8-byte, single-length MAC key which is used in the
User Derived Key

ANSI X9.9-1 or the ANSI X9.19 basic MAC processing rules. MACD specifies a 16-byte, double-length internal MAC key that uses the single-length control vector for both the left and right half of the key (MAC || MAC). The double-length MAC key is used in the ANSI X9.19 optional double-key MAC processing rules. The keyword 'TOKEN ' is also accepted. If you specify TOKEN with a rule array of VISA or NOFORMAT, the key type is determined by the valid internal token of the single-length or double-length MAC key in the generated_key_identifier parameter. If you specify TOKEN with a rule array of SESS-MAC, the key type is determined by the valid internal token of the single-length or double-length MAC key in the source_key_identifier.

rule_array_count
Direction: Input Type: Integer

The number of keywords specified in the rule_array parameter. The value must be 1.

rule_array
Direction: Input Type: Character string

The process rule for the user derived key in an 8-byte field. The keywords must be in 8 bytes of contiguous storage, left-justified and padded on the right with blanks.

The keywords are shown in Table 126.

Table 126. Keywords for User Derived Key Control Information

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Derived Key Process Rules (required)</td>
<td></td>
</tr>
<tr>
<td>NOFORMAT</td>
<td>For generating a user derived key with no formatting done on the array before encryption under the derivation_key_identifier.</td>
</tr>
<tr>
<td>SESS-MAC</td>
<td>To update an existing user derived key supplied in the source_key_identifier parameter with data provided in the data_array parameter.</td>
</tr>
<tr>
<td>VISA</td>
<td>For generating a user derived key using the VISA algorithm to format the data array input before encryption under the derivation_key_identifier. For guidance information refer to the VISA Integrated Circuit Card Specification, V1.3 Aug 31, 1996.</td>
</tr>
</tbody>
</table>

derivation_key_identifier
Direction: Input/Output Type: String

For a rule_array value of VISA or NOFORMAT, this is a 64-byte key label or internal key token of the derivation key used to generate the user derived key. The key must be an EXPORTER key type. For any other keyword, this field must be a null token.

source_key_identifier
Direction: Input/Output Type: String
User Derived Key

For a `rule_array` value of SESS-MAC, this is a 64-byte internal token of a single-length or double-length MAC key. For any other keyword, this field must be a null token.

**data_array**

*Direction: Input*  
*Type: String*

Two 16-byte data elements required by the corresponding `rule_array` and `key_type` parameters. The data array consists of two 16-byte hexadecimal character fields whose specification depends on the process rule and key type. VISA requires only one 16-byte hexadecimal character input. Both NOFORMAT and SESS-MAC require one 16-byte input for a key type of MAC and two 16-byte inputs for a key type of MACD. If only one 16-byte field is required, then the rest of the data array is ignored by the callable service.

**generated_key_identifier**

*Direction: Input/Output*  
*Type: String*

The 64-byte internal token of the generated single-length or double-length MAC key. This is an input field only if TOKEN is specified for `key_type`.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

This service requires that the ANSI system keys be installed in the CKDS.

The following table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Chapter 6. Protecting Data

Use ICSF to protect sensitive data stored on your system, sent between systems, or stored off your system on magnetic tape. To protect data, encipher it under a key. When you want to read the data, decipher it from ciphertext to plaintext form.

ICSF provides encipher and decipher callable services to perform these functions. If you use a key to encipher data, you must use the same key to decipher the data. To use clear keys directly, ICSF provides symmetric key decipher, symmetric key encipher, encode and decode callable services. These services encipher and decipher with clear keys. You can use clear keys indirectly by first using the clear key import callable service, and then using the encipher and decipher callable services.

This topic describes these services:

- "Ciphertext Translate (CSNBCTT or CSNBCTT1 and CSNECTT or CSNECTT1)" on page 328
- "Decipher (CSNBDEC or CSNBDEC1 and CSNEDEC or CSNEDEC1)" on page 331
- "Decode (CSNBDCO and CSNEDCO)" on page 338
- "Encipher (CSNBENC or CSNBENC1 and CSNEENC or CSNEENC1)" on page 340
- "Encode (CSNBECO and CSNEECO)" on page 348
- "Symmetric Algorithm Decipher (CSNBSAD or CSNBSAD1 and CSNESAD or CSNESAD1)" on page 350
- "Symmetric Algorithm Encipher (CSNBSAE or CSNBSAE1 and CSNESAE or CSNESAE1)" on page 356
- "Symmetric Key Decipher (CSNBSYD or CSNBSYD1 and CSNESYD or CSNESYD1)" on page 362
- "Symmetric Key Encipher (CSNBSYE or CSNBSYE1 and CSNESYE or CSNESYE1)" on page 371

Modes of Operation

To encipher or decipher data or keys, ICSF uses either the U.S. National Institute of Standards and Technology (NIST) Data Encryption Standard (DES) algorithm or the Commercial Data Masking Facility (CDMF). The DES algorithm is documented in Federal Information Processing Standard #46. CDMF provides DES cryptography using an effectively shortened DATA key. See "System Encryption Algorithm" on page 49 for more information.

To encipher or decipher data, ICSF also uses the U.S. National Institute of Standards and Technology (NIST) Advanced Encryption Standard (AES) algorithm. The AES algorithm is documented in Federal Information Processing Standard 197.

ICSF enciphers and deciphers using several modes of operation. Some of the modes have variations related to padding or blocking of the data. The text in parentheses is the processing rule associated with that mode.

The supported modes are:

- Electronic code book (ECB)
- Cipher block chaining (CBC)
  - Cipher block chaining with ciphertext stealing (CBC-CS)
  - Cipher block chaining compatible with CUSP/PCF (CUSP)
– Cipher block chaining compatible with IPS (IPS)
– Cipher block chaining using PKCS#7 padding (PKCS-PAD)
– Cipher block chaining using ANSI X9.23 padding (X9.23)
– Cipher block chaining using IBM 4700 padding (4700-PAD)

• Cipher Feedback (CFB)
  – Cipher Feedback with a non-blocksize segment (CFB-LCFB)

• Output Feedback (OFB)
• Galois/Counter Mode (GCM)

Electronic Code Book (ECB) Mode
In the ECB mode, each block of plaintext is separately enciphered and each block of the ciphertext is separately deciphered. In other words, the encipherment or decipherment of a block is totally independent of other blocks. ICSF uses the ECB encipherment mode for enciphering and deciphering data with clear keys using the encode and decode callable services.

ICSF does not support ECB encipherment mode on CDMF-only systems.

Cipher Block Chaining (CBC) Mode
The CBC mode uses an initial chaining vector (ICV) in its processing. The CBC mode only processes blocks of data in exact multiples of the blocksize. The ICV is exclusive ORed with the first block of plaintext prior to the encryption step; the block of ciphertext just produced is exclusive-ORed with the next block of plaintext, and so on. You must use the same ICV to decipher the data. This disguises any pattern that may exist in the plaintext. CBC mode is the default for encrypting and decrypting data using the Encipher and Decipher callable services. Cipher Processing Rules” on page 874 describes the CBC-specific processing rules in detail.

Cipher Feedback (CFB) Mode
The CFB mode uses an initial chaining vector (ICV) in its processing. CFB mode performs cipher feedback encryption. CFB mode operates on segments instead of blocks. The segment length (called s) is between one bit and the block size (called b) for the underlying algorithm (DES or AES), inclusive. ICSF only allows segment sizes which are a multiple of eight bits (complete bytes). Each encryption step takes an input block, enciphers it with the key provided to generate an output block, takes the most significant s bits of the output block, and then exclusive ORs that with the plaintext segment. The first input block is the ICV and each subsequent input block is formed by concatenating the (b-s) least significant bits of the previous input block and the ciphertext (s bits) from the previous step to form a full block. The input text can be of any length. The output text will have the same length as the input text.

Output Feedback (OFB) Mode
The OFB mode uses an initial chaining vector (ICV) in its processing. OFB mode requires that the ICV is a nonce (the ICV must be unique for each execution of the mode under the given key). Each encryption step takes an input block, enciphers it with the key provided to generate an output block, and then exclusive ORs the output block with the plaintext block. The first input block is the ICV and each subsequent input block is the previous output block. The input text can be of any length. The output text will have the same length as the input text.
Galois/Counter Mode (GCM)

The GCM mode uses an initialization vector (IV) in its processing. This mode is used for authenticated encryption with associated data. GCM provides confidentiality and authenticity for the encrypted data and authenticity for the additional authenticated data (AAD). The AAD is not encrypted. GCM mode requires that the IV is a nonce, i.e., the IV must be unique for each execution of the mode under the given key. The steps for GCM encryption are:

1. The hash subkey for the GHASH function is generated by applying the block cipher to the “zero” block.
2. The pre-counter block ($J_0$) is generated from the IV. In particular, when the length of the IV is 96 bits, then the padding string $0^{31}\|1$ is appended to the IV to form the pre-counter block. Otherwise, the IV is padded with the minimum number of ‘0’ bits, possibly none, so that the length of the resulting string is a multiple of 128 bits (the block size); this string in turn is appended with 64 additional ‘0’ bits, followed by the 64-bit representation of the length of the IV, and the GHASH function is applied to the resulting string to form the pre-counter block.
3. The 32-bit incrementing function is applied to the pre-counter block to produce the initial counter block for an invocation of the GCTR function on the plaintext. The output of this invocation of the GCTR function is the ciphertext.
4. The AAD and the ciphertext are each appended with the minimum number of ‘0’ bits, possibly none, so that the bit lengths of the resulting strings are multiples of the block size. The concatenation of these strings is appended with the 64-bit representations of the lengths of the AAD and the ciphertext to produce block $u$.
5. The GHASH function is applied to block $u$ to produce a single output block.
6. This output block is encrypted using the GCTR function with the pre-counter block that was generated in Step 2 and the result is truncated to the specified tag length to form the authentication tag.
7. The ciphertext and the tag are returned as the output.

The plaintext can be of any length. The ciphertext will have the same length as the plaintext.

For GCM decryption, the tag is an input parameter. ICSF calculates a tag using the same process as encryption and compares that to the parameter passed by the caller. If they match, the decryption will proceed.

Triple DES Encryption

Triple-DES encryption uses a triple-length DATA key comprised of three 8-byte DES keys to encipher 8 bytes of data using this method:

- Encipher the data using the first key
- Decipher the result using the second key
- Encipher the second result using the third key

The procedure is reversed to decipher data that has been triple-DES enciphered:

- Decipher the data using the third key
- Encipher the result using the second key
- Decipher the second result using the first key

ICSF uses the triple-DES encryption in the CBC encipherment mode.
A variation of the triple DES algorithm supports the use of a double-length DATA key comprised of two 8-byte DATA keys. In this method, the first 8-byte key is reused in the last encipherment step.

Due to export regulations, triple-DES encryption may not be available on your processor.

---

**Ciphertext Translate (CSNBCTT or CSNBCTT1 and CSNECTT or CSNECTT1)**

This callable service is only supported on the IBM zSeries 900.

ICSF provides a ciphertext translate callable service on DES-capable systems. The callable service deciphers encrypted data (ciphertext) under one data translation key and reenciphers it under another data translation key without having the data appear in the clear outside the Cryptographic Coprocessor Feature. ICSF uses the data translation key as either the input or the output data transport key. Such a function is useful in a multiple node network, where sensitive data is passed through multiple nodes prior to it reaching its final destination.

"Using the Ciphertext Translate Callable Service" on page 66 provides some tips on using the callable service.

Use the ciphertext translate callable service to decipher text under an "input" key and then to encipher the text under an "output" key. The callable service uses the cipher block chaining (CBC) mode of the DES. This service is available only on a DES-capable system.

**Choosing Between CSNBCTT and CSNBCTT1**

CSNBCTT and CSNBCTT1 provide identical functions. When choosing the service to use, consider this:

- **CSNBCTT** requires the input text and output text to reside in the caller's primary address space. Also, a program using CSNBCTT adheres to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface.
  
  The callable service name for AMODE(64) invocation is CSNECTT.

- **CSNBCTT1** allows the input text and output text to reside either in the caller's primary address space or in a data space. This allows you to translate more data with one call. However, a program using CSNBCTT1 does not adhere to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface, and may need to be modified prior to it running with other cryptographic products that follow this programming interface.

  The callable service name for AMODE(64) invocation is CSNECTT1.

For CSNBCTT1 and CSNECTT1, `text_id_in` and `text_id_out` are access list entry token (ALET) parameters of the data spaces containing the input text and output text.
Ciphertext Translate

Format

CALL CSNBCTT(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_identifier_in,
    key_identifier_out,
    text_length,
    text_in,
    initialization_vector_in,
    initialization_vector_out,
    text_out )

CALL CSNBCTT1(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_identifier_in,
    key_identifier_out,
    text_length,
    text_in,
    initialization_vector_in,
    initialization_vector_out,
    text_out,
    text_id_in,
    text_id_out )

Parameters

return_code
Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output  Type: String
Ciphertext Translate

The data that is passed to the installation exit.

**key_identifier_in**

Direction: Input/Output  
Type: String

The 64-byte string of the internal key token containing the data translation (DATAXLAT) key, or the label of the CKDS record containing the DATAXLAT key used to encipher the input string.

**key_identifier_out**

Direction: Input/Output  
Type: String

The 64-byte string of an internal key token containing the DATAXLAT key, or the label of the CKDS record containing the DATAXLAT key, used to reencipher the encrypted text.

**text_length**

Direction: Input  
Type: Integer

The length of the ciphertext that is to be processed. The text length must be a multiple of 8 bytes. The maximum length of text is 2,147,836,647 bytes.

**Note:** The MAXLEN value may still be specified in the options data set, but only the maximum value limit will be enforced.

**text_in**

Direction: Input  
Type: String

The text that is to be translated. The text is enciphered under the data translation key specified in the key_identifier_in parameter.

**initialization_vector_in**

Direction: Input  
Type: String

The 8-byte initialization vector that is used to decipher the input data. This parameter is the initialization vector used at the previous cryptographic node.

**initialization_vector_out**

Direction: Input  
Type: String

The 8-byte initialization vector that is used to encipher the input data. This is the new initialization vector used when the callable service enciphers the plaintext.

**text_out**

Direction: Output  
Type: String

The field where the callable service returns the translated text.

**text_id_in**

Direction: Input  
Type: Integer
Ciphertext Translate

For CSNBCTT1 only, the ALET of the text to be translated.

text_id_out

Direction: Input
Type: Integer

For CSNBCTT1 only, the ALET of the text_out field that the application supplies.

Restrictions

The input ciphertext length must be an exact multiple of 8 bytes. The minimum length of the ciphertext that can be translated is 8 bytes.

You cannot use this service on a CDMF-only system.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The initialization vectors must have already been established between the communicating applications or must be passed with the data.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Decipher (CSNBDEC or CSNBDEC1 and CSNEDEC or CSNEDEC1)

Use the decipher callable service to decipher data in an address space or a data space using the cipher block chaining mode. ICSF supports these processing rules to decipher data. You choose the type of processing rule that the decipher callable service should use for block chaining.

Processing Rule  Purpose
-------------------------  ----------------------------------
ANSI X9.23                For cipher block chaining. The ciphertext must be an exact multiple of 8 bytes, but the plaintext will be
**Decipher**

1 to 8 bytes shorter than the ciphertext. The `text_length` will also be reduced to show the original length of the plaintext.

**CBC**

For cipher block chaining. The ciphertext must be an exact multiple of 8 bytes, and the plaintext will have the same length.

**CUSP**

For cipher block chaining, but the ciphertext can be of any length. The plaintext will be the same length as the ciphertext.

**IBM 4700**

For cipher block chaining. The ciphertext must be an exact multiple of 8 bytes, but the plaintext will be 1 to 8 bytes shorter than the ciphertext. The `text_length` will also be reduced to show the original length of the plaintext.

**IPS**

For cipher block chaining, but the ciphertext can be of any length. The plaintext will be the same length as the ciphertext.

The cipher block chaining (CBC) mode uses an initial chaining value (ICV) in its processing. The first 8 bytes of ciphertext is deciphered and then the ICV is exclusive ORed with the resulting 8 bytes of data to form the first 8-byte block of plaintext. Thereafter, the 8-byte block of ciphertext is deciphered and exclusive ORed with the previous 8-byte block of ciphertext until all the ciphertext is deciphered.

The selection between single-DES decryption mode and triple-DES decryption mode is controlled by the length of the key supplied in the `key_identifier` parameter. If a single-length key is supplied, single-DES decryption is performed. If a double-length or triple-length key is supplied, triple-DES decryption is performed.

A different ICV may be passed on each call to the decipher callable service. However, the same ICV that was used in the corresponding encipher callable service must be passed.

Short blocks are text lengths of 1 to 7 bytes. A short block can be the only block. Trailing short blocks are blocks of 1 to 7 bytes that follow an exact multiple of 8 bytes. For example, if the text length is 21, there are two 8-byte blocks and a trailing short block of 5 bytes. Because the DES and CDMF process only text in exact multiples of 8 bytes, some special processing is required to decipher such short blocks. Short blocks and trailing short blocks of 1 to 7 bytes of data are processed according to the Cryptographic Unit Support Program (CUSP) rules, or by the record chaining scheme devised by and used in the Information Protection System (IPS) in the IPS/CMS product.

These methods of treating short blocks and trailing short blocks do not increase the length of the ciphertext over the plaintext. If the plaintext was padded during encipherment, the length of the ciphertext will always be an exact multiple of 8 bytes.

ICSF supports these padding schemes:

- ANSI X9.23
- 4700-PAD
Choosing Between CSNBDEC and CSNBDEC1

CSNBDEC and CSNBDEC1 provide identical functions. When choosing which service to use, consider this:

- **CSNBDEC** requires the ciphertext and plaintext to reside in the caller's primary address space. Also, a program using CSNBDEC adheres to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface.

  The callable service name for AMODE(64) invocation is CSNEDEC.

- **CSNBDEC1** allows the ciphertext and plaintext to reside either in the caller's primary address space or in a data space. This can allow you to decipher more data with one call. However, a program using CSNBDEC1 does not adhere to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface, and may need to be modified prior to it running with other cryptographic products that follow this programming interface.

  The callable service name for AMODE(64) invocation is CSNEDEC1.

For CSNBDEC1 and CSNEDEC1, *cipher_text_id* and *clear_text_id* are access list entry token (ALET) parameters of the data spaces containing the ciphertext and plaintext.

**Format**

```c
CALL CSNBDEC(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_identifier,
    text_length,
    cipher_text,
    initialization_vector,
    rule_array_count,
    rule_array,
    chaining_vector,
    clear_text )
```

```c
CALL CSNBDEC1(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_identifier,
    text_length,
    cipher_text,
    initialization_vector,
    rule_array_count,
    rule_array,
    chaining_vector,
    clear_text,
    cipher_text_id,
    clear_text_id )
```

**Parameters**

- **return_code**
  
  Direction: Output  
  Type: Integer
Decipher

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

key_identifier
Direction: Input/Output Type: String

A 64-byte string that is the internal key token containing the data-encrypting key, or the label of a CKDS record containing a data-encrypting key, to be used for deciphering the data. If the key token or key label contains a single-length key, single-DES decryption is performed. If the key token or key label contains a double-length or triple-length key, triple-DES decryption is performed.

On the IBM @server zSeries 990, IBM @server zSeries 890, z9 EC and z9 BC single and double length CIPHER and DECIPHER keys are also supported.

text_length
Direction: Input/Output Type: Integer

On entry, you supply the length of the ciphertext. The maximum length of text is 214783647 bytes. A zero value for the text_length parameter is not valid. If the returned deciphered text (clear_text parameter) is a different length because of the removal of padding bytes, the value is updated to the length of the plaintext.

Note: The MAXLEN value may still be specified in the options data set, but only the maximum value limit will be enforced.

The application program passes the length of the ciphertext to the callable service. The callable service returns the length of the plaintext to your application program.

cipher_text
Direction: Input Type: String
Decipher

The text to be deciphered.

initialization_vector

Direction: Input  Type: String

The 8-byte supplied string for the cipher block chaining. The first block of the ciphertext is deciphered and exclusive ORed with the initial chaining vector (ICV) to get the first block of cleartext. The input block is the next ICV. To decipher the data, you must use the same ICV used when you enciphered the data.

rule_array_count

Direction: Input  Type: Integer

The number of keywords you supply in the rule_array parameter. The value must be 1, 2, or 3.

rule_array

Direction: Input  Type: Character string

An array of 8-byte keywords providing the processing control information. The array is positional. See the keywords in Table 129. The first keyword in the array is the processing rule. You choose the processing rule you want the callable service to use for deciphering the data. The second keyword is the ICV selection keyword. The third keyword (or the second if the ICV selection keyword is allowed to default) is the encryption algorithm to use.

The service will fail if keyword DES is specified in the rule_array in a CDMF-only system. The service will likewise fail if keyword CDMF is specified in the rule_array in a DES-only system.

</tbody>
</table>

**ICV Selection (optional)**

| CONTINUE   | This specifies taking the initialization vector from the output chaining vector (OCV) contained in the work area to which the chaining_vector parameter points. CONTINUE is valid only for processing rules CBC, IPS, and CUSP. |
| INITIAL    | This specifies taking the initialization vector from the initialization_vector parameter. INITIAL is the default value. |

**Encryption Algorithm (optional)**

| CDMF       | This specifies using the Commercial Data Masking Facility and ignoring the token marking. You cannot use double- or triple-length keys with CDMF. The CDMF keyword, or tokens marked as CDMF, are only supported on an IBM @server zSeries 900. |
| DES        | This specifies using the data encryption standard and ignoring the token marking. |
| TOKEN      | This specifies using the data encryption algorithm in the DATA key token. This is the default. |

"Cipher Processing Rules" on page 874 describes the cipher processing rules in detail.

chaining_vector

**Direction:** Input/Output  
**Type:** String

An 18-byte field that ICSF uses as a system work area. Your application program must not change the data in this string. The chaining vector holds the output chaining vector (OCV) from the caller. The OCV is the first 8 bytes in the 18-byte string.

The direction is output if the ICV selection keyword of the rule_array parameter is INITIAL. The direction is input/output if the ICV selection keyword of the rule_array parameter is CONTINUE.

clear_text

**Direction:** Output  
**Type:** String

The field where the callable service returns the deciphered text.

cipher_text_id
Decipher

Direction: Input     Type: Integer

For CSNBDEC1/CSNEDEC1 only, the ALET of the ciphertext to be deciphered.

clear_text_id

Direction: Input     Type: Integer

For CSNBDEC1/CSNEDEC1 only, the ALET of the clear text supplied by the application.

Restrictions

The service will fail under these conditions:
• If the keyword DES is specified in the rule_array parameter in a CDMF-only system
• If the keyword CDMF is specified in the rule_array parameter in a DES-only system
• If the key token contains double or triple-length keys and triple-DES is not enabled.
• If the keyword CDMF is specified on a PCIXCC, CEX2C, or CEX3C.
• If a token is marked CDMF on a PCIXCC, CEX2C, or CEX3C.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

On a CCF system, only a DATA key token or DATA key label can be used in this service.

Single and double length CIPHER and DECIPHER keys are supported on a PCIXCC, CEX2C, or CEX3C.

Related Information

You cannot overlap the plaintext and ciphertext fields. For example:

```
pppppp
    cccccc  is not supported.

cccccc
    pppppp  is not supported.

ppppppcccccc  is supported.
```

P represents the plaintext and c represents the ciphertext.

On z990, z890, z9 EC or z9 BC system, the PCIXCC/CEX2C will support non destructive overlap. For example:

```
pppppp
    cccccc  is supported.
```

"Cipher Processing Rules" on page 874 discusses the cipher processing rules.

The Encipher callable services are described under "Encipher (CSNBENC or CSNBENC1 and CSNEENC or CSNEENC1)" on page 340.
Decipher

The Decipher - DES access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Decode (CSNBDCO and CSNEDCO)

Use this callable service to decipher an 8-byte string using a clear key. The callable service uses the electronic code book (ECB) mode of the DES. (This service is available only on a DES-capable system.)

The callable service name for AMODE(64) invocation is CSNEDCO.

Considerations

If you have only a clear key, you are not limited to using only the encode and decode callable services.

- You can pass your clear key to the clear key import service, and get back a token that will allow you to use the encipher and decipher callable services.
- On an IBM @server zSeries 990 and subsequent releases, consider using the Symmetric Key Decipher service ("Symmetric Key Decipher (CSNBSYD or CSNBSYD1 and CSNESYD or CSNESYD1)" on page 362).

Format

```call CSNBDCO(  return_code,  reason_code,  exit_data_length,  exit_data,  clear_key,  cipher_text,  clear_text)```
Parameters

**return_code**
Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

**reason_code**
Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

**exit_data_length**
Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the **exit_data** parameter.

**exit_data**
Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**clear_key**
Direction: Input  
Type: String

The 8-byte clear key value that is used to decode the data.

**cipher_text**
Direction: Input  
Type: String

The ciphertext that is to be decoded. Specify 8 bytes of text.

**clear_text**
Direction: Output  
Type: String

The 8-byte field where the plaintext is returned by the callable service.

Restrictions

You cannot use this service on a CDMF-only system.

Usage Notes

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

### Encipher (CSNBENC or CSNBENC1 and CSNEENC or CSNEENC1)

Use the encipher callable service to encipher data in an address space or a data space using the cipher block chaining mode. ICSF supports these processing rules to encipher data. You choose the type of processing rule that the encipher callable service should use for the block chaining.

<table>
<thead>
<tr>
<th>Processing Rule</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANSI X9.23</td>
<td>For block chaining not necessarily in exact multiples of 8 bytes. This process rule pads the plaintext so that ciphertext produced is an exact multiple of 8 bytes.</td>
</tr>
<tr>
<td>CBC</td>
<td>For block chaining in exact multiples of 8 bytes.</td>
</tr>
<tr>
<td>CUSP</td>
<td>For block chaining not necessarily in exact multiples of 8 bytes. The ciphertext will be the same length as the plaintext.</td>
</tr>
<tr>
<td>IBM 4700</td>
<td>For block chaining not necessarily in exact multiples of 8 bytes. This process rule pads the plaintext so that the ciphertext produced is an exact multiple of 8 bytes.</td>
</tr>
<tr>
<td>IPS</td>
<td>For block chaining not necessarily in exact multiples of 8 bytes. The ciphertext will be the same length as the plaintext.</td>
</tr>
</tbody>
</table>

For more information about the processing rules, see Table 132 on page 344 and "Cipher Processing Rules" on page 874.

The cipher block chaining (CBC) mode of operation uses an initial chaining vector (ICV) in its processing. The ICV is exclusive ORed with the first 8 bytes of plaintext prior to the encryption step, and thereafter, the 8-byte block of ciphertext just
produced is exclusive ORed with the next 8-byte block of plaintext, and so on. This disguises any pattern that may exist in the plaintext.

The selection between single-DES encryption mode and triple-DES encryption mode is controlled by the length of the key supplied in the `key_identifier` parameter. If a single-length key is supplied, single-DES encryption is performed. If a double-length or triple-length key is supplied, triple-DES encryption is performed.

To nullify the CBC effect on the first 8-byte block, supply 8 bytes of zero. However, the ICV may require zeros.

Cipher block chaining also produces a resulting chaining value called the output chaining vector (OCV). The application can pass the OCV as the ICV in the next encipher call. This results in record chaining.

Note that the OCV that results is the same, whether an encipher or a decipher callable service was invoked, assuming the same text, ICV, and key were used.

Short blocks are text lengths of 1 to 7 bytes. A short block can be the only block. Trailing short blocks are blocks of 1 to 7 bytes that follow an exact multiple of 8 bytes. For example, if the text length is 21, there are two 8-byte blocks, and a trailing short block of 5 bytes. Short blocks and trailing short blocks of 1 to 7 bytes of data are processed according to the Cryptographic Unit Support Program (CUSP) rules, or by the record chaining scheme devised by and used by the Information Protection System (IPS) in the IPS/CMS program product. These methods of treating short blocks and trailing short blocks do not increase the length of the ciphertext over the plaintext.

An alternative method is to pad the plaintext and produce a ciphertext that is longer than the plaintext. The plaintext can be padded with up to 8 bytes using one of several padding schemes. This padding produces a ciphertext that is an exact multiple of 8 bytes long.

If the ciphertext is to be transmitted over a network, where one or more intermediate nodes will use the ciphertext translate callable service, the ciphertext must be produced using one of these methods of padding:

- ANSI X9.23
- 4700

If the cleartext is already a multiple of 8, the ciphertext can be created using any processing rule.

Because of padding, the returned ciphertext length is longer than the provided plaintext; the `text_length` parameter will have been modified. The returned ciphertext field should be 8 bytes longer than the length of the plaintext to accommodate the maximum amount of padding. You should provide this extension in your installation's storage because ICSF cannot detect whether the extension was done.

The minimum length of data that can be enciphered is one byte.

**Attention:** If you lose the data-encrypting key under which the data (plaintext) is enciphered, the data enciphered under that key (ciphertext) **cannot** be recovered.
Choosing between CSNBENC and CSNBENC1

CSNBENC and CSNBENC1 provide identical functions. When choosing which service to use, consider this:

- **CSNBENC** requires the cleartext and ciphertext to reside in the caller's primary address space. Also, a program using CSNBENC adheres to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface. The callable service name for AMODE(64) invocation is CSNEENC.

- **CSNBENC1** allows the cleartext and ciphertext to reside either in the caller's primary address space or in a data space. This can allow you to encipher more data with one call. However, a program using CSNBENC1 does not adhere to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface, and may need to be modified prior to it running with other cryptographic products that follow this programming interface. The callable service name for AMODE(64) invocation is CSNEENC1.

For CSNBENC1 and CSNEENC1, `clear_text_id` and `cipher_text_id` are access list entry token (ALET) parameters of the data spaces containing the cleartext and ciphertext.

Format

```
CALL CSNBENC(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_identifier,
    text_length,
    clear_text,
    initialization_vector,
    rule_array_count,
    rule_array,
    pad_character,
    chaining_vector,
    cipher_text )
```

```
CALL CSNBENC1(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_identifier,
    text_length,
    clear_text,
    initialization_vector,
    rule_array_count,
    rule_array,
    pad_character,
    chaining_vector,
    cipher_text,
    clear_text_id,
    cipher_text_id )
```

Parameters

- **return_code**
  
  Direction: Output
  
  Type: Integer
Encipher

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

**reason_code**

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

**exit_data_length**

Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output Type: String

The data that is passed to the installation exit.

**key_identifier**

Direction: Input/Output Type: String

A 64-byte string that is the internal key token containing the data-encrypting key, or the label of a CKDS record containing the data-encrypting key, to be used for encrypting the data. If the key token or key label contains a single-length key, single-DES encryption is performed. If the key token or key label contains a double-length or triple-length key, triple-DES encryption is performed.

On an IBM zSeries 990 and subsequent releases, single and double length CIPHER and ENCIPHER keys are also supported.

**text_length**

Direction: Input/Output Type: Integer

On entry, the length of the plaintext (clear_text parameter) you supply. The maximum length of text is 2,147,836,47 bytes. A zero value for the text_length parameter is not valid. If the returned enciphered text (cipher_text parameter) is a different length because of the addition of padding bytes, the value is updated to the length of the ciphertext.

**Note:** The MAXLEN value may still be specified in the options data set, but only the maximum value limit will be enforced (2147483647).

The application program passes the length of the plaintext to the callable service. The callable service returns the length of the ciphertext to the application program.

**clear_text**
Encipher

Direction: Input Type: String

The text that is to be enciphered.

**initialization_vector**

Direction: Input Type: String

The 8-byte supplied string for the cipher block chaining. The first 8 bytes (or less) block of the data is exclusive ORed with the ICV and then enciphered. The input block is enciphered and the next ICV is created. You must use the same ICV to decipher the data.

**rule_array_count**

Direction: Input Type: Integer

The number of keywords you supply in the `rule_array` parameter. The value must be 1, 2, or 3.

**rule_array**

Direction: Input Type: Character string

An array of 8-byte keywords providing the processing control information. The array is positional. See the keywords in Table 132. The first keyword in the array is the processing rule. You choose the processing rule you want the callable service to use for enciphering the data. The second keyword is the ICV selection keyword. The third keyword (or the second if the ICV selection keyword is allowed to default to INITIAL) is the encryption algorithm to use.

The service will fail if keyword DES is specified in the `rule_array` in a CDMF-only system. The service will likewise fail if the keyword CDMF is specified in the `rule_array` in a DES-only system.

**Table 132. Keywords for the Encipher Rule Array Control Information**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Processing Rule (required)</strong></td>
<td></td>
</tr>
<tr>
<td>CBC</td>
<td>Performs ANSI X3.102 cipher block chaining. The data must be a multiple of 8 bytes. An OCV is produced and placed in the <code>chaining_vector</code> parameter. If the ICV selection keyword CONTINUE is specified, the CBC OCV from the previous call is used as the ICV for this call.</td>
</tr>
<tr>
<td>CUSP</td>
<td>Performs ciphering that is compatible with IBM's CUSP and PCF products. The data can be of any length and does not need to be in multiples of 8 bytes. The ciphertext will be the same length as the plaintext. The CUSP/PCF OCV is placed in the <code>chaining_vector</code> parameter. If the ICV selection keyword CONTINUE is specified, the CUSP/PCF OCV from the previous call is used as the ICV for this call.</td>
</tr>
<tr>
<td>IPS</td>
<td>Performs ciphering that is compatible with IBM's IPS product. The data may be of any length and does not need to be in multiples of 8 bytes. The ciphertext will be the same length as the plaintext. The IPS OCV is placed in the <code>chaining_vector</code> parameter. If the ICV selection keyword CONTINUE is specified, the IPS OCV from the previous call is used as the ICV for this call.</td>
</tr>
</tbody>
</table>
Table 132. Keywords for the Encipher Rule Array Control Information (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X9.23</td>
<td>Performs cipher block chaining with 1 to 8 bytes of padding. This is compatible with the requirements in ANSI standard X9.23. If the data is not in exact multiples of 8 bytes, X9.23 pads the plaintext so that the ciphertext produced is an exact multiple of 8 bytes. The plaintext is padded to the next multiple 8 bytes, even if this adds 8 bytes. An OCV is produced.</td>
</tr>
<tr>
<td>4700-PAD</td>
<td>Performs padding by extending the user's plaintext with the caller's specified pad character, followed by a one-byte binary count field that contains the total number of bytes added to the message. 4700-PAD pads the plaintext so that the ciphertext produced is an exact multiple of 8 bytes. An OCV is produced.</td>
</tr>
</tbody>
</table>

**ICV Selection (optional)**

<table>
<thead>
<tr>
<th>ICV Selection</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTINUE</td>
<td>This specifies taking the initialization vector from the output chaining vector (OCV) contained in the work area to which the chaining_vector parameter points. CONTINUE is valid only for processing rules CBC, IPS, and CUSP.</td>
</tr>
<tr>
<td>INITIAL</td>
<td>This specifies taking the initialization vector from the initialization_vector parameter. INITIAL is the default value.</td>
</tr>
</tbody>
</table>

**Encryption Algorithm (optional)**

<table>
<thead>
<tr>
<th>Encryption Algorithm</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CDMF</td>
<td>This specifies using the Commercial Data Masking Facility and ignoring the token marking. You cannot use double-length or triple-length keys with CDMF. The CDMF keyword, or tokens marked as CDMF, are only supported on an IBM iSeries zSeries 900.</td>
</tr>
<tr>
<td>DES</td>
<td>This specifies using the data encryption standard and ignoring the token marking.</td>
</tr>
<tr>
<td>TOKEN</td>
<td>This specifies using the data encryption algorithm in the DATA key token. TOKEN is the default.</td>
</tr>
</tbody>
</table>

These recommendations help the caller determine which encipher processing rule to use:

- If you are exchanging enciphered data with a specific implementation, for example, CUSP or ANSI X9.23, use that processing rule.
- If the ciphertext translate callable service is to be invoked on the enciphered data at an intermediate node, ensure that the ciphertext is a multiple of 8 bytes. Use CBC, X9.23, or 4700-PAD to prevent the creation of ciphertext that is not a multiple of 8 bytes and that cannot be processed by the ciphertext translate callable service.
- If the ciphertext length must be equal to the plaintext length and the plaintext length cannot be a multiple of 8 bytes, use either the IPS or CUSP processing rule.

"Cipher Processing Rules" on page 874 describes the cipher processing rules in detail.

**pad_character**

Direction: Input  
Type: Integer
Encipher

An integer, 0 to 255, that is used as a padding character for the 4700-PAD process rule (rule_array parameter).

chaining_vector

Direction: Input/Output Type: String

An 18-byte field that ICSF uses as a system work area. Your application program must not change the data in this string. The chaining vector holds the output chaining vector (OCV) from the caller. The OCV is the first 8 bytes in the 18-byte string.

The direction is output if the ICV selection keyword of the rule_array parameter is INITIAL.

The direction is input/output if the ICV selection keyword of the rule_array parameter is CONTINUE.

cipher_text

Direction: Output Type: String

The enciphered text the callable service returns. The length of the ciphertext is returned in the text_length parameter. The cipher_text may be 8 bytes longer than the length of the clear_text field because of the padding that is required for some processing rules.

clear_text_id

Direction: Input Type: Integer

For CSNBENC1/CSNEENCC1 only, the ALET of the clear text to be enciphered.

cipher_text_id

Direction: Input Type: Integer

For CSNBENC1/CSNEENCC1 only, the ALET of the ciphertext that the application supplied.

Restrictions

The service will fail under these conditions:

- If the keyword DES is specified in the rule_array parameter in a CDMF-only system
- If the keyword CDMF is specified in the rule_array parameter in a DES-only system
- If the key token contains double- or triple-length keys and triple-DES is not enabled.
- If the keyword CDMF is specified on a PCIXCC, CEX2C, or CEX3C.
- If a token is marked CDMF on a PCIXCC, CEX2C, or CEX3C.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.
Encipher

On a CCF system, only a DATA key token or DATA key label can be used in this service.

Single and double length CIPHER and ENCRYPT keys are supported on a PCIXCC, CEX2C, or CEX3C.

The **Encipher - DES** access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Related Information**

You cannot overlap the plaintext and ciphertext fields. For example:

- pppppp
  - ccccccc is not supported.

- ccccccc
  - pppppp is not supported.

- ppppppcccccc is supported.

P represents the plaintext and c represents the ciphertext.

On z990, z890, z9 EC and z9 BC systems, the PCIXCC/CEX2C will support non-destructive overlap. For example:

- ccccccc
  - pppppp is supported.

The method used to produce the OCV is the same with the CBC, 4700-PAD, and X9.23 processing rules. However, that method is different from the method used by the CUSP and IPS processing rules.

"Cipher Processing Rules" on page 874 discusses the cipher processing rules.
Encipher

The Decipher callable services are described under "Decipher (CSNBDEC or CSNBDEC1 and CSNEDEC or CSNEDEC1)" on page 331.

Encode (CSNBECO and CSNEECO)

Use the encode callable service to encipher an 8-byte string using a clear key. The callable service uses the electronic code book (ECB) mode of the DES. (This service is available only on a DES-capable system.)

The callable service name for AMODE(64) invocation is CSNEECO.

Considerations

If you have only a clear key, you are not limited to using just the encode and decode callable services.

- You can pass your clear key to the clear key import service, and get back a token that will allow you to use the encipher and decipher callable services.
- On an IBM @server zSeries 990 and subsequent releases, consider using the Symmetric Key Encipher service ("Symmetric Key Encipher (CSNBSYE or CSNBSYE1 and CSNESYE or CSNESYE1)" on page 371).

Format

CALL CSNBECO(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    clear_key,
    clear_text,
    cipher_text)

Parameters

return_code

Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length

Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.
### Encode

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**clear_key**

Direction: Input  
Type: String

The 8-byte clear key value that is used to encode the data.

**clear_text**

Direction: Input  
Type: String

The plaintext that is to be encoded. Specify 8 bytes of text.

**cipher_text**

Direction: Output  
Type: String

The 8-byte field where the ciphertext is returned by the callable service.

### Restrictions

You cannot use this service on a CDMF-only system.

### Usage Notes

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Symmetric Algorithm Decipher

Symmetric Algorithm Decipher (CSNBSAD or CSNBSAD1 and CSNESAD or CSNESAD1)

The symmetric algorithm decipher callable service decipheres data with the AES algorithm. Data is deciphered that has been enciphered in either CBC mode or ECB mode.

You can specify that the clear text data was padded before encryption using the method described in the PKCS standards. In this case, the callable service will remove the padding bytes and return the unpadded clear text data. PKCS padding is described in "PKCS Padding Method" on page 877.

The callable service names for AMODE(64) invocation are CSNESAD and CSNESAD1.

Choosing Between CSNBSAD and CSNBSAD1 or CSNESAD and CSNESAD1

CSNBSAD, CSNBSAD1, CSNESAD, and CSNESAD1 provide identical functions. When choosing which service to use, consider this:

- CSNBSAD and CSNESAD require the cipher text and plaintext to reside in the caller's primary address space. Also, a program using CSNBSAD adheres to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface.

- CSNBSAD1 and CSNESAD1 allow the cipher text and plaintext to reside either in the caller's primary address space or in a data space. This can allow you to decipher more data with one call. However, a program using CSNBSAD1 and CSNESAD1 does not adhere to the IBM CCA: Cryptographic API and may need to be modified prior to it running with other cryptographic products that follow this programming interface.

For CSNBSAD1 and CSNESAD1, cipher_text_id and clear_text_id are access list entry token (ALET) parameters of the data spaces containing the cipher text and plaintext.
Symmetric Algorithm Decipher

Format

CALL CSNBSAD(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_identifier_length,

    cipher_text,
    clear_text_length,
    clear_text,
    optional_data_length,
    optional_data
    cipher_text_id
clear_text_id)

Parameters

return_code
Direction: Output
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output
Type: Integer
Symmetric Algorithm Decipher

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

**exit_data_length**

Direction: Ignored  Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

**exit_data**

Direction: Ignored  Type: String

This field is ignored.

**rule_array_count**

Direction: Input  Type: Integer

The number of keywords you supplied in the rule_array parameter. The value may be 2, 3 or 4.

**rule_array**

Direction: Input  Type: String

An array of 8-byte keywords providing the processing control information. The keywords must be in contiguous storage, left-justified and padded on the right with blanks.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Algorithm (one keyword, required)</strong></td>
<td></td>
</tr>
<tr>
<td>AES</td>
<td>Specifies that the Advanced Encryption Standard (AES) algorithm is to be used. The block size is 16 bytes. The key length may be 16, 24, or 32 bytes.</td>
</tr>
<tr>
<td><strong>Processing Rule (optional - zero or one keyword)</strong></td>
<td></td>

### Symmetric Algorithm Decipher

**Table 135. Symmetric Algorithm Decipher Rule Array Keywords (continued)**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INITIAL</td>
<td>This specifies that this is the first request of a sequence of chained requests, and indicates that the initialization vector should be taken from the <code>initialization_vector</code> parameter. This is the default value.</td>
</tr>
<tr>
<td>CONTINUE</td>
<td>This specifies that this request is part of a sequence of chained requests, and is not the first request in that sequence. The initialization vector will be taken from the work area identified in the <code>chain_data</code> parameter. This keyword is only valid for processing rule CBC.</td>
</tr>
</tbody>
</table>

**key_identifier_length**

Direction: Input  
Type: Integer  

The length of the `key_identifier` parameter. The length must be 64 bytes for an AES DATA Internal Key Token (version X’04’) or a CKDS label, or between the actual length of the token and 725 for an AES CIPHER Internal Key Token (version X’05’).

**key_identifier**

Direction: Input  
Type: String  

This specifies an internal secure AES token or the labelname of a secure AES token in the CKDS. Normal CKDS labelname syntax is required.

The AES key identifier must be an encrypted key contained in an internal key token, where the key is enciphered under the AES master key. The key can be 128-, 192-, or 256-bits in length.

**key_parms_length**

Direction: Input  
Type: Integer  

The length of the `key_parms` parameter. This must be 0.

**key_parms**

Direction: Ignored  
Type: String  

This parameter is ignored. It is reserved for future use.

**block_size**

Direction: Input  
Type: Integer  

The block size for the cryptographic algorithm. AES requires the block size to be 16.

**initialization_vector_length**

Direction: Input  
Type: Integer  

The length of the `initialization_vector` parameter. The length should be equal to the block length for the algorithm specified. This parameter is ignored if the process rule is ECB.
Symmetric Algorithm Decipher

**initialization_vector**

Direction: Input  
Type: String

This parameter contains the initialization vector (IV) for CBC mode decryption, including CBC mode invoked using the PKCS-PAD keyword. This parameter is ignored if the process rule is ECB. For AES CBC mode decryption, the initialization vector length must be 16 bytes, the length of an AES block. The IV must be the same value used when the data was encrypted.

**chain_data_length**

Direction: Input/Output  
Type: Integer

The length of the *chain_data* parameter. On input it contains the length of the buffer provided with parameter *chain_data*. On output, it is updated with the length of the data returned in the *chain_data* parameter.

**chain_data**

Direction: Input/Output  
Type: String

A buffer that is used as a work area for sequences of chained symmetric algorithm decipher requests. When the keyword INITIAL is used, this is an output parameter and receives data that is needed when deciphering the next part of the input data. When the keyword CONTINUE is used, this is an input/output parameter; the value received as output from the previous call in the sequence is provided as input to this call, and in turn this call will return new *chain_data* that will be used as input on the next call. When CONTINUE is used, both the data (*chain_data* parameter) and the length (*chain_data_length* parameter) must be the same values that were received in these parameters as output on the preceding call to the service in the chained sequence.

The exact content and layout of *chain_data* is not described. For AES CBC encryption, the field must be at least 32-bytes in length. For AES ECB encryption the field is not used and any length is acceptable including zero.

**cipher_text_length**

Direction: Input  
Type: Integer

The length of the cipher text. The length must be a multiple of the algorithm block size.

**cipher_text**

Direction: Input  
Type: String

The text to be deciphered.

**clear_text_length**

Direction: Input/Output  
Type: Integer

On input, this parameter specifies the size of the storage pointed to by the *clear_text* parameter. On output, this parameter has the actual length of the text stored in the *clear_text* parameter.
Symmetric Algorithm Decipher

If process rule PKCS-PAD is used, the clear text length will be less than the cipher text length since padding bytes are removed.

clear_text
Direction: Output       Type: String

The deciphered text the service returns.

optional_data_length
Direction: Input       Type: Integer

The length of the optional_data parameter. This parameter must be 0.

optional_data
Direction: Ignored      Type: String

Optional data required by a specified algorithm.

cipher_text_id
Direction: Input       Type: Integer

For CSNBSAD1 and CSNESAD1 only, the ALET of the dataspace in which the cipher_text parameter resides.

clear_text_id
Direction: Input       Type: Integer

For CSNBSAD1 and CSNESAD1 only, the ALET of the dataspace in which the clear_text parameter resides.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The Symmetric Algorithm Decipher - secure AES keys access control point controls the function of this service.

### Symmetric Algorithm Encipher (CSNBSAE or CSNBSAE1 and CSNESAE or CSNESAE1)

The symmetric algorithm encipher callable service enciphers data with the AES algorithm. Data is enciphered that has been deciphered in either CBC mode or ECB mode.

The callable service names for AMODE(64) invocation are CSNESAE and CSNESAE1

### Choosing between CSNBSAE and CSNBSAE1 or CSNESAE and CSNESAE1

CSNBSAE, CSNBSAE1, CSNESAE, and CSNESAE1 provide identical functions. When choosing which service to use, consider this:

- CSNBSAE and CSNESAE require the cipher text and plaintext to reside in the caller’s primary address space. Also, a program using CSNBSAE adheres to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface.
- CSNBSAE1 and CSNESAE1 allow the cipher text and plaintext to reside either in the caller’s primary address space or in a data space. This can allow you to encipher more data with one call. However, a program using CSNBSAE1 and CSNESAE1 does not adhere to the IBM CCA: Cryptographic API and may need to be modified prior to it running with other cryptographic products that follow this programming interface.

For CSNBSAE1 and CSNESAE1, `cipher_text_id` and `clear_text_id` are access list entry token (ALET) parameters of the data spaces containing the cipher text and plaintext.

Parameters

**return_code**

Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output Type: Integer
Symmetric Algorithm Encipher

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length
Direction: Ignored  Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data
Direction: Ignored  Type: String

This field is ignored.

rule_array_count
Direction: Input  Type: Integer

The number of keywords you supplied in the rule_array parameter. The value may be 2, 3 or 4.

rule_array
Direction: Input  Type: String

This keyword provides control information to the callable service. The keywords must be eight bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks.

Table 137. Symmetric Algorithm Encipher Rule Array Keywords

<table>

<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEYIDENT</td>
<td>This indicates that the value in the key_identifier parameter is either an internal key token or the label of a key token in the CKDS. The key must be a secure AES key, that is, enciphered under the current master key.</td>
</tr>
</tbody>
</table>

ICV Selection (optional - zero or one keyword)

| INITIAL          | This specifies that this is the first request of a sequence of chained requests, and indicates that the initialization vector should be taken from the initialization_vector parameter. This is the default value. |
| CONTINUE         | This specifies that this request is part of a sequence of chained requests, and is not the first request in that sequence. The initialization vector will be taken from the work area identified in the chain_data parameter. This keyword is only valid for processing rule CBC. |

key_identifier_length

Direction: Input  Type: Integer

The length of the key_identifier parameter. The length must be 64 bytes for an AES DATA Internal Key Token (version X'04') or a CKDS label, or between the actual length of the token and 725 for an AES CIPHER Internal Key Token (version X'05').

key_identifier

Direction: Input  Type: String

This specifies an internal secure AES token or the labelname of a secure AES token in the CKDS. Normal CKDS labelname syntax is required.

The AES key identifier must be an encrypted key contained in an internal key token, where the key is enciphered under the AES master key. The key can be 128-, 192-, or 256-bits in length.

key_parms_length

Direction: Input  Type: Integer

The length of the key_parms parameter in bytes. It must be set to 0.

key_parms

Direction: Ignored  Type: String

This parameter is ignored. It is reserved for future use.

block_size

Direction: Input  Type: Integer

The block size for the cryptographic algorithm. AES requires the block size to be 16.

initialization_vector_length

Symmetric Algorithm Encipher

Chapter 6. Protecting Data
Symmetric Algorithm Encipher

**Direction:** Input  **Type:** Integer

The length of the *initialization_vector* parameter in bytes. This parameter is ignored if the process rule is ECB.

**initialization_vector**

**Direction:** Input  **Type:** String

This parameter contains the initialization vector (IV) for CBC mode encryption, including the CBC mode invoked using the PKCS-PAD keyword. This parameter is ignored if the process rule is ECB. For AES CBC mode encryption, the initialization vector length must be 16 bytes, the length of an AES block. The same IV must be used when decrypting the data.

**chain_data_length**

**Direction:** Input/Output  **Type:** Integer

The length in bytes of the *chain_data* parameter. On input it contains the length of the buffer provided with parameter *chain_data*. On output, it is updated with the length of the data returned in the *chain_data* parameter.

**chain_data**

**Direction:** Input/Output  **Type:** String

A buffer that is used as a work area for sequences of chained symmetric algorithm encipher requests. When the keyword INITIAL is used, this is an output parameter and receives data that is needed when enciphering the next part of the input data. When the keyword CONTINUE is used, this is an input/output parameter; the value received as output from the previous call in the sequence is provided as input to this call, and in turn this call will return new *chain_data* that will be used as input on the next call. When CONTINUE is used, both the data (*chain_data* parameter) and the length (*chain_data_length* parameter) must be the same values that were received in these parameters as output on the preceding call to the service in the chained sequence.

The exact content and layout of *chain_data* is not described. For AES CBC encryption, the field must be at least 32-bytes in length. For AES ECB encryption the field is not used and any length is acceptable including zero.

**clear_text_length**

**Direction:** Input  **Type:** Integer

The length of the clear text data in the *clear_text* parameter. Unless process rule PKCS-PAD is used, the length must be a multiple of the algorithm block size. The length must be 1 or greater.

**clear_text**

**Direction:** Input  **Type:** String

The text to be enciphered.
Symmetric Algorithm Encipher

Direction: Input/Output Type: Integer

On input, this parameter specifies the size of the storage pointed to by the cipher_text parameter. On output, this parameter has the actual length of the text stored in the buffer addressed by the cipher_text parameter.

If process rule PKCS-PAD is used, the cipher text length will exceed the clear text length by at least one byte, and up to 16-bytes. For other process rules, the cipher text length will be equal to the clear text length.

cipher_text
Direction: Output Type: String

The enciphered text the service returns.

optional_data_length
Direction: Input Type: Integer

The length of the optional_data parameter. This parameter is reserved for future use. It must be set to 0.

optional_data
Direction: Ignored Type: String

The optional data used in processing the request. This parameter is ignored.

cipher_text_id
Direction: Input Type: Integer

For CSNBSAE1 and CSNESAE1 only, the ALET of the dataspace in which the cipher_text parameter resides.

clear_text_id
Direction: Input Type: Integer

For CSNBSAE1 and CSNESAE1 only, the ALET of the dataspace in which the clear_text parameter resides.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The Symmetric Algorithm Encipher - secure AES keys access control point controls the function of this service.

Symmetric Key Decipher (CSNBSYD or CSNBSYD1 and CSNESYD or CSNESYD1)

Use the symmetric key decipher callable service to decipher data using one of the supported modes. ICSF supports several processing rules to decipher data. You choose the type of processing rule that the Symmetric Key Decipher callable service should use for block chaining. See “Modes of Operation” on page 325 for more information.

</tr>
</tbody>
</table>
Symmetric Key Decipher

The Advanced Encryption Standard (AES) and Data Encryption Standard (DES) are supported. AES encryption uses a 128-, 192-, or 256-bit key. DES encryption uses a 56-, 112-, or 168-bit key. See the processing rule descriptions for limitations. For each algorithm, certain processing rules are not allowed. See the rule_array parameter description for more information.

All modes except ECB use an initial chaining vector (ICV) in their processing.

All modes that utilize chaining produce a resulting chaining value called the output chaining vector (OCV). The application can pass the OCV as the ICV in the next decipher call. This results in record chaining.

The selection between single-DES decryption mode and triple-DES decryption mode is controlled by the length of the key supplied in the key_identifier parameter. If a single-length key is supplied, single-DES decryption is performed. If a double-length or triple-length key is supplied, triple-DES decryption is performed.

The key may be specified as a clear key value, an internal clear key token, or the label name of a clear key or an encrypted key in the CKDS.
Choosing Between CSNBSYD and CSNBSYD1

CSNBSYD and CSNBSYD1 provide identical functions. When choosing which service to use, consider this:

- **CSNBSYD** requires the ciphertext and plaintext to reside in the caller's primary address space. Also, a program using CSNBSYD adheres to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface. The callable service name for AMODE(64) invocation is CSNESYD.

- **CSNBSYD1** allows the ciphertext and plaintext to reside either in the caller's primary address space or in a data space. This can allow you to decipher more data with one call. However, a program using CSNBSYD1 does not adhere to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface, and may need to be modified prior to it running with other cryptographic products that follow this programming interface.

For CSNBSYD1, *cipher_text_id* and *clear_text_id* are access list entry token (ALET) parameters of the data spaces containing the ciphertext and plaintext. The callable service name for AMODE(64) invocation is CSNESYD1.

Format

```call csnbsyd(

  clear_text_id)

Parameters

return_code
Direction: Output  Type: Integer

The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”] lists the return codes.

reason_code
Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”] lists the reason codes.

exit_data_length
Direction: Ignored  Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data
Direction: Ignored  Type: String

This field is ignored.

rule_array_count
Direction: Input  Type: Integer
Symmetric Key Decipher

The number of keywords you supplied in the `rule_array` parameter. The value may be 1, 2, 3 or 4.

**rule_array**

Direction: Input  
Type: String

An array of 8-byte keywords providing the processing control information. The keywords must be in contiguous storage, left-justified and padded on the right with blanks.

**Table 139. Symmetric Key Decipher Rule Array Keywords**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Algorithm (required)</strong></td>
<td></td>
</tr>
<tr>
<td>AES</td>
<td>Specifies that the Advanced Encryption Standard (AES) algorithm is to be used. The block size is 16 bytes. The key length may be 16, 24, or 32 bytes. The <code>chain_data</code> field must be at least 32 bytes in length. The OCV is the first 16 bytes in the <code>chain_data</code>. AES does not support the CUSP, IPS, or X9.23 processing rules.</td>
</tr>
<tr>
<td>DES</td>
<td>Specifies that the Data Encryption Standard (DES) algorithm is to be used. The algorithm, DES or TDES, will be determined from the length of the key supplied. The key length may be 8, 16, or 24. The block size is 8 bytes. The <code>chain_data</code> field must be at least 16 bytes in length. The OCV is the first eight bytes in the <code>chain_data</code>. DES does not support the GCM processing rule.</td>
</tr>
<tr>
<td><strong>Processing Rule (optional)</strong></td>
<td></td>
</tr>
<tr>
<td>CBC</td>
<td>Performs cipher block chaining. The text length must be a multiple of the block size for the specified algorithm. CBC is the default value.</td>
</tr>
<tr>
<td>CBC-CS</td>

</tbody>
</table>

**Key Rule (optional)**

| KEY-CLR    | This specifies that the key parameter contains a clear key value. KEY-CLR is the default value.                                      |
| KEYIDENT   | This specifies that the key_identifier field will be an internal clear token, or the label name of a clear key or encrypted key in the CKDS. Normal CKDS labelname syntax is required.               |

**ICV Selection (optional)**

| INITIAL    | This specifies taking the initialization vector from the initialization_vector parameter. INITIAL is the default value. INITIAL is not valid with processing rule GCM.                                |
| CONTINUE   | This specifies taking the initialization vector from the output chaining vector contained in the work area to which the chain_data parameter points. CONTINUE is not valid for processing rules ECB, GCM, or X9.23. |
| FINAL      | This specifies taking the initialization vector from the output chaining vector contained in the work area to which the chain_data parameter points. Using FINAL indicates that this call contains the last portion of data. FINAL is valid for processing rules CBC-CS, CFB, CFB-LCFB, and OFB. |
| ONLY       | This specifies taking the initialization vector from the initialization_vector parameter and that the entirety of the data to be processed is in this single call. ONLY is valid for processing rules CBC-CS, CFB, CFB-LCFB, GCM, and OFB. |

**key_identifier_length**

Direction: Input  
Type: Integer

The length of the key_identifier parameter. For clear keys, the length is in bytes and includes only the value of the key. The maximum size is 256 bytes.

For the KEYIDENT keyword, this parameter value must be 64.

**key_identifier**

Direction: Input  
Type: String

For the KEY-CLR keyword, this specifies the cipher key. The parameter must be left justified.

For the KEYIDENT keyword, this specifies an internal clear token, or the label name of a clear key or an encrypted key in the CKDS. Normal CKDS labelname syntax is required. KEYIDENT is valid with DES and AES.

**key_parms_length**
Symmetric Key Decipher

**key_parms**
Direction: Input
Type: String

This parameter contains key-related parameters specific to the encryption algorithm and processing mode.

- For the CFB-LCFB processing rule, this 1-byte field specifies the segment size in bytes. Valid values are 1 to the block size, inclusive. The block size is eight for DES and sixteen for AES.
- For the GCM processing rule, this contains the authentication tag for the provided ciphertext (cipher_text parameter) and additional authenticated data (optional_data parameter).
- For all other processing rules, this field is ignored.

For the modes where `key_parms` is used, you must specify the same `key_parms` used when enciphering the text.

**block_size**
Direction: Input
Type: Integer

This parameter contains the processing size of the text block in bytes. This value will be algorithm specific. Be sure to specify the same block size as used to encipher the text.

**initialization_vector_length**
Direction: Input
Type: Integer

The length of the `initialization_vector` parameter. This parameter is ignored for the ECB processing rule. For the GCM processing rule, NIST recommends a length of 12, but tolerates any non-zero length. For all other processing rules, the length should be equal to the block length for the algorithm specified.

**initialization_vector**
Direction: Input
Type: String

This initialization chaining value. You must use the same ICV that was used to encipher the data. This parameter is ignored for the ECB processing rule.

**chain_data_length**
Direction: Input/Output
Type: Integer
Symmetric Key Decipher

The length of the chain_data parameter. On output, the actual length of the chaining vector will be stored in the parameter. This parameter is ignored if the ICV selection keyword is ONLY.

chain_data
Direction: Input/Output Type: String

This field is used as a system work area for the chaining vector. Your application program must not change the data in this string. The chaining vector holds the output chaining vector from the caller.

The direction is output if the ICV selection keyword is INITIAL. This parameter is ignored if the ICV selection keyword is ONLY.

The mapping of the chain_data depends on the algorithm specified. For AES, the chain_data field must be at least 32 bytes in length. The OCV is in the first 16 bytes in the chain_data. For DES, chain_data field must be at least 16 bytes in length.

cipher_text_length
Direction: Input Type: Integer

The length of the ciphertext. A zero value in the cipher_text_length parameter is not valid except with the GCM processing rule when performing a GMAC operation. The length must be a multiple of the algorithm block size for the CBC, ECB, and PKCS-PAD processing rules, but may be any length with the other processing rules.

cipher_text
Direction: Input Type: String

The text to be deciphered.

clear_text_length
Direction: Input/Output Type: Integer

On input, this parameter specifies the size of the storage pointed to by the clear_text parameter. On output, this parameter has the actual length of the text stored in the clear_text parameter. The clear_text parameter must be at least the same length as the cipher_text parameter, except for the PKCS-PAD and X9.23 processing rules, where the padding is automatically dropped on output.

clear_text
Direction: Output Type: String

The deciphered text the service returns.

optional_data_length
Direction: Input Type: Integer

The length of the optional_data parameter. For the GCM processing rule, this parameter contains the length of the Additional Authenticated Data (AAD). For all other processing rules, this field is ignored.
Symmetric Key Decipher

optional_data
Direction: Input, Type: String

Optional data required by a specified algorithm or processing mode. For the GCM processing rule, this parameter contains the Additional Authenticated Data (AAD). For all other processing rules, this field is ignored.

You must specify the same optional_data used when enciphering the text using Symmetric Key Encipher.

cipher_text_id
Direction: Input, Type: Integer

For CSNBSYD1 only, the ALET of the ciphertext to be deciphered.

clear_text_id
Direction: Input, Type: Integer

For CSNBSYD1 only, the ALET of the clear text supplied by the application.

Usage Notes

- SAF may be invoked to verify the caller is authorized to use the specified key label stored in the CKDS.
- To use a CKDS encrypted key, the ICSF segment of the CSFKEYS class general resource profile associated with the specified key label must contain SYMCPACFWRAP(YES).
- No pre- or post-processing exits are enabled for this service.
- The master keys need to be loaded only when using this service with encrypted key labels.
- The AES algorithm will use hardware if it is available. Otherwise, clear key operations will be performed in software.
- AES has the same availability restrictions as triple-DES.
- This service will fail if execution would cause destructive overlay of the cipher_text field.

When the label of an encrypted key is specified for the key_identifier parameter, the appropriate access control point listed below must be enabled.

## Related Information

You **cannot** overlap the plaintext and ciphertext fields. For example:

```
pppppp
    cccccc
```

```
ccccc

pppppp
```

```
ppppppcccccc
```

P represents the plaintext and c represents the ciphertext.

"Cipher Processing Rules" on page 874 discusses the cipher processing rules.

## Symmetric Key Encipher (CSNBSYE or CSNBSYE1 and CSNESYE or CSNESYE1)

Use the symmetric key encipher callable service to encipher data using one of the supported modes. ICSF supports several processing rules to encipher data. You choose the type of processing rule that the Symmetric Key Encipher callable service should use for the block chaining. See "Modes of Operation" on page 325 for more information.

<table>
<thead>
<tr>
<th>Processing Rule</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANSI X9.23</td>
<td>For cipher block chaining. The ciphertext must be an exact multiple of the block size for the specified algorithm (8 bytes for DES). The plaintext will be</td>
</tr>
</tbody>
</table>
Symmetric Key Encipher

between 1 and 8 bytes shorter than the ciphertext. This process rule always pads the plaintext during encryption so that ciphertext produced is an exact multiple of the block size, even if the plaintext was already a multiple of the blocksize.

CBC
For cipher block chaining. The ciphertext must be an exact multiple of the block size for the specified algorithm (8 bytes for DES, 16 bytes for AES). The plaintext will have the same length as the ciphertext.

CBC-CS
For cipher block chaining. The ciphertext can be any length. The plaintext will have the same length as the ciphertext.

CFB
Performs cipher feedback encryption with the segment size equal to the block size. The ciphertext can be of any length. The plaintext will have the same length as the ciphertext.

CFB-LCFB
Performs cipher feedback encryption with the segment size set by the caller. The ciphertext can be of any length. The plaintext will have the same length as the ciphertext.

CUSP
For cipher block chaining. The ciphertext can be of any length. The plaintext will have the same length as the ciphertext.

ECB
Performs electronic code book encryption. The ciphertext must be an exact multiple of the block size for the specified algorithm (8 bytes for DES, 16 bytes for AES). The plaintext will have the same length as the ciphertext.

GCM
Perform Galois/Counter mode decryption, which provides both confidentiality and authentication for the plaintext and authentication for the additional authenticated data (AAD). The ciphertext can be any length. The plaintext will have the same length as the ciphertext. Additionally, the authentication tag will be verified before any data is returned.

IPS
For cipher block chaining. The ciphertext can be any length. The plaintext will have the same length as the ciphertext.

OFB
Perform output feedback mode encryption. The ciphertext can be any length. The plaintext will have the same length as the ciphertext.

PKCS-PAD
For cipher block chaining. The ciphertext must be an exact multiple of the block size (8 bytes for DES and 16 bytes for AES). The plaintext will be between 1 and the blocksize (8 bytes for DES, 16 bytes for AES) bytes shorter than the ciphertext. This process rule always pads the ciphertext so that ciphertext produced is an exact multiple of the blocksize, even if the plaintext was already a multiple of the blocksize.
The Advanced Encryption Standard (AES) and Data Encryption Standard (DES) are supported. AES encryption uses a 128-, 192-, or 256-bit key. The CBC, CBC-CS, CFB, CFB-LCFB, ECB, GCM, OFB, and XTS-AES modes are supported.

All modes except ECB and XTS-AES use an initial chaining vector (ICV) in their processing.

All modes that tolerate chaining produce a resulting chaining value called the output chaining vector (OCV). The application can pass the OCV as the ICV in the next encipher call. This results in record chaining.

The selection between single-DES decryption mode and triple-DES decryption mode is controlled by the length of the key supplied in the key_identifier parameter. If a single-length key is supplied, single-DES decryption is performed. If a double-length or triple-length key is supplied, triple-DES decryption is performed.

The key may be specified as a clear key value, an internal clear key token, or the label name of a clear key or an encrypted key in the CKDS.

Choosing between CSNBSYE and CSNBSYE1

CSNBSYE and CSNBSYE1 provide identical functions. When choosing which service to use, consider this:

- **CSNBSYE** requires the cleartext and ciphertext to reside in the caller’s primary address space. Also, a program using CSNBSYE adheres to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface. The callable service name for AMODE(64) invocation is CSNESYE.

- **CSNBSYE1** allows the cleartext and ciphertext to reside either in the caller’s primary address space or in a data space. This can allow you to encipher more data with one call. However, a program using CSNBSYE1 does not adhere to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface, and may need to be modified prior to it running with other cryptographic products that follow this programming interface. For CSNBSYE1, clear_text_id and cipher_text_id are access list entry token (ALET) parameters of the data spaces containing the cleartext and ciphertext. The callable service name for AMODE(64) invocation is CSNESYE1.
Symmetric Key Encipher

Format

```
CALL CSNBSYE(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_identifier_length,

    chain_data,
    clear_text_length,
    clear_text,
    cipher_text_length,
    cipher_text,
    optional_data_length,
    optional_data,
    clear_text_id,
    cipher_text_id
)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

**reason_code**

Direction: Output  
Type: Integer
Symmetric Key Encipher

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length
Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data
Direction: Ignored Type: String

This field is ignored.

rule_array_count
Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. The value may be 1, 2, 3 or 4.

rule_array
Direction: Input Type: String

An array of 8-byte keywords providing the processing control information. The keywords must be in contiguous storage, left-justified and padded on the right with blanks.

Table 142. Symmetric Key Encipher Rule Array Keywords

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>

</tbody>
</table>

**Key Rule (optional)**

| KEY-CLR        | This specifies that the key parameter contains a clear key value. KEY-CLR is the default. |
| KEYIDENT       | This specifies that the `key_identifier` field will be an internal clear token, or the label name of a clear key or encrypted key in the CKDS. Normal CKDS labelname syntax is required. |

**ICV Selection (optional)**

| INITIAL        | This specifies taking the initialization vector from the `initialization_vector` parameter. INITIAL is the default value. INITIAL is not valid with processing rule GCM. |
| CONTINUE        | This specifies taking the initialization vector from the output chaining vector contained in the work area to which the `chain_data` parameter points. CONTINUE is not valid for processing rules ECB, GCM, or X9.23. |
| FINAL           | This specifies taking the initialization vector from the output chaining vector contained in the work area to which the `chain_data` parameter points. Using FINAL indicates that this call contains the last portion of data. FINAL is valid for processing rules CBC-CS, CFB, CFB-LCFB, and OFB. |
| ONLY            | This specifies taking the initialization vector from the `initialization_vector` parameter and that the entirety of the data to be processed is in this single call. ONLY is valid for processing rules CBC-CS, CFB, CFB-LCFB, GCM, and OFB. |
Symmetric Key Encipher

**key_identifier_length**

**Direction:** Input  **Type:** Integer

The length of the `key_identifier` parameter. For clear keys, the length is in bytes and includes only the value of the key.

For the KEYIDENT keyword, this parameter value must be 64.

**key_identifier**

**Direction:** Input  **Type:** String

For the KEY-CLR keyword, this specifies the cipher key. The parameter must be left justified.

For the KEYIDENT keyword, this specifies an internal clear token, or the label name of a clear key or an encrypted key in the CKDS. Normal CKDS label name syntax is required.

**key_parms_length**

**Direction:** Input  **Type:** Integer

The length of the `key_parms` parameter.

- For the CFB-LCFB processing rule, this length must be 1.
- For the GCM processing rule, this is the length in bytes of the authentication tag to be generated. Valid lengths are 4, 8, 12, 13, 14, 15, 16. Using a length of 4 or 8 is strongly discouraged.
- For all other processing rules, this field is ignored.

When deciphering the text, you must specify this same length.

**key_parms**

**Direction:** Input/Output  **Type:** String

This parameter contains key-related parameters specific to the encryption algorithm and processing mode.

- For the CFB-LCFB processing rule, this 1-byte field specifies the segment size in bytes. Valid values are 1 to the blocksize, inclusive. The blocksize is eight for DES and sixteen for AES.
- For the GCM processing rule, this will contain the generated authentication tag for the provided plaintext (plain_text parameter) and additional authenticated data (optional_data parameter).
- For all other processing rules, this field is ignored.

For the modes where `key_parms` is used, you must specify the same `key_parms` when deciphering the text using the Symmetric Key Decipher callable service.

**block_size**

**Direction:** Input  **Type:** Integer

This parameter contains the processing size of the text block in bytes. This value will be algorithm specific.
Symmetric Key Encipher

**initialization_vector_length**
Direction: Input  Type: Integer

The length of the initialization_vector parameter. This parameter is ignored for the ECB processing rule. For the GCM processing rule, NIST recommends a length of 12, but tolerates any non-zero length. For all other processing rules, the length should be equal to the block length for the algorithm specified.

**initialization_vector**
Direction: Input  Type: String

This initialization chaining value. You must use the same ICV to decipher the data. This parameter is ignored for the ECB processing rule.

**chain_data_length**
Direction: Input/Output  Type: Integer

The length of the chain_data parameter. On output, the actual length of the chaining vector will be stored in the parameter. This parameter is ignored if the ICV selection keyword in ONLY.

**chain_data**
Direction: Input/Output  Type: String

This field is used as a system work area for the chaining vector. Your application program must not change the data in this string. The chaining vector holds the output chaining vector from the caller.

The direction is output if the ICV selection keyword is INITIAL. This parameter is ignored if the ICV selection keyword in ONLY.

The mapping of the chain_data depends on the algorithm specified. For AES, the chain_data field must be at least 32 bytes in length. The OCV is in the first 16 bytes in the chain_data. For DES, the chain_data field must be at least 16 bytes in length.

**clear_text_length**
Direction: Input  Type: Integer

The length of the cleartext. A zero value in the clear_text_length parameter is not valid except with the GCM processing rule when performing a GMAC operation. The length must be a multiple of the algorithm block size for the CBC, ECB, and PKCS-PAD processing rules, but may be any length with the other processing rules. For the processing rules that support partial blocks (or segments for CFB-LCFB), it is recommended that is the final block (or segment) be the only one that is partial. Having a partial block in the middle is not a supported operation as defined by the standards documents and may not be portable to other encryption systems.

**clear_text**
Direction: Input  Type: String

The text to be enciphered.
Symmetric Key Encipher

cipher_text_length
Direction: Input/Output  Type: Integer

On input, this parameter specifies the size of the storage pointed to by the cipher_text parameter. On output, this parameter has the actual length of the text stored in the buffer addressed by the cipher_text parameter.

cipher_text
Direction: Output  Type: String

The enciphered text the service returns.

optional_data_length
Direction: Input  Type: Integer

The length of the optional_data parameter. For the GCM processing rule, this parameter contains the length of the Additional Authenticated Data (AAD), and may be any length, including zero. For all other processing rules, this field is ignored.

optional_data
Direction: Input  Type: String

Optional data required by a specified algorithm. Optional data required by a specified algorithm or processing mode. For the GCM processing rule, this parameter contains the Additional Authenticated Data (AAD). For all other processing rules, this field is ignored.

You must specify the same optional_data when deciphering the text using Symmetric Key Decipher.

clear_text_id
Direction: Input  Type: Integer

For CSNBSYE1 only, the ALET of the clear text to be enciphered.

cipher_text_id
Direction: Input  Type: Integer

For CSNBSYE1 only, the ALET of the ciphertext that the application supplied.

Usage Notes

- SAF may be invoked to verify the caller is authorized to use the specified key label stored in the CKDS.
- To use a CKDS encrypted key, the ICSF segment of the CSFKEYS class general resource profile associated with the specified key label must contain SYMCPACFWRAP(YES).
- No pre- or post-processing exits are enabled for this service.
- The master keys need to be loaded only when using this service with the encrypted key labels.
Symmetric Key Encipher

- The AES algorithm will use hardware if it is available. Otherwise, clear key operations will be performed in software.
- AES has the same availability restrictions as triple-DES.
- This service will fail if execution would cause destructive overlay of the clear_text field.

When the label of an encrypted key is specified for the key_identifier parameter, the appropriate access control point listed below must be enabled.

Related Information

You **cannot** overlap the plaintext and ciphertext fields. For example:

```
pppppp
ccccc  is not supported.
```

```
ccccc
pppppp  is not supported.
```
Symmetric Key Encipher

pppppcccccc is supported.

P represents the plaintext and c represents the ciphertext.

The method used to produce the OCV is the same with the CBC and X9.23 processing rules. However, that method is different from the method used by the CUSP and IPS processing rules.

"Cipher Processing Rules" on page 874 discusses the cipher processing rules.
Symmetric Key Encipher
Chapter 7. Verifying Data Integrity and Authenticating Messages

ICSF provides several methods to verify the integrity of transmitted messages and stored data:

- Message authentication code (MAC)
- Hash functions, including modification detection code (MDC) processing and one-way hash generation

Note: You can also use digital signatures (see Chapter 9, “Using Digital Signatures,” on page 511) to authenticate messages.

The choice of callable service depends on the security requirements of the environment in which you are operating. If you need to ensure the authenticity of the sender as well as the integrity of the data, and both the sender and receiver can share a secret key, consider message authentication code processing. If you need to ensure the integrity of transmitted data in an environment where it is not possible for the sender and the receiver to share a secret cryptographic key, consider hashing functions, such as the modification detection code process.

The callable services are described in the following topics:

- “HMAC Generate (CSNBHMG or CSNBHMG1 and CSNEHMG or CSNEHMG1)” on page 385
- “HMAC Verify (CSNBHMV or CSNBHMV1 and CSNEHMV or CSNEHMV1)” on page 389
- “MAC Generate (CSNBMGN or CSNBMGN1 and CSNEMGN or CSNEMGN1)” on page 393
- “MAC Verify (CSNBMVR or CSNBMVR1 and CSNEMVR or CSNEMVR1)” on page 398
- “MDC Generate (CSNBMDG or CSNBMDG1 and CSNEMDG or CSNEMDG1)” on page 404
- “One-Way Hash Generate (CSNBOWH or CSNBOWH1 and CSNEOWH or CSNEOWH1)” on page 408
- “Symmetric MAC Generate (CSNBSMG or CSNBSMG1 and CSNESMG or CSNESMG1)” on page 413
- “Symmetric MAC Verify (CSNBSMV or CSNBSMV1 and CSNESMV or CSNESMV1)” on page 417

How MACs are Used

When a message is sent, an application program can generate an authentication code for it using the MAC generation callable service. ICSF supports the ANSI X9.9-1 basic procedure and both the ANSI X9.19 basic procedure and optional double key MAC procedure. The service computes the text of the message authentication code using the algorithm and a key. The ANSI X9.9-1 or ANSI X9.19 basic procedures accept either a single-length MAC generation (MAC) key or a data-encrypting (DATA) key, and the message text. The ANSI X9.19 optional double key MAC procedure accepts a double-length MAC key and the message text. The message text may be in clear or encrypted form. The originator of the message sends the MAC with the message text.

When the receiver gets the message, an application program calls the MAC verification callable service. The callable service generates a MAC using the same algorithm as the sender and either the single-length or double-length MAC
verification key, the single-length or double-length MAC generation key, or DATA key, and the message text. The MACVER callable service compares the MAC it generates with the one sent with the message and issues a return code that indicates whether the MACs match. If the return code indicates that the MACs match, the receiver can accept the message as genuine and unaltered. If the return code indicates that the MACs do not match, the receiver can assume that the message is either bogus or has been altered. The newly computed MAC is not revealed outside the cryptographic feature.

In a similar manner, MACs can be used to ensure the integrity of data stored on the system or on removable media, such as tape.

Secure use of the MAC generation and MAC verification services requires the use of MAC and MACVER keys in these services, respectively. To accomplish this, the originator of the message generates a MAC/MACVER key pair, uses the MAC key in the MAC generation service, and exports the MACVER key to the receiver. The originator of the message enforces key separation on the link by encrypting the MACVER key under a transport key that is not an NOCV key before exporting the key to the receiver. With this type of key separation enforced, the receiver can only receive a MACVER key and can use only this key in the MAC verification service. This ensures that the receiver cannot alter the message and produce a valid MAC with the altered message. These security features are not present if DATA keys are used in the MAC generation service, or if DATA or MAC keys are used in the MAC verification service.

By using MACs, you get the following benefits:

- **For data transmitted over a network**, you can validate the authenticity of the message as well as ensure that the data has not been altered during transmission. For example, an active eavesdropper can tap into a transmission line, and interject bogus messages or alter sensitive data being transmitted. If the data is accompanied by a MAC, the recipient can use a callable service to detect whether the data has been altered. Since both the sender and receiver share a secret key, the receiver can use a callable service that calculates a MAC on the received message and compares it to the MAC transmitted with the message. If the comparison is equal, the message may be accepted as unaltered. Furthermore, since the shared key is secret, when a MAC is verified it can be assumed that the sender was, in fact, the other person who knew the secret key.

- **For data stored on tape or DASD**, you can ensure that the data read back onto the system was the same as the data written onto the tape or DASD. For example, someone might be able to bypass access controls. Such an access might escape the notice of auditors. However, if a MAC is stored with the data, and verified when the data is read, you can detect alterations to the data.

### How Hashing Functions Are Used

Hashing functions include the MDC and one-way hash. You need to hash text before submitting it to digital signature services (see Chapter 9, “Using Digital Signatures,” on page 511).

### How MDCs Are Used

When a message is sent, an application program can generate a modification detection code for it using the **MDC generation callable service**. The service computes the modification detection code, a 128-bit value, using a one-way cryptographic function and the message text (which itself may be in clear or encrypted form). The originator of the message ensures that the MDC is transmitted
with integrity to the intended receiver of the message. For example, the MDC could be published in a reliable source of public information.

When the receiver gets the message, an application program calls the MDC callable service. The callable service generates an MDC by using the same one-way cryptographic function and the message text. The application program can compare the new MDC with the one generated by the originator of the message. If the MDCs match, the receiver knows that the message was not altered.

In a similar manner, MDCs can be used to ensure the integrity of data stored on the system or on removable media, such as tape.

By using MDCs, you get the following benefits:

- **For data transmitted over a network between locations that do not share a secret key**, you can ensure that the data has not been altered during transmission. It is easy to compute an MDC for specific data, yet hard to find data that will result in a given MDC. In effect, the problem of ensuring the integrity of a large file is reduced to ensuring the integrity of a 128-bit value.

- **For data stored on tape or DASD**, you can ensure that the data read back onto the system was the same as the data written onto the tape or DASD. Once an MDC has been established for a file, the MDC generation callable service can be run at any later time on the file. The resulting MDC can be compared with the stored MDC to detect deliberate or inadvertent modification.

SHA-1 is a FIPS standard required for DSS. MD5 is a hashing algorithm used to derive Message Digests in Digital Signature applications.

### HMAC Generate (CSNBHMG or CSNBHMG1 and CSNEHMG or CSNEHMG1)

Use the HMAC generate callable service to generate a keyed hash message authentication code (MAC) for the text string provided as input.

The callable service names for AMODE(64) are CSNEHMG and CSFEHMG1.

### Choosing Between CSNBHMG and CSNBHMG1

CSNBHMG and CSNBHMG1 provide identical functions. When choosing which service to use, consider the following:

- CSNBHMG requires the application-supplied text to reside in the caller’s primary address space.
- CSNBHMG1 allows the application-supplied text to reside either in the caller’s primary address space or in a data space. This can allow you to process more data with one call. For CSNBHMG1, text_id_in is an access list entry token (ALET) parameter of the data space containing the application-supplied text.
HMAC Generate

Format

CALL CSNBHMG(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_identifier_length,
    key_identifier,
    text_length,
    text,
    chaining_vector_length,
    chaining_vector,
    mac_length,
    mac )

CALL CSNBHMG1(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_identifier_length,
    key_identifier,
    text_length,
    text,
    chaining_vector_length,
    chaining_vector,
    mac_length,
    mac,
    text_id_in )

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.
HMAC Generate

**exit_data**
Direction: Input/Output  Type: String

The data that is passed to the installation exit.

**rule_array_count**
Direction: Input  Type: Integer

The number of keywords you supplied in the `rule_array` parameter. The value may be 2 or 3.

**rule_array**
Direction: Input  Type: String

Keywords that provide control information to the callable service. The following table lists the keywords. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

*Table 145. Keywords for HMAC Generate Control Information*

<table>
<thead>

**key_identifier_length**
Direction: Input  Type: Integer

Chapter 7. Verifying Data Integrity and Authenticating Messages  387
HMAC Generate

The length of the key_identifier parameter. The maximum value is 725.

key_identifier
Direction: Input/Output  Type: String

The 64-byte label or internal token of an encrypted HMAC key.

text_length
Direction: Input  Type: Integer

The length of the text you supply in the text parameter. The maximum length of text is 214783647 bytes. For FIRST and MIDDLE calls, the text_length must be a multiple of 64 for SHA-1, SHA-224 and SHA-256 and a multiple of 128 for SHA-384 and SHA-512 hash methods.

text
Direction: Input  Type: String

The application-supplied text for which the MAC is generated.

chaining_vector_length
Direction: Input/Output  Type: Integer

The length of the chaining_vector in bytes. The value must be 128 bytes.

chaining_vector
Direction: Input/Output  Type: String

An 128-byte string that ICSF uses as a system work area. Your application program must not change the data in this string. The chaining vector permits data to be chained from one invocation call to another.

On the first call, initialize this parameter as binary zeros.

mac_length
Direction: Input/Output  Type: Integer

The length of the mac parameter in bytes. This parameter is updated to the actual length of the mac parameter on output. The minimum value is 4, and the maximum value is 64.

mac
Direction: Output  Type: String

The field in which the callable service returns the MAC value if the segmenting rule is ONLY or LAST.

text_id_in
Direction: Input  Type: Integer

For CSNBHMG1 only, the ALET of the text for which the MAC is generated.
HMAC Generate

Usage Notes

This table lists the access control points in the ICSF role that control the function for this service.

    text,
    chaining_vector_length,
    chaining_vector,
    mac_length,
    mac)

CALL CSNBHMV1(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_identifier_length,
    key_identifier,
    text_length,
    text,
    chaining_vector_length,
    chaining_vector,
    mac_length,
    mac,
    text_id_in)
```

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer
The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the
exit_data parameter.

**exit_data**

Direction: Input/Output  Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  Type: Integer

The number of keywords you supplied in the rule_array parameter. The value may be 2 or 3.

**rule_array**

Direction: Input  Type: String

Keywords that provide control information to the callable service. The following table lists the keywords. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>

HMAC Verify

**key_identifier_length**

Direction: Input  
Type: Integer  

The length of the *key_identifier* parameter. The maximum value is 725.

**key_identifier**

Direction: Input/Output  
Type: String  

The 64-byte label or internal token of an encrypted HMAC or HMACVER key.

**text_length**

Direction: Input  
Type: Integer  

The length of the text you supply in the *text* parameter. The maximum length of *text* is 214783647 bytes. For FIRST and MIDDLE calls, the *text_length* must be a multiple of 64 for SHA-1, SHA-224 and SHA-256 and a multiple of 128 for SHA-384 and SHA-512 hash methods.

**text**

Direction: Input  
Type: String  

The application-supplied text for which the MAC is generated.

**chaining_vector_length**

Direction: Input/Output  
Type: Integer  

The length of the *chaining_vector* in bytes. The value must be 128 bytes.

**chaining_vector**

Direction: Input/Output  
Type: String  

An 128-byte string that ICSF uses as a system work area. Your application program must not change the data in this string. The chaining vector permits data to be chained from one invocation call to another.

On the first call, initialize this parameter as binary zeros.

**mac_length**

Direction: Input  
Type: Integer  

The length of the *mac* parameter in bytes. The maximum value is 64.

**mac**

Direction: Input  
Type: String  

The field that contains the MAC value you want to verify.

**text_id_in**

Direction: Input  
Type: Integer  

For CSNBHMV1 only, the ALET of the text for which the MAC is generated.
Usage Notes

MAC Generate (CSNBGMGN or CSNBGMGN1 and CSNEMGN or CSNEMGN1)

Use the MAC generate callable service to generate a 4-, 6-, or 8-byte message authentication code (MAC) for an application-supplied text string. You can specify that the callable service uses either the ANSI X9.9-1 procedure or the ANSI X9.19 optional double key MAC procedure to compute the MAC. For the ANSI X9.9-1 procedure you identify either a MAC generate key or a DATA key, and the message text. For the ANSI X9.19 optional double key MAC procedure, you identify a double-length MAC key and the message text.

The MAC generate callable service also supports the padding rules specified in the EMV Specification and ISO 16609. For the EMV MAC procedure, you identify a single- or double-length MAC key and the message text. For the ISO 16609 procedure you identify a double-length MAC or DATA key and the message text.
Choosing Between CSNBMGN and CSNBMGN1

CSNBMGN and CSNBMGN1 provide identical functions. When choosing which service to use, consider the following:

- **CSNBMGN** requires the application-supplied text to reside in the caller's primary address space. Also, a program using CSNBMGN adheres to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface.

  The callable service name for AMODE(64) invocation is CSNEMGN.

- **CSNBMGN1** allows the application-supplied text to reside either in the caller's primary address space or in a data space. This can allow you to process more data with one call. However, a program using CSNBMGN1 does not adhere to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface, and may need to be modified before it can run with other cryptographic products that follow this programming interface.

  The callable service name for AMODE(64) invocation is CSNEMGN1.

For CSNBMGN1, `text_id_in` is an access list entry token (ALET) parameter of the data space containing the application-supplied text.

Format

```plaintext
CALL CSNBMGN(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_identifier,
    text_length,
    text,
    rule_array_count,
    rule_array,
    chaining_vector,
    mac )
```

```plaintext
CALL CSNBMGN1(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_identifier,
    text_length,
    text,
    rule_array_count,
    rule_array,
    chaining_vector,
    mac,
    text_id_in )
```

Parameters

**return_code**

Direction: Output   Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**
MAC Generate

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length
Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output  Type: String

The data that is passed to the installation exit.

key_identifier
Direction: Input/Output  Type: String

The 64-byte key label or internal key token that identifies a single or double-length MAC generate key, a DATAM key, or a single-length DATA key. The type of key depends on the MAC process rule in the rule_array parameter.

text_length
Direction: Input  Type: Integer

The length of the text you supply in the text parameter. The maximum length of text is 214783647 bytes. If the text_length is not a multiple of 8 bytes and if the ONLY or LAST keyword of the rule_array parameter is called, the text is padded in accordance with the processing rule specified.

Note: The MAXLEN value may still be specified in the options data set, but only the maximum value limit will be enforced.

text
Direction: Input  Type: String

The application-supplied text for which the MAC is generated.

rule_array_count
Direction: Input  Type: Integer

The number of keywords specified in the rule_array parameter. The value can be 0, 1, 2, or 3.

rule_array
Direction: Input  Type: Character string
MAC Generate

Zero to three keywords that provide control information to the callable service. The keywords are shown in Table 151. The keywords must be in 24 bytes of contiguous storage with each of the keywords left-justified in its own 8-byte location and padded on the right with blanks. For example,

'X9.9-1  MIDDLE  MACLEN4 '

The order of the rule_array keywords is not fixed.

You can specify one of the MAC processing rules and then choose one of the segmenting control keywords and one of the MAC length keywords.

Table 151. Keywords for MAC generate Control Information

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MAC Process Rules (optional)</strong></td>
<td></td>
</tr>
<tr>
<td>EMVMAC</td>
<td>EMV padding rule with a single-length MAC key. The key_identifier parameter must identify a single-length MAC or a single-length DATA key. The text is always padded with 1 to 8 bytes so that the resulting text length is a multiple of 8 bytes. The first pad character is X'80'. The remaining 0 to 7 pad characters are X'00'.</td>
</tr>
<tr>
<td>EMVMACD</td>
<td>EMV padding rule with a double-length MAC key. The key_identifier parameter must identify a double-length MAC key. The padding rules are the same as for EMVMAC.</td>
</tr>
<tr>
<td>X9.19OPT</td>
<td>ANSI X9.19 optional double key MAC procedure. The key_identifier parameter must identify a double-length MAC key. The padding rules are the same as for X9.9-1.</td>
</tr>
<tr>
<td>X9.9-1</td>
<td>ANSI X9.9-1 and X9.19 basic procedure. The key_identifier parameter must identify a single-length MAC or a single-length DATA key. X9.9-1 causes the MAC to be computed from all of the data. The text is padded only if the text length is not a multiple of 8 bytes. If padding is required, the pad character X'00' is used. This is the default value.</td>
</tr>
<tr>
<td>TDES-MAC</td>
<td>ISO 16609 procedure. The key_identifier must identify a double-length MAC or a double-length DATA key. The text is padded only if the text length is not a multiple of 8 bytes.</td>
</tr>
<tr>
<td><strong>Segmenting Control (optional)</strong></td>
<td></td>
</tr>
<tr>
<td>FIRST</td>
<td>First call, this is the first segment of data from the application program.</td>
</tr>
<tr>
<td>LAST</td>
<td>Last call; this is the last data segment.</td>
</tr>
<tr>
<td>MIDDLE</td>
<td>Middle call; this is an intermediate data segment.</td>
</tr>
<tr>
<td>ONLY</td>
<td>Only call; segmenting is not employed by the application program. This is the default value.</td>
</tr>
<tr>
<td><strong>MAC Length and Presentation (optional)</strong></td>
<td></td>
</tr>
<tr>
<td>HEX-8</td>
<td>Generates a 4-byte MAC value and presents it as 8 hexadecimal characters.</td>
</tr>
<tr>
<td>HEX-9</td>
<td>Generates a 4-byte MAC value and presents it as 2 groups of 4 hexadecimal characters with a space between the groups.</td>
</tr>
<tr>
<td>MACLEN4</td>
<td>Generates a 4-byte MAC value. This is the default value.</td>
</tr>
<tr>
<td>MACLEN6</td>
<td>Generates a 6-byte MAC value.</td>
</tr>
<tr>
<td>MACLEN8</td>
<td>Generates an 8-byte MAC value.</td>
</tr>
</tbody>
</table>
**MAC Generate**

**chaining_vector**

Direction: Input/Output  
Type: String

An 18-byte string that ICSF uses as a system work area. Your application program must not change the data in this string. The chaining vector permits data to be chained from one invocation call to another.

On the first call, initialize this parameter as binary zeros.

**mac**

Direction: Output  
Type: String

The 8-byte or 9-byte field in which the callable service returns the MAC value if the segmenting rule is ONLY or LAST. Allocate an 8-byte field for MAC values of 4 bytes, 6 bytes, 8 bytes, or HEX-8. Allocate a 9-byte MAC field if you specify HEX-9 in the rule_array parameter.

**text_id_in**

Direction: Input  
Type: Integer

For CSNBMGN1/CSNEMGN1 only, the ALET of the text for which the MAC is generated.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

**CCF Systems:** To use a DATA key, the NOCV-enablement keys must be present in the CKDS. Using a DATA key instead of a MAC generate key in this service substantially increases the path length for generating the MAC.

To calculate a MAC in one call, specify the ONLY keyword for segmenting control for the rule_array parameter. For two or more calls, specify the FIRST keyword for the first input block, the MIDDLE keyword for intermediate blocks (if any), and the LAST keyword for the last block.

For a given text string, the resulting MAC is the same whether the text is segmented or not.

The **MAC Generate** access control point controls the function of this service.

The following table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.
Mac Generate

Table 152. MAC generate required hardware

<table>
<thead>

Related Information

For more information about MAC processing rules and segmenting control, refer to IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface Reference.

The MAC verification callable service is described in MAC Verify (CSNBMVR or CSNBMVR1 and CSNEMVR or CSNEMVR1).

MAC Verify (CSNBMVR or CSNBMVR1 and CSNEMVR or CSNEMVR1)

Use the MAC verify callable service to verify a 4-, 6-, or 8-byte message authentication code (MAC) for an application-supplied text string. You can specify that the callable service uses either the ANSI X9.9-1 procedure or the ANSI X9.19 optional double key MAC procedure to compute the MAC. For the ANSI X9.9-1
procedure you identify either a MAC verify key, a MAC generation key, or a DATA key, and the message text. For the ANSI X9.19 optional double key MAC procedure, you identify either a double-length MAC verify key or a double-length MAC generation key and the message text. The cryptographic feature compares the generated MAC with the one sent with the message. A return code indicates whether the MACs are the same. If the MACs are the same, the receiver knows the message was not altered. The generated MAC never appears in storage is not revealed outside the cryptographic feature.

The MAC verify callable service also supports the padding rules specified in the EMV Specification and ISO 16609. For the EMV MAC procedure, you identify a single- or double-length MAC key and the message text. For the ISO 16609 procedure you identify a double-length MAC or DATA key and the message text.

Choosing Between CSNBMVR and CSNBMVR1

CSNBMVR and CSNBMVR1 provide identical functions. When choosing which service to use, consider the following:

- **CSNBMVR** requires the application-supplied text to reside in the caller's primary address space. Also, a program using CSNBMVR adheres to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface. The callable service name for AMODE(64) invocation is CSNEMVR.

- **CSNBMVR1** allows the application-supplied text to reside either in the caller's primary address space or in a data space. This can allow you to verify more data with one call. However, a program using CSNBMVR1 does not adhere to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface, and may need to be modified before it can run with other cryptographic products that follow this programming interface. The callable service name for AMODE(64) invocation is CSNEMVR1.

For CSNBMVR1, text_id_in is an access list entry token (ALET) parameter of the data space containing the application-supplied text.

Format

```
CALL CSNBMVR( 
    return_code, 
    reason_code, 
    exit_data_length, 
    exit_data, 
    key_identifier, 
    text_length, 
    text, 
    rule_array_count, 
    rule_array, 
    chaining_vector, 
    mac )
```
MAC Verify

CALL CSNBMVR1(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_identifier,
    text_length,
    text,
    rule_array_count,
    rule_array,
    chaining_vector,
    mac,
    text_id_in )

Parameters

**return_code**

Direction: Output  Type: Integer

The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the return codes.

**reason_code**

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the reason codes.

**exit_data_length**

Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X’00000000’ to X’7FFFFFFF’ (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  Type: String

The data that is passed to the installation exit.

**key_identifier**

Direction: Input/Output  Type: String

The 64-byte key label or internal key token that identifies a single or double-length MAC verify key, a single or double-length MAC verify key, a single or double length MAC generation key, a DATAM or DATAMV key, or a single-length DATA key. The type of key depends on the MAC process rule in the rule_array parameter.

**text_length**

Direction: Input  Type: Integer
MAC Verify

The length of the text you supply in the text parameter. The maximum length of text is 214783647 bytes. If the text_length parameter is not a multiple of 8 bytes and if the ONLY or LAST keyword of the rule_array parameter is called, the text is padded in accordance with the processing rule specified.

**Note:** The MAXLEN value may still be specified in the options data set, but only the maximum value limit will be enforced (2147483647).

text
Direction: Input Type: String

The application-supplied text for which the MAC is generated.

rule_array_count
Direction: Input Type: Integer

The number of keywords specified in the rule_array parameter. The value can be 0, 1, 2, or 3.

rule_array
Direction: Input Type: String

Zero to three keywords that provide control information to the callable service. The keywords are shown in Table 153. The keywords must be in 24 bytes of contiguous storage with each of the keywords left-justified in its own 8-byte location and padded on the right with blanks. For example,

```
'X9.9-1 MIDDLE MACLEN4 '
```

The order of the rule_array keywords is not fixed.

You can specify one of the MAC processing rules and then choose one of the segmenting control keywords and one of the MAC length keywords.

**Segmenting Control (optional)**

| FIRST     | First call; this is the first segment of data from the application program.                                                                                                                                   |
| LAST      | Last call; this is the last data segment.                                                                                                                                                                  |
| MIDDLE    | Middle call; this is an intermediate data segment.                                                                                                                                                       |
| ONLY      | Only call; the application program does not employ segmenting. This is the default value.                                                                                                                 |

**MAC Length and Presentation (optional)**

| HEX-8     | Verifies a 4-byte MAC value that is represented as 8 hexadecimal characters.                                                                                                                                |
| HEX-9     | Verifies a 4-byte MAC value that is represented as 2 groups of 4 hexadecimal characters with a space character between the groups.                                                                      |
| MACLEN4   | Verifies a 4-byte MAC value. This is the default value.                                                                                                                                                   |
| MACLEN6   | Verifies a 6-byte MAC value.                                                                                                                                                                              |
| MACLEN8   | Verifies an 8-byte MAC value.                                                                                                                                                                             |

**chaining_vector**

Direction: Input/Output  Type: String

An 18-byte string that ICSF uses as a system work area. Your application program must not change the data in this string. The chaining vector permits data to be chained from one invocation call to another.

On the first call, initialize this parameter to binary zeros.

**mac**

Direction: Output  Type: String

The 8- or 9-byte field that contains the MAC value you want to verify. The value in the field must be left-justified and padded with zeros. If you specified the X'09' keyword in the rule_array parameter, the input MAC is 9 bytes.

**text_id_in**

Direction: Input  Type: Integer

For CSNBMVR1/CSNEMVR1 only, the ALET of the text for which the MAC is to be verified.
**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

To verify a MAC in one call, specify the ONLY keyword on the segmenting rule keyword for the `rule_array` parameter. For two or more calls, specify the FIRST keyword for the first input block, MIDDLE for intermediate blocks (if any), and LAST for the last block.

For a given text string, the MAC resulting from the verification process is the same regardless of how the text is segmented, or how it was segmented when the original MAC was generated.

**CCF Systems only:** To use a MAC generation key or a DATA key, the NOCV enablement keys must be present in the CKDS. Using either a MAC generation key or a DATA key instead of a MAC verify key in this service substantially increases the path length for verifying the MAC.

The **MAC Verify** access control point controls the function of this service.

The following table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

*Table 154. MAC verify required hardware*

Related Information

For more information about MAC processing rules and segmenting control, refer to *IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface Reference*.

The MAC generation callable service is described in "MAC Generate (CSNBMGN or CSNBMGN1 and CSNEMGN or CSNEMGN1)" on page 393.

MDC Generate (CSNBMDG or CSNBMDG1 and CSNEMDG or CSNEMDG1)

A modification detection code (MDC) can be used to provide a form of support for data integrity.

Use the MDC generate callable service to generate a 128-bit modification detection code (MDC) for an application-supplied text string.

The returned MDC value should be securely stored and/or sent to another user. To validate the integrity of the text string at a later time, the MDC generate callable service is again used to generate a 128-bit MDC. The new MDC value is compared with the original MDC value. If the values are equal, the text is accepted as unchanged.

Choosing Between CSNBMDG and CSNBMDG1

CSNBMDG and CSNBMDG1 provide identical functions. When choosing which service to use, consider the following:

- **CSNBMDG** requires the application-supplied text to reside in the caller’s primary address space. Also, a program using CSNBMDG adheres to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface. The callable service name for AMODE(64) invocation is CSNEMDG.

- **CSNBMDG1** allows the application-supplied text to reside either in the caller’s primary address space or in a data space. This can allow you to process more data with one call. However, a program using CSNBMDG1 does not adhere to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface and may need to be modified before it can run with other cryptographic products that follow this programming interface. The callable service name for AMODE(64) invocation is CSNEMDG1.

For CSNBMDG1, *text_id_in* parameter specifies the access list entry token (ALET) for the data space containing the application-supplied text.
MDC Generate

Format

CALL CSNBMDG(
  return_code,
  reason_code,
  exit_data_length,
  exit_data,
  text_length,
  text,
  rule_array_count,
  rule_array,
  chaining_vector,
  mdc )

CALL CSNBMDG1(
  return_code,
  reason_code,
  exit_data_length,
  exit_data,
  text_length,
  text,
  rule_array_count,
  rule_array,
  chaining_vector,
  mdc,
  text_id_in )

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes," on page 725 lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes," on page 725 lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

text_length
MDC Generate

Direction: Input  Type: Integer

The length of the text you supply in the text parameter. The maximum length of text is 214783647 bytes.

Note: The MAXLEN value may still be specified in the options data set, but only the maximum value limit will be enforced (2147483647).

Additional restrictions on length of the text depend on whether padding of the text is requested, and on the segmenting control used.

- When padding is requested (by specifying a process rule of PADMDC-2 or PADMDC-4 in the rule_array parameter), a text length of 0 is valid for any segment control specified in the rule_array parameter (FIRST, MIDDLE, LAST, or ONLY). When LAST or ONLY is specified, the supplied text will be padded with X'FF's and a padding count in the last byte to bring the total text length to the next multiple of 8 that is greater than or equal to 16.

- When no padding is requested (by specifying a process rule of MDC-2 or MDC-4), the total length of the text provided (over a single or segmented calls) must be at least 16 bytes, and a multiple of 8.
  For segmented calls with no padding, text length of 0 is valid on any of the calls provided the total length over the segmented calls is at least 16 and a multiple of 8.
  For a single call (that is, segment control is ONLY) with no padding, the length the text provided must be at least 16, and a multiple of 8.

text

Direction: Input  Type: String

The application-supplied text for which the MDC is generated.

rule_array_count

Direction: Input  Type: Integer

The number of keywords specified in the rule_array parameter. This value must be 2.

rule_array

Direction: Input  Type: Character string

The two keywords that provide control information to the callable service are shown in Table 155. The two keywords must be in 16 bytes of contiguous storage with each of the two keywords left-justified in its own 8-byte location and padded on the right with blanks. For example, ‘MDC-2  FIRST ’

Choose one of the MDC process rule control keywords and one of the segmenting control keywords from the following table.

Table 155. Keywords for MDC Generate Control Information

<table>

chaining_vector

Direction: Input/Output  Type: String

An 18-byte string that ICSF uses as a system work area. Your application program must not change the data in this string. The chaining vector permits data to be chained from one invocation call to another.

On the first call, initialize this parameter as binary zeros.

mdc

Direction: Input/Output  Type: String

A 16-byte field in which the callable service returns the MDC value when the segmenting rule is ONLY or LAST. When the segmenting rule is FIRST or MIDDLE, the value returned in this field is an intermediate MDC value that will be used as input for a subsequent call and must not be changed by the application program.

text_id_in

Direction: Input  Type: Integer

For CSNBMDG1/CSNEMDG1 only, the ALET for the data space containing the text for which the MDC is to be generated.

Usage Notes

To calculate an MDC in one call, specify the ONLY keyword for segmenting control in the rule_array parameter. For more than one call, specify the FIRST keyword for
MDC Generate

the first input block, the MIDDLE keyword for any intermediate blocks, and the LAST keyword for the last block. For a given text string, the resulting MDC is the same whether the text is segmented or not.

The two versions of MDC calculation (with two or four encipherments per 8 bytes of input text) allow the caller to trade a performance improvement for a decrease in security. Since 2 encipherments create results different from the results of 4 encipherments, ensure that you use the same number of encipherments to verify the MDC value.

The following table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

One-Way Hash Generate (CSNBOWH or CSNBOWH1 and CSNEOWH or CSNEOWH1)

Use the one-way hash generate callable service to generate a one-way hash on specified text. This service supports the following methods:

- MD5 - software only
- SHA-1
- RIPEMD-160 - software only
- SHA-224
- SHA-256
- SHA-384
- SHA-512

The callable service names for AMODE(64) invocation are CSNEOWH and CSNEOWH1.
One-Way Hash Generate

Format

```c
CALL CSNBOWH(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    text_length,
    text,
    chaining_vector_length,
    chaining_vector,
    hash_length,
    hash)
```

```c
CALL CSNBOWH1(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    text_length,
    text,
    chaining_vector_length,
    chaining_vector,
    hash_length,
    hash,
    text_id_in)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, "ICSF and TSS Return and Reason Codes"](#) lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. [Appendix A, "ICSF and TSS Return and Reason Codes"](#) lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from 'X'00000000' to 'X'7FFFFFFF' (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**

Direction: Input/Output  
Type: String
One-Way Hash Generate

The data that is passed to the installation exit.

rule_array_count
Direction: Input Type: Integer
The number of keywords you are supplying in the rule_array parameter. The value must be 1 or 2.

rule_array
Direction: Input Type: String
Keywords that provide control information to the callable service are listed in Table 157. The optional chaining flag keyword indicates whether calls to this service are chained together logically to overcome buffer size limitations. Each keyword is left-justified in an 8-byte field and padded on the right with blanks. All keywords must be in contiguous storage.

<td>Hash algorithm is SHA-1 algorithm. Use this hash method for DSS. Length of hash generated is 20 bytes.</td>
</tr>
<tr>
<td>SHA-224</td>
<td>Hash algorithm is SHA-256 algorithm. Length of hash generated is 28 bytes.</td>
</tr>
<tr>
<td>SHA-256</td>
<td>Hash algorithm is SHA-256 algorithm. Length of hash generated is 32 bytes.</td>
</tr>
<tr>
<td>SHA-384</td>
<td>Hash algorithm is SHA-384 algorithm. Length of hash generated is 48 bytes.</td>
</tr>
<tr>
<td>SHA-512</td>
<td>Hash algorithm is SHA-512 algorithm. Length of hash generated is 64 bytes.</td>
</tr>
<tr>
<td><strong>Chaining Flag (optional)</strong></td>
<td></td>
</tr>
<tr>
<td>FIRST</td>
<td>Specifies this is the first call in a series of chained calls. Intermediate results are stored in the hash field.</td>
</tr>
<tr>
<td>LAST</td>
<td>Specifies this is the last call in a series of chained calls.</td>
</tr>
</tbody>
</table>
## One-Way Hash Generate

### Table 157. Keywords for One-Way Hash Generate Rule Array Control Information (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIDDLE</td>
<td>Specifies this is a middle call in a series of chained calls. Intermediate results are stored in the <em>hash</em> field.</td>
</tr>
<tr>
<td>ONLY</td>
<td>Specifies this is the only call and the call is not chained. This is the default.</td>
</tr>
</tbody>
</table>

**text_length**

Direction: Input | Type: Integer

The length of the *text* parameter in bytes.

**Note:** If you specify the FIRST or MIDDLE keyword, then the text length must be a multiple of the blocksize of the hash method. For MD5, RPMD-160, SHA-1, SHA-224 and SHA-256, this is a multiple of 64 bytes. For SHA-384 and SHA-512, this is a multiple of 128 bytes.

For ONLY and LAST, this service performs the required padding according to the algorithm specified.

**text**

Direction: Input | Type: String

The application-supplied text on which this service performs the hash.

**chaining_vector_length**

Direction: Input | Type: Integer

The byte length of the *chaining_vector* parameter. This must be 128 bytes.

**chaining_vector**

Direction: Input/Output | Type: String

This field is a 128-byte work area. Your application must not change the data in this string. The chaining vector permits chaining data from one call to another.

**hash_length**

Direction: Input | Type: Integer

The length of the supplied *hash* field in bytes.

**Note:** For SHA-1 and RPMD-160 this must be at least 20 bytes; for MD5 this must be at least 16 bytes. For SHA-224 and SHA-256, the length must be at least 32 bytes long. Even though the length of the SHA-224 hash is less than SHA-256, the extra bytes are used as a work area during the generation of the hash value. The SHA-224 value is left-justified and padded with zeroes.

For SHA-384 and SHA-512, the length must be at least 64 bytes long. Even though the length of the SHA-384 hash is less than SHA-512, the
extra bytes are used as a work area during the generation of the hash value. The SHA-384 value is left-justified and padded with zeroes.

**hash**

Direction: Input/Output  
Type: String

This field contains the hash, left-justified. The processing of the rest of the field depends on the implementation. If you specify the FIRST or MIDDLE keyword, this field contains the intermediate hash value. Your application must not change the data in this field between the sequence of FIRST, MIDDLE, and LAST calls for a specific message.

**text_id_in**

Direction: Input  
Type: Integer

For CSNBOWH1 only, the ALET for the data space containing the text for which to generate the hash.

**Usage Notes**

Although MD5, SHA-1 and SHA-256 allow it, bit length text is not supported for any hashing method.

The following table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

z/OS V1R13 ICSF Application Programmer's Guide
Symmetric MAC Generate (CSNBSMG or CSNBSMG1 and CSNESMG or CSNESMG1)

Use the symmetric MAC generate callable service to generate a 96- or 128-bit message authentication code (MAC) for an application-supplied text string using an AES key.

The callable service names for AMODE(64) invocation are CSNESMG and CSNESMG1.

Choosing Between CSNBSMG and CSNBSMG1 or CSNESMG and CSNESMG1

CSNBSMG, CSNBSMG1, CSNESMG, and CSNESMG1 provide identical functions. When choosing which service to use, consider this:

- CSNBSMG and CSNESMG require the text to reside in the caller's primary address space. Also, a program using CSNBSMG adheres to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface.
- CSNBSMG1 and CSNESMG1 allow the text to reside either in the caller's primary address space or in a data space. This can allow you to decipher more data with one call. However, a program using CSNBSMG1 and CSNESMG1 do not adhere to the IBM CCA: Cryptographic API and may need to be modified prior to it running with other cryptographic products that follow this programming interface.

For CSNBSMG1 and CSNESMG1, text_id_in is an access list entry token (ALET) parameter of the data spaces containing the text.

Format

```call CSNBSMG(    return_code,    reason_code,    exit_data_length,    exit_data,    key_identifier_length,    key_identifier,    text_length,    text,    rule_array_count,    rule_array,    chaining_vector_length,    chaining_vector,    reserved_data_length,    reserved_data,    mac_length    mac )```
Symmetric MAC Generate

CALL CSNBSMG1(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_identifier_length,
    key_identifier,
    text_length,
    text,
    rule_array_count,
    rule_array,
    chaining_vector_length,
    chaining_vector,
    reserved_data_length,
    reserved_data
    mac_length
    mac
    text_id_in)

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

key_identifier_length
Direction: Input Type: String

The length of the key_identifier parameter. For the KEY-CLR keyword, the length is in bytes and includes only the value of the key length. The key length value can be 16, 24, or 32. For the KEYIDENT keyword, the length must be 64.

key_identifier

Symmetric MAC Generate

Direction: Input Type: String

For the KEY-CLR keyword, this specifies the clear AES key. The parameter must be left justified. For the KEYIDENT keyword, this specifies an internal clear AES token or the label name of a clear AES key in the CKDS. Normal CKDS label name syntax is required.

text_length
Direction: Input Type: Integer

The length of the text you supply in the text parameter. The maximum length of text is 2147483647 bytes. If the text_length is not a multiple of 8 bytes and if the ONLY or LAST keyword of the rule_array parameter is called, the text is padded in accordance with the processing rule specified.

text
Direction: Input Type: String

The application-supplied text for which the MAC is generated.

rule_array_count
Direction: Input Type: Integer

The number of keywords specified in the rule_array parameter. The value can be 1, 2, 3 or 4.

rule_array
Direction: Input Type: Character string

This keyword provides control information to the callable service. The keywords must be eight bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks.

You can specify one of the MAC processing rules and then choose one of the segmenting control keywords and one of the MAC length keywords.

</tr>
</tbody>
</table>

**chaining_vector_length**

Direction: Input/Output  
Type: Integer

The length of the chaining_vector parameter. On output, the actual length of the chaining vector will be stored in the parameter.

**chaining_vector**

Direction: Input/Output  
Type: String

This field is used as a system work area for the chaining vector. Your application program must not change the data in this string. The chaining vector holds the output chaining vector from the caller.

The mapping of the chaining_vector depends on the algorithm specified. For AES, the chaining_vector field must be at least 36 bytes in length.

**reserved_data_length**

Direction: Input  
Type: Integer

Reserved for future use. Value must be zero.

**reserved_data**

Direction: Ignored  
Type: String

Reserved for future use.

**mac_length**

Direction: Input  
Type: Integer

The length in bytes of the MAC to be returned in the mac field. The allowable values are 12 and 16 bytes.

**mac**

Direction: Output  
Type: String

The 12-byte or 16-byte field in which the callable service returns the MAC value if the segmenting rule is ONLY or LAST.
Symmetric MAC Generate

text_id_in

Direction: Input  Type: Integer

For CSNSMG1 and CSNESMG1 only, the ALET of the text for which the MAC is generated.

Usage Notes

The following table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Symmetric MAC Verify (CSNBSMV or CSNBSMV1 and CSNESMV or CSNESMV1)

Use the symmetric MAC verify callable service to verify a 96- or 128-bit message authentication code (MAC) for an application-supplied text string using an AES key.

The callable service names for AMODE(64) invocation are CSNESMV and CSNESMV1.

Choosing Between CSNBSMV and CSNBSMV1 or CSNESMV and CSNESMV1

CSNBSMV, CSNBSMV1, CSNESMV, and CSNESMV1 provide identical functions. When choosing which service to use, consider this:

- CSNBSMV and CSNESMV require the text to reside in the caller’s primary address space. Also, a program using CSNBSMV adheres to the IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface.
- CSNBSMV1 and CSNESMV1 allow the text to reside either in the caller’s primary address space or in a data space. This can allow you to decipher more data with one call. However, a program using CSNBSMV1 and CSNESMV1 do not adhere to the IBM CCA: Cryptographic API and may need to be modified prior to it running with other cryptographic products that follow this programming interface.
Symmetric MAC Verify

For CSNBSMV1 and CSNESMV1, text_id_in is an access list entry token (ALET) parameter of the data spaces containing the text.

Format

CALL CSNBSMV(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_identifier_length,
    key_identifier,
    text_length,
    text,
    rule_array_count,
    rule_array,
    chaining_vector_length,
    chaining_vector,
    reserved_data_length,
    reserved_data
    mac_length
    mac )

CALL CSNBSMV1( 
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_identifier_length,
    key_identifier,
    text_length,
    text,
    rule_array_count,
    rule_array,
    chaining_vector_length,
    chaining_vector,
    reserved_data_length,
    reserved_data
    mac_length
    mac
    text_id_in )

Parameters

return_code
Direction: Output
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Symmetric MAC Verify

Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

key_identifier_length
Direction: Input Type: Integer

The length of the key_identifier parameter. For the KEY-CLR keyword, the length is in bytes and includes only the value of the key length. The key length value can be 16, 24, or 32. For the KEYIDENT keyword, the length must be 64.

key_identifier
Direction: Input Type: String

For the KEY-CLR keyword, this specifies the clear AES key. The parameter must be left justified. For the KEYIDENT keyword, this specifies an internal clear AES token or the label name of a clear AES key in the CKDS. Normal CKDS label name syntax is required.

text_length
Direction: Input Type: Integer

The length of the text you supply in the text parameter. The maximum length of text is 2147483647 bytes. If the text_length parameter is not a multiple of 8 bytes and if the ONLY or LAST keyword of the rule_array parameter is called, the text is padded in accordance with the processing rule specified.

text
Direction: Input Type: String

The application-supplied text for which the MAC is verified.

rule_array_count
Direction: Input Type: Integer

The number of keywords specified in the rule_array parameter. The value can be 1, 2, 3 or 4.

rule_array
Direction: Input Type: String
Symmetric MAC Verify

This keyword provides control information to the callable service. The keywords must be eight bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks. The order of the rule_array keywords is not fixed.

You can specify one of the MAC processing rules and then choose one of the segmenting control keywords and one of the MAC length keywords.

Table 161. Keywords for symmetric MAC verify control information

</tr>
</tbody>
</table>

chaining_vector_length

Direction: Input/Output Type: String

The length of the chaining_vector parameter. On output, the actual length of the chaining vector will be stored in the parameter.

chaining_vector

Direction: Input/Output Type: String

This field is used as a system work area for the chaining vector. Your application program must not change the data in this string. The chaining vector holds the output chaining vector from the caller.

The mapping of the chaining_vector depends on the algorithm specified. For AES, the chaining_vector field must be at least 36 bytes in length.

reserved_data_length

Direction: Input Type: Integer
Symmetric MAC Verify

Reserved for future use. Value must be zero.

reserved_data
Direction: Ignored Type: String

Reserved for future use.

mac_length
Direction: Input Type: Integer

The length in bytes of the MAC to be verified the mac field. The allowable values are 12 and 16 bytes.

mac
Direction: Input Type: String

The 12-byte or 16-byte field that contains the MAC value you want to verify. The value must be left-justified and padded with zeros.

text_id_in
Direction: Input Type: Integer

For CSNBSMV1 and CSNESMV1 only, the ALET of the text for which the MAC is to be verified.

Usage Notes

The following table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Symmetric MAC Verify
Chapter 8. Financial Services

The process of validating personal identities in a financial transaction system is called personal authentication. The personal identification number (PIN) is the basis for verifying the identity of a customer across financial industry networks. ICSF provides callable services to translate, verify, and generate PINs. You can use the callable services to prevent unauthorized disclosures when organizations handle PINs.

These callable services are described in these topics:
- "Clear PIN Encrypt (CSNBCPE and CSNECPE)" on page 434
- "Clear PIN Generate (CSNBPGN and CSNEPGN)" on page 438
- "Clear PIN Generate Alternate (CSNBCPA and CSNECPA)" on page 442
- "CVV Key Combine (CSNBCKC and CSNECKC)" on page 448
- "Encrypted PIN Generate (CSNBEPG and CSNEEPG)" on page 453
- "Encrypted PIN Translate (CSNBPTR and CSNEPTR)" on page 458
- "Encrypted PIN Verify (CSNBPVR and CSNEPVR)" on page 466
- "PIN Change/Unblock (CSNBPCU and CSNEPCU)" on page 473
- "Secure Messaging for Keys (CSNBSKY and CSNESKY)" on page 479
- "Secure Messaging for PINs (CSNBSPN and CSNESPN)" on page 482
- "SET Block Compose (CSNDSBC and CSNFSBC)" on page 497
- "SET Block Decompose (CSNDSBD and CSNFSBD)" on page 492
- "Transaction Validation (CSNBTRV and CSNETRV)" on page 498
- "VISA CVV Service Generate (CSNBCSG and CSNECSG)" on page 502
- "VISA CVV Service Verify (CSNBCSV and CSNECSV)" on page 506

How Personal Identification Numbers (PINs) are Used

Many people are familiar with PINs, which allow them to use an automated teller machine (ATM). From the system point of view, PINs are used primarily in financial networks to authenticate users — typically, a user is assigned a PIN, and enters the PIN at automated teller machines (ATMs) to gain access to his or her accounts. It is extremely important that the PIN be kept private, so that no one other than the account owner can use it. ICSF allows your applications to generate PINs, to verify supplied PINs, and to translate PINs from one format to another.

How VISA Card Verification Values Are Used

The Visa International Service Association (VISA) and MasterCard International, Incorporated have specified a cryptographic method to calculate a value that relates to the personal account number (PAN), the card expiration date, and the service code. The VISA card-verification value (CVV) and the MasterCard card-verification code (CVC) can be encoded on either track 1 or track 2 of a magnetic striped card and are used to detect forged cards. Because most online transactions use track-2, the ICSF callable services generate and verify the CVV4 by the track-2 method.

The VISA CVV service generate callable service calculates a 1- to 5-byte value through the DES-encryption of the PAN, the card expiration date, and the service code using two data-encrypting keys or two MAC keys. The VISA CVV service verify callable service calculates the CVV by the same method, compares it to the

4. The VISA CVV and the MasterCard CVC refer to the same value. CVV is used here to mean both CVV and CVC.
CVV supplied by the application (which reads the credit card's magnetic stripe) in the CVV_value, and issues a return code that indicates whether the card is authentic.

Translating Data and PINs in Networks

More and more data is being transmitted across networks where, for various reasons, the keys used on one network cannot be used on another network. Encrypted data and PINs that are transmitted across these boundaries must be “translated” securely from encryption under one key to encryption under another key. For example, a traveler visiting a foreign city might wish to use an ATM to access an account at home. The PIN entered at the ATM might need to be encrypted at the ATM and sent over one or more financial networks to the traveler's home bank. At the home bank, the PIN must be verified prior to access being allowed. On intermediate systems (between networks), applications can use the Encrypted PIN translate callable service to re-encrypt a PIN block from one key to another. Running on ICSF, such applications can ensure that PINs never appear in the clear and that the PIN-encrypting keys are isolated on their own networks.

Working with Europay–MasterCard–Visa smart cards

There are several services you can use in secure communications with EMV smart cards. The processing capabilities are consistent with the specifications provided in these documents:

- EMV 2000 Integrated Circuit Card Specification for Payment Systems Version 4.0 (EMV4.0) Book 2
- Integrated Circuit Card Specification (VIS) 1.4.0 Corrections

EMV smart cards include the following processing capabilities:

- The diversified key generate (CSNBDKG and CSNEDKG) callable service with rule-array options TDES-XOR, TDESEMV2, and TDESEMV4 enables you to derive a key used to cipher and authenticate messages, and more particularly message parts, for exchange with an EMV smart card. You use the derived key with services such as encipher, decipher, MAC generate, MAC verify, secure messaging for keys, and secure messaging for PINs. These message parts can be combined with message parts created using the secure messaging for keys and secure messaging for PINs services.

- The secure messaging for keys (CSNBSKY and CSNESKY) service enables you to securely incorporate a key into a message part (generally the value portion of a TLV component of a secure message for a card). Similarly, the secure messaging for PINs (CSNBSPN and CSNESPN) service enables secure incorporation of a PIN block into a message part.

- The PIN change/unblock (CSNBPCU and CSNEPCU) service enables you to encrypt a new PIN to send to a new EMV card, or to update the PIN value on an initialized EMV card. This verb generates both the required session key (from the master encryption key) and the required authentication code (from the master authentication key).

- The ZERO-PAD option of the PKA encrypt (CSNPKKE) service enables you to validate a digital signature created according to ISO 9796-2 standard by encrypting information you format, including a hash value of the message to be validated. You compare the resulting enciphered data to the digital signature accompanying the message to be validated.
The MAC generate and MAC verify services post-pad a X'80'...X'00' string to a message as required for authenticating messages exchanged with EMV smart cards.

---

**PIN Callable Services**

You use the PIN callable services to generate, verify, and translate PINs. This topic discusses the PIN callable services, as well as the various PIN algorithms and PIN block formats supported by ICSF. It also explains the use of PIN-encrypting keys.

**Generating a PIN**

To generate personal identification numbers, call the Clear PIN Generate or Encrypted PIN Generate callable service. Using a PIN generation algorithm, data used in the algorithm, and the PIN generation key, the Clear PIN generate callable service generates a clear PIN and a PIN verification value, or offset. The Clear PIN Generate callable service can only execute in special secure mode. For a description of this mode, see "Special Secure Mode" on page 10. Using a PIN generation algorithm, data used in the algorithm, the PIN generation key, and an outbound PIN encrypting key, the encrypted PIN generate callable service generates and formats a PIN and encrypts the PIN block.

**Encrypting a PIN**

To format a PIN into a supported PIN block format and encrypt the PIN block, call the Clear PIN encrypt callable service.

**Generating a PIN Validation Value from an Encrypted PIN Block**

To generate a clear VISA PIN validation value (PVV) from an encrypted PIN block, call the clear PIN generate alternate callable service. The PIN block can be encrypted under an input PIN-encrypting key (IPINENC) or an output PIN encrypting key (OPINENC). Using an IPINENC key requires that NOCV keys are enabled in the CKDS.

**Verifying a PIN**

To verify a supplied PIN, call the Encrypted PIN verify callable service. You supply the enciphered PIN, the PIN-encrypting key that enciphers the PIN, and other data. You must also specify the PIN verification key and PIN verification algorithm. The callable service generates a verification PIN. The service compares the two personal identification numbers and if they are the same, it verifies the supplied PIN.

**Translating a PIN**

To translate a PIN block format from one PIN-encrypting key to another or from one PIN block format to another, call the Encrypted PIN translate callable service. You must identify the input PIN-encrypting key that originally enciphered the PIN. You also need to specify the output PIN-encrypting key that you want the callable service to use to encipher the PIN. If you want to change the PIN block format, specify a different output PIN block format from the input PIN block format.

**Algorithms for Generating and Verifying a PIN**

ICSF supports these algorithms for generating and verifying personal identification numbers:
- IBM 3624 institution-assigned PIN
Using PINs on Different Systems

ICSF allows you to translate different PIN block formats, which lets you use personal identification numbers on different systems. ICSF supports these formats:

- IBM 3624
- IBM 3621 (same as IBM 5906)
- IBM 4704 encrypting PINPAD format
- ISO 0 (same as ANSI 9.8, VISA 1, and ECI 1)
- ISO 1 (same as ECI 4)
- ISO 2
- ISO 3
- VISA 2
- VISA 3
- VISA 4
- ECI 2
- ECI 3

The formats are discussed in "PIN Formats and Algorithms" on page 863.

PIN-Encrypting Keys

A unique master key variant enciphers each type of key. For further key separation, an installation can choose to have each PIN block format enciphered under a different PIN-encrypting key. The PIN-encrypting keys can have a 16-byte PIN block variant constant exclusive ORed on them prior to using to translate or verify PIN blocks. This is specified in the format control field in the Encrypted PIN translate and Encrypted PIN verify callable services.

You should only use PIN block variant constants when you are communicating with another host processor with the Integrated Cryptographic Service Facility.

Derived Unique Key Per Transaction Algorithms

ICSF supports ANSI X9.24 derived unique key per transaction algorithms to generate PIN-encrypting keys from user data. ICSF supports both single- and double-length key generation. Keywords for single- and double-length key generation can not be mixed. A PCICC, PCIXCC, CEX2C, or CEX3C is required for this support. Double-length key generation is only supported on z990 with the May 2004 LIC or higher, z890, z9 EC, z9 BC and IBM System z10 EC.

Encrypted PIN Translate

The UKPTIPIN, IPKTOPIN and UKPTBOTH keywords will cause the service to generate single-length keys. DUKPT-IP, DUKPT-OP and DUKPT-BH are the respective keywords to generate double-length keys. The input_PIN_profile and output_PIN_profile must supply the current key serial number when these keywords are specified.
**Encrypted PIN Verify**

The UKPTIPIN keyword will cause the service to generate single-length keys. DUKPT-IP is the keyword for double-length key generation. The input_PIN_profile must supply the current key serial number when these keywords are specified.

For more information about PIN-encrypting keys, see [z/OS Cryptographic Services][1] [ICSF Administrator’s Guide](https://www.ibm.com/docs/en/zos-cics-es).  

---

**ANSI X9.8 PIN Restrictions**

Access control points (ACP) in the ICSF role control PIN block processing restrictions from the X9.8 standard. These access control points are available on the z196 with the CEX3C. These callable services are affected by these access control points. These access control points are disabled in the default role. A TKE Workstation is required to enable these ACPs.

- Clear PIN Generate Alternate (CSNBCPA and CSNECPA)
- Encrypted PIN Generate (CSNBEPG and CSNEEPG)
- Encrypted PIN Translate (CSNBPTR and CSNEPTR)
- Encrypted PIN Verify (CSNPBPR and CSNEPVR)
- Secure Messaging for PINs (CSNBSPN and CSNESPN)

There are four access control points:

- ANSI X9.8 PIN - Enforce PIN block restrictions
- ANSI X9.8 PIN - Allow modification of PAN
- ANSI X9.8 PIN - Allow only ANSI PIN blocks
- ANSI X9.8 PIN – Use stored decimalization tables only

PIN decimalization tables can be stored in the CEX3C coprocessors for use by callable services. Only tables that have been activated can be used. A TKE Workstation is required to manage the tables in the coprocessors.

**Note:** ICSF routes work to all active coprocessors based on work load. All coprocessors must have the same set of active decimalization tables for the **ANSI X9.8 PIN – Use stored decimalization tables only** access control point to be effective.

**ANSI X9.8 PIN - Enforce PIN block restrictions**

When **ANSI X9.8 PIN - Enforce PIN block restrictions** access control point is enable, the following restrictions will be enforced:

- CSNBPTR and CSNBSPN will not accept IBM 3624 PIN format in the output profile parameter when the input profile parameter is not IBM 3624.
- CSNBPTR will not accept ISO-0 or ISO-3 formats in the input PIN profile unless ISO-0 or ISO-3 is in the output PIN profile.
- CSNBPTR and CSNBSPN will not accept ISO-1 or ISO-2 formats in the output profile parameter when the input profile parameter contains ISO-0, ISO-3, or VISA4.
- When the input profile parameter of CSNBPTR or CSNBSPN contains either ISO-0 or ISO-3 formats, the decrypted PIN block will be examined to ensure that the PAN within the PIN block is the same as the PAN which was supplied as the input PAN parameter, and that this is the same as the PAN which was supplied as the output PAN parameter.

---

• The input PAN and output PAN parameters of CSNBPTR or CSNBSPN must be equivalent.
• When the rule array for CSNBCPA contains VISA-PVV, the input PIN profile must contain ISO-0 or ISO-3 formats.

**ANSI X9.8 PIN - Allow modification of PAN**

In order to enable the **ANSI X9.8 PIN - Allow modification of PAN** access control point, the **ANSI X9.8 PIN - Enforce PIN block restrictions** must also be enabled. The **ANSI X9.8 PIN - Allow modification of PAN** access control point cannot be enabled by itself.

When the **ANSI X9.8 PIN - Allow modification of PAN** access control point is enabled, the input PAN and output PAN parameters will be tested in CSNBPTR or CSNBSPN. The input PAN will be compared to the portions of the PAN which are recoverable from the decrypted PIN block. If the PANs compare, then the account number will be changed in the output PIN block.

**ANSI X9.8 PIN - Allow only ANSI PIN blocks**

In order to enable the **ANSI X9.8 PIN - Allow only ANSI PIN blocks** access control point, the **ANSI X9.8 PIN - Enforce PIN block restrictions** must also be enabled. The **ANSI X9.8 PIN - Allow only ANSI PIN blocks** access control point cannot be enabled by itself.

When this access control point is enabled, CSNBPTR will allow reformatting of the PIN block as shown in the following table.

<table>
<thead>
<tr>
<th>Reformat To:</th>
<th>ISO Format 0</th>
<th>ISO Format 1</th>
<th>ISO Format 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reformat to:</td>
<td>ISO Format 0</td>
<td>ISO Format 1</td>
<td>ISO Format 3</td>
</tr>
<tr>
<td>ISO Format 0</td>
<td>Reformat permitted</td>
<td>Not permitted</td>
<td>Reformat permitted</td>
</tr>
<tr>

<td>Reformat permitted</td>
<td>Reformat permitted</td>
<td>Reformat permitted</td>
</tr>
<tr>
<td>ISO Format 3</td>
<td>Reformat permitted</td>
<td>Not permitted</td>
<td>Change of PAN not permitted</td>
</tr>
</tbody>
</table>

**ANSI X9.8 PIN – Use stored decimalization tables only**

The **ANSI X9.8 PIN – Use stored decimalization tables only** access control point may be enabled by itself.

When this access control point is enabled, CSNBPGN, CSNBCPA, CSNBEPG, and CSNBPVPR services must supply a decimalization table that matches the active decimalization tables stored in the coprocessors. The decimalization table in the *data_array* parameter will be compared against the active decimalization tables in the coprocessor and if the supplied table matches a stored table, the request will be processed. If the supplied table doesn’t match any of the stored tables or there are no stored tables, the request will fail.

PIN decimalization tables can be stored in the CEX3C coprocessors for use by callable services. Only tables that have been activated can be used. A TKE Workstation is required to manage the tables in the coprocessors.
Note: ICSF routes work to all active coprocessors based on work load. All coprocessors must have the same set of decimalization tables for the decimalization table access control point to be effective.

The PIN Profile

The PIN profile consists of:
- PIN block format (see "PIN Block Format")
- Format control (see "Format Control" on page 432)
- Pad digit (see "Pad Digit" on page 432)
- Current Key Serial Number (for UKPT and DUKPT – see "Current Key Serial Number" on page 433)

Table 164 shows the format of a PIN profile.

Table 164. Format of a PIN Profile

PIN Block Format and PIN Extraction Method Keywords

In the Clear PIN Generate Alternate, Encrypted PIN Translate and Encrypted PIN Verify callable services, you may specify a PIN extraction keyword for a given PIN block format. In this table, the allowable PIN extraction methods are listed for each PIN block format. The first PIN extraction method keyword listed for a PIN block format is the default. If you specify a PIN extraction method keyword that is not the default, the request will be routed to the PCI Cryptographic Coprocessor on the z900 server.
<table>
<thead>
<tr>
<th>PIN Block Format</th>

</tr>
<tr>
<td>VISA-4</td>
<td>PINBLOCK</td>
<td>The PIN extraction method keywords specify a PIN extraction method for a PINBLOCK format.</td>
</tr>
<tr>
<td>3621</td>
<td>PADDIGIT, HEXDIGIT, PINLEN04 to PINLEN12, PADEXIST</td>
<td>The PIN extraction method keywords specify a PIN extraction method for an IBM 3621 PIN block format. The first keyword, PADDIGIT, is the default PIN extraction method for the PIN block format.</td>
</tr>
<tr>
<td>3624</td>
<td>PADDIGIT, HEXDIGIT, PINLEN04 to PINLEN16, PADEXIST</td>
<td>The PIN extraction method keywords specify a PIN extraction method for an IBM 3624 PIN block format. The first keyword, PADDIGIT, is the default PIN extraction method for the PIN block format.</td>
</tr>
</tbody>
</table>
The PIN extraction methods operate as follows:

**PINBLOCK**
- Specifies that the service use one of these:
  - the PIN length, if the PIN block contains a PIN length field
  - the PIN delimiter character, if the PIN block contains a PIN delimiter character.

**PADDIGIT**
- Specifies that the service use the pad value in the PIN profile to identify the end of the PIN.

**HEXDIGIT**
- Specifies that the service use the first occurrence of a digit in the range from X'A' to X'F' as the pad value to determine the PIN length.

**PINLENxx**
- Specifies that the service use the length specified in the keyword, where xx can range from 4 to 16 digits, to identify the PIN.

**PADEXIST**
- Specifies that the service use the character in the 16th position of the PIN block as the value of the pad value.

### Enhanced PIN Security Mode

An Enhanced PIN Security Mode is available. This optional mode is selected by enabling the PTR Enhanced PIN Security access control point in the PCICC, PCIXCC, CEX2C, or CEX3C default role. When active, this control point affects all PIN callable services that extract or format a PIN using a PIN-block format of 3621 or 3624 with a PIN-extraction method of PADDIGIT.

Table 167 summarizes the callable services affected by the Enhanced PIN Security Mode and describes the effect that the mode has when the access control point is enabled.

<table>
<thead>
<tr>
<th>PIN-block format and PIN-extraction method</th>

</tr>
<tr>
<td>3621 or 3624 format and PADDIGIT</td>
<td>Encrypted_PIN_Translate</td>
<td>Restricted to non-decimal digit for PAD digit.</td>
</tr>
</tbody>
</table>

Format Control

This keyword specifies whether there is any control on the user-supplied PIN format. The 8-byte value must be left-justified and padded with blanks. Specify one of these values:

- **NONE**  No format control.
- **PBVC**  A PIN block variant constant (PBVC) enforces format control. Use the PBVC value only if you have coded PBVC in the encrypted PIN translate callable service. For the PBVC, the clear PIN key-encrypting key has been exclusive ORed with one of the PIN block formats. The cryptographic feature removes the pattern from the clear PIN key-encrypting key prior to it decrypting the PIN block.

**Restriction:** PBVC is not supported on IBM zSeries 990 and subsequent releases.

**Notes:**

1. Only control vectors and extraction methods valid for the Cryptographic Coprocessor Feature may be used if the PBVC format control is desired.

2. PBVC is supported for compatibility with prior releases of OS/390 ICSF and existing ICSF applications. It is recommended that a format control of NONE be specified for maximum flexibility to run on PCI Cryptographic Coprocessors.

If you do not specify a value for the format control parameter, ICSF uses hexadecimal zeros.

Table 182 on page 447 lists the PIN block variant constants.

Pad Digit

Some PIN formats require this parameter. If the PIN format does not need a pad digit, the callable service ignores this parameter. Table 168 on page 433 shows the format of a pad digit. The PIN profile pad digit must be specified in upper case.
Table 168. Format of a Pad Digit

<table>
<thead>
<tr>
<th>Bytes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>16–22</td>
<td>Seven space characters</td>
</tr>
<tr>
<td>23</td>
<td>Character representation of a hexadecimal pad digit or a space if a pad digit is not needed. Characters must be one of these: 0–9, A–F, or a blank.</td>
</tr>
</tbody>
</table>

Each PIN format supports only a pad digit in a certain range. This table lists the valid pad digits for each PIN block format.

Table 169. Pad Digits for PIN Block Formats

<table>
<thead>
<tr>
<th>PIN Block Format</th>
<th>Output PIN Profile</th>
<th>Input PIN Profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECI-2</td>

<td>F</td>
<td>Pad digit is not used</td>
</tr>
<tr>
<td>3621</td>
<td>0 through F</td>
<td>0 through F</td>
</tr>
<tr>
<td>3624</td>
<td>0 through F</td>
<td>0 through F</td>
</tr>
<tr>
<td>4704-EPP</td>
<td>F</td>
<td>Pad digit is not used</td>
</tr>
</tbody>
</table>

The callable service returns an error indicating that the PAD digit is not valid if all of these conditions are met:

1. The PTR Enhanced Security access control point is enabled in the active role
2. The output PIN profile specifies 3621 or 3624 as the PIN-block format
3. The output PIN profile specifies a decimal digit (0-9) as the PAD digit

**Recommendations for the Pad Digit**

IBM recommends that you use a nondecimal pad digit in the range of A through F when processing IBM 3624 and IBM 3621 PIN blocks. If you use a decimal pad digit, the creator of the PIN block must ensure that the calculated PIN does not contain the pad digit, or unpredictable results may occur.

For example, you can exclude a specific decimal digit from being in any calculated PIN by using the IBM 3624 calculation procedure and by specifying a decimalization table that does not contain the desired decimal pad digit.

**Current Key Serial Number**

The current key serial number is the concatenation of the initial key serial number (a 59-bit value) and the encryption counter (a 21-bit value). The concatenation is an 80-bit (10-byte) value. Table 170 on page 434 shows the format of the current key serial number.
When UKPT or DUKPT is specified, the PIN profile parameter is extended to a 48-byte field and must contain the current key serial number.

<table>

</tr>
</tbody>
</table>

### Decimalization Tables

Decimalization tables can be loaded in the coprocessors to restrict attacks using modified tables. The management of the tables requires a TKE Workstation.

Clear PIN Generate (CSNBPGN and CSNEPGN), Clear PIN Generate Alternate (CSNBCPA and CSNECPA), Encrypted PIN Generate (CSNBEPG and CSNEEPG), and Encrypted PIN Verify (CSNPBPR and CSNEPVR) callable services will make use of the stored decimalization tables.

The **ANSI X9.8 PIN – Use stored decimalization tables only** access control point is used to restrict the use of tables. When the access control point is enabled, the table supplied by the callable service will be compared against the active tables stored in the coprocessor. If the supplied table doesn’t match any of the active tables, the request will fail.

A TKE workstation (Version 7.1 or later) is required to manage the PIN decimalization tables. The tables must be loaded and then activated. Only active tables are checked when the access control point is enabled.

**Note:** ICSF routes work to all active coprocessors based on work load. All coprocessors must have the same set of decimalization tables for the decimalization table access control point to be effective.

### Clear PIN Encrypt (CSNBCEP and CSNECEP)

The Clear PIN Encrypt callable service formats a PIN into one of these PIN block formats and encrypts the results. You can use this service to create an encrypted PIN block for transmission. With the RANDOM keyword, you can have the service generate random PIN numbers.

**Note:** A clear PIN is a sensitive piece of information. Ensure that your application program and system design provide adequate protection for any clear PIN value.

- IBM 3621 format
- IBM 3624 format
- ISO-0 format (same as the ANSI X9.8, VISA-1, and ECI formats)
- ISO-1 format (same as the ECI-4 format)
- ISO-2 format
- ISO-3 format
- IBM 4704 encrypting PINPAD (4704-EPP) format
- VISA 2 format
- VISA 3 format
- VISA 4 format
- ECI2 format
- ECI3 format
An enhanced PIN security mode, on PCICC, PCIXCC, CEX2C, or CEX3C, is available for formatting an encrypted PIN block into IBM 3621 format or IBM 3624 format. To do this, you must enable the PTR Enhanced PIN Security access control point in the default role. When activated, this mode limits checking of the PIN to decimal digits. No other PIN block consistency checking will occur.

The callable service name for AMODE(64) invocation is CSNECPE.

### Format

```
CALL CSNECPE(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    PIN_encrypting_key_identifier,
    rule_array_count,
    rule_array,
    clear_PIN,
    PIN_profile,
    PAN_data,
    sequence_number,
    encrypted_PIN_block )
```

### Parameters

**return_code**
- Direction: Output
- Type: Integer
- The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”] lists the return codes.

**reason_code**
- Direction: Output
- Type: Integer
- The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”] lists the reason codes.

**exit_data_length**
- Direction: Input/Output
- Type: Integer
- The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFFFF' (2 gigabytes). The data is defined in the exit_data parameter.

**exit_data**
- Direction: Input/Output
- Type: String
- The data that is passed to the installation exit.

**PIN_encrypting_key_identifier**
- Direction: Input/Output
- Type: String
Clear PIN Encrypt

The 64-byte string containing an internal key token or a key label of an internal key token. The internal key token contains the key that encrypts the PIN block. The control vector in the internal key token must specify an OPINENC key type and have the CPINENC usage bit set to 1.

rule_array_count
Direction: Input Type: Integer

The number of keywords you are supplying in the rule_array parameter. Valid values are 0 and 1.

rule_array
Direction: Input Type: Character string

Keywords that provide control information to the callable service. The keyword is left-justified in an 8-byte field, and padded on the right with blanks. All keywords must be in contiguous storage. The rule array keywords are shown as follows:

Table 171. Process Rules for the Clear PIN Encryption Callable Service

<table>
<thead>
<tr>
<th>Process Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCRYPT</td>
<td>This is the default. Use of this keyword is optional.</td>
</tr>
<tr>
<td>RANDOM</td>
<td>Causes the service to generate a random PIN value. The length of the PIN is based on the value in the clear_PIN variable. Set the value of the clear PIN to zero and use as many digits as the desired random PIN; pad the remainder of the clear PIN variable with space characters.</td>
</tr>
</tbody>
</table>

clear_PIN
Direction: Input Type: String

A 16-character string with the clear PIN. The value in this variable must be left-justified and padded on the right with space characters.

PIN_profile
Direction: Input Type: String

A 24-byte string containing three 8-byte elements with a PIN block format keyword, the format control keyword, NONE, and a pad digit as required by certain formats. See “The PIN Profile” on page 429 for additional information.

PAN_data
Direction: Input Type: String

A 12-byte PAN in character format. The service uses this parameter if the PIN profile specifies the ISO-0 or VISA-4 keyword for the PIN block format. Otherwise, ensure that this parameter is a 12-byte variable in application storage. The information in this variable will be ignored, but the variable must be specified.
**Clear PIN Encrypt**

**Note:** When using the ISO-0 keyword, use the 12 rightmost digits of the PAN data, excluding the check digit. When using the VISA-4 keyword, use the 12 leftmost digits of the PAN data, excluding the check digit.

**sequence_number**

Direction: Input  
Type: Integer

The 4-byte character integer. The service currently ignores the value in this variable. For future compatibility, the suggested value is 99999.

**encrypted_PIN_block**

Direction: Output  
Type: String

The field that receives the 8-byte encrypted PIN block.

**Restrictions**

The format control specified in the PIN profile must be NONE. If PBVC is specified as the format control, the service will fail.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

SAF will be invoked to check authorization to use the Clear PIN encrypt service and the label of the `PIN_encrypting_key_identifier`.

The Clear PIN Encrypt access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Clear PIN Generate

Clear PIN Generate (CSNBPGN and CSNEPGN)

Use the Clear PIN generate callable service to generate a clear PIN, a PIN validation value (PVV), or an offset according to an algorithm. You supply the algorithm or process rule using the `rule_array` parameter.

- IBM 3624 (IBM-PIN or IBM-PINO)
- IBM German Bank Pool (GBP-PINO) - not supported on an IBM @server zSeries 990 and subsequent releases.
- VISA PIN validation value (VISA-PVV)
- Interbank PIN (INBK-PIN)

The callable service can execute only when ICSF is in special secure mode. This mode is described in “Special Secure Mode” on page 10.

For guidance information about VISA, see their appropriate publications. The Interbank PIN algorithm is available only on S/390 Enterprise Servers, the S/390 Multiprise, and the IBM @server zSeries.

The callable service name for AMODE(64) invocation is CSNEPGN.

Format

```
CALL CSNBPGN(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    PIN_generating_key_identifier,
    rule_array_count,
    rule_array,
    PIN_length,
    PIN_check_length,
    data_array,
    returned_result )
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer
Clear PIN Generate

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFFFF' (2 gigabytes). The data is defined in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

PIN_generating_key_identifier
Direction: Input/Output Type: Character string

The 64-byte key label or internal key token that identifies the PIN generation (PINGEN) key. If the PIN_generating_key_identifier identifies a key which does not have the default PIN generation key control vector, the request will be routed to a PCI Cryptographic Coprocessor.

rule_array_count
Direction: Input Type: Integer

The number of process rules specified in the rule_array parameter. The value must be 1.

rule_array
Direction: Input Type: Character string

The process rule provides control information to the callable service. Specify one of the values in Table 173. The keyword is left-justified in an 8-byte field, and padded on the right with blanks.

Table 173. Process Rules for the Clear PIN Generate Callable Service

<table>
<thead>
<tr>
<th>Process Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GBP-PIN</td>
<td>The IBM German Bank Pool PIN, which uses the institution PINGEN key to generate an institution PIN (IPIN).</td>
</tr>
<tr>
<td>GBP-PINO</td>
<td>The IBM German Bank Pool PIN offset, which uses the pool PINGEN key to generate a pool PIN (PPIN). It uses the institution PIN (IPIN) as input and calculates the PIN offset, which is the output. GBP-PINO is not supported on an IBM @server zSeries 990 and subsequent releases.</td>
</tr>
<tr>
<td>IBM-PIN</td>
<td>The IBM 3624 PIN, which is an institution-assigned PIN. It does not calculate the PIN offset.</td>
</tr>
<tr>
<td>IBM-PINO</td>
<td>The IBM 3624 PIN offset, which is a customer-selected PIN and calculates the PIN offset (the output).</td>
</tr>
<tr>
<td>INBK-PIN</td>
<td>The Interbank PIN is generated.</td>
</tr>
<tr>
<td>VISA-PVV</td>
<td>The VISA PIN validation value. Input is the customer PIN.</td>
</tr>
</tbody>
</table>

PIN_length
Direction: Input Type: Integer
Clear PIN Generate

The length of the PIN used for the IBM algorithms only, IBM-PIN or IBM-PINO. Otherwise, this parameter is ignored. Specify an integer from 4 through 16. If the length is greater than 12, the request will be routed to the PCI Cryptographic Coprocessor.

PIN_check_length

**Direction:** Input  **Type:** Integer

The length of the PIN offset used for the IBM-PINO process rule only. Otherwise, this parameter is ignored. Specify an integer from 4 through 16.

**Note:** The PIN check length must be less than or equal to the integer specified in the `PIN_length` parameter.

data_array

**Direction:** Input  **Type:** String

Three 16-byte data elements required by the corresponding `rule_array` parameter. The data array consists of three 16-byte fields or elements whose specification depends on the process rule. If a process rule only requires one or two 16-byte fields, then the rest of the data array is ignored by the callable service. Table 174 describes the array elements.

**Table 174. Array Elements for the Clear PIN Generate Callable Service**

<table>
<thead>
<tr>
<th>Array Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clear_PIN</td>
<td>Clear user selected PIN of 4 to 12 digits of 0 through 9. Left-justified and padded with spaces. For IBM-PINO, this is the clear customer PIN (CSPIN). For GBP-PINO, this is the institution PIN. For IBM-PIN and GBP-PIN, this field is ignored.</td>
</tr>
<tr>
<td>Decimalization_table</td>
<td>Decimalization table for IBM and GBP only. Sixteen digits of 0 through 9. <strong>Note:</strong> If the ANSI X9.8 PIN – Use stored decimalization tables only access control point is enabled in the ICSF role, this table must match one of the active decimalization tables in the coprocessors.</td>
</tr>
<tr>
<td>Trans_sec_parm</td>
<td>For VISA only, the leftmost sixteen digits. Eleven digits of the personal account number (PAN). One digit key index. Four digits of customer selected PIN. For Interbank only, sixteen digits. Eleven right-most digits of the personal account number (PAN). A constant of 6. One digit key selector index. Three digits of PIN validation data.</td>
</tr>
<tr>
<td>Validation_data</td>
<td>Validation data for IBM and IBM German Bank Pool padded to 16 bytes. One to sixteen characters of hexadecimal account data left-justified and padded on the right with blanks.</td>
</tr>
</tbody>
</table>

Table 175 on page 441 lists the data array elements required by the process rule (`rule_array` parameter). The numbers refer to the process rule’s position within the array.
Clear PIN Generate

<td>1</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Generate offset for GBP algorithm is equivalent to IBM offset generation with PIN_check_length of 4 and PIN_length of 6.

**returned_result**

Direction: Output Type: Character string

The 16-byte generated output, left-justified and padded on the right with blanks.

**Restrictions**

PIN lengths of 13-16 require the optional PCI Cryptographic Coprocessor.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

If you are using the IBM 3624 PIN and IBM German Bank Pool PIN algorithms, you can supply an unencrypted customer selected PIN to generate a PIN offset.

This table shows the access control points in the ICSF role that control the function of this service.

Table 176. Required access control points for Clear PIN Generate

<table>
<thead>
<tr>
<th>Rule array keywords</th>
<th>Access control point</th>
</tr>
</thead>

Related Information

PIN algorithms are shown in PIN Formats and Algorithms

Clear PIN Generate Alternate (CSNBCPA and CSNECPA)

Use the clear PIN generate alternate service to generate a clear VISA PVV (PIN validation value) from an input encrypted PIN block, or to produce a 3624 offset from a customer-selected encrypted PIN. The PIN block can be encrypted under either an input PIN-encrypting key (IPINENC) or an output PIN-encrypting key (OPINENC).

An enhanced PIN security mode, on PCICC, PCIXCC, CEX2C, or CEX3C, is available for extracting PINs from encrypted PIN blocks. This mode only applies when specifying a PIN-extraction method for an IBM 3621 or an IBM 3624 PIN-block. To do this, you must enable the PTR Enhanced PIN Security access control point in the default role. When activated, this mode limits checking of the PIN to decimal digits and a PIN length minimum of 4 is enforced. No other PIN-block consistency checking will occur.

An enhanced PIN security mode on a CEX3C is available to implement restrictions required by the ANSI X9.8 PIN standard. To enforce these restrictions, you must enable the following control points in the default role.

- ANSI X9.8 PIN - Enforce PIN block restrictions
- ANSI X9.8 PIN - Allow modification of PAN
- ANSI X9.8 PIN - Allow only ANSI PIN blocks

The callable service name for AMODE(64) invocation is CSNECPA.
Clear PIN Generate Alternate

Format

```
CALL CSNCPA(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    PIN_encryption_key_identifier,
    PIN_generation_key_identifier,
    PIN_profile,
    PAN_data,
    encrypted_PIN_block,
    rule_array_count,
    rule_array,
    PIN_check_length,
    data_array,
    returned_PVV)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that are assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the **exit_data** parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**PIN_encryption_key_identifier**

Direction: Input/Output  
Type: String

A 64-byte string consisting of an internal token that contains an IPINENC or OPINENC key or the label of an IPINENC or OPINENC key that is used to encrypt the PIN block. If you specify a label, it must resolve uniquely to either an IPINENC or OPINENC key. If the **PIN_encryption_key_identifier** identifies a
Clear PIN Generate Alternate

key which does not have the default PIN encrypting control vector (either IPIENC or OPINENC), the request will be routed to the PCI Cryptographic Coprocessor for processing.

**PIN_generation_key_identifier**

Direction: Input/Output  Type: String

A 64-byte string that consists of an internal token that contains a PIN generation (PINGEN) key or the label of a PINGEN key. If the **PIN_generation_key_identifier** identifies a key which does not have the default PIN generating control vector, the request will be routed to the PCI Cryptographic Coprocessor for processing.

**PIN_profile**

Direction: Input  Type: Character string

The three 8-byte character elements that contain information necessary to extract a PIN from a formatted PIN block. The pad digit is needed to extract the PIN from a 3624 or 3621 PIN block in the clear PIN generate alternate service. See “The PIN Profile” on page 429 for additional information.

**PAN_data**

Direction: Input  Type: String

A 12-byte field that contains 12 characters of PAN data. The personal account number recovers the PIN from the PIN block if the PIN profile specifies ISO-0 or VISA-4 block formats. Otherwise it is ignored, but you must specify this parameter.

For ISO-0, use the rightmost 12 digits of the PAN, excluding the check digit. For VISA-4, use the leftmost 12 digits of the PAN, excluding the check digit.

**encrypted_PIN_block**

Direction: Input  Type: String

An 8-byte field that contains the encrypted PIN that is input to the VISA PVV generation algorithm. The service uses the IPIENC or OPINENC key that is specified in the **PIN_encryption_key_identifier** parameter to encrypt the block.

**rule_array_count**

Direction: Input  Type: Integer

The number of process rules specified in the **rule_array** parameter. The value may be 1, 2, or 3.

**rule_array**

Direction: Input  Type: Character string

The process rule for the PIN generation algorithm. Specify IBM-PINO or “VISA-PVV” (the VISA PIN verification value) in an 8-byte field, left-justified, and padded with blanks. The **rule_array** points to an array of one or two 8-byte elements as follows:
Clear PIN Generate Alternate

Table 178. Rule Array Elements for the Clear PIN Generate Alternate Service

<table>
<thead>
<tr>
<th>Rule Array Element</th>
<th>Function of Rule Array keyword</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>PIN calculation method</td>
</tr>
<tr>
<td>2</td>
<td>PIN extraction method</td>
</tr>
</tbody>
</table>

The first element in the rule array must specify one of the keywords that indicate the PIN calculation method as shown:

Table 179. Rule Array Keywords (First Element) for the Clear PIN Generate Alternate Service

<table>
<thead>
<tr>
<th>PIN Calculation Method Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBM-PINO</td>
<td>This keyword specifies use of the IBM 3624 PIN Offset calculation method.</td>
</tr>
<tr>
<td>VISA-PVV</td>
<td>This keyword specifies use of the VISA PVV calculation method.</td>
</tr>
</tbody>
</table>

If the second element in the rule array is provided, one of the PIN extraction method keywords shown in Table 166 on page 430 may be specified for the given PIN block format. See "PIN Block Format and PIN Extraction Method Keywords" on page 429 for additional information. If the default extraction method for a PIN block format is desired, you may code the rule array count value as 1.

The PIN extraction methods operate as follows:

PINBLOCK
   Specifies that the service use one of these:
   - the PIN length, if the PIN block contains a PIN length field
   - the PIN delimiter character, if the PIN block contains a PIN delimiter character.

PADDIGIT
   Specifies that the service use the pad value in the PIN profile to identify the end of the PIN.

HEXDIGIT
   Specifies that the service use the first occurrence of a digit in the range from X'A' to X'F' as the pad value to determine the PIN length.

PINLENxx
   Specifies that the service use the length specified in the keyword, where xx can range from 4 to 16 digits, to identify the PIN.

PADEXIST
   Specifies that the service use the character in the 16th position of the PIN block as the value of the pad value.

PIN_check_length
Direction: Input
Type: Integer

The length of the PIN offset used for the IBM-PINO process rule only. Otherwise, this parameter is ignored. Specify an integer from 4 through 16.
Clear PIN Generate Alternate

**Note:** The PIN check length must be less than or equal to the integer specified in the `PIN_length` parameter. If the `PIN_check_length` variable is greater than the PIN length, the `PIN_check_length` variable will be set to the PIN length.

**data_array**

- **Direction:** Input
- **Type:** String

Three 16-byte elements. Table 180 describes the format when IBM-PINO is specified. Table 181 describes the format when VISA-PVV is specified.

**Table 180. Data Array Elements for the Clear PIN Generate Alternate Service (IBM-PINO)**

<table>
<thead>
<tr>
<th>Array Element</th>
<th>Description</th>
</tr>
</thead>
</table>
| decimalization_table | This element contains the decimalization table of 16 characters (0 to 9) that are used to convert hexadecimal digits (X'0' to X'F') of the enciphered validation data to the decimal digits X'0' to X'9').  
**Note:** If the **ANSI X9.8 PIN – Use stored decimalization tables only** access control point is enabled in the ICSF role, this table must match one of the active decimalization tables in the coprocessors. |
| validation_data    | This element contains one to 16 characters of account data. The data must be left justified and padded on the right with space characters. |
| Reserved-3         | This field is ignored, but you must specify it.                             |

When using the VISA-PVV keyword, identify these elements in the data array.

**Table 181. Data Array Elements for the Clear PIN Generate Alternate Service (VISA-PVV)**

<table>
<thead>
<tr>
<th>Array Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trans_sec_parm</td>
<td>For VISA-PVV only, the leftmost twelve digits. Eleven digits of the personal account number (PAN). One digit key index. The rest of the field is ignored.</td>
</tr>
<tr>
<td>Reserved-2</td>
<td>This field is ignored, but you must specify it.</td>
</tr>
<tr>
<td>Reserved-3</td>
<td>This field is ignored, but you must specify it.</td>
</tr>
</tbody>
</table>

**returned_PVV**

- **Direction:** Output
- **Type:** Character

A 16-byte area that contains the 4-byte PVV left-justified and padded with blanks.

**Restrictions**

The IBM-PINO PIN calculation method requires the optional PCICC, PCIXCC, CEX2C, or CEX3C.

On CCF systems, to use an IPINENC key, you must install the NOCV-enablement keys in the CKDS.
Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

Use of the Visa-PVV PIN-calculation method will always output four digits rather than padding the output with binary zeros to the length of the PIN.

On CCF systems, to use an IPINENC key, you must install the NOCV-enablement keys in the CKDS.

This table lists the PIN block variant constants (PBVC) to use.

Note: PBVC is supported for compatibility with prior releases of OS/390 ICSF and existing ICSF applications. If PBVC is specified in the format control parameter of the PIN profile, the Clear PIN Generate Alternate service will not be routed to a PCI Cryptographic Coprocessor for processing. This means that only control vectors and extraction methods valid for the Cryptographic Coprocessor Feature may be used if PBVC formatting is desired. It is recommended that a format control of NONE be used for maximum flexibility.

Restriction: PBVC is supported only on an IBM zSeries 900.

#### CVV Key Combine (CSNBCKC and CSNECKC)

Use this callable service to combine 2 single length CCA internal key tokens into 1 double-length CCA key token containing a CVVKEY-A key type for use with the VISA CVV Service Generate or VISA CVV Service Verify callable services. This combined double-length key satisfies current VISA requirements and eases translation between TR-31 and CCA formats for CVV keys.

The callable service name for AMODE(64) is CSNECKC.
CVV Key Combine

Format

CALL CSNBCKC(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_a_identifier_length,
    key_a_identifier,
    key_b_identifier_length,
    key_b_identifier,
    output_key_identifier_length,
    output_key_identifier
)

Parameters

return_code

Direction: Output
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code

Direction: Output
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length

Direction: Input/Output
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data

Direction: Input/Output
Type: String

The data that is passed to the installation exit.

rule_array_count

Direction: Input
Type: Integer

The number of keywords you are supplying in the rule_array parameter. The rule_array_count parameter must be 0, 1, or 2.

rule_array

Direction: Input
Type: String
The rule_array contains keywords that provide control information to the callable service. The keywords are 8 bytes in length and must be left-aligned and padded on the right with space characters. The rule_array keywords for this callable service are shown in the following table.

### Table 185. Keywords for CVV Key Combine Rule Array Control Information

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Key Wrapping Method (One Optional)</strong></td>
<td></td>
</tr>
<tr>
<td>USECONFIG</td>
<td>Specifies that the configuration setting for the default wrapping method is to be used to wrap the key. This is the default.</td>
</tr>
<tr>
<td>WRAP-ENH</td>
<td>Specifies that the new enhanced wrapping method is to be used to wrap the key.</td>
</tr>
<tr>
<td>WRAP-ECB</td>
<td>Specifies that the original wrapping method is to be used.</td>
</tr>
<tr>
<td><strong>Translation Control (One Optional)</strong></td>
<td></td>
</tr>
<tr>
<td>ENH-ONLY</td>
<td>Specify this keyword to indicate that the key once wrapped with the enhanced method cannot be wrapped with the original method. This restricts translation to the original method. If the keyword is not specified translation to the original method will be allowed. This turns on bit 56 in the control vector. This keyword is not valid if processing a zero CV data key. <strong>Note:</strong> If the default wrapping method is ECB mode, but the enhanced mode and the ENH-ONLY restriction are desired for a particular key token, combine the ENH-ONLY keyword with the WRAP-ENH keyword. If this is not done, then an error will be returned because ENH-ONLY will conflict with the default wrapping mode if the default wrapping method is ECB mode.</td>
</tr>
</tbody>
</table>

### key_a_identifier_length

**Direction:** Input  
**Type:** Integer

This parameter specifies the length of the key_a_identifier parameter, in bytes. The value must be 64.

### key_a_identifier

**Direction:** Input  
**Type:** String

This parameter contains a 64-byte internal key token or a label of a single-length zero CV DATA key, a DATA key with the MAC gen and/or verify bits on, or a CVVKEY-A key. The internal key token contains the key-A key that encrypts information in the CVV process.

### key_b_identifier_length

**Direction:** Input  
**Type:** Integer

This parameter specifies the length of the key_b_identifier parameter, in bytes. The value in this parameter must be 64.

### key_b_identifier

**Direction:** Input  
**Type:** String

This parameter contains a 64-byte internal key token or a label of a single-length zero CV DATA key, a DATA key with the MAC gen and/or verify bits on, or a CVVKEY-B key. The internal key token contains the key-B key that decrypts information in the CVV process.
CVV Key Combine

output_key_identifier_length

Direction: Input   Type: Integer

This parameter specifies the length of the output_key_identifier parameter, in bytes. The value in this parameter must be 64.

output_key_identifier

Direction: Output   Type: String

This parameter contains the output key token. It is either a double-length DATA key or a MAC key with CV bits 0-3 set to 0010 to indicate a CVVKEY-A key.

Restrictions

None.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS.

The access control points in the ICSF role that control the function of this service are:

- CVV Key Combine
- CVV Key Combine – Allow wrapping override keywords
- CVV Key Combine – Permit mixed key types

If key-A and key-B have different CV values for either the Export bit (CV bit 17) or the TR-31 Export bit (CV bit 57), then the keys cannot be combined and an error is returned (8 / 39).

Both key-A and key-B must be usable in the same role for either the CVV Generate or CVV Verify service, otherwise an error occurs.

Both key-A and key-B must be usable for the same service (CVV Generate or CVV Verify). It is not acceptable to combine a Generate and a Verify key.

If key-A or key-B is a Generate-Only key and the pair pass all criteria to be combined as a single output key, the resulting CV in the output token will indicate a double-length Generate-Only key capability.

The key types of the key_a_identifier and key_b_identifier must be the same unless the CVV Key Combine – Permit mixed key types access control point is enable. This means both key identifiers must be DATA keys or both must be MAC keys when the access control point is disabled. When enabled, DATA keys can be used with MAC keys.

This following table shows the action taken by the service for different combinations of input key types.
Table 186. Key type combinations for the CVV key combine callable service

**Encrypted PIN Generate (CSNBEPG and CSNEEPG)**

The Encrypted PIN Generate callable service formats a PIN and encrypts the PIN block. To generate the PIN, the service uses one of these PIN calculation methods:

- IBM 3624 PIN
- IBM German Bank Pool Institution PIN
- Interbank PIN

To format the PIN, the service uses one of these PIN block formats:

- IBM 3621 format
- IBM 3624 format
- ISO-0 format (same as the ANSI X9.8, VISA-1, and ECI-1 formats)
- ISO-1 format (same as the ECI-4 format)
- ISO-2 format
- ISO-3 format
- IBM 4704 encrypting PINPAD (4704-EPP) format
- VISA 2 format
- VISA 3 format
- VISA 4 format
- ECI-2 format
- ECI-3 format
Encrypted PIN Generate

An enhanced PIN security mode, on PCICC, PCIXCC, CEX2C, and CEX3C, is available for formatting an encrypted PIN block into IBM 3621 format or IBM 3624 format. To do this, you must enable the PTR Enhanced PIN Security access control point in the default role. When activated, this mode limits checking of the PIN to decimal digits. No other PIN block consistency checking will occur.

The callable service name for AMODE(64) invocation is CSNEEPG.

Format

```
CALL CSNEEPG(
   return_code,
   reason_code,
   exit_data_length,
   exit_data,
   PIN_generating_key_identifier,
   outbound_PIN_encrypting_key_identifier,
   rule_array_count,
   rule_array,
   PIN_length,
   data_array,
   PIN_profile,
   PAN_data,
   sequence_number,
   encrypted_PIN_block
)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFFFF' (2 gigabytes). The data is defined in the exit_data parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**PIN_generating_key_identifier**
Encrypted PIN Generate

Direction: Input/Output Type: String

The 64-byte internal key token or a key label of an internal key token in the CKDS. The internal key token contains the PIN-generating key. The control vector must specify the PINGEN key type and have the EPINGEN usage bit set to 1.

outbound_PIN_encrypting_key_identifier
Direction: Input Type: String

A 64-byte internal key token or a key label of an internal key token in the CKDS. The internal key token contains the key to be used to encrypt the formatted PIN and must contain a control vector that specifies the OPINENC key type and has the EPINGEN usage bit set to 1.

rule_array_count
Direction: Input Type: Integer

The number of keywords you are supplying in the rule_array parameter. The value must be 1.

rule_array
Direction: Input Type: Character string

Keywords that provide control information to the callable service. Each keyword is left-justified in an 8-byte field, and padded on the right with blanks. All keywords must be in contiguous storage. The rule array keywords are shown as follows:

<table>
<thead>
<tr>
<th>Process Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GBP-PIN</td>
<td>This keyword specifies the IBM German Bank Pool Institution PIN calculation method is to be used to generate a PIN.</td>
</tr>
<tr>
<td>IBM-PIN</td>
<td>This keyword specifies the IBM 3624 PIN calculation method is to be used to generate a PIN.</td>
</tr>
<tr>
<td>INBK-PIN</td>
<td>This keyword specifies the Interbank PIN calculation method is to be used to generate a PIN.</td>
</tr>
</tbody>
</table>

PIN_length
Direction: Input Type: Integer

A integer defining the PIN length for those PIN calculation methods with variable length PINS; otherwise, the variable should be set to zero.

data_array
Direction: Input Type: String

Three 16-byte character strings, which are equivalent to a single 48-byte string. The values in the data array depend on the keyword for the PIN calculation method. Each element is not always used, but you must always declare a
Encrypted PIN Generate

Table 190. Array Elements for the Encrypted PIN Generate Callable Service

<table>
<thead>
<tr>
<th>Array Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decimalization_table</td>
<td>Decimalization table for IBM and GBP only. Sixteen characters that are used to map the hexadecimal digits (X'0' to X'F') of the encrypted validation data to decimal digits (X'0' to X'9'). <strong>Note:</strong> If the ANSI X9.8 PIN – Use stored decimalization tables only access control point is enabled in the ICSF role, this table must match one of the active decimalization tables in the coprocessors.</td>
</tr>
<tr>
<td>Trans_sec_parm</td>
<td>For Interbank only, sixteen digits. Eleven right-most digits of the personal account number (PAN). A constant of 6. One digit key selector index. Three digits of PIN validation data.</td>
</tr>
<tr>
<td>Validation_data</td>
<td>Validation data for IBM and IBM German Bank Pool padded to 16 bytes. One to sixteen characters of hexadecimal account data left-justified and padded on the right with blanks.</td>
</tr>
</tbody>
</table>

Table 191 lists the data array elements required by the process rule (rule_array parameter). The numbers refer to the process rule’s position within the array.

Table 191. Array Elements Required by the Process Rule

<table>
<thead>
<tr>
<th>Process Rule</th>
<th>IBM-PIN</th>
<th>GBP-PIN</th>
<th>INBK-PIN</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**PIN_profile**

Direction: Input  
Type: String array

A 24-byte string containing the PIN profile including the PIN block format. See "The PIN Profile" on page 429 for additional information.

**PAN_data**

Direction: Input  
Type: String

A 12-byte string that contains 12 digits of Personal Account Number (PAN) data. The service uses this parameter if the PIN profile specifies the ISO-0 or VISA-4 keyword for the PIN block format. Otherwise, ensure that this parameter is a 4-byte variable in application storage. The information in this variable will be ignored, but the variable must be specified.

**Note:** When using the ISO-0 keyword, use the 12 rightmost digit of the PAN data, excluding the check digit. When using the VISA-4 keyword, use the 12 leftmost digits of the PAN data, excluding the check digit.
Encrypted PIN Generate

Direction: Input  Type: Integer

The 4-byte string that contains the sequence number used by certain PIN block formats. The service uses this parameter if the PIN profile specifies the 3621 or 4704-EPP keyword for the PIN block format. Otherwise, ensure that this parameter is a 4-byte variable in application data storage. The information in the variable will be ignored, but the variable must be declared. To enter a sequence number, do this:

• Enter 99999 to use a random sequence number that the service generates.
• For the 3621 PIN block format, enter a value in the range from 0 to 65535.
• For the 4704-EPP PIN block format, enter a value in the range from 0 to 255.

encrypted_PIN_block

Direction: Output  Type: String

The field where the service returns the 8-byte encrypted PIN.

Restrictions

The format control specified in the PIN profile must be NONE. If PBVC is specified as the format control, the service will fail.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

SAF will be invoked to check authorization to use the Encrypted PIN Generate service and any key labels specified as input.

This table shows the access control points in the ICSF role that control the function of this service.

<table>
<thead>
<tr>
<th>Rule array keywords</th>
<th>Access control point</th>

### Encrypted PIN Translate (CSNBPTR and CSNEPTR)

Use the encrypted PIN translate callable service to reencipher a PIN block from one PIN-encrypting key to another and, optionally, to change the PIN block format, such as the pad digit or sequence number.

The unique-key-per-transaction key derivation for single and double-length keys is available for the encrypted PIN translate service. This support is available for the `input_PIN_encrypting_key_identifier` and the `output_PIN_encrypting_key_identifier` parameters for both REFORMAT and TRANSLAT process rules. The `rule_array` keyword determines which PIN key(s) are derived key(s).

The encrypted PIN translate service can be used for unique-key-per-transaction key derivation.

An enhanced PIN security mode, on PCICC, PCIXCC, CEX2C, and CEX3C, is available for formatting an encrypted PIN block into IBM 3621 format or IBM 3624 format. To do this, you must enable the PTR Enhanced PIN Security access control point in the default role. When activated, this mode limits checking of the PIN to decimal digits. No other PIN block consistency checking will occur.

The enhanced PIN security mode also extracts PINs from encrypted PIN blocks. This mode only applies when specifying a PIN-extraction method for an IBM 3621 or an IBM 3624 PIN-block. You must enable the Enhanced PIN Security access control point in the default role. When activated, this mode limits checking of the PIN to decimal digits and a PIN length minimum of 4 is enforced. As with formatting an encrypted PIN block, no other PIN-block consistency checking will occur.

An enhanced PIN security mode on a CEX3C is available to implement restrictions required by the ANSI X9.8 PIN standard. To enforce these restrictions, you must enable the following control points in the default role:

- ANSI X9.8 PIN - Enforce PIN block restrictions
- ANSI X9.8 PIN - Allow modification of PAN
- ANSI X9.8 PIN - Allow only ANSI PIN blocks
Encrypted PIN Translate

The callable service name for AMODE(64) invocation is CSNEPTR.

Format

```call CSNBPTR(
  return_code,
  reason_code,
  exit_data_length,
  exit_data,
  input_PIN_encrypting_key_identifier,
  output_PIN_encrypting_key_identifier,
  input_PIN_profile,
  PAN_data_in,
  PIN_block_in,
  rule_array_count,
  rule_array,
  output_PIN_profile,
  PAN_data_out,
  sequence_number,
  PIN_block_out )
```

Parameters

**return_code**

Direction: Output Type: Integer

The return code specifies the general result of the callable service. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the return codes.

**reason_code**

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the reason codes.

**exit_data_length**

Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**

Direction: Input/Output Type: String

The data that is passed to the installation exit.

**input_PIN_encrypting_key_identifier**

Direction: Input/Output Type: String

The input PIN-encrypting key (IPINENC) for the `PIN_block_in` parameter specified as a 64-byte internal key token or a key label. If keyword UKPTIPIN, UKPTBOTH, DUKPT-IP or DUKPT-BH is specified in the `rule_array`, then the
Encrypted PIN Translate

$input\_PIN\_encrypting\_key\_identifier$ must specify a key token or key label of a
KEYGENKY with the UKPT usage bit enabled.

$\text{output\_PIN\_encrypting\_key\_identifier}$

Direction: Input/Output Type: String

The output PIN-encrypting key (OPINENC) for the $\text{PIN\_block\_out}$ parameter specified as a 64-byte internal key token or a key label. If keyword UKPTOPIN, UKPTBOTH, DUKPT-OP or DUKPT-BH is specified in the $\text{rule\_array}$, then the $\text{output\_PIN\_encrypting\_key\_identifier}$ must specify a key token or key label of a
KEYGENKY with the UKPT usage bit enabled.

$input\_PIN\_profile$

Direction: Input Type: Character string

The three 8-byte character elements that contain information necessary to
either create a formatted PIN block or extract a PIN from a formatted PIN block.
A particular PIN profile can be either an input PIN profile or an output PIN profile depending on whether the PIN block is being enciphered or deciphered by the callable service. See "The PIN Profile" on page 429 for additional information.

If you choose the TRANSLAT processing rule (this is not enforced on the
PCIXCC, CEX2C, or CEX3C) in the $\text{rule\_array}$ parameter, the $\text{input\_PIN\_profile}$ and the $\text{output\_PIN\_profile}$ must specify the same PIN block format. If you
choose the REFORMAT processing rule in the $\text{rule\_array}$ parameter, the input
PIN profile and output PIN profile can have different PIN block formats. If you
specify UKPTIPIN/DUKPT-IP or UKPTBOTH/DUKPT-BH in the $\text{rule\_array}$
parameter, then the $\text{input\_PIN\_profile}$ is extended to a 48-byte field and must
contain the current key serial number. See "The PIN Profile" on page 429 for
additional information.

The pad digit is needed to extract the PIN from a 3624 or 3621 PIN block in the
Encrypted PIN translate callable service with a process rule ($\text{rule\_array}$
parameter) of REFORMAT. If the process rule is TRANSLAT, the pad digit is
ignored.

$\text{PAN\_data\_in}$

Direction: Input Type: Character string

The personal account number (PAN) if the process rule ($\text{rule\_array}$ parameter)
is REFORMAT and the input PIN format is ISO-0 or VISA-4 only. Otherwise,
this parameter is ignored. Specify 12 digits of account data in character format.

For ISO-0, use the rightmost 12 digits of the PAN, excluding the check digit.

For VISA-4, use the leftmost 12 digits of the PAN, excluding the check digit.

$\text{PIN\_block\_in}$

Direction: Input Type: String

The 8-byte enciphered PIN block that contains the PIN to be translated.

$\text{rule\_array\_count}$

Direction: Input Type: Integer
Encrypted PIN Translate

The number of process rules specified in the rule_array parameter. The value may be 1, 2 or 3.

rule_array

Direction: Input Type: Character string

The process rule for the callable service.

Both the <code>input_PIN_profile</code> and the <code>output_PIN_profile</code> must be 48 bytes and contain the respective key serial number.</td>
</tr>
</tbody>
</table>

**output_PIN_profile**

Direction: Input  
Type: Character string

The three 8-byte character elements that contain information necessary to either create a formatted PIN block or extract a PIN from a formatted PIN block. A particular PIN profile can be either an input PIN profile or an output PIN profile, depending on whether the PIN block is being enciphered or deciphered by the callable service.

- If you choose the TRANSLAT processing rule in the `rule_array` parameter, the `input_PIN_profile` and the `output_PIN_profile` must specify the same PIN block format, except on a PCIXCC, CEX2C, or CEX3C.
- If you choose the REFORMAT processing rule in the `rule_array` parameter, the input PIN profile and output PIN profile can have different PIN block formats.
- If you specify UKPTOPIN or UKPTBOTH in the `rule_array` parameter, then the `output_PIN_profile` is extended to a 48-byte field and must contain the current key serial number. See "The PIN Profile" on page 429 for additional information.
- If you specify DUKPT-OP or DUKPT-BH in the `rule_array` parameter, then the `output_PIN_profile` is extended to a 48-byte field and must contain the current key serial number. See "The PIN Profile" on page 429 for additional information.

**PAN_data_out**

Direction: Input  
Type: Character string

The personal account number (PAN) if the process rule (``rule_array`` parameter) is REFORMAT and the output PIN format is ISO-0 or VISA-4 only. Otherwise, this parameter is ignored. Specify 12 digits of account data in character format.

For ISO-0, use the rightmost 12 digits of the PAN, excluding the check digit.

For VISA-4, use the leftmost 12 digits of the PAN, excluding the check digit.

**sequence_number**

Direction: Input  
Type: Integer
**Encrypted PIN Translate**

The sequence number if the process rule (*rule_array* parameter) is REFORMAT and the output PIN block format is 3621 or 4704-EPP only. Specify the integer value 99999. Otherwise, this parameter is ignored.

**PIN_block_out**

Direction: Output  
Type: String

The 8-byte output PIN block that is reenciphered.

**Restrictions**

Use of the ISO-2 PIN block format requires the optional PCICC, PCIXCC, CEX2C, or CEX3C.

Use of the UKPT keywords require the optional PCICC, PCIXCC, CEX2C, or CEX3C. Use of the DUKPT keywords require a PCIXCC, CEX2C, or CEX3C.

PAD digit restricted to non-decimal digit when Enhanced PIN Security access control point is enabled and if the output PIN profile specifies 3624 or 3621 as the PIN-block format.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

PIN block formats are more rigorously validated on the IBM @server zSeries 990 and subsequent releases than on CCF systems.

Some PIN block formats are known by several names. This table shows the additional names.

*Table 195. Additional Names for PIN Formats*

<table>
<thead>
<tr>
<th>PIN Format</th>
<th>Additional Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO-0</td>
<td>ANSI X9.8, VISA format 1, ECI format 1</td>
</tr>
<tr>
<td>ISO-1</td>
<td>ECI format 4</td>
</tr>
</tbody>
</table>

This table lists the PIN block variant constants (PBVC) to be used.

**Note:** PBVC is NOT supported on the IBM @server zSeries 990 and subsequent releases. If PBVC is specified in the format control parameter of the PIN profile, the Encrypted PIN translate service will not be routed to a PCI Cryptographic Coprocessor for processing. This means that only control vectors and extraction methods valid for the Cryptographic Coprocessor Feature may be used if PBVC formatting is desired. It is recommended that a format control of NONE be used for maximum flexibility.

---

Chapter 8. Financial Services  | 465
Encrypted PIN Verify

Encrypted PIN Verify (CSNBPVR and CSNEPVR)

Use the Encrypted PIN verify callable service to verify that one of these customer selected trial PINs is valid:

- IBM 3624 (IBM-PIN)
- IBM 3624 PIN offset (IBM-PINO)
- IBM German Bank Pool (GBP-PIN)
- IBM German Bank Pool PIN offset (GBP-PINO) - not supported on the IBM zSeries 990
- VISA PIN validation value (VISA-PVV)
- VISA PIN validation value (VISAPVV4)
- Interbank PIN (INBK-PIN)

The unique-key-par-transaction key derivation for single and double-length keys is available for the `input_PIN_encrypting_key_identifier` parameter.

An enhanced PIN security mode, on PCICC, PCIXCC, CEX2C, and CEX3C, is available for extracting PINs from encrypted PIN blocks. This mode only applies when specifying a PIN-extraction method for an IBM 3621 or an IBM 3624 PIN-block. To do this, you must enable the PTR Enhanced PIN Security access control point in the default role. When activated, this mode limits checking of the PIN to decimal digits and a PIN length minimum of 4 is enforced. No other PIN-block consistency checking will occur.

The callable service name for AMODE(64) invocation is CSNEPVR.

Format

```call csnbpvr(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    input_PIN_encrypting_key_identifier,
    PIN_verifying_key_identifier,
    input_PIN_profile,
    PAN_data,
    encrypted_PIN_block,
    rule_array_count,
    rule_array,
    PIN_check_length,
    data_array )
```

Parameters

`return_code`

Direction: Output  
Type: Integer

The `return_code` specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

`reason_code`

Direction: Output  
Type: Integer
The reason code specifies the result of the callable service that is returned to
the application program. Each return code has different reason codes that
indicate specific processing problems. Appendix A, “ICSF and TSS Return and
Reason Codes” lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be
from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the
exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

input_PIN_encrypting_key_identifier
Direction: Input/Output Type: String

The 64-byte key label or internal key token containing the PIN-encrypting key
(IPINENC) that enciphers the PIN block. If keyword UKPTIPIN or DUKPT-IP is
specified in the rule_array, then the input_PIN_encrypting_key_identifier must
specify a key token or key label of a KEYGENKY with the UKPT usage bit
enabled.

PIN_verifying_key_identifier
Direction: Input/Output Type: String

The 64-byte key label or internal key token that identifies the PIN verify
(PINVER) key.

input_PIN_profile
Direction: Input Type: Character string

The three 8-byte character elements that contain information necessary to
either create a formatted PIN block or extract a PIN from a formatted PIN block.
A particular PIN profile can be either an input PIN profile or an output PIN
profile depending on whether the PIN block is being enciphered or deciphered
by the callable service. If you specify UKPTIPIN in the rule_array parameter,
then the input_PIN_profile is extended to a 48-byte field and must contain the
current key serial number. See “The PIN Profile” on page 429 for additional
information.

If you specify DUKPT-IP in the rule_array parameter, then the input_PIN_profile
is extended to a 48-byte field and must contain the current key serial number. See “The PIN Profile” on page 429 for additional information.

The pad digit is needed to extract the PIN from a 3624 or 3621 PIN block in the
encrypted PIN verify callable service.

PAN_data
Direction: Input Type: Character string
Encrypted PIN Verify

The personal account number (PAN) is required for ISO-0 and VISA-4 only. Otherwise, this parameter is ignored. Specify 12 digits of account data in character format.

For ISO-0, use the rightmost 12 digits of the PAN, excluding the check digit.
For VISA-4, use the leftmost 12 digits of the PAN, excluding the check digit.

encrypted_PIN_block
Direction: Input    Type: String

The 8-byte enciphered PIN block that contains the PIN to be verified.

rule_array_count
Direction: Input    Type: Integer

The number of process rules specified in the rule_array parameter. The value may be 1, 2 or 3.

rule_array
Direction: Input    Type: Character string

The process rule for the PIN verify algorithm.

<tbody>
<tr>
<td><strong>PIN Block Format and PIN Extraction Method</strong></td>
<td>See &quot;PIN Block Format and PIN Extraction Method Keywords&quot; on page 429 for additional information and a list of PIN block formats and PIN extraction method keywords. <strong>Note:</strong> If a PIN extraction method is not specified, the first one listed in Table 166 on page 430 for the PIN block format will be the default.</td>
</tr>
</tbody>
</table>

**DUKPT Rule (one optional)**

- **UKPTIPIN**
  - The input_PIN_encrypting_key_identifier is derived as a single length key. The input_PIN_encrypting_key_identifier must be a KEYGENKY key with the UKPT usage bit enabled. The input_PIN_profile must be 48 bytes and contain the key serial number.

- **DUKPT-IP**
  - The input_PIN_encrypting_key_identifier is to be derived using the DUKPT algorithm. The input_PIN_encrypting_key_identifier must be a KEYGENKY key with the DUKPT usage bit enabled. The input_PIN_profile must be 48 bytes and contain the key serial number.

**PIN_check_length**

- **Direction:** Input  
  - **Type:** Integer

  The PIN check length for the IBM-PIN or IBM-PINO process rules only. Otherwise, it is ignored. Specify the rightmost digits, 4 through 16, for the PIN to be verified.

**data_array**

- **Direction:** Input  
  - **Type:** String

  Three 16-byte elements required by the corresponding rule_array parameter. The data array consists of three 16-byte fields whose specification depend on the process rule. If a process rule only requires one or two 16-byte fields, then the rest of the data array is ignored by the callable service. Table 200 describes the array elements.

Table 200. Array Elements for the Encrypted PIN Verify Callable Service

<table>
<thead>
<tr>
<th>Array Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decimalization_table</td>
<td>Decimation table for IBM and GBP only. Sixteen decimal digits of 0 through 9. <strong>Note:</strong> If the ANSI X9.8 PIN – Use stored decimation tables only access control point is enabled in the ICSF role, this table must match one of the active decimation tables in the coprocessors.</td>
</tr>

Restrictions

GBP-PINO is only supported if the Encrypted PIN Verify service is processed on the Cryptographic Coprocessor Feature. If the service is routed to a PCI Cryptographic Coprocessor, the service request will fail if the GBP-PINO calculation method is specified. GBP-PINO is not supported on the IBM @server zSeries 990, IBM @server zSeries 890, z9 EC or z9 BC.

Use of the ISO-2 PIN block format requires the optional PCICC, PCIXCC, CEX2C, or CEX3C.

Use of the UKPTIPIN keyword requires the optional PCICC, PCIXCC, CEX2C, or CEX3C.

Use of the VISAPVV4 keyword requires the optional PCICC, PCIXCC, CEX2C, or CEX3C.

Use of the DUKPT-IP keyword requires a PCIXCC, CEX2C, or CEX3C.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

PIN block formats are more rigorously validated on the IBM @server zSeries 990 than on CCF systems.
Encrypted PIN Verify

This table lists the PIN block variant constants (PBVC) to be used.

**Restriction:** PBVC is not supported on an IBM zSeries 990. If PBVC is specified in the format control parameter of the PIN profile, the Encrypted PIN Verify service will not be routed to a PCI Cryptographic Coprocessor for processing. This means that only control vectors and extraction methods valid for the Cryptographic Coprocessor Feature may be used if PBVC formatting is desired. It is recommended that a format control of NONE be used for maximum flexibility.

### Related Information

[ PIN Formats and Algorithms](#) discusses the PIN algorithms in detail.
The PIN Change/Unblock callable service is used to generate a special PIN block to change the PIN accepted by an integrated circuit card (smartcard). The special PIN block is based on the new PIN and the card-specific diversified key and, optionally, on the current PIN of the smartcard. The new PIN block is encrypted with a session key. The session key is derived in a two-step process. First, the card-specific diversified key (ICC Master Key) is derived using the TDES-ENC algorithm of the diversified key generation callable service. The session key is then generated according to the rule array algorithm:

- TDES-XOR - XOR ICC Master Key with the Application Transaction Counter (ATC)
- TDESEMV2 - use the EMV2000 algorithm with a branch factor of 2
- TDESEMV4 - use the EMV2000 algorithm with a branch factor of 4

The generating DKYGENKY cannot have replicated halves. The `encryption_issuer_master_key_identifier` is a DKYGENKY that permits generation of a SMPIN key. The `authentication_issuer_master_key_identifier` is also a DKYGENKY that permits generation of a double length MAC key.

The PIN block format is specified by the VISA ICC Card specification: two mutually exclusive rule array keywords, VISAPCU1 and VISAPCU2. They refer to whether the current PIN is used in the generation of the new PIN. For VISAPCU1, it is not used, for VISAPCU2 it is used.

An enhanced PIN security mode, on PCICC, PCIXCC, CEX2C, or CEX3C is available for extracting PINs from encrypted PIN blocks. This mode only applies when specifying a PIN-extraction method for an IBM 3621 or an IBM 3624 PIN-block. To do this, you must enable the PTR Enhanced PIN Security access control point in the default role. When activated, this mode limits checking of the PIN to decimal digits and a PIN length minimum of 4 is enforced. No other PIN-block consistency checking will occur.

The callable service name for AMODE(64) invocation is CSNEPCU.
PIN Change/Unblock

```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicates specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from 'X'00000000' to 'X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  
Type: String
PIN Change/Unblock

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  
Type: Integer

The number of keywords you are supplying in the *rule_array* parameter. The valid values are 1 and 2.

**rule_array**

Direction: Input  
Type: String

Keywords that provides control information to the callable service. The keywords are left-justified in an 8-byte field and padded on the right with blanks. The keywords must be in contiguous storage. Specify one or two of these options:

| Table 205. Rule Array Keywords for PIN Change/Unblock |
| --- | --- |
| **Keyword** | **Meaning** |
| **Algorithm (optional)** |  |
| TDES-XOR | TDES encipher clear data to generate the intermediate (card-unique) key, followed by XOR of the final 2 bytes of each key with the ATC counter. This is the default. |
| TDESEMV2 | Same processing as in the diversified key generate service. |
| TDESEMV4 | Same processing as in the diversified key generate service. |
| **PIN processing method (required)** |  |
| VISAPCU1 | Form the new PIN from the new reference PIN and the smart-card-unique, intermediate key. |
| VISAPCU2 | Form the new PIN from the new reference PIN and the smart-card-unique, the intermediate (card-unique) key and the current reference PIN. |

**authentication_issuer_master_key_length**

Direction: Input  
Type: Integer

The length of the *authentication_issuer_master_key_identifier* parameter. Currently, the value must be 64.

**authentication_issuer_master_key_identifier**

Direction: Input/Output  
Type: String

The label name or internal token of a DKYGENKY key type that is to be used to generate the card-unique diversified key. The control vector of this key must be a DKYL0 key that permits the generation of a double-length MAC key (DMAC). This DKYGENKY may not have replicated key halves.

**encryption_issuer_master_key_length**

Direction: Input  
Type: Integer

The length of the *encryption_issuer_master_key_identifier* parameter. Currently, the value must be 64.
PIN Change/Unblock

**encryption_issuer_master_key_identifier**

Direction: Input/Output  
Type: String

The label name or internal token of a DKYGENKY key type that is to be used to generate the card-unique diversified key and the secure messaging session key for the protection of the output PIN block. The control vector of this key must be a DKYL0 key that permits the generation of a DMPIN key type. This DKYGENKY may not have replicated key halves.

**key_generation_data_length**

Direction: Input  
Type: Integer

The length of the *key_generation_data* parameter. This value must be 10, 18, 26 or 34 bytes.

**key_generation_data**

Direction: Input  
Type: String

The data provided to generate the card-unique session key. For TDES-XOR, this consists of 8 or 16 bytes of data to be processed by TDES to generate the card-unique diversified key followed by a 16 bit ATC counter to offset the card-unique diversified key to form the session key. For TDESEMV2 and TDESEMV4, this may be 10, 18, 26 or 34 bytes. See "Diversified Key Generate (CSNBDKG and CSNEDKG)" on page 117 for more information.

**new_reference_PIN_key_length**

Direction: Input  
Type: Integer

The length of the *new_reference_PIN_key_identifier* parameter. Currently, the value must be 64.

**new_reference_PIN_key_identifier**

Direction: Input/Output  
Type: String

The label name or internal token of a PIN encrypting key that is to be used to decrypt the *new_reference_PIN_block*. This must be an IPINENC or OPINENC key. If the label name is supplied, the name must be unique in the CKDS.

**new_reference_PIN_block**

Direction: Input  
Type: String

This is an 8-byte field that contains the enciphered PIN block of the new PIN.

**new_reference_PIN_profile**

Direction: Input  
Type: String

This is a 24-byte field that contains three 8-byte elements with a PIN block format keyword, a format control keyword (NONE) and a pad digit as required by certain formats.

**new_reference_PIN_PAN_data**
PIN Change/Unblock

Direction: Input               Type: String

This is a 12-byte field containing PAN in character format. This data may be needed to recover the new reference PIN if the format is ISO-0 or VISA-4. If neither is used, this parameter may be blanks.

current_reference_PIN_key_length

Direction: Input               Type: Integer

The length of the current_reference_PIN_key_identifier parameter. For the current implementation, the value must be 64. If the rule_array contains VISAPCU1, this value must be 0.

current_reference_PIN_key_identifier

Direction: Input/Output        Type: String

The label name or internal token of a PIN encrypting key that is to be used to decrypt the current_reference_PIN_block. This must be an IPINENC or OPINENC key. If the labelname is supplied, the name must be unique on the CKDS. If the rule_array contains VISAPCU1, this value is ignored.

current_reference_PIN_block

Direction: Input               Type: String

This is an 8-byte field that contains the enciphered PIN block of the new PIN. If the rule_array contains VISAPCU1, this value is ignored.

current_reference_PIN_profile

Direction: Input               Type: String

This is a 24-byte field that contains three 8-byte elements with a PIN block format keyword, a format control keyword (NONE) and a pad digit as required by certain formats. If the rule_array contains VISAPCU1, this value is ignored.

current_reference_PIN_PAN_data

Direction: Input               Type: String

This is a 12-byte field containing PAN in character format. This data may be needed to recover the new reference PIN if the format is ISO-0 or VISA-4. If neither is used, this parameter may be blanks. If the rule_array contains VISAPCU1, this value is ignored.

output_PIN_data_length

Direction: Input               Type: Integer

Currently this field is reserved. The value of this parameter should be 0.

output_PIN_data

Direction: Input               Type: String

Currently this field is reserved.
PIN Change/Unblock

output_PIN_profile

Direction: Input  Type: String

This is a 24-byte field that contains three 8-byte elements with a PIN block format keyword (VISAPCU1 or VISAPCU2), a format control keyword, NONE, (left aligned and padded on the right with space characters) and 8 byte spaces.

output_PIN_message_length

Direction: Input/Output  Type: Integer

The length of the output_PIN_message field. Currently the value must be at least 16.

output_PIN_message

Direction: Output  Type: String

The reformatted PIN block with the new reference PIN enciphered under the SMPIN session key.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

There are additional access points for this service.

RACF will be invoked to check authorization to use the PIN change/unblock service and any labelname specified.

The following table shows the access control points in the ICSF role that control the function of this service.

Table 206. Required access control points for PIN Change/Unblock

<table>
<thead>
<tr>
<th>PIN-block encrypting key-type</th>
<th>Access control point</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPINENC</td>
<td>PIN Change/Unblock - change EMV PIN with OPINENC</td>
</tr>
<tr>
<td>IPINENC</td>
<td>PIN Change/Unblock - change EMV PIN with IPINENC</td>
</tr>
</tbody>
</table>

When the authentication_key_identifier or encryption_key_identifier is specified with control vector bits (19 – 22) of B’1111’, the Diversified Key Generate - DKYGENKY – DALL access control point must also be enabled.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Table 207. PIN Change/Unblock hardware

</tr>
</tbody>
</table>
Secure Messaging for Keys (CSNBSKY and CSNESKY)

The Secure Messaging for Keys callable service will encrypt a text block including a clear key value decrypted from an internal or external DES token. The text block is normally a "Value" field of a secure message TLV (Tag/Length/Value) element of a secure message. TLV is defined in ISO/IEC 7816-4.

The callable service name for AMODE(64) invocation is CSNESKY.

Format

```call cnbsky(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    input_key_identifier,
    key_encrypting_key_identifier,
    secmsg_key_identifier,
    text_length,
    clear_text,
    initialization_vector,
    key_offset,
    key_offset_field_length,
    enciphered_text,
    output_chaining_vector )
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.
Secure Messaging for Keys

**reason_code**

**Direction:** Output  
**Type:** Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicates specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

**exit_data_length**

**Direction:** Input/Output  
**Type:** Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

**Direction:** Input/Output  
**Type:** String

The data that is passed to the installation exit.

**rule_array_count**

**Direction:** Input  
**Type:** Integer

The number of keywords you are supplying in the rule_array parameter. The valid values are 0 and 1.

**rule_array**

**Direction:** Input  
**Type:** Character String

Keywords that provide control information to the callable service. The processing method is the encryption mode used to encrypt the message.

Table 208. Rule Array Keywords for Secure Messaging for Keys

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Enciphering mode (optional)</strong></td>
<td></td>
</tr>
<tr>
<td>TDES-CBC</td>
<td>Use CBC mode to encipher the message (default).</td>
</tr>
<tr>
<td>TDES-ECB</td>
<td>Use EBC mode to encipher the message.</td>
</tr>
</tbody>
</table>

**input_key_identifier**

**Direction:** Input/Output  
**Type:** String

The internal token, external token, or key label of an internal token of a double length DES key. The key is recovered in the clear and placed in the text to be encrypted. The control vector of the DES key must not prohibit export.

**key_encrypting_key_identifier**

**Direction:** Input/Output  
**Type:** String
Secure Messaging for Keys

If the `input_key_identifier` is an external token, then this parameter is the internal token or the key label of the internal token of IMPORTER or EXPORTER. If it is not, it is a null token. If a key label is specified, the key label must be unique.

`secmsg_key_identifier`

Direction: Input/Output  Type: String

The internal token or key label of a secure message key for encrypting keys. This key is used to encrypt the updated `clear_text` containing the recovered DES key.

`text_length`

Direction: Input  Type: Integer

The length of the `clear_text` parameter that follows. Length must be a multiple of eight. Maximum length is 4K.

`clear_text`

Direction: Input  Type: String

Clear text that contains the recovered DES key at the offset specified and is then encrypted. Any padding or formatting of the message must be done by the caller on input.

`initialization_vector`

Direction: Input  Type: String

The 8-byte supplied string for the TDES-CBC mode of encryption. The `initialization_vector` is XORed with the first 8 bytes of `clear_text` prior to encryption. This field is ignored for TDES-ECB mode.

`key_offset`

Direction: Input  Type: Integer

The offset within the `clear_text` parameter at `key_offset` where the recovered clear `input_key_identifier` value is to be placed. The first byte of the `clear_text` field is offset 0.

`key_offset_field_length`

Direction: Input  Type: Integer

The length of the field within `clear_text` parameter at `key_offset` where the recovered clear `input_key_identifier` value is to be placed. Length must be a multiple of eight and is equal to the key length of the recovered key. The key must fit entirely within the `clear_text`.

`enciphered_text`

Direction: Output  Type: String

The field where the enciphered text is returned. The length of this field must be at least as long as the `clear_text` field.
Secure Messaging for Keys

**output_chaining_vector**

Direction: Output  
Type: String

This field contains the last 8 bytes of enciphered text and is used as the initialization_vector for the next encryption call if data needs to be chained for TDES-CBC mode. No data is returned for TDES-ECB.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

SAF will be invoked to check authorization to use the secure messaging for keys service and any key labels specified as input.

Keys only appear in the clear within the secure boundary of the cryptographic coprocessor and never in host storage.

The **Secure Messaging for Keys** access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

<table>

**Secure Messaging for PINs (CSNBSNP and CSNESNP)**

The Secure Messaging for PINs callable service will encrypt a text block including a clear PIN block recovered from an encrypted PIN block. The input PIN block will be reformatted if the block format in the input_PIN_profile is different than the block format in the output_PIN_profile. The clear PIN block will only be self encrypted if the SELFENC keyword is specified in the rule_array. The text block is normally a
Secure Messaging for PINs

'Value' field of a secure message TLV (Tag/Length/Value) element of a secure message. TLV is defined in ISO/IEC 7816-4.

An enhanced PIN security mode on a CEX3C is available to implement restrictions required by the ANSI X9.8 PIN standard. To enforce these restrictions, you must enable the following control points in the default role.

- ANSI X9.8 PIN - Enforce PIN block restrictions
- ANSI X9.8 PIN - Allow modification of PAN
- ANSI X9.8 PIN - Allow only ANSI PIN blocks

The callable service name for AMODE(64) invocation is CSNESPN.

Format

```call CSNESPN(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    input_PIN_block,
    PIN_encrypting_key_identifier,
    input_PIN_profile,
    input_PAN_data,
    secmsg_key_identifier,
    output_PIN_profile,
    output_PAN_data,
    text_length,
    clear_text,
    initialization_vector,
    PIN_offset,
    PIN_offset_field_length,
    enciphered_text,
    output_chaining_vector )
```

Parameters

return_code

Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicates specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length

Direction: Input/Output  Type: Integer
Secure Messaging for PINs

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  
Type: Integer

The number of keywords you are supplying in the rule_array parameter. The valid values are 0, 1, or 2.

**rule_array**

Direction: Input  
Type: Character String

Keywords that provide control information to the callable service. The processing method is the algorithm used to create the generated key. The keywords are left justified and padded on the right with blanks.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Enciphering mode (optional)</em></td>
<td></td>

<td>Use CBC mode to encipher the message (default).</td>
</tr>
<tr>
<td>TDES-ECB</td>
<td>Use EBC mode to encipher the message.</td>
</tr>
<tr>
<td><em>PIN encryption (optional)</em></td>
<td></td>
</tr>
<tr>
<td>CLEARPIN</td>
<td>Recovered clear input PIN block (may be reformatted) is placed in the clear in the message for encryption with the secure message key (default).</td>
</tr>
<tr>
<td>SELFENC</td>
<td>Recovered clear input PIN block (may be reformatted) is self-encrypted and then placed in the message for encryption with the secure message key.</td>
</tr>
</tbody>
</table>

**input_PIN_block**

Direction: Input  
Type: String

The 8-byte input PIN block that is to be recovered in the clear and perhaps reformatted, and then placed in the clear_text to be encrypted.

**PIN_encrypting_key_identifier**

Direction: Input/Output  
Type: String

The internal token or key label of the internal token of the PIN encrypting key used in encrypting the input_PIN_block. The key must be an IPINENC key.

**input_PIN_profile**

Direction: Input  
Type: Character String
Secure Messaging for PINs

The three 8-byte character elements that contain information necessary to extract the PIN from a formatted PIN block. The valid input PIN formats are ISO-0, ISO-1, ISO-2 and ISO-3. See "The PIN Profile" on page 429 for additional information.

**input_PAN_data**

Direction: Input Type: Character String

The 12 digit personal account number (PAN) if the input PIN format is ISO-0 only. Otherwise, the parameter is ignored.

**secmsg_key_identifier**

Direction: Input/Output Type: String

The internal token or key label of an internal token of a secure message key for encrypting PINs. This key is used to encrypt the updated clear_text.

**output_PIN_profile**

Direction: Input Type: String

The three 8-byte character elements that contain information necessary to create a formatted PIN block. If reformatting is not required, the input_PIN_profile and the output_PIN_profile must specify the same PIN block format. Output PIN block formats supported are ISO-0, ISO-1, ISO-2 and ISO-3.

**output_PAN_data**

Direction: Input Type: String

The 12 digit personal account number (PAN) if the output PIN format is ISO-0 only. Otherwise, this parameter is ignored.

**text_length**

Direction: Input Type: Integer

The length of the clear_text parameter that follows. Length must be a multiple of eight. Maximum length is 4K.

**clear_text**

Direction: Input Type: String

Clear text that contains the recovered and/or reformatted/encrypted PIN at offset specified and then encrypted. Any padding or formatting of the message must be done by the caller on input.

**initialization_vector**

Direction: Input Type: String

The 8-byte supplied string for the TDES-CBC mode of encryption. The initialization_vector is XORed with the first 8 bytes of clear_text prior to encryption. This field is ignored for TDES-ECB mode.
Secure Messaging for PINs

Direction: Input Type: Integer

The offset within the clear_text parameter where the reformatted PIN block is to be placed. The first byte of the clear_text field is offset 0.

**PIN_offset_field_length**

Direction: Input Type: Integer

The length of the field within clear_text parameter at PIN_offset where the recovered clear input_PIN_block value is to be placed. The PIN block may be self-encrypted if requested by the rule array. Length must be eight. The PIN block must fit entirely within the clear_text.

**enciphered_text**

Direction: Output Type: String

The field where the enciphered text is returned. The length of this field must be at least as long as the clear_text field.

**output_chaining_vector**

Direction: Output Type: String

This field contains the last 8 bytes of enciphered text and is used as the initialization_vector for the next encryption call if data needs to be chained for TDES-CBC mode. No data is returned for TDES-ECB.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

SAF will be invoked to check authorization to use the secure messaging for PINs service and any key labels specified as input.

Keys only appear in the clear within the secure boundary of the cryptographic coprocessors and never in host storage.

The **Secure Messaging for PINs** access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

### SET Block Compose (CSNDSBC and CSNFSBC)

The SET Block Compose callable service performs DES-encryption of data, OAEP-formatting through a series of SHA-1 hashing operations, and the RSA-encryption of the Optimal Asymmetric Encryption Padding (OAEP) block.

The callable service name for AMODE(64) invocation is CSNFSBC.

### Format

```plaintext
CALL CSNDSBC(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    block_contents_identifier,
    XData_string_length,
    XData_string,
    data_to_encrypt_length,
    data_to_encrypt,
    data_to_hash_length,
    data_to_hash,
    initialization_vector,
    RSA_public_key_identifier_length,
    RSA_public_key_identifier,
    DES_key_block_length,
    DES_key_block,
    RSA_OAEP_block_length,
    RSA_OAEP_block,
    chaining_vector,
    DES_encrypted_data_block )
```

### Parameters

**return_code**

- **Direction:** Output
- **Type:** Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.
SET Block Compose

**reason_code**

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicates specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the reason codes.

**exit_data_length**

Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input Type: Integer

The number of keywords you are supplying in the rule_array parameter. The value must be 1 or 2.

**rule_array**

Direction: Input Type: Character String

Keywords that provides control information to the callable service. The keyword must be in 8 bytes of contiguous storage, left-justified and padded on the right with blanks.

| Table 212. Keywords for SET Block Compose Control Information |
|---------------------------------|-----------------|
| **Keyword** | **Meaning** |
| **Block Type (required)** | |
| SET1.00 | The structure of the RSA-OAEP encrypted block is defined by SET protocol. |
| **Formatting Information (optional)** | |
| DES-ONLY | DES encryption only is to be performed; no RSA-OAEP formatting will be performed. (See Usage Notes.) |

**block_contents_identifier**

Direction: Input Type: String

A one-byte string, containing a binary value that will be copied into the Block Contents (BC) field of the SET DB data block (indicates what data is carried in the Actual Data Block, ADB, and the format of any extra data (XData_string)). This parameter is ignored if DES-ONLY is specified in the rule-array.
SET Block Compose

XData_string_length
Direction: Input Type: Integer

The length in bytes of the data contained within XData_string. The maximum length is 94 bytes. This parameter is ignored if DES-ONLY is specified in the rule-array.

XData_string
Direction: Input Type: String

Extra-encrypted data contained within the OAEP-processed and RSA-encrypted block. The format is indicated by block_contents_identifier. For a XData_string_length value of zero, XData_string must still be specified, but will be ignored by ICSF. The string is treated as a string of hexadecimal digits. This parameter is ignored if DES-ONLY is specified in the rule-array.

data_to_encrypt_length
Direction: Input/Output Type: Integer

The length in bytes of data that is to be DES-encrypted. The length has a maximum value of 32 MB minus 8 bytes to allow for up to 8 bytes of padding. The data is identified in the data_to_encrypt parameter. On output, this value is updated with the length of the encrypted data in the DES_encrypted_data_block.

data_to_encrypt
Direction: Input Type: String

The data that is to be DES-encrypted (with a 64-bit DES key generated by this service). The data will be padded by this service according to the PKCS #5 padding rules.

data_to_hash_length
Direction: Input Type: Integer

The length in bytes of the data to be hashed. The hash is an optional part of the OAEP block. If the data_to_hash_length is 0, no hash will be included in the OAEP block. This parameter is ignored if DES-ONLY is specified in the rule_array parameter.

data_to_hash
Direction: Input Type: String

The data that is to be hashed and included in the OAEP block. No hash is computed or inserted in the OAEP block if the data_to_hash_length is 0. This parameter is ignored if DES-ONLY is specified in the rule_array parameter.

initialization_vector
Direction: Input Type: String
SET Block Compose

An 8-byte string containing the initialization vector to be used for the cipher block chaining for the DES encryption of the data in the data_to_encrypt parameter. The same initialization vector must be used to perform the DES decryption of the data.

RSA_public_key_identifier_length

Direction: Input
Type: Integer

The length of the RSA_public_key_identifier field. The maximum size is 2500 bytes. This parameter is ignored if DES-ONLY is specified in the rule-array.

RSA_public_key_identifier

Direction: Input
Type: String

A string containing either the key label of the RSA public key or the RSA public key token to be used to perform the RSA encryption of the OAEP block. The modulus bit length of the key must be 1024 bytes. This parameter is ignored if DES-ONLY is specified in the rule-array.

DES_key_block_length

Direction: Input/Output
Type: Integer

The length of the DES_key_block. The current length of this field is defined to be exactly 64 bytes.

DES_key_block

Direction: Input/Output
Type: String

The DES key information returned from a previous SET Block Compose service. The contents of the DES_key_block is the 64-byte DES internal key token (containing the DES key enciphered under the host master key). Your application program must not change the data in this string.

RSA_OAEP_block_length

Direction: Input/Output
Type: Integer

The length of a block of storage to hold the RSA-OAEP_block. The length must be at least 128 bytes on input. The length value will be updated on exit with the actual length of the RSA-OAEP_block, which is exactly 128 bytes. This parameter is ignored if DES-ONLY is specified in the rule-array.

RSA_OAEP_block

Direction: Output
Type: String

The OAEP-formatted data block, encrypted under the RSA public key passed as RSA_public_key_identifier. When the OAEP-formatted data block is returned, it is left justified within the RSA-OAEP_block field if the input field length (RSA-OAEP_block_length) was greater than 128 bytes. This parameter is ignored if DES-ONLY is specified in the rule-array.

chaining_vector

Direction: Input/Output
Type: String
SET Block Compose

An 18-byte field that ICSF uses as a system work area. Your application program must not change the data in this string. This field is ignored by this service, but must be specified.

**DES_encrypted_data_block**

Direction: Output  
Type: String

The DES-encrypted data block (data passed in as `data_to_encrypt`). The length of the encrypted data is returned in `data_to_encrypt_length`. The `DES_encrypted_data_block` may be 8 bytes longer than the length of the `data_to_encrypt` because of padding added by this service.

**Restrictions**

Not all CCA implementations support a key label as input in the `RSA_public_key_identifier` parameter. Some implementations may only support a key token.

The `data_to_encrypt` and the `DES_encrypted_data_block` cannot overlap.

The maximum data block that can be supplied for DES encryption is the limit as expressed by the Encipher callable service.

**CCF Systems only**: NOCV keys must be installed in the CKDS to use SET block compose service on a CDMF-only system.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The first time the SET Block Compose service is invoked to form an RSA-OAEP block and DES-encrypt data for communication between a specific source and destination (for example, between the merchant and payment gateway), do not specify the DES-ONLY keyword. A DES key will be generated by the service and returned in the key token contained in the `DES_key_block`. On subsequent calls to the Compose SET Block service for communication between the same source and destination, the DES key can be re-used. The caller of the service must supply the `DES_key_block`, the `DES_key_block_length`, the `data_to_encrypt`, the `data_to_encrypt_length`, and the rule-array keywords SET1.00 and DES-ONLY. You do not need to supply the block contents identifier, XDATA string and length, RSA-OAEP block and length, and RSA public key information, although you must still specify the parameters. For this invocation, the RSA-OAEP formatting is bypassed and only DES encryption is performed, using the supplied DES key.

The **SET Block Compose** access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

SET Block Decompose (CSNDSBD and CSNFSBD)

Decomposes the RSA-OAEP block and the DES-encrypted data block of the SET protocol to provide unencrypted data back to the caller.

The callable service name for AMODE(64) invocation is CSNFSBD.

Format

```call csndsbd{
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    RSA_OAEP_block_length,
    RSA_OAEP_block,

    XData_string_length,
    XData_string,
    chaining_vector,
    data_block,
    hash_block_length,
    hash_block
}```
Parameters

**return_code**

Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes," on page 725 lists the return codes.

**reason_code**

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicates specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes," on page 725 lists the reason codes.

**exit_data_length**

Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  Type: Integer

The number of keywords you are supplying in the rule_array parameter. The value must be 1 or 2.

**rule_array**

Direction: Input  Type: String

One keyword that provides control information to the callable service. The keyword indicates the block type. The keyword must be in 8 bytes of contiguous storage, left-justified and padded on the right with blanks.

**Table 214. Keywords for SET Block Compose Control Information**

</tr>
</thead>
<tbody>
<tr>
<td>PINBLOCK</td>
<td>Specifies that the OAEP block will contain PIN information in the XDATA field, including an ISO-0 format PIN block. The DES_key_block must be 128 bytes in length and contain a IPINENC or OPINENC key. The PIN block will be encrypted under the PIN encrypting key. The PIN information and the encrypted PIN block are returned in the XDATA_string parameter.</td>
</tr>
</tbody>
</table>

**RSA_OAEP_block_length**

Direction: Input  Type: Integer

The length of RSA-OAEP_block must be 128 bytes. This parameter is ignored if DES-ONLY is specified in the rule-array.

**RSA_OAEP_block**

Direction: Input  Type: String

The RSA-encrypted OAEP-formatted data block. This parameter is ignored if DES-ONLY is specified in the rule-array.

**DES_encrypted_data_block_length**

Direction: Input/Output  Type: Integer

The length in bytes of the DES-encrypted data block. The input length must be a multiple of 8 bytes. Updated on return to the length of the decrypted data returned in data_block. The maximum value of DES_encrypted_data_block_length is 32MB bytes.

**DES_encrypted_data_block**

Direction: Input  Type: String

The DES-encrypted data block. The data will be decrypted and passed back as data_block.

**initialization_vector**

Direction: Input  Type: String

An 8-byte string containing the initialization vector to be used for the cipher block chaining for the DES decryption of the data in the DES_encrypted_data_block parameter. You must use the same initialization vector that was used to perform the DES encryption of the data.

**RSA_private_key_identifier_length**

Direction: Input  Type: Integer

The length of the RSA_private_key_identifier field. The maximum size is 2500 bytes. This parameter is ignored if DES-ONLY is specified in the rule-array.

**RSA_private_key_identifier**
SET Block Decompose

Direction: Input Type: String

A key label of the RSA private key or an internal token of the RSA private key to be used to decipher the RSA-OAEP block passed in RSA-OAEP_block. The modulus bit length of the key must be 1024. This parameter is ignored if DES-ONLY is specified in the rule-array.

DES_key_block_length
Direction: Input/Output Type: Integer

The length of the DES_key_block. The current length of this field may be 64 or 128 bytes. If rule array keyword PINBLOCK is specified, the length must be 128 bytes.

DES_key_block
Direction: Input/Output Type: String

The DES_key_block contains either one or two DES internal key tokens. If only one token is specified on input, it contains either a null DES token (or binary zeros) or (if DES-ONLY is specified) the DES key information returned from a previous SET Block Decompose service invocation. This is the 64-byte DES internal key token formed with the DES key which was retrieved from the RSA-OAEP block and enciphered under the host master key. Your application must not change this DES key information. If two tokens are specified in the DES_key_block, the first 64 bytes contain the DES token described previously. The second 64 bytes, used when PINBLOCK is specified in the rule array, contains the DES internal token or the CKDS key label of the IPINENC or OPINENC key used to encrypt the PIN block returned to the caller in the XDATA_string parameter. If a key label is specified, it must be left-justified and padded on the right with blanks.

block_contents_identifier
Direction: Output Type: String

A one-byte string, containing the binary value from the block contents (BC) field of the SET data block (DB). It indicates what data is carried in the actual data block (ADB) and the format of any extra data (XData_string). This parameter is ignored if DES-ONLY is specified in the rule-array.

XData_string_length
Direction: Input/Output Type: Integer

The length of a string where the data contained within XData_string will be returned. The string must be at least 94 bytes in length. The value will be updated upon exit with the actual length of the returned XData_string. This parameter is ignored if DES-ONLY is specified in the rule-array.

XData_string
Direction: Output Type: String

Extra-encrypted data contained within the OAEP-processed and RSA-encrypted block. The format is indicated by block_contents_identifier. The string is treated
SET Block Decompose

by ICSF as a string of hexadecimal digits. The service will always return the
data from the beginning of the XDataString to the end of the SET DB block, a
maximum of 94 bytes of data. The caller must examine the value returned in
*block_contents_identifier* to determine the actual length of the XDataString. This
parameter is ignored if DES-ONLY is specified in the rule-array.

**chaining_vector**

Direction: Input/Output  
Type: String

An 18-byte field that ICSF uses as a system work area. Your application
program must not change the data in this string. This field is ignored by this
service, but must be specified.

**data_block**

Direction: Output  
Type: String

The data that was decrypted (passed in as *DES_encrypted_data_block*). Any
padding characters are removed.

**hash_block_length**

Direction: Input/Output  
Type: Integer

The length in bytes of the SHA-1 hash returned in *hash_block*. On input, this
parameter must be set to the length of the *hash_block* field. The length must be
at least 20 bytes. On output, this field is updated to reflect the length of the
SHA-1 hash returned in the *hash_block* field (exactly 20 bytes). This parameter
is ignored if DES-ONLY is specified in the *rule_array* parameter.

**hash_block**

Direction: Output  
Type: String

The SHA-1 hash extracted from the RSA-OAEP block. This parameter is
ignored if DES-ONLY is specified in the *rule_array* parameter.

**Restrictions**

Not all CCA implementations support a key label as input in the
*RSA_private_key_identifier* parameter. Some implementations may only support a
key token.

The RSA private key used by this service must have been generated as a
signature-only key. This restriction does not apply if you are running on the IBM
@server zSeries 990 and subsequent releases.

The *data_block* and the *DES_encrypted_data_block* cannot overlap.

**CCF Systems only**: The ANSI system keys must be installed in the CKDS to use
the SET block decompose service on a CDMF-only system.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service,
the key label, or internal secure key tokens that are stored in the CKDS or PKDS.
When the SET Block Decompose service is invoked without the DES-ONLY keyword, the DES key is retrieved from the RSA-OAEP block and returned in the key token contained in the DES_key_block. On subsequent calls to the SET Block Decompose service, a caller can re-use the DES key. The caller of the service must supply the DES_key_block, the DES_key_block_length, the DES_encrypted_data_block, the DES_encrypted_data_block_length, the initialization and chaining vectors, and the rule_array keywords SET1.00 and DES-ONLY. The RSA private key information, RSA-OAEP block and length, XData string and length, and hash block and length need not be supplied (although the parameters must still be specified). For this invocation, the decryption of the RSA-OAEP block is bypassed; only DES decryption is performed, using the supplied DES key.

When the SET Block Decompose service is invoked with the PINBLOCK keyword, DES-ONLY may not also be specified. If both of these rule array keywords are specified, the service will fail. If PINBLOCK is specified and the DES_key_block_length field is not 128, the service will fail.

The SET Block Decompose access control point controls the function of this service. If a PIN-block encrypting key is supplied in the DES_key_block, the access control point matching the key type of the key must be enabled in the ICSF role.

### Transaction Validation (CSNBTRV and CSNETRV)

The transaction validation callable service supports the generation and validation of American Express card security codes (CSC). This service generates and verifies transaction values based on information from the transaction and a cryptographic key. You select the validation method, and either the generate or verify mode, through rule-array keywords.

For the American Express process, the control vector supplied with the cryptographic key must indicate a MAC or MACVER class key. The key may be single or double length. DATAM and DATAMV keys are not supported. The MAC generate control vector bit must be on (bit 20) if you request CSC generation and MAC verify bit (bit 21) must be on if you request verification.

The callable service name for AMODE(64) invocation is CSNETRV.

### Format

```plaintext
CALL CSNBTRV(
   return_code,
   reason_code,
   exit_data_length,
   exit_data,
   rule_array_count,
   rule_array,
   transaction_key_identifier_length,
   transaction_key_identifier,
   transaction_info_length,
   transaction_info,
   validation_values_length,
   validation_values )
```
Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicates specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input Type: Integer

The number of keywords you are supplying in the rule_array parameter. The valid values are 1 or 2.

rule_array
Direction: Input Type: Character String

Keywords that provides control information to the callable service. The keywords are left-justified in an 8-byte field and padded on the right with blanks. The keywords must be in contiguous storage. Specify one or two of the values in Table 217.

### transaction_key_identifier_length

**Direction:** Input  
**Type:** Integer

The length of the `transaction_key_identifier` parameter.

### transaction_key_identifier

**Direction:** Input  
**Type:** String

The labelname or internal token of a MAC or MACVER class key. Key may be single or double length.

### transaction_info_length

**Direction:** Input  
**Type:** Integer

The length of the `transaction_info` parameter. For the American Express CSC codes, the length must be 19.

### transaction_info

**Direction:** Input  
**Type:** String

For American Express, this is a 19-byte field containing the concatenation of the 4-byte expiration data (in the format YYMM) and the 15-byte American Express account number. Provide the information in character format.

### validation_values_length

**Direction:** Input/Output  
**Type:** Integer

The length of the `validation_values` parameter. Maximum value for this field is 64.

### validation_values

**Direction:** Input  
**Type:** String

This variable contains American Express CSC values. The data is output for **GENERATE** and input for **VERIFY**.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

There are additional access control points for this service.

RACF will be invoked to check authorization for using this service and the label name specified.

The following table shows the access control points in the ICSF role that control the function of this service.

Table 219. Required access control points for Transaction Validation

**VISA CVV Service Generate (CSNBCSG and CSNECSG)**

Use the VISA CVV Service Generate callable service to generate a:
- VISA Card Verification Value (CVV)
- MasterCard Card Verification Code (CVC)
- Diner's Club Card Verification Value (CVV)
as defined for track 2.

This service generates a CVV that is based upon the information that the `PAN_data`, `expiration_date`, and `service_code` parameters provide.

The service uses the Key-A and the Key-B keys to cryptographically process this information. Key-A and Key-B can be single-length DATA or MAC keys or a combined Key-A, Key-B double length DATA or MAC key. If the requested CVV is shorter than 5 characters, the CVV is padded on the right by space characters. The CVV is returned in the 5-byte variable that the `CVV_value` parameter identifies. When you verify a CVV, compare the result to the value that the `CVV_value` supplies.

The callable service name for AMODE(64) invocation is CSNECSG.

**Format**

```call csncbsg(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    PAN_data,
    expiration_date,
    service_code,
    CVV_key_A_Identifier,
    CVV_key_B_Identifier,
    CVV_value)
```

**Parameters**

- `return_code`
  - Direction: Output
  - Type: Integer
VISA CVV Service Generate

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  Type: Integer

The number of keywords you are supplying in the rule_array parameter. The parameter rule_array_count must be 0, 1, or 2.

**rule_array**

Direction: Input  Type: String

Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields, and padded on the right with blanks. All keywords must be in contiguous storage.

<table>

</tbody>
</table>

**PAN_data**

Direction: Input  
Type: String

The **PAN_data** parameter specifies an address that points to the place in application data storage that contains personal account number (PAN) information in character form. The PAN is the account number as defined for the track-2 magnetic-stripe standards.

- If the **PAN-13** keyword is specified in the rule array, 13 characters are processed.
- If the **PAN-14** keyword is specified in the rule array, 14 characters are processed.
- If the **PAN-15** keyword is specified in the rule array, 15 characters are processed.
- If the **PAN-16** keyword is specified in the rule array, 16 characters are processed.
- If the **PAN-17** keyword is specified in the rule array, 17 characters are processed.
- If the **PAN-18** keyword is specified in the rule array, 18 characters are processed.
- If the **PAN-19** keyword is specified in the rule array, 19 characters are processed.

Even if you specify the **PAN-13, PAN-14 or PAN-15** keywords, the server might copy 16 bytes to a work area. Therefore ensure that the callable service can address 16 bytes of storage.

**expiration_date**

Direction: Input  
Type: String

The **expiration_date** parameter specifies an address that points to the place in application data storage that contains the card expiration date in numeric character form in a 4-byte field. The application programmer must determine whether the CVV will be calculated with the date form of YYMM or MMYY.

**service_code**

Direction: Input  
Type: String

VISA CVV Service Generate
VISA CVV Service Generate

The service_code parameter specifies an address that points to the place in application data storage that contains the service code in numeric character form in a 3-byte field. The service code is the number that the track-2 magnetic-stripe standards define. The service code of '000' is supported.

CVV_key_A_Identifier
Direction: Input/Output Type: String

A 64-byte string that is the internal key token containing a single- or double-length DATA or MAC key or the label of a CKDS record containing a single- or double-length DATA or MAC key.

When this key is a double-length key, CVV_key_B_identifier must be 64 byte of binary zero. When a double-length MAC key is used, the CV bits 0-3 must indicate a CVVKEY-A key (0010).

A single-length key contains the key-A key that encrypts information in the CVV process. The left half of a double-length key contains the key-A key that encrypts information in the CVV process and the right half contains the key-B key that decrypts information.

CVV_key_B_Identifier
Direction: Input/Output Type: String

A 64-byte string that is the internal key token containing a single-length DATA or MAC key or the label of a CKDS record containing a single-length DATA or MAC key. When CVV_key_A_identifier a double-length key, this parameter must be 64 byte of binary zero. The key contains the key-B key that decrypts information in the CVV process.

CVV_value
Direction: Output Type: String

The CVV_value parameter specifies an address that points to the place in application data storage that will be used to store the computed 5-byte character output value.

Restrictions

The CVV generate callable service is not supported on CCF systems with a CDMF-only configuration.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

PAN-19 requires the z990, z890, z9 EC, z9 BC, z10 EC or z10 BC with Jan. 2005 or higher version of Licensed Internal Code (LIC).

The VISA CVV Generate access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

VISA CVV Service Verify (CSNBCCSV and CSNECSV)

Use the VISA CVV Service Verify callable service to verify a:

- VISA Card Verification Value (CVV)
- MasterCard Card Verification Code (CVC)
- Diner’s Club Card Verification Value (CVV)

as defined for track 2.

This service verifies a CVV that is based upon the information that the PAN_data, the expiration_date, and the service_code parameters provide.

The service uses the Key-A and the Key-B keys to cryptographically process this information. If the requested CVV is shorter than 5 characters, the CVV is padded on the right by space characters. On an IBM zSeries 900 or lower, the user must pad out the CVV_value parameter with blanks if the supplied CVV is less than 5 characters. The generated CVV is then compared to the value that the CVV_value supplies for verification.

The callable service name for AMODE(64) invocation is CSNECSV.
VISA CVV Service Verify

Format

CALL CSNBCSV(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    PAN_data,
    expiration_date,
    service_code,
    CVV_key_A_Identifier,
    CVV_key_B_Identifier,
    CVV_value)

Parameters

return_code
Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicates specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output  Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input  Type: Integer

The number of keywords you are supplying in the rule_array parameter. The parameter rule_array_count must be 0, 1, or 2.

rule_array
Direction: Input  Type: String
Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields, and padded on the right with blanks. All keywords must be in contiguous storage.

Table 223. CVV Verify Rule Array Keywords

<td>Specifies that the CVV is to be computed as 4 bytes, followed by 1 blank.</td>
</tr>
<tr>
<td>CVV-5</td>
<td>Specifies that the CVV is to be computed as 5 bytes.</td>
</tr>
</tbody>
</table>

**PAN_data**

Direction: Input          Type: String

The **PAN_data** parameter specifies an address that points to the place in application data storage that contains personal account number (PAN) information in character form. The PAN is the account number as defined for the track-2 magnetic-stripe standards.

- If the **PAN-13** keyword is specified in the rule array, 13 characters are processed.
- If the **PAN-14** keyword is specified in the rule array, 14 characters are processed.
- If the **PAN-15** keyword is specified in the rule array, 15 characters are processed.
- If the **PAN-16** keyword is specified in the rule array, 16 characters are processed.
- If the **PAN-17** keyword is specified in the rule array, 17 characters are processed.
- If the **PAN-18** keyword is specified in the rule array, 18 characters are processed.
- If the **PAN-19** keyword is specified in the rule array, 19 characters are processed.
**VISA CVV Service Verify**

Even if you specify the **PAN-13, PAN-14 or PAN-15** keywords, the server might copy 16 bytes to a work area. Therefore ensure that the callable service can address 16 bytes of storage.

**expiration_date**

Direction: Input  
Type: String

The `expiration_date` parameter specifies an address that points to the place in application data storage that contains the card expiration date in numeric character form in a 4-byte field. The application programmer must determine whether the CVV will be calculated with the date form of YYMM or MMYY.

**service_code**

Direction: Input  
Type: String

The `service_code` parameter specifies an address that points to the place in application data storage that contains the service code in numeric character form in a 3-byte field. The service code is the number that the track-2 magnetic-stripe standards define. The service code of '000' is supported.

**CVV_key_A_Identifier**

Direction: Input/Output  
Type: String

A 64-byte string that is the internal key token containing a single- or double-length DATA or MAC key or the label of a CKDS record containing a single- or double-length DATA or MAC key.

When this key is a double-length key, `CVV_key_B_Identifier` must be 64 byte of binary zero. When a double-length MAC key is used, the CV bits 0-3 must indicate a CVVKEY-A key (0010).

A single-length key contains the key-A key that encrypts information in the CVV process. The left half of a double-length key contains the key-A key that encrypts information in the CVV process and the right half contains the key-B key that decrypts information.

**CVV_key_B_Identifier**

Direction: Input/Output  
Type: String

A 64-byte string that is the internal key token containing a single-length DATA or MAC key or the label of a CKDS record containing a single-length DATA or MAC key. When `CVV_key_A_Identifier` a double-length key, this parameter must be 64 byte of binary zero. The key contains the key-B key that decrypts information in the CVV process.

**CVV_value**

Direction: Input  
Type: String

The `CVV_value` parameter specifies an address that contains the CVV value which will be compared to the computed CVV value. This is a 5-byte field.

On an IBM zSeries 900, the user must pad out the `CVV_value` parameter with blanks if the supplied CVV is less than 5 characters.
VISA CVV Service Verify

Restrictions

The CVV verify callable service is not supported on CCF systems with a CDMF-only configuration.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

PAN-19 requires the z990, z890, z9 EC, z9 BC, z10 EC or z10 BC with Jan. 2005 or higher version of Licensed Internal Code (LIC).

The VISA CVV Verify access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Chapter 9. Using Digital Signatures

This topic describes the PKA callable services that support using digital signatures to authenticate messages.

- “Digital Signature Generate (CSNDDSG and CSNFDSG)”
- “Digital Signature Verify (CSNDDSV and CSNFDSV)” on page 518

Digital Signature Generate (CSNDDSG and CSNFDSG)

Use the digital signature generate callable service to generate a digital signature using a PKA private key. The digital signature generate callable service may use an RSA, DSS, or ECC private key, depending on the algorithm you are using. DSS is not supported on the PCIXCC, CEX2C, or CEX3C.

The PKA private key must be valid for signature usage. This service supports these methods:

- ANSI X9.30 (DSS)
- ANSI X9.30 (ECDSA)
- ANSI X9.31 (RSA)
- ISO 9796-1 (RSA)
- RSA DSI PKCS 1.0 and 1.1 (RSA)
- Padding on the left with zeros (RSA)

**Note:** The maximum signature length is 512 bytes (4096 bits).

The input text should have been previously hashed using either the one-way hash generate callable service or the MDC generation callable service. If the signature formatting algorithm specifies ANSI X9.31, you must specify the hash algorithm used to hash the text (SHA-1 or RPMD-160). See “Formatting Hashes and Keys in Public-Key Cryptography” on page 885.

If the `PKA_private_key_identifier` specifies an RSA private key, you select the method of formatting the text through the `rule_array` parameter. If the `PKA_private_key_identifier` specifies a DSS private key, the DSS signature generated is according to ANSI X9.30. For DSS, the signature is generated on a 20-byte hash created from SHA-1 algorithm. If the `PKA_private_key_identifier` specifies an ECC private key, the ECC signature generated is according to ANSI X9.30.

**Note:** For PKCS the message digest and the message-digest algorithm identifier are combined into an ASN.1 value of type DigestInfo, which is BER-encoded to give an octet string D (see Table 225). D is the text string supplied in the `hash` variable.

The callable service name for AMODE(64) invocation is CSNFDSG.
Digital Signature Generate

Format

```
CALL CSNDDSG(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    PKA_private_key_identifier_length,
    PKA_private_key_identifier,
    hash_length,
    hash,
    signature_field_length,
    signature_bit_length,
    signature_field)
```

Parameters

return_code
Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output  Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input  Type: Integer

The number of keywords you are supplying in the rule_array parameter. The value may be 0, 1, 2, or 3.

rule_array
Direction: Input  Type: String
Keywords that provide control information to the callable service. One keyword specifies the method for calculating the digital signature. Another keyword specifies formatting of the hash value for RSA digital signature generation. A third keyword specifies the hash method used to prepare the hash value for RSA digital signature generation. [Table 225] lists the keywords. Each keyword is left-justified in an 8-byte field and padded on the right with blanks. All keywords must be in contiguous storage.

</tr>
</tbody>
</table>

**PKA_private_key_identifier_length**

Direction: Input Type: Integer

The length of the **PKA_private_key_identifier** field. The maximum size is 3500 bytes.

**PKA_private_key_identifier**

Direction: Input Type: String
Digital Signature Generate

An internal token or label of an RSA or DSS private key or Retained key. If the signature format is X9.31, the modulus of the RSA key must have a length of at least 1024 bits. If the signature algorithm is ECDSA, this must be a token or label of an ECC private key.

hash_length

Direction: Input Type: Integer

The length of the hash parameter in bytes. It must be the exact length of the text to sign. The maximum size is 512 bytes. If you specify ZERO-PAD in the rule_array parameter, the length is restricted to 36 bytes unless the RSA key is a signature only key, then the maximum length is 512 bytes.

On the IBM eServer zSeries 990 and subsequent releases, the hash length limit is controlled by a new access control point. Only RSA key management keys are affected by this access control point. The limit for RSA signature use only keys is 512 bytes. This new access control point is always disabled in the Default role. You must have a TKE workstation to enable it.

hash

Direction: Input Type: String

The application-supplied text on which to generate the signature. The input text must have been previously hashed, and for PKCS formatting, it must be BER-encoded as previously described. For X9.31, the hash algorithms must have been either SHA-1 or RIPEMD-160. See the rule_array parameter for more information.

signature_field_length

Direction: Input/Output Type: Integer

The length in bytes of the signature_field to contain the generated digital signature. Upon return, this field contains the actual length of the generated signature. The maximum size is 512 bytes.

Note: For RSA, this must be at least the RSA modulus size (rounded up to a multiple of 32 bytes for the X9.31 signature format, or one byte for all other signature formats). For DSS, this must be at least 40 bytes.

For RSA and DSS, this field is updated with the minimum byte length of the digital signature.

For ECDSA, signature algorithm R concatenated with S is the digital signature. The maximum output value will be 1042 bits (131 bytes). The size of the signature is determined by the size of P. Both R and S will have size P. For prime curves, the maximum is 2 * 521 bits. For brain pool curves, the maximum size is 2 * 512 bits.

signature_bit_length

Direction: Output Type: Integer

The bit length of the digital signature generated. For ISO-9796 this is 1 less than the modulus length. For other RSA processing methods, this is the modulus length. For DSS, this is 320.
Digital Signature Generate

**signature_field**
Direction: Output
Type: String

The digital signature generated is returned in this field. The digital signature is in the low-order bits (right-justified) of a string whose length is the minimum number of bytes that can contain the digital signature. This string is left-justified within the *signature_field*. Any unused bytes to the right are undefined.

**Restrictions**

Although ISO-9796 does not require the input hash to be an integral number of bytes in length, this service requires you to specify the *hash_length* in bytes.

X9.31 requires the RSA token to have a modulus bit length of at least 1024 bits and the length must also be a multiple of 256 bits (or 32 bytes).

The length of the *hash* parameter in bytes. It must be the exact length of the text to sign. The maximum size is 512 bytes. If you specify ZERO-PAD in the *rule_array* parameter, the length is restricted to 36 bytes unless the RSA key is a signature only key, then the maximum length is 512 bytes.

On the IBM @server zSeries 990 and subsequent releases, the hash length limit is controlled by a new access control point. If OFF (disabled), the maximum hash length limit for ZERO-PAD is the modulus length of the PKA private key. If ON (enabled), the maximum hash length limit for ZERO-PAD is 36 bytes. Only RSA key management keys are affected by this access control point. The limit for RSA signature use only keys is 512 bytes. This new access control point is always disabled in the Default role. You must have a TKE workstation to enable it.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The *Digital Signature Generate* access control point controls the function of this service.

The length of the hash for ZERO-PAD is restricted to 36 bytes. If the *DSG ZERO-PAD unrestricted hash length* access control point is enabled in the ICSF role, the length of the hash is not restricted. This access control is disabled by default.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

### Digital Signature Verify (CSNDDSV and CSNFDSV)

Use the **digital signature verify callable service** to verify a digital signature using a PKA public key.

- The digital signature verify callable service can use the RSA, DSS, or ECC public key, depending on the digital signature algorithm used to generate the signature. DSS is supported only on the IBM @server zSeries 900.
- The digital signature verify callable service can also use the public keys that are contained in trusted blocks regardless of whether the block also contains rules to govern its use when generating or exporting keys with the RKX service. If the TPK-ONLY keyword is used in the `rule_array`, an error will occur if the `PKA_public_key_identifier` does not contain a trusted block.

This service supports these methods:
Digital Signature Verify

- ANSI X9.30 (DSS and ECC)
- ANSI X9.31 (RSA)
- ISO 9796 (RSA)
- RSA DSI PKCS 1.0 and 1.1 (RSA)
- Padding on the left with zeros (RSA)

Input text should have been previously hashed. You can use either the one-way hash generate callable service or the MDC generation callable service. See also "Formatting Hashes and Keys in Public-Key Cryptography" on page 885.

Note: The maximum signature length is 512 bytes.

The callable service name for AMODE(64) invocation is CSNFDVS.

Format

CALL CSNDDSV(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    PKA_public_key_identifier_length,
    PKA_public_key_identifier,
    hash_length,
    hash,
    signature_field_length,
    signature_field)

Parameters

return_code
Direction: Output          Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output          Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output    Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Digital Signature Verify

Direction: Input/Output  Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input  Type: Integer

The number of keywords you are supplying in the rule_array parameter. The value must be 0, 1, or 2.

rule_array
Direction: Input  Type: String

Contains an array of keywords that provide control information to the callable service. One keyword specifies the method to use to verify the RSA digital signature. Another keyword specifies the input token is a Trusted Block. A third keyword specifies the algorithm used to validate the signature. Table 227 lists the keywords. Each keyword is left-justified in an 8-byte field and padded on the right with blanks. All keywords must be in contiguous storage.

</tr>
</tbody>
</table>
Digital Signature Verify

**PKA_public_key_identifier_length**

Direction: Input  Type: Integer

The length of the **PKA_public_key_identifier** parameter containing the public key token or label. The maximum size is 3500 bytes.

**PKA_public_key_identifier**

Direction: Input  Type: String

A token or label of the RSA or DSS public key or internal trusted block. If this parameter contains a token or the label of an Internal Trusted Block, the **rule_array** parameter must specify TPK-ONLY. If the signature algorithm is ECDSA, this must be a token label of an ECC public key.

**hash_length**

Direction: Input  Type: Integer

The length of the **hash** parameter in bytes. It must be the exact length of the text that was signed. The maximum size is 512 bytes.

**hash**

Direction: Input  Type: String

The application-supplied text on which the supplied signature was generated. The text must have been previously hashed and, for PKCS formatting, BER-encoded as previously described.

**signature_field_length**

Direction: Input  Type: Integer

The length in bytes of the **signature_field** parameter. The maximum size is 512 bytes.

**signature_field**

Direction: Input  Type: String

This field contains the digital signature to verify. The digital signature is in the low-order bits (right-justified) of a string whose length is the minimum number of bytes that can contain the digital signature. This string is left-justified within the **signature_field**.

**Restrictions**

The ability to recover a message from a signature (which ISO-9796 allows but does not require) is **not** supported.

The exponent of the RSA public key must be odd.

Although ISO-9796 does not require the input hash to be an integral number of bytes in length, this service requires you to specify the **hash_length** in bytes.
**Digital Signature Verify**

X9.31 requires the RSA token to have a modulus bit length of at least 1024 bits and the length must also be a multiple of 256 bits (or 32 bytes).

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

For DSS if \( r = 0 \) or \( s = 0 \) then verification always fails. The DSS digital signature is of the form \( r \| s \), each 20 bytes.

The **Digital Signature Verify** access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Digital Signature Verify
Chapter 10. Managing PKA Cryptographic Keys

This topic describes the callable services that generate and manage PKA keys.

- "PKA Key Generate (CSNDPKG and CSNFPKG)"
- "PKA Key Import (CSNDPKI and CSNFPKI)" on page 531
- "PKA Key Token Build (CSNDPKB and CSNFPKB)" on page 535
- "PKA Key Token Change (CSNDKTC and CSNFKTC)" on page 548
- "PKA Key Translate (CSNDPKT and CSNFPKT)" on page 551
- "PKA Public Key Extract (CSNDPKX and CSNFPKX)" on page 555
- "Retained Key Delete (CSNDRKD and CSNFRKD)" on page 558
- "Retained Key List (CSNDRKL and CSNFRKL)" on page 560

PKA Key Generate (CSNDPKG and CSNFPKG)

Use the PKA key generate callable service to generate these PKA keys:

- PKA internal tokens for use with the DSS algorithm in the digital signature services
- RSA keys for use on the Cryptographic Coprocessor Feature, PCI Cryptographic Coprocessor, PCI X Cryptographic Coprocessor, Crypto Express2 Coprocessor, or Crypto Express3 Coprocessor.
- ECC keys for use on the Crypto Express3 Coprocessor.

Input to the PKA key generate callable service is either a skeleton key token that has been built by the PKA key token build service or a valid internal RSA token. PKG will generate a key with the same modulus length and the same exponent. In the case of a valid internal ECC token, PKG will generate a key based on the curve type and size. Internal tokens with a X'09' section are not supported.

DSS key generation requires this information in the input skeleton token:

- Size of modulus p in bits
- Prime modulus p
- Prime divisor q
- Public generator g
- Optionally, the private key name

DSS standards define restrictions on p, q, and g. (Refer to the Federal Information Processing Standard (FIPS) Publication 186 for DSS standards.) This callable service does not verify all of these restrictions. If you do not follow these restrictions, the keys you generate may not be valid DSS keys. The PKA Key Token Build service or an existing internal or external PKA DSS token can generate the input skeleton token, but all of the preceding must be provided. You can extract the DSS public key token from the internal private key token by calling the PKA public key extract callable service.

**Note:** DSS keys are not supported on a PCIXCC, CEX2C, or CEX3C.

RSA key generation requires this information in the input skeleton token:

- Size of the modulus in bits. The modulus for modulus-exponent form keys is between 512 and 1024. The CRT modulus is between 512 and 4096. The modulus for the variable-length-modulus-exponent form is between 512 and 4096.

RSA key generation has these restrictions: For modulus-exponent, there are restrictions on modulus, public exponent, and private exponent. For CRT, there are
restrictions on dp, dq, U, and public exponent. See the Key value structure in "PKA
Key Token Build (CSNDPKB and CSNFPKB)" on page 535 for a summary of
restrictions.

**Note:** The Transaction Security System PKA96 PKA key generate verb supports
RSA key generation only; it does not support DSS key generation.

ECC key generation requires this information in the skeleton token:
- The key type: ECC
- The type of curve: Prime or Brainpool
- The size of P in bits: 192, 224, 256, 384 or 521 for Prime curves and 160, 192,
  224, 256, 320, 384, or 512 for Brainpool curves
- Key usage information
- Optionally, application associated data

The generated ECC private key will be returned in one of the following forms:
- Clear key
- Encrypted key enciphered under the ECC master key
- Encrypted key enciphered by an AES transport key

The callable service name for AMODE(64) invocation is CSNFPKG.

**Format**

```plaintext
CALL CSNDPKG(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    regeneration_data_length,
    regeneration_data,
    skeleton_key_identifier_length,
    skeleton_key_identifier,
    transport_key_identifier,
    generated_key_token_length,
    generated_key_token)
```

**Parameters**

**return_code**
Direction: Output  Type: Integer

The **return_code** specifies the general result of the callable service. [Appendix A, ‘ICSF and TSS Return and Reason Codes’](#) lists the return codes.

**reason_code**
Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to
the application program. Each return code has different reason codes assigned
to it that indicate specific processing problems. [Appendix A, ‘ICSF and TSS
Return and Reason Codes’](#) lists the reason codes.
PKA Key Generate

exit_data_length
Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output  Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input  Type: Integer

The number of keywords you supplied in the rule_array parameter. Value may be 1 or 2.

rule_array
Direction: Input  Type: String

A keyword that provides control information to the callable service. See Table 229 for a list. A keyword is left-justified in an 8-byte field and padded on the right with blanks.

Table 229. Keywords for PKA Key Generate Rule Array

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Private Key Encryption (required)</td>
<td></td>
</tr>
<tr>
<td>CLEAR</td>
<td>Return the private key in clear text. The private key in clear text is an external token. Only valid for RSA and ECC keys.</td>
</tr>
<tr>
<td>MASTER</td>
<td>Encipher the private key under the master key. The keyword is not supported if a skeleton token with a X'09' section is provided.</td>
</tr>
<tr>
<td>RETAIN</td>
<td>Retain the private key within a cryptographic coprocessor for additional security. This is only valid for RSA signature keys. Because of this, the RETAIN keyword is not supported for: a skeleton token with a X'09' section provided. an ECC token.</td>
</tr>
<tr>
<td>XPORT</td>
<td>Encipher the private key under the transport_key_identifier. This keyword is valid only for RSA and ECC keys.</td>
</tr>
</tbody>
</table>

Options (optional)

CLONE
Mark a generated and retained private key as usable in cryptographic engine cloning process. This keyword is supported only if RETAIN is also specified. Only valid for RSA keys. The keyword is not supported for: a skeleton token with a X'09' section is provided. an ECC token.

Processing Controls (Optional when regeneration_data_length is non-zero)
### PKA Key Generate

Table 229. Keywords for PKA Key Generate Rule Array  (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>

<td>The transport key identifier identifies an AES KEK token.</td>
</tr>
</tbody>
</table>

**regeneration_data_length**

- **Direction:** Input
- **Type:** Integer

The value must be 0 for DSS and ECC tokens. For RSA tokens, the regeneration_data_length can be non-zero. If it is non-zero, it must be between 8 and 512 bytes inclusive.

**regeneration_data**

- **Direction:** Input
- **Type:** String

This field points to a string variable containing a string used as the basis for creating a particular public-private key pair in a repeatable manner.

**skeleton_key_identifier_length**

- **Direction:** Input
- **Type:** Integer

The length of the skeleton_key_identifier parameter in bytes. The maximum allowed value is 3500 bytes.

**skeleton_key_identifier**

- **Direction:** Input
- **Type:** String

The application-supplied skeleton key token generated by PKA key token build or label of the token that contains the required network quantities for DSS key generation, the required curve type and bit length for ECC key generation, or the required modulus length and public exponent for RSA key generation. If RETAIN was specified and the skeleton_key_identifier is a label, the label must match the private key name of the key.

For DSS and RSA keys, the skeleton_key_identifier parameter must contain a token which specifies a modulus length in the range 512 – 4096 bits.

**transport_key_identifier**

- **Direction:** Input
- **Type:** String

A variable-length field containing an AES or DES key identifier used to encrypt the generated key. For RSA keys this must be a DES transport key and for ECC keys this must be an AES transport key.

If the XPORT Rule is not specified or the key being generated is a DSS key, this parameter must be 64 bytes of binary zeros.
For XPORT rule, this is an IMPORTER or EXPORTER key or the label of an IMPORTER or EXPORTER key. If you specify a label, it must resolve uniquely to either an IMPORTER or EXPORTER key. This parameter is a:

- 64-byte label of a CKDS record that contains the transport key.
- 64-byte DES internal key token containing the transport key.
- a variable-length AES internal key token containing the transport key.

**generated_key_token_length**

Direction: Input/Output  Type: Integer

The length of the generated key token. The field is checked to ensure it is at least equal to the token being returned. The maximum size is 3500 bytes. On output, this field is updated with the actual token length.

**generated_key_token**

Direction: Input/Output  Type: String

The internal token or label of the generated DSS, ECC, or RSA key. The label can be that of a retained key for most RSA key tokens.

Checks are made to ensure that:

- An ECC Token in the PKDS will only be overlayed if an ECC token is specified in the skeleton_key_identifier.
- A retained key is not overlayed in PKDS. If the label is that of a retained key, the private name in the token must match the label name. If a label is specified in the generated_key_token field, the generated_key_token_length returned to the application will be the same as the input length. If RETAIN was specified, but the generated_key_token was not specified as a label, the generated key length returned to the application will be zero (the key was retained in the PCI Cryptographic Coprocessor). If the record already exists in the PKDS with the same label as the one specified as the generated_key_token, the record will be overwritten with the newly generated key token (unless the PKDS record is an existing retained private key, in which case it cannot be overwritten). If there is no existing PKDS record with this label in the case of generating a retained key, a record will be created. For generation of a non-retained key, if a label is specified in the generated_key_token field, a record must already exist in the PKDS with this same label or the service will fail.
- A retained key is not overlayed in PKDS. If the label is that of a retained key, the private name in the token must match the label name. If a label is specified in the generated_key_token field, the generated_key_token_length returned to the application will be the same as the input length. If RETAIN was specified, but the generated_key_token was not specified as a label, the generated key length returned to the application will be zero (the key was retained in the PCI Cryptographic Coprocessor). If the record already exists in the PKDS with the same label as the one specified as the generated_key_token, the record will be overwritten with the newly generated key token (unless the PKDS record is an existing retained private key, in which case it cannot be overwritten). If there is no existing PKDS record with this label in the case of generating a retained key, a record will be created. For generation of a non-retained key, if a label is specified in the generated_key_token field, a record must already exist in the PKDS with this same label or the service will fail.
PKA Key Generate

Restrictions

2048-bit RSA keys may have a public exponent in the range of 1-256 bytes. 4096-bit RSA key public exponents are restricted to the values 3 and 65537.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

The PKA Key Generate access control point controls the function of this service. Additional access control points control the use of rule array keys.

*Table 230. Required access control points for PKA Key Generate rule array keys*

<table>
<thead>
<tr>
<th>Key algorithm</th>
<th>Rule array keyword</th>
<th>Access control point</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSA</td>
<td>CLEAR</td>
<td>PKA Key Generate – Clear RSA keys</td>
</tr>
<tr>
<td>ECC</td>
<td>CLEAR</td>
<td>PKA Key Generate – Clear ECC keys</td>
</tr>
<tr>
<td>RSA</td>
<td>CLONE</td>
<td>PKA Key Generate - Clone</td>
</tr>
</tbody>
</table>

To generate keys based on the value supplied in the regeneration_data variable, you must enable at least one of these access control points:

- When not using the RETAIN keyword, **PKA Key Generate - Permit Regeneration Data**
- When using the RETAIN keyword, **PKA Key Generate - Permit Regeneration Data Retain**

For ECC keys, when an transport key is specified, the **Variable-length Symmetric Token - disallow weak wrap** access control point can be enabled in the active role to prevent stronger keys from being wrapped by weaker keys.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

*Table 231. PKA key generate required hardware*

<table>

### PKA Key Import (CSNDPKI and CSNFPKI)

Use this service to import an external PKA private key token. (The private key must consist of a PKA private key and public key.) The secret values of the key may be:

- **Clear**
- Encrypted under a limited-authority DES importer key if the `source_key_identifier` is an RSA token
- Encrypted under an AES Key Encryption Key if the `source_key_identifier` is an ECC token

This service can also import a clear PKA key. The PKA key token build service creates a clear PKA key token.

This service can also import an external trusted block token for use with the remote key export callable service.

Output of this service is an ICSF internal token of the RSA, DSS, or ECC private key or trusted block.
PKA Key Import

The callable service name for AMODE(64) invocation is CSNFPKI.

Restriction: DSS keys are not supported on the PCIXCC, CEX2C, or CEX3C.

Format

```
CALL CSNDPKI(
    return_code, 
    reason_code, 
    exit_data_length, 
    exit_data, 
    rule_array_count, 
    rule_array, 
    source_key_identifier_length, 
    source_key_identifier, 
    importer_key_identifier, 
    target_key_identifier_length, 
    target_key_identifier)
```

Parameters

return_code

Direction: Output
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code

Direction: Output
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length

Direction: Input/Output
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data

Direction: Input/Output
Type: String

The data that is passed to the installation exit.

rule_array_count

Direction: Input
Type: Integer

The number of keywords you supplied in the rule_array parameter. This may be 0 or 1.

rule_array
PKA Key Import

Direction: Input Type: Character String

The rule_array parameter is an array of keywords. The keywords must be 8 bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks. The rule_array keywords are:

Table 232. Keywords for PKA Key Import

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Token Type (optional)</td>
<td></td>
</tr>
<tr>
<td>RSA</td>
<td>Specifies that the key token is for an RSA key. This is the default.</td>
</tr>
<tr>
<td>ECC</td>
<td>Specifies that the key token is for an ECC key.</td>
</tr>
</tbody>
</table>

source_key_identifier_length

Direction: Input Type: Integer

The length of the source_key_identifier parameter. The maximum size is 3500 bytes.

source_key_identifier

Direction: Input Type: String

Contains an external token or label of a PKA private key, without section identifier 0x14 (Trusted Block Information), or the trusted block in external form as produced by the Trusted Block Create (CSNDTBC and CSNETBC) service with the ACTIVATE keyword.

If a PKA private key without the section identifier 0x14 is passed in:
- There are no qualifiers. A retained key can not be used.
- The key token must contain both public-key and private-key information. The private key can be in cleartext or it can be enciphered.
- This is the output of the PKA key generate (CSNDPKG) callable service or the PKA key token build (CSNDPKB) callable service.
- If encrypted, it was created on another platform.

If a PKA key token with section 0x14 is passed in:
- This service will be used to encipher the MAC key within the trusted block under the PKA master key instead of the IMP-PKA key-encrypting key.
- The importer_key_identifier must contain an IMP-PKA KEK in this case.

importer_key_identifier

Direction: Input/Output Type: String

A variable-length field containing an AES or DES key identifier used to wrap the imported key. For RSA keys and trusted blocks, this must be a DES limited authority transport key (IMP-PKA). For ECC keys, this must be an AES transport key.

This parameter contains one of the following:
- 64-byte label of a CKDS record that contains the transport key.
- 64-byte DES internal key token containing the transport key.
PKA Key Import

- a variable-length AES internal key token containing the transport key.

This parameter is ignored for clear tokens.

**target_key_identifier_length**

Direction: Input/Output
Type: Integer

The length of the target_key_identifier parameter. The maximum size is 3500 bytes. On output, and if the size is of sufficient length, the variable is updated with the actual length of the target_key_identifier field.

**target_key_identifier**

Direction: Input/Output
Type: String

This field contains the internal token or label of the imported PKA private key or a Trusted Block. If a label is specified on input, a PKDS record with this label must exist. The PKDS record with this label will be overwritten with imported key unless the existing record is a retained key. If the record is a retained key, the import will fail. A retained key record cannot be overwritten. If no label is specified on input, this field is ignored.

**Restrictions**

This service imports RSA keys of up to 4096 bits. However, the hardware configuration sets the limits on the modulus size of keys for digital signatures and key management; thus, the key may be successfully imported but fail when used if the limits are exceeded.

The importer_key_identifier is a limited-authority key-encrypting key.

CRT form tokens with a private section ID of X'05' cannot be imported into ICSF.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

An RSA modulus-exponent form token imported on the PCICC, PCIXCC, CEX2C, or CEX3C results in a X'06' format, while a token imported on a Cryptographic Coprocessor Feature will result in a X'02' format. If the modulus length is less than 512, the token will be imported on the CCF, and it will be X'02' format.

This service imports keys of any modulus size up to 4096 bits. However, the hardware configuration sets the limits on the modulus size of keys for digital signatures and key management; thus, the key may be successfully imported but fail when used if the limits are exceeded.

The **PKA Key Import** access control point controls the function of this service. If the source_key_token parameter points to a trusted block, the **PKA Key Import - Import an External Trusted Block** access control point must also be enabled.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

---

### PKA Key Token Build (CSNDPKB and CSNFPKB)

Use this callable service to build external PKA key tokens containing unenciphered private RSA, DSS, or ECC keys, or public RSA, DSS, or ECC keys. This callable service is used to create the following:

- A skeleton_key_token for use with the PKA Key Generate callable service (see Table 229 on page 527)
- A key token with a public key that has been obtained from another source
- A key token with a clear private-key and the associated public key
PKA Key Token Build

- A key token for an RSA private key in optimized Chinese Remainder Theorem (CRT) form.
- An RSA token with 'X'09' section identifier using the RSAMEVAR keyword to obtain a token for a key in modulus-exponent form that is variable length.

DSS key generation requires this information in the input skeleton token:
- Size of modulus p in bits
- Prime modulus p
- Prime divisor q
- Public generator g
- Optionally, the private key name

**Note:** DSS standards define restrictions on the prime modulus p, prime divisor q, and public generator g. (Refer to the Federal Information Processing Standard (FIPS) Publication 186 for DSS standards.) This callable service does not verify all of these restrictions. If you do not follow the restrictions, the keys you generate may not be valid DSS keys.

**Restriction:** DSS is not supported on a PCIXCC, CEX2C, or CEX3C. PKA key token build will still build DSS tokens, but they cannot be used in any other service on the z890, z990, z9 EC, z9 BC, z10 EC and z10 BC.

ECC key generation requires this information in the skeleton token:
- The key type: ECC
- The type of curve: Prime or Brainpool
- The size of P in bits: 192, 224, 256, 384 or 521 for Prime curves and 160, 192, 224, 256, 320, 384, or 521 for Brainpool curves
- Key usage information
- Optionally, application associated data

The callable service name for AMODE(64) invocation is CSNFPKB.

**Format**

```call csndpkb(
    return_code,
    reason_code,
    exit_data_length,

    key_token)
```
PKA Key Token Build

Parameters

return_code

Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length

Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data

Direction: Ignored Type: String

This field is ignored.

rule_array_count

Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. Value must be 1, 2 or 3.

rule_array

Direction: Input Type: String

One or two keywords that provide control information to the callable service. Table 234 lists the keywords. The keywords must be in contiguous storage with each of the keywords left-justified in its own 8-byte location and padded on the right with blanks.

Table 234. Keywords for PKA Key Token Build Control Information

<table>

<td>Indicates key translation is not allowed. This is the default. NO-XLATE is only allowed with key types RSA-PRIV, RSAMEVAR, RSA-CRT, and ECC-PAIR and is valid with all key usage rules.</td>
</tr>
</tbody>
</table>

#### `key_value_structure_length`

- **Direction:** Input
- **Type:** Integer

This is a segment of contiguous storage containing a variable number of input clear key values. The length depends on the key type parameter in the rule array and on the actual values input. The length is in bytes.
### PKA Key Token Build

**Table 235. Key Value Structure Length Maximum Values for Key Types**

</tbody>
</table>

**key_value_structure**

**Direction:** Input  
**Type:** String

This is a segment of contiguous storage containing a variable number of input clear key values and the lengths of these values in bits or bytes, as specified. The structure elements are ordered, of variable length, and the input key values must be right-justified within their respective structure elements and padded on the left with binary zeros. If the leading bits of the modulus are zero's, don’t count them in the length. Table 236 defines the structure and contents as a function of key type.

**Table 236. Key Value Structure Elements for PKA Key Token Build**

  - xxx, This field is the length of the public key Q value in bytes. This value can be zero if the key token is used as a skeleton key token in the PKA Key Generate callable service. The maximum value could be up to 133 bytes which includes a one byte value indicating compressed or uncompressed key value.

- **006**
  - xxx
  - Public key value Q

### Notes:

1. All length fields are in binary.
2. All binary fields (exponent, lengths, modulus, and so on) are stored with the high-order byte field first. This integer number is right-justified within the key structure element field.
3. You must supply all values in the structure to create a token containing an RSA or DSS private key for input to the PKA key import service.
PKA Key Token Build

Direction: Input Type: Integer

The length can be 0 or 64.

private_key_name
Direction: Input Type: EBCDIC character

This field contains the name of a private key. The name must conform to ICSF label syntax rules. That is, allowed characters are alphanumeric, national (@,#,$) or period (.). The first character must be alphabetic or national. The name is folded to upper case and converted to ASCII characters. ASCII is the permanent form of the name because the name should be independent of the platform. The name is then cryptographically coupled with clear private key data prior to its encryption of the private key. Because of this coupling, the name can never change when the key token is already imported. The parameter is not valid with key types DSS-PUBL or RSA-PUBL.

user_definable_associated_data_length
Direction: Input Type: Integer

The length of the user_definable_associated_data parameter.

Valid for Rule Array Key Type of ECC-PAIR with a maximum value of 100 and must be set to 0 for all other Rule Array Key Types.

user_definable_associated_data
Direction: Input Type: String

The user_definable_associated_data parameter is a pointer to a string variable containing the associated data that will be placed following the IBM associated data in the token. The associated data is data whose integrity but not confidentiality is protected by a key wrap mechanism. It can be used to bind usage control information.

Valid for Rule Array Key Type of ECC-PAIR and is ignored for all others.

reserved_2_length
Direction: Input Type: Integer

Length in bytes of a reserved parameter. You must set this variable to 0.

reserved_2
Direction: Input Type: String

The reserved_2 parameter identifies a string that is reserved. The service ignores it.

reserved_3_length
Direction: Input Type: Integer

Length in bytes of a reserved parameter. You must set this variable to 0.

reserved_3
PKA Key Token Build

Direction: Input Type: String

The reserved_3 parameter identifies a string that is reserved. The service ignores it.

reserved_4_length
Direction: Input Type: Integer.

Length in bytes of a reserved parameter. You must set this variable to 0.

reserved_4
Direction: Input Type: String

The reserved_4 parameter identifies a string that is reserved. The service ignores it.

reserved_5_length
Direction: Input Type: Integer.

Length in bytes of a reserved parameter. You must set this variable to 0.

reserved_5
Direction: Input Type: String

The reserved_5 parameter identifies a string that is reserved. The service ignores it.

key_token_length
Direction: Input/Output Type: Integer

Length of the returned key token. The service checks the field to ensure it is at least equal to the size of the token to return. On return from this service, this field is updated with the exact length of the key_token created. On input, a size of 3500 bytes is sufficient to contain the largest key_token created.

key_token
Direction: Output Type: String

The returned key token containing an unenciphered private or public key. The private key is in an external form that can be exchanged with different Common Cryptographic Architecture (CCA) PKA systems. You can use the public key token directly in appropriate ICSF signature verification or key management services.

Usage Notes

If you are building a skeleton for use in a PKA Key Generate request to generate a retained PKA private key, you must build a private key name section in the skeleton token.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

PKA Key Token Change (CSNDKTC and CSNFKTC)

The PKA Key Token Change callable service changes PKA key tokens (RSA, DSS, and ECC) or trusted block key tokens, from encipherment under the cryptographic coprocessor’s old RSA master key or ECC master key to encipherment under the current cryptographic coprocessor’s RSA master key or ECC master key.

- For RSA and DSS key tokens - Key tokens must be private internal PKA key tokens to be changed by this service. PKA private keys encrypted under the Key Management Master Key (KMMK) cannot be reenciphered using this service unless the KMMK has the same value as the Signature Master Key (SMK).
- For trusted block key tokens - Trusted block key tokens must be internal.
- For ECC key tokens - Key tokens must be private internal ECC key tokens encrypted under the ECC master key.

The callable service name for AMODE(64) invocation is CSNFKTC.

Format

```call csndktc(
  return_code,
  reason_code,
  exit_data_length,
  exit_data,
  rule_array_count,
  rule_array,
  key_identifier_length,
  key_identifier)
```

Parameters

**return_code**

Direction: Output  
Type: Integer
PKA Key Token Change

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicates specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  
Type: Integer

The number of keywords you are supplying in the rule_array parameter. The value must be 1 or 2.

**rule_array**

Direction: Input  
Type: String

The process rules for the callable service. The keywords must be 8 bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks.

**Table 238. Rule Array Keywords for PKA Key Token Change**

<table>

</tr>
</thead>
<tbody>
<tr>
<td>RTCMK</td>
<td>If the <code>key_identifier</code> is an RSA key token, the service will change an RSA private key from encipherment with the old RSA master key to encipherment with the current RSA master key. If the <code>key_identifier</code> is a trusted block token, the service will change the trusted block's embedded MAC key from encipherment with the old RSA master key to encipherment with the current RSA master key. If the <code>key_identifier</code> is an ECC key token, the service will change an ECC private key from encipherment with the old ECC master key to encipherment with the current ECC master key.</td>
</tr>
</tbody>
</table>

**key_identifier_length**

Direction: Input  
Type: Integer

The length of the `key_identifier` parameter. The maximum size is 3500 bytes.

**key_identifier**

Direction: Input/Output  
Type: String

Contains an internal key token of an internal RSA, DSS, ECC, or trusted block key.

If the key token is an RSA key token, the private key within the token is securely reenciphered under the current RSA master key.

If the key token is a Trusted Block key token, the MAC key within the token is securely reenciphered under the current RSA master key.

If the key token is an ECC key token, the private key within the token is securely reenciphered under the current ECC master key.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

To use this service, PKA callable services must be enabled for all RSA and DSS token types. For systems with CEX3C coprocessors, there is no PKA callable services control. The RSA master key must be valid to use this service.

To use this service for ECC tokens, the ECC master key must be valid.

The **PKA Key Token Change RTCMK** access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

RSA key support with moduli within the range 2048-bit to 4096-bit requires the Nov. 2007 or later licensed internal code (LIC). |
| z196            | Crypto Express3 Coprocessor | ECC not supported. |

PKA Key Translate (CSNDPKT and CSNFPKT)

Use the PKA key translate callable service to translate a source CCA RSA key token into a target external smart card key token.

The source CCA RSA key token must be wrapped with a transport key encrypting key (KEK). The XLATE bit must also be turned on in the key usage byte of the source token. The source token is unwrapped using the specified source transport KEK. The target key token will be wrapped with the specified target transport KEK. Existing information in the target token is overwritten.

There are restrictions on which type key can be used for the source and target transport key tokens. These restrictions are enforced by access control points.

There are restrictions on which rule can be used. These restrictions are enforced by access control points.

The callable service name for AMODE(64) invocation is CSNFPKT.
PKA Key Translate

Format

```
CALL CSNDPKT(  
    return_code,  
    reason_code,  
    exit_data_length,  
    exit_data,  
    rule_array_count,  
    rule_array,  
    source_key_identifier_length,  
    source_key_identifier,  
    source_transport_key_identifier_length,  
    source_transport_key_identifier,  
    target_transport_key_identifier_length,  
    target_transport_key_identifier,  
    target_key_token_length,  
    target_key_token)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  
Type: Integer

The number of keywords you supplied in the rule_array parameter. Value must be 1.

**rule_array**
PKA Key Translate

Direction: Input
Type: String

The smartcard format rule for the callable service. A keyword that provides control information to the callable service. See Table 240 for a list. A keyword is left-justified in an 8-byte field and padded on the right with blanks.

Table 240. Keywords for PKA Key Generate Rule Array

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>

</tbody>
</table>

source_key_identifier_length
Direction: Input
Type: Integer

Length in bytes of the source_key_identifier variable. The maximum length is 3500 bytes.

source_key_identifier
Direction: Input
Type: String

This field contains either a key label identifying an RSA private key or an external public-private key token. The private key must be wrapped with a key encrypting key.

source_transport_key_identifier_length
Direction: Input
Type: Integer

Length in bytes of the source_transport_key_identifier parameter. This value must be 64.

source_transport_key_identifier
Direction: Input/Output
Type: String

This field contains an internal token or label of a DES key-encrypting key. This key is used to unwrap the input RSA key token specified with parameter source_key_identifier. See “Usage Notes” on page 554 for details on the type of transport key that can be used.

target_transport_key_identifier_length
Direction: Input
Type: Integer

Length in bytes of the target_transport_key_identifier parameter. This value must be 64.

target_transport_key_identifier
PKA Key Translate

Direction: Input/Output Type: String

This field contains an internal token or label of a DES key-encrypting key. This key is used to wrap the output RSA key returned with parameter target_key_token. See "Usage Notes" for details on the type of transport key that can be used.

target_key_token_length
Direction: Input/Output Type: Integer

Length in bytes of the target_key_token parameter. On output, the value in this variable is updated to contain the actual length of the target_key_token produced by the callable service. The maximum length is 3500 bytes.

target_key_token
Direction: Output Type: String

This field contains the RSA key in the smartcard format specified in the rule array and is protected by the key-encrypting key specified in the target_transport_key parameter. This is not a CCA token, and cannot be stored in the PKDS.

Restrictions

CCA RSA ME tokens will not be translated to the SCCOMCRT format. CCA RSA CRT tokens will not be translated to the SCCOMME format. SCVISA only supports Modulus-Exponent (ME) keys.

Usage Notes

There are access control points that control use of the format rule array keys and the type of transport keys that can be used. All of these access control points are enabled in the default role.

Table 241. Required access control points for PKA Key Translate

<table>
<thead>
<tr>
<th>Smartcard format</th>
<th>Access control point</th>

PKA Public Key Extract (CSNDPKX and CSNFPKX)

Use the PKA public key extract callable service to extract a PKA public key token from a supplied PKA internal or external private key token. This service performs no cryptographic verification of the PKA private token. You can verify the private token by using it in a service such as digital signature generate.

The callable service name for AMODE(64) invocation is CSNFPKX.
PKA Public Key Extract

Format

CALL CSNDPKX(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    source_key_identifier_length,
    source_key_identifier,
    target_public_key_token_length,
    target_public_key_token)

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input Type: Integer

The number of keywords you are supplying in the rule_array parameter. The value must be 0.

rule_array
Direction: Input Type: String

Reserved field. This field is not used, but you must specify it.
**PKA Public Key Extract**

**source_key_identifier_length**

Direction: Input  
Type: integer

The length of the `source_key_identifier` parameter. The maximum size is 3500 bytes. When the `source_key_identifier` parameter is a key label, this field specifies the length of the label.

**source_key_identifier**

Direction: Input/output  
Type: string

The internal or external token of a PKA private key or the label of a PKA private key. This can be the input or output from PKA key import or from PKA key generate.

This service supports:
- RSA private key token formats supported on the PCICC, PCIXCC, CEX2C, or CEX3C. If the `source_key_identifier` specifies a label for a private key that has been retained within a PCICC, PCIXCC, or CEX2C, this service extracts only the public key section of the token.
- ECC private key token formats supported on the CEX3C.

**target_public_key_token_length**

Direction: Input/Output  
Type: Integer

The length of the `target_public_key_token` parameter. The maximum size is 3500 bytes. On output, this field will be updated with the actual byte length of the `target_public_key_token`.

**target_public_key_token**

Direction: Output  
Type: String

This field contains the token of the extracted PKA public key.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the PKDS.

This service extracts the public key from the internal or external form of a private key. However, it does not check the cryptographic validity of the private token.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

*Table 244. PKA public key extract build required hardware*

Retained Key Delete (CSNDRKD and CSNFRKD)

Use the retained key delete callable service to delete a key that has been retained within the PCICC, PCIXCC, CEX2C, or CEX3C. This service also deletes the record that contains the associated key token from the PKDS. It also allows the deletion of a retained key in the PCICC, PCIXCC, CEX2C, or CEX3C even if there isn't a PKDS record, or deletion of a PKDS record for a retained key even if the PCICC, PCIXCC, CEX2C, or CEX3C holding the retained key is not online. Use the rule_array parameter specifying the FORCE keyword and serial number of the PCICC, PCIXCC, CEX2C, or CEX3C that contains the retained key to be deleted. If a PKDS record exists for the same label, but the serial number doesn't match the serial number in rule_array, the service will fail. If any applications still need the public key, use public key extract to create a public key token prior to deletion of the retained key.

The callable service name for AMODE(64) invocation is CSNFRKD.

Format

CALL CSNDRKD(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_label)

Parameters

return_code

Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

reason_code
Retained Key Delete

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length
Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output  Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input  Type: Integer

The number of keywords supplied in the rule_array parameter. The value may be 0 or 2.

rule_array
Direction: Input  Type: Character String

This parameter may be FORCE and the PCICC, PCIXCC, CEX2C, or CEX3C serial number.

key_label
Direction: Input  Type: String

A 64-byte label of a key that has been retained in a PCICC, PCIXCC, CEX2C, or CEX3C.

Usage Notes

ICSF calls the Security Server (RACF) to check authorization to use the Retained Key Delete service and the label of the key specified in key_label.

Retained private keys are domain-specific. Only the LPAR domain that created a Retained private key can delete the key via the Retained Key Delete service.

When a Retained key is deleted using the Retained Key Delete service, ICSF records this event in a type 82 SMF record with a subtype of 15.

If the Retained key does not exist in the PCICC, PCIXCC, CEX2C, or CEX3C and the PKDS record exists and the domain that created the retained key matches the domain of the requestor, ICSF deletes the PKDS record. This situation may occur if the PCICC, PCIXCC, CEX2C, or CEX3C has been zeroized through TKE or the service processor.

If a PKDS record containing the retained key exists but the PCICC, PCIXCC, CEX2C, or CEX3C holding the retained key is not online, ICSF deletes the PKDS
Retained Key Delete

record if the FORCE keyword is specified. The serial number specified in the rule array must be the serial number of the coprocessor where the Retained key was created. The key token in the PKDS record contains this serial number, and the serial number is used to verify that the PKDS record can be deleted.

If the retained key exists on the specified PCICC, PCIXCC, CEX2C, or CEX3C but there is no corresponding PKDS record, ICSF deletes the retained key from the PCICC, PCIXCC, CEX2C, or CEX3C if the FORCE keyword is specified.

The Retained Key Delete access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Retained Key List (CSNDRKL and CSNFRKL)

Use the retained key list callable service to list the key labels of those keys that have been retained within all currently active PCICCs, PCIXCCs, CEX2Cs, or CEX3Cs.

The callable service name for AMODE(64) invocation is CSNFRKL.
Retained Key List

Format

```plaintext
CALL CSNDRKL(
   return_code,
   reason_code,
   exit_data_length,
   exit_data,
   rule_array_count,
   rule_array,
   key_label_mask,
   retained_keys_count,
   key_labels_count,
   key_labels)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  
Type: Integer

The number of keywords supplied in the `rule_array` parameter. The value must be 0.

**rule_array**

Direction: Input  
Type: Character String

This parameter is ignored by ICSF.
Retained Key List

direction: Input Type: String

A 64-byte key label mask that is used to filter the list of key names returned by
the verb. You can use a wild card (*) to identify multiple keys retained within the
PCICC, PCIXCC, CEX2C, or CEX3C.

Note: If an asterisk (*) is used, it must be the last character in key_label_mask.
There can only be one *.

direction: Output Type: Integer

An integer variable to receive the number of retained keys stored within all
active PCICCs, PCIXCCs, CEX2Cs, and CEX3Cs.

direction: Input/Output Type: Integer

On input this variable defines the maximum number of key labels to be
returned. On output this variable defines the total number of key labels
returned. The maximum value for this field is 100. The value returned in the
retained_keys_count variable can be larger if you have not provided for the
return of a sufficiently large number of key labels in the key_labels_count field.

direction: Output Type: String

A string variable where the key label information will be returned. This field must
be at least 64 times the key label count value. The key label information is a
string of zero or more 64-byte entries. The first 64-byte entry contains a PCICC,
PCIXCC, CEX2C, or CEX3C card serial number, and is followed by one or
more 64-byte entries that each contain a key label of a key retained within that
PCICC, PCIXCC, CEX2C, or CEX3C. The format of the first 64-byte entry is as
follows:
/nnnnnnnnnnnbbbb...bb
where
"/" is the character '/' (EBCDIC: X'61')
"nnnnnn" is the 8-byte PCICC, PCIXCC, CEX2C, or CEX3C card serial number
"bbbb...bbbb" is 55 bytes of blank pad characters
(EBCDIC: X'40')

This information (64-byte card serial number entry followed by one or more
64-byte label entries) is repeated for each active PCICC, PCIXCC, CEX2C, or
CEX3C that contains retained keys that match the key_label_mask. All data
returned is EBCDIC characters. The number of bytes of information returned is
governed by the value specified in the key_labels_count field. The key_labels
field must be large enough to hold the number of 64-byte labels specified in the
key_labels_count field plus one 64-byte entry for each active PCICC, PCIXCC,
CEX2C, or CEX3C (a maximum of 64 PCICCs, PCIXCCs, CEX2Cs, or
CEX3Cs).
Usage Notes

Not all CCA platforms may support multiple PCICC, PCIXCC, CEX2C, or CEX3C cards. In the case where only one card is supported, the `key_labels` field will contain one or more 64-byte entries that each contain a key label of a key retained within the PCICC, PCIXCC, CEX2C, or CEX3C. There will be no 64-byte entry or entries containing a PCICC, PCIXCC, CEX2C, or CEX3C card serial number.

ICSF calls RACF to check authorization to use the Retained Key List service.

ICSF caller must be authorized to the `key_label_mask` name including the `*`.

Retained private keys are domain-specific. ICSF lists only those keys that were created by the LPAR domain that issues the Retained Key List request.

The **Retained Key List** access control point controls the function of this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Retained Key List
Chapter 11. Key Data Set Management

ICSF provides key stores for symmetric and asymmetric operational key tokens. Symmetric keys tokens (AES, DES and HMAC) are stored in the Cryptographic Key Data Set (CKDS). Asymmetric keys tokens (DSS, RSA, and ECC) and trusted blocks are stored in the PKA Key Data Set (PKDS).

This topic describes the callable services that manage key tokens in the key stores.

- "PKDS Key Record Write (CSNDKRW and CSNFKRW)" on page 589

CKDS Key Record Create (CSNBKRC and CSNEKRC)

Use the CKDS key record create callable service to add a key record to the CKDS that will be used to store AES and DES tokens. The record contains a key token set to binary zeros and is identified by the label passed in the key_label parameter. This service updates both the DASD copy of the CKDS currently in use by ICSF and the in-storage copy of the CKDS.

The callable service name for AMODE(64) invocation is CSNEKRC.

Format

```plaintext
CALL CSNBKRC(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_label)
```

Parameters

return_code

Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
CKDS Key Record Create

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length

Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data

Direction: Input/Output Type: String

The data that is passed to the installation exit.

key_label

Direction: Input Type: Character string

The 64-byte label of a record in the CKDS that is the target of this service. The created record contains a key token set to binary zeros and has a key type of NULL.

Restrictions

The record must have a unique label. Therefore, there cannot be another record in the CKDS with the same label and a different key type.

This callable service does not support version X'10' external DES key tokens (RKX key tokens).

Usage Notes

The CKDS key record create callable service checks the syntax of the label provided in the key_label parameter to ensure that it follows the KGUP rules. To bypass label syntax checking, use a preprocessing exit to turn on the bypass parse bit in the Exit Parameter Control Block (EXPB). For more information about preprocessing exits and the EXPB, refer to the z/OS Cryptographic Services ICSF System Programmer's Guide.

You must use either the CKDS key record create callable service or KGUP to create an initial record in the CKDS prior to using the CKDS key record write service to update the record with a valid key token. Your applications perform better if you use KGUP to create the initial records and REFRESH the entire in-storage copy of the CKDS, rather than using CKDS key record create to create the initial NULL key entries. This is particularly true if you are creating a large number of key records. CKDS key record create adds a record to a portion of the CKDS that is searched sequentially during key retrieval. Using KGUP followed by a REFRESH puts the null key records in the portion of the CKDS that is ordered in key-label/type sequence. A binary search of the key-label/type sequenced part of the CKDS is more efficient than searching the sequentially ordered section.
CKDS Key Record Create

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Table 247. CKDS record create required hardware

<table>
<thead>
<tr>
<th>Server</th>
<th>Required cryptographic hardware</th>
<th>Restrictions</th>

</tbody>
</table>

CKDS Key Record Create2 (CSNBKRC2 and CSNEKRC2)

Use this service to add a key record to the CKDS. The record will contain a null key token or the key token supplied in the key_token parameter. The record is identified by the label passed in the key_label parameter.

The callable service name for AMODE(64) is CSNEKRC2.

Format

```cpp
CALL CSNBKRC2(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_label,
    key_token_length,
    key_token
)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  
Type: Integer
CKDS Key Record Create2

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  
Type: Integer

The number of keywords you supplied in the rule_array parameter. The value must be 0.

**rule_array**

Direction: Input  
Type: String

This parameter is ignored by ICSF.

**key_label**

Direction: Input  
Type: String

The 64-byte label of a record in the CKDS to be created.

**key_token_length**

Direction: Input  
Type: Integer

The length of the field containing the token to be written to the CKDS. If zero is specified, a null token will be added to the CKDS. The maximum value is 725.

**key_token**

Direction: Input/Output  
Type: String

A symmetric internal token to be written to the CKDS if key_token_length is non-zero. If the token supplied was encrypted under the old master key, the token will be returned encrypted under the current master key.

**Usage Notes**

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

</table>

CKDS Key Record Delete (CSNBKRD and CSNEKRD)

Use the CKDS key record delete callable service to delete a key record containing a DES or AES token from both the DASD copy of the CKDS and the in-storage copy.

The callable service name for AMODE(64) invocation is CSNEKRD.

Format

```call CSNBKRD(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_label)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.
CKDS Key Record Delete

exit_data_length
Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output  Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input  Type: Integer

The number of keywords supplied in the rule_array parameter. This number must always be 1.

rule_array
Direction: Input  Type: Character string

The 8 byte keyword that defines the action to be performed. The keyword must be LABEL-DL.

key_label
Direction: Input  Type: Character string

The 64-byte label of a record in the CKDS that is the target of this service. The record can contain an AES or a DES key token. The record pointed to by this label is deleted.

Restrictions

The record defined by the key_label must be unique. If more than one record per label is found, the service fails.

This callable service does not support version X'10' external DES key tokens (RKX key tokens).

Usage Notes

Secure key tokens cannot be processed when the master key is not loaded.

Clear AES and DES tokens can be processed on a system without a cryptographic coprocessor or accelerator.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.
CKDS Key Record Delete

CKDS Key Record Read (CSNBKRR and CSNEKRR)

Use the CKDS key record read callable service to copy an internal AES or DES key token from the in-storage CKDS to application storage. Other cryptographic services can then use the copied key token directly. The key token can also be used as input to the token copying functions of key generate, key import, or secure key import services to create additional NOCV keys.

The callable service name for AMODE(64) invocation is CSNEKRR.

Format

```call CSNBKRR(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_label,
    key_token)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.
CKDS Key Record Read

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

key_label
Direction: Input Type: Character string

The 64-byte label of a record containing an AES or DES token in the in-storage CKDS. The internal key token in this record is returned to the caller.

key_token
Direction: Output Type: String

The 64-byte internal key token retrieved from the in-storage CKDS.

Restrictions

The record defined by the key_label parameter must be unique and must already exist in the CKDS.

If the internal key token is a clear key token, the token is not returned to the caller unless the caller is in supervisor state or system key.

This callable service does not support version X'10' external DES key tokens (RKX key tokens).

Usage Notes

Clear AES and DES tokens can be processed on a system without a cryptographic coprocessor or accelerator.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

</tbody>
</table>

CKDS Key Record Read2 (CSNBKRR2 and CSNEKRR2)

Use this callable service to copy a key token from the in-storage CKDS to application storage. Other cryptographic services can then use the copied key token directly.

The callable service name for AMODE(64) is CSNEKRR2.

Format

```call
CALL CSNBKRR2(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_label,
    key_token_length,
    key_token
)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.
CKDS Key Record Read2

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X’00000000’ to X’7FFFFFFF’ (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  
Type: Integer

The number of keywords you supplied in the rule_array parameter. The value may be 0.

**rule_array**

Direction: Input  
Type: String

This parameter is ignored by ICSF.

**key_label**

Direction: Input  
Type: String

The 64-byte label of a record in the CKDS to be retrieved.

**key_token_length**

Direction: Input/Output  
Type: Integer

The length of the buffer for the output token. On input, the length of the buffer. The minimum length is 64 bytes and the maximum length is 725 bytes. On output, this parameter will be updated with the length of the token returned in the key_token parameter.

**key_token**

Direction: Output  
Type: String

The buffer into which the return key token is written.

Usage Notes

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

**CKDS Key Record Write (CSNBKRW and CSNEKRW)**

Use the CKDS key record write callable service to write an internal AES or DES key token to the CKDS record specified by the `key_label` parameter. This service supports writing a record to the CKDS which contains a key token with a control vector which is not supported by the Cryptographic Coprocessor Feature. These records will be written to the CKDS with a key type of CV, unless the key is a DES IMPORTER, EXPORTER, PINGEN, PINVER, IPINENC, or OPINENC type. These key types will be preserved in the CKDS record, even if the control vector is not supported by the Cryptographic Coprocessor Feature.

This service updates both the DASD copy of the CKDS currently in use by ICSF and the in-storage copy. The record you are updating must be unique and must already exist in both the DASD and in-storage copies of the CKDS.

This service supports writing a clear AES or DES key token with non-zero key values to the CKDS.

The callable service name for AMODE(64) invocation is CSNEKRW.

**Format**

```call
CALL CSNBKRW(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    key_token,
    key_label)
```

**Parameters**

- `return_code`
  - Direction: Output
  - Type: Integer
CKDS Key Record Write

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the **exit_data** parameter.

**exit_data**
Direction: Input/Output Type: String

The data that is passed to the installation exit.

**key_token**
Direction: Input/output Type: String

The 64-byte internal AES or DES key key token that is written to the CKDS.

**key_label**
Direction: Input Type: Character string

The 64-byte label of a record in the CKDS that is the target of this service. The record is updated with the AES or DES internal key token supplied in the **key_token** parameter.

**Restrictions**
The record defined by the **key_label** parameter must be unique and must already exist in the CKDS.

On CCF systems, writing a NOCV key-encrypting key is restricted to callers in supervisor mode or in system key.

This callable service does not support version X'10' external DES key tokens (RKX key tokens).

**Usage Notes**
With a PCIXCC, CEX2C, or CEX3C, you can write NOCV keys to the CKDS without being in supervisor state.

Secure AES tokens in the CKDS can only be overwritten by a secure AES token encrypted under the same AES master keys. The same is true for secure DES tokens.
DES tokens cannot be overwritten by an AES token. AES tokens cannot be overwritten by a DES token.

Secure key tokens cannot be processed when the master key is not loaded.

Clear AES and DES tokens can be processed on a system without a cryptographic coprocessor or accelerator.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

**Related Information**

You can use this service with the CKDS key record create callable service to write an initial record to key storage. Use it following the key import and key generate callable services to write an operational key imported or generated by these services directly to the CKDS.

**CKDS Key Record Write2 (CSNBKRW2 and CSNEKRW2)**

Use the CKDS key record write2 callable service to write an internal symmetric key token to the variable-length CKDS record specified by the key_label parameter. This service updates both the DASD copy of the CKDS currently in use by ICSF and the in-storage copy. The record you are updating must be unique and must already exist in both the DASD and in-storage copies of the CKDS.

The callable service name for AMODE(64) is CSNEKRW2.
CKDS Key Record Write2

Format

```c
CALL CSNBKRW2(
  return_code,
  reason_code,
  exit_data_length,
  exit_data,
  rule_array_count,
  rule_array,
  key_token_length,
  key_token,
  key_label
)
```

Parameters

**return_code**
- Direction: Output
- Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**
- Direction: Output
- Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**
- Direction: Input/Output
- Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**
- Direction: Input/Output
- Type: String

The data that is passed to the installation exit.

**rule_array_count**
- Direction: Input
- Type: Integer

The number of keywords you supplied in the `rule_array` parameter. The value may be 0.

**rule_array**
- Direction: Input
- Type: String

This parameter is ignored by ICSF.

**key_token_length**
CKDS Key Record Write2

Direction: Input  
Type: Integer

The length in bytes of the token to be written to the CKDS. The maximum value is 725.

**key_token**

Direction: Input/Output  
Type: String

An internal symmetric key token to be written to the CKDS. If the token supplied was encrypted under the old master key, the token will be returned encrypted under the current master key.

**key_label**

Direction: Input  
Type: String

The 64-byte label of a record in the CKDS to be overwritten.

**Usage Notes**

The Usage Notes for the CKDS Key Record Write callable service also apply to the CKDS Key Record Write2 callable service when writing fixed-length symmetric key tokens (versions X'00', X'01', and X'04').

A key token cannot be overwritten by another key token that doesn’t have the exact same algorithm and key type. For example:

- a DES key token cannot be overwritten by an AES token, and an AES key token cannot be overwritten by a DES token
- an AES HMAC token cannot be overwritten by an AES CIPHER token, and an AES CIPHER token cannot be overwritten by an AES HMAC token.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

</tbody>
</table>
Coordinated KDS Administration

Coordinated KDS Administration (CSFCRC and CSFCRC6)

Use the coordinated KDS administration callable service to perform a coordinated CKDS refresh or a coordinated CKDS master key change.

When used for master key change, applications can continue to run CKDS update workloads in parallel, and ICSF guarantees that any dynamic updates will be reflected in the target data set. For coordinated CKDS refresh, you should disable CKDS update workloads when refreshing to a target data set that is different from the currently-active CKDS. This is recommended, because updates occurring to the currently-active CKDS might not be reflected in the target data set. ICSF does not enforce manual disablement of dynamic CKDS updates prior to a coordinated refresh operation, and will itself internally suspend such updates until the coordinated refresh operation completes. Note that the recommendation to disable CKDS updates does not apply to a coordinated refresh when the target data set is the same as the currently-active CKDS. In this case, the updates to the currently-active CKDS are guaranteed to be in the resulting in-storage CKDS when the operation completes.

In a sysplex environment, this callable service enables an application to perform a coordinated sysplex-wide CKDS refresh or CKDS change master key operation from a single ICSF instance.

The callable service name for AMODE(64) invocation is CSFCRC6.

Format

```call csfccrc ( return_code, reason_code, exit_data_length, exit_data, rule_array_count, rule_array, function new_data_set_name, data_set_type, backup_data_set_name, archive_data_set_name, feedback_length, feedback )```

Parameters

**return_code**

Direction: Output  
Type: Integer  

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  
Type: Integer  

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned
Coordinated KDS Administration

exit_data_length
Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data
Direction: Ignored Type: String

This field is ignored.

rule_array_count
Direction: Input Type: Integer

The number of keywords you are supplying in the rule_array parameter. The value must be 0.

rule_array
Direction: Input Type: String

This parameter is ignored.

function
Direction: Input Type: Integer

The function to be performed by this callable service. The value must be 1 for coordinated change master key or 2 for coordinated refresh.

new_data_set_name
Direction: Input Type: String

The name of the new data set to be used by this callable service. For coordinated change master key this data set will be used to reencipher the active KDS data set, and will become the active KDS data set. For coordinated refresh this data set will become the active KDS dataset. This data set name must be a 44 character string with the data set name left justified and padded with blanks.

data_set_type
Direction: Input Type: Integer

The type of data set to be processed by the callable service. This value must be 1 for a CKDS.

backup_data_set_name
Direction: Input Type: String

The name of the backup data set to be used by this callable service when performing a coordinated change master key. This parameter is optional. If

Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.
Coordinated KDS Administration

specified, a backup copy of the reenciphered KDS will be stored in this data set. This data set name must be a 44-character string with the data set name left justified and padded with blanks.

archive_data_set_name

Direction: Input Type: String

The name of the archive data set to be used by the CRC callable service. This parameter is optional. If specified, the active KDS will be renamed to this data set name after performing the coordinated change master key or coordinated refresh to a new data set. This data set name must be a 44-character string with the data set name left justified and padded with blanks. The CRC service will take the suffix (usually .D or .DATA,/I or .INDEX) from the active KDS and apply them to the archive data set name. If the data or index name contains no suffix, or if the suffix applied to the archive data set name exceeds 44 characters, the request will be rejected.

feedback_length

Direction: Input Type: Integer

The length of the feedback field used by the callable service.

feedback

Direction: Output Type: String

A field provided by the caller for the callable service to return additional feedback in.

Usage Notes

All instances of a CKDS sysplex cluster (using the same active CKDS) must be IPLed and started in order to perform a coordinated refresh or reencipher operation. The coordinated KDS administration functions will not be queued for processing on inactive sysplex cluster members.

SAF will be invoked to verify the caller is authorized to use this callable service. The CSFCRC resource in the CSFSERV class protects access to this callable service. To access this service, callers will be required to have a UACC of update for the CSFCRC resource.

A coordinated CKDS sysplex cluster wide refresh on the active CKDS requires CKDS updates to be suspended. A refresh of the active CKDS is only required when KGUP or some other utility has altered the CKDS VSAM dataset. Updates must be suspended in this case to allow the in-storage cache of the CKDS VSAM data set to be rebuilt.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.
PKDS Key Record Create (CSNDKRC and CSNFKRC)

This callable service writes a new record to the PKDS.

The callable service name for AMODE(64) invocation is CSNFKRC.

Format

```call csndkrc (return_code, reason_code, exit_data_length, exit_data, rule_array_count, rule_array, label, token_length, token)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicates specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the reason codes.
PKDS Key Record Create

**exit_data_length**

*Direction: Input/Output Type: Integer*

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**

*Direction: Input/Output Type: String*

The data that is passed to the installation exit.

**rule_array_count**

*Direction: Input Type: Integer*

The number of keywords you are supplying in the `rule_array` parameter. This parameter is ignored by ICSF.

**rule_array**

*Direction: Input Type: String*

This parameter is ignored by ICSF.

**label**

*Direction: Input Type: String*

The label of the record to be created. A 64 byte character string.

**token_length**

*Direction: Input Type: Integer*

The length of the field containing the token to be written to the PKDS. If zero is specified, a null token will be added to the PKDS. The maximum value of `token_length` is the maximum length of a private RSA or DSS token.

**token**

*Direction: Input Type: String*

Data to be written to the PKDS if `token_length` is non-zero. An RSA, DSS, or ECC private token in either external or internal format, or a DSS, RSA, or ECC public token.

**Usage Notes**

To use this service, PKA callable services must be enabled for all RSA and DSS token types. For systems with CEX3C coprocessors, there is no PKA callable services control. The RSA master key must be valid to use this service.

To use this service for clear key ECC tokens, a current ECC master key is not required.
PKDS Key Record Create

To use this service for encrypted key ECC tokens, the ECC master key must be valid.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Table 255. PKDS key record create required hardware

<table>
<thead>
<tr>

PKDS Key Record Delete (CSNDKRD and CSNFKRD)

Use PKDS key record delete to delete a record from the PKDS.

The callable service name for AMODE(64) invocation is CSNFKRD.

Format

```
CALL CSNDKRD(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    label)
```

Parameters

**return_code**

- Direction: Output
- Type: Integer

The return code specifies the general result of the callable service. [Appendix A, ICSF and TSS Return and Reason Codes](#) lists the return codes.

**reason_code**

- Direction: Output
- Type: Integer
PKDS Key Record Delete

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicates specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length

Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data

Direction: Input/Output  Type: String

The data that is passed to the installation exit.

rule_array_count

Direction: Input  Type: Integer

The number of keywords you are supplying in the rule_array parameter. This value must be 0, or 1.

rule_array

Direction: Input  Type: String

Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deletion Mode (optional)</td>
<td>specifies whether the record is to be deleted entirely or whether only its contents are to be erased.</td>
</tr>
<tr>
<td>LABEL-DL</td>
<td>Specifies that the record will be deleted from the PKDS entirely. This is the default deletion mode.</td>
</tr>
<tr>
<td>TOKEN-DL</td>
<td>Specifies that the only the contents of the record are to be deleted. The record will still exist in the PKDS, but will contain only binary zeroes.</td>
</tr>
</tbody>
</table>

label

Direction: Input  Type: String

The label of the record to be deleted. A 64 byte character string.

Restrictions

This service cannot delete the PKDS record for a retained key.
Usage Notes
To use this service, PKA callable services must be enabled for all RSA and DSS token types. For systems with CEX3C coprocessors, there is no PKA callable services control. The RSA master key must be valid to use this service.

To use this service for clear key ECC tokens, a current ECC master key is not required.

To use this service for encrypted key ECC tokens, the ECC master key must be valid.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

PKDS Key Record Read (CSNDKRR and CSNFKRR)

Reads a record from the PKDS and returns the content of the record. This is true even when the record contains a null PKA token.

The callable service name for AMODE(64) invocation is CSNFKRR.

Format

```call ccispcf(  
   return_code,  
   reason_code,  
   exit_data_length,  
   exit_data,  
   rule_array_count,  
   rule_array,  
   label,  
   token_length,  
   token)```
PKDS Key Record Read

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicates specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**rule_array_count**

Direction: Input  
Type: Integer

The number of keywords you are supplying in the rule_array parameter. This parameter is ignored by ICSF.

**rule_array**

Direction: Input  
Type: String

This parameter is ignored by ICSF.

**label**

Direction: Input  
Type: String

The label of the record to be read. A 64 byte character string.

**token_length**

Direction: Input/Output  
Type: Integer

The length of the area to which the record is to be returned. On successful completion of this service, token_length will contain the actual length of the record returned.
PKDS Key Record Read

token

Direction: Output
Type: String

Area into which the returned record will be written. The area should be at least as long as the record.

Usage Notes

To use this service, PKA callable services must be enabled for all RSA and DSS token types. For systems with CEX3C coprocessors, there is no PKA callable services control. The RSA master key must be valid to use this service.

To use this service for clear key ECC tokens, a current ECC master key is not required.

To use this service for encrypted key ECC tokens, the ECC master key must be valid.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Table 258. PKDS key record read required hardware

</tbody>
</table>

PKDS Key Record Write (CSNDKRW and CSNFKRW)

Writes over an existing record in the PKDS.

The callable service name for AMODE(64) invocation is CSNFKRW.
PKDS Key Record Write

Format

```call csndkwr(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    label,
    token_length,
    token)
```

Parameters

**return_code**
- Direction: Output
- Type: Integer

The return code specifies the general result of the callable service. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the return codes.

**reason_code**
- Direction: Output
- Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicates specific processing problems. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the reason codes.

**exit_data_length**
- Direction: Input/Output
- Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**
- Direction: Input/Output
- Type: String

The data that is passed to the installation exit.

**rule_array_count**
- Direction: Input
- Type: Integer

The number of keywords you are supplying in the rule_array parameter. Its value must be 0 or 1.

**rule_array**
- Direction: Input
- Type: String

Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.
PKDS Key Record Write

Table 259. Keywords for PKDS Key Record Write

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write Mode (optional)</td>
<td>specifies the circumstances under which the record is to be written.</td>
</tr>
<tr>
<td>CHECK</td>
<td>Specifies that the record will be written only if a record of type NULL with the same label exists in the PKDS. If such a record exists, ICSF overwrites it. This is the default condition.</td>
</tr>
<tr>
<td>OVERLAY</td>
<td>Specifies that the record will be overwritten regardless of the current content of the record. If a record with the same label exists in the PKDS, ICSF overwrites it.</td>
</tr>
</tbody>
</table>

**label**

*Direction: Input  Type: String*

The label of the record to be overwritten. A 64 byte character string.

**token_length**

*Direction: Input  Type: Integer*

The length of the field containing the token to be written to the PKDS.

**token**

*Direction: Input  Type: String*

The data to be written to the PKDS, which is a DSS, RSA, or ECC private token in either external or internal format, or a DSS, RSA, or ECC public token.

**Restrictions**

This service cannot update a PKDS record for a retained key.

**Usage Notes**

The PKDS Key Record Write service will only overwrite NULL tokens and tokens of the same type. For example an RSA token cannot overwrite an ECC or DSS token.

To use this service, PKA callable services must be enabled for all RSA and DSA token types. For systems with CEX3C coprocessors, there is no PKA callable services control. The RSA master key must be valid to use this service.

To use this service for clear key ECC tokens, a current ECC master key is not required.

To use this service for encrypted key ECC tokens, the ECC master key must be valid.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Chapter 12. Utilities

This topic describes these callable services:

- "Character/Nibble Conversion (CSNBXBC and CSNBXCB)"
- "Code Conversion (CSNBXEA and CSNBXAE)" on page 595
- "ICSF Query Algorithm (CSFIQA and CSFIQA6)" on page 597
- "ICSF Query Facility (CSFIQF and CSFIQF6)" on page 602
- "X9.9 Data Editing (CSNB9ED)" on page 621

Note: These services are not dependent on the hardware. They will run on any server.

Character/Nibble Conversion (CSNBXBC and CSNBXCB)

Use these utilities to convert a binary string to a character string (CSNBXBC) or convert a character string to a binary string (CSNBXCB).

These utilities do not support invocation in AMODE(64).

Format

CALL CSNBXBC(
   return_code,
   reason_code,
   exit_data_length,
   exit_data,
   text_length,
   source_text,
   target_text,
   code_table)

CALL CSNBXCB(
   return_code,
   reason_code,
   exit_data_length,
   exit_data,
   text_length,
   source_text,
   target_text,
   code_table)

Parameters

return_code
Direction: Output
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output
Type: Integer
Character/Nibble Conversion

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length
Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data
Direction: Ignored Type: String

This field is ignored.

text_length
Direction: Input/Output Type: Integer

On input, the text_length contains an integer that is the length of the source_text. The length must be a positive nonzero value. On output, text_length is updated with an integer that is the length of the target_text.

source_text
Direction: Input Type: String

This parameter contains the string to convert.

target_text
Direction: Output Type: String

The converted text that the callable service returns.

code_table
Direction: Input Type: String

A 16-byte conversion table. The code table for binary to EBCDIC conversion is X'F0F1F2F3F4F5F6F7F8F9C1C2C3C4C5C6'.

Usage Notes

These services are structured differently from the other services. They run in the caller's address space in the caller's key and mode.

ICSF need not be active for you to run either of these services. No pre- or post-processing exits are enabled for these services, and no calls to RACF are issued when you run these services.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

</tbody>
</table>

**Code Conversion (CSNBXEA and CSNBXAE)**

Use these utilities to convert ASCII data to EBCDIC data (CSNBXAE) or EBCDIC data to ASCII data (CSNBXEA).

These utilities do not support invocation in AMODE(64).

**Format**

```assembly
CALL CSNBXAE(  return_code,  reason_code,  exit_data_length,  exit_data,  text_length,  source_text,  target_text,  code_table)
```

```assembly
CALL CSNBXEA(  return_code,  reason_code,  exit_data_length,  exit_data,  text_length,  source_text,  target_text,  code_table)
```

**Parameters**

- **return_code**
  - Direction: Output
  - Type: Integer
The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

**Direction:** Output  **Type:** Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

**Direction:** Ignored  **Type:** Integer

This field is ignored. It is recommended to specify 0 for this parameter.

**exit_data**

**Direction:** Ignored  **Type:** String

This field is ignored.

**text_length**

**Direction:** Input  **Type:** Integer

The `text_length` contains an integer that is the length of the `source_text`. The length must be a positive nonzero value.

**source_text**

**Direction:** Input  **Type:** String

This parameter contains the string to convert.

**target_text**

**Direction:** Output  **Type:** String

The converted text that the callable service returns.

**code_table**

**Direction:** Input  **Type:** String

A 256-byte conversion table. To use the default code table, you need to pass a full word of hexadecimal zero's. See Appendix G, "EBCDIC and ASCII Default Conversion Tables," on page 891 for contents of the default table.

**Note:** The Transaction Security System code table has 2 additional 8-byte fields that are not used in the conversion process. ICSF accepts either a 256-byte or a 272-byte code table, but uses only the first 256 bytes in the conversion.

**Usage Notes**

These services are structured differently than the other services. They run in the caller's address space in the caller's key and mode. ICSF need not be active for...
you to run either of these services. No pre- or post-processing exits are enabled for these services, and no calls to RACF are issued when you run these services.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

**Table 262. Code conversion required hardware**

</tbody>
</table>

**ICSF Query Algorithm (CSFIQA and CSFIQA6)**

Use this utility to retrieve information about the cryptographic and hash algorithms available. You can control the amount of data that is returned by passing in `rule_array` keywords. Keyword values describe the cryptographic algorithm or hash algorithm you are interested in.

The service returns a table of information in the `returned_data` parameter. A row of data consists of the algorithm name, the algorithm size, whether or not clear or secure keys are supported and what method ICSF will use to satisfy a request - CPU instructions, a cryptographic accelerator, a cryptographic coprocessor, or software. The service updates the `returned_data_length` field with the actual length of the output `returned_data` field.

The callable service name for AMODE (64) invocation is CSFIQA6.

**Format**

```call csfiqa("
  return_code,
  reason_code,
  exit_data_length,
  exit_data,
  rule_array_count,
  rule_array,
  returned_data_length,
  returned_data,
  reserved_data_length,
  reserved_data)
```
Parameters

**return_code**
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

**reason_code**
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

**exit_data_length**
Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

**exit_data**
Direction: Ignored Type: String

This field is ignored.

**rule_array_count**
Direction: Input Type: Integer

The number of keywords you are supplying in rule_array. Value must be 0 or 1.

**rule_array**
Direction: Input Type: String

Keywords that provide control information to the callable service. The keywords must be 8 bytes of contiguous storage with the keyword left-justified in its 8-byte location and padded on the right with blanks.

Table 263. Keywords for ICSF Query Algorithm

#### returned_data_length

**Direction:** Input/Output  
**Type:** Integer

The length of the returned_data parameter. Currently, the value must be large enough to handle the request. Allow additional space for future enhancements. On output, this field will contain the actual length of the data returned.

#### returned_data

**Direction:** Output  
**Type:** String

This field will contain the table output from the service. Depending on the contents of rule_array, multiple rows may be returned. One row in the table contains:

### Table 264. Output for ICSF Query Algorithm

<table>
<thead>
<tr>
<th>Offset (hex)</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
### ICSF Query Algorithm

**Table 264. Output for ICSF Query Algorithm (continued)**

<table>
<thead>
<tr>
<th>Field (Hex)</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 (X'0')</td>
<td>Algorithm</td>
<td>An 8-byte EBCDIC character string containing the name of the cryptographic algorithm. The character string is padded on the right with blanks. Possible values are: AES, DES (single length DES), DSS, ECC-PRIM, ECC-BP (Brain Pool), HMAC, MDC-2, MDC-4, MD5, RNGL, RPMD-160, RSA-GEN, RSA-KM, RSA-SIG, SHA-1, SHA-2, TDES (double and triple length DES)</td>
</tr>
<tr>
<td>8 (X'8')</td>
<td>Size</td>
<td>An 8-byte EBCDIC string representing the maximum key, modulus, p value, or hash size. The string is padded with blanks on the right. The size is in bits. This is true for all algorithms except RNGL. For RNGL, the size is in bytes.</td>
</tr>
<tr>
<td>16 (X'10')</td>
<td>Key Security</td>
<td>An 8-byte EBCDIC character string containing the string CLEAR, SECURE, NA. The string is padded on the right with blanks.</td>
</tr>
<tr>
<td>24(X'18')</td>
<td>Implementation</td>
<td>An 8-byte EBCDIC character string containing how the algorithm is implemented. The string is padded on the right with blanks. Possible choices are: ACC - Cryptographic Accelerator, CCF - CCF, COP - Cryptographic Coprocessor, CPU - CPACF, SW - Software</td>
</tr>
</tbody>
</table>

The rows are sorted in the following order:
- Algorithm name - alphabetically A to Z
- Algorithm size - numerically highest to least
- Key security - alphabetically A to Z
- Implementation - alphabetically A to Z

**reserved_data_length**

Direction: Input  Type: Integer

The length of the reserved_data parameter. Currently, the value must be 0.
Usage Notes

The `rule_array` keyword allows the caller to select how much information is returned. The returned data can describe all cryptographic support on the base system or it can be filtered by an algorithm.

For example, a `rule_array_count` of 0 will return information about all algorithms and key security. A `rule_array_count` of 1 and a keyword of 'AES' will return information about the AES algorithm support, both clear and secure AES keys.

Only cryptographic coprocessors in the active state are queried.

In general, a key security of SECURE implies that both SECURE and CLEAR key versions of the algorithm are supported by the processor or the cryptographic coprocessor. The exception is TDES support in CCF on a z900. Only SECURE TDES keys are supported.

This service lists an algorithm as being supported when the cryptographic coprocessor or accelerator is capable of performing the function. It does not reflect when an algorithm is unavailable because TKE was used to disable the function.

RNGL keyword refers to the Random Number Generate Long (CSFBRNGL) callable service. The following is returned for implementation:

- COP - when RNGL is implemented using the RNGL verb in the cryptographic coprocessor.
- CCF - when RNGL is implemented using the CCF random number generate function (z900 machines)
- SW - when RNGL is implemented using a loop around the RNG verb in the cryptographic coprocessor, creating the random number 8 bytes at a time.

When a row of the `returned_data` table contains a Key Security value of SECURE and an Implementation value of CPU, this indicates that the CSNBSYE and CSNBSYD callable services support the use of key labels for encrypted keys stored in the CKDS. In other words, the required functions in ICSF, CPACF and the cryptographic coprocessor are available.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

<table>
<thead>
<tr>
<th>Server</th>
<th>Required cryptographic hardware</th>

#### ICSF Query Facility (CSFIQF and CSFIQF6)

Use this utility to retrieve information about ICSF, the cryptographic coprocessors and the CCA code in the coprocessors. This information includes:

- general information about ICSF
- general information about CCA code in a coprocessor
- export control information from a coprocessor
- diagnostic information from a coprocessor

Coprocessor information requests may be directed to a specific ONLINE or ACTIVE coprocessor or any ACTIVE coprocessor.

This service has an interface similar to the IBM 4758 service CSUACFQ. Instead of the output being returned in the rule array, there is a separate output area. The format of the data returned remains the same. This service supports a subset of the keywords supported by CSUACFQ. For the same supported keywords, CSFIQF and CSUACFQ return the same coprocessor-specific information. The service returns information elements in the `returned_data` field and updates the `returned_data_length` with the actual length of the output `returned_data` field.

The callable service name for AMODE(64) invocation is CSFIQF6.

#### Format

```call
CALL CSFIQF(
   return_code,
   reason_code,
   exit_data_length,
   exit_data,
   rule_array_count,
   rule_array,
   returned_data_length,
   returned_data,
   reserved_data_length,
   reserved_data)
```
Parameters

return_code

Direction: Output  Type: Integer

The return code specifies the general result of the callable service. The return codes are listed in Appendix A, “ICSF and TSS Return and Reason Codes”.

reason_code

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. The reason codes are listed in Appendix A, “ICSF and TSS Return and Reason Codes”.

exit_data_length

Direction: Ignored  Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data

Direction: Ignored  Type: String

This field is ignored.

rule_array_count

Direction: Input  Type: Integer

The number of keywords you are supplying in rule_array. Value must be 1 or 2.

rule_array

Direction: Input  Type: String

Keywords that provide control information to callable services. The keywords are left-justified in an 8-byte field and padded on the right with blanks. The keywords must be in contiguous storage. Specify one or two of the values in Table 266.

Table 266. Keywords for ICSF Query Service

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coprocessor (optional) - parameter is ignored for ICSFSTAT.</td>

</tbody>
</table>

returned_data_length
Direction: Input/Output  Type: Integer

The length of the returned_data parameter. Currently, the value must be at least eight times the number of elements returned for the rule_array keyword specified. Allow additional space for future enhancements. On output, this field will contain the actual length of the data returned.

returned_data
Direction: Output  Type: String/Integer

This field will contain the output from the service. The format of the output depends on the rule_array keyword. The format of the data is defined in the tables below, which describe the output for each keyword.

When the format is 8-byte elements that contain numbers, those numbers are represented by numeric characters which are left-justified and padded on the right with space characters. For example, a returned_data element which contains the number two will contain the character string '2 '.

For option NUM-DECT, the output is a 4-byte integer.

For ICSFSTAT, the coprocessor keyword is ignored. The output returned_data for the ICSFSTAT keyword is defined in Table 267 on page 605.

The second character in this string indicates if Duplicate Key Token Checking controls have been enabled for the CKDS. The numbers that can appear in the second character of this string are:

<table>
<thead>
<tr>
<th>Number</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Duplicate Key Token Checking is not enabled for the CKDS.</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Duplicate Key Token Checking is enabled for the CKDS. <strong>Key Store Policy is active for CKDS.</strong></td>
<td></td>
</tr>
</tbody>
</table>
The third character in this string indicates if Key Token Authorization Checking controls have been enabled for the PKDS in either warning or fail mode, and, if so, if the Default Key Label Checking control has also been enabled. The numbers that can appear in the third character of this string are:

<table>
<thead>
<tr>
<th>Number</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Key Token Authorization Checking is not enabled for the PKDS.</td>
</tr>
<tr>
<td>1</td>
<td>Key Token Authorization Checking for PKDS is enabled in FAIL mode. <strong>Key Store Policy is active for PKDS.</strong> Default Key Label Checking is not enabled.</td>
</tr>
<tr>
<td>2</td>
<td>Key Token Authorization Checking for PKDS is enabled in WARN mode. <strong>Key Store Policy is active for PKDS.</strong> Default Key Label Checking is not enabled.</td>
</tr>
<tr>
<td>3</td>
<td>Key Token Authorization Checking for PKDS is enabled in FAIL mode. <strong>Key Store Policy is active for PKDS.</strong> Default Key Label Checking is also enabled.</td>
</tr>
<tr>
<td>4</td>
<td>Key Token Authorization Checking for PKDS is enabled in WARN mode. <strong>Key Store Policy is active for PKDS.</strong> Default Key Label Checking is also enabled.</td>
</tr>
</tbody>
</table>

The fourth character in this string indicates if Duplicate Key Token Checking controls have been enabled for the PKDS. The numbers that can appear in the fourth character of this string are:

<table>
<thead>
<tr>
<th>Number</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Duplicate Key Token Checking is not enabled for the PKDS.</td>
</tr>
<tr>
<td>1</td>
<td>Duplicate Key Token Checking is enabled for the PKDS. <strong>Key Store Policy is active for PKDS.</strong></td>
</tr>
</tbody>
</table>
The fifth character in this string indicates if Granular Key Label Access controls have been enabled in WARN or FAIL mode. The numbers that can appear in the fifth character of this string are:

<table>
<thead>
<tr>
<th>Number</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Granular Key Label Access controls are not enabled.</td>
</tr>
<tr>
<td>1</td>
<td>Granular Key Label Access control is enabled in FAIL mode</td>
</tr>
<tr>
<td>2</td>
<td>Granular Key Label Access control is enabled in WARN mode</td>
</tr>
</tbody>
</table>

The sixth character in this string indicates if Symmetric Key Label Export controls have been enabled for AES and/or DES keys. The numbers that can appear in the sixth character of this string are:

<table>
<thead>
<tr>
<th>Number</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Symmetric Key Label Export controls are not enabled.</td>
</tr>
<tr>
<td>1</td>
<td>Symmetric Key Label Export control is enabled for DES keys only.</td>

reserved_data_length

Direction: Input  
Type: Integer

The length of the reserved_data parameter. Currently, the value must be 0.

reserved_data

Direction: Input  
Type: String

This field is currently not used.

Usage Notes

RACF will be invoked to check authorization to use this service.

PKA key generate available indicates the PKA callable services are enabled and there is at least one ACTIVE coprocessor.

The options ICSFSTAT and ICSFST2 report on the state of PKA callable services. ICSFSTAT reports it in element 2. ICSFST2 reports it in elements 3 and 11. There is a subtle difference between the three options. ICSFSTAT reports PKA callable services as enabled only after the DES master key is loaded and valid. ICSFSTAT does not report PKA callable services as enabled when only the AES master key is loaded and valid. Option ICSFST2 element 3 reports PKA callable services as enabled when the DES and/or AES master key is loaded and valid. Option ICSFST2 element 11 reports PKA callable services as enabled when neither the DES nor AES master keys are loaded and valid.

Note: If your system has CEX3C coprocessors, the PKA callable services control will not be available. The PKA callable services state will be the same as the RSA master key. If the RSA master key is active, the PKA callable services will be enabled in the ICSFSTAT and ICSFST2 reports.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

### X9.9 Data Editing (CSNB9ED)

Use this utility to edit an ASCII text string according to the editing rules of ANSI X9.9-4. It edits the text that the `source_text` parameter supplies according to these rules. The rules are listed here in the order in which they are applied. It returns the result in the `target_text` parameter.

1. This service replaces each carriage-return (CR) character and each line-feed (LF) character with a single-space character.
2. It replaces each lowercase alphabetic character (a through z) with its equivalent uppercase character (A through Z).
3. It deletes all characters other than:
   - Alphabets A...Z
   - Numerics 0...9
   - Space
   - Comma ,
   - Period .
   - Dash -
   - Solidus /
   - Asterisk *
   - Open parenthesis (
   - Close parenthesis )
4. It deletes all leading space characters.
5. It replaces all sequences of two or more space characters with a single-space character.

This utility does not support invocation in AMODE(64).

### Format

```call
CALL CSNB9ED(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    text_length,
    source_text,
    target_text)
```
X9.9 Data Editing

Parameters

**return_code**
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

**reason_code**
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that are assigned to it that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

**exit_data_length**
Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

**exit_data**
Direction: Ignored Type: String

This field is ignored.

**text_length**
Direction: Input/Output Type: Integer

On input, the text_length contains an integer that is the length of the source_text. The length must be a positive, nonzero value. On output, text_length is updated with an integer that is the length of the edited text.

**source_text**
Direction: Input Type: String

This parameter contains the string to edit.

**target_text**
Direction: Output Type: String

The edited text that the callable service returns.

Usage Notes

This service is structured differently from the other services. It runs in the caller's address space in the caller's key and mode.
X9.9 Data Editing

ICSF need not be active for the service to run. There are no pre-processing or post-processing exits that are enabled for this service. While running, this service does not issue any calls to RACF.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Chapter 13. Trusted Key Entry Workstation Interfaces

The Trusted Key Entry (TKE) workstation is an optional feature. It offers an alternative to clear key entry. You can use the TKE workstation to load:

- DES master keys, PKA master keys, and operational keys in a secure way. CCF only supports Operational Transport and PIN keys. On the PCIXCC and CEX2C, all operational keys may be loaded with TKE V4.1 or higher. On the CEX3C, all operational keys may be loaded with TKE 6.0 or higher.
- DES-MK and ASYM-MK master keys on the PCICC, PCIXCC, CEX2C, and CEX3C.
- AES-MK master key and operational key are supported on the z9 and z10 systems with the Nov. 2008 or later licensed internal code (LIC)

This topic describes these callable services:

- "PCI Interface Callable Service (CSFPCI and CSFPCI6)"
- "PKSC Interface Callable Service (CSFPKSC)" on page 629

PCI Interface Callable Service (CSFPCI and CSFPCI6)

TKE uses this callable service to send a request to a specific PCI card queue and remove the corresponding response when complete. This service also allows the TKE workstation to query the list of access control points which may be enabled or disabled by a TKE user. This service is synchronous. The return and reason codes reflect the success or failure of the queue functions rather than the success or failure of the actual PCI request.

The callable service name for AMODE(64) invocation is CSFPCI6.

Format

```
CALL CSFPCI(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    target_pci_coprocessor,
    target_pci_coprocessor_serial_number,
    request_block_length,
    request_block,
    request_data_block_length,
    request_data_block,
    reply_block_length,
    reply_block,
    reply_data_block_length,
    reply_data_block,
    masks_length,
    masks_data)
```

Parameters

- `return_code`
  Direction: Output  
  Type: Integer
PCI Interface

The return code specifies the general result of the callable service. See Appendix A, "ICSF and TSS Return and Reason Codes," for a list of return codes.

reason_code

Direction: Output
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. See Appendix A, "ICSF and TSS Return and Reason Codes" for a list of reason codes.

exit_data_length

Direction: Input/Output
Type: Integer

The length of the data that is passed to the installation exit. The length can be from 'X'00000000' to 'X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data

Direction: Input/Output
Type: String

The data that is passed to the installation exit.

rule_array_count

Direction: Input
Type: Integer

The number of keywords you are supplying in rule_array. The value must be 1.

rule_array

Direction: Input
Type: String

Keyword that provides control information to callable services. The keyword is left-justified in an 8-byte field and padded on the right with blanks. The keyword must be in contiguous storage. These keywords are mutually exclusive:

Table 282. Keywords for PCI Interface Callable Service

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACPOINTS</td>
<td>Queries the list of access control points which may be enabled or disabled by a TKE user.</td>
</tr>
<tr>
<td>ACTIVECP</td>
<td>This keyword is a request to call the PCI card initialization code to revalidate the PCI cards. When the PCI card initialization is completed, both the 64-bit mask indicating which of the PCI cards are online and 64-bit mask indicating which of the PCI cards are active will be returned. This keyword is used by the TKE workstation code after the ACTIVATE portion of the domain zeroize command. This is to ensure that the status of the PCI card is accurately reflected to the users. See the masks_data parameter description for more information.</td>
</tr>
<tr>
<td>APNUM</td>
<td>Specifies the target_pci_coprocessor field to be used.</td>
</tr>
<tr>
<td>SERIALNO</td>
<td>Specifies the target_pci_coprocessor_number field to be used.</td>
</tr>
</tbody>
</table>
Table 282. Keywords for PCI Interface Callable Service (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>PCIMASKS</td>
<td>This keyword is a request to return both the 64-bit mask indicating which of the PCI cards are online and 64-bit mask indicating which of the PCI cards are active. See the masks_data parameter description for more information.</td>
</tr>
<tr>
<td>XCPMASK</td>
<td>This keyword is a request to return both the 64-bit mask indicating which of the PCIXCCs, CEX2Cs, and CEX3Cs are online and the 64-bit mask indicating which of the PCIXCCs, CEX2Cs, and CEX3Cs are active. See the masks_data parameter description for more information.</td>
</tr>
<tr>
<td>CX2MASK</td>
<td>This keyword is a request to return both the 64-bit mask indicating which of the CEX2Cs are online and the 64-bit mask indicating which of the CEX2Cs are active. See the masks_data parameter description for more information.</td>
</tr>
<tr>
<td>CX3MASK</td>
<td>This keyword is a request to return both the 64-bit mask indicating which of the CEX3Cs are online and the 64-bit mask indicating which of the CEX3Cs are active. See the masks_data parameter description for more information.</td>
</tr>
</tbody>
</table>

**Note:** When the PCIMASKS, ACTIVECP, XCPMASK, CX2MASK and CX3MASK keywords are specified, the request_data_block_length, request_data_block, reply_data_block_length, and the reply_data_block parameters are ignored.

**target_pci_coprocessor**

Direction: Input  Type: Integer

The PCICC, PCIXCC, CEX2C, or CEX3C card to which this request is directed. Valid values are between 0 and 64.

**target_pci_coprocessor_serial_number**

Direction: Input/Output  Type: String

The PCICC, PCIXCC, CEX2C, or CEX3C card serial number to which the request is directed. This parameter may be used instead of the target_pci_coprocessor. The length is 8 bytes. This parameter is updated with the serial number of the card if the request was successfully processed.

**request_block_length**

Direction: Input  Type: Integer

Length of CPRB and the request block in the request_block field. The maximum length allowed is 5,500 bytes.

**request_block**

Direction: Input  Type: String

PCICC, PCIXCC, CEX2C, or CEX3C command or query request for the target PCICC, PCIXCC, CEX2C, or CEX3C. This is the complete CPRB and request block to be processed by the PCICC, PCIXCC, CEX2C, or CEX3C.

**request_data_block_length**
Direction: Input Type: Integer

Length of request data block in the request_data_block field. The maximum length allowed is 6,400 bytes. The length field must be a multiple of 4.

request_data_block

Direction: Input Type: String

The data that accompanies the request_block field.

reply_block_length

Direction: Input/Output Type: Integer

Length of CPRB and the reply block in the reply_block field. The maximum length allowed is 5,500 bytes. This field is updated on output with the actual length of the reply_block field.

reply_block

Direction: Output Type: String

Reply from the target PCICC, PCIXCC, CEX2C, or CEX3C. This is the CPRB and reply block that has been processed by the PCICC, PCIXCC, CEX2C, or CEX3C.

reply_data_block_length

Direction: Input/Output Type: Integer

Length of reply block in the reply_data_block field. The maximum length allowed is 6,400 bytes. This field is updated on output with the actual length of the reply_data_block field. This length field must be a multiple of 4. For the ACPOINTS keyword, the minimum length is 2572 bytes.

reply_data_block

Direction: Output Type: String

The data that accompanies the reply_block field.

masks_length

Direction: Input Type: Integer

Length of the reply data being returned in the masks_data field. The length must be 32 bytes. This field is only valid when the input rule_array keyword is PCIMASKS, ACTIVECP XCPMASK, CX2MASK, CX3MASK. For all other rule_array keywords, this field is ignored.

masks_data

Direction: Output Type: String

The data being returned for all requests. The first 8 bytes indicate the count of the PCI cards online. The second 8 bytes indicate a bit mask of the actual PCI cards brought online. The third 8 bytes indicate the count of the PCI cards
active. The fourth 8 bytes indicate a bit mask of the actual PCI cards that are active. For the ACTIVECP keyword, if the PCI card initialization failed, the appropriate return code and reason code is issued and the masks_data field will contain zeros.

Usage Notes

The target_pci_coprocessor, the target_pci_coprocessor_serial_number, the request_block, the reply_block, the request_block_data_block, and the reply_block_data_block, are recorded in SMF Record Type 82, subtype 16.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

PKSC Interface Callable Service (CSFPKSC)

Restriction: This service is only supported on the IBM @server zSeries 900.

TKE uses this callable service to send a request to a specific cryptographic module and receive a corresponding response when processing is complete. The service is synchronous. Note that the return and reason codes reflect the success or failure of CSFPKSC's interaction with the cryptographic module rather than the success or failure of the cryptographic module request. The response block contains the results of the cryptographic module request.

This service does not support invocation in AMODE(64).
PKSC Interface

Format

```
CALL CSFPKSC(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    target_crypto_module,
    request_length,
    request,
    response)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, ICSF and TSS Return and Reason Codes](#) lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code can have different reason codes that indicate specific processing problems. [Appendix A, ICSF and TSS Return and Reason Codes](#) lists the reason codes.

**exit_data_length**

Direction: Input/Output  
Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**

Direction: Input/Output  
Type: String

The data that is passed to the installation exit.

**target_crypto_module**

Direction: Input  
Type: Integer

Cryptographic module to which this request is directed. Value is 0 or 1.

**request_length**

Direction: Input  
Type: Integer

Length of request message in the `request` field. The maximum length allowed is 1024 bytes.

**request**
PKSC Interface

Direction: Input  Type: String
PKSC command or query request for the target cryptographic module. This is the complete architected command or query for the cryptographic module to process.

response
Direction: Output  Type: String
Area where the PKSC response from the target cryptographic module is returned to the caller. The area returned can be up to 512 bytes.

Usage Notes

The format and content of the PKSC request and response areas are proprietary IBM hardware information that may be licensed. Customers interested in this information may contact the IBM Director of Licensing. For the address, refer to Notices.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

PKSC Interface
Chapter 14. Managing Keys According to the ANSI X9.17 Standard

This topic describes the callable services that support the ANSI X9.17 key management standard:

- "ANSI X9.17 EDC Generate (CSNAEGN and CSNGEGN)"
- "ANSI X9.17 Key Export (CSNAKEX and CSNGKEX)" on page 635
- "ANSI X9.17 Key Import (CSNAKIM and CSNGKIM)" on page 640
- "ANSI X9.17 Key Translate (CSNAKTR and CSNGKTR)" on page 645
- "ANSI X9.17 Transport Key Partial Notarize (CSNATKN and CSNGTKN)" on page 650

These services are only supported on an IBM @server zSeries 900.

These callable services, that are described in other topics of this publication, also support the ANSI X9.17 key management standard:

- "Key Generate (CSNBKGN and CSNEKGN)" on page 135
- "Key Part Import (CSNBKPI and CSNEKPI)" on page 160
- "Key Token Build (CSNBKTB and CSNEKTB)" on page 181

ANSI X9.17 EDC Generate (CSNAEGN and CSNGEGN)

Use the ANSI X9.17 EDC generate callable service to generate an error detection code (EDC) on a text string. The service calculates the EDC by by using a key value of X'0123456789ABCDEF' to generate a MAC on the specified text string, as defined by the ANSI X9.17 standard.

Restriction: This service is only supported on an IBM @server zSeries 900.

The callable service name for AMODE(64) invocation is CSNGEGN.

Format

```
CALL CSNAEGN(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    text_length,
    text,
    chaining_vector,
    EDC)
```

Parameters

return_code

Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
ANSI X9.17 EDC Generate

Direction: Output                  Type: Integer

The reason code specifies the result of the callable service that is returned to
the application program. Each return code has different reason codes that are
assigned to it that indicate specific processing problems. Appendix A, "ICSF and
TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Input/Output              Type: Integer

The length of the data that is passed to the installation exit. The length can be
from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the
exit_data parameter.

exit_data
Direction: Input/Output              Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input                    Type: Integer

The number of keywords you supplied in the rule_array parameter. The value
must be 0.

rule_array
Direction: Input                    Type: String

Keywords that provide control information to the callable service. Currently there
are no keywords that are defined for this variable, but you must declare the
variable. To do so, declare an area of blanks of any length.

text_length
Direction: Input                    Type: Integer

The length of the user-supplied text parameter for which the service should
calculate the EDC.

text
Direction: Input                    Type: String

The application-supplied text field for which the service is to generate the EDC.

chaining_vector
Direction: Input/Output              Type: String

An 18-byte string that ICSF uses as a system work area. The chaining vector
permits data to be chained from one call to another. ICSF ignores the
information in this field, but you must declare an 18-byte string.

EDC
ANSI X9.17 EDC Generate

Direction: Output Type: String

A 9-byte field where the callable service returns the EDC generated as two
groups of four ASCII-encoded hexadecimal characters that are separated by an
ASCII space character.

Usage Notes

The ANSI X9.17 standard states that for EDC, prior to the service generating the
MAC the caller must first edit the input text according to topic 4.3 of ANSI
X9.9-1982. It is the caller’s responsibility to do the editing prior to calling the ANSI
X9.17 EDC generate service. If the supplied text is not a multiple of 8, the service
pads the text with X'00' up to a multiple of 8, as specified in ANSI X9.9-1.

To use this service you must have the ANSI system keys installed in the CKDS.

This table lists the required cryptographic hardware for each server type and
describes restrictions for this callable service.

Table 285. ANSI X9.17 EDC generate required hardware

ANSI X9.17 Key Export (CSNAKEX and CSNGKEX)

Use the ANSI X9.17 key export callable service to export a DATA key or a pair of
DATA keys, along with an ANSI key-encrypting key (AKEK), using the ANSI X9.17
protocol. This service converts a single DATA key, or combines two DATA keys, into
a single MAC key. You can use the MAC key in either, or both, the MAC generation,
or MAC verification service to authenticate the service message. In addition, this
service also supports the export of a CCA IMPORTER or EXPORTER KEK.

If you export only DATA keys, the DATA keys are exported encrypted under the
specified transport AKEK. You have the option of applying the ANSI X9.17 key
offset or key notarization process to the transport AKEK.

If you export both DATA keys and an AKEK, the DATA keys are exported encrypted
under the key-encrypting key that is also being exported. The AKEK is exported
encrypted under the specified transport AKEK. You have the option of applying the
ANSI X9.17 key offset or key notarization process to the transport AKEK. The ANSI
ANSI X9.17 Key Export

X9.17 key offset process is applied to the source AKEK. Use the CKT keyword to specify whether to use an offset of 0 or 1. Use an offset of 0 when sending the DATA key to a key translation center along with a transport AKEK.

Note: You must create the cryptographic service message and maintain the offset counter value that is associated with the AKEK.

Restriction: This service is only supported on an IBM server zSeries 900.

The callable service name for AMODE(64) invocation is CSNGKEX.

Format

```call csnakex(
  return_code,
  reason_code,
  exit_data_length,
  exit_data,
  rule_array_count,
  rule_array,
  origin_identifier,
  destination_identifier,
  source_data_key_1_identifier,
  source_data_key_2_identifier,
  source_key_encrypting_key_identifier,
  transport_key_identifier,
  outbound_kek_count,
  target_data_key_1,
  target_data_key_2,
  target_key_encrypting_key,
  mac_key_token)
```

Parameters

**return_code**

Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicates specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Input/Output  Type: Integer

The length of the data that is passed to the installation exit. The length can be from 'X'00000000' to 'X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

**exit_data**
ANSI X9.17 Key Export

Direction: Input/Output Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. The value can be 0 to 4. If you specify 0, the callable service does not perform either notarization or offset.

rule_array
Direction: Input Type: String

Zero to four keywords that provide control information to the callable service. See the list of keywords in Table 286. The keywords must be in 8 to 32 bytes of contiguous storage. Left-justify each keyword in its own 8-byte location and pad on the right with blanks. You must specify this parameter even if you specify no keyword.

Table 286. Keywords for ANSI X9.17 Key Export Rule Array

Table 286. Keywords for ANSI X9.17 Key Export Rule Array (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKT</td>
<td>Valid only when a key-encrypting key is being exported along with a DATA key. If this keyword is specified, any DATA keys being exported are encrypted under the key-encrypting key using an offset value of 0. If this keyword is not specified (this is the default), any DATA keys being exported are encrypted under the key-encrypting key using an offset value of 1. The CKT keyword is not valid with CCA-IMP or CCA-EXP keywords.</td>
</tr>
</tbody>
</table>

**origin_identifier**

Direction: Input  
Type: String

This parameter is valid if the NOTARIZE keyword is specified. It specifies an area that contains a 16-byte string that contains the origin identifier that is defined in the ANSI X9.17 standard. The string must be ASCII characters, left-justified, and padded on the right by space characters. This parameter must be a minimum of four, non-space characters. ICSF ignores this parameter if you specify the OFFSET or CPLT-NOT keyword in the `rule_array` parameter.

**destination_identifier**

Direction: Input  
Type: String

This parameter is valid if the NOTARIZE keyword is specified. It specifies an area that contains a 16-byte string. The 16-byte string contains the destination identifier that is defined in the ANSI X9.17 standard. The string must be ASCII characters, left-justified, and padded on the right by space characters. This parameter must be a minimum of four, non-space characters. ICSF ignores this parameter if you specify the OFFSET or CPLT-NOT keyword in the `rule_array` parameter.

**source_data_key_1_identifier**

Direction: Input/Output  
Type: String

A 64-byte area that contains an internal token, or the label of a CKDS entry that contains a DATA key. ICSF ignores this field if you specify CCA-EXP or CCA-IMP in the `rule_array` parameter.

**source_data_key_2_identifier**

Direction: Input/Output  
Type: String

A 64-byte area that contains an internal token, or the label of a CKDS entry that contains a DATA key. This parameter is valid only if you specify 2-KD, 2-KD+KK, or 2-KD+*KK as the source key rule keyword on the `rule_array` parameter. ICSF ignores this parameter if you specify other source key rule keywords, or if you specify CCA-EXP or CCA-IMP in the `rule_array` parameter.

**source_key_encrypting_key_identifier**

Direction: Input/Output  
Type: String
ANSI X9.17 Key Export

A 64-byte area that contains an internal token, or the label of a CKDS entry that contains either an AKEK, a CCA IMPORTER, or a CCA EXPORTER key. If this parameter contains an AKEK, you must specify 1-KD+KK, 2-KD+KK, 1-KD+*KK, or 2-KD+*KK for the source key rule on the rule_array parameter. If this parameter contains a CCA IMPORTER or CCA EXPORTER key, you must specify CCA-IMP or CCA-EXP, respectively, for the source key rule on the rule_array parameter. ICSF ignores this field if you specify any other source key rule keywords.

transport_key_identifier

Direction: Input/Output  Type: String

A 64-byte area that contains either an internal token or a label that refers to an internal token for an AKEK.

outbound KEK_count

Direction: Input  Type: String

An 8-byte area that contains an ASCII count that is used in the notarization process. The count is an ASCII character string, left-justified, and padded on the right by ASCII space characters. ICSF interprets a single ASCII space character as a zero counter. The maximum value is 99999999.

target_data_key_1

Direction: Output  Type: String

A 16-byte area where the exported data key 1 is returned. The enciphered key is an ASCII-encoded hexadecimal string.

target_data_key_2

Direction: Output  Type: String

A 16-byte area where the exported data key 2 is returned. The enciphered key is an ASCII-encoded hexadecimal string. This key is returned if 2-KD, 2-KD+KK, or 2-KD+*KK is specified in the rule_array parameter.

target_key_encrypting_key

Direction: Output  Type: String

If the rule_array parameter specifies 1-KD+KK, 2-KD+KK, 1-KD+*KK, or 2-KD+*KK, this parameter specifies a 32-byte area that contains the exported AKEK. If the rule_array parameter specifies CCA-IMP or CCA-EXP, this parameter specifies a 32-byte area that contains the exported key-encrypting key (KEK). The enciphered key is an ASCII-encoded hexadecimal string. If the rule_array parameter specifies 1-KD+KK or 2-KD+KK, the 16-byte ASCII-encoded output is left-justified in the field and the rest of the field remains unchanged.

MAC_key_token

Direction: Output  Type: String
ANSI X9.17 Key Export

A 64-byte area that contains an internal token for a MAC key that is intended for use in the MAC generation or MAC verification process. This field is the EXCLUSIVE OR of the two supplied DATA keys when the source key rule in the rule_array parameter specifies 2-KD, 2-KD+KK, or 2-KD+*KK. When the source key rule specifies 1-KD, the DATA key is converted to a MAC key and returned as an internal token in this field.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

You must install the ANSI system keys in the CKDS to use this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

ANSI X9.17 Key Import (CSNAKIM and CSNGKIM)

Use the ANSI X9.17 key import callable service to import a DATA key or a pair of DATA keys, along with an ANSI key-encrypting key (AKEK), using the ANSI X9.17 protocol. This service converts a single DATA key, or combines two DATA keys, into a single MAC key. The MAC key can be used in either, or both, the MAC generation or the MAC verification service to authenticate the service message. In addition, this service also supports the import of the KEK to a CCA IMPORTER or EXPORTER KEK, as well as an AKEK.

If you are importing only DATA keys, this service assumes that the DATA keys are encrypted under the specified transport AKEK. You have the option of applying the ANSI X9.17 key offset or key notarization process to the transport AKEK.

If you are importing both DATA keys and an AKEK, this service assumes that the AKEK is encrypted under the specified transport AKEK. This service also assumes that the DATA keys are encrypted under the source AKEK that is also being imported. You have the option of applying the ANSI X9.17 key offset or key
notarization process to the transport AKEK. ICSF applies the ANSI X9.17 key offset process to the source AKEK with an offset of 1.

**Note:** You must create the cryptographic service message and maintain the offset counter value that is associated with the AKEK.

**Restriction:** This service is only supported on an IBM Eserver zSeries 900.

The callable service name for AMODE(64) invocation is CSNGKIM.

**Format**

```call
CALL CSNGKIM(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    origin_identifier,
    destination_identifier,
    source_data_key_1,
    source_data_key_2,
    source_key_encrypting_key,
    inbound_KEK_count,
    transport_key_identifier,
    target_data_key_1,
    target_data_key_2,
    target_key_encrypting_key,
    MAC_key_token)
```

**Parameters**

**return_code**

Direction: Output Type: Integer

The return code specifies the general result of the callable service. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the return codes.

**reason_code**

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that are assigned to it that indicate specific processing problems. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the reason codes.

**exit_data_length**

Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from 'X'00000000' to 'X'7FFFFFFF' (2 gigabytes). The data is identified in the `exit_data` parameter.

**exit_data**
ANSI X9.17 Key Import

Direction: Input/Output  Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input  Type: Integer

The number of keywords you supplied in the rule_array parameter. The value can be 0 to 3. If you specify 0, ICSF does not perform either notarization or offset.

rule_array
Direction: Input  Type: String

Zero to three keywords that provide control information to the callable service. See the list of keywords in Table 288. The keywords must be in 8 to 24 bytes of contiguous storage. Each of the keywords must be left-justified in its own 8-byte location and padded on the right with blanks. You must specify this parameter even if you do not specify a keyword.

</tbody>
</table>
ANSI X9.17 Key Import

**origin_identifier**

**Direction:** Input  
**Type:** String

This parameter is valid if you specify the NOTARIZE keyword in the `rule_array` parameter. It specifies an area that contains a 16-byte string that contains the origin identifier that is defined in the ANSI X9.17 standard. The string must be ASCII characters, left-justified, and padded on the right by space characters. The string must be a minimum of four, non-space characters. This parameter is ignored if the OFFSET or CPLT-NOT keyword is specified.

**destination_identifier**

**Direction:** Input  
**Type:** String

This parameter is valid if you specify the NOTARIZE keyword in the `rule_array` parameter. It specifies an area that contains a 16-byte string that contains the destination identifier that is defined in the ANSI X9.17 standard. The string must be ASCII characters, left-justified, and padded on the right by space characters. It must be a minimum of four non-space characters. This parameter is ignored if the OFFSET or CPLT-NOT keyword is specified.

**source_data_key_1**

**Direction:** Input  
**Type:** String

A 16-byte area that contains the enciphered DATA key to be imported. You must supply the DATA key as an ASCII-encoded hexadecimal string. The field is ignored if the `rule_array` parameter specifies CCA-IMP or CCA-EXP.

**source_data_key_2**

**Direction:** Input  
**Type:** String

A 16-byte area that contains the second enciphered DATA key to be imported. This parameter is valid only if the `rule_array` parameter specifies KK, or 2-KD+"KK. You must supply the key as an ASCII-encoded hexadecimal string. This field is ignored if the `rule_array` parameter specifies other source key rules.

**source_key_encrypting_key**

**Direction:** Input  
**Type:** String

A 16- or 32-byte area that contains an enciphered AKEK, if the `rule_array` parameter specifies either 1-KD+KK, 2-KD+KK, 1-KD+"KK, or 2-KD+"KK. This parameter specifies a KEK, if the `rule_array` parameter specifies either CCA-IMP or CCA-EXP. The area is 16 bytes if the `rule_array` parameter specifies a single-length AKEK (1-KD+KK or 2-KD+KK). The area is 32 bytes if the `rule_array` parameter specifies a double-length AKEK (1-KD+"KK or 2-KD+"KK). You must supply the key as an ASCII-encoded hexadecimal string. This field is ignored if the `rule_array` parameter specifies 1-KD or 2-KD.

**inbound KEK_count**

**Direction:** Input  
**Type:** String
ANSI X9.17 Key Import

An 8-byte area that contains an ASCII count for use in the notarization process. The count is an ASCII character string, left-justified, and padded on the right by space characters. ICSF interprets a single space character as a zero counter. The maximum value is 99999999.

**transport_key_identifier**

Direction: Input/Output  Type: String

A 64-byte area that contains an internal token or a label that refers to an internal token for an AKEK.

**target_data_key_1**

Direction: Output  Type: String

A 64-byte area where the imported data key 1 is returned as an ICSF internal key token. ICSF does not support the direct import by label.

**target_data_key_2**

Direction: Output  Type: String

A 64-byte area where the imported data key 2 is returned as an ICSF internal key token. ICSF does not support the direct import by label. This key is returned if 2-KD, 2-KD+KK, or 2-KD+*KK is specified in the `rule_array` parameter.

**target_key_encrypting_key**

Direction: Output  Type: String

A 64-byte area where the imported key-encrypting key is returned as an ICSF internal key token. If the `rule_array` parameter specifies 1-KD+KK, 1-KD+*KK, 2-KD+KK, or 2-KD+*KK, the internal key token contains an AKEK. If the `rule_array` parameter specifies either CCA-IMP or CCA-EXP, the internal token contains a CCA IMPORTER or a CCA EXPORTER, respectively.

**MAC_key_token**

Direction: Output  Type: String

A 64-byte area that contains an internal token for a MAC key that is intended for use in the MAC generation or MAC verification function. This field is the EXCLUSIVE OR of the two imported DATA keys if the source key rule in the `rule_array` parameter specifies 2-KD, 2-KD+KK, or 2-KD+*KK. If the source key rule in the `rule_array` parameter specifies 1-KD, ICSF converts the DATA key to a MAC key and returns it as an internal token in this field.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

You must install the ANSI system keys in the CKDS to use this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

ANSI X9.17 Key Translate (CSNAKTR and CSNGKTR)

Use the ANSI X9.17 key translate callable service to translate a key from encryption under one AKEK to encryption under another AKEK. In a single service call you can translate either one or two encrypted DATA keys, or a single encrypted key-encrypting key. In addition, this service also imports the supplied DATA keys. If the rule_array parameter specifies 2-KD, this service exclusive-ORs the two imported DATA keys and converts the result into a MAC key, which it returns in the MAC_key_token field. The MAC key is used to perform MAC processing on the service message. If the rule_array specifies keywords 1-KD and 2-KD, ICSF translates only DATA keys. The service uses the inbound transport key-encrypting key to decrypt the DATA keys, and uses the outbound transport key-encrypting key to reencrypt the DATA keys. The service uses the ANSI X9.17 key offset process during decryption or importing. The service can use the ANSI X9.17 notarization process during reencryption or exporting of the DATA keys.

If the rule_array parameter specifies 1-KD+KK or 1-KD+*KK, the service translates only the AKEK. The service uses the inbound transport key-encrypting key to decrypt or import the input AKEK, applying the ANSI X9.17 offset process. The service uses the outbound transport key-encrypting key to reencipher or export the AKEK, with or without applying the optional ANSI X9.17 notarization process. ICSF uses the inbound key-encrypting key that is being translated to import the supplied DATA key, applying the ANSI X9.17 offset processing only with an offset of 0. The DATA key is imported as previously discussed then converted to a MAC key token and returned in the MAC_key_token field.

**Restriction:** This service is only supported on an IBM @server zSeries 900.

The callable service name for AMODE(64) invocation is CSNGKTR.
ANSI X9.17 Key Translate

Format

```c
CALL CSNAKTR(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    inbound KEK count,
    inbound transport_key_identifier,
    inbound_data_key_1,
    inbound_data_key_2,
    inbound_key_encrypting_key,
    outbound_origin_identifier,
    outbound Destination_identifier,
    outbound KEK count,
    outbound transport_key_identifier,
    outbound_data_key_1,
    outbound_data_key_2,
    outbound_key_encrypting_key,
    MAC_key_token)
```

Parameters

return_code

Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that are assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length

Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data

Direction: Input/Output Type: String

The data that is passed to the installation exit.

rule_array_count

Direction: Input Type: Integer
The number of keywords you supplied in the rule_array parameter. The value can be 0 to 3. If you specify 0, the service does not perform notarization or offset.

**rule_array**

Direction: Input  
Type: String

Zero to three keywords that provide control information to the callable service. See the list of keywords in [Table 290](#). The keywords must be in 8 to 24 bytes of contiguous storage. Each of the keywords must be left-justified in its own 8-byte location and padded on the right with blanks. You must specify this parameter even if you do not specify any keywords.

**Table 290. Keywords for ANSI X9.17 Key Translate Rule Array**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Notarization Rule (optional with no defaults)</strong></td>
<td></td>
</tr>
<tr>
<td>CPLT-NOT</td>
<td>Complete ANSI X9.17 notarization using the value obtained from the outbound KEK count parameter. The outbound transport key specified must be partially notarized.</td>
</tr>
<tr>

</tr>
<tr>
<td>1-KD</td>
<td>Import and translate one DATA key. This is the default parameter.</td>
</tr>
<tr>
<td>1-KD+KK</td>
<td>Import and translate one DATA key and a single-length AKEK.</td>
</tr>
<tr>
<td>1-KD+*KK</td>
<td>Import and translate one DATA key and a double-length AKEK.</td>
</tr>
<tr>
<td>2-KD</td>
<td>Import and translate two DATA keys.</td>
</tr>
</tbody>
</table>

**inbound KEK count**

Direction: Input  
Type: String

An 8-byte area that contains an ASCII count for use in the offset process. The count is an ASCII character string, left-justified, and padded on the right by space characters. ICSF interprets a single space character as a zero counter. The maximum value is 99999999.

**inbound_transport_key_identifier**

Direction: Input/Output  
Type: String

A 64-byte area that contains either an internal token, or a label that refers to an internal token for an AKEK.

**inbound_data_key_1**

Direction: Input  
Type: String
A 16-byte area that contains the enciphered DATA key that the service is importing and translating. You must specify the DATA key as an ASCII-encoded hexadecimal string.

**inbound_data_key_2**  
*Direction: Input  Type: String*

A 16-byte area that contains the second enciphered DATA key that the service is importing and translating. This field is valid if the `rule_array` parameter specifies 2-KD. You must supply the key as an ASCII-encoded hexadecimal string. This field is ignored if the `rule_array` parameter specifies other source key rules.

**inbound_key_encrypting_key**  
*Direction: Input  Type: String*

A 16- or 32-byte area that contains an enciphered AKEK that the service is to translate. The area is 16 bytes if the `rule_array` parameter specifies a source key rule of single-length AKEK. The area is 32 bytes if the source key rule specifies a double-length AKEK (1-KD+"KK"). You must supply the key as an ASCII-encoded hexadecimal string. ICSF ignores this field if the `rule_array` specifies either 1-KD or 2-KD.

**outbound_origin_identifier**  
*Direction: Input  Type: String*

This parameter is valid if the `rule_array` parameter specifies a keyword of NOTARIZE. It specifies an area that contains a 16-byte string that contains the origin identifier that is defined in the ANSI X9.17 standard. The string must be ASCII characters, left-justified, and padded on the right by space characters. The string must be a minimum of four non-space characters. ICSF ignores this field if the `rule_array` parameter specifies a keyword of CPLT-NOT.

**outbound_destination_identifier**  
*Direction: Input  Type: String*

This parameter is valid if the `rule_array` parameter specifies a keyword of NOTARIZE. It specifies an area that contains a 16-byte string that contains the destination identifier that is defined in the ANSI X9.17 standard. The string must be ASCII characters, left-justified, and padded on the right by space characters. The string must be a minimum of four non-space characters. This parameter is ignored if the `rule_array` parameter specifies a keyword of CPLT-NOT.

**outbound KEK_count**  
*Direction: Input  Type: String*

An 8-byte area that contains an ASCII count for use in the notarization process. The count is an ASCII character string, left-justified, and padded on the right by space characters. ICSF interprets a single space character as a zero counter. The maximum value is 999999999.

**outbound_transport_key_identifier**
ANSI X9.17 Key Translate

Direction: Input/Output  Type: String

A 64-byte area that contains either an internal token, or a label that refers to an internal token for an AKEK.

**outbound_data_key_1**

Direction: Output  Type: String

A 16-byte area where the service returns the translated data key 1 an ASCII-encoded hexadecimal string. The service returns the key only if the rule_array specifies 1-KD or 2-KD. ICSF ignores this field if the rule_array parameter specifies either 1-KD+KK or 1-KD+*KK.

**outbound_data_key_2**

Direction: Output  Type: String

A 16-byte area where the service returns the translated data key 2 as an ASCII-encoded hexadecimal string. The service returns the key only if the rule_array parameter specifies 2-KD. ICSF ignores this field if the rule_array parameter specifies 1-KD, 1-KD+KK, or 1-KD+*KK.

**outbound_key_encrypting_key**

Direction: Output  Type: String

A 16- or 32-byte area that contains the enciphered, translated AKEK. The area is 16 bytes if the rule_array parameter specifies a single-length AKEK (1-KD+KK). The area is 32 bytes if the rule_array parameter specifies a double-length AKEK (1-KD+*KK). The service returns the key as an ASCII-encoded hexadecimal string. ICSF ignores this field if the rule_array parameter specifies either 1-KD or 2-KD.

**MAC_key_token**

Direction: Output  Type: String

A 64-byte area that contains an internal token for a MAC key that is intended for use in the MAC generation or MAC verification process. This field is the EXCLUSIVE OR of the two imported DATA keys when the rule_array parameter specifies 2-KD for the source key rule. If the rule_array parameter specifies 1-KD, the service returns the imported key in this field as an ICSF internal key token.

**Usage Notes**

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

You must install the ANSI system keys in the CKDS to use this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

#### ANSI X9.17 Transport Key Partial Notarize (CSNATKN and CSNGTKN)

Use the ANSI X9.17 transport key partial notarize callable service to preprocess an ANSI X9.17 transport key-encrypting key with origin and destination identifiers. ICSF completes the notarization process when you use the partially notarized key in the ANSI X9.17 key export, ANSI X9.17 key import, or ANSI X9.17 key translate services and specify the CPLT-NOT rule_array keyword.

**Note:** You cannot reverse the partial notarization process. If you want to keep the original value of the AKEK, you must record the value.

**Restriction:** This service is only supported on an IBM @server zSeries 900.

The callable service name for AMODE(64) invocation is CSNGTKN.

#### Format

```c
CALL CSNATKN(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    origin_identifier,
    destination_identifier,
    source_transport_key_identifier,
    target_transport_key_identifier)
```

#### Parameters

- `return_code`
  
  **Direction:** Output  
  **Type:** Integer
ANSI X9.17 Transport Key Partial Notarize

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that are assigned to it that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length
Direction: Input/Output Type: Integer

The length of the data that is passed to the installation exit. The length can be from X'00000000' to X'7FFFFFFF' (2 gigabytes). The data is identified in the exit_data parameter.

exit_data
Direction: Input/Output Type: String

The data that is passed to the installation exit.

rule_array_count
Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. Currently no rule_array keywords are defined; thus, this field must be set to 0.

rule_array
Direction: Input Type: String

Currently, no rule_array keywords are defined for this service. You must still specify this parameter for possible future use.

origin_identifier
Direction: Input Type: String

A 16-byte string that contains the origin identifier that is defined in the ANSI X9.17 standard. The string must be ASCII characters, left-justified, and padded on the right by space characters. The string must be a minimum of four non-space characters.

destination_identifier
Direction: Input Type: String

A 16-byte string that contains the destination identifier that is defined in the ANSI X9.17 standard. The string must be ASCII characters, left-justified, and padded on the right by space characters. The string must be a minimum of four non-space characters.

source_transport_key_identifier

Chapter 14. Managing Keys According to the ANSI X9.17 Standard  651
ANSI X9.17 Transport Key Partial Notarize

Direction: Input/Output  Type: String

A 64-byte area that contains either an internal token, or a label of an internal token for an AKEK that permits notarization.

target_transport_key_identifier

Direction: Output  Type: String

A 64-byte area where the internal token of a partially notarized AKEK will be returned. This AKEK cannot be used directly as a notarizing KEK until the notarization process has been completed. To do this, specify CPLT-NOT as the rule_array keyword in any service in which you intend to use this key as a notarizing KEK.

Usage Notes

SAF may be invoked to verify the caller is authorized to use this callable service, the key label, or internal secure key tokens that are stored in the CKDS or PKDS.

You must install the ANSI system keys in the CKDS to use this service.

This table lists the required cryptographic hardware for each server type and describes restrictions for this callable service.

Part 3. PKCS #11 Callable Services
Chapter 15. Using PKCS #11 Tokens and Objects

This topic describes the callable services for creating and maintaining PKCS #11 tokens and objects. ICSF provides a number of callable services to assist you in managing PKCS #11 tokens and maintaining the token data set (TKDS). Services are also provided for generating, using, and managing key objects.

The following callable services are described:

- "PKCS #11 Derive multiple keys (CSFPDMK and CSFPDMK6)"
- "PKCS #11 Derive key (CSFPDVK and CSFPDVK6)" on page 663
- "PKCS #11 Get attribute value (CSFPGAV and CSFPGAV6)" on page 668
- "PKCS #11 Generate key pair (CSFPGKP and CSFPGKP6)" on page 671
- "PKCS #11 Generate secret key (CSFPGSK and CSFPGSK6)" on page 673
- "PKCS #11 Generate HMAC (CSFPHMG and CSFPHMG6)" on page 675
- "PKCS #11 Verify HMAC (CSFPHMV and CSFPHMV6)" on page 679
- "PKCS #11 One-way hash, sign, or verify (CSFPOWH and CSFPOWH6)" on page 682
- "PKCS #11 Private key sign (CSFPPPKS and CSFPPPS6)" on page 687
- "PKCS #11 Public key verify (CSFPPPKV and CSFPPPK6)" on page 689
- "PKCS #11 Pseudo-random function (CSFPPRF and CSFPPRF6)" on page 692
- "PKCS #11 Set attribute value (CSFPSAV and CSFPSAV6)" on page 695
- "PKCS #11 Secret key decrypt (CSFPSKDV and CSFPSKDV6)" on page 697
- "PKCS #11 Secret key encrypt (CSFPSKE and CSFPSKE6)" on page 701
- "PKCS #11 Token record create (CSFPTRC and CSFPTRC6)" on page 707
- "PKCS #11 Token record delete (CSFPTRD and CSFPTRD6)" on page 711
- "PKCS #11 Token record list (CSFPTRL and CSFPTRL6)" on page 713
- "PKCS #11 Unwrap key (CSFPUWK and CSFPUWK6)" on page 717
- "PKCS #11 Wrap key (CSFPWPK and CSFPWPK6)" on page 720

As of ICSF FMID HCR7770, a TKDS is no longer required to use the PKCS #11 services. If ICSF is started without a TKDS, however, only the omnipresent token will be available. The omnipresent token supports session objects only. Session objects are objects that do not persist beyond the life of a PKCS #11 session.

PKCS #11 Derive multiple keys (CSFPDMK and CSFPDMK6)

Use the PKCS #11 Derive Multiple Keys callable service to generate multiple secret key objects and protocol dependent keying material from an existing secret key object. This service does not support any recovery methods.

The key handle must be a handle of a PKCS #11 secret key object. The CKA_DERIVE attribute for the secret key object must be true. The mechanism keyword specified in the rule array indicates what derivation protocol to use. The derive parms list provides additional input/output data. The format of this list is dependent on the protocol being used.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPDMK6.
PKCS #11 Derive multiple keys

Format

```c
CALL CSFPDMK(
   return_code,
   reason_code,
   exit_data_length,
   exit_data,
   rule_array_count,
   rule_array,
   attribute_list_length,
   attribute_list,
   base_key_handle,
   parms_list_length,
   parms_list)
```

Parameters

**return_code**
- Direction: Output
- Type: Integer

  The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the return codes.

**reason_code**
- Direction: Output
- Type: Integer

  The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the reason codes.

**exit_data_length**
- Direction: Ignored
- Type: Integer

  This field is ignored. It is recommended to specify 0 for this parameter.

**exit_data**
- Direction: Ignored
- Type: String

  This field is ignored.

**rule_array_count**
- Direction: Input
- Type: Integer

  The number of keywords you supplied in the `rule_array` parameter. This value must be 1.

**rule_array**
- Direction: Input
- Type: String

  Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.
Table 293. Keywords for derive multiple keys

</table>

| IKE2PHA2      | Use the IKEv2 phase 2 protocol to derive multiple keys and salt values using a previously derived IKE derivation key as the base key and a previously derived secret key as an additional key (optional). The derivation produces one of the following key sets: |
|               | • One authentication key                                                                                                                                 |
|               | • One GMAC key plus salt value                                                                                                                                 |
|               | • One authentication key plus one encryption key                                                                                                                                 |
|               | • One GCM key plus a salt value                                                                                                                                 |
|               | Two such sets are produced, one for the initiator and one for the responder.                                                              |
|               | Using IKE terminology, this mechanism performs $KEYMAT = prf(SK_d, [g^ir | Ni | Nr])$.                                                            |
|               | Where:                                                                                                                                   |
|               | • Ni | Nr - is the concatenated initiator/responder nonce string                                                                                   |
|               | • SK_d - is the base key                                                                                                                                 |
|               | • g^ir - is the optional additional key                                                                                                                                 |
|               | • $KEYMAT$ - is the generated key material which is partitioned into the key set                                                                 |

**attribute_list_length**

Direction: Input  Type: Integer

The length of the attributes supplied in the `attribute_list` parameter in bytes. The maximum value for this field is 32752.

**attribute_list**
PKCS #11 Derive multiple keys

List of attributes for the derived secret key object. See "Attribute List" on page 94 for the format of an attribute_list.

**base_key_handle**

The 44-byte handle of the base key object. See "Handles" on page 95 for the format of a key_handle.

**parms_list_length**

The length of the parameters supplied in the parms_list parameter in bytes.

**parms_list**

The protocol specific parameters. This field has a varying format depending on the mechanism specified:

### Authorization

There are multiple keys involved in this service — one or two base keys and the target keys (the new keys created from the base key).

- To use a base key that is a public object, the caller must have SO (READ) authority or USER (READ) authority (any access).
- To use a base key that is a private object, the caller must have USER (READ) authority (user access).
- To derive a target key that is a public object, the caller must have SO (READ) authority or USER (UPDATE) authority.
- To derive a target key that is a private object, the caller must have SO (CONTROL) authority or USER (UPDATE) authority.

### Usage Notes

Key derivation functions are performed in software.
PKCS #11 Derive multiple keys

For the SSL-KM and TLS-KM mechanisms, an attribute list is required if encryption keys are to be generated.

For the IKE1PHA1, IKE2PHA1, IKE1PHA2, and IKE2PHA2 mechanisms, the following attribute rules apply to the derived keys:

- Derivation keys will have the following attributes which may not be overridden by other values in the attribute list:
  - CKA_CLASS=CKO_SECRET_KEY
  - CKA_KEY_TYPE=CKK_GENERIC_SECRET
  - CKA_DERIVE=TRUE
  - CKA_VALUE_LEN=as specified in the parms list

- Authentication keys will have the following attributes which may not be overridden by other values in the attribute list:
  - CKA_CLASS=CKO_SECRET_KEY
  - CKA_KEY_TYPE=CKK_GENERIC_SECRET
  - CKA_SIGN=TRUE=TRUE
  - CKA_VERIFY=TRUE=TRUE
  - CKA_VALUE_LEN=as specified in the parms list

- Encryption, GMAC, and GCM keys will be typed according to information found in the attribute list. However, they will have the following attributes which may not be overridden by other values in the attribute list:
  - CKA_CLASS=CKO_SECRET_KEY
  - For key types other than CKK_DES, CKK_DES2, and CKK_DES3,
    CKA_VALUE_LEN=as specified in the parms list

- All key types will inherit the values of the CKA_SENSITIVE, CKA_ALWAYS_SENSITIVE, CKA_EXTRACTABLE, and CKA_NEVER_EXTRACTABLE attributes from the base key. These may not be overridden by other values in the attribute list. If an additional key is specified, its values will be applied after setting the base key values as follows:
  - If the additional key has CKA_SENSITIVE=TRUE, so will the derived key(s)
  - If the additional key has CKA_EXTRACTABLE=FALSE, so will the derived keys(s)
  - If the additional key has CKA_ALWAYS_SENSITIVE=FALSE, so will the derived keys(s)
  - If the additional key has CKA_NEVER_EXTRACTABLE=FALSE, so will the derived keys(s)

- If encryption, GMAC, or GCM keys are to be derived, an attribute list is required for the key typing information. Otherwise, it is optional. For all keys, other applicable secret key attributes may be specified in the attribute list. Any attribute not specified will be assigned the default value normally assigned to a newly created secret key.

For the IKE1PHA1, IKE1PHA2, and IKE2PHA2 mechanisms, the additional key must be a secret key (CKA_CLASS=CKO_SECRET_KEY) capable of performing key derivation (CKA_DERIVE=TRUE). It must also be contained in the same PKCS #11 token as the base key.

The IKE1PHA1, IKE2PHA1, IKE1PHA2, and IKE2PHA2 mechanisms have the following limitations if the operation is FIPS 140 restricted:

- The MD5 PRF may not be specified.
The length of the base key must be at least half the length of the output of the PRF function.

**PKCS #11 Derive key (CSFPDVK and CSFPDVK6)**

Use the PKCS #11 Derive Key callable service to generate a new secret key object from an existing key object. This service does not support any recovery methods.

The deriving key handle must be a handle of an existing PKCS #11 key object. The CKA_DERIVE attribute for this object must be true. The mechanism keyword specified in the rule array indicates what derivation protocol to use. The derive parms list provides additional input data. The format of this list is dependent on the protocol being used.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPDVK6.

**Format**

```call CSFPDVK(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    attribute_list_length,
    attribute_list,
    base_key_handle,
    parms_list_length,
    parms_list,
    target_key_handle
)
```

**Parameters**

- **return_code**
  
  Direction: Output  
  Type: Integer

  The return code specifies the general result of the callable service. [Appendix A, ICSF and TSS Return and Reason Codes](#) lists the return codes.

- **reason_code**
  
  Direction: Output  
  Type: Integer

  The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. [Appendix A, "ICSF and TSS Return and Reason Codes"](#) lists the reason codes.

- **exit_data_length**
  
  Direction: Ignored  
  Type: Integer

  This field is ignored. It is recommended to specify 0 for this parameter.

- **exit_data**
  
  This field is ignored. It is recommended to specify 0 for this parameter.

<th>Type: String</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This field is ignored.</td>
</tr>
</tbody>
</table>

**rule_array_count**

Direction: Input  Type: Integer

The number of keywords you supplied in the *rule_array* parameter. This value must be 1.

**rule_array**

Direction: Input  Type: String

Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

</tbody>
</table>

**target_key_handle**

Direction: Output  
Type: String

Upon successful completion, the 44-byte handle of the secret key object that was derived.

**Authorization**

There are multiple keys involved in this service — one or two base keys and the target key (the new key created from the base key).

- To use a base key that is a public object, the caller must have SO (READ) authority or USER (READ) authority (any access).
- To use a base key that is a private object, the caller must have USER (READ) authority (user access).
- To derive a target key that is a public object, the caller must have SO (READ) authority or USER (UPDATE) authority.
- To derive a target key that is a private object, the caller must have SO (CONTROL) authority or USER (UPDATE) authority.

**Usage Notes**

Derivation of the EC-DH shared secret "Z" may be performed in hardware or software. All other key derivation operations are performed in software.

Key derivation functions are performed in software.

For the IKESEED, IKESHARE, and IKEREKEY mechanisms, the following attribute rules apply to the derived key:

- The key will have the following attributes which may not be overridden by other values in the attribute list:
  - CKA_CLASS=CKO_SECRET_KEY
  - CKA_KEY_TYPE=CKK_GENERIC_SECRET
  - CKA_DERIVE=TRUE
  - CKA_VALUE_LEN=length of the output of the PRF function
- Other applicable secret key attributes may be specified in the attribute list. However, an attribute list is not required. Any attribute not specified will be assigned the default value normally assigned to a newly created secret key. In particular, CKA_SENSITIVE defaults to FALSE and CKA_EXTRACTABLE defaults to TRUE.
PKCS #11 Derive key

- CKA_ALWAYS_SENSITIVE is set to FALSE if the CKA_ALWAYS_SENSITIVE attribute from the base key is FALSE. Otherwise it is set equal to the value of the CKA_SENSITIVE attribute assigned to the derived key.

- CKA_NEVER_EXTRACTABLE is set to FALSE if the CKA_NEVER_EXTRACTABLE attribute from the base key is FALSE. Otherwise it is set opposite to the value of the CKA_EXTRACTABLE attribute assigned to the derived key.

For the IKEREKEY mechanism, the additional key must be a secret key (CKA_CLASS=CKO_SECRET_KEY) capable of performing key derivation (CKA_DERIVE=TRUE). It must also be contained in the same PKCS #11 token as the base key.

For the IKESEED, IKESHARE, and IKEREKEY mechanisms, the MD5 PRF may not be specified if the operation is FIPS 140 restricted.

For the IKESHARE and IKEREKEY mechanisms, the length of the base key must be at least half the length of the output of the PRF function if the operation is FIPS 140 restricted.

For the IKESEED mechanism, the length of the concatenated initiator/responder nonce value must be at least half the length of the output of the PRF function if the operation is FIPS 140 restricted.

PKCS #11 Get attribute value (CSFPGAV and CSFPGAV6)

Use the get attribute value callable service (CSFPGAV) to retrieve the attributes of an object.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPGAV6.

Format

```
CALL CSFPGAV(
   return_code,
   reason_code,
   exit_data_length,
   exit_data,
   handle,
   rule_array_count,
   rule_array,
   attribute_list_length,
   attribute_list)
```

Parameters

return_code

Direction: Output
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
PKCS #11 Get attribute value

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Ignored  
Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data
Direction: Ignored  
Type: String

This field is ignored.

handle
Direction: Input  
Type: String

The 44-byte handle of the object. See "Handles" on page 95 for the format of a handle.

rule_array_count
Direction: Input  
Type: Integer

The number of keywords supplied in the rule_array parameter. This value must be 0.

rule_array
Direction: Input  
Type: String

Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

attribute_list_length
Direction: Input/Output  
Type: Integer

On input, the length of the attribute_list parameter in bytes.

On output, the length of the attribute_list parameter in bytes. If the length supplied on input is insufficient to hold all attributes, the length on output is set to the minimum length required.

attribute_list
PKCS #11 Get attribute value

Direction: Output
Type: String

A list of object attributes.

See "Attribute List" on page 94 for the format of an attribute_list.

Authorization

The token authorization required and the amount of attribute information returned is dependent on the values of the attributes the object possesses.

The authority to retrieve the non-sensitive attributes is as follows:

- For a public object - any authority to the token (USER (READ) or SO (READ))
- For a private object - USER (READ) or SO (CONTROL)

If the caller is not authorized to retrieve the non-sensitive attributes, the service fails.

If the caller is authorized to retrieve the non-sensitive attributes and the object does not possess any sensitive attributes, the service returns all the object's attributes.

If the caller is authorized to retrieve the non-sensitive attributes and the object does possess sensitive attributes, processing is as defined in this table:

<table>
<thead>
<tr>
<th>Object</th>
<th>PKCS #11 role authority</th>
<th>CKA_SENSITIVE</th>
<th>CKA_EXTRACTABLE</th>
<th>Attributes returned</th>
</tr>
</thead>
<tbody>
<tr>
<td>Public</td>
<td>USER (READ) or SO (READ)</td>
<td>True</td>
<td>True or False</td>
<td>Non-sensitive only</td>
</tr>
<tr>
<td>Private</td>
<td>USER (READ) or SO (CONTROL)</td>
<td>True</td>
<td>True or False</td>
<td>Non-sensitive only</td>
</tr>
<tr>
<td>Public</td>
<td>USER (READ) or SO (READ)</td>
<td>False</td>
<td>False</td>
<td>Non-sensitive only</td>
</tr>
<tr>
<td>Private</td>
<td>USER (READ) or SO (CONTROL)</td>
<td>False</td>
<td>False</td>
<td>Non-sensitive only</td>
</tr>
<tr>
<td>Public</td>
<td>USER (READ) or SO (READ)</td>
<td>False</td>
<td>True</td>
<td>Sensitive and non-sensitive</td>
</tr>
<tr>
<td>Private</td>
<td>SO (CONTROL)</td>
<td>False</td>
<td>True</td>
<td>Non-sensitive only</td>
</tr>
<tr>
<td>Private</td>
<td>USER (READ)</td>
<td>False</td>
<td>True</td>
<td>Sensitive and non-sensitive</td>
</tr>
</tbody>
</table>

Note:

- Session and token objects require the same authority.
- The sensitive attributes are as follows:
  - CKA_VALUE for a secret key, Elliptic Curve private key, DSA private key, or Diffie-Hellman private key object.
  - CKA_PRIVATE_EXPONENT, CKA_PRIME_1, CKA_PRIME_2, CKA_EXPONENT_1, CKA_EXPONENT_2, and CKA_COEFFICIENT for a private key object.
- See z/OS Cryptographic Services ICSF Writing PKCS #11 Applications for more information on the SO and User PKCS #11 roles.
PKCS #11 Get attribute value

Usage Notes

1. If the object is marked sensitive or not extractable, the sensitive attributes are not returned
2. If the caller is authorized to list the non-sensitive attributes of an object, but not the sensitive ones, the sensitive attributes are not returned
3. If the caller is not authorized to list the non-sensitive attributes of the object, the service fails

PKCS #11 Generate key pair (CSFPGKP and CSFPGKP6)

Use the generate key pair callable service to generate an RSA, DSA, Elliptic Curve, or Diffie-Hellman key pair. New token or session objects are created to hold the key pair.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPGKP6.

Format

```
CALL CSFPGKP(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    token_handle,
    rule_array_count,
    rule_array,
    public_key_attribute_list_length,
    public_key_attribute_list,
    public_key_object_handle,
    private_key_attribute_list_length,
    private_key_attribute_list,
    private_key_object_handle)
```

Parameters

return_code

Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, ICSF and TSS Return and Reason Codes lists the return codes.

reason_code

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length

Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.
PKCS #11 Generate key pair

exit_data
Direction: Ignored Type: String

This field is ignored.

token_handle
Direction: Input Type: String

The 44-byte handle of the token of the key objects. See "Handles" on page 95 for the format of a token_handle.

rule_array_count
Direction: Input Type: Integer

The number of keywords you supplied in the rule_array_parameter. This value must be 0.

text_array
Direction: Input Type: String

Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

public_key_attribute_list_length
Direction: Input Type: Integer

The length of the attributes supplied in the public_key_attribute list parameter in bytes.

public_key_attribute_list
Direction: Input Type: String

List of attributes for the public key object. The maximum value for this field is 32750. See "Attribute List" on page 94 for the format of a public_key_attribute_list.

public_key_object_handle
Direction: Output Type: String

The 44-byte handle of the new public key object.

private_key_attribute_list_length
Direction: Input Type: Integer

The length of the attributes supplied in the private_key_attribute_list parameter in bytes.

private_key_attribute_list
Direction: Input Type: String

List of attributes for the private key object. The maximum value for this field is 32750. See "Attribute List" on page 94 for the format of a private_key_attribute_list.

private_key_object_handle
PKCS #11 Generate key pair

Direction: Output Type: String

The 44-byte handle of the new private key object.

Authorization

To generate a public object, the caller must have SO (READ) authority or USER (UPDATE) authority.

To generate a private object, the caller must have SO (CONTROL) authority or USER (UPDATE) authority.

Usage Notes

The type of key pair generated is determined by the key type attributes in the public_key_attributes_list and private_key_attributes_list parameters.

DSA, Elliptic Curve, and Diffie-Hellman key pairs are generated in software. RSA key pair generation may be done in hardware or software.

PKCS #11 Generate secret key (CSFPGBK and CSFPGBK6)

Use the generate secret key callable service to generate a secret key or set of domain parameters. A new token or session object is created to hold the information.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPGBK6.

Format

```
CALL CSFPGBK(
  return_code,
  reason_code,
  exit_data_length,
  exit_data,
  handle,
  rule_array_count,
  rule_array,
  attribute_list_length,
  attribute_list,
  parms_list_length,
  parms_list
)
```

Parameters

**return_code**

Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output Type: Integer
PKCS #11 Generate secret key

The reason code specifies the result of the callable service that is returned to
the application program. Each return code has different reason codes that
indicate specific processing problems. Appendix A, “ICSF and TSS Return and
Reason Codes” lists the reason codes.

exit_data_length
Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data
Direction: Ignored Type: String

This field is ignored.

handle
Direction: Input/Output Type: String

On input, the 44-byte handle of the token. On output, the 44-byte handle of the
new secret key or domain parameters object. See “Handles” on page 95 for the
format of a handle.

rule_array_count
The number of keywords you supplied in the rule_array parameter. This value
must be 1.

rule_array
Direction: Input Type: String

Keywords that provide control information to the callable service.

Table 304. Keywords for generate secret key

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mechanism (One of the following must be specified)</td>
<td></td>
</tr>
<tr>
<td>SSL</td>
<td>Generate a generic secret key object where the client is using SSL (for CKM_SSL3_PRE_MASTER_KEY_GEN)</td>
</tr>
<tr>
<td>TLS</td>
<td>Generate a generic secret key object where the client is using TLS (for CKM_TLS_PRE_MASTER_KEY_GEN)</td>
</tr>
<tr>
<td>KEY</td>
<td>Generate a secret key object according to the key type attribute in the attributes_list parameter (for CKM_GENERIC_SECRET_KEY_GEN, CKM_DES_KEY_GEN, CKM_DES2_KEY_GEN, CKM_DES3_KEY_GEN, CKM_AES_KEY_GEN, CKM_RC4_KEY_GEN, and CKM_BLOWFISH_KEY_GEN)</td>
</tr>
<tr>
<td>PARMS</td>
<td>Generate a domain parameters object according to the key type attribute in the attributes_list parameter (for CKM_DSA_PARAMETER_GEN and CKM_DH_PKCS_PARAMETER_GEN)</td>
</tr>
</tbody>
</table>

attribute_list_length
Direction: Input Type: Integer
**PKCS #11 Generate secret key**

The length of the attributes supplied in the `attribute_list` parameter in bytes. The maximum value for this field is 32750.

`attribute_list`

- **Direction:** Input
- **Type:** String

List of attributes for the secret key object. See [“Attribute List” on page 94](#) for the format of an `attribute_list`.

`parms_list_length`

- **Direction:** Input
- **Type:** Integer

The length of the parameters supplied in the `parms_list` parameter in bytes.

`parms_list`

- **Direction:** Input/Output
- **Type:** String

The protocol specific parameters. This field has a varying format depending on the mechanism specified:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Length in bytes</th>
<th>Direction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>2</td>
<td>input</td>
<td>SSL or TLS version number in binary, e.g., for version 3.01 this would be x'0301'</td>
</tr>
</tbody>
</table>

For the KEY and PARMS mechanisms, there are no parameters. The `parms_list_length` parameter must be set to zero for these mechanisms.

**Authorization**

To generate a public object, the caller must have SO (READ) authority or USER (UPDATE) authority.

To generate a private object, the caller must have SO (CONTROL) authority or USER (UPDATE) authority.

**Usage Notes**

Domain parameters are generated in software. Secret key generation may be done in hardware or software.

---

**PKCS #11 Generate HMAC (CSFPHMG and CSFPHMG6)**

Use the PKCS #11 Generate HMAC callable service to generate a hashed message authentication code (MAC). This service does not support any recovery methods.

The key handle must be a handle of a PKCS #11 generic secret key object. The mechanism keyword specified in the rule array indicates the hash algorithm to use. The CKA_SIGN attribute for the secret key object must be true.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPHMG6.
PKCS #11 Generate HMAC

Format

```call csfhmg(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    text_length,
    text,
    text_id,
    chain_data_length,
    chain_data,
    key_handle,
    hmac_length,
    hmac
)```

Parameters

**return_code**
Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**
Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**
Direction: Ignored  
Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

**exit_data**
Direction: Ignored  
Type: String

This field is ignored.

**rule_array_count**
Direction: Input  
Type: Integer

The number of keywords you supplied in the `rule_array` parameter. This value must be 1 or 2.

**rule_array**
Direction: Input  
Type: String
Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

Table 306. Keywords for generate HMAC

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mechanism (required)</strong></td>
<td></td>
</tr>
<tr>
<td>MD5</td>
<td>Generate an HMAC. Use MD5 hashing. Output returned in the hmac parameter is 16 bytes in length.</td>

<tr>
<td>ONLY</td>
<td>Specifies this is the only call and the call is not chained. This is the default.</td>
</tr>
</tbody>
</table>

- **text_length**
  - Direction: Input
  - Type: Integer
  - Length of the text parameter in bytes. The length can be from 0 to 2147483647.

- **text**
  - Direction: Input
  - Type: String
  - Value for which an HMAC will be generated.

- **text_id**
  - Direction: Input
  - Type: Integer
  - The ALET identifying the space where the text resides.

- **chain_data_length**
  - Direction: Input/Output
  - Type: Integer
PKCS #11 Generate HMAC

The byte length of the chain_data parameter. This must be 128 bytes.

**chain_data**

Direction: Input/Output  Type: String

This field is a 128-byte work area. The chain data permits chaining data from one call to another. ICSF initializes the chain data on a FIRST call and may change it on subsequent MIDDLE and LAST calls. Your application must not change the data in this field between the sequence of FIRST, MIDDLE, and LAST calls for a specific message. The chain data has the following format:

*Table 307. chain_data parameter format*

<table>
<thead>
<tr>
<th>Offset</th>
<th>Length</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>4</td>
<td>Flag word</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bit  Meaning when set on</td>
</tr>
<tr>
<td>0</td>

<td>0 Cryptographic state object has been allocated</td>
</tr>
<tr>
<td>1-31</td>
<td>31</td>
<td>Reserved for IBM's use</td>
</tr>
<tr>
<td>4</td>
<td>44</td>
<td>Cryptographic state object handle</td>
</tr>
<tr>
<td>48</td>
<td>80</td>
<td>Reserved for IBM's use</td>
</tr>
</tbody>
</table>

**key_handle**

Direction: Input  Type: String

The 44-byte handle of a generic secret key object. This parameter is ignored for MIDDLE and LAST chaining requests. See "Handles" on page 95 for the format of a key_handle.

**hmac_length**

Direction: Ignored  Type: Integer

Reserved field

**hmac**

Direction: Output  Type: String

Upon successful completion of an ONLY or LAST request, this field contains the generated HMAC value, left justified. The caller must provide an area large enough to hold the generated HMAC as defined by the mechanism specified. This field is ignored for FIRST and MIDDLE requests.

**Authorization**

To use this service with a public object, the caller must have at least SO (READ) authority or USER (READ) authority (any access).

To use this service with a private object, the caller must have at least USER (READ) authority (user access).

**Usage Notes**

HMAC operations are performed in software.

If the FIRST rule is used to start a series of chained calls:
The key used to initiate the chained calls must not be deleted until the chained calls are complete.

The application should make a LAST call to free ICSF resources allocated. If processing is to be aborted without making a LAST call and the chain_data parameter indicates that a cryptographic state object has been allocated, the caller must free the object by calling CSFPTRD (or CSFPTRD6 for 64-bit callers) passing the state object's handle.

PKCS #11 Verify HMAC (CSFPHMV and CSFPHMV6)

Use the PKCS #11 Verify HMAC callable service to verify a hash message authentication code (MAC). This service does not support any recovery methods.

The key handle must be a handle of a PKCS #11 generic secret key object. The mechanism keyword specified in the rule array indicates the hash algorithm to use. The CKA_VERIFY attribute for the secret key object must be true.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPHMV6.

Format

CALL CSFPHMV(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    text_length,
    text,
    text_id,
    chain_data_length,
    chain_data,
    key_handle,
    hmac_length,
    hmac )

Parameters

return_code
Direction: Output    Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output    Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
PKCS #11 Verify HMAC

exit_data
Direction: Ignored Type: String
This field is ignored.

rule_array_count
Direction: Input Type: Integer
The number of keywords you supplied in the rule_array parameter. This value must be 1 or 2.

rule_array
Direction: Input Type: String
Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

</tbody>
</table>
PKCS #11 Verify HMAC

text_length
Direction: Input  Type: Integer

Length of the text parameter in bytes. The length can be from 0 to 2147483647.

text
Direction: Input  Type: String

Value for which an HMAC will be generated.

text_id
Direction: Input  Type: Integer

The ALET identifying the space where the text resides.

chain_data_length
Direction: Input/Output  Type: Integer

The byte length of the chain_data parameter. This must be 128 bytes.

chain_data
Direction: Input/Output  Type: String

This field is a 128-byte work area. The chain data permits chaining data from one call to another. ICSF initializes the chain data on a FIRST call and may change it on subsequent MIDDLE and LAST calls. Your application must not change the data in this field between the sequence of FIRST, MIDDLE, and LAST calls for a specific message. The chain data has the following format:

Table 309. chain_data parameter format

<table>
<thead>
<tr>

</tbody>
</table>

key_handle
Direction: Input  Type: String

The 44-byte handle of a generic secret key object. This parameter is ignored for MIDDLE and LAST chaining requests. See “Handles” on page 95 for the format of a key_handle.

hmac_length
Direction: Ignored  Type: Integer

Reserved field

hmac
Direction: Input  Type: String
PKCS #11 Verify HMAC

This field contains the HMAC value to be verified on ONLY and LAST requests, left justified. The caller must provide an HMAC value of the required length as determined by the mechanism specified. This field is ignored for FIRST and MIDDLE requests.

Authorization

To use this service with a public object, the caller must have at least SO (READ) authority or USER (READ) authority (any access).

To use this service with a private object, the caller must have at least USER (READ) authority (user access).

Usage Notes

HMAC operations are performed in software.

Return code 4, reason code 8000 indicates the HMAC didn’t verify.

If the FIRST rule is used to start a series of chained calls:
- The key used to initiate the chained calls must not be deleted until the chained calls are complete.
- The application should make a LAST call to free ICSF resources allocated. If processing is to be aborted without making a LAST call and the chain_data parameter indicates that a cryptographic state object has been allocated, the caller must free the object by calling CSFPRTRD (or CSFPTRD6 for 64-bit callers) passing the state object’s handle.

PKCS #11 One-way hash, sign, or verify (CSFPOWH and CSFPOWH6)

Use the one-way hash, sign, or verify callable service to generate a one-way hash on specified text, sign specified text, or verify a signature on specified text. For one-way hash, this service supports the following methods:
- MD2 - software only
- MD5 - software only
- SHA-1
- RIPEMD-160 - software only
- SHA-224
- SHA-256
- SHA-384
- SHA-512

For sign and verify, the following methods are supported:
- MD2 with RSA-PKCS 1.5
- MD5 with RSA-PKCS 1.5
- SHA1 with RSA-PKCS 1.5, DSA, or ECDSA
- SHA-224 with RSA-PKCS 1.5, DSA, or ECDSA
- SHA-256 with RSA-PKCS 1.5, DSA, or ECDSA
- SHA-384 with RSA-PKCS 1.5, DSA, or ECDSA
- SHA-512 with RSA-PKCS 1.5, DSA, or ECDSA

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPOWH6.
PKCS #11 One-way hash, sign, or verify (CSFPOWH)

Format

```c
CALL CSFPOWH(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    text_length,
    text,
    text_id,
    chain_data_length,
    chain_data,
    handle,
    hash_length,
    hash )
```

Parameters

**return_code**
- Direction: Output
- Type: Integer

The return code specifies the general result of the callable service. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the return codes.

**reason_code**
- Direction: Output
- Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the reason codes.

**exit_data_length**
- Direction: Ignored
- Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

**exit_data**
- Direction: Ignored
- Type: String

This field is ignored.

**rule_array_count**
- Direction: Input
- Type: Integer

The number of keywords you supplied in the `rule_array` parameter. This value must be 1 or 2.

**rule_array**
- Direction: Input
- Type: String
Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

<td>The data is to be hashed then signature verified using ECDSA. The hash method must be SHA-1, SHA-224, SHA-256, SHA-384, or SHA-512.</td>
</tr>
</tbody>
</table>

**text_length**

Direction: Input  Type: Integer

The length of the text parameter in bytes.

If you specify the FIRST or MIDDLE keyword, then the text length must be a multiple of the block size of the hash method. For MD2, this is a multiple of 16 bytes. For MD5, RPMD-160, SHA-1, SHA-224, and SHA-256, this is a multiple of 64 bytes. For SHA-384 and SHA-512, this is a multiple of 128 bytes. For ONLY and LAST, this service performs the required padding according to the algorithm specified. The length can be from 0 to 2147483647.

**text**

Direction: Input  Type: String

Value to be hashed

**text_id**

Direction: Input  Type: Integer

The ALET identifying the space where the text resides.

**chain_data_length**

Direction: Input/Output  Type: Integer

The byte length of the chain_data parameter. This must be 128 bytes.

**chain_data**

Direction: Input/Output  Type: String

This field is a 128-byte work area. The chain data permits chaining data from one call to another. ICSF initializes the chain data on a FIRST call and may change it on subsequent MIDDLE calls. Your application must not change the data in this field between the sequence of FIRST, MIDDLE, and LAST calls for a specific message. The chain data has the following format:

Table 311. chain_data parameter format

<table>
<thead>
<tr>
<th>Offset</th>
<th>Length</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>4</td>
<td>Flag word</td>
</tr>
</tbody>
</table>

**Bit**  Meaning when set on

| 0 | Cryptographic state object has been allocated |
| 1-31 | Reserved for IBM's use |

| 4 | 44  | Cryptographic state object handle |
| 48 | 80   | Reserved for IBM's use |

handle
PKCS #11 One-way hash, sign, or verify (CSFPOWH)

Direction: Input  Type: String

For hash requests, this is the 44-byte name of the token to which this hash operation is related. The first 32 bytes of the handle are meaningful. The remaining 12 bytes are reserved. See "Handles" on page 95 for the format of a handle.

For sign and verify requests, this is the 44-byte handle to the key object that is to be used. For FIRST and MIDDLE chaining requests, only the first 32 bytes of the handle are meaningful, to identify the token.

hash_length

Direction: Input/Output  Type: Integer

The length of the supplied hash field in bytes.

For hash requests, this field is input only. For SHA-1 and RPMD-160 this must be at least 20 bytes; for MD2 and MD5 this must be at least 16 bytes. For SHA-224 and SHA-256, this must be at least 32 bytes. Even though the length of the SHA-224 hash is less than SHA-256, the extra bytes are used as a work area during the generation of the hash value. The SHA-224 value is left-justified and padded with 4 bytes of binary zeroes. For SHA-384 and SHA-512, thus must be at least 64 bytes. Even though the length of the SHA-384 hash is less than SHA-512, the extra bytes are used as a work area during the generation of the hash value. The SHA-384 value is left-justified and padded with 16 bytes of binary zeroes.

For FIRST and MIDDLE sign and verify requests, this field is ignored.

For LAST and ONLY sign requests, this field is input/output. If the signature generation is successful, ICSF will update this field with the length of the generated signature. If the signature generation is unsuccessful because the supplied hash field is too small, ICSF will update this field with the required length.

For LAST and ONLY verify requests, this field is input only.

hash

Direction: Input/Output  Type: String

This field contains the hash or signature, left-justified. The processing of the rest of the field depends on the implementation.

For hash requests, this field is the generated hash. If you specify the FIRST or MIDDLE keyword, this field contains the intermediate hash value. Your application must not change the data in this field between the sequence of FIRST, MIDDLE, and LAST calls for a specific message.

For FIRST and MIDDLE sign and verify requests, this field is ignored.

For LAST and ONLY sign requests, this field is the generated signature.

For LAST and ONLY verify requests, this field is input signature to be verified.

Authorization

To use this service to sign or verify with a public object, the caller must have at least SO (READ) authority or USER (READ) authority (any access).

To use this service to sign or verify with a private object, the caller must have at least USER (READ) authority (user access).
Usage Notes

If the FIRST rule is used to start a series of chained calls, the application must not change the Hash Method or Requested Operation rules between the calls. The behavior of the service is undefined if the rules are changed.

If the FIRST rule is used to start a series of chained calls, the application should make a LAST call to free ICSF resources allocated. If processing is to be aborted without making a LAST call and the chain_data parameter indicates that a cryptographic state object has been allocated, the caller must free the object by calling CSFPTRD (or CSFPTRD6 for 64-bit callers) passing the state object's handle.

The CSFSERV resource name that protects this service is CSFOWH, the same resource name used to protect the non-PKCS #11 One Way Hash service.

For hash method DETERMIN, ICSF determines the hashing method by RSA decrypting the input signature using the specified public key and examining the result. ICSF will return the “signature did not verify” error (return code 4, reason code X’2AF8’) if this process is unsuccessful for any of the following reasons:

1. ICSF cannot successfully perform the decryption because the public key is the wrong size.
2. The resulting clear text block is not properly RSA-PKCS 1.5 formatted.
3. The resulting clear text block indicates a hashing algorithm not supported by this service was used.

PKCS #11 Private key sign (CSFPPKS and CSFPPKS6)

Use the PKCS #11 private key sign callable service to:

- Decrypt or sign data using an RSA private key using zero-pad or PKCS #1 v1.5 formatting
- Sign data using a DSA private key
- Sign data using an Elliptic Curve private key in combination with DSA

The key handle must be a handle of a PKCS #11 private key object. When the request type keyword DECRYPT is specified in the rule array, CKA_DECRYPT attribute must be true. When no request type is specified, the CKA_SIGN attribute must be true.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPPKS6.

Format

```
CALL CSFPPKS(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    cipher_value_length,
    cipher_value,
    key_handle,
    clear_value_length,
    clear_value)
```
PKCS #11 Private key sign

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length
Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data
Direction: Ignored Type: String

This field is ignored.

rule_array_count
Direction: Input Type: Integer

The number of keywords you supplied in the rule_array_parameter. This value may be 1 or 2.

rule_array
Direction: Input Type: String

Keywords that provide control information to the callable service.

Table 312. Keywords for private key sign

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mechanism (One of the following must be specified)</td>
<td></td>

<tr>
<td>Request type (optional)</td>
<td></td>
</tr>
<tr>
<td>DECRYPT</td>
<td>The request is to decrypt data. This type of request requires the CKA_DECRYPT attribute to be true. If DECRYPT is not specified, the CKA_SIGN attribute must be true. Valid with RSA only.</td>
</tr>
</tbody>
</table>
PKCS #11 Private key sign

cipher_value_length
Direction: Input  Type: Integer

Length of the cipher_value parameter in bytes.

cipher_value
Direction: Input  Type: String

For decrypt, this is the value to be decrypted. Otherwise this is the value to be signed. For RSA-PKCS signature requests, the data to be signed is expected to be a DER encoded DigestInfo structure. For DSA and ECDSA signature requests, the data to be signed is expected to be a SHA1, SHA224, SHA256, SHA384 or SHA512 digest.

key_handle
Direction: Input  Type: String

The 44-byte handle of a private key object. See "Handles" on page 95 for the format of a key_handle.

clear_value_length
Direction: Input/Output  Type: Integer

Length of the clear_value parameter in bytes. On output, this is updated to be the actual length of the decrypted value or the generated signature.

clear_value
Direction: Output  Type: String

For decrypt, this field will contain the decrypted value. Otherwise this field will contain the generated signature.

Authorization

To use this service with a public object, the caller must have SO (READ) authority or USER (READ) authority (any access).

To use this service with a private object, the caller must have USER (READ) authority (user access).

Usage Notes

DSA operations are performed in software. RSA operations may be done in hardware or software.

Request type DECRYPT is not supported for an Elliptic Curve or DSA private key.

PKCS #11 Public key verify (CSFPPKV and CSFPPKV6)

Use the PKCS #11 public key verify callable service to:
• Encrypt or verify data using an RSA public key using zero-pad or PKCS #1 v1.5 formatting. For encryption, the encrypted data is returned
• Verify a signature using a DSA public key. No data is returned
• Verify a signature using an Elliptic Curve public key in combination with DSA. No data is returned
PKCS #11 Public key verify

The key handle must be a handle of a PKCS #11 public key object. When the request type keyword ENCRYPT is specified in the rule array, CKA_ENCRYPT attribute must be true. When no request type is specified, the CKA_VERIFY attribute must be true.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPPKV6.

Format

```
CALL CSFPPKV(
  return_code,
  reason_code,
  exit_data_length,
  exit_data,
  rule_array_count,
  rule_array,
  clear_value_length,
  clear_value,
  key_handle,
  cipher_value_length,
  cipher_value )
```

Parameters

- **return_code**
  Direction: Output  Type: Integer
  The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

- **reason_code**
  Direction: Output  Type: Integer
  The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

- **exit_data_length**
  Direction: Ignored  Type: Integer
  This field is ignored. It is recommended to specify 0 for this parameter.

- **exit_data**
  Direction: Ignored  Type: String
  This field is ignored.

- **rule_array_count**
  Direction: Input  Type: Integer
  The number of keywords you supplied in the rule array parameter. This value must be 1 or 2.
**PKCS #11 Public key verify**

**rule_array**

Direction: Input  
Type: String

Keywords that provide control information to the callable service.

*Table 313. Keywords for public key verify*

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mechanism</td>
<td>(One of the following must be specified)</td>
</tr>
<tr>
<td>RSA-ZERO</td>

</tr>
</tbody>
</table>

**clear_value_length**

Direction: Input  
Type: Integer

The length of the clear_value parameter

**clear_value**

Direction: Input  
Type: String

For encrypt, this is the value to be encrypted. Otherwise this is the signature is be verified.

**key_handle**

Direction: Input  
Type: String

The 44-byte handle of public key object. See "Handles" on page 95 for the format of a key_handle.

**cipher_value_length**

Direction: Input/Output  
Type: Integer

For encrypt, on input, this is the length of the cipher_value parameter in bytes.  
On output, this is updated to be the actual length of the text encrypted into the cipher_value parameter. For signature verification, this is the length of the data to be verified (input only).

**cipher_value**

Direction: Input/Output  
Type: String

For encrypt, this is the encrypted value (output only). For signature verification, this is the data to be verified (input only). For RSA-PKCS signature verification requests, the data to be verified is expected to be a DER encoded DigestInfo structure. For DSA and ECDSA signature verification requests, the data to be verified is expected to be a SHA1, SHA224, SHA256, SHA384 or SHA512 digest.
PKCS #11 Public key verify

Authorization
To use this service with a public object, the caller must have SO (READ) authority or USER (READ) authority (any access).

To use this service with a private object, the caller must have USER (READ) authority (user access).

Usage Notes
DSA operations are performed in software. RSA and ECDSA operations may be done in hardware or software.

Request type ENCRYPT is not supported for an Elliptic Curve or DSA public key.

PKCS #11 Pseudo-random function (CSFPFRF and CSFPFRF6)
Use the PKCS #11 Pseudo-random callable service to generate pseudo-random output of arbitrary length. This service does not support any recovery methods.

The mechanism keyword specified in the rule array indicates what derivation protocol to use. The derive parms list provides additional input/output data. The format of this list is dependent on the protocol being used.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPFRF6.

Format

```
CALL CSFPFRF(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    handle,
    parms_list_length,
    parms_list,
    prf_output_length,
    prf_output)
```

Parameters

**return_code**
- Direction: Output
- Type: Integer

The **return code** specifies the general result of the callable service. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the return codes.

**reason_code**
- Direction: Output
- Type: Integer
PKCS #11 Pseudo-random function

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length
Direction: Ignored Type: Integer
This field is ignored. It is recommended to specify 0 for this parameter.

exit_data
Direction: Ignored Type: String
This field is ignored.

rule_array_count
Direction: Input Type: Integer
The number of keywords you supplied in the rule_array parameter. This value must be 1.

rule_array
Direction: Input Type: String
Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

Table 314. Keywords for derive multiple keys

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mechanism (required)</td>
<td></td>
</tr>
<tr>
<td>TLS-PRF</td>
<td>Use the TLS Pseudo-Random Function derivation protocol as defined in the PKCS #11 standard as mechanism CKM_TLS_PRF. This mechanism derives deterministic random bytes from a caller supplied secret key object and other parameters.</td>
</tr>
<tr>
<td>PRNG</td>
<td>Generate pseudo-random bytes using the best source available. If a secure cryptographic coprocessor that supports RNGL is installed and configured, it will be used to produce true (non-deterministic) random data. Otherwise, a pseudo (deterministic) random algorithm, consistent with ANSI X9.31, will be utilized. If a secure cryptographic coprocessor is installed and configured, it will be used to provide entropy in producing the pseudo-random data. Otherwise, an IBM proprietary entropy algorithm will be used in producing the pseudo-random data</td>
</tr>
</tbody>
</table>

handle
Direction: Input Type: String
For mechanism TLS-PRF, this is the 44-byte handle of the source secret key object. The CKA_DERIVE attribute for the secret key object must be true. If no key is to be used, set the handle to all blanks.

For mechanism PRNG, this is the 44-byte name of the token to which this operation is related. The first 32 bytes of the handle are meaningful. The remaining 12 bytes are reserved and must be blanks.

See “Handles” on page 95 for the format of a handle.
PKCS #11 Pseudo-random function

**parms_list_length**

Direction: Input  Type: Integer

The length of the parameters supplied in the *parms_list* parameter in bytes.

**parms_list**

Direction: Input/Output  Type: String

The protocol specific parameters. This field has a varying format depending on the mechanism specified:

Table 315. *parms_list* parameter format for TLS-PRF mechanism

<table>
<thead>
<tr>
<th>Offset</th>

For the PRNG mechanism, there are no parameters. The *parms_list_length* parameter must be set to zero for this mechanism.

**prf_output_length**

Direction: Input  Type: Integer

The length in bytes of pseudo-random data to be generated and returned in the *prf_output* parameter. The maximum length is 2147483647 bytes.

**prf_output**

Direction: Output  Type: String

The pre-allocated area in which the pseudo-random data is returned.

**Authorization**

To use this service with a public object for mechanism TLS-PRF, the caller must have at least SO (READ) authority or USER (READ) authority (any access).

To use this service with a private object for mechanism TLS-PRF, the caller must have at least USER (READ) authority (user access).

**Usage Notes**

Pseudo-random functions operations are performed in software.

The CSFSERV resource name that protects this service is CSFRNG, the same resource name used to protect the non-PKCS #11 Random Number Generation service.
PKCS #11 Set attribute value (CSFPSAV and CSFPSAV6)

Use the set attribute value callable service (CSFPSAV) to update the attributes of an object.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPSAV6.

Format

CALL CSFPSAV(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    handle,
    rule_array_count,
    rule_array,
    attribute_list_length,
    attribute_list)

Parameters

return_code

Direction: Output  Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

reason_code

Direction: Output  Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

exit_data_length

Direction: Ignored  Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data

Direction: Ignored  Type: String

This field is ignored.

handle

Direction: Input  Type: String

The 44-byte handle of the object. See "Handles" on page 95 for the format of a handle.

rule_array_count
PKCS #11 Set attribute value

*Direction: Input*  
Type: Integer

The number of keywords supplied in the `rule_array` parameter. This value must be 0.

**rule_array**

*Direction: Input*  
Type: String

Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

**attribute_list_length**

*Direction: Input*  
Type: Integer

The length of the `attribute_list` parameter in bytes. The maximum size in bytes is 32752.

**attribute_list**

*Direction: Input*  
Type: String

A list of object attributes.

**Note:** Lengths in the attribute list and attribute structures are unsigned integers. See "Attribute List" on page 94 for the format of an `attribute_list`.

**Authorization**

*Table 316. Authorization requirements for the set attribute value callable service*

<table>
<thead>
<tr>
<th>Action</th>
<th>Object</th>
<th>Authority required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set</td>
<td>Public object, except a CA certificate</td>
<td>USER (UPDATE) or SO (READ)</td>
</tr>
<tr>
<td>Set</td>
<td>Private object, except a CA certificate</td>
<td>USER (UPDATE) or SO (CONTROL)</td>
</tr>
<tr>
<td>Set</td>
<td>Public CA certificate object</td>
<td>USER (CONTROL) or SO (READ)</td>
</tr>
<tr>
<td>Set</td>
<td>Private CA certificate object</td>
<td>USER (CONTROL) or SO (CONTROL)</td>
</tr>
</tbody>
</table>

**Note:**
- Session and token objects require the same authority.
- See [z/OS Cryptographic Services ICSF Writing PKCS #11 Applications](#) for more information on the SO and User PKCS #11 roles and how ICSF determines that a certificate is a CA certificate.

**Usage Notes**

When updating the attributes of an object, all attributes in the template will be processed and the value used is that of the last instance processed.
PKCS #11 Secret key decrypt

PKCS #11 Secret key decrypt (CSFPSKD and CSFPSKD6)

Use the PKCS #11 secret key decrypt callable service to decipher data using a clear symmetric key. AES, DES, BLOWFISH, and RC4 are supported. This service supports CBC, ECB, Galois/Counter, and stream modes and PKCS #7 padding. The key handle must be a handle of a PKCS #11 secret key object. The CKA_DECRYPT attribute must be true.

If the length of output field is too short to hold the output, the service will fail and return the required length of the output field in the clear_text_length parameter.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPSKD6.

Format

```assembly
call csfpskd(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_handle,
    initialization_vector_length,
    initialization_vector,
    chain_data_length,
    chain_data,
    cipher_text_length,
    cipher_text,
    cipher_text_id,
    clear_text_length,
    clear_text,
    clear_text_id )
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Ignored  
Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.
PKCS #11 Secret key decrypt

exit_data

Direction: Ignored Type: String

This field is ignored.

rule_array_count

Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. This value must be 0, 1, 2, or 3.

rule_array

Direction: Input Type: String

Keywords that provide control information to the callable service.

Table 317. Keywords for secret key decrypt

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Encryption Mechanism</td>
<td>(Optional. No default. If not specified, mechanism will be taken from key type of secret key. If specified, must match key type)</td>
</tr>
<tr>
<td>AES</td>
<td>AES algorithm will be used.</td>
</tr>
<tr>
<td>DES</td>
<td>DES algorithm will be used. This is only single-key encryption.</td>
</tr>
<tr>
<td>DES3</td>
<td>DES3 algorithm will be used. This includes double- and triple-key encryption.</td>
</tr>
<tr>
<td>BLOWFISH</td>
<td>BLOWFISH algorithm will be used.</td>
</tr>
<tr>
<td>RC4</td>
<td>RC4 algorithm will be used. This is a stream cipher.</td>
</tr>
<tr>
<td>Processing Rule (optional)</td>
<td></td>
</tr>
<tr>
<td>CBC</td>
<td>Performs cipher block chaining. The cipher text length must be a multiple of the block size for the specified algorithm (8 bytes for DES, DES3, and BLOWFISH, 16 bytes for AES). CBC is the default value for DES, DES3, AES, and BLOWFISH. CBC cannot be specified for RC4.</td>
</tr>
<tr>
<td>CBC-PAD</td>
<td>Performs cipher block chaining. The cipher text length must be greater than zero and a multiple of the block size for the specified algorithm. For FINAL and ONLY calls, PKCS #7 padding is performed. For this reason, the clear text will always be shorter than the cipher text and may even be zero length. CBC-PAD cannot be specified for BLOWFISH or RC4.</td>
</tr>
<tr>
<td>ECB</td>
<td>Performs electronic code book encryption. The cipher text length must be a multiple of the block size for the specified algorithm. ECB cannot be specified for BLOWFISH or RC4.</td>
</tr>
<tr>
<td>GCM</td>
<td>Performs Galois/Counter mode encryption. The cipher text length must be greater than zero. The clear text will be shorter than the cipher text and may even be zero length due to the truncation of the authentication tag. GCM may only be specified with AES. GMAC is a specialized form of GCM where no plain text is returned.</td>
</tr>
<tr>
<td>STREAM</td>
<td>Performs a stream cipher. STREAM cannot be specified for BLOWFISH, DES, DES3, or AES. STREAM is the default value for RC4.</td>
</tr>
</tbody>
</table>

Chaining Selection (optional)
Table 317. Keywords for secret key decrypt (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INITIAL</td>
<td>Specifies this is the first call in a series of chained calls. For cipher block chaining, the initialization vector is taken from the initialization_vector parameter. Cannot be specified with processing rule ECB or GCM.</td>
</tr>
<tr>
<td>CONTINUE</td>
<td>Specifies this is a middle call in a series of chained calls. Intermediate results are read from and stored in the chain_data field. Cannot be specified with processing rule ECB or GCM.</td>
</tr>
<tr>
<td>FINAL</td>
<td>Specifies this is the last call in a series of chained calls. Intermediate results are read from the chain_data field. Cannot be specified with processing rule ECB or GCM.</td>
</tr>
<tr>
<td>ONLY</td>
<td>Specifies this is the only call and the call is not chained. For cipher block chaining, the initialization vector is taken from the initialization_vector parameter. For Galois Counter mode, the initialization parameters are taken from the initialization_vector parameter. ONLY is the default chaining.</td>
</tr>
</tbody>
</table>

**key_handle**
- Direction: Input
- Type: String

The 44-byte handle of secret key object. See [“Handles” on page 95](#) for the format of a key_handle.

**initialization_vector_length**
- Direction: Input
- Type: Integer

Length of the initialization_vector in bytes. For CBC and CBC-PAD, this must be 8 bytes for DES and BLOWFISH and 16 bytes for AES. For GCM, this must be the size of the initialization_vector field (28 bytes).

**initialization_vector**
- Direction: Input
- Type: String

This field has a varying format depending on the mechanism specified. For CBC and CBC-PAD this is the 8 or 16 byte initial chaining value. The format for GCM is shown in the following table.

Table 318. initialization_vector parameter format for GCM mechanism

<table>
<thead>
<tr>
<th>Offset</th>
<th>Length in bytes</th>
<th>Direction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>4</td>
<td>Input</td>
<td>length in bytes of the initialization vector. The minimum value is 1. The maximum value is 128. 12 is recommended.</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
<td>Input</td>
<td>64-bit address of the initialization vector. The data must reside in the caller’s address space. High order word must be set to all zeros by AMODE31 callers.</td>
</tr>
<tr>
<td>12</td>
<td>4</td>
<td>Input</td>
<td>length in bytes of the additional authentication data. The minimum value is 0. The maximum value is 1048576.</td>
</tr>
<tr>
<td>16</td>
<td>8</td>
<td>Input</td>
<td>64-bit address of the additional authentication data. The data must reside in the caller’s address space. High order word must be set to all zeros by AMODE31 callers. This field is ignored if the length of the additional authentication data is zero.</td>
</tr>
<tr>
<td>24</td>
<td>4</td>
<td>Input</td>
<td>Length in bytes of the desired authentication tag. This value must be one of 4, 8, 12, 13, 14, 15, or 16.</td>
</tr>
</tbody>
</table>
PKCS #11 Secret key decrypt

**chain_data_length**
Direction: Input/Output  
Type: Integer

The byte length of the chain_data parameter. This must be 128 bytes.

**chain_data**
Direction: Input/Output  
Type: String

This field is a 128-byte work area. The chain data permits chaining data from one call to another. ICSF initializes the chain data on an INITIAL call, and may change it on subsequent CONTINUE calls. Your application must not change the data in this field between the sequence of INITIAL, CONTINUE, and FINAL calls for a specific message. The chain data has the following format:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Length</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>4</td>
<td>Flag word</td>
</tr>
<tr>
<td>Bit</td>
<td>Meaning when set on</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>Cryptographic state object has been allocated</td>
<td></td>
</tr>
<tr>
<td>1-31</td>
<td>Reserved for IBM's use</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>44</td>
<td>Cryptographic state object handle</td>
</tr>
<tr>
<td>48</td>
<td>80</td>
<td>Reserved for IBM's use</td>
</tr>
</tbody>
</table>

**cipher_text_length**
Direction: Input  
Type: Integer

Length of the cipher_text parameter in bytes. Except for processing rule GCM, the length can be up to 2147483647. For processing rule GCM, the length cannot exceed 1048576 plus the length of the tag.

**cipher_text**
Direction: Input  
Type: String

Text to be decrypted.

**cipher_text_id**
Direction: Input  
Type: Integer

The ALET identifying the space where the cipher text resides.

**clear_text_length**
Direction: Input/Output  
Type: Integer

On input, the length in bytes of the clear_text parameter. On output, the length of the text decrypted into the clear_text parameter.

**clear_text**
Direction: Output  
Type: String

Decrypted text

**clear_text_id**
PKCS #11 Secret key decrypt

Direction: Input
Type: Integer

The ALET identifying the space where the clear text resides.

Authorization

To use this service with a public object, the caller must have at least SO (READ) authority or USER (READ) authority (any access).

To use this service with a private object, the caller must have at least USER (READ) authority (user access).

Usage Notes

If the INITIAL rule is used to start a series of chained calls:

- The key used to initiate the chained calls must not be deleted until the chained calls are complete.
- The application should make a FINAL call to free ICSF resources allocated. If processing is to be aborted without making a FINAL call and the chain_data parameter indicates that a cryptographic state object has been allocated, the caller must free the object by calling CSFPTRD (or CSFPTRD6 for 64-bit callers) passing the state object's handle.

GCM decryption may be used to verify a GMAC on some authentication data. To do this request AES decryption with processing rule. The cipher_text_length and cipher_text fields must be set to the length and value of the GMAC to be verified. A return_code of zero and no clear_text data returned means the GMAC verification was successful.

PKCS #11 Secret key encrypt (CSFPSKE and CSFPSKE6)

Use the PKCS #11 secret key encrypt callable service to encipher data using a clear symmetric key. AES, DES, BLOWFISH, and RC4 are supported. This service supports CBC, ECB, Galois/Counter, and stream modes and PKCS #7 padding. The key handle must be a handle of a PKCS #11 secret key object. The CKA_ENCRYPT attribute must be true.

If the length of output field is too short to hold the output, the service will fail and return the required length of the output field in the cipher_text_length parameter.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPSKE6.
PKCS #11 Secret key encrypt (CSFPSKE)

Format

```c
CALL CSFPSKE(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    key_handle,
    initialization_vector_length,
    initialization_vector,
    chain_data_length,
    chain_data,
    clear_text_length,
    clear_text,
    clear_text_id,
    cipher_text_length,
    cipher_text,
    cipher_text_id )
```

Parameters

**return_code**

Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, "ICSF and TSS Return and Reason Codes" lists the return codes.

**reason_code**

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. Appendix A, "ICSF and TSS Return and Reason Codes" lists the reason codes.

**exit_data_length**

Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

**exit_data**

Direction: Ignored Type: String

This field is ignored.

**rule_array_count**

Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. This value must be 0, 1, 2, or 3.

**rule_array**

Direction: Input Type: String
Keywords that provide control information to the callable service.

**Table 320. Keywords for secret key encrypt**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Encryption Mechanism</td>
<td>(Optional. No default. If not specified, mechanism will be taken from key type of secret key. If specified, must match key type)</td>
</tr>
<tr>
<td>AES</td>
<td>AES algorithm will be used.</td>
</tr>
<tr>
<td>DES</td>
<td>DES algorithm will be used. This is only single-key encryption.</td>
</tr>
<tr>
<td>DES3</td>
<td>DES3 algorithm will be used. This includes double- and triple-key encryption.</td>
</tr>
<tr>
<td>BLOWFISH</td>
<td>BLOWFISH algorithm will be used.</td>
</tr>
<tr>
<td>RC4</td>
<td>RC4 algorithm will be used. This is a stream cipher.</td>
</tr>
<tr>
<td>Processing Rule (optional)</td>
<td></td>
</tr>
<tr>
<td>CBC</td>
<td>Performs cipher block chaining. The text length must be a multiple of the block size for the specified algorithm (8 bytes for DES, DES3, and BLOWFISH, 16 bytes for AES). CBC is the default value for DES, DES3, AES, and BLOWFISH. CBC cannot be specified for RC4.</td>
</tr>
</tbody>
</table>
| CBC-PAD                  | Performs cipher block chaining. Except for FINAL and ONLY chaining calls, the clear text length must be a multiple of the block size for the specified algorithm. For FINAL and ONLY calls:  
  • The clear text length may be shorter than the block size and may even be zero.  
  • PKCS #7 padding is performed. Thus, the cipher text will always be longer than the clear text.  
  CBC-PAD cannot be specified for BLOWFISH or RC4. |
| ECB                      | Performs electronic code book encryption. The text length must be a multiple of the block size for the specified algorithm. ECB cannot be specified for BLOWFISH or RC4. |
| GCM                      | Performs Galois/Counter mode encryption. The clear text length may be shorter than the block size and may even be zero. The authentication tag is returned appended to the cipher text. GCM may only be specified with AES. GMAC is a specialized form of GCM where no plain text is specified. |
| GCM/IVGEN                | Performs similarly to the GCM processing rule except that ICSF will generate part of the initialization vector and return it in the initialization_vector parameter. Having ICSF generate the initialization vector ensures that initialization vectors are never repeated for a given key object. |
| STREAM                   | Performs a stream cipher. STREAM cannot be specified for BLOWFISH, DES, DES3, or AES. STREAM is the default value for RC4. |
| Chaining Selection (optional)|                                                                         |
| INITIAL                  | Specifies this is the first call in a series of chained calls. For cipher block chaining, the initialization vector is taken from the initialization_vector parameter. Intermediate results are stored in the chain_data field. Cannot be specified with processing rule ECB, GCM, or GCM/IVGEN. |
PKCS #11 Secret key encrypt (CSFPSKE)

<td>Specifies this is the last call in a series of chained calls. Intermediate results are read from the chain_data field. Cannot be specified with processing rule ECB, GCM, or GCMIVGEN.</td>
</tr>
<tr>
<td>ONLY</td>
<td>Specifies this is the only call and the call is not chained. For cipher block chaining, the initialization vector is taken from the initialization_vector parameter. For Galois Counter mode, the initialization parameters are taken from the initialization_vector parameter. ONLY is the default chaining.</td>
</tr>
</tbody>
</table>

**key_handle**

Direction: Input  Type: String

The 44-byte handle of secret key object. See "Handles" on page 95 for the format of a key_handle.

**Initialization_vector_length**

Direction: Input  Type: Integer

Length of the initialization_vector in bytes. For CBC and CBC-PAD, this must be 8 bytes for DES and BLOWFISH and 16 bytes for AES. For GCM and GCMIVGEN, this must be the size of the initialization_vector field (28 bytes).

**initialization_vector**

Direction: Input  Type: String

This field has a varying format depending on the mechanism specified. For CBC and CBC-PAD this is the 8 or 16 byte initial chaining value. The format for GCM and GCMIVGEN are shown in the following tables.

Table 321. initialization_vector parameter format for GCM mechanism

<table>

<td>44</td>
<td>Cryptographic state object handle</td>
</tr>
<tr>
<td>48</td>
<td>80</td>
<td>Reserved for IBM’s use</td>
</tr>
</tbody>
</table>

**clear_text_length**

Direction: Input Type: Integer

Length of the *clear_text* parameter in bytes. Except for processing rules GCM and GCMIVGEN, the length can be up to 2147483647. For processing rules GCM and GCMIVGEN, the length cannot exceed 1048576.

**clear_text**
PKCS #11 Secret key encrypt (CSFPSKE)

Direction: Input Type: String

Text to be encrypted

clear_text_id

Direction: Input Type: Integer

The ALET identifying the space where the clear text resides.

cipher_text_length

Direction: Input/Output Type: Integer

On input, the length in bytes of the cipher_text parameter. On output, the length of the text encrypted into the cipher_text parameter.

cipher_text

Direction: Output Type: String

Encrypted text

cipher_text_id

Direction: Output Type: Integer

The ALET identifying the space where the cipher text resides.

Authorization

To use this service with a public object, the caller must have at least SO (READ) authority or USER (READ) authority (any access).

To use this service with a private object, the caller must have at least USER (READ) authority (user access).

Usage Notes

If the INITIAL rule is used to start a series of chained calls:

- The key used to initiate the chained calls must not be deleted until the chained calls are complete.
- The application should make a FINAL call to free ICSF resources allocated. If processing is to be aborted without making a FINAL call and the chain_data parameter indicates that a cryptographic state object has been allocated, the caller must free the object by calling CSFPTRD (or CSFPTRD6 for 64-bit callers) passing the state object's handle.

GCM encryption may be used to produce a GMAC on some authentication data. To do this, request AES encryption with processing rule GCM or GCMVGEN. The clear_text_length field must be set to zero. The authentication tag (the GMAC) is returned in the cipher_text field.

For Processing Rule GCMVGEN, the total number of initialization vector generations for a token key object is limited to 4294967295. Once this number is exceeded, the key object will no longer be eligible for Processing Rule GCMVGEN and is considered “retired”. This usage counter is maintained in the TKDS as part of the key object. For keys that are copied using CSFPTRC (C_CopyObject), the existing counter value is copied to the new key object, but not synchronized after that.
PKCS #11 Secret key encrypt (CSFPSKE)

For Processing Rule GCMIVGEN, session key objects have no maximum lifetime. They may be retired at any time. Once retired, the key object will no longer be eligible for Processing Rule GCMIVGEN.

For Processing Rule GCMIVGEN, the nonce value portion of the initialization vector is predetermined by the caller. It is used to ensure that initialization vector values are not repeated for any given key value. The caller should provide a random value and change the value as often as practical. It must be changed whenever:

- a given key value is replicated as a new persistent key object
- a given persistent key object is replicated as a new session key object
- a given session key value is re-instantiated after system IPL
- a given key value is re-instantiated after ICSF indicates it has been retired

Use of Processing Rule GCMIVGEN with token key objects requires that the first 4 bytes of ECVTSPLX or CVTSNAME be set to a unique value with respect to other systems. See z/OS Cryptographic Services ICSF System Programmer’s Guide, SA22-7520 for information on how to set these fields.

A session key object should never be used for Processing Rule GCMIVGEN if the key value is distributed to multiple systems outside the current sysplex where new initialization vectors may be generated. Use only token key objects in such cases. If session key objects are used, the other systems must use different nonces.

For Processing Rule GCMIVGEN, the 8 bytes of generated initialization vector are stored back into the initialization vector area before the GCM operation is performed. This allows the generated initialization vector to be part of the additional authentication data, if desired.

PKCS #11 Token record create (CSFPTRC and CSFPTRC6)

Use the token record create callable service (CSFPTRC) to do these tasks:

- Initialize or re-initialize a z/OS PKCS #11 token
- Create or copy a token object in the token data set
- Create or copy a session object for the current PKCS #11 session

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPTRC6.

**Format**

```c
CALL CSFPTRC(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    handle,
    rule_array_count,
    rule_array,
    attribute_list_length,
    attribute_list)
```
PKCS #11 Token record create

Parameters

return_code
Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

reason_code
Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length
Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data
Direction: Ignored Type: String

This field is ignored.

handle
Direction: Input/Output Type: String

On input, the 44-byte name of the z/OS PKCS #11 token to be initialized, or the token handle of the object to be created or copied. For the create or re-create functions, the first 32 bytes of the handle are meaningful on input. The remaining 12 bytes are filled in by the token record create service. For the copy function, all 44 bytes of the handle are significant on input.

On output, the 44-byte handle of the z/OS PKCS #11 token or object created.

See “Handles” on page 95 for the format of a handle.

rule_array_count
Direction: Input Type: Integer

The number of keywords supplied in the rule_array parameter. The value must be 1 or 2.

rule_array
Direction: Input Type: String

Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>One of these two keywords must be specified:</td>
<td></td>
</tr>
</tbody>
</table>
PKCS #11 Token record create

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOKEN</td>
<td>Specifies that a token is to be initialized. If the token exists in the token data set, the RECREATE keyword must be specified.</td>
</tr>
<tr>
<td>OBJECT</td>
<td>Specifies that an object (token object or session object) is to be created. If the object is to be a copy of an existing object, the COPY keyword must be specified.</td>
</tr>
</tbody>
</table>

This keyword is optional, and valid only with TOKEN:

| RECREATE  | Specifies that the token exists and is to be re-initialized. All objects of the existing token will be deleted. |

This keyword is optional, and valid only with OBJECT:

| COPY      | Specifies that the object specified by the handle is to be copied into a new object. |

attribute_list_length

Direction: Input  
Type: Integer

Length of the attribute_list parameter in bytes.

The maximum size in bytes is 32752.

attribute_list

Direction: Input  
Type: String

List of token or object attributes.

When creating or re-creating a token, the attribute_list parameter has this format:

<table>
<thead>
<tr>
<th>Bytes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 31</td>
<td>Manufacturer ID</td>
</tr>
<tr>
<td>32 - 47</td>
<td>Model</td>
</tr>
<tr>
<td>48 - 63</td>
<td>Serial number</td>
</tr>
<tr>
<td>64 - 67</td>
<td>Reserved for IBM's use. Must be hexadecimal zeros.</td>
</tr>
</tbody>
</table>

Note: The strings supplied for Manufacturer ID, Model, and Serial number are assumed to be from code page IBM1047.

For objects, see "Attribute List" on page 94 for the format of an attribute_list.

Authorization

Note: Session and token objects require the same SAF authority.

Table 324. Authorization requirements for the token record create callable service

<table>

<td>USER (CONTROL) or both USER (UPDATE) and SO (READ)</td>
</tr>
<tr>
<td>Copy object</td>
<td>Private object, where source or target or both are CA certificate objects</td>
<td>Public object, where source or target or both are CA certificate objects</td>
<td>USER (CONTROL) or both USER (UPDATE) and SO (READ)</td>
</tr>
</tbody>
</table>

Note:
- Session and token objects require the same authority.
- See [z/OS Cryptographic Services ICSF Writing PKCS #11 Applications] for more information on the SO and User PKCS #11 roles and on how ICSF determines that a certificate is a CA certificate.

Usage Notes

When creating an object, these attribute processing rules will be in effect:
- All attributes will be processed and the value of the last instance of an attribute in the template will be saved.

When copying an object, these attribute processing rules will be in effect:
- All attributes will be processed and the value of the last instance of an attribute in the template will be saved except for CKA_EXTRACTABLE and CKA_SENSITIVE. CKA_EXTRACTABLE will be copied from the source object and may be set to False if the value in the source object is True. CKA_SENSITIVE will be copied from the source object and may be set to True if the value in the source object is False.
PKCS #11 Token record delete

PKCS #11 Token record delete (CSFPTRD and CSFPTRD6)

Use the token record delete callable service (CSFPTRD) to delete a z/OS PKCS #11 token, token object, session object, or state object. When a token is deleted, all associated objects are deleted as well. The deletions occur in the token data set (TKDS), and all session memory areas in the ICSF address space.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPTRD6.

Format

```plaintext
CALL CSFPTRD(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    handle,
    rule_array_count,
    rule_array)
```

Parameters

return_code

Direction: Output Type: Integer

The return code specifies the general result of the callable service. Appendix A, “ICSF and TSS Return and Reason Codes” lists the return codes.

reason_code

Direction: Output Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. Appendix A, “ICSF and TSS Return and Reason Codes” lists the reason codes.

exit_data_length

Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data

Direction: Ignored Type: String

This field is ignored.

handle

Direction: Input Type: String

44-byte name of the token or object to be deleted. See "Handles" on page 95 for the format of a handle.

rule_array_count

Direction: Input Type: Integer

The number of rule elements in the rule_array parameter. This is a required parameter for CSFPTRD6. It is ignored for CSFPTRD.
PKCS #11 Token record delete

<table>
<thead>
<tr>
<th>Direction: Input</th>
<th>Type: Integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>The number of keywords supplied in the rule_array parameter. This value must be 1.</td>
<td></td>
</tr>

<td>USER (UPDATE) or SO (READ)</td>
</tr>
<tr>
<td>Private object, except CA certificate</td>
<td>USER (UPDATE) or SO (CONTROL)</td>
</tr>
<tr>
<td>Public CA certificate object</td>
<td>USER (CONTROL) or SO (READ)</td>
</tr>
<tr>
<td>Private CA certificate object</td>
<td>USER (CONTROL) or SO (CONTROL)</td>
</tr>
<tr>
<td>State object</td>
<td>None</td>
</tr>
</tbody>
</table>

Note:

- Session and token objects require the same authority.
- See z/OS Cryptographic Services ICSF Writing PKCS #11 Applications for more information on the SO and User PKCS #11 roles and how ICSF determines that a certificate is a CA certificate.

Usage Notes

An application can free state objects allocated by certain PKCS #11 callable services by calling this service. To do so, specify the handle of the state object in the handle parameter and "OBJECT " in the rule_array parameter. For more information on the PKCS #11 callable services that can allocate state objects, refer to:

- "PKCS #11 Secret key decrypt (CSFPSKD and CSFPSKD6)" on page 697
- "PKCS #11 Secret key encrypt (CSFPSKE and CSFPSKE6)" on page 701
- "PKCS #11 One-way hash, sign, or verify (CSFPOWH and CSFPOWH6)" on page 682
- "PKCS #11 Generate HMAC (CSFPHMG and CSFPHMG6)" on page 675
PKCS #11 Token record list (CSFPTRL and CSFPTRL6)

Use the token record list callable service (CSFPTRL) to:

- Obtain a list of z/OS PKCS #11 tokens. The caller must have SAF authority to the token for a particular token to be listed.
- Obtain a list of token and session objects for a token. Use a search template to restrict the search for specific attributes. The caller must have SAF authority to the token.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPTRL6.

Format

```
CALL CSFPTRL(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    handle,
    rule_array_count,
    rule_array,
    search_template_length,
    search_template,
    list_length,
    handle_count,
    output_list)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes assigned to it that indicate specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the reason codes.

**exit_data_length**

Direction: Ignored  
Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

**exit_data**

Direction: Ignored  
Type: String
PKCS #11 Token record list

handle

Direction: Input  Type: String

For tokens, an empty string (blanks) for the first call, or the 44-byte handle of the last token found for subsequent calls.

For objects, the 44-byte handle of the token for the first call, or the 44-byte handle of the last object found for subsequent calls.

See Usage Notes for more information. See “Handles” on page 95 for the format of a handle.

rule_array_count

Direction: Input  Type: Integer

The number of keywords supplied in the rule_array parameter. This value must be 1 or 2.

rule_array

Direction: Input  Type: String

Keywords that provide control information to the callable service. Each keyword is left-justified in 8-byte fields and padded on the right with blanks. All keywords must be in contiguous storage.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing entity (required)</td>
<td></td>
</tr>
<tr>
<td>TOKEN</td>
<td>Specifies that the list will contain all tokens to which the caller has SAF access. The search_template parameter is ignored.</td>
</tr>
<tr>
<td>OBJECT</td>
<td>Specifies that the list will contain the handles of all objects that match the attributes specified in the search_template parameter and to which the caller has SAF access.</td>
</tr>
<tr>
<td>List options (optional, valid only with OBJECT)</td>
<td></td>
</tr>
<tr>
<td>ALL</td>
<td>Specifies that when listing objects, both public and private objects that meet the search criteria should be listed if the caller has SAF authority for the token. There may be no sensitive attributes in the search template. See the Authorization topic for details.</td>
</tr>
</tbody>
</table>

search_template_length

Direction: Input  Type: Integer

The length of the search_template parameter in bytes. The value must be 0 when the TOKEN keyword is specified.

The maximum size in bytes is 32752.

search_template

Direction: Input  Type: String

A list of criteria (attribute values) that an object must meet to be added to the list. If the search_template_length parameter is 0, no criteria are checked.
PKCS #11 Token record list

See "Attribute List" on page 94 for the format of an attribute_list.

list_length
Direction: Input/Output
Type: Integer

On input, the length in bytes of the output_list parameter. On output, the number of bytes used for the output_list parameter. If the supplied length is insufficient to hold one record, the list_length parameter is set to the minimum length required for a record.

handle_count
Direction: Input/Output
Type: Integer

On input, the maximum number of tokens or object handles to return in the list. On output from a successful call (return_code < 8), the actual number of tokens or object handles in the list.

output_list
Direction: Output
Type: String

A list of token names and descriptions or a list of object handles meeting the search criteria.

Authorization

To list tokens, the caller must have at least USER (READ) or SO (READ) authority.

Authority to list objects depends on the object's attributes and the search criteria as follows:

- To list secret key or private key objects where sensitive key attributes are specified in the search template, this must be true:
  - The object must be marked CKA_SENSITIVE=F and CKA_EXTRACTABLE=T and
  - The caller must have USER (READ) authority

- Otherwise (no sensitive attributes in the search criteria)
  - To list public objects, the caller must have at least USER (READ) or SO (READ) authority
  - To list private objects when the ALL rule array keyword is specified, the caller must have at least USER (READ) or SO (READ) authority
  - To list private objects when the ALL rule array keyword is not specified, the caller must have USER (READ) or SO (CONTROL) authority

<table>
<thead>
<tr>
<th>Token / Object Type</th>
<th>Sensitive Attributes in search criteria</th>
<th>ALL Rule Specified</th>
<th>PKCS #11 Role Authority Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Token</td>
<td>N/A</td>
<td>N/A</td>
<td>USER (READ) or SO (READ)</td>
</tr>
<tr>
<td>Public object</td>

<td>N/A</td>
<td>USER (READ) or SO (READ)</td>
</tr>
<tr>
<td>Private object</td>
<td>No</td>
<td>No</td>
<td>USER (READ) or SO (CONTROL)</td>
</tr>
<tr>
<td>Private object</td>
<td>No</td>
<td>Yes</td>
<td>USER (READ) or SO (READ)</td>
</tr>
</tbody>
</table>

Chapter 15. Using PKCS #11 Tokens and Objects 715
**PKCS #11 Token record list**

<table>
<thead>
<tr>
<th>Token / Object Type</th>
<th>Sensitive Attributes in search criteria</th>
<th>ALL Rule Specified</th>
<th>PKCS #11 Role Authority Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Secret key or Private key object (public or private object class) CKA_SENSITIVE=F and CKA_EXTRACTABLE=T</td>
<td>Yes</td>
<td>N/A</td>
<td>USER (READ)</td>
</tr>
<tr>
<td>Secret key or Private key object (public or private object class) CKA_SENSITIVE=T or CKA_EXTRACTABLE=F</td>
<td>Yes</td>
<td>N/A</td>
<td>N/A (object is not listed)</td>
</tr>
</tbody>
</table>

**Note:**
- Session and token objects require the same authority.
- When the caller does not possess sufficient authority to list a given token or object, that record is skipped. (No information for the token or object is returned.) Processing continues with the next token or object.
- The sensitive attributes are as follows:
  - CKA_VALUE for a secret key object, Elliptic Curve private key, DSA private key, or Diffie-Hellman private key object.
  - CKA_PRIVATE_EXPONENT, CKA_PRIME_1, CKA_PRIME_2, CKA_EXPONENT_1, CKA_EXPONENT_2, and CKA_COEFFICIENT for an RSA private key object.
- See [*z/OS Cryptographic Services ICSF Writing PKCS #11 Applications*](#) for more information on the SO and USER PKCS #11 roles.

**Usage Notes**

**For tokens:** On the initial call to get a list of tokens, the handle parameter should be all blanks. On subsequent calls, the handle parameter should be the last token handle from the output_list returned in the previous call.

The output records are in this format:

<table>
<thead>
<tr>
<th>Bytes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 31</td>
<td>Token name</td>
</tr>
<tr>
<td>32 - 63</td>
<td>Manufacturer ID</td>
</tr>
<tr>
<td>64 - 79</td>
<td>Model</td>
</tr>
<tr>
<td>80 - 95</td>
<td>Serial number</td>
</tr>
<tr>
<td>96 - 103</td>
<td>Date that the token information or any token object was last updated, expressed as Coordinated Universal Time (UCT) in the format yyyy:mm/dd</td>
</tr>
<tr>
<td>104 - 111</td>
<td>Time that the token information or any token object was last updated, expressed as Coordinated Universal Time (UCT) in the format hh:mm:ss th</td>
</tr>
<tr>
<td>112 - 115</td>
<td>Flags</td>
</tr>
</tbody>
</table>

**For objects:** On the initial call to get a list of object handles matching the search template, the handle parameter contains the token handle. On subsequent calls, the
PKCS #11 Token record list

*handle* parameter should contain the last object handle from the *output_list* returned in the previous call. The output records are the 44-byte handles of the objects.

PKCS #11 Unwrap key (CSFPUWK and CSFPUWK6)

Use unwrap key callable service to unwrap and create a key object using another key. The following formatting is supported:

- PKCS 1.2 formatting is supported for a DES, DES3, AES, BLOWFISH, RC4, or GENERIC secret wrapped by an RSA public key.
  - A new secret key object is created with the decrypted key value
  - The unwrapping key must be a private key object
  - The CKA_UNWRAP attribute must be true
- PKCS 8 formatting (CBC mode with padding) is supported for an RSA, DSA, Elliptic Curve, and Diffie-Hellman private key wrapped by a secret key.
  - A new private key object is created with the decrypted key values
  - The unwrapping key must be a secret key object
  - The CKA_UNWRAP attribute must be true
  - The encryption mechanism must be specified in the rule array and must match the key type of the secret key object

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPUWK6.

Format

```
CALL CSFPUWK(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    wrapped_key_length,
    wrapped_key,
    initialization_vector_length,
    initialization_vector,
    unwrapping_key_handle,
    attribute_list_length,
    attribute_list,
    target_key_handle )
```

Parameters

**return_code**

Direction: Output  
Type: Integer  

The return code specifies the general result of the callable service. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the return codes.

**reason_code**

Direction: Output  
Type: Integer
PKCS #11 Unwrap key

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. [Appendix A, "ICSF and TSS Return and Reason Codes"] lists the reason codes.

exit_data_length
Direction: Ignored Type: Integer
This field is ignored. It is recommended to specify 0 for this parameter.

exit_data
Direction: Ignored Type: String
This field is ignored.

rule_array_count
Direction: Input Type: Integer
The number of keywords you supplied in the rule_array parameter. This value must be 1 or 2.

rule_array
Direction: Input Type: String
Keywords that provide control information to the callable service.

Table 326. Keywords for unwrap key

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Formatting Method (required)</td>
<td></td>
</tr>
<tr>
<td>PKCS-1.2</td>
<td>RSA PKCS #1 block type 02 will be used to recover the key value.</td>
</tr>
<tr>
<td>PKCS-8</td>
<td>The private key values are DER encoded as specified by PKCS-8. The encryption mechanism rule array keyword must be specified.</td>
</tr>
<tr>
<td>Encryption Mechanism (required when PKCS-8 specified, ignored otherwise)</td>
<td></td>
</tr>
<tr>
<td>AES</td>
<td>For PKCS-8 processing, the unwrapping key must be an AES secret key object.</td>
</tr>
<tr>
<td>DES</td>
<td>For PKCS-8 processing, the unwrapping key must be a DES secret key object.</td>
</tr>
<tr>
<td>DES3</td>
<td>For PKCS-8 processing, the unwrapping key must be a DES2 or DES3 secret key object.</td>
</tr>
</tbody>
</table>

wrapped_key_length
Direction: Input Type: Integer
Length of the wrapped key in the wrapped_key parameter.

wrapped_key
Direction: Input Type: String
The key to be unwrapped.

initialization_vector_length
PKCS #11 Unwrap key

Direction: Input           Type: Integer

The length of the initialization_vector parameter. The initial value can only be used with PKCS-8. This parameter is ignored for PKCS-1.2. The length must match the key type of the wrapping key (8 for DES, DES2, DES3 and 16 for AES). If the length is zero, the initialization_vector parameter is ignored and an initial value of zero is used.

initialization_vector

Direction: Input           Type: String

The initial chaining value for symmetric encryption. The length must match the key type of the wrapping key. The initial value can only be used with PKCS-8. This parameter is ignored for PKCS-1.2.

unwrapping_key_handle

Direction: Input           Type: String

The 44-byte handle of the private key or secret key object to unwrap the key. See "Handles" on page 95 for the format of a unwrapping_key_handle.

attribute_list_length

Direction: Input           Type: Integer

Length of the attribute_list parameter in bytes. The maximum value for this field is 32750.

attribute_list

Direction: Input           Type: String

List of token or object attributes for the target key. The attributes must be consistent with the class of the object. See "Attribute List" on page 94 for the format of an attribute_list.

target_key_handle

Direction: Output          Type: String

The 44-byte handle of the secret key or private key object created for the unwrapped key. The object will use to token name of the unwrapping key object.

Authorization

There are two keys involved in this service: the unwrapping key and the target key (the new key created from the wrapped key).

- To use an unwrapping key that is a public object, the caller must have SO (READ) authority or USER (READ) authority (any access).
- To use an unwrapping key that is a private object, the caller must have USER (READ) authority (user access).
- To unwrap a target key that is a public object, the caller must have SO (READ) authority or USER (UPDATE) authority.
- To unwrap a target key that is a private object, the caller must have SO (CONTROL) authority or USER (UPDATE) authority.
PKCS #11 Wrap key

PKCS #11 Wrap key (CSFPWPK and CSFPWPK6)

Use wrap key callable service to wrap a key with another key. The following formatting is supported:

- PKCS 1.2 is supported for wrapping a DES, DES3, AES, BLOWFISH, RC4, or GENERIC secret key with an RSA public key.
  - The wrapping key must be a public key object.
  - The CKA_WRAP attribute must be true.
- PKCS 8 formatting (CBC mode with padding) is supported for wrapping an RSA, DSA, Elliptic Curve, or Diffie-Hellman private key with a secret key.
  - The wrapping key must be a secret key object.
  - The CKA_WRAP attribute must be true.
  - The encryption mechanism must be specified in the rule array and must match the key type of the secret key object.

If the length of output field is too short to hold the output, the service will fail and return the required length of the output field in the wrapped_key_length parameter.

The callable service can be invoked in AMODE(24), AMODE(31), or AMODE(64). 64-bit callers must use CSFPWPK6.

Format

```call
CALL CSFPWPK(
    return_code,
    reason_code,
    exit_data_length,
    exit_data,
    rule_array_count,
    rule_array,
    source_key_handle,
    wrapping_key_handle,
    initialization_vector_length,
    initialization_vector,
    wrapped_key_length,
    wrapped_key
)
```

Parameters

**return_code**

Direction: Output  
Type: Integer

The return code specifies the general result of the callable service. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the return codes.

**reason_code**

Direction: Output  
Type: Integer

The reason code specifies the result of the callable service that is returned to the application program. Each return code has different reason codes that indicate specific processing problems. [Appendix A, “ICSF and TSS Return and Reason Codes”](#) lists the reason codes.

**exit_data_length**
PKCS #11 wrap key

Direction: Ignored Type: Integer

This field is ignored. It is recommended to specify 0 for this parameter.

exit_data

Direction: Ignored Type: String

This field is ignored.

rule_array_count

Direction: Input Type: Integer

The number of keywords you supplied in the rule_array parameter. This value must be 1 or 2.

rule_array

Direction: Input Type: String

Keywords that provide control information to the callable service.

Table 327. Keywords for wrap key

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Formatting Method (required)</td>
<td></td>
</tr>
<tr>
<td>PKCS-1.2</td>
<td>RSA PKCS #1 block type 02 will be used to format the key value.</td>
</tr>
<tr>
<td>PKCS-8</td>
<td>The private key values are DER encoded as specified by PKCS-8. The encryption mechanism rule array keyword must be specified.</td>
</tr>
<tr>
<td>Encryption Mechanism (required when PKCS-8 specified, ignored otherwise)</td>
<td></td>
</tr>
<tr>
<td>AES</td>
<td>For PKCS-8 processing, the wrapping key must be an AES secret key object.</td>
</tr>
<tr>
<td>DES</td>
<td>For PKCS-8 processing, the wrapping key must be a DES secret key object.</td>
</tr>
<tr>
<td>DES3</td>
<td>For PKCS-8 processing, the wrapping key must be a DES2 or DES3 secret key object.</td>
</tr>
</tbody>
</table>

source_key_handle

Direction: Input Type: String

The 44-byte handle of the secret key or private key object to be wrapped.

wrapping_key_handle

Direction: Input Type: String

The 44-byte handle of the public key or secret key object to wrap the secret key. See "Handles" on page 95 for the format of a wrapping_key_handle.

Initialization_vector_length

Direction: Input Type: Integer

The length of the initialization_vector parameter. The initialization vector can only be used with PKCS-8. This parameter is ignored for PKCS-1.2. The length must match the key type of the wrapping key (8 for DES, DES2, DES3 and 16-20 for PKCS-11 PKCS #11 wrap key

Chapter 15. Using PKCS #11 Tokens and Objects  721
PKCS #11 wrap key

- If the length is zero, the initialization vector parameter is ignored and
  a value of zero is used.

Initialization_vector

Direction: Input
Type: String

The initial chaining value for symmetric encryption. The length must match the
key type of the wrapping key. The initial value can only be used with PKCS-8.
This parameter is ignored for PKCS-1.2.

wrapped_key_length

Direction: Input/Output
Type: Integer

On input, the length of the wrapped_key parameter. On output, the actual length
of the wrapped key returned in the wrapped_key parameter.

wrapped_key

Direction: Output
Type: String

The wrapped key

Authorization

There are two key objects used by this service, the source key (the key to be
wrapped) and the wrapping key.

- To wrap a source key that is a public object, the caller must have SO (READ)
  authority or USER (READ) authority (any access).
- To wrap a source key that is a private object, the caller must have USER (READ)
  authority (user access)
- To use a wrapping key that is a public object, the caller must have SO (READ)
  authority or USER (READ) authority (any access).
- To use a wrapping key that is a private object, the caller must have USER
  (READ) authority (user access).
Appendix A. ICSF and TSS Return and Reason Codes

This topic includes this information:
- Return codes and reason codes issued on the completion of a call to an ICSF callable service
- Return codes and reason codes issued on the completion of a process on a PCI Cryptographic Accelerator, PCI Cryptographic Coprocessor or PCI X Cryptographic Coprocessor/Crypto Express2 Coprocessor /Crypto Express3 Coprocessor (referred to as cryptographic accelerators or coprocessors).
- ICSF return and reason codes can be specified in the installation options data set on the REASONCODES parameter. If the REASONCODES option is not specified, the default of REASONCODES(ICSF) is used. A REASONCODES line in the description indicates a conversion was done as a result of the REASONCODES option in the installation options data set.
  If you specified REASONCODES(ICSF) and your service was processed on a PCICC, PCIXCC, CEX2C, or CEX3C, a TSS reason code may be returned if there is no 1–1 corresponding ICSF reason code.

Return Codes and Reason Codes

This topic describes return codes and reason codes.

The TSS return and reason codes have been merged with the ICSF codes in this release. If there is a REASONCODES line in the description, it will indicate an alternate reason code you should investigate.

Each return code returns unique reason codes to your application program. The reason codes associated with each return code are described in these topics. The reason code tables present the hexadecimal code followed by the decimal code in parenthesis.

Return Codes

Table 328 lists return codes from the ICSF callable services.

<table>
<thead>
<tr>
<th>Return Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return Code 0 (0)</td>
<td>The call to the service was successfully processed. See the reason code for more information.</td>
</tr>
<tr>
<td>Return Code 4 (4)</td>
<td>The call to the service was successfully processed, but some minor event occurred during processing. See the reason code for more information.</td>
</tr>
<tr>
<td>User action: Review the reason code.</td>
<td></td>
</tr>
<tr>
<td>Return Code 8 (8)</td>
<td>The call to the service was unsuccessful. The parameters passed into the call are unchanged, except for the return code and reason code. There are rare examples where output areas are filled, but their contents are not guaranteed to be accurate. These are described under the appropriate reason code descriptions. The reason code identifies which error was found.</td>
</tr>
<tr>
<td>User action: Review the reason code, correct the problem, and retry the call.</td>
<td></td>
</tr>
<tr>
<td>Return Code Hex (Decimal)</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Return Code C (12)</td>
<td>The call to the service could not be processed because ICSF was not active, ICSF found something wrong in its environment, a TSS security product is not available, or a processing error occurred in a TSS product. The parameters passed into the call are unchanged, except for the return code and reason code. <strong>User action:</strong> Review the reason code and take the appropriate action.</td>
</tr>
<tr>
<td>Return Code 10 (16)</td>
<td>The call to the service could not be processed because ICSF found something seriously wrong in its environment or a processing error occurred in the PCICC, PCIXCC, CEX2C, or CEX3C. The parameters passed into the call are unchanged, except for the return code and reason code. <strong>User action:</strong> Review the reason code and contact your system programmer.</td>
</tr>
</tbody>
</table>

### Reason Codes for Return Code 0 (0)

Table 329 lists reason codes returned from callable services that give return code 0.

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 (0)</td>
<td>The call to the ICSF callable service was successfully processed. No error was encountered. <strong>User action:</strong> None.</td>
</tr>
<tr>
<td>2 (2)</td>
<td>The call to the ICSF callable service was successfully processed. A minor error was detected. A key used in the service did not have odd parity. This key could be one provided by you as a parameter or be one (perhaps of many) that was retrieved from the in-storage CKDS. <strong>User action:</strong> Refer to the reason code obtained when the key passed to this service was transformed into operational form using clear key import, multiple clear key import, key import, secure key import, or multiple secure key import callable services. Check if any of the services prepared an even parity key. If one of these service reported an even parity key, you need to know which key is affected. If none of these services identified an even parity key, then the even parity key detected was found on the CKDS. Report this to your administrator. <strong>REASONCODES:</strong> ICSF 4 (4)</td>
</tr>
<tr>
<td>4 (4)</td>
<td>The call to the ICSF callable service was successfully processed. A minor error was detected. A key used in the service did not have odd parity. This key could be one provided by you as a parameter or be one (perhaps of many) that was retrieved from the in-storage CKDS. <strong>User action:</strong> Refer to the reason code obtained when the key passed to this service was transformed into operational form using clear key import, multiple clear key import, key import, secure key import, or multiple secure key import callable services. Check if any of the services prepared an even parity key. If one of these service reported an even parity key, you need to know which key is affected. If none of these services identified an even parity key, then the even parity key detected was found on the CKDS. Report this to your administrator. <strong>REASONCODES:</strong> TSS 2 (2)</td>
</tr>
<tr>
<td>8 (8)</td>
<td>The CKDS key record read callable service attempted to read a NULL key record. The returned key token contains only binary zeros. <strong>User action:</strong> None required.</td>
</tr>
</tbody>
</table>
### Table 329. Reason Codes for Return Code 0 (0) (continued)

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>862 (2146)</td>
<td>When exporting a key under an AES KEK, it was found that the KEK is weaker than the key being wrapped. This operation is allowed because the &quot;Variable-length Symmetric Token - warn when weak wrap&quot; access control point is enabled. <strong>User action:</strong> None required. If you wish to prohibit weak key wrapping, enable the access control point &quot;Variable-length Symmetric Token - disallow weak wrap&quot; using the TKE workstation.</td>
</tr>
<tr>
<td>BC2 (3010)</td>
<td>The call to CSFIQF was successful. Additionally, the PCICC, PCIXCC, CEX2C, or CEX3C adapter is disabled by TKE.</td>
</tr>
<tr>
<td>2710 (10000)</td>
<td>The call to the callable service was successfully processed. The keys in one or more key identifiers have been reenciphered from encipherment under the old master key to encipherment under the current master key. <strong>User action:</strong> If you obtained your operational token from a file, replace the token in the file with the token just returned from ICSF. Management of internal tokens is a user responsibility. Consider the possible case where the token for this call was fetched from a file, and where this reason code is ignored. For the next invocation of the service, the token will be fetched from the file again, and the service will give this reason code again. If this continues until the master key is changed again, then the next use of the internal token will fail.</td>
</tr>
<tr>
<td>2711 (10001)</td>
<td>The call to the callable service was successfully processed. The keys in one or more key identifiers were encrypted under the old master key. The callable service was unable to reencipher the key.</td>
</tr>
<tr>
<td>2713 (10003)</td>
<td>The call to the callable service was successfully processed. Weak key used. The strength of the KEK key is less than the strength of the key to be wrapped. If Access Control Point 'Variable-length Symmetric Token - disallow weak wrap' is not enabled, this informational Reason Code will be returned. If Access Control Point 'Variable-length Symmetric Token - disallow weak wrap' is enabled you will receive an error from the callable service. <strong>User action:</strong> None.</td>
</tr>
</tbody>
</table>

### Reason Codes for Return Code 4 (4)

Table 330 lists reason codes returned from callable services that give return code 4.

### Table 330. Reason Codes for Return Code 4 (4)

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 (1)</td>
<td>The verification test failed. <strong>REASONCODES:</strong> This reason code also corresponds to these ICSF reason codes: FA0 (4000), 1F40 (8000), 1F44 (8004), 2328 (9000), 232C (9004), 2AF8 (11000), or 36B8 (14008).</td>
</tr>
<tr>
<td>Reason Code Hex (Decimal)</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------</td>

</tbody>
</table>
| 13 (19)                   | This is a combination reason code value. The call to the Encrypted PIN verify (PINVER) callable service was successfully processed. However, the trial PIN that was supplied does not match the PIN in the PIN block.  
**User action:** The PIN is incorrect. If you expected the reason code to be zero, check that you are using the correct key.  
**REASONCODES:** ICSF BD4 (3028)  
In addition, a key in a key identifier token has been reenciphered.  
**User action:** See reason code 10000 (return code 0) for more detail about the key reencipherment. |
| 14 (20)                   | The input text length was odd rather than even. The right nibble of the last byte is padded with X'00'.  
**User action:** None  
**REASONCODES:** ICSF 7D0 (2000) |
| A6 (166)                  | The control vector is not valid because of parity bits, anti-variant bits, inconsistent KEK bits, or because bits 59 to 62 are not zero. |
| B3 (179)                  | The control vector keywords that are in the rule array are ignored. |
| 1AD (429)                 | The digital signature verify ICSF callable service completed successfully but the supplied digital signature failed verification.  
**User action:** None  
**REASONCODES:** ICSF 2AF8 (11000) |
| 7D0 (2000)                | The input text length was odd rather than even. The right nibble of the last byte is padded with X'00'.  
**User action:** None  
**REASONCODES:** TSS 14 (20) |
| 81E (2078)                | The call to CKDS Key Record Read was successful. The key label exists in the CKDS. The key label contains a clear DES or AES key token and is not returned to the caller. |
| BBA (3002)                | The call to the CVV Verify callable service was successfully processed. However, the trial CVV that was supplied does not match the generated CVV. In addition, a key in the key identifier has been reenciphered.  
**REASONCODES:** See reason code 4000 (return code 4) for more details about the incorrect CVV. See reason code 10000 (return code 0) for more details about the key reencipherment. |
| BC9 (3017)                | The call to create a list of information completed successfully, however the storage supplied for the list was insufficient to hold the complete list. |
| BD4 (3028)                | The call to the Encrypted PIN verify (PINVER) callable service was successfully processed. However, the trial PIN that was supplied does not match the PIN in the PIN block.  
**User action:** The PIN is incorrect. If you expected the reason code to be zero, check that you are using the correct key.  
**REASONCODES:** TSS 13 (19) |
### Table 330. Reason Codes for Return Code 4 (4) (continued)

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| BD8 (3032)               | This is a combination reason code value. The call to the Encrypted PIN verify (PINVER) callable service was successfully processed. However, the trial PIN that was supplied does not match the PIN in the PIN block.  
  In addition, a key in a key identifier token has been reenciphered.  
  **REASONCODES:** See reason code 3028 (return code 4) for more detail about the incorrect PIN. See reason code 10000 (return code 0) for more detail about the key reencipherment. |
| BFC (3068)               | The verification pattern of an encrypted CPACF key block doesn't match the current wrapping key's verification pattern. |
| FA0 (4000)               | The CVV did not verify.  
  **User action:** Regenerate the CVV.  
  **REASONCODES:** TSS 1 (1) |
| FA4 (4004)               | Rewrapping is not allowed for one or more keys. |
| 1F40 (8000)              | The call to the MAC verification (MACVER) callable service was successfully processed. However, the trial MAC that you supplied does not match that of the message text.  
  **User action:** The message text may have been modified, such that its contents cannot be trusted. If you expected the reason code to be zero, check that you are using the correct key. Check that all segments of the message were presented and in the correct sequence. Also check that the trial MAC corresponds to the message being authenticated.  
  **REASONCODES:** TSS 1 (1) |
| 1F44 (8004)              | This is a combination reason code value. The call to the MAC verification (MACVER) callable service was successfully processed. However, the trial MAC that was supplied does not match the message text provided.  
  In addition, a key in a key identifier token has been reenciphered.  
  **User action:** See reason code 8000 (return code 4) for more detail about the incorrect MAC. See reason code 10000 (return code 0) for more detail about the key reencipherment.  
  **REASONCODES:** TSS 1 (1) |
| 2328 (9000)              | The call to the key test service processed successfully, but the key test pattern was not verified.  
  **User action:** Investigate why the key failed. When determining this, you can reinstall or regenerate the key.  
  **REASONCODES:** TSS 1 (1) |
| 232C (9004)              | This is a combination reason code value. The call to the key test service processed successfully, but the key test pattern was not verified. Also, the key token has been reenciphered.  
  **User action:** Investigate why the key failed. When determining this, you can reinstall or regenerate the key.  
  **REASONCODES:** TSS 1 (1) |
| 2AF8 (11000)             | The digital signature verify ICSF callable service completed successfully but the supplied digital signature failed verification.  
  **User action:** None  
  **REASONCODES:** TSS 1AD (429) |
Table 330. Reason Codes for Return Code 4 (4) (continued)

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| 36B8 (14008)             | The PKDS record failed the authentication test. 
**User action:** The record has changed since ICSF wrote it to the PKDS. The user action is application dependent. 
**REASONCODES:** TSS 1 (1) |
| 8D10 (36112)             | CKDS conversion completed successfully but some tokens could not be rewrapped because the control vector prohibited rewrapping from the enhanced wrapping method. |

**Reason Codes for Return Code 8 (8)**

Table 331 lists reason codes returned from callable services that give return code 8.

Most of these reason codes indicate that the call to the service was unsuccessful. No cryptographic processing took place. Therefore, no output parameters were filled. Exceptions to this are noted in the descriptions.

Table 331. Reason Codes for Return Code 8 (8)

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| 00C (12)                 | A key identifier was passed to a service or token. It is checked in detail to ensure that it is a valid token, and that the fields within it are valid values. There is a token validation value (TVV) in the token, which is a non-cryptographic value. This value was again computed from the rest of the token, and compared to the stored TVV. If these two values are not the same, this reason code is returned. 
**User action:** The contents of the token have been altered because it was created by ICSF or TSS. Review your program to see how this could have been caused. |
| 016 (22)                 | The ID number in the request field is not valid. The PAN data is incorrect for VISA CVV. |
| 017 (23)                 | Offset length not correct for data to be inserted. |
| 018 (24)                 | A key identifier was passed to a service. The master key verification pattern in the token shows that the key was created with a master key that is neither the current master key nor the old master key. Therefore, it cannot be reenciphered to the current master key. 
**User action:** Re-import the key from its importable form (if you have it in this form), or repeat the process you used to create the operational key form. If you cannot do one of these, you cannot repeat any previous cryptographic process that you performed with this token. 
**REASONCODES:** ICSF 2714 (10004) |
| 019 (025)                | A length parameter has an incorrect value. The value in the length parameter could have been zero (when a positive value was required) or a negative value. If the supplied value was positive, it could have been larger than your installation's defined maximum, or for MDC generation with no padding, it could have been less than 16 or not an even multiple of 8. 
**User action:** Check the length you specified. If necessary, check your installation's maximum length with your ICSF administrator. Correct the error. |
<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>033 (51)</td>
<td>The encipher and decipher callable services sometime require text (plaintext or ciphertext) to have a length that is an exact multiple of 8 bytes. Padding schemes always create ciphertext with a length that is an exact multiple of 8. If you want to decipher ciphertext that was produced by a padding scheme, and the text length is not an exact multiple of 8, then an error has occurred. The CBC mode of enciphering requires a text length that is an exact multiple of 8. The ciphertext translate callable service cannot process ciphertext whose length is not an exact multiple of 8. The value that the text_length parameter specifies is not a multiple of the cryptographic algorithm block length. <strong>User action:</strong> Review the requirements of the service you are using. Either adjust the text you are processing or use another process rule.</td>
</tr>

</tbody>
</table>
| 7D4 (2004)               | A length parameter has an incorrect value. The value in the length parameter could have been zero (when a positive value was required) or a negative value. If the supplied value was positive, it could have been larger than your installation’s defined maximum, or for MDC generation with no padding, it could have been less than 16 or not an even multiple of 8.  
**User action:** Check the length you specified. If necessary, check your installation’s maximum length with your ICSF administrator. Correct the error.  
**REASONCODES:** TSS 019 (025) |
| 7D8 (2008)               | Two parameters (perhaps the plaintext and ciphertext areas, or text_in and text_out areas) overlap each other. That is, some part of these two areas occupy the same address in memory. This condition cannot be processed.  
**User action:** Determine which two areas are responsible, and redefine their positions in memory.  
**REASONCODES:** TSS 0A4 (164) |
| 7D9 (2009)               | TKE: ACI can not load both loads and profiles in one call. |
| 7DA (2010)               | TKE: ACI can only load one role or one profile at a time. |
| 7DC (2012)               | The rule_array_count parameter contains a number that is not valid.  
**User action:** Refer to the rule_array_count parameter described in this publication under the appropriate callable service for the correct value.  
**REASONCODES:** TSS 023 (035) |
| 7DD (2013)               | TKE: Length of hash pattern for keypart is not valid for DH transport key algorithm specified. |
| 7DE (2014)               | TKE: PCB buffer is empty. |
| 7E0 (2016)               | The rule_array parameter contents are incorrect. One or more of the rules specified are not valid for this service OR some of the rules specified together may not be combined.  
**User action:** Refer to the rule_array parameter described in this publication under the appropriate callable service for the correct value. |
| 7E2 (2018)               | The form parameter specified in the random number generate callable service should be ODD, EVEN, or RANDOM. One of these values was not supplied.  
**User action:** Change your parameter to use one of the required values for the form parameter.  
**REASONCODES:** TSS 021 (033) |
| 7E3 (2019)               | TKE: Signature in request CPRB did not verify. |
| 7E4 (2020)               | TKE: TSN in request CPRB is not valid. |
| 7E8 (2024)               | A reserved field in a parameter, probably a key identifier, has a value other than zero.  
**User action:** Key identifiers should not be changed by application programs for other uses. Review any processing you are performing on key identifiers and leave the reserved fields in them at zero. |
<p>| 7EB (2027)               | TKE: DH transport key hash pattern doesn't match. |</p>

<tr>
<td>7EC (2028)</td>
<td>While deciphering ciphertext that had been created using a padding technique, it was found that the last byte of the plaintext did not contain a valid count of pad characters. Note that all cryptographic processing has taken place, and the clear_text parameter contains the deciphered text. When deciphering ciphertext that had been created using Galois/Counter Mode (GCM) either through PKCS #11 Secret key decrypt (CSFPSKD or CSFPSKD6) or Symmetric Key Decipher (CSNBSYD, CSNBSYD1, CSNESYD, or CSNESYD1), the GCM tag provided did not match the data provided. No cleartext was returned. <strong>User action:</strong> The text_length parameter was not reduced. Therefore, it contains the length of the base message, plus the length of the padding bytes and the count byte. Review how the message was padded prior to it being enciphered. The count byte that is not valid was created prior to the message's encipherment. You may need to check whether the ciphertext was not created using a padding scheme. Otherwise, check with the creator of the ciphertext on the method used to create it. You could also look at the plaintext to review the padding scheme used, if any. If using GCM, verify that the parameters provided (ciphertext, additional authenticated data, and tag) match those provided to, or returned from, the corresponding call to PKCS #11 Secret key encrypt (CSFPSKE or CSFPSKE6) or Symmetric Key Encipher (CSNBSYE, CSNBSYE1, CSNESYE, or CSNESYE1).</td>

</tbody>
</table>
### Table 331. Reason Codes for Return Code 8 (8) (continued)

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| 7F4 (2036)               | The contents of a chaining vector or the chaining data passed to a callable service are not valid. If you called the MAC generation callable service, or the MDC generation callable service with a MIDDLE or LAST segmenting rule, the count field has a number that is not valid. If you called the MAC verification callable service, then this will have been a MIDDLE or LAST segmenting rule. If you called the Symmetric Key Encipher, Symmetric Key Decipher, PKCS#11 Secret Key Encrypt or PKCS #11 Secret Key Decrypt, the chaining data passed is unusable, either because a CONTINUE or FINAL was not preceded by an INITIAL or CONTINUE, or because an attempt was made to continue chaining calls after a partial block has been processed.  
**User action:** Check to ensure that the chaining vector or chaining data is not modified by your program. The chaining vector or chaining data returned by ICSF should only be used to process one message set, and not intermixed between alternating message sets. This means that if you receive and process two or more independent message streams, each should have its own chaining vector. Similarly, each message stream should have its own key identifier.  
If you use the same chaining vector and key identifier for alternating message streams, you will not get the correct processing performed.  
**REASONCODES:** TSS 0A5 (165) |

| 7F6 (2038)               | No RSA private key information was provided in the supplied token.  
**User action:** Check that the token supplied was of the correct type for the service. |

| 7F8 (2040)               | This check is based on the first byte in the key identifier parameter. The key identifier provided is either an internal token, where an external or null token was required; or an external or null token, where an internal token was required. The token provided may be none of these, and, therefore, the parameter is not a key identifier at all. Another cause is specifying a `key_type` of IMP-PKA for a key in importable form.  
**User action:** Check the type of key identifier required and review what you have provided.  
Also check that your parameters are in the required sequence.  
**REASONCODES:** TSS 03F (063) and TSS 09A (154) |

| 7FC (2044)               | The caller must be in task mode, not SRB mode. |

| 800 (2048)               | The `key_form` is not valid for the `key_type`  
**User action:** Review the `key_form` and `key_type` parameters. For a `key_type` of IMP-PKA, the secure key import callable service supports only a `key_form` of OP. |

| 802 (2050)               | A UKPT keyword was specified, but there is an error in the `PIN_profile` key serial number.  
**User action:** Correct the PIN profile key serial number. |

| 803 (2051)               | Invalid message length in OAEP-decoded information. |

| 804 (2052)               | A single-length key, passed to the secure key import callable service in the `clear_key` parameter, must be padded on the right with binary zeros. The fact that it is a single-length key is identified by the `key_form` parameter, which identifies the key as being DATA, MACGEN, MACVER, and so on.  
**User action:** If you are providing a single-length key, pad the parameter on the right with zeros. Alternatively, if you meant to pass a double-length key, correct the `key_form` parameter to a valid double-length key type. |

| 805 (2053)               | No message found in OAEP-decoded information. |

| 806 (2054)               | Invalid RSA enciphered key cryptogram; OAEP optional encoding parameters failed validation. |
Table 331. Reason Codes for Return Code 8 (8) (continued)

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>807 (2055)</td>
<td>The RSA public key is too small to encrypt the DES key.</td>
</tr>
<tr>
<td>808 (2056)</td>
<td>The key_form parameter is neither IM nor OP. Most constants, these included, can be supplied in lower or uppercase. Note that this parameter is 4 bytes long, so the value IM or OP is not valid. They must be padded on the right with blanks. <strong>User action:</strong> Review the value provided and change it to IM or OP, as required. <strong>REASONCODES:</strong> TSS 029 (041)</td>
</tr>
<tr>
<td>80C (2060)</td>
<td>The value specified for the key_length parameter of the key generate callable service is not valid. <strong>User action:</strong> Review the value provided and change it as appropriate. <strong>REASONCODES:</strong> TSS 02B (043)</td>
</tr>
<tr>
<td>810 (2064)</td>
<td>The key_type and the key_length are not consistent. <strong>User action:</strong> Review the key_type parameter provided and match it with the key_length parameter. <strong>REASONCODES:</strong> TSS 0A0 (160)</td>
</tr>
<tr>
<td>811 (2065)</td>
<td>A null key token was not specified for a key identifier parameter. <strong>User action:</strong> Check the service description and determine which key identifier parameter must be a null token.</td>
</tr>
<tr>
<td>813 (2067)</td>
<td>TKE: A key part register is in an invalid state. This includes the case where an attempt is made to load a FIRST key part, but a register already contains a key or key part with the same key name. <strong>User action:</strong> Supply a different label name for the key part register or clear the existing key part register with the same label name.</td>
</tr>
<tr>
<td>814 (2068)</td>
<td>You supplied a key identifier or token to the key generate, key import, multiple secure key import, key export, or CKDS key record write callable service. This key identifier holds an importer or exporter key, and the NOCV bit is on in the token. Only programs running in supervisor state or in a system key (key 0–7) may provide a key identifier with this bit set on. Your program was not running in supervisor state or a system key. <strong>User action:</strong> Either use a different key identifier, or else run in supervisor state or a system key.</td>
</tr>
<tr>
<td>815 (2069)</td>
<td>TKE: The control vector in the key part register does not match the control vector in the key structure.</td>
</tr>
<tr>
<td>816 (2070)</td>
<td>TKE: All key part registers are already in use. <strong>User action:</strong> Either free existing key part registers by loading keys from ICSF or clearing selected key part registers from TKE or select another PCIXCC, CEX2C, or CEX3C for loading the key part register.</td>
</tr>
<tr>
<td>817 (2071)</td>
<td>TKE: The key part hash pattern supplied does not match the hash pattern of the key part currently in the register.</td>
</tr>
<tr>
<td>Reason Code Hex (Decimal)</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| 818 (2072) | A request was made to the key generate callable service to generate double-length keys of SINGLE effective length, in the IMEX form. This request is valid only if the KEK_key_identifier_1 parameter identifies a NOCV importer, and the caller (wrongly) supplies a CV importer. The combination of IMEX for the key_form parameter and a CV importer key-encrypting key can only be used for single-length keys.  
**User action:** Either use a key identifier that holds (or identifies) a NOCV importer, or specify a single-length key in the key_type parameter. |
| 81B (2075) | TKE: The length of the key part received is different from the length of the accumulated value already in the key part register. |
| 81C (2076) | A request was made to the key import callable service to import a single-length key. However, the right half of the key in the source_key_identifier parameter is not zeros. Therefore, it appears to identify the right half of a double-length key. This combination is not valid. This error does not occur if you are using the word TOKEN in the key_type parameter.  
**User action:** Check that you specified the value in the key_type parameter correctly, and that you are using the correct or corresponding source_key_identifier parameter. |
| 81D (2077) | TKE: An error occurred storing or retrieving the key part register data.  
**User action:** Verify that the selected PCIXCC, CEX2C, or CEX3C is functioning correctly and retry the operation. |
| 81F (2079) | An encrypted symmetric key token was passed to the service. Either an encrypted key token is not supported for this service (CSNDPKE) or the required hardware is not present (CSNBSYD and CSNBSYE). |
| 824 (2084) | The key token is not valid for the CSNBTC service. If the source_key_identifier is an external token, then the KEK_key_identifier cannot be marked as CDMF.  
**User action:** Correct the appropriate key identifiers. |
| 828 (2088) | The origin_identifier or destination_identifier you supplied is not a valid ASCII hexadecimal string.  
**User action:** Check that you specified a valid ASCII string for the origin_identifier or destination_identifier parameter. |
| 829 (2089) | The algorithm does not match the algorithm of the key identifier.  
**User action:** Make sure the rule_array keywords specified are valid for the type of key specified. Refer to the rule_array parameter described in this publication under the appropriate callable service for the valid values. |
| 82C (2092) | The source_key_identifier or inbound_key_identifier you supplied in an ANSI X9.17 service is not a valid ASCII hexadecimal string.  
**User action:** Check that you specified a valid ASCII string for the source_key_identifier or inbound_key_identifier parameter. |
| 82D (2093) | Key identifiers contain a version number. The version number in a supplied key identifier (internal or external) is inconsistent with one or more fields in the key identifier, making the key identifier unusable.  
**User action:** Use a token containing the required version number. |
| 82F (2095) | The value in the key_form parameter is incompatible with the value in the key_type parameter.  
**User action:** Ensure compatibility of the selected parameters. |
<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| 830 (2096)               | The `outbound_KEY_count` or `inbound_KEY_count` you supplied is not a valid ASCII hexadecimal string.  
**User action:** Check that you specified a valid ASCII hexadecimal string for the `outbound_KEY_count` or `inbound_KEY_count` parameter.  
**REASONCODES:** TSS 07A (122) |
| 831 (2097)               | The value in the `key_identifier_length` parameter is incompatible with the value in the `key_type` parameter.  
**User action:** Ensure compatibility of the selected parameters. |
| 832 (2098)               | Either a key bit length that was not valid was found in an AES key token (length not 128, 192, or 256 bits) or a version X'01' DES token had a token-marks field that was not valid. |
| 833 (2099)               | Encrypted key length in an AES key token was not valid when an encrypted key is present in the token. |
| 834 (2100)               | You supplied a `pad_character` that is not valid for a Transaction Security System compatibility parameter for which ICSF supports only one value; or, you supplied a KEY keyword and a non-zero `master_key_version_number` in the Key Token Build service; or, you supplied a non-zero regeneration data length for a DSS key in the PKA Generate service.  
**User action:** Check that you specified the valid value for the TSS compatibility parameter.  
**REASONCODES:** TSS 2CB (715) |
| 838 (2104)               | An input character is not in the code table.  
**User action:** Correct the code table or the source text.  
**REASONCODES:** TSS 02D (045) |
| 83C (2108)               | An unused field must be binary zeros, and an unused key identifier field generally must be zeros.  
**User action:** Correct the parameter list.  
**REASONCODES:** TSS 02F (047) |
| 83F (2111)               | There is an inconsistency between the wrapping information in the key token and the request to wrap a key. |
| 840 (2112)               | The length is incorrect for the key type.  
**User action:** Check the key length parameter. DATA keys may have a length of 8, 16, or 24. DATAXLAT and MAC keys must have a length of 8. All other keys should have a length of 16. Also check that the parameters are in the required sequence. |
| 841 (2113)               | A key token contains invalid payload.  
**User action:** Recreate the key token. |
| 844 (2116)               | Parameter contents or a parameter value is not correct.  
**User action:** Specify a valid value for the parameter.  
**REASONCODES:** TSS 021 (033) |
| 846 (2118)               | Invalid value(s) in TR-31 key block header.  
**User action:** Check the TR-31 key block header for correctness. Also check that the PADDING optional block is the last optional block in a set of optional blocks.

</tbody>
</table>
| 85E (2142)               | This code can be generated for the following reasons:  
  - On a call to Key Generate2, either or both of the key usage fields for  
    `generated_key_identifier_1` and `generated_key_identifier_2` contain incorrect values or are  
    in conflict. See Table 40 on page 154 for the valid combinations.  
  - On a call to Key Translate2 using the REFORMAT Cipherment rule and providing a  
    variable-length AES token, the key usage fields for `input_key_token` contain disallowed  
    values or prohibit the operation.  
  
  **User action:** Call Key Generate2 or Key Translate2 using key tokens whose key usage  
  fields contain a valid combination. |
| 85F (2143)               | On a call to Key Translate2 using the REFORMAT Cipherment rule and providing a  
  variable-length AES token, the key management fields for `input_key_token` contain  
  disallowed values or prohibit the operation.  
  
  **User action:** Call Key Translate2 using a key token whose key-management fields contain  
  allowed values. |
| 861 (2145)               | When exporting a key under an AES KEK, it was found that the KEK was weaker than the  
  key being wrapped. This operation is disallowed because the “Variable-length Symmetric  
  Token - disallow weak wrap” access control point is enabled.  
  
  **User action:** If weak key wrapping is to be allowed, disable access control point  
  “Variable-length Symmetric Token - disallow weak wrap” using the TKE workstation. |
| 863 (2147)               | The key type that was to be generated by this callable service is not valid.  
  
  **User action:** Refer to the parameters described in this publication under the appropriate  
  callable service for the correct parameter values. |
| 865 (2149)               | The key that was to be generated by this callable service is stronger than the input material.  
  
  **User action:** Validate the key material is is at least as strong as the key to be generated. |
| 86A (2154)               | At least one key token passed to this callable service does not have the required key type  
  for the specified function.  
  
  **User action:** Refer to the parameters described in this publication under the appropriate  
  callable service for the correct parameter values. |
| 86E (2156)               | Multiple ECC tokens were passed to this callable service. The curve types of the all the  
  token parameters do not match.  
  
  **User action:** Check that the curve types of the input ECC tokens are the same. |
| 871 (2161)               | The requested or default wrapping method conflicts with one or both input tokens.  
  
  **User action:** On the call to the CVV Key Combine service, make sure that the desired  
  wrapping method (either specified as a `rule_array` keyword or the default wrapping method)  
  is consistent with the wrapping method of the input token(s). For example, an input token  
  that can only be wrapped in the enhanced method (ENH-ONLY flag on in the CV) cannot  
  produce an output token wrapped in the original method (ECB mode). |
| BB9 (3001)               | SET block decompose service was called with an encrypted OAEP block with a block  
  contents identifier that indicates a PIN block is present. No PIN encrypting key was supplied  
  to process the PIN block. The block contents identifier is returned in the  
  `block_contents_identifier` parameter.  
  
  **User action:** Supply a PIN encrypting key and resubmit the job. |
<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| BBB (3003)               | An output parameter is too short to hold the output of the request. The length parameter for the output parameter has been updated with the required length for the request.  
**User action:** Update the size of the output parameter and length specified in the length field and resubmit the request. |
| BBC (3004)               | A request was made to the Clear PIN generate or Encrypted PIN verify callable service, and the `PIN_length` parameter has a value outside the valid range. The valid range is from 4 to 16, inclusive.  
**User action:** Correct the value in the `PIN_length` parameter to be within the valid range from 4 to 16.  
**REASONCODES:** TSS 064 (100) |
| BBE (3006)               | The UDX verb in the PCICC, PCIXCC, CEX2C, or CEX3C is not authorized to be executed. |
| BC0 (3008)               | A request was made to the Clear PIN generate callable service, and the `PIN_check_length` parameter has a value outside the valid range. The valid range is from 4 to 16, inclusive.  
**User action:** Correct the value in the `PIN_check_length` parameter to be within the valid range from 4 to 16.  
**REASONCODES:** TSS 065 (101) |
| BC1 (3009)               | For PKCS #11 attribute processing, an attribute has been specified in the template that is not consistent with another attribute of the object being created or updated.  
**User action:** Correct the template for the object. |
| BC3 (3011)               | The CRT value (p, q, Dp, Dq or U) is longer than the length allowed by the parameter block for clear key processing on an accelerator. A modulus whose length is less than or equal to 1024 bits is 64 bytes in length. A modulus whose length is greater than 1024 bits but less than or equal to 2048 bits is 128 bytes in length.  
**User action:** Reconfigure CEX2A as a CEX2C or CEX3A as a CEX3C to make use of the key (if the CRT value is not in error and there is no CEX2C or CEX3C installed).  
**REASONCODES:** TSS 065 (101) |
| BC4 (3012)               | A request was made to the Clear PIN generate callable service to generate a VISA-PVV PIN, and the `trans_sec_parm` field has a value outside the valid range. The field being checked in the `trans_sec_parm` is the key index, in the 12th byte. This `trans_sec_parm` field is part of the `data_array` parameter.  
**User action:** Correct the value in the key index, held within the `trans_sec_parm` field in the `data_array` parameter, to hold a number from the valid range.  
**REASONCODES:** TSS 069 (105) |
| BC5 (3013)               | The AES clear key value LRC in the token failed validation.  
**User action:** Correct the AES clear key value.  
**REASONCODES:** TSS 06A (106) |
| BC8 (3016)               | A request was made to the Encrypted PIN Translate or the Encrypted PIN verify callable service, and the PIN block value or PADDIGIT value in the `input_PIN_profile` or `output_PIN_profile` parameter has a value that is not valid.  
**User action:** Correct the PIN block value.  
**REASONCODES:** TSS 06A (106) |
<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BCB (3019)</td>
<td>The call to insert or delete a z/OS PKCS #11 token object failed because the token was not found in the TKDS data space or a request to delete a PKCS #11 session object failed because the token was not found in the session data space.</td>
</tr>
</tbody>
</table>
| BCC (3020) | For a PKCS #11 callable service, the PKCS #11 object specified is the incorrect class for the request.  
**User action:** Specify the correct class of object for the service. |
| BCD (3021) | The call to add a z/OS PKCS #11 token failed because the token already exists in the TKDS data space or a request to add a z/OS PKCS #11 token object failed because an object with the same handle already exists. |
| BCE (3022) | The call to add or update a z/OS PKCS #11 tokens object failed because the supplied attributes are too large to be stored in the TKDS. |
| BD0 (3024) | A request was made to the Encrypted PIN Translate callable service and the format control value in the input_PIN_profile or output_PIN_profile parameter has a value that is not valid. The valid values are NONE or PBVC.  
**User action:** Correct the format control value to either NONE or PBVC. |
| BD1 (3025) | The call to create a list of z/OS PKCS #11 tokens, a list of objects of a z/OS PKCS #11 token, the information for a z/OS PKCS #11 token or the attributes of a PKCS #11 object failed because the length of the output field was insufficient to hold the data. The length field has been updated with the length of a single list or entry, token information or object attributes.  
**REASONCODES:** TSS 06B (107) |
| BD2 (3026) | The z/OS PKCS #11 token or object handle syntax is invalid.  
**REASONCODES:** TSS 074 (116) |
| BD3 (3027) | The call to read or update a z/OS PKCS #11 token or object failed because the token or object was not found in the TKDS data space, or if the call to read or update a PKCS #11 session object failed because the object was not found. |
| BD4 (3028) | A request was made to the Clear PIN generate callable service. The clear_PIN supplied as part of the data_array parameter for an GBP-PINO request begins with a zero (0). This value is not valid.  
**User action:** Correct the clear_PIN value.  
**REASONCODES:** TSS 06B (107) |
| BD5 (3029) | For PKCS #11 attribute processing, an invalid attribute was specified in the template. The attribute is neither a PKCS #11 nor vendor-specified attribute supported by this implementation of PKCS #11.  
**User action:** Correct the template by removing the invalid attribute or changing the attribute to a valid attribute. |
<p>| BD6 (3030) | An invalid value was specified for a particular PKCS #11 attribute in a template when creating or updating an object. |
| BD7 (3031) | The certificate specified in creating a PKCS #11 certificate object was not properly encoded. |
| BD9 (3033) | The attribute template for creating or updating a PKCS #11 object was incomplete. Required attributes for the object class were not specified in the template. |
| BDA (3034) | The call to modify PKCS #11 object attributes failed because the CKA_MODIFIABLE attribute was set to false when the object was recreated. |</p>

## Table 331. Reason Codes for Return Code 8 (8) (continued)

<table>
<thead>
<tr>
<th>Reason Code Hex</th>
<th>Description</th>
</tr>
</thead>
</table>
| BEE (3054)      | A request was made to a callable service with a key token wrapped with the enhanced X9.24 CBC method. Tokens wrapped with the enhanced method are not supported by this release of ICSF.  

**User action:** Contact your ICSF administrator to resolve which key token is to be used. |
| BF5 (3061)      | The provided asymmetric key identifier cannot be used for the requested function. PKA Key Management Extensions have been enabled by a CSF.PKAEXTNS.ENABLE profile in the XFACILIT class. A CSFKEYS profile covering the key includes an ICSF segment, and the ASYMUSAGE field of that segment restricts the key from being used for the specified function.  

An SMF type 82 subtype 27 record is logged in the SMF database. |
| BF6 (3062)      | The provided symmetric key identifier cannot be exported using the provided asymmetric key identifier. PKA Key Management Extensions have been enabled by a CSF.PKAEXTNS.ENABLE profile in the XFACILIT class. A CSFKEYS or XCSFKEY profile covering the symmetric key includes an ICSF segment and the SYMEXPORTABLE field of that segment places restrictions on how the key can be exported. The SYMEXPORTABLE field either specifies BYNONE, or else specifies BYLIST but the provided asymmetric key identifier is not one of those permitted to export the symmetric key (as identified by the SYMEXPORTCERTS or SYMEXPORTKEYS fields).  

An SMF type 82 subtype 27 record is logged to the SMF database. |
| BF7 (3063)      | ICSF key store policy checking is active. The request failed the ICSF token policy check because the caller is not authorized to the label for the token in the key data set (CKDS or PKDS). The request is not allowed to continue because the token check policy is in FAIL mode.  

SMF type 82 subtype 25 records are logged in the SMF dataset. An SMF type 80 with event code qualifier of ACCESS is logged.  

The policy is defined by the CSF.CKDS.TOKEN.CHECK_LABEL.FAIL resource or the CSF.PKDS.TOKEN.CHECK_LABEL.FAIL resource in the XFACILIT class. |
| BF8 (3064)      | ICSF key store policy checking is active. The specified token does not exist in the key data set (CKDS or PKDS as appropriate). The CSF-CKDS-DEFAULT or CSF-PKDS-DEFAULT resource in the CSFKEYS class is either not defined or the caller is not authorized to the CSF-CKDS-DEFAULT or CSF-PKDS-DEFAULT resource. The resource is not in WARNING mode, so the request is not allowed to continue.  

An SMF type 80 record with event qualifier ACCESS is logged indicating the request failed.  

The policy is defined by the CSF.CKDS.TOKEN.CHECK_DEFAULT_LABEL or the CSF.PKDS.TOKEN.CHECK_DEFAULT_LABEL resource in the XFACILIT class. |
| BF9 (3065)      | ICSF token policy checking is active. The caller is requesting to add a token to the key data set (CKDS or PKDS as appropriate) that already exists within the key data set. The request fails.  

The policy is defined by the CSF.CKDS.TOKEN.NODUPLICATES resource or the CSF.PKDS.TOKEN.NODUPLICATES resource in the XFACILIT class. |
| BFB (3067)      | The provided symmetric key label refers to an encrypted CCA key token, and the CSFKEYS profile covering it does not allow its use in high performance encrypted key operations.  

**User action:** Contact your ICSF or RACF administrator if you need to use this key in calls to Symmetric Key Encipher (CSNBSYE) or Symmetric Key Decipher (CSNBSYD). Otherwise, use Encipher (CSNBENC) or Decipher (CSNBDEC) instead. |
<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| BFC (3068)               | A cryptographic operation using a specific PKCS #11 key object is being requested. The key object has exceeded its useful life for the operation requested. The request is not processed.  
**User action:** Use a different key. |
| BFD (3069)               | A cryptographic operation that requires FIPS 140-2 compliance is being requested. Either ICSF has not been configured to run in FIPS mode or the system environment does not support it. The request is not processed.  
**User action:** Contact your ICSF administrator to request that ICSF be configured for either FIPS standard mode or FIPS compatibility mode. |
| BFE (3070)               | A cryptographic operation that requires FIPS 140-2 compliance is being requested. The desired algorithm, mode, or key size is not approved for FIPS 140-2. The request is not processed.  
**User action:** Repeat the request using an algorithm, mode, and/or key size approved for FIPS 140-2. Refer to [z/OS Cryptographic Services ICSF Writing PKCS #11 Applications](#) for this list of approved algorithms, modes, and key sizes. |
| BFF (3071)               | An application using a z/OS PKCS #11 token that is marked ‘Write Protected’ is attempting to do one of the following:  
- Store a persistent object in the token.  
- Delete the token.  
- Reinitialize the token.  
ICSF always marks the session object only omnipresent token as ‘Write Protected.’ ICSF will also mark an ordinary token ‘Write Protected’ if it contains objects not supported by this release of ICSF.  
**User action:** Use a z/OS PKCS #11 token that is not marked ‘Read Only’ or, if this is an ordinary token (not the omnipresent token), attempt the delete or reinitialization from a different member of the sysplex. |
| C04 (3076)               | A symmetric key token was supplied in a key identifier parameter which is wrapped using the enhanced X9.24 key wrapping method. The token can not be rewrapped to the original method because the wrapping flag in the control vector prohibits this wrapping. |
| C07 (3079)               | A request was made to use a key token wrapped with the X9.24 enhanced wrapping method introduced in HCR7780. Key tokens wrapped with the enhanced method can not be used on this release. Also, key tokens wrapped with the enhanced method can not be updated or deleted from the CKDS on this release.  
**User Action:** Run your application on a release that support the enhanced wrapping method. |
| C08 (3080)               | Use of an ECC token has been attempted. The usage of this type of token is not supported on the release of ICSF currently running.  
**User Action:** Check the ICSF release for support of this token type. |
| C0B (3083)               | The specified key token buffer length is of insufficient size for the buffer to contain the output key token.  
**User action:** Specify a key token buffer that is sufficiently large enough to receive the output key token. |
<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| C0C (3084)               | The key token associated with the specified key label is not a DES or AES key token, but this callable service is only compatible with DES and AES key tokens.  
**User action:** Either modify the program logic to utilize only key labels for DES and/or AES key tokens, or use an ICSF callable service that supports all of the symmetric key token types. |
| C0D (3085)               | Rule array keyword specifies a function not supported by this hardware. For example, ECC specified in rule array for PKA Key Token Change callable service but request is being executed on a system that does not support ECC keys.  
**User Action:** Specify a different, supported, rule array keyword, or execute the service on a system that supports the function. |
| C0E (3086)               | Specified token is not supported by this hardware. For example, an ECC token is being used but request is being executed on a system that does not support ECC keys.  
**User Action:** Specify a different, supported, token, or execute the request on a system that supports the function. |
| C0F (3087)               | A coordinated KDS refresh was attempted to an empty KDS. The new KDS of a coordinated KDS refresh must be initialized and must contain the same MKVP values as the active KDS.  
**User action:** Perform a coordinated KDS refresh using a new KDS that is initialized and that contains the same MKVP values as the active KDS. |
| C10 (3088)               | A coordinated KDS change master key was attempted and either the new KDS or backup KDS contained a different LRECL attribute from the active KDS. The new KDS and optionally the backup KDS must contain the same LRECL attribute as the active KDS during a coordinate KDS change master key.  
**User action:** Perform a coordinated KDS change master key using a new KDS and optionally a backup KDS with the same LRECL attribute as the active KDS. |
| C11 (3089)               | The new KDS specified for a coordinated KDS change master key was not empty when the operation began. The new KDS must be empty before performing a coordinated KDS change master key.  
**User action:** Perform the coordinated KDS change master key with a new KDS that is empty. |
| C12 (3090)               | The backup KDS specified for a coordinated KDS change master key was not empty when the operation began. When using the optional backup function, the backup KDS must be empty before performing a coordinated KDS change master key.  
**User action:** Perform the coordinated KDS change master key with a backup KDS that is empty. |
| C13 (3091)               | The new KDS specified for a coordinated KDS refresh contains different MKVPs than the active KDS. In order to perform a coordinated KDS refresh, the new KDS specified must contain the same MKVPs as the active KDS.  
**User action:** Perform the coordinated KDS refresh with a new KDS that contains the same MKVPs as the active KDS. |
| C1F (3103)               | The new KDS specified for either a coordinated KDS refresh or coordinated KDS change master key is not a valid data set name.  
**User action:** Specify a valid data set name for the new KDS when performing either a coordinated KDS refresh or coordinated KDS change master key. |

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| C27 (3111)                | A coordinated KDS change master key was attempted using an archive KDS with the same name as the backup KDS. When using the archive and backup functions, the archive KDS name must be different from the backup KDS.  
  **User action:** Specify an archive KDS with a different name from the backup KDS and retry the function. The archive KDS name and the backup KDS are optional. The archive KDS name must not exist on the system prior to performing a coordinated KDS refresh or a coordinated KDS change master key. The backup KDS must be allocated and match the same VSAM attributes as the active KDS. |
| C28 (3112)                | A coordinated KDS refresh or a coordinated KDS change master key was attempted using an archive KDS with the same name as the active KDS. When using the archive function, the archive KDS name must be different from the active KDS.  
  **User action:** Specify an archive KDS with a different name from the active KDS and retry the function. The archive KDS name must not exist on the system prior to performing a coordinated KDS refresh or a coordinated KDS change master key. |
| C29 (3113)                | A coordinated KDS refresh or a coordinated KDS change master key was attempted using an archive KDS with the same name as the new KDS. When using the archive function, the archive KDS name must be different from the new KDS.  
  **User action:** Specify an archive KDS with a different name than the new KDS and retry the function. The archive KDS name must not exist on the system prior to performing a coordinated KDS refresh or a coordinated KDS change master key. |
| C2A (3114)                | Either a coordinated KDS refresh or coordinated KDS change master key was attempted while another coordinated KDS refresh or coordinated KDS change master key was still in progress. The coordinated KDS function was initiated by another ICSF instance in the sysplex. Only one coordinated KDS function may execute at a time in the sysplex.  
  **User action:** Wait for the previous coordinated KDS function to complete and retry the function. |
| C30 (3120)                | A coordinated KDS change master key was attempted on an active KDS that was not initialized. The active KDS must be initialized before performing a coordinated KDS change master key.  
  **User action:** Initialize the active KDS and retry the function |
| C31 (3121)                | The archive option was specified for a coordinated KDS refresh of the active KDS. The archive option is only valid for coordinated KDS refreshes to a new KDS or coordinated KDS change master key.  
  **User action:** Do not specify an archive data set when performing a coordinated KDS refresh of the active KDS. |
| C3C (3132)                | The archive data set name specified for coordinated KDS refresh or coordinated KDS change master key is too long. The archive data set name must allow enough space for renaming the KDS VSAM data and index portions within 44 characters.  
  **User action:** Specify a shorter name for the archive data set name to allow enough space for renaming the KDS VSAM data and index portions within 44 characters. The archive data set name is optional. When specified, the archive data set name must not exist on the system prior to performing the coordinated KDS function. |

</thead>
</table>
| C3D (3133)               | During a coordinated KDS refresh or coordinated KDS change master key with the archive option specified, the active KDS could not be renamed to the archive data set name. This failure occurred because the active KDS VSAM data and index suffix names were not valid for performing the rename.  
**User action:** Consider alternate names for the active KDS VSAM data and index suffixes. The archive data set name is optional. When specified the archive data set name must not exist on the system prior to performing the coordinated KDS function. |
| C3E (3134)               | A coordinated KDS change master key attempted to use a new KDS that is currently another sysplex members active KDS. Performing a coordinated KDS change master key to another sysplex members active KDS is not allowed as it would alter all sysplex members configured in that sysplex KDS cluster (same active KDS).  
**User action:** Specify a new KDS that is not currently the active KDS of another sysplex member and retry the function. |
| F9F (3999)               | On a call to CKDS Key Record Delete or CKDS Key Record Write2, the label refers to a Variable-length Symmetric key token with an unrecognized algorithm or key type in the associated data section. Only key tokens with a recognized algorithm or key type can be managed on this release of ICSF.  
**User action:** Call CKDS Key Record Delete or CKDS Key Record Write2 on a release of ICSF which recognizes the algorithm and key type of this token. |
| FA0 (4000)               | The encipher and decipher callable services sometime require text (plaintext or ciphertext) to have a length that is an exact multiple of 8 bytes. Padding schemes always create ciphertext with a length that is an exact multiple of 8. If you want to decipher ciphertext that was produced by a padding scheme, and the text length is not an exact multiple of 8, then an error has occurred. The CBC mode of enciphering requires a text length that is an exact multiple of 8.  
The ciphertext translate callable service cannot process ciphertext whose length is not an exact multiple of 8.  
**User action:** Review the requirements of the service you are using. Either adjust the text you are processing or use another process rule. |
| 1388 (5000)              | Target cryptographic module is not available in the configuration.  
**User action:** Correct the target cryptographic module parameter and resubmit. |
| 138C (5004)              | Format of the cryptographic request message is not valid.  
**User action:** Correct the request and resubmit it. |
| 1390 (5008)              | Length of the cryptographic request message is not valid.  
**User action:** Message length of request must be nonzero, a multiple of eight, and less than the system maximum. Correct the request and resubmit it. |
| 1782 (6018)              | One or more of the parameters passed to this callable service are in error.  
**User action:** Refer to the parameter descriptions in this publication under the appropriate callable service to ensure the parameter values specified by your application are valid. |
### Reason Codes for Return Code 8 (8) (continued)

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| 2710 (10000)             | A key identifier was passed to a service or token. It is checked in detail to ensure that it is a valid token, and that the fields within it are valid values. There is a token validation value (TVV) in the token, which is a non-cryptographic value. This value was again computed from the rest of the token, and compared to the stored TVV. If these two values are not the same, this reason code is returned.  
  **User action:** The contents of the token have been altered because it was created by ICSF or TSS. Review your program to see how this could have been caused.  
  **REASONCODES:** TSS 0C (12) and 1D (29) |
| 2714 (10004)             | A key identifier was passed to a service. The master key verification pattern in the token shows that the key was created with a master key that is neither the current master key nor the old master key. Therefore, it cannot be reenciphered to the current master key.  
  **User action:** Re-import the key from its importable form (if you have it in this form), or repeat the process you used to create the operational key form. If you cannot do one of these, you cannot repeat any previous cryptographic process that you performed with this token.  
  **REASONCODES:** TSS 030 (048) |
| 271C (10012)             | A key label was supplied for a key identifier parameter. This label is the label of a key in the in-storage CKDS or the PKDS. Either the key could not be found, or a key record with that label and the specific type required by the ICSF callable service could not be found. For a retained key label, this error code is also returned if the key is not found in the PCICC, PCIXCC, CEX2C, or CEX3C specified in the PKDS record.  
  **User action:** Check with your administrator if you believe that this key should be in the in-storage CKDS or the PKDS. The administrator may be able to bring it into storage. If this key cannot be in storage, use a different label.  
  **REASONCODES:** TSS 01E (030) |
| 2720 (10016)             | You specified a value for a `key_type` parameter that is not an ICSF-defined name.  
  **User action:** Review the ICSF key types and use the appropriate one.  
  **REASONCODES:** TSS 03D (061) |
| 2724 (10020)             | You specified the word TOKEN for a `key_type` parameter, but the corresponding key identifier, which implies the key type to use, has a value that is not valid in the control vector field. Therefore, a valid key type cannot be determined.  
  **User action:** Review the value that you stored in the corresponding key identifier. Check that the value for `key_type` is obtained from the appropriate `key_identifier` parameter.  
  **REASONCODES:** TSS 027 (039) |
| 272C (10028)             | Either the left half of the control vector in a key identifier (internal or external) equates to a key type that is not valid for the service you are using, or the value is not that of any ICSF control vector. For example, an exporter key-encrypting key is not valid in the key import callable service.  
  **User action:** Determine which key identifier is in error and use the key identifier that is required by the service.  
  **REASONCODES:** TSS 027 (039) |
<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| 2730 (10032)             | Either the right half of the control vector in a key identifier (internal or external) equates to a key type that is not valid for the service you are using, or the value is not that of any ICSF control vector. For example, an exporter key-encrypting key is not valid in the key import callable service.  
**User action:** Determine which key identifier is in error and use the key identifier that is required by the service.  
**REASONCODES:** TSS 027 (039) |
| 2734 (10036)             | Either the complete control vector (CV) in a key identifier (internal or external) equates to a key type that is not valid for the service you are using, or the value is not that of any ICSF control vector.  
The difference between this and reason codes 10028 and 10032 is that each half of the control vector is valid, but as a combination, the whole is not valid. For example, the left half of the control vector may be the importer key-encrypting key and the right half may be the input PIN-encrypting (IPINENC) key.  
**User action:** Determine which key identifier is in error and use the key identifier that is required by the service.  
**REASONCODES:** TSS 027 (039) |
| 2738 (10040)             | Key identifiers contain a version number. The version number in a supplied key identifier (internal or external) is inconsistent with one or more fields in the key identifier, making the key identifier unusable.  
**User action:** Use a token containing the required version number.  
**REASONCODES:** TSS 031 (049) |
| 273C (10044)             | A cross-check of the control vector the key type implies has shown that it does not correspond with the control vector present in the supplied internal key identifier.  
**User action:** Change either the key type or key identifier.  
**REASONCODES:** TSS 0B7 (183) |
| 2740 (10048)             | The key_type parameter does not contain one of the valid types for the service or the keyword TOKEN.  
**User action:** Check the supplied parameter with the ICSF key types. If you supplied the keyword TOKEN, check that you have padded it on the right with blanks.  
**REASONCODES:** TSS 03D (061) |
| 2744 (10052)             | A null key identifier was supplied and the key_type parameter contained the word TOKEN. This combination of parameters is not valid.  
**User action:** Use either a null key identifier or the word TOKEN, not both.  
**REASONCODES:** TSS 027 (039) |
| 2748 (10056)             | You called the key import callable service. The importer key-encrypting key is a NOCV importer and you specified TOKEN for the key_type parameter. This combination is not valid.  
**User action:** Specify a value in the key_type parameter for the operational key form.  
**REASONCODES:** TSS 027 (039) |
<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| 274C (10060)             | You called the key export callable service. A label was supplied in the `key_identifier` parameter for the key to be exported and the `key_type` was TOKEN. This combination is not valid because the service needs a key type in order to retrieve a key from the CKDS.  
**User action:** Specify the type of key to be exported in the `key_type` parameter.  
**REASONCODES:** TSS 03D (061) |
| 2754 (10068)             | A flag in a key identifier indicates the master key verification pattern (MKVP) is not present in an internal key token. This setting is not valid.  
**User action:** Use a token containing the required flag values.  
**REASONCODES:** TSS 02F (047) |
| 2758 (10072)             | A flag in a key identifier indicates the encrypted key is not present in an external token. This setting is not valid.  
**User action:** Use a token containing the required flag values.  
**REASONCODES:** TSS 02F (047) |
| 275C (10076)             | A flag in a key identifier indicates the control vector is not present. This setting is not valid.  
**User action:** Use a token containing the required flag values.  
**REASONCODES:** TSS 02F (047) |
| 2760 (10080)             | An ICSF private flag in a key identifier has been set to a value that is not valid.  
**User action:** Use a token containing the required flag values. Do not modify ICSF or the reserved flags for your own use. |
| 2768 (10088)             | If you supplied a label in the `key_identifier` parameter, a record with the supplied label was found in the CKDS, but the key type (CV) is not valid for the service. If you supplied an internal key token for the `key_identifier` parameter, it contained a key type that is not valid.  
**User action:** Check with your ICSF administrator if you believe that this key should be in the in-storage CKDS. The administrator may be able to bring it into storage. If this key cannot be in storage, use a different label.  
**REASONCODES:** TSS 027 (039) |
| 276C (10092)             | You supplied a source key that does not have odd parity and specified ENFORCE as the parity rule on the `rule_array` parameter for either the ANSI X9.17 key export, ANSI X9.17 key import, or ANSI X9.17 key translate callable service.  
**User action:** Either supply an ODD parity key or change the `rule_array` parameter to specify a parity rule of IGNORE. |
| 2770 (10096)             | The transport key you specified is a single-length key, which cannot be used to encrypt a double-length AKEK or ("KK).  
**User action:** Use a double-length AKEK for the transport key. |
| 2774 (10100)             | You specified a transport key that cannot be notarized and specified the keyword NOTARIZE in the `rule_array` parameter. The transport key may have already been partially notarized.  
**User action:** Use a transport key that allows notarization or change the `rule_array` parameter keyword to CPLT-NOT. |
Table 331. Reason Codes for Return Code 8 (8) (continued)

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| 2778 (10104)              | The AKEK you specified is either partially notarized or is a partial AKEK, which is not valid for this service.  
**User action:** Use a correct AKEK that is not partially notarized. A partially notarized key can be used as a transport key if you specify CPLT-NOT in the `rule_array` parameter. |
| 277C (10108)              | You did not supply a partial AKEK for the `key_identifier` parameter of the key part import service.  
**User action:** Correct the `key_id` parameter. |
| 2780 (10112)              | The transport key you specified has not been partially notarized and you have specified CPLT-NOT for the `rule_array` parameter.  
**User action:** Use a transport key that has been partially notarized or change the `rule_array` parameter. |
| 2784 (10116)              | You attempted to export an AKEK with a CCA key export service, which is not supported.  
**User action:** Use the ANSI X9.17 Key Export callable service. |
| 2788 (10120)              | The internal key token you supplied, or the key token that was retrieved by the label you supplied, contains a flag setting or data encryption algorithm bit that is not valid for this service.  
**User action:** Ensure that you supply a key token, or label, for a non-ANSI key type. |
| 278C (10124)              | The key identifier you supplied cannot be exported because there is a prohibit-export restriction on the key.  
**User action:** Use the correct key for the service. |
| 2790 (10128)              | The keyword you supplied in the `rule_array` parameter is not consistent or not valid with another parameter you specified. For example, the keyword SINGLE is not valid with the key type of EXPORTER in the key token build callable service.  
**User action:** Correct either the `rule_array` parameter or the other parameter. |
| 2791 (10129)              | S390 KEKs with NOCV (flagged as such by the MASK_NOCV bit in the flags field of the token), are not permitted in the RKX service. |
| 2AF8 (11000)              | The value specified for length parameter for a key token, key, or text field is not valid.  
**User action:** Correct the appropriate length field parameter. |
| 2AFC (11004)              | The hash value (of the secret quantities) in the private key section of the internal token failed validation. The values in the token are corrupted. You cannot use this key.  
**User action:** Recreate the token using the appropriate combination of the PKA key token build, PKA key generate, and PKA key import callable services. |
<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2B00 (11008)</td>
<td>The public or private key values are not valid. (For example, the modulus or an exponent is zero.) You cannot use the key. <strong>User action:</strong> You may need to recreate the token using the PKA key token build or PKA key import callable service or regenerate the key values on another platform. <strong>REASONCODES:</strong> TSS 302 (770)</td>
</tr>
<tr>
<td>2B04 (11012)</td>
<td>The internal or external private key token contains flags that are not valid. <strong>User action:</strong> You may need to recreate the token using the PKA key token build or PKA key import callable service. <strong>REASONCODES:</strong> TSS 02F (047)</td>
</tr>
<tr>
<td>2B08 (11016)</td>
<td>The calculated hash of the public information in the PKA token does not match the hash in the private section of the token. The values in the token are corrupted. <strong>User action:</strong> Verify the public key section and the key name section of the token. If the token is still rejected, then you need to recreate the token using the appropriate combination of the PKA key token build, PKA key generate, and PKA key import callable services. <strong>REASONCODES:</strong> TSS 02F (047)</td>
</tr>
<tr>
<td>2B0C (11020)</td>
<td>The hash pattern of the PKA master key (SMK or KMMK) in the supplied internal PKA private key token does not match the current system's PKA master key. This indicates the system PKA master key has changed since the token was created. You cannot use the token. <strong>User action:</strong> Recreate the token using the appropriate combination of the PKA key token build, PKA key generate, and PKA key import callable services. <strong>REASONCODES:</strong> TSS 030 (048)</td>
</tr>
<tr>
<td>2B10 (11024)</td>
<td>The PKA tokens have incomplete values, for example, a PKA public key token without modulus. <strong>User action:</strong> Recreate the key. <strong>REASONCODES:</strong> TSS 02F (047)</td>
</tr>
<tr>
<td>2B14 (11028)</td>
<td>The modulus of the PKA key is too short for processing the hash or PKCS block. <strong>User action:</strong> Either use a PKA key with a larger modulus size, use a hash algorithm that generates a smaller hash (digital signature services), or specify a shorter DATA key size (symmetric key export, symmetric key generate). <strong>REASONCODES:</strong> TSS 048 (072)</td>
</tr>
<tr>
<td>2B18 (11032)</td>
<td>The supplied private key can be used only for digital signature. Key management services are disallowed. <strong>User action:</strong> Supply a key with key management enabled. <strong>REASONCODES:</strong> TSS 040 (064)</td>
</tr>
<tr>

<tr>
<td>--------------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| 2B20 (11040)             | The recovered encryption block was not a valid PKCS-1.2 or zero-pad format. (The format is verified according to the recovery method specified in the rule-array.) If the recovery method specified was PKCS-1.2, refer to PKCS-1.2 for the possible error in parsing the encryption block.  
**User action:** Ensure that the parameters passed to CSNDSYI or CSNFSYI are correct. Possible causes for this error are incorrect values for the RSA private key or incorrect values in the `RSA_enciphered_key` parameter, which must be formatted according to PKCS-1.2 or zero-pad rules when created.  
**REASONCODES:** TSS 42 (66) |
| 2B24 (11044)             | The first section of a supplied PKA token was not a private or public key section.  
**User action:** Recreate the key.  
**REASONCODES:** TSS 0B5(181) |
| 2B28 (11048)             | The eyecatcher on the PKA internal private token is not valid.  
**User action:** Reimport the private token using the PKA key import callable service. |
| 2B2C (11052)             | An incorrect PKA token was supplied. One of the following situations is possible:  
- The service requires a private key token of the correct type.  
- The supplied token may be of a type that is not supported on this system.  
**User action:** Check that the supplied token is:  
- a PKA private key token of the correct type.  
- a type supported by this system. |
| 2B30 (11056)             | The input PKA token contains length fields that are not valid.  
**User action:** Recreate the key token. |
| 2B38 (11064)             | The RSA-OAEP block did not verify when it decomposed. The block type is incorrect (must be X'03').  
**User action:** Recreate the RSA-OAEP block.  
**REASONCODES:** TSS 2CF (719) |
| 2B3C (11068)             | The RSA-OAEP block did not verify when it decomposed. The verification code is not correct (must be all zeros).  
**User action:** Recreate the RSA-OAEP block.  
**REASONCODES:** TSS 2D1 (721) |
| 2B40 (11072)             | The RSA-OAEP block did not verify when it decomposed. The random number I is not correct (must be non-zero with the high-order bit equal to zero).  
**User action:** Recreate the RSA-OAEP block.  
**REASONCODES:** TSS 2D0 (720) |
| 2B48 (11080)             | The RSA public or private key specified a modulus length that is incorrect for this service.  
**User action:** Re-invoke the service with an RSA key with the proper modulus length.  
**REASONCODES:** See reason codes 41 (65) and 2F8 (760) |

</tbody>
</table>
### Table 331. Reason Codes for Return Code 8 (8) (continued)

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| 3EA4 (16036)              | The CKDS key record create callable service requires that the key created not already exist in the CKDS or PKDS. A key of the same label was found.  
**User action:** Make sure the application specifies the correct label. If the label is correct, contact your ICSF security administrator or system programmer.  
**REASONCODES:** TSS 02C (044) |
| 3EA8 (16040)              | Data in the PKDS record did not match the expected data. This occurs if the record does not contain a null PKA token and CHECK was specified.  
**User action:** If the record is to be overwritten regardless of its content, specify OVERLAY. |
| 3EAC (16044)              | One or more key labels specified as input to the PKA key generate or PKA key import service incorrectly refer to a retained private key. If generating a retained private key, this error may result from one of these conditions:  
• The private key name of the retained private key being generated is the same as an existing PKDS record, but the PKDS record label was not specified as the input skeleton (source) key identifier.  
• The label specified in the `generated_key_token` parameter as the target for the retained private key was not the same as the private key name  
If generating or importing a non-retained key, this error occurs when the label specified as the target key specifies a retained private key. The retained private key cannot be over-written.  
**User action:** Make sure the application specifies the correct label. If the label is correct, contact your ICSF security administrator or system programmer. |
| 3EB0 (16048)              | Retained keys on the PKDS cannot be deleted or updated using the PKDS key record delete or PKDS key record write callable services, respectively.  
**User action:** Use the retained key delete callable service to delete retained keys. |

#### Reason Codes for Return Code C (12)

Table 332 on page 766 lists reason codes returned from callable services that give return code 12. These reason codes indicate that the call to the callable service was not successful. Either cryptographic processing did not take place, or the last cryptographic unit was switched offline. Therefore, no output parameters were filled.

**Note:** The higher-order halfword of the reason code field for return code C (12) may contain additional coding. See reason codes 1790, 273C, and 2740 in this table. For example, in the reason code 42738, the 4 is an SVC 99 error code and the 2738 is listed in this table:
<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>

</tr>
</thead>
</table>
| 0 (0)                    | ICSF is not available. One of the following situations is possible:  
  • ICSF is not started  
  • ICSF is started, but does not have access to any cryptographic units.  
  • ICSF is started, but the DES-MK, AES-MK, or ECC-MK is not defined.  
  • ICSF is started, but the requested function is not available. For instance, an ECC operation was requested but the required hardware is not installed.  
  **User action:** Check the availability of ICSF with your ICSF administrator.                                                                 |                                                                            |
| 4 (4)                    | The CKDS or PKDS management service you called is not available because it has been disallowed by the ICSF User Control Functions panel.  
  **User action:** Contact the security administrator or system programmer to determine why the CKDS or PKDS management services have been disallowed. |                                                                            |
| 8 (8)                    | The service or algorithm is not available on current hardware. Your request cannot be processed.  
  **User action:** Correct the calling program or run on applicable hardware.                                                                 |                                                                            |
| C (12)                   | The service that you called is unavailable because the installation exit for that service had previously failed.  
  **User action:** Contact your ICSF administrator or system programmer.                                                                 |                                                                            |
| 10 (16)                  | A requested installation service routine could not be found. Your request was not processed.  
  **User action:** Contact your ICSF administrator or system programmer.                                                                 |                                                                            |
| 1C (28)                  | Cryptographic asynchronous processor failed.  
  **User action:** Contact your IBM support center.                                                                                                 |                                                                            |
| 20 (32)                  | Cryptographic asynchronous instruction was not executed.  
  **User action:** Ensure cryptographic services are enabled.                                                                                      |                                                                            |
| 28 (40)                  | The callable service that you called is unsupported for AMODE(64) applications. Your request cannot be processed.                                                                                     |                                                                            |
| 2C (44)                  | The callable service that you called was linked with the AMODE(64) stub. The application is not running AMODE(64). Your request cannot be processed.  
  **User action:** Link your application with the service stub with the appropriate addressing mode.                                          |                                                                            |
| 0C5 (197)                | I/O error reading or writing to the DASD copy of the CKDS or PKDS in use by ICSF.  
  **User action:** Contact your ICSF security administrator or system programmer. The RPL feedback code will be placed in the high-order halfword of the reason code field. |                                                                            |
| 144 (324)                | There was insufficient coprocessor memory available to process your request. This could include the Flash EPROM used to store keys, profiles and other application data.  
  **User action:** Contact your system programmer or the IBM Support Center.                                                                     |                                                                            |
| 2FC (764)                | The master key is not in a valid state.  
  **User action:** Contact your ICSF administrator.                                                                                              |                                                                            |
<p>| 7D7 (2007)               | TKE: Change type in PCB is not recognized.                                                                                                                                                                 |                                                                            |</p>

<tr>
<td>--------------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| BE6 (3046) | An RSA retained key can no longer be generated with its key-usage flag set to allow key unwrapping (KM-ONLY or KEY-MGMT). Key usage must be SIG-ONLY.  
**User action:** None required. |
| BE8 (3048) | The services using encrypted AES keys, encrypted DES, or encrypted ECC keys are not available because the master key is required but not loaded or there is no access to any cryptographic units. Your request cannot be processed.  
**User action:** Check the availability of ICSF with your ICSF administrator |
| BF2 (3058) | A PKDS sysplex operation has been waiting unsuccessfully to obtain an enqueue. A failure to obtain either the SYSZPKDS or SYSZPKUP resource will result in the timeout. |
| C00 (3072) | The serialization subtask terminated for an unexpected reason prior to completing the request. No dynamic CKDS or PKDS update services are possible at this point.  
**User action:** Contact your system programmer who can investigate the problem and restart the I/O subtask by stopping and restarting ICSF. |
| C01 (3073) | An error occurred attempting to obtain the system ENQ for a key data set update.  
**User action:** If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| C03 (3075) | A symmetric key token was supplied in a key identifier parameter which is wrapped using the enhanced X9.24 key wrapping method. The cryptographic coprocessors available to process the request don't support the enhanced key wrapping.  
**User action:** Contact system personnel to get coprocessors installed on your system which will support the enhanced X9.24 key wrapping. |
| C06 (3078) | The CKDS was created with an unsupported LRECL. |
| C09 (3081) | An attempt was made to load a PKDS that only uses the ECC master key on a pre-HCR7780 release of ICSF. Pre-HCR7780 systems do not support the ECC master key and use of an ECC MK-only PKDS is not allowed.  
**User action:** Change the PKDS selected. Specify a PKDS that is empty, uses an RSA master key, or uses both RSA and ECC master keys. |
| C0A (3082) | A callable service generated or updated a symmetric key token and the X9.24 enhanced wrapping method was used to wrap the key. This key token is not usable on your system and ICSF will not allow the key to be generated. The key was wrapped with the enhanced wrapping method because a CEX3C coprocessor has the default wrapping configuration set to enhanced. This was most likely done by TKE changing the configuration.  
**User action:** Have the ICSF administrator set the default wrapping configuration to original for the LPAR that this system is running in. |
| C17 (3095) | The sysplex KDS cluster members' new AES master key registers were loaded with different values during a coordinated KDS change master key. All sysplex KDS cluster members' (same active KDS) new AES master key registers must be loaded with the same value or all must be empty when performing a coordinated KDS change master key.  
**User action:** Ensure all sysplex KDS cluster members' new AES master key registers are loaded with the same value or all are empty and retry the function. |
Table 332. Reason Codes for Return Code C (12) (continued)

<tr>
<td>C18 (3096)</td>
<td>One or more sysplex KDS cluster members' new DES master key registers were loaded and others were empty during a coordinated KDS change master key. All sysplex KDS cluster members' (same active KDS) new DES master key registers must be loaded with the same value or all must be empty when performing a coordinated KDS change master key. <strong>User action:</strong> Ensure all sysplex KDS cluster members' new DES master key registers are loaded with the same value or all are empty and retry the function.</td>
</tr>
<tr>
<td>C19 (3097)</td>
<td>The sysplex KDS cluster members' new DES master key registers were loaded with different values during a coordinated KDS change master key. All sysplex KDS cluster members' (same active KDS) new DES master key registers must be loaded with the same value or all must be empty when performing a coordinated KDS change master key. <strong>User action:</strong> Ensure all sysplex KDS cluster members' new DES master key registers are loaded with the same value or all are empty and retry the function.</td>
</tr>
<tr>
<td>C1A (3098)</td>
<td>A coordinated KDS change master key was attempted with empty DES new master key registers and empty AES new master key registers. At least one of the new master key registers must be loaded with a value to perform a coordinated KDS change master key. <strong>User action:</strong> Load at least one of the DES new master key registers or AES new master key registers on all sysplex KDS cluster members with the same value and retry the function.</td>
</tr>
<tr>
<td>C1B (3099)</td>
<td>An ICSF subtask terminated during coordinated KDS refresh or coordinated KDS change master key processing. <strong>User action:</strong> Refer to the <a href="http://www.ibm.com/support/docview.wss?rs=180&amp;context=COMDOC4158">z/OS Cryptographic Services ICSF Administrator's Guide</a> for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center.</td>
</tr>
<tr>
<td>C1C (3100)</td>
<td>An error occurred attempting to obtain an ENQ for performing either a coordinated KDS refresh or coordinated KDS change master key. <strong>User action:</strong> The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center.</td>
</tr>
<tr>
<td>C1D (3101)</td>
<td>A target system (member of the sysplex KDS cluster) was unable to open the new KDS for either a coordinated KDS refresh or coordinated KDS change master key. <strong>User action:</strong> Refer to the <a href="http://www.ibm.com/support/docview.wss?rs=180&amp;context=COMDOC4158">z/OS Cryptographic Services ICSF Administrator's Guide</a> for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center.</td>
</tr>
<tr>
<td>C1E (3102)</td>
<td>One or more sysplex KDS cluster members' new AES master key registers were loaded and others were empty during a coordinated KDS change master key. All sysplex KDS cluster members' (same active KDS) new AES master key registers must be loaded with the same value or all must be empty when performing a coordinated KDS change master key. <strong>User action:</strong> Ensure all sysplex KDS cluster members new AES master key registers are loaded with the same value or all are empty and retry the function.</td>
</tr>
<tr>
<td>C2B (3115)</td>
<td>Either a coordinated KDS refresh or coordinated KDS change master key was cancelled. <strong>User action:</strong> Refer to the <a href="http://www.ibm.com/support/docview.wss?rs=180&amp;context=COMDOC4158">z/OS Cryptographic Services ICSF Administrator's Guide</a> for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center.</td>
</tr>
<tr>
<td>Reason Code Hex (Decimal)</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| C2C (3116) | A catalog problem occurred during either a coordinated KDS refresh or coordinated KDS change master key. The problem occurred when looking up either the active KDS or new KDS in the catalog.  
**User action:** Ensure both the active KDS and new KDS are cataloged and retry the function. |
| C2D (3117) | A coordinated KDS refresh or coordinated KDS change master key was attempted on a system with a level of hardware that is not supported by the function. This reason code is also used if the licensed internal code (LIC) level on the originating system is lower than the licensed internal code (LIC) level on 1 or more of the other sysplex KDS cluster members.  
**User action:** Refer to "Coordinated KDS Administration (CSFCRC and CSFCRC6)" on page 580 for a list of supported hardware levels. Perform the coordinated KDS function from the system running the highest level of licensed internal code (LIC). |
| C2E (3118) | A coordinated KDS change master key was attempted with the DES new master key register loaded but with no current DES master key set. In order to perform a coordinated KDS change master key to a new DES master key, a valid DES master key must have previously been set.  
**User action:** Set a valid DES master key and then use the coordinated KDS change master key to change the DES master key. |
| C2F (3119) | A coordinated KDS change master key was attempted with the AES new master key register loaded but with no current AES master key set. In order to perform a coordinated KDS change master key to a new AES master key, a valid AES master key must have previously been set.  
**User action:** Set a valid AES master key and then use the coordinated KDS change master key to change the AES master key. |
| C32 (3122) | A sysplex communication failure occurred during either coordinated KDS refresh or coordinated KDS change master key.  
**User action:** Refer to the [z/OS Cryptographic Services ICSF Administrator's Guide](z/OS Cryptographic Services ICSF Administrator's Guide) for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| C33 (3123) | A failure occurred processing KDS updates during a coordinated KDS change master key.  
**User action:** Refer to the [z/OS Cryptographic Services ICSF Administrator's Guide](z/OS Cryptographic Services ICSF Administrator's Guide) for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| C34 (3124) | An internal failure occurred in a coordinated KDS subtask while performing either a coordinated KDS refresh or a coordinated KDS change master key.  
**User action:** Refer to the [z/OS Cryptographic Services ICSF Administrator's Guide](z/OS Cryptographic Services ICSF Administrator's Guide) for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| C35 (3125) | An internal failure occurred in a coordinated KDS subtask while performing either a coordinated KDS refresh or a coordinated KDS change master key.  
**User action:** Refer to the [z/OS Cryptographic Services ICSF Administrator's Guide](z/OS Cryptographic Services ICSF Administrator's Guide) for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| C36 (3126)               | An internal failure occurred in the sysplex subtask while performing either a coordinated KDS refresh or coordinated KDS change master key.  
**User action:** Refer to the *z/OS Cryptographic Services ICSF Administrator’s Guide* for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| C37 (3127)               | An internal failure occurred in the serialization subtask while performing either a coordinated KDS refresh or coordinated KDS change master key.  
**User action:** Refer to the *z/OS Cryptographic Services ICSF Administrator’s Guide* for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| C38 (3128)               | An internal failure occurred in the I/O subtask while performing a coordinated KDS change master key.  
**User action:** Refer to the *z/OS Cryptographic Services ICSF Administrator’s Guide* for information on recovering from a coordinated CKDS administration failure. The function may be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| C3A (3130)               | A target system (member of the sysplex KDS cluster) is not being responsive to a system that is originating either a coordinated KDS refresh or coordinated KDS change master key.  
**User action:** Refer to the *z/OS Cryptographic Services ICSF Administrator’s Guide* for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| C3B (3131)               | The active KDS could not be reenciphered to the new KDS during a coordinated KDS change master key.  
**User action:** Refer to the *z/OS Cryptographic Services ICSF Administrator’s Guide* for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| C3E (3134)               | A failure occurred either renaming the active KDS to the archive KDS or renaming the new KDS to the active KDS during a coordinated KDS refresh or coordinated KDS change master key.  
**User action:** Refer to the *z/OS Cryptographic Services ICSF Administrator’s Guide* for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| C40 (3136)               | A coordinated KDS refresh or coordinated KDS change master key was originated from a system at a lower ICSF FMID release level than one or more of the target systems (sysplex KDS cluster members). The coordinated KDS functions must be originated from a system running the highest ICSF FMID level.  
**User action:** Retry the function from a sysplex KDS cluster member running the highest ICSF FMID level. |
### Table 332. Reason Codes for Return Code C (12) (continued)

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| C41 (3137)                | An internal failure occurred during the set master key step of a coordinated KDS change master key.  
**User action:** Refer to the [z/OS Cryptographic Services ICSF Administrator's Guide](https://www.ibm.com/support/knowledgecenter/SSSA5P_13.1.0/com.ibm.zos.v1r13.doc/ged_icsf/logon.html) for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| C42 (3138)                | A failure occurred trying to back out from a failed rename of the active KDS to the archive KDS or a failed rename of the new KDS to the active KDS during a coordinated KDS refresh or coordinated KDS change master key.  
**User action:** Refer to the [z/OS Cryptographic Services ICSF Administrator's Guide](https://www.ibm.com/support/knowledgecenter/SSSA5P_13.1.0/com.ibm.zos.v1r13.doc/ged_icsf/logon.html) for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| C43 (3139)                | A failure occurred switching the new KDS to the active KDS during either a coordinated KDS refresh or a coordinated KDS change master key.  
**User action:** Refer to the [z/OS Cryptographic Services ICSF Administrator's Guide](https://www.ibm.com/support/knowledgecenter/SSSA5P_13.1.0/com.ibm.zos.v1r13.doc/ged_icsf/logon.html) for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| C44 (3140)                | A coordinated KDS refresh or a coordinated KDS change master key failed because one of the target systems (sysplex KDS cluster members) had not finished ICSF initialization.  
**User action:** Allow all sysplex KDS cluster members to finish ICSF initialization and retry the function. |
| 1779 (6009)               | One or more target systems (sysplex KDS cluster members) did not successfully load the new KDS during a coordinated KDS refresh or coordinated KDS change master key. This a common result of an unresponsive target system.  
**User action:** Refer to the [z/OS Cryptographic Services ICSF Administrator's Guide](https://www.ibm.com/support/knowledgecenter/SSSA5P_13.1.0/com.ibm.zos.v1r13.doc/ged_icsf/logon.html) for information on recovering from a coordinated CKDS administration failure. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| 1780 (6016)               | A DASD IO error was encountered during access of the CKDS, PKDS, or TKDS.  
**User action:** Contact your ICSF security administrator or system programmer. The SVC 99 error code will be placed in the high-order halfword of the reason code field. |
| 178C (6028)               | ESTAE could not be established in common I/O routines.  
**User action:** Contact your system programmer or the IBM Support Center. |
| 1790 (6032)               | The dynamic allocation of the DASD copy of the CKDS, PKDS, or TKDS in use by ICSF failed.  
**User action:** Contact your ICSF security administrator or system programmer. The SVC 99 error code will be placed in the high-order halfword of the reason code field. |
| 1794 (6036)               | A dynamic deallocation error occurred when closing and deallocating a CKDS, PKDS, or TKDS.  
**User action:** Contact your security administrator or system programmer. The SVC 99 error code will be placed in the high-order halfword of the reason code field. |
Table 332. Reason Codes for Return Code C (12) (continued)

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1795 (6037)              | A failure occurred routing KDS updates to the originating system of a coordinated KDS change master key.  
**User action:** Refer to the [z/OS Cryptographic Services ICSF Administrator's Guide](#) for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| 1796 (6038)              | The I/O subtask became out of sync with the sysplex KDS cluster during a coordinated KDS change master key. The I/O subtask will be restarted to get back in sync with the sysplex KDS cluster.  
**User action:** Refer to the [z/OS Cryptographic Services ICSF Administrator's Guide](#) for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| 1797 (6039)              | ICSF was unable to attach a coordinated KDS subtask for either a coordinated KDS refresh or coordinated KDS change master key.  
**User action:** Refer to the [z/OS Cryptographic Services ICSF Administrator's Guide](#) for information on recovering from a coordinated CKDS administration failure. The function can be retried. If the error is common and persistent, contact your system programmer or the IBM Support Center. |
| 2724 (10020)             | A key retrieved from the in-storage CKDS failed the MAC verification (MACVER) check and is unusable.  
**User action:** Contact your ICSF administrator. |
| 2728 (10024)             | A key retrieved from the in-storage CKDS or a key to be written to the PKDS was rejected for use by the installation exit.  
**User action:** Contact your ICSF administrator or system programmer. |
| 272C (10028)             | You cannot use the secure key import or multiple secure key import callable services because the cryptographic unit is not enabled for processing. The cryptographic unit is not in special secure mode or is disabled in the environment control mask (ECM).  
**User action:** Contact your ICSF administrator (your administrator can enable the processing mode or the ECM). |
| 2734 (10036)             | More than one key with the same label was found in the CKDS or PKDS. This function requires a unique key per label. The probable cause may be the use of an incorrect label pointing to a key type that allows multiple keys per label.  
**User action:** Make sure the application specifies the correct label. If the label is correct, contact your ICSF security administrator or system programmer to verify the contents of the CKDS or PKDS. |
| 273C (10044)             | OPEN of the PKDS in use by ICSF failed.  
**User action:** Contact your ICSF security administrator or system programmer. |
| 2740 (10048)             | I/O error reading or writing to the DASD copy of the CKDS or PKDS in use by ICSF.  
**User action:** Contact your ICSF security administrator or system programmer. The RPL feedback code will be placed in the high-order halfword of the reason code field.  
**REASONCODES:** TSS 0C5 (197) |
<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| 2744 (10052)             | Automatic REFRESH to free storage in the linear section of the CKT failed.  
**User action**: Contact your ICSF security administrator or system programmer and request that a REFRESH be done. |
| 274C (10060)             | The I/O subtask terminated for an unexpected reason prior to completing the request. No dynamic CKDS or PKDS update services are possible at this point.  
**User action**: Contact your system programmer who can investigate the problem and restart the I/O subtask by stopping and restarting ICSF. |
| 2B04 (11012)             | This function is disabled in the environment control mask (ECM).  
**User action**: Contact your ICSF administrator. |
| 2B08 (11016)             | The master key is not in a valid state.  
**User action**: Contact your ICSF administrator. |
| REASONCODES: TSS 2FC (764) |  |
| 2B0C (11020)             | The modulus of the public or private key is larger than allowed and configured in the CCC or FCV. You cannot use this key on this system.  
**User action**: Regenerate the key with a smaller modulus size. |
| 2B10 (11024)             | The system administrator has used the ICSF User Control Functions panel to disable the RSA functions.  
**User action**: Wait until administrator functions are complete and the RSA functions are again enabled. |
| 2B18 (11032)             | A CAMQ is valid for PKSC but not for PKA.  
**User action**: Contact your ICSF administrator. |
| 2B1C (11036)             | A PKDS is not available for processing.  
**User action**: Contact your ICSF administrator. |
| 2B20 (11040)             | The PKDS Control Record hash pattern is not valid.  
**User action**: Contact your ICSF administrator. |
| 2B24 (11044)             | The PKDS could not be accessed.  
**User action**: Contact your ICSF administrator. |
| 2B28 (11048)             | The PCICC, PCIXCC, CEX2C, or CEX3C failed.  
**User action**: Contact your IBM support center. |
| 2B2C (11052)             | The specific PCICC, PCIXCC, CEX2C, or CEX3C requested for service is temporarily unavailable. PKDS could not be accessed. The specific PCICC, PCIXCC, CEX2C, or CEX3C may be attempting some recovery action. If recovery action is successful, the PCICC, PCIXCC, CEX2C, or CEX3C will be made available. If the recovery action fails, the PCICC, PCIXCC, CEX2C, or CEX3C will be made permanently unavailable.  
**User action**: Retry the function. |
| 2B30 (11056)             | The PCICC, PCIXCC, CEX2C, or CEX3C failed. The response from the processor was incomplete.  
**User action**: Contact your IBM support center. |
### Table 332. Reason Codes for Return Code C (12) (continued)

<table>
<thead>
<tr>
<th>Reason Code Hex (Decimal)</th>
<th>Description</th>
</tr>
</thead>
</table>
| 2B34 (11060)             | The service could not be performed because the required PCICC, PCIXCC, CEX2C, or CEX3C was not active, or did not have a master key set.  
  **User action:** If the service required a specific PCICC, PCIXCC, CEX2C, or CEX3C, verify that the value specified is correct. Reissue the request when the required PCICC, PCIXCC, CEX2C, or CEX3C is available, and has the master key set. |
| 2B38 (11064)             | Service could not be performed because of a hardware error on the PCICC, PCIXCC, CEX2C, or CEX3C. |
| 2B40 (11072)             | CEX2C has been reconfigured to a CEX2A, or CEX3C has been reconfigured to a CEX3A. TKE will not recognize the coprocessor until it is reconfigured back to a CEX2C or CEX3C. |
| 2EDC (11996)             | The Cryptographic Coprocessor Feature is not available for CKDS initialization because the cryptographic unit is not in special secure mode.  
  **User action:** Contact your ICSF administrator. |
| 2EE0 (12000)             | You cannot use the Clear PIN generate callable service because the cryptographic unit is not enabled for processing. The cryptographic unit is not in special secure mode.  
  **User action:** Contact your ICSF administrator who can enable the processing mode. |
| 8CA2 (36002)             | CSFPCI was called to set the RSA master key in a PCIXCC, CEX2C or CEX3C. This function is disabled because dynamic RSA master key change is enabled and the RSA master key can only be changed from the ICSF TSO Change asymmetric master key utility. |
| 8CB4 (36020)             | A refresh of the CKDS failed because the DASD copy of the CKDS is enciphered under the wrong master key. This may have resulted from an automatic refresh during processing of the CKDS key record create callable service.  
  **User action:** Contact your ICSF administrator. |
| 8D14 (36116)             | The PKDS specified for refresh, reencipher or activate has an incorrect dataset attribute.  
  **User action:** Create a larger PKDS. See [z/OS Cryptographic Services ICSF System Programmer's Guide](https://www.ibm.com/support/knowledgecenter/SSEKGS_ICSF/icsf_pgmguide.html)  
| 8D3C (36156)             | A PKCS #11 service is being requested. The service is disabled due to an ICSF FIPS self test failure. The request is not processed.  
  **User action:** Report the problem to your IBM support center |
| 8D40 (36160)             | The attempt to reencipher the CKDS failed because there is an enhanced wrapped token in the CKDS.  
  **User Action:** Reencipher the CKDS on a system that supports the enhanced wrapping method. |
| 8D5A (36186)             | A request was made to reencipher a CKDS. The CKDS specified cannot be reenciphered on this release of ICSF because the CKDS contains Variable-length Symmetric key tokens with an unrecognized algorithm or key type in the associated data section. Only key tokens with a recognized algorithm or key type can be managed on this release of ICSF.  
  **User action:** Perform the reencipher operation on a release of ICSF which recognizes the algorithm and key type of all tokens in the specified CKDS. |
| 8D56 (36182)             | A coprocessor failure was detected during initialization.  
  **User action:** The error is accompanied by the CSFM540I message. Follow instructions associated with that message. |

</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>Flag byte</td>
</tr>
<tr>
<td></td>
<td>Bit</td>
</tr>
</tbody>
</table>
|       | 0   | Encrypted key and master key verification pattern (MKVP) are present.  
|       |     | (Off for a clear key token, on for an encrypted key token.)  
|       | 1   | Control vector (CV) value in this token has been applied to the key.  
|       | 2   | No key is present or the AES MKVP is not present if the key is encrypted.  
|       | 3-7 | Reserved. Must be set to 0.  
| 7     | 1-byte LRC checksum of clear key value.  
| 8–15  | Master key verification pattern (MKVP)  
|       |     | (For a clear AES key token this value will be hex zeros.)  
| 16–47 | 128-bit, 192-bit, or 256-bit key value, left-justified and padded on the right with hex zeros.  
| 48–55 | 8-byte control vector.  
|       |     | (For a clear AES key token this value will be hex zeros.)  
| 56–57 | 2-byte integer specifying the length in bits of the clear key value.  
| 58–59 | 2-byte integer specifying the length in bytes of the encrypted key value.  
|       |     | (For a clear AES key token this value will be hex zeros.)  
| 60–63 | Token validation value (TVV). See [Token Validation Value](#) for more information.  

**Token Validation Value**

ICSF uses the token validation value (TVV) to verify that a token is valid. The TVV prevents a key token that is not valid or that is overlaid from being accepted by ICSF. It provides a checksum to detect a corruption in the key token.

When an ICSF callable service generates a key token, it generates a TVV and stores the TVV in bytes 60-63 of the key token. When an application program passes a key token to a callable service, ICSF checks the TVV. To generate the TVV, ICSF performs a twos complement ADD operation (ignoring carries and overflow) on the key token, operating on four bytes at a time, starting with bytes 0-3 and ending with bytes 56-59.

**DES Key Token Formats**

**DES Internal Key Token**

Table 335 shows the format for a DES internal key token.

Table 335. Internal Key Token Format

<table>
<thead>
<tr>
<th>Bytes</th>
<th>Description</th>
</tr>
</thead>
</table>
| 0     | X'01' (flag indicating this is an internal key token)  
| 1–3   | Implementation-dependent bytes (X'000000' for ICSF)  
| 4     | Key token version number (X'00' or X'01')  
| 5     | Reserved (X'00')  

---

ICSF uses the token validation value (TVV) to verify that a token is valid. The TVV prevents a key token that is not valid or that is overlaid from being accepted by ICSF. It provides a checksum to detect a corruption in the key token.

When an ICSF callable service generates a key token, it generates a TVV and stores the TVV in bytes 60-63 of the key token. When an application program passes a key token to a callable service, ICSF checks the TVV. To generate the TVV, ICSF performs a twos complement ADD operation (ignoring carries and overflow) on the key token, operating on four bytes at a time, starting with bytes 0-3 and ending with bytes 56-59.

</tr>
</tbody>
</table>
External RKX DES Key Token

Table 337 defines an external DES key-token called an RKX key-token. An RKX key-token is a special token used exclusively by the Remote Key Export (CSNDRKX and CSNFRKX) and DES key-storage callable services (for example, CKDS Key Record Write). No other callable services use or reference an RKX key-token or key-token record. For additional information about the usage of RKX key tokens, see "Remote Key Loading" on page 33.

Note: Callable services other than the Remote Key Export and the DES key-storage callable services do not support RKX key tokens or RKX key token records.

As can be seen in the table, RKX key tokens are 64 bytes in length, have a token identifier flag (X'02'), a token version number (X'10'), and room for encrypted keys like normal CCA DES key tokens. Unlike normal CCA DES key-tokens, RKX key tokens do not have a control vector, flag bits, and a token-validation value. In addition, they have a confounder value, a MAC value, and room for a third encrypted key.

Table 337. External RKX DES key-token format, version X'10'

<table>
<thead>
<tr>
<th>Offset</th>
<th>Length</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>1</td>
<td>X'02' (a token identifier flag that indicates an external key-token)</td>
</tr>
<tr>
<td>01</td>
<td>3</td>
<td>Reserved, binary zero</td>
</tr>
<tr>
<td>04</td>
<td>1</td>
<td>The token version number (X'10')</td>
</tr>
<tr>
<td>05</td>
<td>2</td>
<td>Reserved, binary zero</td>
</tr>
<tr>
<td>07</td>
<td>1</td>
<td>Key length in bytes, including confounder</td>
</tr>
<tr>
<td>08</td>
<td>8</td>
<td>Confounder</td>
</tr>
<tr>
<td>16</td>
<td>8</td>
<td>Key left</td>
</tr>
<tr>
<td>24</td>
<td>8</td>
<td>Key middle (binary zero if not used)</td>
</tr>
<tr>
<td>32</td>
<td>8</td>
<td>Key right (binary zero if not used)</td>
</tr>
<tr>
<td>40</td>
<td>8</td>
<td>Rule ID</td>
</tr>
</tbody>
</table>

The trusted block rule identifier used to create this key token. A subsequent call to Remote Key Export (CSNDRKX or CSNFRKX) can use this token with a trusted block rule that references the rule ID that must have been used to create this token. The trusted block rule can be compared with this rule ID for verification purposes.

The Rule ID is an 8-byte string of ASCII characters, left justified and padded on the right with space characters. Acceptable characters are A...Z, a...z, 0...9, - (X'2D'), and _ (X'5F'). All other characters are reserved for future use.

| 48     | 8      | Reserved, binary zero |

Appendix B. Key Token Formats
Table 337. External RKX DES key-token format, version X’10’ (continued)

<table>
<thead>
<tr>
<th>Offset</th>
<th>Length</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>56</td>
<td>8</td>
<td>MAC value</td>
</tr>
</tbody>
</table>

ISO 16609 TDES CBC-mode MAC, computed over the 56 bytes starting at offset 0 and including the encrypted key value and the rule ID using the same MAC key that is used to protect the trusted block itself.

This MAC value guarantees that the key and the rule ID cannot be modified without detection, providing integrity and binding the rule ID to the key itself. This MAC value must verify with the same trusted block used to create the key, thus binding the key structure to that specific trusted block.

Notes:
1. A fixed, randomly derived variant is exclusive-ORed with the MAC key before it is used to encipher the generated or exported key and confounder.
2. The MAC key is located within a trusted block (internal format) and can be recovered by decipherment under a variant of the PKA master key.
3. The trusted block is originally created in external form by the Trusted Block Create callable service and then converted to internal form by the PKA Key Import callable service prior to the Remote Key Export call.

### DES Null Key Token

Table 338 shows the format for a DES null key token.

Table 338. Format of Null Key Tokens

<table>
<thead>

RSA Key Token Formats

RSA Public Key Token

An RSA public key token contains the following sections:

- A required token header, starting with the token identifier X'1E'
- A required RSA public key section, starting with the section identifier X'04'

Table 345 presents the format of an RSA public key token. All length fields are in binary. All binary fields (exponents, lengths, and so on) are stored with the high-order byte first (left, low-address, S/390 format).

Table 345. RSA Public Key Token

<td>Public key exponent (this is generally a 1-, 3-, or 64- to 512-byte quantity), e. e must be odd and 1&lt;e&lt;n. (Frequently, the value of e is $2^{16}+1$)</td>
</tr>
<tr>
<td>12+xxx</td>
<td>yyy</td>
<td>Modulus, n.</td>
</tr>
</tbody>
</table>

RSA Private External Key Token

An RSA private external key token contains the following sections:

- A required PKA token header starting with the token identifier X'1E'
A required RSA private key section starting with one of the following section identifiers:
  - X'02' which indicates a modulus-exponent form RSA private key section (not optimized) with modulus length of up to 1024 bits for use with the Cryptographic Coprocessor Feature or the PCI Cryptographic Coprocessor.
  - X'08' which indicates an optimized Chinese Remainder Theorem form private key section with modulus bit length of up to 4096 bits for use with the PCICC, PCIXCC, CEX2C, or CEX3C.
  - X'09' which indicates a modulus-exponent form RSA private key section (not optimized) with modulus length of up to 4096 bits for use with the CEX2C or CEX3C.

A required RSA public key section, starting with the section identifier X'04'

An optional private key name section, starting with the section identifier X'10'

Table 346 presents the basic record format of an RSA private external key token. All length fields are in binary. All binary fields (exponents, lengths, and so on) are stored with the high-order byte first (left, low-address, S/390 format). All binary fields (exponents, modulus, and so on) in the private sections of tokens are right-justified and padded with zeros to the left.

RSA Private Internal Key Token

An RSA private internal key token contains the following sections:

- A required PKA token header, starting with the token identifier X’1F’
- Basic record format of an RSA private internal key token. All length fields are in binary. All binary fields (exponents, lengths, and so on) are stored with the high-order byte first (left, low-address, S/390 format). All binary fields (exponents, modulus, and so on) in the private sections of tokens are right-justified and padded with zeros to the left.

End of the encrypted secure subsection; all of the fields starting with the confounder field and ending with the variable length pad field are encrypted under the OPK using TDES (CBC outer chaining) for key confidentiality.

DSS Key Token Formats

**DSS Public Key Token**

A DSS public key token contains the following sections:

- A required token header, starting with the token identifier X'1E'
- A required DSS public key section, starting with the section identifier X'03'

*Table 354* presents the format of a DSS public key token. All length fields are in binary. All binary fields (exponents, lengths, and so on) are stored with the high-order byte first (left, low-address, S/390 format).

**DSS Private External Key Token**

A DSS private external key token contains the following sections:
- A required PKA token header, starting with the token identifier X'1E'
- A required DSS private key section, starting with the section identifier X'01'
- A required DSS public key section, starting with the section identifier X'03'
- An optional private key name section, starting with the section identifier X'10'

Table 355 presents the format of a DSS private external key token. All length fields are in binary. All binary fields (exponents, lengths, and so on) are stored with the high-order byte first (left, low-address, S/390 format). All binary fields (exponents, modulus, and so on) in the private sections of tokens are right-justified and padded with zeros to the left.

**DSS Private Internal Key Token**

A DSS private internal key token contains the following sections:
- A required PKA token header, starting with the token identifier X'1F'
- A required DSS private key section, starting with the section identifier X'01'
- A required DSS public key section, starting with the section identifier X'03'
- An optional private key name section, starting with the section identifier X'10'
- A required internal information section, starting with the eyecatcher 'PKTN'

Table 356 presents the format of a DSS private internal token. All length fields are in binary. All binary fields (exponents, lengths, and so on) are stored with the high-order byte first (left, low-address, S/390 format). All binary fields (exponents, modulus, and so on) in the private sections of tokens are right-justified and padded with zeros to the left.

**Trusted Block Key Token**

A trusted block key-token (trusted block) is an extension of CCA PKA key tokens using new section identifiers. A trusted block was introduced to CCA beginning with Release 3.25. They are an integral part of a remote key-loading process.

Trusted blocks contain various items, some of which are optional, and some of which can be present in different forms. Tokens are composed of concatenated sections that, unlike CCA PKA key tokens, occur in no prescribed order.

As with other CCA key-tokens, both internal and external forms are defined:

- An external trusted block contains a randomly generated confounder and a triple-length MAC key enciphered under a DES IMP-PKA transport key. The MAC key is used to calculate an ISO 16609 CBC mode TDES MAC of the trusted block contents. An external trusted block is created by the Trusted_Block_Create verb. This verb can:
1. Create an inactive external trusted block
2. Change an external trusted block from inactive to active

- An internal trusted block contains a confounder and triple-length MAC key enciphered under a variant of the PKA master key. The MAC key is used to calculate a TDES MAC of the trusted block contents. A PKA master key verification pattern is also included to enable determination that the proper master key is available to process the key. The Remote_Key_Export verb only operates on trusted blocks that are internal. An internal trusted block must be imported from an external trusted block that is active using the PKA_Key_Import verb.

**Note:** Trusted blocks do not contain a private key section.

**Trusted block sections**

A trusted block is a concatenation of a header followed by an unordered set of sections. The data structures of these sections are summarized in the following table:

<table>
<thead>
<tr>
<th>Section</th>
<th>Reference</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header</td>
<td>Table 360 on page 814</td>
<td>Trusted block token header</td>
</tr>
<tr>
<td>X'11'</td>
<td>Table 361 on page 815</td>
<td>Trusted block public key</td>
</tr>
<tr>
<td>X'12'</td>
<td>Table 362 on page 816</td>
<td>Trusted block rule</td>
</tr>
<tr>
<td>X'13'</td>
<td>Table 369 on page 823</td>
<td>Trusted block name (key label)</td>
</tr>
<tr>
<td>X'14'</td>
<td>Table 370 on page 823</td>
<td>Trusted block information</td>
</tr>
<tr>
<td>X'15'</td>
<td>Table 374 on page 826</td>
<td>Trusted block application-defined data</td>
</tr>
</tbody>
</table>

Every trusted block starts with a token header. The first byte of the token header determines the key form:

- An external header (first byte X'1E'), created by the Trusted_Block_Create verb
- An internal header (first byte X'1F'), imported from an active external trusted block by the PKA_Key_Import verb

Following the token header of a trusted block is an unordered set of sections. A trusted block is formed by concatenating these sections to a trusted block header:

- An optional public-key section (trusted block section identifier X'11')
  The trusted block trusted RSA public-key section includes the key itself in addition to a key-usage flag. No multiple sections are allowed.
- An optional rule section (trusted block section identifier X'12')
  A trusted block may have zero or more rule sections.
1. A trusted block with no rule sections can be used by the PKA_Key_Token_Change and PKA_Key_Import callable services. A trusted block with no rule sections can also be used by the Digital_Signature_Verify verb, provided there is an RSA public-key section that has its key-usage flag bits set to allow digital signature operations.
2. At least one rule section is required when the Remote_Key_Export verb is used to:
   - Generate an RKX key-token
   - Export an RKX key-token
   - Export a CCA DES key-token
– Encrypt the clear generated or exported key using the provided vendor certificate

3. If a trusted block has multiple rule sections, each rule section must have a unique 8-character Rule ID.

- An optional name (key label) section (trusted block section identifier X'13')
  The trusted block name section provides a 64-byte variable to identify the trusted block, just as key labels are used to identify other CCA keys. This name, or label, enables a host access-control system such as RACF to use the name to verify that the application has authority to use the trusted block. No multiple sections are allowed.

- A required information section (trusted block section identifier X'14')
  The trusted block information section contains control and security information related to the trusted block. The information section is required while the others are optional. This section contains the cryptographic information that guarantees its integrity and binds it to the local system. No multiple sections are allowed.

- An optional application-defined data section (trusted block section identifier X'15')
  The trusted block application-defined data section can be used to include application-defined data in the trusted block. The purpose of the data in this section is defined by the application. CCA does not examine or use this data in any way. No multiple sections are allowed.

**Trusted block integrity**

An enciphered confounder and triple-length MAC key contained within the required information section of the trusted block is used to protect the integrity of the trusted block. The randomly generated MAC key is used to calculate an ISO 16609 CBC mode TDES MAC of the trusted block contents. Together, the MAC key and MAC value provide a way to verify that the trusted block originated from an authorized source, and binds it to the local system.

An external trusted block has its MAC key enciphered under an IMP-PKA key-encrypting key. An internal trusted block has its MAC key enciphered under a variant of the PKA master key, and the master key verification pattern is stored in the information section.

**Number representation in trusted blocks**

- All length fields are in binary
- All binary fields (exponents, lengths, and so forth) are stored with the high-order byte first (left, low-address, z/OS format); thus the least significant bits are to the right and preceded with zero-bits to the width of a field
- In variable-length binary fields that have an associated field-length value, leading bytes that would otherwise contain X'00' can be dropped and the field shortened to contain only the significant bits

**Format of trusted block sections**

At the beginning of every trusted block is a trusted block header. The header contains the following information:

- A token identifier, which specifies if the token contains an external or internal key-token
- A token version number to allow for future changes
- A length in bytes of the trusted block, including the length of the header

The trusted block header is defined in the following table:
Table 360. Trusted block header

<table>
<thead>
<tr>
<th>Offset (bytes)</th>
<th>Length (bytes)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>001</td>

<td>002</td>
<td>Length of the key-token structure in bytes.</td>
</tr>
<tr>
<td>004</td>
<td>004</td>
<td>Reserved, binary zero.</td>
</tr>
</tbody>
</table>

Note: See “Number representation in trusted blocks” on page 813.

Following the header, in no particular order, are trusted block sections. There are five different sections defined, each identified by a one-byte section identifier (X'11' - X'15'). Two of the five sections have subsections defined. A subsection is a tag-length-value (TLV) object, identified by a two-byte subsection tag.

Only sections X'12' and X'14' have subsections defined; the other sections do not. A section and its subsections, if any, are one contiguous unit of data. The subsections are concatenated to the related section, but are otherwise in no particular order. Section X'12' has five subsections defined (X'0001' - X'0005'), and section X'14' has two (X'0001' and X'0002'). Of all the subsections, only subsection X'0001' of section X'14' is required. Section X'14' is also required.

The trusted block sections and subsections are described in detail in the following sections.

**Trusted block section X'11':** Trusted block section X'11' contains the trusted RSA public key in addition to a key-usage flag indicating whether the public key is usable in key-management operations, digital signature operations, or both.

Section X'11' is optional. No multiple sections are allowed. It has no subsections defined.

This section is defined in the following table:
Table 361. Trusted block trusted RSA public-key section (X’11’)

<table>
<thead>
<tr>

<td>Trusted block public key can be used in key management operations only</td>
</tr>
</tbody>
</table>

Note: See “Number representation in trusted blocks” on page 813.

**Trusted block section X’12’:** Trusted block section X’12’ contains information that defines a rule. A trusted block may have zero or more rule sections.

1. A trusted block with no rule sections can be used by the PKA_Key_Token_Change and PKA_Key_Import callable services. A trusted block with no rule sections can be used by the Digital_Signature_Verify verb, provided there is an RSA public-key section that has its key-usage flag set to allow digital signature operations.

2. At least one rule section is required when the Remote_Key_Export verb is used to:
   - Generate an RKX key-token
   - Export an RKX key-token
   - Export a CCA DES key-token
   - Generate or export a key encrypted by a public key. The public key is contained in a vendor certificate (section X’11’), and is the root certification key for the ATM vendor. It is used to verify the digital signature on public-key certificates for specific individual ATMs.

3. If a trusted block has multiple rule sections, each rule section must have a unique 8-character Rule ID.

Section X’12’ is the only section allowed to have multiple sections. Section X’12’ is optional. Multiple sections are allowed.
Note: The overall length of the trusted block may not exceed its maximum size of 3500 bytes.

Five subsections (TLV objects) are defined.

This section is defined in the following table:

Table 362. Trusted block rule section (X’12’)

**Trusted block section (X'12') subsection X'0003':** Subsection X'0003' of the trusted block rule section (X'12') is the common export key parameters TLV object. This subsection is optional, but is required for the key export of an existing source key (identified by the source_key_identifier parameter) in either RKX key-token.
format or CCA DES key-token format. For new key generation, this subsection applies the output key variant to the cleartext generated key, if such an option is desired. It contains the input source key and output export key minimum and maximum lengths, an output key variant length and variant, a CV length, and a CV to be exclusive-ORed with the cleartext transport key.

This subsection is defined in the following table:

Table 366. Common export key parameters subsection (X'0003') of trusted block rule section (X'12')

<td>011+xxx</td>
<td>001</td>
<td><strong>- If the length is 16, and if the CV (offset 012+xxx) is valued to 16 bytes of X'00' (ignoring the key-part bit), then:</strong></td>
</tr>
<tr>
<td>011+xxx</td>
<td>001</td>
<td>1. Ignore all CV bit definitions</td>
</tr>
<tr>
<td>011+xxx</td>
<td>001</td>
<td>2. If CCA DES key-token format, set the flag byte of the symmetric encrypted output key to indicate a CV value is present.</td>
</tr>
<tr>
<td>011+xxx</td>
<td>001</td>
<td>3. If the source key is 8 bytes in length, do not replicate the key to 16 bytes.</td>
</tr>
</tbody>
</table>
### Table 366. Common export key parameters subsection (X'0003') of trusted block rule section (X'12') (continued)

<table>
<thead>
<tr>
<th>Offset (bytes)</th>
<th>Length (bytes)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>012+xxx</td>
<td>yyy</td>
<td>CV. Place this CV into the output exported key-token, provided that the symmetric encrypted output key format selected (offset 018 in rule section) is CCA DES key-token.</td>
</tr>
</tbody>
</table>

- If the symmetric encrypted output key format flag (offset 018 in section X'12') indicates return an RKX key-token (X'00'), then ignore this CV. Otherwise, exclusive-OR this CV into the cleartext transport key.
- Exclusive-OR the CV of the source key into the cleartext transport key if the CV length (offset 011+xxx) is set to 0. If a transport key to encrypt a source key has equal left and right key halves, return an error. Replicate the key halves of the key identified by the *source_key_identifier* parameter whenever all of these conditions are met:
  1. The Replicate Key command (offset X'00DB') is enabled in the active role
  2. The CV length (offset 011+xxx) is 16, and both CV halves are non-zero
  3. The *source_key_identifier* parameter (contained in either a CCA DES key-token or RKX key-token) identifies an 8-byte key
  4. The key-form bits (40 - 42) of this CV do not indicate a single-length key (are not set to zero)
  5. Key-form bit 40 of this CV does not indicate the key is to have guaranteed unique halves (is not set to 1).

**Note:** A transport key is not used when the symmetric encrypted output key is in RKX key-token format.

---

**Note:** See "Number representation in trusted blocks" on page 813.

### Trusted block section X'12' subsection X'0004'**: Subsection X'0004' of the trusted block rule section (X'12') is the source key rule reference TLV object. This subsection is optional, but is required if using an RKX key-token as a source key (identified by *source_key_identifier* parameter). It contains the rule ID for the rule used to create the export key. If this subsection is not present, an RKX key-token format source key will not be accepted for use.

This subsection is defined in the following table:
Table 367. Source key rule reference subsection (X'0004' of trusted block rule section (X'12')

<table>
<thead>
<tr>
<th>Offset (bytes)</th>
<th>Length (bytes)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>002</td>
<td>Subsection tag: X'0004'</td>
</tr>
<tr>

<td>002</td>
<td>Subsection length in bytes (14).</td>
</tr>
<tr>
<td>004</td>
<td>001</td>
<td>Subsection version number (X'00').</td>
</tr>
<tr>
<td>005</td>
<td>001</td>
<td>Reserved, must be binary zero.</td>
</tr>
<tr>
<td>006</td>
<td>008</td>
<td>Rule ID.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Rule identifier for the rule that must have been used to create the source key.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The Rule ID is an 8-byte string of ASCII characters, left justified and padded on the right with space characters. Acceptable characters are A...Z, a...z, 0...9, - (X'2D'), and _ (X'5F'). All other characters are reserved for future use.</td>
</tr>
</tbody>
</table>

**Note:** See “Number representation in trusted blocks” on page 813.

**Trusted block section X'12' subsection X'0005':** Subsection X'0005' of the trusted block rule section (X'12') is the export key CCA token parameters TLV object. This subsection is optional. It contains a mask length, mask, and template for the export key CV limit. It also contains the template length and template for the source key label. When using a CCA DES key-token as a source key input parameter, its key type can be "filtered" by using the export key CV limit mask (offset 005) and limit template (offset 005+yyy) in this subsection.

This subsection is defined in the following table:

Table 368. Export key CCA token parameters subsection (X'0005') of trusted block rule section (X'12')

<table>
<thead>
<tr>
<th>Offset (bytes)</th>
<th>Length (bytes)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>002</td>
<td>Subsection tag: X'0005'</td>
</tr>
<tr>
<td>002</td>
<td>002</td>
<td>Subsection length in bytes (10+yyy+yyy+zzz).</td>
</tr>
<tr>
<td>004</td>
<td>001</td>
<td>Subsection version number (X'00').</td>
</tr>
<tr>
<td>005</td>
<td>002</td>
<td>Reserved, must be binary zero.</td>
</tr>
<tr>
<td>007</td>
<td>001</td>
<td>Flags (must be set to binary zero).</td>
</tr>
<tr>
<td>008</td>
<td>001</td>
<td>Export key CV limit mask length in bytes (yyy).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Do not use CV limits if this CV limit mask length (yyy) is zero. Use CV limits if yyy is non-zero, in which case yyy:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Must be 8 or 16</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Must not be less than the export key minimum length (offset 008 in subsection X'0003')</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Must be equal in length to the actual source key length of the key</td>
</tr>
</tbody>
</table>

**Example:** An export key minimum length of 16 and an export key CV limit mask length of 8 returns an error.

<td></td>
<td>characters (X'23', X'24', X'40', and X'2A'), and the space character</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(X'20') are allowed</td>
</tr>
</tbody>
</table>
Note: See “Number representation in trusted blocks” on page 813.

**Trusted block section X’13’:** Trusted block section X’13’ contains the name (key label). The trusted block name section provides a 64-byte variable to identify the trusted block, just as key labels are used to identify other CCA keys. This name, or label, enables a host access-control system such as RACF to use the name to verify that the application has authority to use the trusted block.

Section X’13’ is optional. No multiple sections are allowed. It has no subsections defined. This section is defined in the following table:

<table>
<thead>
<tr>
<th>Offset (bytes)</th>
<th>Length (bytes)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>001</td>
<td>Section identifier:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>X’13’  Trusted block name (key label)</td>
</tr>
<tr>
<td>001</td>
<td>001</td>
<td>Section version number (X’00’).</td>
</tr>
<tr>
<td>002</td>
<td>002</td>
<td>Section length in bytes (68).</td>
</tr>
<tr>
<td>004</td>
<td>064</td>
<td>Name (key label).</td>
</tr>
</tbody>
</table>

Note: See “Number representation in trusted blocks” on page 813.

**Trusted block section X’14’:** Trusted block section X’14’ contains control and security information related to the trusted block. This information section is separate from the public key and other sections because this section is required while the others are optional. This section contains the cryptographic information that guarantees its integrity and binds it to the local system.

Section X’14’ is required. No multiple sections are allowed. Two subsections are defined. This section is defined in the following table:

<table>
<thead>
<tr>
<th>Offset (bytes)</th>
<th>Length (bytes)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>001</td>
<td>Section identifier:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>X’14’  Trusted block information</td>
</tr>
<tr>
<td>001</td>
<td>001</td>
<td>Section version number (X’00’).</td>
</tr>
<tr>
<td>002</td>
<td>002</td>
<td>Section length in bytes (10+xxx).</td>
</tr>
<tr>
<td>004</td>
<td>002</td>
<td>Reserved, binary zero.</td>
</tr>
<tr>
<td>006</td>
<td>004</td>
<td>Flags:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>X’00000000’  Trusted block is in the inactive state</td>
</tr>
<tr>
<td></td>
<td></td>
<td>X’00000001’  Trusted block is in the active state</td>
</tr>
<tr>
<td>010</td>
<td>xxx</td>
<td>Information section subsections (tag-length-value objects).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>One or two objects in TLV format.</td>
</tr>
</tbody>
</table>

Note: See “Number representation in trusted blocks” on page 813.

Section X’14’ has two information subsections (tag-length-value objects) defined. These subsections are summarized in the following table:
Table 371. Summary of trusted block information subsections

<table>
<thead>
<tr>
<th>Rule subsection tag</th>
<th>TLV object</th>
<th>Optional or required</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'0001'</td>
<td>Protection information</td>
<td>Required</td>
<td>Contains the encrypted 8-byte confounder and triple-length (24-byte) MAC key, the ISO-16609 TDES CBC MAC value, and the MKVP of the PKA master key (computed using MDC4).</td>
</tr>
<tr>
<td>X'0002'</td>
<td>Activation and expiration dates</td>
<td>Optional</td>
<td>Contains flags indicating whether or not the coprocessor is to validate dates, and contains the activation and expiration dates that are considered valid for the trusted block.</td>
</tr>
</tbody>
</table>

Note: See “Number representation in trusted blocks” on page 813.

**Trusted block section X'14' subsection X'0001'**: Subsection X'0001' of the trusted block information section (X'14') is the protection information TLV object. This subsection is required. It contains the encrypted 8-byte confounder and triple-length (24-byte) MAC key, the ISO-16609 TDES CBC MAC value, and the MKVP of the PKA master key (computed using MDC4).

This subsection is defined in the following table:

Table 372. Protection information subsection (X'0001') of trusted block information section (X'14')

<table>
<thead>

<tr>
<td>046</td>
<td>016</td>
<td>MKVP. Contains the PKA master key verification pattern, computed using MDC4, when the trusted block is in internal form, otherwise contains binary zero.</td>
</tr>
</tbody>
</table>

Note: See “Number representation in trusted blocks” on page 813.

**Trusted block section X'14' subsection X'0002'**: Subsection X'0002' of the trusted block information section (X'14') is the activation and expiration dates TLV object. This subsection is optional. It contains flags indicating whether or not the coprocessor is to validate dates, and contains the activation and expiration dates that are considered valid for the trusted block.
This subsection is defined in the following table:

<table>
<thead>
<tr>
<th>Offset (bytes)</th>
<th>Length (bytes)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>002</td>

</tr>
<tr>
<td></td>
<td></td>
<td>Compare the activation date (offset 008) and the expiration date (offset 012) to the coprocessor's internal real-time clock. Return an error if the coprocessor date is before the activation date or after the expiration date.</td>
</tr>
<tr>
<td>008</td>
<td>004</td>
<td>Activation date.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Contains the first date that the trusted block can be used for generating or exporting keys. Format of the date is YYMD, where:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>YY Big-endian year (return an error if greater than 9999)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>M Month (return an error if any value other than X'01' - X'0C')</td>
</tr>
<tr>
<td></td>
<td></td>
<td>D Day of month (return an error if any value other than X'01' - X'1F'; day must be valid for given month and year, including leap years)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Return an error if the activation date is after the expiration date or is not valid.</td>
</tr>
<tr>
<td>012</td>
<td>004</td>
<td>Expiration date.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Contains the last date that the trusted block can be used. Same format as activation date (offset 008). Return an error if date is not valid.</td>
</tr>
</tbody>
</table>

**Note:** See “Number representation in trusted blocks” on page 813.

**Trusted block section X'15':** Trusted block section X'15' contains application-defined data. The trusted block application-defined data section can be used to include application-defined data in the trusted block. The purpose of the data in this section is defined by the application; it is neither examined nor used by CCA in any way.

Section X'15' is optional. No multiple sections are allowed. It has no subsections defined. This section is defined in the following table:
Table 374. Trusted block application-defined data section X'15'

<table>
<thead>
<tr>
<th>Offset (bytes)</th>

<td>xxx</td>
<td>Application-defined data</td>
</tr>
<tr>
<td></td>
<td></td>
<td>May be used to hold a public-key certificate for the trusted public key.</td>
</tr>
</tbody>
</table>

**Note:** See [Number representation in trusted blocks](https://www.ibm.com) on page 813.
Appendix C. Control Vectors and Changing Control Vectors with the CVT Callable Service

This section contains a control vector table which displays the default value of the control vector that is associated with each type of key. It also describes how to change control vectors with the control vector translate callable service.

Control Vector Table

Note: The Control Vectors used in ICSF are exactly the same as documented in CCA and the TSS documents.

The master key enciphers all keys operational on your system. A transport key enciphers keys that are distributed off your system. Before a master key or transport key enciphers a key, ICSF exclusive ORs both halves of the master key or transport key with a control vector. The same control vector is exclusive ORed to the left and right half of a master key or transport key.

Also, if you are entering a key part, ICSF exclusive ORs each half of the key part with a control vector before placing the key part into the CKDS.

Each type of key on ICSF (except the master key) has either one or two unique control vectors associated with it. The control vector that ICSF exclusive ORs the master key or transport key with depends on the type of key the master key or transport key is enciphering. For double-length keys, a unique control vector exists for each half of a specific key type. For example, there is a control vector for the left half of an input PIN-encrypting key, and a control vector for the right half of an input PIN-encrypting key.

If you are entering a key part into the CKDS, ICSF exclusive ORs the key part with the unique control vector(s) associated with the key type. ICSF also enciphers the key part with two master key variants for a key part. One master key variant enciphers the left half of the key part, and another master key variant enciphers the right half of the key part. ICSF creates the master key variants for a key part by exclusive ORing the master key with the control vectors for key parts. These procedures protect key separation.

Table 375 displays the default value of the control vector that is associated with each type of key. Some key types do not have a default control vector. For keys that are double-length, ICSF enciphers a unique control vector on each half. Control vectors indicated with an *** are supported by the Cryptographic Coprocessor Feature.

  - **101**: Double-length key, right half, halves guaranteed unique

### Specifying a Control-Vector-Base Value

You can determine the value of a control vector by working through the following series of questions:

1. Begin with a field of 64 bits (eight bytes) set to 'B0'. The most significant bit is referred to as bit 0. Define the key type and subtype (bits 8 to 14), as follows:
   - The main key type bits (bits 8 to 11). Set bits 8 to 11 to one of the following values:
### Bits 8 to 11  Main Key Type

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Data operation keys</td>
</tr>
<tr>
<td>0010</td>
<td>PIN keys</td>
</tr>
<tr>
<td>0011</td>
<td>Cryptographic variable-encrypting keys</td>
</tr>
<tr>
<td>0100</td>
<td>Key-encrypting keys</td>
</tr>
<tr>
<td>0101</td>
<td>Key-generating keys</td>
</tr>
<tr>
<td>0111</td>
<td>Diversified key-generating keys</td>
</tr>
</tbody>
</table>

- The key subtype bits (bits 12 to 14). Set bits 12 to 14 to one of the following values:

**Note:** For Diversified Key Generating Keys, the subtype field specifies the hierarchical level of the DKYGENKY. If the subtype is non-zero, then the DKYGENKY can only generate another DKYGENKY key with the hierarchy level decremented by one. If the subtype is zero, the DKYGENKY can only generate the final diversified key (a non-DKYGENKY key) with the key type specified by the usage bits.

### Bits 12 to 14  Key Subtype

</tbody>
</table>

2. For key-encrypting keys, set the following bits:

- The key-generating usage bits (gks, bits 18 to 20). Set the gks bits to B’111’ to indicate that the Key Generate callable service can use the associated...
key-encrypting key to encipher generated keys when the Key Generate callable service is generating various key-pair key-form combinations (see the Key-Encrypting Keys section of Figure 8). Without any of the gks bits set to 1, the Key Generate callable service cannot use the associated key-encrypting key. The Key Token Build callable service can set the gks bits to 1 when you supply the OPIM, IMEX, IMIM, OPEX, and EXEX keywords.

- The IMPORT and EXPORT bit and the XLATE bit (ix, bits 21 and 22). If the ‘i’ bit is set to 1, the associated key-encrypting key can be used in the Data Key Import, Key Import, Data Key Export, and Key Export callable services. If the ‘x’ bit is set to 1, the associated key-encrypting key can be used in the Key Translate callable service.

- The key-form bits (fff, bits 40 to 42). The key-form bits indicate how the key was generated and how the control vector participates in multiple-enciphering. To indicate that the parts can be the same value, set these bits to B'010'. For information about the value of the key-form bits in the right half of a control vector, see Step 8.

3. For MAC and MACVER keys, set the following bits:
   - The MAC control bits (bits 20 and 21). For a MAC-generate key, set bits 20 and 21 to B'11'. For a MAC-verify key, set bits 20 and 21 to B'01'.
   - The key-form bits (fff, bits 40 to 42). For a single-length key, set the bits to B'000'. For a double-length key, set the bits to B'010'.

4. For PINGEN and PINVER keys, set the following bits:
   - The PIN calculation method bits (aaaa, bits 0 to 3). Set these bits to one of the following values:

<table>
<thead>
<tr>
<th>Bits 0 to 3</th>
<th>Calculation Method Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>NO-SPEC</td>
<td>A key with this control vector can be used with any PIN calculation method.</td>
</tr>
<tr>
<td>0001</td>
<td>IBM-PIN or IBM-PINO</td>
<td>A key with this control vector can be used only with the IBM PIN or PIN Offset calculation method.</td>
</tr>
<tr>
<td>0010</td>
<td>VISA-PVV</td>
<td>A key with this control vector can be used only with the VISA-PVV calculation method.</td>
</tr>
<tr>
<td>0100</td>
<td>GBP-PIN or GBP-PINO</td>
<td>A key with this control vector can be used only with the German Banking Pool PIN or PIN Offset calculation method.</td>
</tr>
<tr>
<td>0011</td>
<td>INBK-PIN</td>
<td>A key with this control vector can be used only with the Interbank PIN calculation method.</td>
</tr>
<tr>
<td>0101</td>
<td>NL-PIN-1</td>
<td>A key with this control vector can be used only with the NL-PIN-1, Netherlands PIN calculation method.</td>
</tr>
</tbody>
</table>

- The prohibit-offset bit (o, bit 37) to restrict operations to the PIN value. If set to 1, this bit prevents operation with the IBM 3624 PIN Offset calculation method and the IBM German Bank Pool PIN Offset calculation method.
5. For PINGEN, IPINENC, and OPINENC keys, set bits 18 to 22 to indicate whether the key can be used with the following callable services

<table>
<thead>
<tr>
<th>Service Allowed</th>
<th>Bit Name</th>
<th>Bit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clear PIN Generate</td>
<td>CPINGEN</td>
<td>18</td>
</tr>
<tr>
<td>Encrypted PIN Generate</td>
<td>EPINGENA</td>
<td>19</td>
</tr>
<tr>
<td>Alternate</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Encrypted PIN Generate</td>
<td>EPINGEN</td>
<td>20</td>
</tr>
<tr>
<td>Alternate</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Clear PIN Generate</td>
<td>CPINGEN</td>
<td>21</td>
</tr>
<tr>
<td>Alternate</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Encrypted Pin Verify</td>
<td>EPINVER</td>
<td>19</td>
</tr>
<tr>
<td>Clear PIN Encrypt</td>
<td>CPINENC</td>
<td>18</td>
</tr>
</tbody>
</table>

6. For the IPINENC (inbound) and OPINENC (outbound) PIN-block ciphering keys, do the following:

- Set the TRANSLAT bit (t, bit 21) to 1 to permit the key to be used in the PIN Translate callable service. The Control Vector Generate callable service can set the TRANSLAT bit to 1 when you supply the TRANSLAT keyword.
- Set the REFORMAT bit (r, bit 22) to 1 to permit the key to be used in the PIN Translate callable service. The Control Vector Generate callable service can set the REFORMAT bit and the TRANSLAT bit to 1 when you supply the REFORMAT keyword.

7. For the cryptographic variable-encrypting keys (bits 18 to 22), set the variable-type bits (bits 18 to 22) to one of the following values:

<table>
<thead>
<tr>
<th>Bits 18 to 22</th>
<th>Generic Key Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00000</td>
<td>CVARPINE</td>
<td>Used in the Encrypted PIN Generate Alternate service to encrypt a clear PIN.</td>
</tr>
<tr>
<td>00010</td>
<td>CVARXCVL</td>
<td>Used in the Control Vector Translate callable service to decrypt the left mask array.</td>
</tr>
<tr>
<td>00011</td>
<td>CVARXCVR</td>
<td>Used in the Control Vector Translate callable service to decrypt the right mask array.</td>
</tr>
<tr>
<td>00100</td>
<td>CVARENC</td>
<td>Used in the Cryptographic Variable Encipher callable service to encrypt an unformatted PIN.</td>
</tr>
</tbody>
</table>

8. For key-generating keys, set the following bits:

- For KEYGENKY, set bit 18 for UKPT usage and bit 19 for CLR8-ENC usage.
- For DKYGENKY, bits 12–14 will specify the hierarchical level of the DKYGENKY key. If the subtype CV bits are non-zero, then the DKYGENKY can only generate another DKYGENKY key with the hierarchical level decremented by one. If the subtype CV bits are zero, the DKYGENKY can only generate the final diversified key (a non-DKYGENKY key) with the key type specified by usage bits.
To specify the subtype values of the DKYGENKY, keywords DKYL0, DKYL1, DKYL2, DKYL3, DKYL4, DKYL5, DKYL6 and DKYL7 will be used.

- For DKYGENKY, bit 18 is reserved and must be zero.
- Usage bits 18-22 for the DKYGENKY key type are defined as follows. They will be encoded as the final key type that the DKYGENKY key generates.

<table>
<thead>
<tr>
<th>Bits 19 to 22</th>
<th>Keyword</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>DDATA</td>
<td>DATA, DATAC, single or double length</td>
</tr>
<tr>
<td>0010</td>
<td>DMAC</td>
<td>MAC, DATAM</td>
</tr>
<tr>
<td>0011</td>
<td>DMV</td>
<td>MACVER, DATAMV</td>
</tr>
<tr>
<td>0100</td>
<td>DIMP</td>
<td>IMPORTER, IKEYXLAT</td>
</tr>
<tr>
<td>0101</td>
<td>DEXP</td>
<td>EXPORTER, OKEYXLAT</td>
</tr>
<tr>
<td>0110</td>
<td>DPVR</td>
<td>PINVER</td>
</tr>
<tr>
<td>1000</td>
<td>DMKEY</td>
<td>Secure message key for encrypting keys</td>
</tr>
<tr>
<td>1001</td>
<td>DMPIN</td>
<td>Secure message key for encrypting PINs</td>
</tr>
<tr>
<td>1111</td>
<td>DALL</td>
<td>All key types may be generated except DKYGENKY and KEYGENKY keys. Usage of the DALL keyword is controlled by a separate access control point.</td>
</tr>
</tbody>
</table>

9. For secure messaging keys, set the following bits:
   - Set bit 18 to 1 if the key will be used in the secure messaging for PINs service. Set bit 19 to 1 if the key will be used in the secure messaging for keys service.

10. For all keys, set the following bits:
   - The export bit (E, bit 17). If set to 0, the export bit prevents a key from being exported. By setting this bit to 0, you can prevent the receiver of a key from exporting or translating the key for use in another cryptographic subsystem. Once this bit is set to 0, it cannot be set to 1 by any service other than Control Vector Translate. The Prohibit Export callable service can reset the export bit.
   - The key-part bit (K, bit 44). Set the key-part bit to 1 in a control vector associated with a key part. When the final key part is combined with previously accumulated key parts, the key-part bit in the control vector for the final key part is set to 0. The Control Vector Generate callable service can set the key-part bit to 1 when you supply the KEY-PART keyword.
   - The anti-variant bits (bit 30 and bit 38). Set bit 30 to 0 and bit 38 to 1. Many cryptographic systems have implemented a system of variants where a 7-bit value is exclusive-ORed with each 7-bit group of a key-encrypting key before enciphering the target key. By setting bits 30 and 38 to opposite values, control vectors do not produce patterns that can occur in variant-based systems.
   - Control vector bits 64 to 127. If bits 40 to 42 are B'000' (single-length key), set bits 64 to 127 to 0. Otherwise, copy bits 0 to 63 into bits 64 to 127 and set bits 105 and 106 to B'01'.
Set the parity bits (low-order bit of each byte, bits 7, 15, ..., 127). These bits contain the parity bits (P) of the control vector. Set the parity bit of each byte so the number of zero-value bits in the byte is an even number.

For secure messaging keys, usage bit 18 on will enable the encryption of keys in a secure message and usage bit 19 on will enable the encryption of PINs in a secure message.

The ENH-ONLY bit (H, bit 56). Set the ENH-ONLY bit to 1 in a control vector to require the key value be encrypted with the enhanced wrapping method. The Control Vector Generate callable service can set the ENH-ONLY bit to 1 when you supply the ENH-ONLY keyword.

Changing Control Vectors with the Control Vector Translate Callable Service

Do the following when using the Control Vector Translate callable service:

- Provide the control information for testing the control vectors of the source, target, and key-encrypting keys to ensure that only sanctioned changes can be performed
- Select the key-half processing mode.

Providing the Control Information for Testing the Control Vectors

To minimize your security exposure, the Control Vector Translate callable service requires control information (mask array information) to limit the range of allowable control vector changes. To ensure that this service is used only for authorized purposes, the source-key control vector, target-key control vector, and key-encrypting key (KEK) control vector must pass specific tests. The tests on the control vectors are performed within the secured cryptographic engine.

The tests consist of evaluating four logic expressions, the results of which must be a string of binary zeros. The expressions operate bitwise on information that is contained in the mask arrays and in the portions of the control vectors associated with the key or key-half that is being processed. If any of the expression evaluations do not result in all zero bits, the callable service is ended with a control vector violation return and reason code (8/39). See Figure 12 on page 839. Only the 56 bit positions that are associated with a key value are evaluated. The low-order bit that is associated with key parity in each key byte is not evaluated.

Mask Array Preparation

A mask array consists of seven 8-byte elements: A1, B1, A2, B2, A3, B3, and B4. You choose the values of the array elements such that each of the following four expressions evaluates to a string of binary zeros. (See Figure 12 on page 839.) Set the A bits to the value that you require for the corresponding control vector bits. In expressions 1 through 3, set the B bits to select the control vector bits to be evaluated. In expression 4, set the B bits to select the source and target control vector bits to be evaluated. Also, use the following control vector information:

- C1 is the control vector associated with the left half of the KEK.
- C2 is the control vector associated with the source key, or selected source-key half/halves.
- C3 is the control vector associated with the target key or selected target-key half/halves.

1. 
   (C1 exclusive-OR A1) logical-AND B1
This expression tests whether the KEK used to encipher the key meets your criteria for the desired translation.

2. \((C_2 \text{ exclusive-OR } A_2) \text{ logical-AND } B_2\)
   
   This expression tests whether the control vector associated with the source key meets your criteria for the desired translation.

3. \((C_3 \text{ exclusive-OR } A_3) \text{ logical-AND } B_3\)
   
   This expression tests whether the control vector associated with the target key meets your criteria for the desired translation.

4. \((C_2 \text{ exclusive-OR } C_3) \text{ logical-AND } B_4\)
   
   This expression tests whether the control vectors associated with the source key and the target key meet your criteria for the desired translation.

Encipher two copies of the mask array, each under a different cryptographic-variable key (key type CVARENC). To encipher each copy of the mask array, use the Cryptographic Variable Encipher callable service. Use two different keys so that the enciphered-array copies are unique values. When using the Control Vector Translate callable service, the \textit{mask_array_left} parameter and the \textit{mask_array_right} parameter identify the enciphered mask arrays. The \textit{array_key_left} parameter and the \textit{array_key_right} parameter identify the internal keys for deciphering the mask arrays. The \textit{array_key_left} key must have a key type of CVARXCVL and the \textit{array_key_right} key must have a key type of CVARXCVR. The cryptographic process deciphers the arrays and compares the results; for the service to continue, the deciphered arrays must be equal. If the results are not equal, the service returns the return and reason code for data that is not valid (8/385).

Use the Key Generate callable service to create the key pairs CVARENC-CVARXCVL and CVARENC-CVARXCVR. Each key in the key pair must be generated for a different node. The CVARENC keys are generated for, or imported into, the node where the mask array will be enciphered. After enciphering the mask array, you should destroy the enciphering key. The CVARXCVL and CVARXCVR keys are generated for, or imported into, the node where the Control Vector Translate callable service will be performed.

If using the \texttt{BOTH} keyword to process both halves of a double-length key, remember that bits 41, 42, 104, and 105 are different in the left and right halves of the CCA control vector and must be ignored in your mask-array tests (that is, make the corresponding \(B_2\) and/or \(B_3\) bits equal to zero).

When the control vectors pass the masking tests, the verb does the following:

- Deciphers the source key. In the decipher process, the service uses a key that is formed by the exclusive-OR of the KEK and the control vector in the key token variable the \textit{source_key_token} parameter identifies.

- Enciphers the deciphered source key. In the encipher process, the service uses a key that is formed by the exclusive-OR of the KEK and the control vector in the key token variable the \textit{target_key_token} parameter identifies.

- Places the enciphered key in the key field in the key token variable the \textit{target_key_token} parameter identifies.
Selecting the Key-Half Processing Mode

Use the Control Vector Translate callable service to change a control vector associated with a key. Rule-array keywords determine which key halves are processed in the call, as shown in Figure 13 on page 840.
**Keyword**  **Meaning**  
**SINGLE**  This keyword causes the control vector of the left half of the source key to be changed. The updated key half is placed into the left half of the target key in the target key token. The right half of the target key is unchanged.

The **SINGLE** keyword is useful when processing a single-length key, or when first processing the left half of a double-length key (to be followed by processing the right half).

**RIGHT**  This keyword causes the control vector of the right half of the source key to be changed. The updated key half is placed into the right half of the target key of the target key token. The left half of the source key is copied unchanged into the left half of the target key in the target key token.

**BOTH**  This keyword causes the control vector of both halves of the source key to be changed. The updated key is placed into the target key in the target key token.

A single set of control information must permit the control vector changes applied to each key half. Normally, control vector bit positions 41, 42, 105, and 106 are different for each key half. Therefore, set bits 41 and 42 to B’00’ in mask array elements B₁, B₂, and B₃.

You can verify that the source and target key tokens have control vectors with matching bits in bit positions 40-42 and 104-106, the “form field” bits. Ensure that bits 40-42 of mask array B₄ are set to B’111’.

**LEFT**  This keyword enables you to supply a single-length key and obtain a double-length key. The source key token must contain:
- The KEK-enciphered single-length key
- The control vector for the single-length key (often this is a null value)
- A control vector, stored in the source token where the right-half control vector is normally stored, used in decrypting the single-length source key when the key is being processed for the target right half of the key.

The service first processes the source and target tokens as with the **SINGLE** keyword. Then the source token is processed using the single-length enciphered key and the source token right-half control vector.
vector to obtain the actual key value. The key value is then enciphered using the KEK and the control vector in the target token for the right-half of the key.

This approach is frequently of use when you must obtain a double-length CCA key from a system that only supports a single-length key, for example when processing PIN keys or key-encrypting keys received from non-CCA systems.

To prevent the service from ensuring that each key byte has odd parity, you can specify the NOADJUST keyword. If you do not specify the NOADJUST keyword, or if you specify the ADJUST keyword, the service ensures that each byte of the target key has odd parity.

**When the Target Key Token CV Is Null**

When you use any of the LEFT, BOTH, or RIGHT keywords, and when the control vector in the target key token is null (all B'0'), then bit 3 in byte 59 will be set to B'1' to indicate that this is a double-length DATA key.

**Control Vector Translate Example**

As an example, consider the case of receiving a single-length PIN-block encrypting key from a non-CCA system. Often such a key will be encrypted by an unmodified transport key (no control vector or variant is used). In a CCA system, an inbound PIN encrypting key is double-length.

First use the Key Token Build callable service to insert the single-length key value into the left-half key-space in a key token. Specify USE-CV as a key type and a control vector value set to 16 bytes of X'00'. Also specify EXTERNAL, KEY, and CV keywords in the rule array. This key token will be the source key key token.

Second, the target key token can also be created using the Key Token Build callable service. Specify a key type of IPINENC and the NO-EXPORT rule array keyword.

Then call the Control Vector Translate callable service and specify a rule-array keyword of LEFT. The mask arrays can be constructed as follows:

- A₁ is set to the value of the KEK's control vector, most likely the value of an IMPORTER key, perhaps with the NO-EXPORT bit set. B₁ is set to eight bytes of X'FF' so that all bits of the KEK's control vector will be tested.
- A₂ is set to eight bytes of X'00', the (null) value of the source key control vector. B₂ is set to eight bytes of X'FF' so that all bits of the source-key “control vector” will be tested.
- A₃ is set to the value of the target key's left-half control vector. B₃ is set to X'FFFF FFFF FF9F FFFF'. This will cause all bits of the control vector to be tested except for the two ("fff") bits used to distinguish between the left-half and right-half target-key control vector.
- B₄ is set to eight bytes of X'00' so that no comparison is made between the source and target control vectors.
Appendix D. Coding Examples

This appendix provides sample routines using the ICSF callable services for these languages:

- C
- COBOL
- Assembler
- PL/1

The C, COBOL and Assembler H examples that follow use the key generate, encipher, and decipher callable services to determine whether the deciphered text matches the starting text.

C

C programs must include the header file csfbext.h, which contains stubs for calling the ICSF services. This file is installed in the HFS directory /usr/include and is copied to SYS1.SIEAHDR.H(CSFBEXT).

Information on creating C applications that call ICSF PKCS #11 services is available in z/OS Cryptographic Services ICSF Writing PKCS #11 Applications.

In addition, C applications that include csfbext.h must be link edited with the appropriate DLL sidedeck for the addressing model:

**Standard 31-bit**
Link with /usr/lib/CSFDLL31.x or SYS1.SIEASID(CSFDLL31)

**31-bit with XPLINK**
Link with /usr/lib/CSFDLL3X.x or SYS1.SIEASID(CSFDLL3X)

**64-bit**
Link with /usr/lib/CSFDLL64.x or SYS1.SIEASID(CSFDLL64)

Information on creating C applications that call ICSF PKCS #11 services is available in z/OS Cryptographic Services ICSF Writing PKCS #11 Applications.

```c
#include <stdio.h>
#include "csfbext.h"

void printHex(unsigned char *, unsigned int);

Appendix E. Using ICSF with BSAFE

ICSF works in conjunction with RSA Security, Inc.’s BSAFE toolkit (BSAFE 3.1 or later). If you are currently using applications developed with BSAFE, we strongly recommend you take advantage of the increased security and performance available with ICSF interfaces. The BHAPI interface has been stabilized since ICSF FMID HCR770B and may be removed in a future release.

Through BSAFE 3.1 you can access the ICSF services to:
- Compute message digests or hashes
- Generate random numbers
- Encipher and decipher data using the DES algorithm
- Generate and verify RSA digital signatures

Some BSAFE Basics

BSAFE has many algorithm information types (called AIs). Many of the AIs can perform several cryptographic functions. For this reason, you must specify the algorithmic method (AM) to be used by supplying a chooser. If the cryptographic function requires a key, you supply key information to the BSAFE application with a key information (KI) type. For the most current information on the BSAFE user interface and a complete description of algorithm information types, algorithm methods, choosers, and key information types, refer to BSAFE User’s Manual and BSAFE Library Reference Manual.

Computing Message Digests and Hashes

MD5 and SHA1 hashing are both available from ICSF via BSAFE. If your BSAFE application uses the AM_MD5 or the AM_SHA algorithm methods, you can add a couple of BSAFE function calls and the application will use ICSF and the Cryptographic Coprocessor Feature instead of the BSAFE algorithm method.

The following list shows BSAFE AI types with choosers that may include AM_MD5:
- AI_MD5
- AI_MD5_BER
- AI_MD5WithDES_CBCPad
- AI_MD5WithDES_CBCPadBER
- AI_MD5WithRC2_CBCPad
- AI_MD5WithRC2_CBCPadBER
- AI_MD5WithRSAEncryption
- AI_MD5WithRSAEncryptionBER
- AI_MD5WithXOR
- AI_MD5WithXOR_BER

The following list shows BSAFE AI types with choosers that may include AM_SHA:
- AI_SHA1
- AI_SHA1_BER
- AI_SHA1WithDES_CBCPad
- AI_SHA1WithDES_CBCPadBER

Generating Random Numbers

If your BSAFE application uses the algorithm method AM_MD5RANDOM, you can add a chooser definition containing the algorithm method AM_HWRANDOM (new
with BSAFE 3.1) and a couple of BSAFE function calls and your program can use ICSF and the Cryptographic Coprocessor Feature to generate random numbers instead of the BSAFE algorithm method.

BSAFE 3.1 provides a new algorithm information type, AI_HWRandom. You need to set your random number generation object with AI_HWRandom, and initialize the object with a chooser containing AM_HW_RANDOM, in order to use ICSF with the Cryptographic Coprocessor Feature for generating random numbers. You do not, however, have to make a B_RandomUpdate call, since the S/390 and IBM @server zSeries cryptographic solution does not require a seed.

The only AI type with choosers that may include AM_HW_RANDOM is AI_HWRandom.

**Encrypting and Decrypting with DES**

If your BSAFE application uses either the AM_DES_CBC_ENCRYPT or the AM_DES_CBC_DECRYPT algorithm methods, you can add a chooser containing the algorithm methods AM_TOKEN_DES_CBC_ENCRYPT and/or AM_TOKEN_DES_CBC_DECRYPT (both new with BSAFE 3.1) and a couple of BSAFE function calls and your program can use ICSF and the Cryptographic Coprocessor Feature to encrypt and/or decrypt data using the DES algorithm.

For your encryption or decryption key, you can use either a clear key in the form of a KI_8Byte or KI_DES8 or KI_Item (8 bytes long), or a CCA DES Key Token in the form of a KI_TOKEN (64 bytes long). KI_TOKEN is a new key information type in BSAFE 3.1.

The following list shows BSAFE AI types with choosers that may include either AM_TOKEN_DES_CBC_ENCRYPT, AM_TOKEN_DES_CBC_DECRYPT, or both:

- AI_DES_CBC_BSAFE1
- AI_DES_CBC_IV8
- AI_DES_CBCPadBER
- AI_DES_CBCPadIV8
- AI_DES_CBCPadPEM
- AI_MD5WithDES_CBCPad
- AI_MD5WithDES_CBCPadBER
- AI_SHA1WithDES_CBCPad
- AI_SHA1WithDES_CBCPadBER

**Generating and Verifying RSA Digital Signatures**

You can use algorithm method AM_TOKEN_RSA_PRV_ENCRYPT with AM_MD5 or AM_SHA to have ICSF and the Cryptographic Coprocessor Feature generate RSA digital signatures. To verify the RSA digital signature using the S/390 or IBM @server zSeries cryptographic solution, you can use AM_TOKEN_RSA_PUB_DECRYPT (with AM_MD5 or AM_SHA). Your BSAFE application must contain a couple of new BSAFE function calls to access the S/390 and IBM @server zSeries services. AM_TOKEN_RSA_PRV_ENCRYPT and AM_TOKEN_RSA_PUB_DECRYPT are new in BSAFE 3.1. For more information, see “Using the New Function Calls in Your BSAFE Application” on page 857.

For signature generation, you can use either a clear private key in the form of a KI_PKCS_RSAPrivate or a CCA RSA private key token in the form of a KI_TOKEN. For signature verification, you can use either a public RSA key in the form of a KI_RSAPublic or a CCA RSA public key token in the form of a KI_TOKEN.
KI_TOKEN is a new key information type in BSAFE. For more information about KI_TOKEN, see "Using the BSAFE KI_TOKEN" on page 859.

The following list shows BSAFE AI types with choosers that may include AM_TOKEN_RSA_PRV_ENCRYPT:
- AI_MD5WithRSAEncryption
- AI_MD5WithRSAEncryptionBER
- AI_SHA1WithRSAEncryption
- AI_SHA1WithRSAEncryptionBER

The following list shows BSAFE AI types with choosers that may include AM_TOKEN_RSA_PUB_DECRYPT:
- AI_MD5WithRSAEncryption
- AI_SHA1WithRSAEncryption

Encrypting and Decrypting with RSA

You can use algorithm method AM_TOKEN_RSA_ENCRYPT to have ICSF encrypt a symmetric key (or other string of 48 bytes or fewer). To decrypt the string using ICSF, you can use AM_TOKEN_RSA_CRT_DECRYPT. You'll need a couple of new BSAFE function calls to access the S/390 and IBM @server zSeries services (see "Using the New Function Calls in Your BSAFE Application.")

To encrypt a string, you can use either a public key in the form KI_RSAPublic or a CCA RSA public key token in the form of a KI_TOKEN.

To decrypt a string, you can use either a private key in the form KI_PKCS_RSAPrivate or a CCA RSA private key token in the form of a KI_TOKEN.

Using the New Function Calls in Your BSAFE Application

To have your BSAFE application access the ICSF, S/390, and IBM @server zSeries Cryptographic Coprocessor Feature services, you need to add several new elements to your program. These elements are explained with examples in the steps that follow.

1. At the beginning of your program, declare one or more session choosers and also the hardware table list. For information about choosers and the hardware table list, see BSAFE User's Manual.

   /*-------------------------------------------------------------*
   * SESSION_CHOOSER will replace OLD_CHOOSER.                    *
   * B_ALGORITHM_METHOD **SESSION_CHOOSER = NULL_PTR;              *
   *-------------------------------------------------------------*/

   /*-------------------------------------------------------------*
   * CCA_VTABLE is a vector table of functions that will be        *
   * substituted for BSAFE equivalents. It is supplied by IBM      *
   * and will be loaded into your application when you invoke      *
   * QueryCrypto.                                                  *
   *-------------------------------------------------------------*/

   HW_TABLE_LIST CCA_VTABLE = (HW_TABLE_LIST)NULL_PTR;

2. Declare a tag list. The content of the tag list is supplied by BSAFE at the B_CreateSessionChooser call, which is discussed in a later step.

   unsigned char **taglist = (unsigned char **)NULL_PTR;

3. For random number generation, DES encryption or decryption or RSA encryption or decryption, you need to define and declare an additional chooser
wherever your current chooser is defined and declared. For instance, suppose your application is doing an RSA encryption, and OLD_CHOOSER is defined as follows:

```c
/*--------------------------------------------------------------*
* OLD_CHOOSER is used for this application when ICSF and     *
* the crypto hardware is not available.                      *
*--------------------------------------------------------------*/
B_ALGORITHM_METHOD *OLD_CHOOSER[] = {
  &AM_SHA,
  &AM_RSA_ENCRYPT,
  (B_ALGORITHM_METHOD *)NULL_PTR
};

/*--------------------------------------------------------------*
* ICSF_CHOOSER is a 'skeleton' for SESSION_CHOOSER.          *
* SESSION_CHOOSER will be used for this application if       *
* ICSF and the crypto hardware are not available.           *
*--------------------------------------------------------------*/
B_ALGORITHM_METHOD *ICSF_CHOOSER[] = {
  &AM_SHA,
  &AM_TOKEN_RSA_PUB_ENCRYPT,
  (B_ALGORITHM_METHOD *)NULL_PTR
};

4. At the beginning of the main function in your application, add a call to the ICSF QueryCrypto function followed by a conditional call to the BSAFE B_CreateSessionChooser function.

```c
/*---------------------------------------------*
* Check for the existence of crypto hardware. If it's there, *
* QueryCrypto will supply CCA_VTABLE            *
*---------------------------------------------*/
if ((status = QueryCrypto(CRYPTO_Q_DES_AND_RSA,&CCA_VTABLE)) == 0)
  /*---------------------------------------------*
* B_CreateSessionChooser will replace the       *
* BSAFE software functions with their CCA      *
* hardware equivalents.                       *
* *                                               *
* Note that the last three parameters are not *
* used with CCA                                 *
*---------------------------------------------*/
  if ((status = B_CreateSessionChooser(ICSF_CHOOSER,
    &SESSION_CHOOSER,
    CCA_VTABLE,
    (ITEM *)NULL_PTR,
    (POINTER *)NULL_PTR,
    &taglist)) != 0)
    break;

5. Set up the conditions under which any alternate choosers are used to initialize the appropriate algorithm object. For information about initializing algorithm objects, see BSAFE User's Manual.

```c
/**************************************************************************/
* Initialize the algorithm object with the appropriate           *
* chooser.                                    *
**************************************************************************/
if (SESSION_CHOOSER != NULL_PTR)
  if ((status = B_xxxxxxxInit
      (xxxxxxxObject,SESSION_CHOOSER,
       (A_SURRENDER_CTX *)NULL_PTR)
     != 0)
    break;
  else ;
else
  if ((status = B_xxxxxxxInit
```
6. When your application no longer needs the session chooser, program a call to the BSAFE B_FreeSessionChooser function.

```c
if (SESSION_CHOOSER != NULL_PTR)
    B_FreeSessionChooser(&SESSION_CHOOSER,&taglist);
```

---

**Using the BSAFE KI_TOKEN**

Those ICSF functions that require a key, like encipher and decipher, expect the key in the form of a CCA token. If you already have a CCA token, perform the following steps before you try to set your algorithm object. For information about how to perform the following tasks, see *BSAFE User's Manual* and *BSAFE Library Reference Manual*.

1. Create a key object.
2. Declare a KEY_TOKEN_INFO and fill it in.
   - **KEY_TOKEN_INFO** is defined as follows in the *BSAFE User's Manual*:
     ```c
typedef struct {  
    ITEM manufacturerID;  
    ITEM internalKeyInfo;  
} KEY_TOKEN_INFO;
```
   - The first ITEM is the address and length of one of the following three strings, depending on the CCA key token type you are using:
     - com.ibm.CCADES
     - com.ibm.CCARSAPublic
     - com.ibm.CCARSAPrivate
   - The second ITEM is the address and length of your CCA key token.
3. Set the key information (B_SetKeyInfo) into the key object using the item and a key information type of KI_TOKEN as input.

If you don't already have a CCA token, you can supply a clear key to the function using one of the key information types mentioned in the section discussing the function you are using. BSAFE will convert the key to a CCA token. If you supply a clear BSAFE KI type to one of the ICSF functions, and the function is performed successfully, you can retrieve the key as a CCA token by invoking B_GetKeyInfo with KI_TOKEN as the key information type. A KEY_TOKEN_INFO struct is returned.

---

**ICSF Triple DES via BSAFE**

ICSF performs single, double, or triple DES depending on the length of the DES key; if you're using BSAFE to access ICSF triple DES, you should use the algorithm methods AM_TOKEN_DES_CBC_ENCRYPT and AM_TOKEN_DES_CBC_DECRYPT.

If you've already have an ICSF token, follow the instructions in the section titled "Using the BSAFE KI_TOKEN."

If you're using a clear key, follow the same procedure, except use your clear key padded on the right with binary zeroes to a length of 64 as the internalKeyInfo part of your KI_TOKEN_INFO. ICSF will convert your clear key to an internal ICSF key token.
Here's an example:

```c
B_KEY_OBJ desKey = {B_KEY_OBJ}NULL_PTR;
KEY_TOKEN_INFO myTokenInfo;
unsigned char myToken[64] = {0};
unsigned char * myTokenP;
unsigned char myDoubleKey[16]; /* Input to this function */
unsigned char mfgID[] = "com.ibm.CCADES";
unsigned char * mfgIDP;

myTokenP = myToken;
mfgIDP = mfgID;
T_memcpy(myToken,myDoubleKey,sizeof(myDoubleKey));
myTokenInfo.manufacturerID.len = strlen(mfgID);
myTokenInfo.manufacturerID.data = mfgIDP;
myTokenInfo.internalKeyInfo.len = sizeof(myToken);
myTokenInfo.internalKeyInfo.data = myTokenP;

/* Create a key object. */
if ((status = B_CreateKeyObject (&desKey)) != 0)
    break;

/* Set the key object. */
if ((status = B_SetKeyInfo
    (desKey, KI_TOKEN, myTokenInfo )) != 0)
    break;
```

---

Retrieving ICSF Error Information

When using the ICSF and Cryptographic Coprocessor Feature, Init, Update, and Final calls can result in BSAFE returning a status of BE_HARDWARE (0x020B). When this occurs, you can derive the ICSF return and reason codes by using a new BSAFE operation, B_GetExtendedErrorInfo. For an explanation of the return codes and reason codes, see Appendix A, "ICSF and TSS Return and Reason Codes," on page 725.

A coding example follows.

```c
#include "balg.h"
#include "algobj.h"
#include "cca.h"

{
    
    B_ALGORITHM_OBJECT * aop;
    ITEM * errp;
    unsigned char * algorithmMethod;
    CCA_ERROR_DATA * edp;
    unsigned int CCAreturnCode=0;
    unsigned int CCAreasonCode=0;
    unsigned char algorithmName[40]={0x00};
    
    if (status==BE_HARDWARE) {
        B_GetExtendedErrorInfo(aop,errp,algorithmMethod);
    }
```
edp = errp->data;
CCAreturnCode = (unsigned int) edp->returnCode;
CCAreasonCode = (unsigned int) edp->reasonCode;
}
.
.
}

The prototype for B_GetExtendedErrorInfo is in balg.h, as shown in the example that follows.

B_GetExtendedErrorInfo (  
B_ALGORITHM_OBJ algorithmObject,  /* in--algorithm object */
ITEM * errorData,  /* out--address and length of error data */
POINTER algorithmMethod  /* out--address of faulting AM */
);

Appendix E. Using ICSF with BSAFE
Appendix F. Cryptographic Algorithms and Processes

This appendix describes the personal identification number (PIN) formats and algorithms.

PIN Formats and Algorithms

For PIN calculation procedures, see IBM Common Cryptographic Architecture: Cryptographic Application Programming Interface Reference.

PIN Notation

This section describes various PIN block formats. The following notations describe the contents of PIN blocks:

- **P** = A 4-bit decimal digit that is one digit of the PIN value.
- **C** = A 4-bit hexadecimal control value. The valid values are X'0', X'1', and X'2'.
- **L** = A 4-bit hexadecimal value that specifies the number of PIN digits. The value ranges from 4 to 12, inclusive.
- **F** = A 4-bit field delimiter of value X'F'.
- **f** = A 4-bit delimiter filler that is either P or F, depending on the length of the PIN.
- **D** = A 4-bit decimal padding value. All pad digits in the PIN block have the same value.
- **X** = A 4-bit hexadecimal padding value. All pad digits in the PIN block have the same value.
- **x** = A 4-bit hexadecimal filler that is either P or X, depending on the length of the PIN.
- **R** = A 4-bit hexadecimal random digit. The sequence of R digits can each take a different value.
- **r** = A 4-bit random filler that is either P or R, depending on the length of the PIN.
- **Z** = A 4-bit hexadecimal zero (X'0').
- **z** = A 4-bit zero filler that is either P or Z, depending on the length of the PIN.
- **S** = A 4-bit hexadecimal digit that constitutes one digit of a sequence number.
- **A** = A 4-bit decimal digit that constitutes one digit of a user-specified constant.

PIN Block Formats

This section describes the PIN block formats and assigns a code to each format.

**ANSI X9.8**
This format is also named ISO format 0, VISA format 1, VISA format 4, and ECI format 1.

P1 = CLPPPPffffffffFF
P2 = ZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZ

© Copyright IBM Corp. 1997, 2011
PIN Block = P1 XOR P2

where C = X'0'
   L = X'4' to X'C'

Programming Note: The rightmost 12 digits (excluding the check digit) in P2 are the rightmost 12 digits of the account number for all formats except VISA format 4. For VISA format 4, the rightmost 12 digits (excluding the check digit) in P2 are the leftmost 12 digits of the account number.

ISO Format 1
This format is also named ECI format 4.
   PIN Block = CLPPPPrrrrrrrrRR

where C = X'1'
   L = X'4' to X'C'

ISO Format 2
   PIN Block = CLPPPPffffffffFF

where C = X'2'
   L = X'4' to X'C'

VISA Format 2
   PIN Block = LPPPPzzDDDDDDDDDD

where L = X'4' to X'6'

VISA Format 3
This format specifies that the PIN length can be 4-12 digits, inclusive. The PIN starts from the leftmost digit and ends by the delimiter ('F'), and the remaining digits are padding digits.

An example of a 6-digit PIN:
   PIN Block = PPPPPPFXXXXXXXXX

IBM 4700 Encrypting PINPAD Format
This format uses the value X'F' as the delimiter for the PIN.
   PIN Block = LPPPPffffffFSS

where L = X'4' to X'C'

IBM 3624 Format
This format requires the program to specify the delimiter, X, for determining the PIN length.
   PIN Block = PPPPxxxxxxxxXXXX

IBM 3621 Format
This format requires the program to specify the delimiter, X, for determining the PIN length.
   PIN Block = SSSSPPPxxxxxxxx

ECI Format 2
This format defines the PIN to be 4 digits.
   PIN Block = PPPPPRRRRRRRRRRR
ECI Format 3

PIN Block = LPPPPzzRRRRRRRRR

where L = X'4' to X'6'

PIN Extraction Rules
This section describes the PIN extraction rules for the Encrypted PIN verify and
Encrypted PIN translate callable services.

Encrypted PIN Verify Callable Service
The service extracts the customer-entered PIN from the input PIN block according
to the following rules:

- If the input PIN block format is ANSI X9.8, ISO format 0, VISA format 1, VISA
  format 4, ECI format 1, ISO format 1, ISO format 2, VISA format 2, IBM
  Encrypting PINPAD format, or ECI format 3, the service extracts the PIN
  according to the length specified in the PIN block.
- If the input PIN block format is VISA format 3, the specified delimiter (padding)
  determines the PIN length. The search starts at the leftmost digit in the PIN
  block. If the input PIN block format is 3624, the specification of a PIN extraction
  method for the 3624 is supported through rule array keywords. If no PIN
  extraction method is specified in the rule array, the specified delimiter (padding)
  determines the PIN length.
- If the input PIN block format is 3621, the specification of a PIN extraction
  method for the 3621 is supported through rule array keywords. If no PIN
  extraction method is specified in the rule array, the specified delimiter (padding)
  determines the PIN length.
- If the input PIN block format is ECI format 2, the PIN is the leftmost 4 digits.

For the VISA algorithm, if the extracted PIN length is less than 4, the services sets
a reason code that indicates that verification failed. If the length is greater than or
equal to 4, the service uses the leftmost 4 digits as the referenced PIN.

For the IBM German Banking Pool algorithm, if the extracted PIN length is not 4,
the service sets a reason code that indicates that verification failed.

For the IBM 3624 algorithm, if the extracted PIN length is less than the PIN check
length, the service sets a reason code that indicates that verification failed.

Clear PIN Generate Alternate Callable Service
The service extracts the customer-entered PIN from the input PIN block according
to the following rules:

- This service supports the specification of a PIN extraction method for the 3624
  and 3621 PIN block formats through the use of the rule_array keyword.
  *Rule_array* points to an array of one or two 8-byte elements. The first element in
  the rule array specifies the PIN calculation method. The second element in the
  rule array (if specified) indicates the PIN extraction method. Refer to the "Clear
  PIN Generate Alternate (CSNBCPA and CSNECPA)" on page 442 for an
  explanation of PIN extraction method keywords.

Encrypted PIN Translate Callable Service
The service extracts the customer-entered PIN from the input PIN block according
to the following rules:

- If the input PIN block format is ANSI X9.8, ISO format 0, VISA format 1, VISA
  format 4, ECI format 1, ISO format 1, ISO format 2, VISA format 2, IBM
Encrypting PINPAD format, or ECI format 3, and if the specified PIN length is less than 4, the service sets a reason code to reject the operation. If the specified PIN length is greater than 12, the operation proceeds to normal completion with unpredictable contents in the output PIN block. Otherwise, the service extracts the PIN according to the specified length.

- If the input PIN block format is VISA format 3, the specified delimiter (padding) determines the PIN length. The search starts at the leftmost digit in the PIN block. If the input PIN block format is 3624, the specification of a PIN extraction method for the 3624 is supported through rule array keywords. If no PIN extraction method is specified in the rule array, the specified delimiter (padding) determines the PIN length.

- If the input PIN block format is 3621, the specification of a PIN extraction method for the 3621 is supported through rule array keywords. If no PIN extraction method is specified in the rule array, the specified delimiter (padding) determines the PIN length.

- If the input block format is ECI format 2, the PIN is always the leftmost 4 digits.

If the maximum PIN length allowed by the output PIN block is shorter than the extracted PIN, only the leftmost digits of the extracted PIN that form the allowable maximum length are placed in the output PIN block. The PIN length field in the output PIN block, if it exists, specifies the allowable maximum length.

**PIN Change/Unblock Callable Service**

The PIN Block calculation PIN Change/Unblock:

1. Form three 8-byte, 16-digit blocks, -1, -2, and -3, and set all digits to X’0’
2. Replace the rightmost four bytes of block-1 with the authentication code described in the previous section.
3. Set the second digit of block-2 to the length of the new PIN (4 to 12), followed by the new PIN, and padded to the right with X’F’
4. Include any current PIN by placing it into the leftmost digits of block-3.
5. Exclusive-OR blocks -1, -2, and -3 to form the 8-byte PIN block.
6. Pad the PIN block with other portions of the message for the smart card:
   - Prepend X’08’
   - Append X’80’
   - Append an additional six bytes of X’00’

The resulting message is ECB-mode triple-encrypted with an appropriate session key.

**IBM PIN Algorithms**

This section describes the IBM PIN generation algorithms, IBM PIN offset generation algorithm, and IBM PIN verification algorithms.

**3624 PIN Generation Algorithm**

This algorithm generates a n-digit PIN based on an account-related data or person-related data, namely the validation data. The assigned PIN length parameter specifies the length of the generated PIN.

The algorithm requires the following input parameters:
- A 64-bit validation data
- A 64-bit decimalization table
- A 4-bit assigned PIN length
A 128-bit PIN-generation key

The service uses the PIN generation key to encipher the validation data. Each digit of the enciphered validation data is replaced by the digit in the decimalization table whose displacement from the leftmost digit of the table is the same as the value of the digit of the enciphered validation data. The result is an intermediate PIN. The leftmost n digits of the intermediate PIN are the generated PIN, where n is specified by the assigned PIN length.

Figure 14 illustrates the 3624 PIN generation algorithm.

German Banking Pool PIN Generation Algorithm

This algorithm generates a 4-digit PIN based on an account-related data or person-related data, namely the validation data.

The algorithm requires the following input parameters:

- A 64-bit validation data
- A 64-bit decimalization table
- A 128-bit PIN-generation key

The validation data is enciphered using the PIN generation key. Each digit of the enciphered validation data is replaced by the digit in the decimalization table whose displacement from the leftmost digit of the table is the same as the value of the digit of enciphered validation data. The result is an intermediate PIN. The rightmost 4 digits of the leftmost 6 digits of the intermediate PIN are extracted. The leftmost digit of the extracted 4 digits is checked for zero. If the digit is zero, the digit is changed to one; otherwise, the digit remains unchanged. The resulting four digits is the generated PIN.
Figure 15 illustrates the German Banking Pool (GBP) PIN generation algorithm.

PIN Offset Generation Algorithm

To allow the customer to select his own PIN, a PIN offset is used by the IBM 3624 and GBP PIN generation algorithms to relate the customer-selected PIN to the generated PIN.

The PIN offset generation algorithm requires two parameters in addition to those used in the 3624 PIN generation algorithm. They are a customer-selected PIN and a 4-bit PIN check length. The length of the customer-selected PIN is equal to the assigned-PIN length, n.

The 3624 PIN generation algorithm described in the previous section is performed. The offset data value is the result of subtracting (modulo 10) the leftmost n digits of the intermediate PIN from the customer-selected PIN. The modulo 10 subtraction ignores borrows. The rightmost m digits of the offset data form the PIN offset, where m is specified by the PIN check length. Note that n cannot be less than m. To generate a PIN offset for a GBP PIN, m is set to 4 and n is set to 6.

Figure 15. GBP PIN Generation Algorithm

PIN Offset Generation Algorithm

To allow the customer to select his own PIN, a PIN offset is used by the IBM 3624 and GBP PIN generation algorithms to relate the customer-selected PIN to the generated PIN.

The PIN offset generation algorithm requires two parameters in addition to those used in the 3624 PIN generation algorithm. They are a customer-selected PIN and a 4-bit PIN check length. The length of the customer-selected PIN is equal to the assigned-PIN length, n.

The 3624 PIN generation algorithm described in the previous section is performed. The offset data value is the result of subtracting (modulo 10) the leftmost n digits of the intermediate PIN from the customer-selected PIN. The modulo 10 subtraction ignores borrows. The rightmost m digits of the offset data form the PIN offset, where m is specified by the PIN check length. Note that n cannot be less than m. To generate a PIN offset for a GBP PIN, m is set to 4 and n is set to 6.

Figure 16 illustrates the PIN offset generation algorithm.
3624 PIN Verification Algorithm

This algorithm generates an intermediate PIN based on the specified validation data. A part of the intermediate PIN is adjusted by adding an offset data. A part of the result is compared with the corresponding part of the customer-entered PIN.

The algorithm requires the following input parameters:
- A 64-bit validation data
- A 64-bit decimalization table
- A 128-bit PIN-verification key
- A 4-bit PIN check length

Figure 16. PIN-Offset Generation Algorithm
• An offset data
• A customer-entered PIN

The rightmost m digits of the offset data form the PIN offset, where m is the PIN check length.

1. The validation data is enciphered using the PIN verification key. Each digit of the enciphered validation data is replaced by the digit in the decimalization table whose displacement from the leftmost digit of the table is the same as the value of the digit of enciphered validation data.

2. The leftmost n digits of the result is added (modulo 10) to the offset data value, where n is the length of the customer-entered PIN. The modulo 10 addition ignores carries.

3. The rightmost m digits of the result of the addition operation form the PIN check number. The PIN check number is compared with the rightmost m digits of the customer-entered PIN. If they match, PIN verification is successful; otherwise, verification is unsuccessful.

When a nonzero PIN offset is used, the length of the customer-entered PIN is equal to the assigned PIN length.

Figure 17 illustrates the PIN verification algorithm.
German Banking Pool PIN Verification Algorithm

This algorithm generates an intermediate PIN based on the specified validation data. A part of the intermediate PIN is adjusted by adding an offset data. A part of the result is extracted. The extracted value may or may not be modified before it compares with the customer-entered PIN.

The algorithm requires the following input parameters:

- Length of CE PIN
- PIN Check Length
- PIN CN: PIN Check Number
- CE PIN: Customer-entered PIN

Figure 17. PIN Verification Algorithm
A 64-bit validation data
A 64-bit decimalization table
A 128-bit PIN verification key
An offset data
A customer-entered PIN

The rightmost 4 digits of the offset data form the PIN offset.

1. The validation data is enciphered using the PIN verification key. Each digit of the enciphered validation data is replaced by the digit in the decimalization table whose displacement from the leftmost digit of the table is the same as the value of the digit of enciphered validation data.

2. The leftmost 6 digits of the result is added (modulo 10) to the offset data. The modulo 10 addition ignores carries.

3. The rightmost 4 digits of the result of the addition (modulo 10) are extracted.

4. The leftmost digit of the extracted value is checked for zero. If the digit is zero, the digit is set to one; otherwise, the digit remains unchanged. The resulting four digits are compared with the customer-entered PIN. If they match, PIN verification is successful; otherwise, verification is unsuccessful.

Figure 18 illustrates the GBP PIN verification algorithm.

Figure 18. GBP PIN Verification Algorithm

VISA PIN Algorithms

The VISA PIN verification algorithm performs a multiple encipherment of a value, called the transformed security parameter (TSP), and a extraction of a 4-digit PIN verification value (PVV) from the ciphertext. The calculated PVV is compared with the referenced PVV and stored on the plastic card or data base. If they match, verification is successful.

PVV Generation Algorithm

The algorithm generates a 4-digit PIN verification value (PVV) based on the transformed security parameter (TSP).

The algorithm requires the following input parameters:
- A 64-bit TSP
- A 128-bit PVV generation key
1. A multiple encipherment of the TSP using the double-length PVV generation key is performed.

2. The ciphertext is scanned from left to right. Decimal digits are selected during the scan until four decimal digits are found. Each selected digit is placed from left to right according to the order of selection. If four decimal digits are found, those digits are the PVV.

3. If, at the end of the first scan, less than four decimal digits have been selected, a second scan is performed from left to right. During the second scan, all decimal digits are skipped and only nondecimal digits can be processed. Nondecimal digits are converted to decimal digits by subtracting 10. The process proceeds until four digits of PVV are found.

Figure 19 illustrates the PVV generation algorithm.

**Programming Note:** For VISA PVV algorithms, the leftmost 11 digits of the TSP are the personal account number (PAN), the leftmost 12th digit is a key table index to select the PVV generation key, and the rightmost 4 digits are the PIN. The key table index should have a value between 1 and 6, inclusive.

**PVV Verification Algorithm**
The algorithm requires the following input parameters:
- A 64-bit TSP
A 16-bit referenced PVV
A 128-bit PVV verification key

A PVV is generated using the PVV generation algorithm, except a PVV verification key rather than a PVV generation key is used. The generated PVV is compared with the referenced PVV. If they match, verification is successful.

**Interbank PIN Generation Algorithm**

The Interbank PIN calculation method consists of the following steps:

1. Let \( X \) denote the transaction_security parameter element converted to an array of 16 4-bit numeric values. This parameter consists of (in the following sequence) the 11 rightmost digits of the customer PAN (excluding the check digit), a constant of 6, a 1-digit key indicator, and a 3-digit validation field.

2. Encrypt \( X \) with the double-length PINGEN (or PINVER) key to get 16 hexadecimal digits (64 bits).

3. Perform decimalization on the result of the previous step by scanning the 16 hexadecimal digits from left to right, skipping any digit greater than \( X'9' \) until 4 decimal digits (for example, digits that have values from \( X'0' \) to \( X'9' \)) are found.

   If all digits are scanned but 4 decimal digits are not found, repeat the scanning process, skipping all digits that are \( X'9' \) or less and selecting the digits that are greater than \( X'9' \). Subtract 10 (\( X'A' \)) from each digit selected in this scan.

   If the 4 digits that were found are all zeros, replace the 4 digits with 0100.

4. Concatenate and use the resulting digits for the Interbank PIN. The 4-digit PIN consists of the decimal digits in the sequence in which they are found.

**Cipher Processing Rules**

DES defines operations on 8-byte data strings. Although the fundamental concepts of ciphering (enciphering and deciphering) and data verification are simple, there are different approaches to processing data strings that are not a multiple of 8 bytes in length. These approaches are defined in various standards and IBM products.

**CBC and ANSI X3.106**

ANSI standard X3.106 defines four methods of operation for ciphering. One of these modes, cipher block chaining (CBC), defines the basic method for performing ciphering on multiple blocks. A plaintext data string, which must be a multiple of the block size, is processed as a series of blocks. The ciphered result from processing a block is exclusive ORed with the next block. The last block of the ciphered result is defined as an output chaining vector (OCV). ICSF stores the output chaining vector value in the \textit{chaining\_vector} parameter.

An initial chaining vector is exclusive ORed with the first group of 8 input bytes.

In summary:

- An input chaining vector (ICV) is required.
- If the \textit{text\_length} is not an exact multiple of 8 bytes, the request fails.
- The plaintext is not padded, for example, the output text length is not increased.

ICSF provides an enhancement to CBC mode called ciphertext-stealing. This allows for a text length that is not a multiple of the block size. This is accomplished by manipulating the last two blocks in a certain way. The second to last block is encrypted in the normal manner, but then some of the bits are "stolen" and added to the last (partial) block. These bits can be recovered by decrypting the last block.
This enhancement is currently proposed to NIST as *Proposal To Extend CBC Mode By “Ciphertext Stealing”*, dated May 6, 2007.

**ANSI X9.23 and IBM 4700**

An enhancement to the basic cipher block chaining mode of ANSI X3.106 is defined so the data lengths that are not an exact multiple of 8 bytes can be processed. The ANSI X9.23 method *always* adds from 1 byte to 8 bytes to the plaintext before encipherment. The last added byte is the count of the added bytes and is in the range of X'01' to X'08'. The standard defines that the other added bytes, the pad characters, are random.

When ICSF enciphers the plaintext, the resulting ciphertext is always 1 to 8 bytes longer than the plaintext.

When ICSF deciphers the ciphertext, ICSF uses the last byte of the deciphered data as the number of bytes to be removed (the pad bytes and the count byte). The resulting plaintext is the same as the original plaintext.

The output chaining vector can be used as feedback with this method in the same way as with the X3.106 method.

In summary, for the ANSI X9.23 method:
- X9.23 processing requires the caller to supply an ICV.
- X9.23 encipher does not allow specification of a pad character.

The 4700 padding rule is similar to the X9.23 rule. The only difference is that in the X9.23 method, the padding character is not user-selected, but the padding string is selected by the encipher process.

**Segmenting**

The callable services can operate on large data objects. *Segmenting* is the process of dividing the function into more than one processing step. Your application can divide the process into multiple steps without changing the final outcome.

To provide segmenting capability, the MAC generation, MAC verification, and MDC generation callable services require an 18-byte system work area in the application address space that is provided as the chaining vector parameter to the callable service. The application program must not change the system work area.

**Cipher Last-Block Rules**

The DES defines cipher-block chaining as operating on multiples of 8 bytes, and AES uses multiples of 16 bytes. Various algorithms are used to process strings that are multiples of the block size. The algorithms are generically named “last-block rules”. You select the supported last-block rules by using these keywords:
- X9.23
- IPS
- CUSP (also used with PCF)
- 4700-PAD
- CBC-CS

You specify which cipher last-block rule you want to use in the `rule_array` parameter of the callable service.
If the length of the data to be enciphered is an exact multiple of 8 bytes, the ICV is exclusive ORed with the first 8-byte block of plaintext, and the resulting 8 bytes are passed to the DES with the specified key. The resulting 8-byte block of ciphertext is then exclusive ORed with the second 8-byte block of plaintext, and the value is enciphered. This process continues until the last 8-byte block of plaintext is to be enciphered. Because the length of this last block is exactly 8 bytes, the last block is processed in an identical manner to all the preceding blocks.

To produce the OCV, the last block of ciphertext is enciphered again (thus producing a double-enciphered block). The user can pass this value of the OCV as the ICV in his next encipher call to produce chaining between successive calls. The caller can alternatively pass the same ICV on every call to the callable service.

If the length of data to be enciphered is greater than 7 bytes, and is not an exact multiple of 8 bytes, the process is the same as that above, until the last partial block of 1 to 7 bytes is reached. To encipher the last short block, the previous 8-byte block of ciphertext is passed to the DES with the specified key. The first 1 to 7 bytes of this double-enciphered block has two uses. The first use is to exclusive OR this block with the last short block of plaintext to form the last short block of the ciphertext. The second use is to pass it back as the OCV. Thus, the OCV is the last complete 8-byte block of plaintext, doubly enciphered.

If the length of the data to be enciphered is less than 8 bytes, the ICV is enciphered under the specified key. The first 1 to 7 bytes of the enciphered ICV is exclusive ORed with the plaintext to form the ciphertext. The OCV is the enciphered ICV.

The Information Protection System (IPS)

The Information Protection System (IPS) offers two forms of chaining: block and record. Under record chaining, the OCV for each enciphered data string becomes the ICV for the next. Under block chaining, the same ICV is used for each encipherment.

Files that are enciphered directly with the ICSF encipher callable service cannot be properly deciphered using the IPS/CMS CIPHER command or the IPS/CMS subroutines. Both IPS/CMS CIPHER and AMS REPRO ENCIPHER write headers to their files that contain information (principally the ICV and chaining method) needed for decipherment. The encipher callable service does not generate these headers. Specialized techniques are described in IPS/CMS documentation to overcome some, if not all, of these limitations, depending on the chaining mode. As a rough test, you can attempt a decipherment with the CIPHER command HDWARN option, which causes CIPHER to continue processing even though the header is absent.

The encipher callable service returns an OCV used by IPS for record chaining. This allows cryptographic applications using ICSF to be compatible with IPS record chaining.

Record chaining provides a superior method of handling successive short blocks, and has better error recovery features when the caller passes successive short blocks.

The principle used by record chaining is that the OCV is the last 8 bytes of ciphertext. This is handled as follows:

- If the length of the data to be enciphered is an exact multiple of 8 bytes, the ICV is exclusive ORed with the first 8 byte block of plaintext, and the resulting 8 bytes
are passed to the DES with the specified key. The resulting 8-byte block of ciphertext is then exclusive ORed with the second 8-byte block of plaintext, and the resulting value is enciphered. This process continues until the last 8-byte block of plaintext is to be enciphered. Because the length of this last block is exactly 8 bytes, the last block is processed in an identical manner to all the preceding blocks.

The OCV is the last 8 bytes of ciphertext.

The user can pass this value as the ICV in the next encipher call to produce chaining between successive calls.

- If the length of data to be enciphered is greater than 7 bytes, and is not an exact multiple of 8 bytes, the process is the same as that above, until the last partial block of 1 to 7 bytes is reached. To encipher the last short block, the previous 8-byte block of ciphertext is passed to the DES with the specified key. The first 1 to 7 bytes of this doubly enciphered block is then exclusive ORed with the last short block of plaintext to form the last short block of the ciphertext. The OCV is the last 8 bytes of ciphertext.

- If the length of the data to be enciphered is less than 8 bytes, then the ICV is enciphered under the specified key. The first 1 to 7 bytes of the enciphered ICV is exclusive ORed with the plaintext to form the ciphertext. The OCV is the rightmost 8 bytes of the plaintext ICV concatenated with the short block of ciphertext. For example:

<table>
<thead>
<tr>
<th>ICV</th>
<th>ciphertext</th>
<th>OCV</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABCDEFGH</td>
<td>XYZ</td>
<td>DEFGHXYZ</td>
</tr>
</tbody>
</table>

PKCS Padding Method

This section describes the algorithm used to pad clear text when the PKCS-PAD method is specified. Padding is applied before encryption when this keyword is specified with the Symmetric Algorithm Encipher callable service, and it is removed from decrypted data when the keyword is specified with the Symmetric Algorithm Decipher callable service.

The rules for PKCS padding are very simple:

- Padding bytes are always added to the clear text before it is encrypted.
- Each padding byte has a value equal to the total number of padding bytes that are added. For example, if 6 padding bytes must be added, each of those bytes will have the value 0x06.
- The total number of padding bytes is at least one, and is the number that is required in order to bring the data length up to a multiple of the cipher algorithm block size.

The callable services described in this document use AES, which has a cipher block size of 16 bytes. The total number of padding bytes added to the clear text will always be between 1 and 16. The table below indicates exactly how many padding bytes are added according to the data length, and also shows the value of the padding bytes that are applied.

<table>
<thead>
<tr>
<th>Value of clear text length (mod 16)</th>
<th>Number of padding bytes added</th>
<th>Value of each padding byte</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>16</td>
<td>0x10</td>
</tr>
<tr>
<td>1</td>
<td>15</td>
<td>0x0F</td>
</tr>
<tr>
<td>2</td>
<td>14</td>
<td>0x0E</td>
</tr>
<tr>
<td>3</td>
<td>13</td>
<td>0x0D</td>
</tr>
</tbody>
</table>
Value of clear text length (mod 16) | Number of padding bytes added | Value of each padding byte
---|---|---
4 | 12 | 0x0C
5 | 11 | 0x0B
6 | 10 | 0x0A
7 | 9 | 0x09
8 | 8 | 0x08
9 | 7 | 0x07
10 | 6 | 0x06
11 | 5 | 0x05
12 | 4 | 0x04
13 | 3 | 0x03
14 | 2 | 0x02
15 | 1 | 0x01

Note that the PKCS standards that define this padding method describe it in a way that limits the maximum padding length to 8 bytes. This is a consequence of the fact that the algorithms at that time used 8-byte blocks. We extend the definition to apply to 16-byte AES cipher blocks.

**PKCS Padding Method (Example 1)**

Clear text consists of the following 18 bytes:

F14ADBDA019D6DB7 EFD91546E3FF8444 9BCB

In order to make this a multiple of 16 bytes (the AES block size), we must add 14 bytes. Each byte will contain the value 0xFE, which is 14, the total number of padding bytes added. The result is that the padded clear text is as follows:

F14ADBDA019D6DB7 EFD91546E3FF8444 9BCB0E0E0E0E0E0E 0E0E0E0E0E0E0E

The padded value is 32 bytes in length, which is two AES blocks. This padded string is encrypted in CBC mode, and the resulting ciphertext will also be 32 bytes in length.

**PKCS Padding Method (Example 2)**

Clear text consists of the following 16 bytes:

971ACD01C9C7ADEA CC83257926F490FF

This is already a multiple of the AES block size, but PKCS padding rules say that padding is always applied. Thus, we add 16 bytes of padding to bring the total length to 32, the next multiple of the AES block size. Each pad byte has the value 0x10, which is 16, the total number of padding bytes added. The result is that the padded clear text is as follows:

971ACD01C9C7ADEA CC83257926F490FF 0EFE0E0E0E0E0E0E 0E0E0E0E0E0E0E0E

The padded value is 32 bytes in length, which is two AES blocks. This padded string is encrypted in CBC mode, and the resulting cipher text will also be 32 bytes in length.
Wrapping Methods for Symmetric Key Tokens

This section explains how symmetric keys are wrapped with master and key-encrypting keys. For DES and AES keys, two methods are detailed. These use the 64-byte token. HMAC keys will use a variable length token with associated data and the payload wrapping method. In the future, all symmetric keys will be able to use the variable length token and the payload wrapping method.

ECB Wrapping of DES Keys (Original Method)

The wrapping of a double-length key (*K) using a double-length *KEK is defined as follows:
\[ e^{*KEK}(KL) || e^{*KEK}(KR) = e^{KEKL}(d^{KEKR}(e^{KEKL}(KL))) || e^{KEKL}(d^{KEKR}(e^{KEKL}(KR))) \]

Where:
- KL is the left 64 bits of *K.
- KR is the right 64 bits of *K.
- KEKL is the left 64 bits of *KEK.
- KEKR is the right 64 bits of *KEK.
- || means concatenation

CBC Wrapping of AES Keys

The key value in AES tokens are wrapped using the AES algorithm and cipher block chaining (CBC) mode of encryption. The key value is left justified in a 32-byte block, padded on the right with zero and encrypted.

The enhanced wrapping of an AES key (*K) using an AES *MK is defined as follows: \[ e^{MK}(*K) = ecbcMK(*K) \]

Enhanced CBC Wrapping of DES Keys (Enhanced Method)

The enhanced CBC wrapping method uses triple DES encryption, an internal chaining of the key value and CBC mode.

The enhanced wrapping of a double-length key (*K) using a double-length *KEK is defined as follows:
\[ e^{*KEK}(KL) = ecbcKEKL(dcbcKEKR(ecbcKEKL(KLPRIME || KR))) \]

Where:
- KL is the left 64 bits of *K.
- KR is the right 64 bits of *K.
- KLPRIME is the 64 bit modified value of KL
- KEKL is the left 64 bits of *KEK.
- KEKR is the right 64 bits of *KEK.
- SHA1(X) is the 160-bit SHA-1 hash of X
- || means concatenation.
- XOR means bitwise exclusive OR
- ecbbc means encryption using cipher block chaining mode
- dcbbc means decryption using cipher block chaining mode
Wrapping key derivation for enhanced wrapping of DES keys

The wrapping key is exactly the same key that is used by CCA today, with one exception. Instead of using the base key itself (master key or key-encrypting key), ICSF will use a key that is derived from that base key. The derived key will have the control vector applied to it in the standard CCA manner, and then use the resulting key to wrap the new-format target key token. The reason for using a derived key is to ensure that no attacks against this wrapping scheme are possible using the existing CCA functions. For example, it was observed that an attack was possible by copying the wrapped key into an ECB CCA key token, if the wrapping key was used instead of a derivative of that key.

The key will be derived using a method defined in the NIST standard SP 800-108, "Recommendation for Key Derivation Using Pseudorandom Functions" (October, 2009). Derivation will use the method "KDF in Counter Mode" using pseudorandom function (PRF) HMAC-SHA256. This method provides sufficient strength for deriving keys for any algorithm used.

The HMAC algorithm is defined as follows:

\[
\text{HMAC}(K, \text{text}) = H((K_0 \oplus \text{opad}) \mid\mid H((K_0 \oplus \text{ipad}) \mid\mid \text{text}))
\]

where opad is the constant 0x5C repeated to form a string the same length as K0, and ipad is the constant 0x36 repeated to form a string the same length as K0. If the key K is equal in length to the input block size of the hash function (512 bits for SHA-256), then K0 is set to the value of K. Otherwise, K0 is formed from K by hashing and/or padding.

The KDF specification calls for inputs optionally including two byte strings, Label and Context. The context will not be used. The label will contain information on the usage of this key, to distinguish it from other derivations that CCA may use in the future for different purposes. Since the security of the derivation process is rooted in the security of the derivation key and in the HMAC and KDF functions themselves, it is not necessary for this label string to be of any particular minimum size. The separation indicator byte of 0x00 specified in the NIST document will follow the label.

The label value will be defined so that it will be unique to derivation for this key wrapping process. This means that in any future designs which use the same KDF, ICSF must use a different value for the label. The label will be the 16 byte value consisting of the following ASCII characters:

```
ENHANCEDWRAP2010 (X'454E4841 4E434544 57524150 32303130')
```

The parameters for the counter mode KDF defined in SP 800-108 are as follows:

- Fixed values:
  - h (length of output of PRF) = 256 bits
  - r (length of the counter, in bits) = 32 - the counter will be an unsigned 4-byte value

- Inputs:
  - KI (input key) will be the key we are deriving from
  - Label will be the value shown above (ASCII ENHANCEDWRAP2010)
  - Separator byte of 0x00 will follow the label value
  - Context will be a null string (no context is used)
  - L will be the length of the derived key to be produced, rounded up to the next multiple of 256
– PRF (pseudorandom function) will be HMAC-SHA256

The KDF function will produce a pseudorandom bit string that is a multiple of 256 and will use as many bits of that as are required for the key to be produced. Bits for the key will be taken starting from the leftmost bit of the pseudorandom string, and any unused bits at the right will be discarded.

Variable length token (AESKW method)

The wrapping method for the variable-length key tokens will be AESKW as defined in ANSI X9.102.

The wrapping of the payload of a variable length key (*K) using an AES *MK is defined as follows:

\[ e^{*MK}(*K) = e^{AESKW}^{*MK}(P) \]

\[ P = ICV || Pad Length || Hash Length || Hash options || Data Hash || *K || Padding \]

Where:

- ICV is the 6 byte constant 0xA6A6A6A6A6A6
- Pad length is the length of the Padding in bits
- Hash length is the length of the Data Hash in bytes
- Hash options is a 4-byte field
- Data Hash is the hash of the associated data block
- Padding is the number of bytes, 0x00, to make of the overall length of P a multiple of 16
- \( e^{AESKW} \) means encryption using the AESKW method

PKA92 Key Format and Encryption Process

The PKA Symmetric Key Generate and the PKA Symmetric Key Import callable services optionally support a PKA92 method of encrypting a DES or CDMF key with an RSA public key. This format is adapted from the IBM Transaction Security System (TSS) 4753 and 4755 product's implementation of “PKA92”. The callable services do not create or accept the complete PKA92 AS key token as defined for the TSS products. Rather, the callable services only support the actual RSA-encrypted portion of a TSS PKA92 key token, the AS External Key Block.

Forming an AS External Key Block - The PKA96 implementation forms an AS External Key Block by RSA-encrypting a key block using a public key. The key block is formed by padding the key record detailed in Table 376 with zero bits on the left, high-order end of the key record. The process completes the key block with three sub-processes: masking, overwriting, and RSA encrypting.

**Masking Sub-process**

1. Form the initial key block by padding the PKR with zero bits on the left, high-order end to the length of the modulus.
2. Create a mask by CBC encrypting a multiple of 8 bytes of binary zeros using K as the key and the length of the modulus, and IV as the initialization vector as defined in the key record at offsets 45 and 53. Exclusive-OR the mask with the key record and call the result PKR.
3. Exclusive-OR the mask with the key block.

**Overwriting Sub-process**

1. Set the high-order bits of PKR to B'01', and set the low-order bits to B'0110'.
2. Exclusive-OR K and IV and write the result at offset 45 in PKR.
3. Write IV at offset 53 in PKR. This causes the masked and overwritten PKR to have IV at its original position.

**Encrypting Sub-process** - RSA encrypt the overwritten PKR masked key record using the public key of the receiving node. This is the last step in creating an AS external key block.

**Recovering a Key from an AS External Key Block** - Recover the encrypted DES key from an AS External Key Block by performing decrypting, validating, unmasking, and extraction sub-processes.

**Decrypting Sub-process** - RSA decrypt the AS External Key Block using an RSA private key and call the result of the decryption PKR. The private key must be usable for key management purposes.

**Validating Sub-process** - Verify that the high-order two bits of the decrypted key block are valued to B'01' and that the low-order four bits of the PKR record are valued to B'0110'.

**Unmasking Sub-process** - Set IV to the value of the 8 bytes at offset 53 of the PKR record. Note that there is a variable quantity of padding prior to offset 0. See Table 376 on page 881

Set K to the exclusive-OR of IV and the value of the 8 bytes at offset 45 of the PKR record.
Create a mask that is equal in length to the key block by CBC encrypting a multiple of 8 bytes of binary zeros using K as the key and IV as the initialization vector. Exclusive-OR the mask with PKR and call the result the key record.

Copy K to offset 45 in the PKR record.

**Extraction Sub-process.** Confirm that:
- The four bytes at offset 1 in the PKR are valued to X'0000 0000'
- The two control vector fields at offsets 21 and 29 are identical
- If the control vector is an IMPORTER or EXPORTER key class, that the EID in the key record is not the same as the EID stored in the cryptographic engine.

The control vector base of the recovered key is the value at offset 21. If the control vector base bits 40 to 42 are valued to B'010' or B'110', the key is double length. Set the right half of the received key’s control vector equal to the left half and reverse bits 41 and 42 in the right half.

The recovered key is at offset 37 and is either 8 or 16 bytes long based on the control vector base bits 40 to 42. If these bits are valued to B'000', the key is single length. If these bits are valued to B'010' or B'110', the key is double length.

---

**ANSI X9.17 Partial Notarization Method**

The ANSI X9.17 notarization process can be divided into two procedures:

1. **Partial notarization**, in which the ANSI key-encrypting key (AKEK) is cryptographically combined with the origin and destination identifiers.
   - **Note:** IBM defines this step as partial notarization. The ANSI X9.17 standard does not use the term partial notarization.

2. **Offsetting**, in which the result of the first step is exclusive-ORed with a counter value. ICSF performs the offset procedure to complete the notarization process when you use a partially notarized AKEK.

This appendix describes partial notarization for the ANSI X9.17 notarization process.

**Partial Notarization**

Partial notarization improves performance when you use an AKEK for many cryptographic service messages, each with a different counter value.

This section describes the steps in partial notarization. For more information about partial notarization, see [ANSI X9.17 Key Management Services](page 50) For a description of the steps ICSF uses to complete the notarization of an AKEK or to notarize a key in one process, see *ANSI X9.17 - 1985, Financial Institution Key Management (Wholesale)*.

**Notations Used in the Calculations**

- *KK* The 16-byte AKEK to be partially notarized
- KKL The leftmost 8 bytes of *KK*
- KKR The rightmost 8 bytes of *KK*
- KK The 8-byte AKEK to be partially notarized
- KK1 An 8-byte intermediate result
- KK2 An 8-byte intermediate result
FMID  The 16-byte origin identifier
FMID1 The leftmost 8 bytes of FMID
FMID2 The rightmost 8 bytes of FMID

TOID The 16-byte destination identifier
TOID1 The leftmost 8 bytes of TOID
TOID2 The rightmost 8 bytes of TOID

NSL An 8-byte intermediate result
NSL1 The leftmost 4 bytes of NSL

NSR An 8-byte intermediate result
NSR2 The rightmost 4 bytes of NSR

*KKNI The 16-byte partially notarized AKEK
KKNIL The leftmost 8 bytes of *KKNI

KKNIR The rightmost 8 bytes of *KKNI
KKNI The 8-byte partially notarized AKEK

XOR Denotes the exclusive-OR operation

TOID1<<1 Denotes the ASCII TOID1 left-shifted one bit
FMID1<<1 Denotes the ASCII FMID1 left-shifted one bit
eK(X) Denotes DES encryption of plaintext X using key K
\| Denotes the concatenation operation

Partial Notarization Calculation for a Double-Length AKEK
For a double-length AKEK, the partial notarization calculation consists of the following steps:
1. Set KK1 = KKL XOR TOID1<<1
2. Set KK2 = KKR XOR FMID1<<1
3. Set NSL = eKK2(TOID2)
4. Set NSR = eKK1(FMID2)
5. Set KKNIL = KKL XOR NSL
6. Set KKNIR = KKR XOR NSR
7. Set *KKNI = KKNIL \| KKNIR

Partial Notarization Calculation for a Single-Length AKEK
For a single-length AKEK, the partial notarization calculation consists of the following steps:
1. Set KK1 = KK XOR TOID1<<1
2. Set KK2 = KK XOR FMID1<<1
3. Set NSL = eKK2(TOID2)
4. Set NSR = eKK1(FMID2)
5. Set NSL = NSL1 \| NSR2
6. Set KKNI = KK XOR NSL

Transform CDMF Key Algorithm
The CDMF key transformation algorithm uses a 64-bit cryptographic key.
1. Set parity bits of the key to zero by ANDing the key with X'FEFEFEFEFEFEFEFEFEFEFEF' to produce Kx.
2. Using DES, encipher Kx under the constant K1.
3. XOR this value with Kx to produce Ky.
4. AND Ky with X'0EFE0EFE0EFE0EFE' to produce Kz.
5. Using DES, encipher Kz under K2 to produce eK2(Kz).
6. Adjust eK2(Kz) to odd parity in each byte. The result is the transformed key.

The following figure illustrates these steps. (e indicates DES encryption.)

---

**Figure 20. The CDMF Key Transformation Algorithm**

---

**Formatting Hashes and Keys in Public-Key Cryptography**

The digital signature generate and digital signature verify callable services support several methods for formatting a hash, and in some cases a descriptor for the hashing method, into a bit-string to be processed by the cryptographic algorithm. This topic discusses the ANSI X9.31 and PKCS #1 methods. The ISO 9796-1 method can be found in the ISO standard.
This topic also describes the PKCS #1, version 1, 1.5, and 2.0, methods for placing a key in a bit string for RSA ciphering in a key exchange.

**ANSI X9.31 Hash Format**

With ANSI X9.31, the string that is processed by the RSA algorithm is formatted by the concatenation of a header, padding, the hash and a trailer, from the most significant bit to the least significant bit, such that the resulting string is the same length as the modulus of the key. For the ICSF implementation, the modulus length must be a multiple of 8 bits.

- The header consists of X'6B'.
- The padding consists of X'BB', repeated as many times as required, and terminated by X'BA'.
- The hash value follows the padding.
- The trailer consists of a hashing mechanism specifier and final byte. These specifiers are defined:
  - X'31': RIPEMD-160
  - X'33': SHA-1
- A final byte of X'CC'.

**PKCS #1 Formats**

Version 2.0 of the PKCS #1 standard defines methods for formatting keys and hashes prior to RSA encryption of the resulting data structures. The lower versions of the PKCS #1 standard defined block types 0, 1, and 2, but in the current standard that terminology is dropped.

ICSF implemented these processes using the terminology of the Version 2.0 standard:

- For formatting keys for secured transport (CSNDSYX, CSNDSYG, CSNDSYI):
  - RSAES-OAEP, the preferred method for key-encipherment when exchanging DATA keys between systems. Keyword PKCSOAEP is used to invoke this formatting technique. The P parameter described in the standard is not used and its length is set to zero.
  - RSAES-PKCS1-v1_5, is an older method for formatting keys. Keyword PKCS-1.2 is used to invoke this formatting technique.

- For formatting hashes for digital signatures (CSNDDSG and CSNDDSV):
  - RSASSA-PKCS1-v1_5, the newer name for the block-type 1 format. Keyword PKCS-1.1 is used to invoke this formatting technique.
  - The PKCS #1 specification no longer discusses use of block-type 0. Keyword PKCS-1.0 is used to invoke this formatting technique. Use of block-type 0 is discouraged.

Using the terminology from older versions of the PKCS #1 standard, block types 0 and 1 are used to format a hash and block type 2 is used to format a DES key. The blocks consist of (|| means concatenation): X'00' || BT || PS || X'00' D where:

- BT is the block type, X'00', X'01', X'02'.

---

5. PKCS standards can be retrieved from http://www.rsasecurity.com/rsalabs/pkcs.
6. The PKA 92 method and the method incorporated into the SET standard are other examples of the Optimal Asymmetric Encryption Padding (OAEP) technique. The OAEP technique is attributed to Bellare and Rogaway.
PS is the padding of as many bytes as required to make the block the same length as the modulus of the RSA key, and is bytes of X'00' for block type 0, X'01' for block type 1, and random and non-X'00' for block type 2. The length of PS must be at least 8 bytes.

D is the key, or the concatenation of the BER-encoded hash identifier and the hash.

You can create the BER encoding of an MD5 or SHA-1 value by prepending these strings to the 16 or 20-byte hash values, respectively:

MD5  X'3020300C 06082A86 4886F70D 02050500 0410'
SHA-1 X'30213009 06052B0E 03021A05 000414'

Visa and EMV-related smart card formats and processes

The VISA and EMV specifications for performing secure messaging with an EMV compliant smart card are covered in these documents:

- EMV 2000 Integrated Circuit Card Specification for Payment Systems Version 4.0 (EMV4.0) Book 2
- Integrated Circuit Card Specification (VIS) 1.4.0 Corrections

Book 2, Annex A1.3, describes how a smart-card, card-specific authentication code is derived from a card-issuer-supplied encryption key (ENC-MDK). The Integrated Circuit Card Specification (VIS) 1.4.0 Corrections indicates that the key used should be an authentication key (MAC-MDK).

Book 2, Annex A1.3 describes how a smart-card, card-specific session key is derived from a card-issuer-supplied PIN-block-encryption key (ENC-MDK). The encryption key is derived using a "tree-based-derivation" technique. IBM CCA offers two variations of the tree-based technique (TDESEMV2 and TDESEMV4), and a third technique CCA designates TDES-XOR.

In addition, Book 2 describes construction of the PIN block sent to an EMV card to initialize or update the user's PIN.

Augmented by the above-mentioned documentation, the relevant processes are described in these sections:

- "Deriving the smart-card-specific authentication code"
- "Constructing the PIN-block for transporting an EMV smart-card PIN" on page 888
- "Deriving the CCA TDES-XOR session key" on page 888
- "Deriving the EMV TDESEMVn tree-based session key" on page 889
- "PIN-block self-encryption" on page 889

Deriving the smart-card-specific authentication code

To ensure that an original or replacement PIN is received from an authorized source, the EMV PIN-transport PIN-block incorporates an authentication code. The authentication code is the rightmost four bytes resulting from the ECB-mode
Constructing the PIN-block for transporting an EMV smart-card PIN

The PIN block is used to transport a new PIN value. The PIN block also contains an authentication code, and optionally the "current" PIN value, enabling the smart card to further ensure receipt of a valid PIN value. To enable incorporation of the PIN block into the a message for an EMV smart-card, the PIN block is padded to 16 bytes prior to encryption.

PINs of length 4 - 12 digits are supported.

PIN-block construction:
1. Form three 8-byte, 16-digit blocks, block-1, block-2, and block-3, and set all digits to X'0'.
2. Replace the rightmost four bytes of block-1 with the authentication code described in the previous section.
3. Set the second digit of block-2 to the length of the new PIN (4 to 12), followed by the new PIN, and padded to the right with X'F'.
4. Include any current PIN by placing it into the leftmost digits of block-3.
5. Exclusive-OR block-1, block-2, and block-3 to form the 8-byte PIN block.
6. Pad the PIN block with other portions of the message for the smart card:
   - Prepend X'08' (the length of the PIN block)
   - Append X'80', followed by 6 bytes of X'00'

The resulting message is ECB-mode triple-encrypted with an appropriate session key.

Deriving the CCA TDES-XOR session key

In the diversified key generate and PIN change/unblock services, the TDES-XOR process first derives a smart-card-specific intermediate key from the issuer-supplied ENC-MDK key and card-specific data. (This intermediate key is also used in the TDESEMV2 and TDESEMV4 processes. See the next section.) The intermediate key is then modified using the application transaction counter (ATC) value supplied by the smart card.

The double-length session-key creation steps:
1. Obtain the left-half of an intermediate key by ECB-mode triple-DES encrypting the (first) eight bytes of card specific data using the issuer-supplied ENC-MDK key.
2. Again using the ENC-MDK key, obtain the right-half of the intermediate key by ECB-mode triple-DES encrypting:
   - The second 8 bytes of card-specific derivation data when 16 bytes have been supplied
   - The exclusive-OR of the supplied 8 bytes of derivation data with X'FFFFFFFF FFFFFFFF'
3. Pad the ATC value to the left with six bytes of X'00' and exclusive-OR the result with the left-half of the intermediate key to obtain the left-half of the session key.
4. Obtain the one’s complement of the ATC by exclusive-ORing the ATC with X’FFFF’. Pad the result on the left with six bytes of X’00’. Exclusive-OR the 8-byte result with the right-half of the intermediate key to obtain the right-half of the session key.

**Deriving the EMV TDESEMVn tree-based session key**

In the diversified key generate and PIN change/unblock services, the TDESEMV2 and TDESEMV4 keywords call for the creation of the session key with this process:

1. The intermediate key is obtained as explained above for the TDES-XOR process.
2. Combine the intermediate key with the two-byte Application Transaction Counter (ATC) and an optional Initial Value. The process is defined in the EMV 2000 Integrated Circuit Card Specification for Payment Systems Version 4.0 (EMV4.0) Book 2 Book 2, Annex A1.3.
   - TDESEMV2 causes processing with a branch factor of 2 and a height of 16.
   - TDESEMV4 causes processing with a branch factor of 4 and a height of 8.

**PIN-block self-encryption**

In the Secure Messaging for PINs (CSNBSNP and CSNESPN) service, you can use the SELFENC rule-array keyword to specify that the 8-byte PIN block shall be used as a DES key to encrypt the PIN block. The verb appends the self-encrypted PIN block to the clear PIN-block in the output message.

**Key Test Verification Pattern Algorithms**

The key test verification pattern algorithms are:
- The DES algorithm is used by the Key Test callable service to generate and verify the verification pattern.
- The SHAVP1 algorithm is used by the Key Test2 callable service to generate and verify the verification pattern.

**DES Algorithm (single- and double-length keys)**

For DES keys, the Key Test callable service uses this algorithm to generate and verify the verification pattern.

$$KK = eC(KL) \times XOR KL$$
$$VP = eKK(KR XOR RN) \times XOR RN$$

where:
- $eK(x)$ - $x$ is encrypted by key $K$ using the DES algorithm
- $KL$ is the left 128-bit clear key value of the key
- $KR$ is the right 128-bit clear key value of the key (will be hex zero for a single length key)
- $C$ is X’4545454545454545’
- $KK$ is a 128-bit intermediate value
- $RN$ is a 128-bit pseudo-random number
- $VP$ is the 128-bit verification pattern

**SHAVP1 Algorithm**

This algorithm is used by the Key Test2 callable service to generate and verify the verification pattern.
VP = Trunc128( SHA256( KA || KT || KL || K ))

Where:
- VP is the 128-bit verification pattern
- TruncN(x) is truncation of the string x to the left most N bits
- SHA256(x) is the SHA-256 hash of the string x
- KA is the one-byte CCA variable-length key token constant for the algorithm of key (HMAC X'03')
- KT is the two-byte CCA variable-length key token constant for the type of key (MAC X'0002')
- KL is the two-byte bit length of the clear key value
- K is the clear key value left justified and padded on the right with binary zeros to byte boundary || is string concatenation
This section presents tables showing EBCDIC to ASCII and ASCII to EBCDIC conversion tables. In the table headers, EBC refers to EBCDIC and ASC refers to ASCII.

Table 377 shows the EBCDIC to ASCII default conversion table.

Appendix H. Access Control Points and Callable Services

The TKE workstation allows you to enable or disable callable service access control points. For systems that do not use the optional TKE Workstation, all access control points (current and new) are enabled in the DEFAULT Role with the appropriate licensed internal code on the PCI Cryptographic Coprocessor, PCI X Cryptographic Coprocessor, Crypto Express2 Coprocessor, or Crypto Express3 Coprocessor.

Access to services that are executed on the PCIXCC, CEX2C, or CEX3C is through Access Control Points in the DEFAULT Role. To execute callable services on the PCI X Cryptographic Coprocessor/Crypto Express2 Coprocessor, access control points must be enabled for each service in the DEFAULT Role.

New TKE users and non-TKE users have all access control points enabled. This is also true for new TKE V5.x users. If you are migrating from TKE V4.0, V4.1, or V4.2 to TKE V5.0 and have a PCIXCC/CEX2C/CEX3C, all your current access control points will remain the same and any new access control points for ICSF will not be enabled.

**Note:** Access control points DKYGENKY-DALL and DSG ZERO-PAD unrestricted hash length and PTR enhanced PIN security are always disabled in the DEFAULT role for all customers (TKE and Non-TKE). A TKE Workstation is required to enable these access control points.

Access control points added in ICSF FMID HCR7790:

- ANSI X9.8 PIN – Use stored decimalization tables only
- CVV Key Combine
- CVV Key Combine - Allow wrapping override keywords
- CVV Key Combine - Permit mixed key types
- ECC Diffie-Hellman – Allow PASSTHRU
- ECC Diffie-Hellman – Allow key wrap override
- ECC Diffie-Hellman – Allow Prime Curve 192
- ECC Diffie-Hellman – Allow Prime Curve 224
- ECC Diffie-Hellman – Allow Prime Curve 256
- ECC Diffie-Hellman – Allow Prime Curve 384
- ECC Diffie-Hellman – Allow Prime Curve 521
- ECC Diffie-Hellman – Allow BP Curve 160
- ECC Diffie-Hellman – Allow BP Curve 192
- ECC Diffie-Hellman – Allow BP Curve 224
- ECC Diffie-Hellman – Allow BP Curve 256
- ECC Diffie-Hellman – Allow BP Curve 320
- ECC Diffie-Hellman – Allow BP Curve 384
- ECC Diffie-Hellman – Allow BP Curve 512
- ECC Diffie-Hellman – Prohibit weak key generate
- ECC Diffie-Hellman Callable Service
- Restrict Key Attribute - Permit setting the TR-31 export bit
- Secure Key Import2 - IM
- Symmetric Key Import2 - HMAC/AES, AESKW
- Symmetric Key Export - AESKW
- TR31 Export – Permit any CCA key if INCL-CV is specified
- TR31 Export – Permit KEYGENKY:UKPT to B0
- TR31 Export – Permit MAC/MACVER:AMEX-CSC to C0:G/C/V
- TR31 Export – Permit MAC/MACVER:CVV-KEYA to C0:G/C/V
- TR31 Export – Permit MAC/MACVER:ANY-MAC to C0:G/C/V
- TR31 Export – Permit DATA to C0:G/C
- TR31 Export – Permit ENCIIPHER/DECIIPHER/CIPHER to D0:E/D/B
- TR31 Export – Permit DATA to D0:B
- TR31 Export – Permit EXPORTER/OKEYXLAT to K0:E
- TR31 Export – Permit IMPORTER/IKEYXLAT to K0:D
- TR31 Export – Permit EXPORTER/OKEYXLAT to K1:E
- TR31 Export – Permit IMPORTER/IKEYXLAT to K1:D
- TR31 Export – Permit MAC/DATA/DATAM to M0:G/C
- TR31 Export – Permit MACVER/DATAMV to M0:V
- TR31 Export – Permit MAC/DATA/DATAM to M1:G/C
- TR31 Export – Permit MACVER/DATAMV to M1:V
- TR31 Export – Permit MAC/DATA/DATAM to M3:G/C
- TR31 Export – Permit MACVER/DATAMV to M3:V
- TR31 Export – Permit OPINENC to P0/E
- TR31 Export – Permit IPINENC to P0/D
- TR31 Export – Permit PINVER:NO-SPEC to V0
- TR31 Export – Permit PINGEN:NO-SPEC to V0
- TR31 Export – Permit PINVER:NO-SPEC/IBM-PIN/IBM-PINO to V1
- TR31 Export – Permit PINGEN:NO-SPEC/IBM-PIN/IBM-PINO to V1
- TR31 Export – Permit PINVER:NO-SPEC/VISA-PVV to V2
- TR31 Export – Permit PINGEN:NO-SPEC/VISA-PVV to V2
- TR31 Export – Permit DKYGENKY:DKYL0+DMAC to E0
- TR31 Export – Permit DKYGENKY:DKYL0+DMV to E0
- TR31 Export – Permit DKYGENKY:DKYL0+DALL to E0
- TR31 Export – Permit DKYGENKY:DKYL1+DMAC to E0
- TR31 Export – Permit DKYGENKY:DKYL1+DMV to E0
- TR31 Export – Permit DKYGENKY:DKYL1+DALL to E0
- TR31 Export – Permit DKYGENKY:DKYL0+DDATA to E1
- TR31 Export – Permit DKYGENKY:DKYL0+DMPIN to E1
- TR31 Export – Permit DKYGENKY:DKYL0+DALL to E1
- TR31 Export – Permit DKYGENKY:DKYL1+DDATA to E1
- TR31 Export – Permit DKYGENKY:DKYL1+DMPIN to E1
- TR31 Export – Permit DKYGENKY:DKYL1+DALL to E1
- TR31 Export – Permit DKYGENKY:DKYL0+DMAC to E2
- TR31 Export – Permit DKYGENKY:DKYL0+DALL to E2
- TR31 Export – Permit DKYGENKY:DKYL1+DMAC to E2
- TR31 Export – Permit DKYGENKY:DKYL1+DALL to E2
- TR31 Export – Permit DATA/MAC/CIPHER/ENCIPHER to E3
- TR31 Export – Permit DATA to E3
- TR31 Export – Permit DKYGENKY:DKYL0+DDATA to E4
- TR31 Export – Permit DKYGENKY:DKYL0+DALL to E4
• TR31 Export – Permit DKYGENKY:DKYL0+DEXP to E5
• TR31 Export – Permit DKYGENKY:DKYL0+DMAC to E5
• TR31 Export – Permit DKYGENKY:DKYL0+DDATA to E5
• TR31 Export – Permit DKYGENKY:DKYL0+DALL to E5
• TR31 Export – Permit PINGEN/PINVER to V0/V1/V2:N
• TR31 Export – Permit version A TR-31 key blocks
• TR31 Export – Permit version B TR-31 key blocks
• TR31 Export – Permit version C TR-31 key blocks
• TR31 Import – Permit C0 to MAC/MACVER:CVVKEY-A
• TR31 Import – Permit C0 to MAC/MACVER:AMEX-CSC
• TR31 Import – Permit K0:E to EXPORTER/OKEYXLAT
• TR31 Import – Permit K0:D to IMPORTER/IKEYXLAT
• TR31 Import – Permit K0:B to EXPORTER/OKEYXLAT
• TR31 Import – Permit K0:B to IMPORTER/IKEYXLAT
• TR31 Import – Permit K1:E to EXPORTER/OKEYXLAT
• TR31 Import – Permit K1:D to IMPORTER/IKEYXLAT
• TR31 Import – Permit K1:B to EXPORTER/OKEYXLAT
• TR31 Import – Permit K1:B to IMPORTER/IKEYXLAT
• TR31 Import – Permit M0/M1/M3 to MAC/MACVER:ANY-MAC
• TR31 Import – Permit P0:E to OPINENC
• TR31 Import – Permit P0:D to IPINENC
• TR31 Import – Permit V0 to PINGEN:NO-SPEC
• TR31 Import – Permit V0 to PINVER:NO-SPEC
• TR31 Import – Permit V1 to PINGEN:IBM-PIN/IBM-PINO
• TR31 Import – Permit V1 to PINVER:IBM-PIN/IBM-PINO
• TR31 Import – Permit V2 to PINGEN:VISA-PVV
• TR31 Import – Permit V2 to PINVER:VISA-PVV
• TR31 Import – Permit E0 to DKYGENKY:DKYL0+DMAC
• TR31 Import – Permit E0 to DKYGENKY:DKYL0+DMV
• TR31 Import – Permit E0 to DKYGENKY:DKYL1+DMAC
• TR31 Import – Permit E0 to DKYGENKY:DKYL1+DMV
• TR31 Import – Permit E1 to DKYGENKY:DKYL0+DMPIN
• TR31 Import – Permit E1 to DKYGENKY:DKYL0+DDATA
• TR31 Import – Permit E1 to DKYGENKY:DKYL1+DMPIN
• TR31 Import – Permit E1 to DKYGENKY:DKYL1+DDATA
• TR31 Import – Permit E2 to DKYGENKY:DKYL0+DMAC
• TR31 Import – Permit E2 to DKYGENKY:DKYL1+DMAC
• TR31 Import – Permit E3 to ENCIPHER
• TR31 Import – Permit E4 to DKYGENKY:DKYL0+DDATA
• TR31 Import – Permit E5 to DKYGENKY:DKYL0+DMAC
• TR31 Import – Permit E5 to DKYGENKY:DKYL0+DDATA
• TR31 Import – Permit E5 to DKYGENKY:DKYL0+DEXP
• TR31 Import – Permit V0/V1/V2:N to PINGEN/PINVER
• TR31 Import – Permit version A TR-31 key blocks
• TR31 Import – Permit version B TR-31 key blocks
- TR31 Import – Permit version C TR-31 key blocks
- TR31 Import – Permit override of default wrapping method
- Variable-length Symmetric Token - disallow weak wrap
- Variable-length Symmetric Token - warn when weak wrap

Access control points added in ICSF FMID HCR7780:
- ANSI X9.8 PIN - Enforce PIN block restrictions
- ANSI X9.8 PIN - Allow modification of PAN
- ANSI X9.8 PIN - Allow only ANSI PIN blocks
- Clear New ECC Master Key
- Load First ECC Master Key Part
- Combine ECC Master Key Parts
- Set ECC Master Key
- Generate ECC keys in the clear
- Symmetric token wrapping - internal enhanced method
- Symmetric token wrapping - internal original method
- Symmetric token wrapping - external enhanced method
- Symmetric token wrapping - external original method
- Diversified Key Generate - Allow wrapping override keywords
- Symmetric Key Generate - Allow wrapping override keywords
- Key Part Import - Allow wrapping override keywords
- Multiple Clear Key Import - Allow wrapping override keywords
- Multiple Secure Key Import - Allow wrapping override keywords
- Symmetric Key Import - Allow wrapping override keywords
- CKDS Conversion2 - Allow use of REFORMAT
- CKDS Conversion2 - Allow wrapping override keywords
- CKDS Conversion2 - Convert from enhanced to original
- PCF CKDS Conversion - Allow wrapping override keywords
- Key Translate2
- Key Translate2 - Allow wrapping override keywords
- Key Translate2 - Allow use of REFORMAT
- HMAC Generate – SHA-1
- HMAC Generate – SHA-224
- HMAC Generate – SHA-256
- HMAC Generate – SHA-384
- HMAC Generate – SHA-512
- Restrict Key Attribute – Export Control
- Key Generate2 – OP
- Key Generate2 – Key Set
- Symmetric Key Token Change2
- Symmetric Key Token Change2 – RTCMK
- Secure Key Import2 - HMAC, OP
- Symmetric Key Import2 - HMAC,PKOAEP2
- Symmetric Key Export – HMAC,PKOAEP2
- HMAC Verify – SHA-1
• HMAC Verify – SHA-224
• HMAC Verify – SHA-256
• HMAC Verify – SHA-384
• HMAC Verify – SHA-512
• Key Part Import2 – Load first key part, require 3 key parts
• Key Part Import2 – Load first key part, require 2 key parts
• Key Part Import2 - Load first key part, require 1 key parts
• Key Part Import2 - Add second of 3 or more key parts
• Key Part Import2 - Add last required key part
• Key Part Import2 - Add optional key part
• Key Part Import2 – Complete key
• Key Test and Key Test2

Access control points added in ICSF FMID HCR7770 are:
• PKA Key Token Change RTNMARK
• PKA Key Translate - from CCA RSA to SC Visa Format
• PKA Key Translate - from CCA RSA to SC ME Format
• PKA Key Translate - from CCA RSA to SC CRT Format
• PKA Key Translate - from source EXP KEK to target EXP KEK
• PKA Key Translate - from source IMP KEK to target EXP KEK
• PKA Key Translate - from source IMP KEK to target IMP KEK
• Symmetric Key Encipher/Decipher - Encrypted DES keys
• Symmetric Key Encipher/Decipher - Encrypted AES keys

In addition, access control point PKA Key Token Change was renamed to PKA Key Token Change RTCMK

Access Control Points for HCR7751 are:
• Clear New AES Master Key Register (ISPF ACP)
• Load First AES Master Key Part (ISPF ACP)
• Combine AES Master Key Parts (ISPF ACP)
• Set AES Master Key (ISPF ACP)
• Multiple Clear Key Import/Multiple Secure Key Import - AES
• Symmetric Algorithm Encipher - Secure AES
• Symmetric Algorithm Decipher - Secure AES
• Symmetric Key Generate - AES, PKCSOEAP, PKCS-1.2
• Symmetric Key Generate - AES, ZERO-PAD
• Symmetric Key Import - AES, PKCSOEAP, PKCS-1.2
• Symmetric Key Import - AES, ZERO-PAD
• Symmetric Key Export - AES, PKCSOAEP, PKCS-1.2
• Symmetric Key Export - AES, ZERO-PAD

These access control points require the Nov. 2008 or later licensed internal code (LIC).

For the relationship between access control points and callable services, see Table 379 on page 898.
Callable Service Access Control Points

If an access control point is disabled, the corresponding ICSF callable service or utility will fail during execution with an access denied error.

Table 379. Callable service access control points

<table>

Notes:

1. The Access Control Points available depend on the coprocessor you are using.
2. To use PKA Key Generate - Clear or PKA Key Generate - Clone, the PKA Key Generate access control point must be enabled or the callable service will fail.
3. To use SET Block Decompose - PIN ext IPINENC or PIN ext OPINENC, the SET Block Decompose access control point must be enabled or the callable service will fail.
4. Diversified Key Generate - single length or same halves requires either Diversified Key Generate - TDES-ENC or Diversified Key Generate - TDES-DEC be enabled.
5. In order to use ATM Remote Key Loading, TKE users will have to enable the access control points for these functions:
• Trusted Block Create - Activate an Inactive Trusted Key Block
• Trusted Block Create - Create Trusted Key Block in Inactive Form
• PKA Key Import - Import an External Trusted Key Block to internal form
• Remote Key Export - Generate or export a key for use by a non-CCA node
Appendix I. Accessibility

Accessibility features help a user who has a physical disability, such as restricted
mobility or limited vision, to use software products successfully. The major
accessibility features in z/OS® enable users to:

- Use assistive technologies such as screen readers and screen magnifier
  software
- Operate specific or equivalent features using only the keyboard
- Customize display attributes such as color, contrast, and font size

Using assistive technologies

Assistive technology products, such as screen readers, function with the user
interfaces found in z/OS. Consult the assistive technology documentation for
specific information when using such products to access z/OS interfaces.

Keyboard navigation of the user interface

Users can access z/OS user interfaces using TSO/E or ISPF. Refer to z/OS TSO/E
information about accessing TSO/E and ISPF interfaces. These guides describe
how to use TSO/E and ISPF, including the use of keyboard shortcuts or function
keys (PF keys). Each guide includes the default settings for the PF keys and
explains how to modify their functions.

z/OS information

z/OS information is accessible using screen readers with the BookServer/Library
Server versions of z/OS books in the Internet library at:
http://www.ibm.com/systems/z/os/zos/bkserv/
Notices

This information was developed for products and services offered in the USA.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
USA

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

IBM World Trade Asia Corporation
Licensing
2-31 Roppongi 3-chome, Minato-ku
Tokyo 106, Japan

Programming Interface Information

This book documents intended Programming Interfaces that allow the customer to write programs to obtain the services of z/OS Integrated Cryptographic Service Facility.

Trademarks

IBM®, the IBM logo, and ibm.com® are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the Web at "Copyright and trademark information" at www.ibm.com/legal/copytrade.shtml.

Linux is a trademark of Linus Torvalds in the United States, other countries, or both.

Microsoft, Windows, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Other company, product, or service names may be trademarks or service marks of others.
This glossary defines terms and abbreviations used in Integrated Cryptographic Service Facility (ICSF). If you do not find the term you are looking for, refer to the index of the appropriate Integrated Cryptographic Service Facility document or view IBM Glossary of Computing Terms located at: http://www.ibm.com/ibm/terminology

This glossary includes terms and definitions from:
- IBM Glossary of Computing Terms. Definitions are identified by the symbol (D) after the definition.
- The American National Standard Dictionary for Information Systems, ANSI X3.172-1990, copyright 1990 by the American National Standards Institute (ANSI). Copies can be purchased from the American National Standards Institute, 11 West 42nd Street, New York, New York 10036. Definitions are identified by the symbol (A) after the definition.
- The Information Technology Vocabulary, developed by Subcommittee 1, Joint Technical Committee 1, of the International Organization for Standardization and the International Electrotechnical Commission (ISO/IEC JTC1/SC1). Definitions of published parts of this vocabulary are identified by the symbol (I) after the definition; definitions taken from draft international standards, committee drafts, and working papers being developed by ISO/IEC JTC1/SC1 are identified by the symbol (T) after the definition, indicating that final agreement has not yet been reached among the participating National Bodies of SC1.

Definitions specific to the Integrated Cryptographic Services Facility are labeled “In ICSF.”

A

access method services (AMS). The facility used to define and reproduce VSAM key-sequenced data sets (KSDS). (D)

Advanced Encryption Standard (AES). In computer security, the National Institute of Standards and Technology (NIST) Advanced Encryption Standard (AES) algorithm. The AES algorithm is documented in a draft Federal Information Processing Standard.

AES. Advanced Encryption Standard.

American National Standard Code for Information Interchange (ASCII). The standard code using a coded character set consisting of 7-bit characters (8 bits including parity check) that is used for information exchange among data processing systems, data communication systems, and associated equipment. The ASCII set consists of control characters and graphic characters.

ANSI key-encrypting key (AKEK). A 64- or 128-bit key used exclusively in ANSI X9.17 key management applications to protect data keys exchanged between systems.

ANSI X9.17. An ANSI standard that specifies algorithms and messages for DES key distribution.

ANSI X9.19. An ANSI standard that specifies an optional double-MAC procedure which requires a double-length MAC key.

application program. (1) A program written for or by a user that applies to the user's work, such as a program that does inventory control or payroll. (2) A program used to connect and communicate with stations in a network, enabling users to perform application-oriented activities. (D)

application program interface (API). (1) A functional interface supplied by the operating system or by a separately orderable licensed program that allows an application program written in a high-level language to use specific data or functions of the operating system or the licensed program. (D) (2) In ICSF, a callable service.

asymmetric cryptography. Synonym for public key cryptography. (D)

authentication pattern. An 8-byte pattern that ICSF calculates from the master key when initializing the cryptographic key data set. ICSF places the value of the authentication pattern in the header record of the cryptographic key data set.

authorized program facility (APF). A facility that permits identification of programs authorized to use restricted functions. (D)

C

callable service. A predefined sequence of instructions invoked from an application program, using a CALL instruction. In ICSF, callable services perform cryptographic functions and utilities.

CBC. Cipher block chaining.

CCA. Common Cryptographic Architecture.
CCF.  Cryptographic Coprocessor Feature.

CDMF.  Commercial Data Masking Facility.

CEDA.  A CICS transaction that defines resources online. Using CEDA, you can update both the CICS system definition data set (CSD) and the running CICS system.

CEX2A.  Crypto Express2 Accelerator
CEX2C.  Crypto Express2 Coprocessor
CEX3A.  Crypto Express3 Accelerator
CEX3C.  Crypto Express3 Coprocessor

checksum.  (1) The sum of a group of data associated with the group and used for checking purposes. (T) (2) In ICSF, the data used is a key part. The resulting checksum is a two-digit value you enter when you use the key-entry unit to enter a master key part or a clear key part into the key-storage unit.

Chinese Remainder Theorem (CRT).  A mathematical theorem that defines a format for the RSA private key that improves performance.

CICS.  Customer Information Control System.

cipher block chaining (CBC).  A mode of encryption that uses the data encryption algorithm and requires an initial chaining vector. For encipher, it exclusively ORs the initial block of data with the initial control vector and then enciphers it. This process results in the encryption both of the input block and of the initial control vector that it uses on the next input block as the process repeats. A comparable chaining process works for decipher.

ciphertext.  (1) In computer security, text produced by encryption. (2) Synonym for enciphered data. (D)

CKDS.  Cryptographic Key Data Set.

clear key.  Any type of encryption key not protected by encryption under another key.

CMOS.  Complementary metal oxide semiconductor.

coexistence mode.  An ICSF method of operation during which CUSP or PCF application program can run on ICSF without recompiling it. In this mode, ICSF cannot run simultaneously with CUSP or PCF.

complementary keys.  A pair of keys that have the same clear key value, are different but complementary types, and usually exist on different systems.

console.  A part of a computer used for communication between the operator or maintenance engineer and the computer. (A)

control-area split.  In systems with VSAM, the movement of the contents of some of the control intervals in a control area to a newly created control area in order to facilitate insertion or lengthening of a data record when there are no remaining free control intervals in the original control area. (D)

control block.  (1) A storage area used by a computer program to hold control information. (I) Synonymous with control area. (2) The circuitry that performs the control functions such as decoding microinstructions and generating the internal control signals that perform the operations requested. (A)

control interval.  A fixed-length area of direct-access storage in which VSAM stores records and creates distributed free space. Also, in a key-sequenced data set or file, the set of records pointed to by an entry in the sequence-set index record. The control interval is the unit of information that VSAM transmits to or from direct access storage. A control interval always comprises an integral number of physical records. (D)

control interval split.  In systems with VSAM, the movement of some of the stored records in a control interval to a free control interval to facilitate insertion or lengthening of a record that does not fit in the original control interval. (D)

control statement input data set.  A key generator utility program data set containing control statements that a particular key generator utility program job will process.

control statement output data set.  A key generator utility program data set containing control statements to create the complements of keys created by the key generator utility program.

control vector.  In ICSF, a mask that is exclusive ORed with a master key or a transport key before ICSF uses that key to encrypt another key. Control vectors ensure that keys used on the system and keys...
distributed to other systems are used for only the cryptographic functions for which they were intended.

**CPACF.** CP Assist for Cryptographic Functions

**CP Assist for Cryptographic Functions.** Implemented on all z890, z900, z9 EC, z9 BC, z10 EC and z10 BC processors to provide SHA-1 secure hashing.

cross memory mode. Synchronous communication between programs in different address spaces that permits a program residing in one address space to access the same or other address spaces. This synchronous transfer of control is accomplished by a calling linkage and a return linkage.

**CRT.** Chinese Remainder Theorem.

**Crypto Express2 Coprocessor.** An asynchronous cryptographic coprocessor available on the z890, z900, z9 EC, z9 BC, z10 EC and z10 BC.

**Crypto Express3 Coprocessor.** An asynchronous cryptographic coprocessor available on z10 EC and z10 BC.

cryptographic adapter (4755 or 4758). An expansion board that provides a comprehensive set of cryptographic functions for the network security processor and the workstation in the TSS family of products.

cryptographic coprocessor. A microprocessor that adds cryptographic processing functions to specific z890, z900, z9 EC, z9 BC, z10 EC and z10 BC processors. The Cryptographic Coprocessor Feature is a tamper-resistant chip built into the processor board.

cryptographic key data set (CKDS). (1) A data set that contains the encrypting keys used by an installation. (D) (2) In ICSF, a VSAM data set that contains all the cryptographic keys. Besides the encrypted key value, an entry in the cryptographic key data set contains information about the key.

cryptography. (1) The transformation of data to conceal its meaning. (2) In computer security, the principles, means, and methods for encrypting plaintext and decrypting ciphertext. (D) (3) In ICSF, the use of cryptography is extended to include the generation and verification of MACs, the generation of MDCs and other one-way hashes, the generation and verification of PINs, and the generation and verification of digital signatures.

**CUSP (Cryptographic Unit Support Program).** The IBM cryptographic offering, program product 5740-XY6, using the channel-attached 3848. CUSP is no longer in service.

**CUSP/PCF conversion program.** A program, for use during migration from CUSP or PCF to ICSF, that converts a CUSP or PCF cryptographic key data set into a ICSF cryptographic key data set.

**Customer Information Control System (CICS).** An IBM licensed program that enables transactions entered at remote terminals to be processed concurrently by user written application programs. It includes facilities for building, using, and maintaining databases.

**CVC.** Card verification code used by MasterCard.

**CVV.** Card verification value used by VISA.

**data encryption algorithm (DEA).** In computer security, a 64-bit block cipher that uses a 64-bit key, of which 56 bits are used to control the cryptographic process and 8 bits are used for parity checking to ensure that the key is transmitted properly. (D)

**data encryption standard (DES).** In computer security, the National Institute of Standards and Technology (NIST) Data Encryption Standard, adopted by the U.S. government as Federal Information Processing Standard (FIPS) Publication 46, which allows only hardware implementations of the data encryption algorithm. (D)

**data key or data-encrypting key.** (1) A key used to encipher, decipher, or authenticate data. (D) (2) In ICSF, a 64-bit encryption key used to protect data privacy using the DES algorithm or the CDMF algorithm. AES data keys are now supported by ICSF.

**data set.** The major unit of data storage and retrieval, consisting of a collection of data in one of several prescribed arrangements and described by control information to which the system has access. (D)

**data-translation key.** A 64-bit key that protects data transmitted through intermediate systems when the originator and receiver do not share the same key.

**DEA.** Data encryption algorithm.

**decipher.** (1) To convert enciphered data in order to restore the original data. (T) (2) In computer security, to convert ciphertext into plaintext by means of a cipher system. (3) To convert enciphered data into clear data. Contrast with encipher. Synonymous with decrypt. (D)

**decode.** (1) To convert data by reversing the effect of some previous encoding. (1) (A) (2) In ICSF, to decipher data by use of a clear key.

**decrypt.** See decipher.

**DES.** Data Encryption Standard.
**diagnostics data set.** A key generator utility program data set containing a copy of each input control statement followed by a diagnostic message generated for each control statement.

**digital signature.** In public key cryptography, information created by using a private key and verified by using a public key. A digital signature provides data integrity and source nonrepudiation.

**Digital Signature Algorithm (DSA).** A public key algorithm for digital signature generation and verification used with the Digital Signature Standard.

**Digital Signature Standard (DSS).** A standard describing the use of algorithms for digital signature purposes. One of the algorithms specified is DSA (Digital Signature Algorithm).

**domain.** (1) That part of a network in which the data processing resources are under common control. (T) (2) In ICSF, an index into a set of master key registers.

**double-length key.** A key that is 128 bits long. A key can be either double- or single-length. A single-length key is 64 bits long.

**DSA.** Digital Signature Algorithm.

**DSS.** Digital Signature Standard.

**E**

**ECB.** Electronic codebook.

**ECI.** Eurochèque International S.C., a financial institution consortium that has defined three PIN block formats.

**EID.** Environment Identification.

**electronic codebook (ECB) operation.** (1) A mode of operation used with block cipher cryptographic algorithms in which plaintext or ciphertext is placed in the input to the algorithm and the result is contained in the output of the algorithm. (D) (2) A mode of encryption using the data encryption algorithm, in which each block of data is enciphered or deciphered without an initial chaining vector. It is used for key management functions and the encode and decode callable services.

**electronic funds transfer system (EFTS).** A computerized payment and withdrawal system used to transfer funds from one account to another and to obtain related financial data. (D)

**encipher.** (1) To scramble data or to convert data to a secret code that masks the meaning of the data to any unauthorized recipient. Synonymous with encrypt. (2) Contrast with decipher. (D)

**enciphered data.** Data whose meaning is concealed from unauthorized users or observers. (D)

**encode.** (1) To convert data by the use of a code in such a manner that reconversion to the original form is possible. (T) (2) In computer security, to convert plaintext into an unintelligible form by means of a code system. (D) (3) In ICSF, to encipher data by use of a clear key.

**encrypt.** See encipher.

**exit.** (1) To execute an instruction within a portion of a computer program in order to terminate the execution of that portion. Such portions of computer programs include loops, subroutines, modules, and so on. (T) (2) In ICSF, a user-written routine that receives control from the system during a certain point in processing—for example, after an operator issues the START command.

**exportable form.** A condition a key is in when enciphered under an exporter key-encrypting key. In this form, a key can be sent outside the system to another system. A key in exportable form cannot be used in a cryptographic function.

**exporter key-encrypting key.** A 128-bit key used to protect keys sent to another system. A type of transport key.

**F**

**file.** A named set of records stored or processed as a unit. (T)

**G**

**GBP.** German Bank Pool.

**German Bank Pool (GBP).** A German financial institution consortium that defines specific methods of PIN calculation.

**H**

**hashing.** An operation that uses a one-way (irreversible) function on data, usually to reduce the length of the data and to provide a verifiable authentication value (checksum) for the hashed data.

**header record.** A record containing common, constant, or identifying information for a group of records that follows. (D)

**I**

**ICSF.** Integrated Cryptographic Service Facility.

**importable form.** A condition a key is in when it is enciphered under an importer key-encrypting key. A key is received from another system in this form. A key in importable form cannot be used in a cryptographic function.
**importer key-encrypting key.** A 128-bit key used to protect keys received from another system. A type of transport key.

**initial chaining vector (ICV).** A 64-bit random or pseudo-random value used in the cipher block chaining mode of encryption with the data encryption algorithm.

**initial program load (IPL).** (1) The initialization procedure that causes an operating system to commence operation. (2) The process by which a configuration image is loaded into storage at the beginning of a work day or after a system malfunction. (3) The process of loading system programs and preparing a system to run jobs. (D)

**input PIN-encrypting key.** A 128-bit key used to protect a PIN block sent to another system or to translate a PIN block from one format to another.

**installation exit.** See exit.

**Integrated Cryptographic Service Facility (ICSF).** A licensed program that runs under MVS/System Product 3.1.3, or higher, or OS/390 Release 1, or higher, or z/OS, and provides access to the hardware cryptographic feature for programming applications. The combination of the hardware cryptographic feature and ICSF provides secure high-speed cryptographic services.

**International Organization for Standardization.** An organization of national standards bodies from many countries, established to promote the development of standards to facilitate the international exchange of goods and services and to develop cooperation in intellectual, scientific, technological, and economic activity. ISO has defined certain standards relating to cryptography and has defined two PIN block formats.

ISO. International Organization for Standardization.

**J**

**job control language (JCL).** A control language used to identify a job to an operating system and to describe the job’s requirements. (D)

**K**

**key-encrypting key (KEK).** (1) In computer security, a key used for encryption and decryption of other keys. (D) (2) In ICSF, a master key or transport key.

**key generator utility program (KGUP).** A program that processes control statements for generating and maintaining keys in the cryptographic key data set.

**key output data set.** A key generator utility program data set containing information about each key that the key generator utility program generates except an importer key for file encryption.

**key part.** A 32-digit hexadecimal value that you enter for ICSF to combine with other values to create a master key or clear key.

**key part register.** A register in the key storage unit that stores a key part while you enter the key part.

**key store policy.** Ensures that only authorized users and jobs can access secure key tokens that are stored in one of the ICSF key stores - the CKDS or the PKDS.

**key store policy controls.** Resources that are defined in the XFACILIT class. A control can verify the caller has authority to use a secure token and identify the action to take when the secure token is not stored in the CKDS or PKDS.

**L**

**linkage.** The coding that passes control and parameters between two routines.

**load module.** All or part of a computer program in a form suitable for loading into main storage for execution. A load module is usually the output of a linkage editor. (T)

**LPAR mode.** The central processor mode that enables the operator to allocate the hardware resources among several logical partitions.

**M**

**MAC generation key.** A 64-bit or 128-bit key used by a message originator to generate a message authentication code sent with the message to the message receiver.

**MAC verification key.** A 64-bit or 128-bit key used by a message receiver to verify a message authentication code received with a message.

**magnetic tape.** A tape with a magnetizable layer on which data can be stored. (T)

**master key.** (1) In computer security, the top-level key in a hierarchy of key-encrypting keys. (2) ICSF uses master keys to encrypt operational keys. Master keys are known only to the cryptographic coprocessors and are maintained in tamper proof cryptographic coprocessors. Examples of cryptographic coprocessors are CCF, PCICC, PCIXCC, CEX2C, and CEX3C. Some of the master keys that ICSF supports are a 128-bit DES master key, a 192-bit signature master key, and the 192-bit key management master key, a 192-bit symmetric master key (that is, DES), a 192-bit asymmetric master key, and a 256-bit AES master key.

**master key concept.** The idea of using a single cryptographic key, the master key, to encrypt all other keys on the system.

Glossary 917
**master key register.** A register in the cryptographic coprocessors that stores the master key that is active on the system.

**master key variant.** A key derived from the master key by use of a control vector. It is used to force separation by type of keys on the system.

**MD4.** Message Digest 4. A hash algorithm.

**MD5.** Message Digest 5. A hash algorithm.

**message authentication code (MAC).** (1) The cryptographic result of block cipher operations on text or data using the cipher block chain (CBC) mode of operation. (D) (2) In ICSF, a MAC is used to authenticate the source of the message, and verify that the message was not altered during transmission or storage.

**modification detection code (MDC).** (1) A 128-bit value that interrelates all bits of a data stream so that the modification of any bit in the data stream results in a new MDC. (2) In ICSF, an MDC is used to verify that a message or stored data has not been altered.

**multiple encipherment.** The method of encrypting a key under a double-length key-encrypting key.

**new master key register.** A register in the key storage unit that stores a master key before you make it active on the system.

**NIST.** U.S. National Institute of Science and Technology.

**NOCV processing.** Process by which the key generator utility program or an application program encrypts a key under a transport key itself rather than a transport key variant.

**noncompatibility mode.** An ICSF method of operation during which CUSP or PCF can run independently and simultaneously on the same z/OS, OS/390 or MVS system. You cannot run a CUSP or PCF application program on ICSF in this mode.

**nonrepudiation.** A method of ensuring that a message was sent by the appropriate individual.

**notarization.** The ANSI X9.17 process involving the coupling of an ANSI key-encrypting key (AKEK) with ASCII character strings containing origin and destination identifiers and then exclusive ORing (or offsetting) the result with a binary counter.

**offset.** The process of exclusively ORing a counter to a key.

**old master key register.** A register in the key storage unit that stores a master key that you replaced with a new master key.

**operational form.** The condition of a key when it is encrypted under the master key so that it is active on the system.

**output PIN-encrypting key.** A 128-bit key used to protect a PIN block received from another system or to translate a PIN block from one format to another.

**PAN.** Personal Account Number.

**parameter.** Data passed between programs or procedures. (D)

**parmlib.** A system parameter library, either SYS1.PARMLIB or an installation-supplied library.

**partial notarization.** The ANSI X9.17 standard does not use the term partial notarization. IBM has divided the notarization process into two steps and defined the term partial notarization as a process during which only the first step of the two-step ANSI X9.17 notarization process is performed. This step involves the coupling of an ANSI key-encrypting key (AKEK) with ASCII character strings containing origin and destination identifiers.

**partitioned data set (PDS).** A data set in direct access storage that is divided into partitions, called members, each of which can contain a program, part of a program, or data. (D)

**PCI Cryptographic Coprocessor.** The 4758 model 2 standard PCI-bus card supported on the field upgraded IBM S/390 Parallel Enterprise Server - Generation 5, the IBM S/390 Parallel Enterprise Server - Generation 6 and the IBM @server zSeries.

**PCICA.** PCI Cryptographic Accelerator.

**PCICC.** PCI Cryptographic Coprocessor.

**PCI X Cryptographic Coprocessor.** An asynchronous cryptographic coprocessor available on the IBM @server zSeries 990 and IBM @server zSeries 800.

**PCIXCC.** PCI X Cryptographic Coprocessor.

**Personal Account Number (PAN).** A Personal Account Number identifies an individual and relates that individual to an account at a financial institution. It consists of an issuer identification number, customer account number, and one check digit.

**OAEP.** Optimal asymmetric encryption padding.
personal identification number (PIN). The 4- to 12-digit number entered at an automatic teller machine to identify and validate the requester of an automatic teller machine service. Personal identification numbers are always enciphered at the device where they are entered, and are manipulated in a secure fashion.

Personal Security card. An ISO-standard “smart card” with a microprocessor that enables it to perform a variety of functions such as identifying and verifying users, and determining which functions each user can perform.

PIN block. A 64-bit block of data in a certain PIN block format. A PIN block contains both a PIN and other data.

PIN generation key. A 128-bit key used to generate PINs or PIN offsets algorithmically.

PIN key. A 128-bit key used in cryptographic functions to generate, transform, and verify the personal identification numbers.

PIN offset. For 3624, the difference between a customer-selected PIN and an institution-assigned PIN. For German Bank Pool, the difference between an institution PIN (generated with an institution PIN key) and a pool PIN (generated with a pool PIN key).

PIN verification key. A 128-bit key used to verify PINs algorithmically.

PKA. Public Key Algorithm.

PKCS. Public Key Cryptographic Standards (RSA Data Security, Inc.)

PKDS. Public key data set (PKA cryptographic key data set).

plaintext. Data in normal, readable form.

primary space allocation. An area of direct access storage space initially allocated to a particular data set or file when the data set or file is defined. See also secondary space allocation. (D)

private key. In computer security, a key that is known only to the owner and used with a public key algorithm to decrypt data or generate digital signatures. The data is encrypted and the digital signature is verified using the related public key.

processor complex. A configuration that consists of all the machines required for operation.

Processor Resource/Systems Manager. Enables logical partitioning of the processor complex, may provide additional byte-multiplexer channel capability, and supports the VM/XA System Product enhancement for Multiple Preferred Guests.

Programmed Cryptographic Facility (PCF). (1) An IBM licensed program that provides facilities for enciphering and deciphering data and for creating, maintaining, and managing cryptographic keys. (D) (2) The IBM cryptographic offering, program product 5740-XY5, using software only for encryption and decryption. This product is no longer in service; ICSF is the replacement product.

PR/SM. Processor Resource/Systems Manager.

public key. In computer security, a key made available to anyone who wants to encrypt information using the public key algorithm or verify a digital signature generated with the related private key. The encrypted data can be decrypted only by use of the related private key.

public key algorithm (PKA). In computer security, an asymmetric cryptographic process in which a public key is used for encryption and digital signature verification and a private key is used for decryption and digital signature generation.

public key cryptography. In computer security, cryptography in which a public key is used for encryption and a private key is used for decryption. Synonymous with asymmetric cryptography.

RACE Integrity Primitives Evaluation Message Digest. A hash algorithm.

RDO. Resource definition online.

record chaining. When there are multiple cipher requests and the output chaining vector (OCV) from the previous encipher request is used as the input chaining vector (ICV) for the next encipher request.

Resource Access Control Facility (RACF). An IBM licensed program that provides for access control by identifying and verifying the users to the system, authorizing access to protected resources, logging the detected unauthorized attempts to enter the system, and logging the detected accesses to protected resources. (D)

retained key. A private key that is generated and retained within the secure boundary of the PCI Cryptographic Coprocessor.

return code. (1) A code used to influence the execution of succeeding instructions. (A) (2) A value returned to a program to indicate the results of an operation requested by that program. (D)

Rivest-Shamir-Adleman (RSA) algorithm. A process for public key cryptography that was developed by R. Rivest, A. Shamir, and L. Adleman.

RMI. Resource Measurement Facility.
RSA. Rivest-Shamir-Adleman.

SAF. Security Authorization Facility.

save area. Area of main storage in which contents of registers are saved. (A)

secondary space allocation. In systems with VSAM, area of direct access storage space allocated after primary space originally allocated is exhausted. See also primary space allocation. (D)

secure key. A key that is encrypted under a master key. When ICSF uses a secure key, it is passed to a cryptographic coprocessor where the coprocessor decrypts the key and performs the function. The secure key never appears in the clear outside of the cryptographic coprocessor.

Secure Sockets Layer. A security protocol that provides communications privacy over the Internet by allowing client/server applications to communicate in a way that is designed to prevent eavesdropping, tampering, or message forgery.

sequential data set. A data set whose records are organized on the basis of their successive physical positions, such as on magnetic tape. (D)

SET. Secure Electronic Transaction.

SHA (Secure Hash Algorithm, FIPS 180). (Secure Hash Algorithm, FIPS 180) The SHA (Secure Hash Algorithm) family is a set of related cryptographic hash functions designed by the National Security Agency (NSA) and published by the National Institute of Standards and Technology (NIST). The first member of the family, published in 1993, is officially called SHA. However, today, it is often unofficially called SHA-0 to avoid confusion with its successors. Two years later, SHA-1, the first successor to SHA, was published. Four more variants, have since been published with increased output ranges and a slightly different design: SHA-224, SHA-256, SHA-384, and SHA-512 (all are sometimes referred to as SHA-2).

SHA-1 (Secure Hash Algorithm 1, FIPS 180). A hash algorithm required for use with the Digital Signature Standard.

SHA-2 (Secure Hash Algorithm 2, FIPS 180). Four additional variants to the SHA family, with increased output ranges and a slightly different design: SHA-224, SHA-256, SHA-384, and SHA-512 (all are sometimes referred to as SHA-2).

SHA-224. One of the SHA-2 algorithms.

SHA-256. One of the SHA-2 algorithms.

SHA-384. One of the SHA-2 algorithms.

SHA-512. One of the SHA-2 algorithms.

single-length key. A key that is 64 bits long. A key can be single- or double-length. A double-length key is 128 bits long.

smart card. A plastic card that has a microchip capable of storing data or process information.

special secure mode. An alternative form of security that allows you to enter clear keys with the key generator utility program or generate clear PINs.

SSL. Secure Sockets Layer.

supervisor state. A state during which a processing unit can execute input/output and other privileged instructions. (D)

System Authorization Facility (SAF). An interface to a system security system like the Resource Access Control Facility (RACF).

system key. A key that ICSF creates and uses for internal processing.

System Management Facility (SMF). A base component of z/OS that provides the means for gathering and recording information that can be used to evaluate system usage. (D)

T

TDEA. Triple Data Encryption Algorithm.

TKE. Trusted key entry.

Transaction Security System. An IBM product offering including both hardware and supporting software that provides access control and basic cryptographic key-management functions in a network environment. In the workstation environment, this includes the 4755 Cryptographic Adapter, the Personal Security Card, the 4754 Security Interface Unit, the Signature Verification feature, the Workstation Security Services Program, and the AIX Security Services Program/6000. In the host environment, this includes the 4753 Network Security Processor and the 4753 Network Security Processor MVS Support Program.

transport key. A 128-bit key used to protect keys distributed from one system to another. A transport key can either be an exporter key-encrypting key, an importer key-encrypting key, or an ANSI key-encrypting key.

transport key variant. A key derived from a transport key by use of a control vector. It is used to force separation by type for keys sent between systems.
TRUE. Task-related User Exit (CICS). The CICS-ICSF Attachment Facility provides a CSFATRUE and CSFATREN routine.

U

UAT. UDX Authority Table.

UDF. User-defined function.

UDK. User-derived key.

UDP. User Developed Program.

UDX. User Defined Extension.

V

verification pattern. An 8-byte pattern that ICSF calculates from the key parts you enter when you enter a master key or clear key. You can use the verification pattern to verify that you have entered the key parts correctly and specified a certain type of key.

Virtual Storage Access Method (VSAM). An access method for indexed or sequential processing of fixed and variable-length records on direct-access devices. The records in a VSAM data set or file can be organized in logical sequence by means of a key field (key sequence), in the physical sequence in which they are written on the data set or file (entry-sequence), or by means of relative-record number.

Virtual Telecommunications Access Method (VTAM). An IBM licensed program that controls communication and the flow of data in an SNA network. It provides single-domain, multiple-domain, and interconnected network capability. (D)

VISA. A financial institution consortium that has defined four PIN block formats and a method for PIN verification.

VISA PIN Verification Value (VISA PVV). An input to the VISA PIN verification process that, in practice, works similarly to a PIN offset.

Numerics

3621. A model of an IBM Automatic Teller Machine that has a defined PIN block format.

3624. A model of an IBM Automatic Teller Machine that has a defined PIN block format and methods of PIN calculation.

4753. The Network Security processor. The IBM 4753 is a processor that uses the Data Encryption Algorithm and the RSA algorithm to provide cryptograpic support for systems requiring secure transaction processing (and other cryptographic services) at the host computer.

4758. The IBM PCI Cryptographic processor provides a secure programming and hardware environment where DES and RSA processes are performed.

The NSP includes a 4755 cryptographic adapter in a workstation which is channel attached to a S/390 host computer.

PKCS #11 wrap key (CSFPWPK) 720
PKDS key record create (CSNDKRC) 583
PKDS key record delete (CSNDKRD) 585
PKDS key record read (CSNDKRR) 587
PKDS key record write (CSNDKRW) 589
PKSC interface (CSFPKSC) 629
PPKCS #11 Generate key pair (CSFPGKP) 671
prohibit export (CSNBPEX) 27, 225
prohibit export extended (CSNBPEXX) 28, 226
random number generate (CSNRNG) 28, 228
random number generate (CSNRNGL) 228
remote key export (CSNDKRX) 28, 232
restrict key attribute (CSNBRKA and CSNERKA) 28, 30, 31
Restrict Key Attribute (CSNBRKA and CSNERKA) 239
retained key delete (CSNDRKD) 558
retained key list (CSNDRKL) 560
secure key import (CSNSKIK) 28, 243
secure messaging for keys (CSNSKYSKY) 479
secure messaging for PINs (CSNSKSPN) 482
security considerations 9
sequences 62
set attribute value (CSFPSAV) 695
SET block compose (CSNDSTBC) 85, 487
SET block decompose (CSNDSTBD) 85, 492
symmetric algorithm decipher (CSNBSDD, CSNBSDD1, CSNESAD and CSNESAD1) 350
symmetric key decipher (CSNSYD and CSNSYD1) 362
symmetric key encipher (CSNSBAE, CSNSBAS, and CSNSAE1) 356
symmetric key encipher (CSNSBEY, CSNSBEX, and CSNSYE1) 371
symmetric key export (CSNSDYSX) 28, 251
symmetric key generate (CSNSDYG) 28, 258
symmetric key import (CSNSDYS) 29, 266
Symmetric Key Import2 (CSNSDYS2 and CSNFSY2) 272
Symmetric MAC generate (CSNBSMG, CSNBSMG1, CSNESMG, and CSNESMG1) 413
Symmetric MAC Generate Callable Service (CSNBSMG, CSNBSMG1, CSNESMG, and CSNESMG1) 55
Symmetric MAC verify (CSNBSMV, CSNBSMV1, CSNESMV, and CSNESMV1) 417
Symmetric MAC Verify Callable Service (CSNBSMV, CSNBSMV1, CSNESMV, and CSNESMV1) 55
syntax 3
token record create (CSFPTRC) 707
token record delete (CSFPTRD) 711
token record list (CSFPTRL) 713
TR-31 export (CSNBT31X and CSNET31X) 283
TR-31 import (CSNBT31I and CSNET31I) 298
callable service (continued)
TR-31 Optional Data Build (CSNBT31O and CSNET31O) 311
TR-31 Optional Data Read (CSNBT31R and CSNET31R) 314
TR-31 Parse (CSNBT31P and CSNET31P) 318
transaction validation 59
Transaction Validation (CSNBT3RV) 498
transform CDMF key (CSNBTCK) 29, 277
(vector) ciphertext 53
trusted block create (CSNDTBC) 29, 279
User derived key (CSFUDK) 321
using key types and key forms 11
VISA CVV service generate (CSNBCCSG) 502
VISA CVV service verify (CSNBCCSV) 506
with ALETs (alternate entry point) 4
X9.9 data editing (CSNB9ED) 61, 621
CBC processing rule 335, 344
CDMF
overview 49
CDMF algorithm 15
CDMF key, transforming
algorithm 884
callable service 277
certificate length parameter
remote key export callable service 233
certificate parameter
remote key export callable service 234
certificate_parms parameter
remote key export callable service 234
certificate_parms_length parameter
remote key export callable service 234
chaining vector length parameter
one-way hash generate callable service 411
Symmetric MAC generate callable service 416
Symmetric MAC verify callable service 420
chaining vector parameter
decipher callable service 336
cipher callable service 346
MAC generate callable service 397
MAC verify callable service 402
MDC generate callable service 407
one-way hash generate callable service 411
Symmetric MAC generate callable service 416
Symmetric MAC verify callable service 420
changing control vectors 837
character/nibble conversion callable service (CSNBSBC and CSNBSBCB)
format 593
parameters 593
syntax 593
character/nibble conversion callable services (CSNBSBC and CSNBSBCB)
overview 61
choosing between
CSNBCTT and CSNBCTT1 328
CSNBD and CSNBD1 333
CSNBENC and CSNBENC1 342
CSNBMDG and CSNBMDG1 404
CSNBME and CSNBME1 394
CSNBMR and CSNBMR1 399
choosing between (continued)

CSNBSYD and CSNBSYD1 364, 413
CSNBSYE and CSNBSYE1 373
CSNESAE and CSNESAE1 356

CIPHER
keys 20
cipher block chaining (CBC) 325
mode 326
cipher feedback (CFB)
mode 326
cipher text id parameter
decipher callable service 355
encipher callable service 361
ciphertext
cryptographic variable encipher callable service 110
deciphering 53, 325
encoding 348
field 337, 347, 371, 380
translating 53, 328
ciphertext id parameter
decipher callable service 336, 370
encipher callable service 346, 379
ciphertext parameter
decipher callable service 334
decode callable service 339
encipher callable service 346
encode callable service 349
ciphertext translate callable service (CSNBCTT or
CSNBCTT1)
format 329
parameters 329
syntax 329
using 66

CKDS (cryptographic key data set)
record format 783, 788, 789, 792
CKDS key record create callable service (CSNBKRC)
format 565
overview 47
parameters 565
syntax 565
CKDS key record delete callable service (CSNBKRD)
format 569
parameters 569
syntax 569
CKDS key record read callable service (CSNBKRR)
format 571
overview 47
parameters 571
syntax 571
CKDS key record write callable service (CSNBKRW)
format 575
overview 48
parameters 575
syntax 575

clear key
deciphering data with 338
definition 24
enciphering 243
enciphering data with 348
encoding and decoding data with 53
protecting 325

clear key import callable service (CSNBCKI)
format 100
overview 25
parameters 100
syntax 100
clear key length parameter
multiple clear key import callable service 207, 212
clear key parameter
clear key import callable service 101
decode callable service 339
encode callable service 349
multiple clear key import callable service 207, 212
secure key import callable service 244
clear PIN encrypt callable service (CSNBCPE)
format 435
syntax 435
clear PIN encrypt service (CSNBCPE)
parameters 435
clear PIN generate alternate callable service
(CSNBCPA)
format 442
overview 57
parameters 442
syntax 442
clear PIN generate callable service (CSNPBGN)
format 438
parameters 438
syntax 438
clear PIN generate key identifier parameter 444
clear PIN generate callable service 439
clear text id parameter
decipher callable service 337, 355, 370
encipher callable service 346, 361, 379
clear text parameter
decipher callable service 336
decode callable service 339
encipher callable service 343
encode callable service 349
code conversion callable service (CSNBXEA and
CSNBXAE)
format 595
parameters 595
syntax 595
code conversion callable services (CSNBXEA and
CSNBXAE)
overview 61
code table parameter
character/nibble conversion callable service 594
code conversion callable service 596
coding examples 843
Assembler H 848
C 843
COBOL 846
