DFHRM0143 applid Recovery manager autostart override record is invalid. 'AUTOASIS' is assumed.

**Explanation:** Recovery manager has found an autostart override record in the global catalog data set, but it has an invalid length or is in the wrong format.

**System Action:** A dump is taken and the system continues. The autostart override value is assumed to be AUTOASIS. The autostart override record is removed from the catalog at startup as usual.

**User Response:** Investigate why the global catalog data set should have been incorrectly modified. The DFHRMUTL utility is used to correctly set the autostart override record prior to starting CICS.

**Destination:** Console

**Module:** DFHRMDM

**XMEOUT Parameter:** applid

---

DFHRM0144 applid Recovery manager catalog record indicates that no recovery is possible. An initial start is required.

**Explanation:** Recovery manager has read its catalog record from the global catalog data set and this indicates that no recovery is possible. The most likely reason is that CICS detected a corrupted log before the last CICS shutdown. Startup cannot continue with these start parameters.

**System Action:** CICS terminates abnormally with a dump.

**User Response:** Determine whether the CICS startup job correctly identifies the global catalog data set. If it does, the system log may be unusable and you must perform an initial start of CICS.

If the global catalog data set was incorrectly identified, retry the job with the correct global catalog data set.

**Destination:** Console

**Module:** DFHRMDM

**XMEOUT Parameter:** applid

---

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Determine whether the CICS startup job correctly identifies the global catalog data set. If it does, the system log may be unusable and you must perform an initial start of CICS.

If the global catalog data set was incorrectly identified, retry the job with the correct global catalog data set.

**Destination:** Console

**Module:** DFHRMDM

**XMEOUT Parameter:** applid

---

DFHRM0145 applid Recovery manager does not recognize the form of start requested by SIT parameters and overrides.

**Explanation:** Recovery manager cannot determine what sort of CICS start to perform. The parameters on the SIT and any settings read from the catalog data set are inconsistent with a valid start type.

**System Action:** CICS terminates abnormally with a dump.

**User Response:** This failure is caused by an internal CICS inconsistency. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Module:** DFHRMDM

**XMEOUT Parameter:** applid

---

DFHRM0146D applid Global catalog data set recovery data not found. System log data will be lost. Reply 'GO' or 'CANCEL'.

**Explanation:** A cold start has been requested, and no recovery control record information was found in the global catalog data set. Either this is the first execution of CICS with this global catalog data set, the wrong global catalog data set is being used, or the global catalog data set has been initialized without information necessary for recovery.

**System Action:** The system waits for a response.

**User Response:** If this is the first time CICS has been run with this global catalog data set, or if it is intended to delete all recovery information from the system log, reply 'GO'. This forces an initial start with no system log information retained from previous CICS executions. In particular, information used to resynchronize with remote CICS systems is cleared as well as all local recovery information.

If this is not the first time, or if you wish to retain system log information and try with another global catalog data set, reply 'CANCEL' to terminate this CICS execution. Nothing is discarded in this case. Check the global catalog data set and try again.

**Destination:** Console

**Module:** DFHRMDM

**XMEOUT Parameter:** applid
**DFHRM0147 applid Reply CANCEL was received.**

**Explanation:** A reply of ‘CANCEL’ was received in response to message DFHRM0146.

**System Action:** CICS terminates.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** None.

**Destination:** Console

**Module:** DFHRMDM

**XMEOUT Parameter:** applid

---

**DFHRM0148 date time applid Intersystem communication recovery. Resource updates are in sync. network UOW id netuowid remote system name.**

**Explanation:** Intersystem communication recovery is in progress. The remote system has attempted to resynchronize a unit of work and the local system no longer has any knowledge of that unit of work. This is because the local system was the coordinator, and the last agent or presumed abort protocols were being used. Any local resource updates associated with the unit of work were backed out. The remote system has sent notification that the resource updates in the remote system are still indoubt (and will be backed out following resynchronization) or have already been backed out.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** CSMT

**Module:** DFHRMLN

**XMEOUT Parameters:** date, time, applid, netuowid, name

---

**DFHRM0149I applid Recovery manager autostart override record will be deleted.**

**Explanation:** Recovery manager has found an autostart override record in the global catalog data set. It is deleted after the correct startup type is determined unless this is a diagnostic run. If this is a diagnostic run the recovery manager global catalog records are not altered.

**System Action:** Unless this is a diagnostic run the record is removed from the global catalog data set and will not influence subsequent starts.

**User Response:** None.

**Destination:** Console

**Module:** DFHRMDM

**XMEOUT Parameter:** applid

---

**DFHRM0150 applid Diagnostic run due to AUTODIAG override is finished. CICS will now terminate.**

**Explanation:** Recovery manager has performed a diagnostic run and now terminates with a dump. This is a result of an AUTODIAG override in the auto override record.

**System Action:** The system terminates. A dump is taken.

**User Response:** No further action is necessary.

**Destination:** Console

**Module:** DFHRMDM

**XMEOUT Parameter:** applid

---

**DFHRM0151 applid Diagnostic run is initiated. A simulated AUTO start is performed for diagnostic purposes only.**

**Explanation:** Recovery manager has detected a diagnostic run override (AUTODIAG) on the global catalog. This run of CICS will not perform any application processing and is for diagnostic purposes only.

**System Action:** The system continues. A dump is taken later prior to terminating.

**User Response:** No further action is necessary at this time. See the CICS Problem Determination Guide for details of the reasons you might want to perform a diagnostic run, and for other diagnostics you may wish to preserve at the same time.

**Destination:** Console

**Module:** DFHRMDM

**XMEOUT Parameter:** applid

---

**DFHRM0152 applid Recovery manager autostart override record is set to AUTODIAG.**

**Explanation:** The recovery manager auto override record on the global catalog has been set to AUTODIAG to allow a diagnostic run before the next initial start.

**System Action:** Processing continues.

**User Response:** No action is necessary. See the CICS Problem Determination Guide for information about how to perform a diagnostic run.

**Destination:** Console

**Module:** DFHRMDM

**XMEOUT Parameter:** applid

---

**DFHRM0154 applid Uncommitted local resource updates found on the System Log. COLD start is NOT preserving data integrity.**

**Explanation:** A cold start has been requested, but units of work containing uncommitted local resource updates have been found on the system log. The cold start will ignore this information and so data integrity will not be preserved for the affected resources.

**System Action:** The cold start continues.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**Destination:** Console

**Module:** DFHRMU1E

**XMEOUT Parameter:** applid

---

**DFHRM0156 applid This COLD start will NOT cause any damage to local resources.**

**Explanation:** The recovery manager established that there were no uncommitted resource updates recorded on the system log from a previous execution of CICS. Thus there is no local recovery necessary.

**System Action:** System initialization continues.

**User Response:** None.

**Destination:** Console

**Module:** DFHRMU1E

**XMEOUT Parameter:** applid
DFHRM0200 applid indoubt_uows indoubt UOWs were reconstructed.

Explanation: This message displays the number of indoubt units of work (UOWs), indoubt_uows, which were reconstructed on a warm or emergency restart.

It is issued only if there is at least one UOW which is indoubt. It is issued before any of the reconstructed UOWs are unshunted and processed in parallel.

System Action: The system has performed the backwards scan of the system log and is about to start unshunting UOWs which need further processing.

The system commits or backs out UOWs which were indoubt and for which either of the following conditions apply:
- The transaction is defined with WAIT(NO)
- The transaction is defined with WAIT(YES) and the WAITTIME has expired.

Note: A WAITTIME of zero implies an indefinite wait.

Where communications with the coordinator systems is possible, UOWs are unshunted and updates are committed or backed out on the local system. These updates are synchronized with the updates made on the coordinator system.

Where communications with the coordinator systems is not immediately possible, UOWs are preserved until resynchronization with the coordinator system is possible or until the WAITTIME expires. The suspension of these indoubt UOWs causes updated recoverable resources to remain locked against subsequent updates.

User Response: None.

If further investigation is required, use the CEMT INQUIRE UOW INDOUBT and CEMT INQUIRE UOWENQ RETAINED commands once CICS has initialized. These commands detail the indoubt UOWs and the associated retained enqueues.

Destination: Console
Module: DFHRMU1E

XMEOUT Parameters: applid, indoubt_uows

DFHRM0201 date time applid bfail_uows backout-failed and cfail_uows commit-failed UOWs were reconstructed.

Explanation: This message displays the number of backout-failed units of work (UOWs), bfail_uows, and the number of commit-failed UOWs, cfail_uows, which were reconstructed on a warm or emergency restart.

This message is issued only if there is at least one such UOW. It is issued before any of the reconstructed UOWs are unshunted and processed in parallel.

Note: This message is issued before the commit-failed and backout-failed UOWs are processed. Many of these UOWs are likely to be resolved during CICS initialization. Any true commit-failed or backout-failed UOWs are highlighted by further messages issued during CICS initialization. Also, once CICS is fully initialized, the master terminal transaction (CEMT) can be used to determine whether there are any outstanding commit-failed or backout-failed UOWs.

System Action: The system has performed the backwards scan of the system log and is about to start unshunting UOWs which need further processing.

UOWs which have failed to back out locally or commit locally are retried.

User Response: None.
Destination: CSMT
Module: DFHRMU1K

XMEOUT Parameters: applid, indoubt_uows, cfail_uows, bfail_uows

DFHRM0202 date time applid inflight_uows inflight UOWs were reconstructed.

Explanation: This message displays the number of inflight units of work (UOWs), inflight_uows, which were reconstructed on an emergency restart.

It is issued only if there is at least one UOW which is inflight. It is issued before any of the reconstructed UOWs are unshunted and processed in parallel.

System Action: The system has performed the backwards scan of the system log and is about to start unshunting UOWs which need further processing.

User Response: None.
Destination: CSMT
Module: DFHRMU1E

XMEOUT Parameters: date, time, applid, inflight_uows

DFHRM0203 applid There are indoubt_uows indoubt, cfail_uows commit-failed and bfail_uows backout-failed UOWs.

Explanation: This message displays the numbers of indoubt units of work (UOWs) indoubt_uows, backout-failed UOWs bfail_uows, and commit-failed UOWs cfail_uows in the CICS system at the time of the normal shutdown.

It is issued only if there is at least one such UOW. If there are none, message DFHRM0204 is issued instead.

Messages DFHRM0203 and DFHRM0204 can be used to determine whether or not it is safe to cold start CICS following a normal shutdown without losing resynchronization information. See DFHRM0204 for more information.

System Action: Shutdown processing continues.

User Response: None.
Destination: Console
Module: DFHRM0204

XMEOUT Parameters: applid, indoubt_uows, cfail_uows, bfail_uows

DFHRM0204 applid There are no indoubt, commit-failed or backout-failed UOWs.

Explanation: There are no indoubt, commit-failed, or backout-failed units of work (UOWs) in the CICS system at the time of the normal shutdown.

If there are any such units of work, message DFHRM0203 is issued.

This message indicates that it safe to do a cold start of CICS without losing any resynchronization information.

System Action: Shutdown processing continues.

User Response: None.
Destination: Console
Module: DFHRMU1K

XMEOUT Parameter: applid
DFHRM0205 date time applid An activity keypoint has been successfully taken.

Explanation: CICS has successfully taken an activity keypoint. This message is also issued for the shutdown keypoint.

System Action: Normal processing continues.

User Response: None.

Destination: CSMT

Module: DFHRMR1K

XMEOUT Parameters: date, time, applid

DFHRM0208 date time applid Intersystem communication recovery. A unit of work recovered only for remote resynchronization is now being committed. Local resources are not synchronized with the unit of work. Original failure date mm/dd/yy failure time hh:mm:ss remote system name transaction tranid task number tranum terminal termid userid network UOW netuowid local UOW X'localuowid'.

Explanation: This message is issued during intersystem communication recovery as a follow up to message DFHRM0106. Communication with the remote system that is the coordinator of this unit of work has been re-established and resynchronization is taking place. It has now been established that the remote system completed the synchronization point. Since this unit of work was recovered as part of a cold start, no local resources were locked pending this resynchronization and local resources are not synchronized with this decision.

System Action: The system allows the unit of work to commit for the purposes of resynchronization with remote systems. No local resources are changed.

User Response: None.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'

DFHRM0209 date time applid Intersystem communication recovery. A unit of work recovered only for remote resynchronization is now being backed out. Local resources are not synchronized with the unit of work. Original failure date mm/dd/yy failure time hh:mm:ss remote system name transaction tranid task number tranum terminal termid userid network UOW netuowid local UOW X'localuowid'.

Explanation: This message is issued during intersystem communication recovery as a follow up to message DFHRM0106. Communication with the remote system that is the coordinator of this unit of work has been re-established and resynchronization is taking place. It has now been established that the remote system did not complete the synchronization point. Since this unit of work was recovered as part of a cold start, no local resources were locked pending this resynchronization and local resources are not synchronized with this decision.

System Action: The system allows the unit of work to back out for resynchronization with remote systems. No local resources are changed.

User Response: None.

Destination: CSMT

Module: DFHRMLN

DFHRM0212 date time applid Intersystem communication recovery. The remote system has reinitialized. The unit of work is treated as committed. Original failure date mm/dd/yy failure time hh:mm:ss remote system name transaction tranid task number tranum terminal termid user id network UOW netuowid local UOW X'localuowid'.

Explanation: Communication with the remote system has been re-established. Resynchronization with the remote system was attempted. It was found that the remote system has restarted and has no knowledge of the unit of work. The distributed unit of work in the remote system might have committed or backed out.

The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. This will never be received.

Since this unit of work was recovered only for remote resynchronization, no local resources were locked pending this decision and local resources are not synchronized with the distributed unit of work. The unit of work is treated as committed in accordance with the ACTION attribute in the transaction definition.

If communication was via an MRO session to a pre-CICS Transaction Server system, this message may be issued even if the remote system was not restarted. This can only occur if the session failed during its first unit of work since connection.

System Action: The system continues. Further remote resynchronization treats this unit of work as committed.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'

DFHRM0213 date time applid Intersystem communication recovery. The remote system has reinitialized. The unit of work is treated as backed out. Original failure date mm/dd/yy failure time hh:mm:ss remote system name transaction tranid task number tranum terminal termid user id network UOW netuowid local UOW X'localuowid'.

Explanation: Communication with the remote system has been re-established. Resynchronization with the remote system was attempted. It was found that the remote system has restarted and has no knowledge of the unit of work. The distributed unit of work in the remote system might have committed or backed out.

The unit of work in the local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. This will never be received.

Since the unit of work was recovered only for remote resynchronization, no local resources were locked pending this outcome and local resources are not synchronized with the distributed unit of work.

The local unit of work is treated as backed out in accordance with the ACTION attribute in the local transaction definition.

If communication was via an MRO session to a pre-CICS Transaction Server system, this message may be issued even if the remote system was not reinitialized. This can only occur if the session failed during its first UOW since connection.
DFHRM0214

System Action: The system continues. Further remote resynchronization treats this unit of work as backed out.

User Response: Take user-defined actions to resynchronize resources in local and remote systems if necessary.

Destination: CSMT

Module:  DFHRMLK4

XMEOUT Parameters: date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'

---

DFHRM0227 date time applid Clear pending issued. The connection to the remote system has been set NOTPENDING. Original failure date mm/dd/yy failure time hh:mm:ss remote system name, trannum, termid, userid, netuowid, X'localuowid'

Explanation: The connection with the remote system has been set NOTPENDING. The unit of work is recorded as committed or backed out, but since this unit of work was recovered only for remote resynchronization, local resources might not be synchronized with this decision.

The local system did not receive acknowledgment that the remote system had received notification of the outcome of the unit of work.

No further resynchronization with this remote system is attempted and the distributed unit of work in the local and remote systems may not be synchronized.

System Action: Processing continues.

User Response: Take user-defined action to resynchronize resources in local and remote systems if necessary.

Destination: CSMT

Module:  DFHRMLK4

XMEOUT Parameters: date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'
Chapter 1. DFH messages

DFHRM0228  applid indoubt_uows indoubt UOWs have been recovered for the purpose of remote resynchronization. Local resources are not synchronized with these UOWs.

Explanation: This message displays the number of indoubt units of work (UOWs), indoubt_uows, which have been recovered for resynchronization with remote systems. This message is only issued on cold starts. Local resources may not be kept synchronized with remote resources because CICS is cold starting.

It is issued only if there is at least one UOW which is indoubt. It is issued before any of the reconstructed UOWs are unshunted and processed in parallel.

System Action: The system has performed the backwards scan of the system log and is about to start unshunting UOWs where resynchronization is possible.

Where communications with the remote system or systems is not immediately possible, UOWs are preserved until resynchronization is possible or until WAITTIME (defined on the transaction definition) expires.

This message is followed by message DFHRM0208 if the UOW has been committed, or by DFHRM0209 if the UOW has been backed out on the remote system or systems.

User Response: None.
Destination: Console
Module: DFHRMU1E.
XMEOUT Parameters: applid, indoubt_uows

DFHRM0229  date time applid bfail_uows backout-failed and cfail_uows commit-failed UOWs have been recovered for the purpose of remote resynchronization. Local resources are not synchronized with these UOWs.

Explanation: This message displays the number of backout-failed units of work (UOWs), bfail_uows, and the number of commit-failed UOWs, cfail_uows, which have been recovered for resynchronization with remote systems. These UOWs may now be in backout-waiting or commit-waiting states after cold start recovery processing. This message is only issued on cold starts. Local resources may not be kept synchronized with remote resources because CICS is cold starting.

This message is issued only if there is at least one such UOW. It is issued before any of the reconstructed UOWs are processed.

System Action: The system has performed the backwards scan of the system log and is about to start resynchronization for UOWs that require this.

Where communications with the remote system or systems is not immediately possible, UOWs are preserved until resynchronization is possible or until WAITTIME (defined on the transaction definition) expires.

This message is followed by message DFHRM0208 if the UOW has been committed, or by DFHRM0209 if the UOW has been backed out on the remote system or systems.

User Response: None.
Destination: CSMT
Module: DFHRMU1E
XMEOUT Parameters: date, time, applid, bfail_uows, cfail_uows

DFHRM0230  date time applid inflight_uows inflight UOWs have been recovered for the purpose of remote resynchronization. Local resources are not synchronized with these UOWs.

Explanation: This message displays the number of inflight units of work (UOWs), inflight_uows, which have been recovered for resynchronization with remote systems. This message is issued only on cold starts. Local resources may not be kept synchronized with remote resources because CICS is cold starting.

It is issued only if there is at least one UOW which is inflight. It is issued before any of the reconstructed UOWs are unshunted and processed in parallel.

System Action: The system has performed the backwards scan of the system log and is about to start unshunting UOWs where resynchronization is possible.

Where communications with the remote system or systems is not immediately possible, UOWs are preserved until resynchronization is possible or until WAITTIME (defined on the transaction definition) expires.

This message is followed by message DFHRM0208 if the UOW has been committed, or by DFHRM0209 if the UOW has been backed out on the remote system or systems.

User Response: None.
Destination: CSMT
Module: DFHRMU1E.
XMEOUT Parameters: date, time, applid, inflight_uows

DFHRM0235  date time applid Intersystem communication recovery. Local resources are not synchronized. Original failure date mm/dd/yy failure time hh:mm:ss remote system name transaction tranid task number trannum terminal termid user userid network UOW netuowid local UOW X'localuowid'

Explanation: Communication with the remote system that is a subordinate of this unit of work failed and has been re-established. Resynchronization with the remote system has occurred. Either the remote system has already taken a decision for its local resource updates in the distributed unit of work, or the remote system was waiting for the decision from this system. In either case, since this unit of work was recovered only for remote resynchronization, the local resources are not synchronized.

System Action: Processing continues.

User Response: Take action to resynchronize resources in the local and remote systems, if necessary.
Destination: CSMT
Module: DFHRMLN
XMEOUT Parameters: date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'

DFHRM0300  KEYWORD 'keyword' IS INVALID OR MISUSED.

Explanation: The SYSIN data set for DFHRMUTL contains an unrecognized keyword or a keyword which is used incorrectly.

System Action: The DFHRMUTL job terminates.

User Response: Correct the invalid keyword and retry.

Note: This message cannot be changed with the message editing utility.
Destination: SYSPRINT
Module: DFHRMUTL
DFHRM0301

**DFHRM0301** `applid` Force purge of transaction ID `tranid` task number `taskno` has been deferred because unit of work `X'uowid'` is in post commit syncpoint processing.

**Explanation:** CICS has received a request to force purge task `taskno`. The unit of work, `uowid`, associated with the target of the force purge request is in a critical phase of syncpoint processing. The target task cannot be purged while it is in this state.

**System Action:** CICS attempts to defer the purge until the target task is no longer protected against purge.

If the syncpoint occurs at the end of the task, the task is permanently protected against purge.

**User Response:** Normally the task should remain in this critical phase of syncpoint for only a short time. If the target task still has not ended, investigate why unit of work `uowid` has still to complete syncpoint processing.

See the [CICS Problem Determination Guide](https://www.ibm.com/support/docview.wss?uid=swg21678811) for guidance about diagnosing task waits.

**Note:** Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

**Destination:** Console

**Module:** DFHRMUTL

**XMEOUT Parameters:** `applid, tranid, taskno, X'uowid'

---

**DFHRM0302 ERROR** `OPENING | READING | WRITING | CLOSING` THE `{DFHGCD | NEWGCD}` DATA SET

RETURN CODE: `X'vsam_retcode', REASON: X'vsam_reason'`

**Explanation:** An error occurred when processing a VSAM data set. The VSAM return and reason codes are `X'vsam_retcode'` and `X'vsam_reason'`.

**System Action:** The DFHRMUTL job terminates.

**User Response:** See the [DFSM/MVS Version 1 Release 5 Macro Instructions for Data Sets](https://www.ibm.com/support/docview.wss?uid=swg21678811) manual for the meaning of the return and reason codes. Check the syslog for associated data services messages.

If the error is in opening the NEWGCD data set, ensure that the VSAM cluster:

- Has the REUSE attribute
- Has a DD card in the JCL
- Does not name the same data set as the DFHGCD DD card
- Is not currently open to another job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Module:** DFHRMUTL

---

**DFHRM0303 ERROR** `OPENING | READING | WRITING` THE `{SYsin | SYSPRINT}` DATA SET.

**Explanation:** An error occurred when processing a QSAM data set.

**System Action:** The DFHRMUTL job terminates.

**User Response:** Ensure that the data set DD card is properly defined. Look for associated syslog messages to identify the source of the problem.

**Note:** This message cannot be changed with the message editing utility.

---

**DFHRM0304 INVALID OR MISSING SET_AUTO_START PARAMETER.**

**Explanation:** The SET_AUTO_START parameter in the SYSIN data set for DFHRMUTL is missing or incorrectly specified.

**System Action:** The DFHRMUTL job terminates.

**User Response:** Ensure that the parameter is in the first line of SYSIN, and the keywords are separated by commas without intervening blanks.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Module:** DFHRMUTL

---

**DFHRM0305 SYSIN DATA SET CAN HAVE AT MOST ONE RECORD.**

**Explanation:** The SYSIN data set should contain either no records or else a single record specifying the parameters for DFHRMUTL.

**System Action:** The DFHRMUTL job terminates.

**User Response:** Correct the records in the SYSIN data set and retry.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Module:** DFHRMUTL

---

**DFHRM0306 CANNOT COPY A GCD WITH NO CONTROL INFORMATION.**

**Explanation:** The COLD_COPY keyword has been specified for a global catalog data set which has no recovery manager control information in it. It is not possible to create a reduced new catalog from an empty catalog.

**System Action:** The DFHRMUTL job terminates.

**User Response:** You should use COLD_COPY only to copy a catalog that has been used by CICS. To initialize a catalog for an initial start, use DFHRMUTL with the SET_AUTO_START=AUTOINIT parameter without attempting to copy it with COLD_COPY.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Module:** DFHRMUTL

---

**DFHRM0307 KEYWORD 'keyword' IS REPEATED IN THE SYSIN DATA SET.**

**Explanation:** Keyword `keyword` has been repeated in the first line of the SYSIN data set for DFHRMUTL.

**System Action:** The DFHRMUTL job terminates.

**User Response:** Remove the duplicate keyword and retry.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Module:** DFHRMUTL
DFHRM0308  SET_AUTO_START=AUTOASIS INVALID. GCD IS A COLD_COPY AND HAS NOT BEEN USED BY CICS.

Explanation: The keyword SET_AUTO_START specified AUTOASIS, but the global catalog supplied in data set DFHGCD has been copied with the DFHRMUTL COLD_COPY function and has not yet been used by CICS. This change is not allowed because the catalog no longer has the necessary records to allow an emergency or warm start.

System Action: The DFHRMUTL job terminates.

User Response: If you need to perform an emergency or warm start, use a restored copy of the global catalog taken before the run of DFHRMUTL which performed the COLD_COPY. If you do not need an emergency or warm start, change the parameter to AUTOINIT or AUTOCOLD and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHRMUTL

DFHRM0309  GCD HAS NOT BEEN USED BY CICS. YOU MUST SPECIFY SET_AUTO_START=AUTOINIT

Explanation: The keyword SET_AUTO_START specified AUTOCOLD or AUTOINIT, but the global catalog supplied in data set DFHGCD has never been used by CICS.

System Action: The DFHRMUTL job terminates.

User Response: Change the SET_AUTO_START parameter to AUTOINIT and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHRMUTL

DFHRM0311  COLD_COPY KEYWORD INVALID WITH SET_AUTO_START=AUTOASIS.

Explanation: The input parameters specified keyword COLD_COPY, but also contained SET_AUTO_START=AUTOASIS. This combination is not supported because CICS can only perform a COLD or INITIAL start using a catalog data set that has been cold-copied, because all definitional records have been removed.

System Action: The DFHRMUTL job terminates.

User Response: Either specify AUTOCOLD or AUTOINIT as the SET_AUTO_START value, or remove the COLD_COPY keyword and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHRMUTL

DFHRM0312  AUTODIAG WITH COLD_COPY NOT ALLOWED.

Explanation: In the parameters for the DFHRMUTL job the option COLD_COPY was specified with SET_AUTO_START=AUTODIAG. This is not allowed.

System Action: The DFHRMUTL job terminates.

User Response: Resubmit the job with the correct parameters.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHRMUTL

DFHRM0313  AUTODIAG CANNOT BE USED.

Explanation: The keyword SET_AUTO_START specified AUTODIAG, but the global catalog supplied in data set DFHGCD has been copied with the DFHRMUTL COLD_COPY function and has not yet been used by CICS. This change is not allowed because the catalog no longer has the necessary records to allow a diagnostic run.

System Action: The DFHRMUTL job terminates.

User Response: If you need to perform a diagnostic run, use a restored copy of the global catalog taken before the run of DFHRMUTL which performed the COLD_COPY. If you do not need a diagnostic run then change the parameter to AUTOINIT or AUTOCOLD and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHRMUTL

DFHRM0400 applid A unit of work was incompletely reconstructed from the system log.

Explanation: A unit of work has been only partially reconstructed from the log records on the system log.

The first log record that the unit of work wrote to the system log was not browsed during CICS restart although processing of the unit of work has not completed its syncpoint processing.

The probable cause is that the primary system log stream has been truncated incorrectly or that the secondary system log stream has been truncated or deleted incorrectly. Alternatively, the data on either log stream may have been corrupted so that the chain representing the unit of work was not completely processed during CICS restart.

These effects may be due to the log stream being modified between CICS runs, problems in the MVS logger, or problems in CICS itself. The most likely cause is that the logstream was deleted or modified between CICS runs. If it was deleted, the CICS logger will have issued a message during the CICS restart reporting that it was creating the logstream.

System Action: CICS makes an exception trace entry including the unit of work in which the problem was detected, issues this message, takes a dump, and then terminates abnormally.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that the primary and secondary system logstreams are valid. If a problem can be rectified, auto-start CICS again.

If the problem cannot be rectified, you should perform an initial start of CICS.

If you are certain that the system log streams have not been deleted or modified between CICS runs, there may be an error in the MVS logger or in CICS. In this case, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. It would be helpful to keep the failing logstream or a report of its contents.

Destination: Console
Module: DFHRM0400
XMEOUT Parameter: applid
**DFHRM0401** applid There is no system log or an empty system log has been detected.

**Explanation:** An empty system log has been detected on a CICS restart which requires the log for recovery processing. This is unexpected because there should always be one or more log records on the system log when CICS has started previously. Alternatively, there is no CICS system log because DUMMY has been specified in the definition of the log stream, and a start that requires a valid system log has been requested.

The probable cause is that the primary system log stream has been destroyed or cleared incorrectly. The data on the primary log stream may have been corrupted so that the CICS logger could not find any valid records on it. Alternatively, the system log has been defined as a DUMMY log inappropriately.

These effects may be due to the log stream being modified between CICS runs, problems in the MVS logger, or problems in CICS itself. The most likely cause is that the logstream was deleted or emptied between CICS runs. If it was deleted, the CICS logger will have issued a message during the CICS restart reporting that it was creating the logstream.

**System Action:** CICS makes an exception trace entry including the unit of work in which the problem was detected, issues this message, takes a dump, and then terminates abnormally.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Ensure that the primary system logstream is valid, and that it is not defined as DUMMY. If the problem can be rectified, start CICS again in the same way.

If the problem cannot be rectified, perform an initial start of CICS.

If you are certain that the system log streams have not been deleted or modified between CICS runs, there may be an error in the MVS logger or in CICS. In this case, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. It would be helpful to keep the failing logstream or a report of its contents.

**Destination:** Console

**Module:** DFHRM5L5

**XMEOUT Parameter:** applid

**DFHRPxxxx (CICS ONC RPC) messages**

**DFHRP0001** applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

**Explanation:** An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System Action:** An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Module:** DFHRP5P

**XMEOUT Parameters:** applid, aaa/bbbb, X'offset', modname

**DFHRP0002** applid A severe error (code X'code') has occurred in module modname.

**Explanation:** An error has been detected in module modname. The code X'code' is the exception trace point ID, which gives an indication of the cause of the error:

- 9F49—error in the C environment
- 9F4A—no storage for the RPC caller
- 9F4C—error from socket call to TCP/IP for MVS
- 9F4D—error from gethostid call to TCP/IP for MVS
- 9F4F—error from select call to TCP/IP for MVS
- 9F55—error from svc_register call to TCP/IP for MVS
- 9F58—error from svcudp_create call to TCP/IP for MVS
- 9F59—error from svcxcp_create call to TCP/IP for MVS
- 9F5B—error from svc_sendreply call to TCP/IP for MVS
• 9F5C—Invalid aup_gids from client
• 9F5D—Machine name from client too long
• 9F5E—Error from svc_getargs call to TCP/IP for MVS
• 9F5F—Error from svc_freargs call to TCP/IP for MVS
• 9F60—Error from getssockopt call to TCP/IP for MVS
• 9F63—Error from maxdesc call to TCP/IP for MVS (unknown error)
• 9F64—Error from maxdesc call to TCP/IP for MVS (not enough sockets)
• 9F65—Error from maxdesc call to TCP/IP for MVS (EFAULT)
• 9F66—Error from maxdesc call to TCP/IP for MVS (EALREADY)
• 9F67—Error from maxdesc call to TCP/IP for MVS (EINVAL)
• 9F68—Error from maxdesc call to TCP/IP for MVS (ENOMEM)
• 9F69—Error from maxdesc call to TCP/IP for MVS (ENOFILE)
• 9F6A—Error from dfhsvc_getreqset call to TCP/IP for MVS (EIBIMUVCERR)
• 9F6B—Error from svc_auth call to TCP/IP for MVS
• 9F6C—Error from svc_decode call to TCP/IP for MVS
• 9F6D—Error from svc_noproc call to TCP/IP for MVS
• 9F6E—Error from svc_systemerr call to TCP/IP for MVS
• 9F6F—Error from xmeout call to TCP/IP for MVS

**System Action:** An exception entry (code X’code’ in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. If a client request is being processed, and the code is 9F4A, no reply is sent to the client.

**Message DFHME0116 is normally produced containing the symptom string for this problem.**

**User Response:** There are some specific user actions that can be taken for certain values of code:

• 9F4A—Retry the current action if possible. If the shortage of storage persists, reduce the number of tasks that can run concurrently, or increase the DSA limits.
• 9F49—Check that the C run-time environment is derived from the same product, version, and release as was used for link-editing at installation time.
• 9F5C—Check the TCP/IP for MVS configuration and release level.
• 9F5D—Check the TCP/IP for MVS configuration and release level.
• 9F6A—Check that TCP/IP for MVS has been started.

For other TCP/IP for MVS problems, look at the TCP/IP for MVS diagnostics.

You may need further assistance from IBM to resolve this problem. See the **CICS External Interfaces Guide** and **Part 4 of the CICS Problem Determination Guide** for guidance on how to proceed.

**Destination:** Console

**Module:** DFHRPRP

**XMEOUT Parameters:** applid, X’code’, modname

---

**DFHRP0102**

**date time applid tranid**

A CICS ONC RPC alias has received an incorrect response on a call made to CICS during alias initialization.

**Explanation:** The alias has received a response that indicates a logic error in the alias while calling CICS to establish its initialization information.

**System Action:** The client request is abandoned, and no reply is sent to the client. A system dump is taken. The alias abends with abend code ARPK. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** See the associated CICS messages for problem diagnosis.

**Destination:** CRPO

**Module:** DFHRPAS

**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP0103**

**date time applid tranid**

A CICS ONC RPC alias has been started incorrectly.

**Explanation:** The alias has been invoked by a means other than the server controller, possibly by a user at a terminal.

**System Action:** There was no client request to process. The alias abends with abend code ARPF.

**User Response:** Check that the alias was not started by a terminal user.

**Destination:** CRPO

**Module:** DFHRPAS

**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP0104**

**date time applid tranid**

A CICS ONC RPC alias has received an incorrect response on a call made to CICS during alias initialization.

**Explanation:** The alias has received a response while calling CICS to establish its initialization information that indicates that the alias may not have been started by server controller.

**System Action:** There is no client request to process. The alias abends with abend code ARPF.

**User Response:** Check that the alias has not been started by a means other than the server controller.

**Destination:** CRPO

**Module:** DFHRPAS

**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP0105**

**date time applid tranid**

A CICS ONC RPC alias has received an incorrect response on a call made to CICS during alias initialization.

**Explanation:** The alias has received a response that indicates that CICS has experienced a temporary error while trying to pass the alias its initialization information from temporary storage.

**System Action:** The client request is abandoned, and no reply is sent to the client. The alias abends with abend code ARPJ.

**User Response:** See the associated CICS messages for problem diagnosis.

**Destination:** CRPO

**Module:** DFHRPAS

**XMEOUT Parameters:** date, time, applid, tranid
DFHRP0106 date time applid tranid A CICS ONC RPC alias has received an incorrect response on a call made to CICS during alias initialization.

Explanation: The alias has detected an error while validating its initialization information. This probably means that the alias has been started by a means other than the server controller.

System Action: The client request is abandoned, and no reply is sent to the client. The alias abends with abend code ARPF.

User Response: Check that the alias was not started by a CECI user.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0107 date time applid tranid A CICS ONC RPC alias has received an incorrect response on a call made to CICS during alias initialization.

Explanation: The alias has received a response that indicates a logic error in the alias while calling CICS to establish its initialization information.

System Action: The client request is abandoned, and no reply is sent to the client. A system dump is taken. The alias abends with abend code ARPI. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated CICS messages for problem diagnosis.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0108 date time applid tranid A CICS ONC RPC alias has been started incorrectly.

Explanation: The alias has detected an error while validating its initialization information. This probably means that the alias has been started by a means other than the server controller.

System Action: There was no client request to process. The alias abends with abend code ARPF.

User Response: Check that the alias was not started by a transient data trigger level or by a CECI user.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0113 date time applid tranid A CICS ONC RPC alias is unable to continue processing because the corresponding alias list entry has been deleted.

Client IP address: clientaddr
Host IP address: hostaddr
Program: X'prognum'
Version: X'versnum'
Procedure: X'procnum'
Protocol: protocol
Port: X'port'
Socket: X'socket'

Explanation: The alias has attempted to update its alias list entry to indicate that it has successfully started. The alias list component has returned a NOT FOUND response.

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPF.

User Response: Check that CICS ONC RPC has not been disabled since this client request was first scheduled. This problem may arise when long-running CICS programs are being used. It may also occur if CICS ONC RPC is disabled and immediately re-enabled.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, X'socket'
DFHRP0119 date time applid tranid A CICS ONC RPC alias is unable to continue processing because it cannot authenticate this client request. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

Explanation: The alias has detected an error with the response returned from the external security manager while attempting to authenticate this client request.

System Action: An svccr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPJ.

User Response: Check that the external security manager is still available.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0120 date time applid tranid A CICS ONC RPC alias is unable to continue processing because this client request is not authenticated. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

Explanation: The alias has received a response while authenticating the userid and password associated with this client request which indicates that this client request is not authenticated to CICS.

System Action: An svccr_auth call with a why-value of AUTH_TOOWEAK is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: Check the userid associated with this client request. See the associated CICS messages relating to the security error for help with problem diagnosis.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0121 date time applid tranid A CICS ONC RPC alias is unable to continue processing because it cannot authenticate this client request. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

Explanation: The alias has received a response while authenticating the userid and password associated with this client request which indicates that the external security manager does not recognize the userid.

System Action: An svccr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPK. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0122 date time applid tranid A CICS ONC RPC alias is unable to continue processing this client request. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

Explanation: The alias has encountered an internal error while authenticating the userid and password associated with this client request.

System Action: An svccr_systemerr call is used to send a reply to the client. A system dump is taken. The alias abends with abend code ARPL.

User Response: Check the userid associated with this client request. See the associated CICS messages relating to the security error for help with problem diagnosis.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0123 date time applid tranid A CICS ONC RPC alias is unable to continue processing this client request. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

Explanation: The alias has detected a temporary error in the remote CICS region while communicating with the resource checker.

System Action: An svccr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPJ.

User Response: Investigate the error in the remote CICS region.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket
DFHRP0124  date time applid tranid A CICS ONC RPC alias is unable to continue processing this client request. Client IP address: clientaddr  Host IP address: hostaddr  Program: X'prognum'  Version: X'versnum'  Procedure: X'procnum'  Protocol: protocol  Port: port  Socket: socket.

Explanation: The alias has encountered an internal error while trying to link to the resource checker.

System Action: An svcerr_systemerr call is used to send a reply to the client. A system dump is taken. The alias abends with abend code ARPI. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0127  date time applid tranid A CICS ONC RPC alias is unable to continue processing this client request. Client IP address: clientaddr  Host IP address: hostaddr  Program: X'prognum'  Version: X'versnum'  Procedure: X'procnum'  Protocol: protocol  Port: port  Socket: socket.

Explanation: The alias has detected a rollback in the resource checker in a remote CICS region.

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPJ.

User Response: Investigate the problem in the remote CICS region. You should consider changing the resource checker so that it does not update any CICS recoverable resources because this is not its primary design intent. Retry the client request.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0128  date time applid tranid A CICS ONC RPC alias is unable to continue processing because it cannot link to the resource checker program. Client IP address: clientaddr  Host IP address: hostaddr  Program: X'prognum'  Version: X'versnum'  Procedure: X'procnum'  Protocol: protocol  Port: port  Socket: socket.

Explanation: The alias has received a response while trying to link to the resource checker which indicates that it is not defined to CICS.

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: Check that the resource checker is defined to CICS.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0129  date time applid tranid A CICS ONC RPC alias is unable to continue processing this client request. Client IP address: clientaddr  Host IP address: hostaddr  Program: X'prognum'  Version: X'versnum'  Procedure: X'procnum'  Protocol: protocol  Port: port  Socket: socket.

Explanation: The alias has received an incorrect response from CICS while trying to link to the resource checker.

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPJ.

User Response: Ensure that the remote CICS region in which the resource checker resides is defined to CICS. If it is, check that the connection is available for use by CICS.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket
Chapter 1. DFH messages

DFHRP0130  

date time applid tranid  
A CICS ONC RPC alias is unable to continue processing this client request as it cannot query the authorization of the CICS program program. EIBRESP2: eibresp2 Client IP address: clientaddr Host IP address: hostaddr Program: X’prognum’ Version: X’versnum’ Procedure: X’procnum’ Protocol: protocol Port: port Socket: socket. 

Explanation: The alias issued an EXEC CICS QUERY SECURITY command for the CICS program program, but received a NOTFND response. 

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abort code ARPG. 

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO 
Module: DFHRPAS 
XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X’prognum’, X’versnum’, X’procnum’, protocol, port, socket 

DFHRP0132  

date time applid tranid  
A CICS ONC RPC alias is unable to continue processing this client request as it cannot query the authorization of the CICS program program. EIBRESP2: eibresp2 Client IP address: clientaddr Host IP address: hostaddr Program: X’prognum’ Version: X’versnum’ Procedure: X’procnum’ Protocol: protocol Port: port Socket: socket. 

Explanation: The alias issued an EXEC CICS QUERY SECURITY command for the CICS program program, but received a NOTFND response. 

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abort code ARPG. 

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

---

**DFHRP0138**

**XMEOUT Parameters:** date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**Explanation:**
The alias has received a response while trying to link to the CICS program that indicates that the program is not defined to CICS.

**System Action:**
An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPG.

**User Response:**
Check that the CICS program is defined to CICS.

**Destination:** CRPO

**Module:** DFHRPAS

**XMEOUT Parameters:** date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

---

**DFHRP0139**

**XMEOUT Parameters:** date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**Explanation:**
The alias has received a response while trying to link to the CICS program that indicates that the remote system in which the program resides is not defined or is not available to CICS.

**System Action:**
An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPG.

**User Response:**
Ensure that the remote CICS region in which the server program resides is defined to CICS. If it is, ensure that the connection is available for use by CICS.

**Destination:** CRPO

**Module:** DFHRPAS

**XMEOUT Parameters:** date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket
DFHRP0140  date time applid tranid A CICS ONC RPC alias is unable to continue processing this client request.  
Client IP address: clientaddr Host IP address:  
hostaddr Program: X'prognum' Version: X'versnum'  
Procedure: X'procnum' Protocol: protocol Port: port  
Socket: socket.

Explanation: The alias has detected a rollback in the CICS program in the remote CICS region.

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPK.

User Response: Investigate why the CICS program rolled back.

Destination:  
Module: DFHRPAS

XMEOUT Parameters: date, time, applid, tranid, clientaddr,  
hostaddr, X'prognum', X'versnum', X'procnum', protocol, port,  
socket

DFHRP0141  date time applid tranid A CICS ONC RPC alias is unable to continue processing as it cannot link to the CICS program program.  
Client IP address: clientaddr Host IP address: hostaddr Program:  
Socket: socket.

Explanation: The alias has received a response while trying to link to the CICS program program that indicates that it is not authorized to do so.

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: If the CICS program must run with resource level security, add a profile to the external security manager that grants access to the CICS program to its clients. If you do not require resource level security in the CICS program, set RESSEC=NO in the alias or mirror transaction definition.

Destination:  
Module: DFHRPAS

XMEOUT Parameters: date, time, applid, tranid, program,  
clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port,  
socket

DFHRP0142  date time applid tranid A CICS ONC RPC alias is unable to continue processing this client request.  
Client IP address: clientaddr Host IP address: hostaddr Program:  
Socket: socket.

Explanation: The alias has encountered an internal error and cannot determine how to send a reply to the client. The CICS program has run successfully, and may have updated CICS resources.

System Action: An svcerr_systemerr call is used to send a reply to the client. A system dump is taken. The alias abends with abend code ARPI. Message DFHME0016 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0016.

Destination:  
Module: DFHRPAS

XMEOUT Parameters: date, time, applid, tranid, clientaddr,  
hostaddr, X'prognum', X'versnum', X'procnum', protocol, port,  
socket

DFHRP0143  date time applid tranid A CICS ONC RPC alias is unable to send a reply to the client because of a length error.

Explanation: The alias is unable to send a reply to the client because the communication area length is zero, but the client was expecting data to be sent in the reply.

System Action: The client request is abandoned, and no reply is sent to the client. A system dump is taken. The alias abends with abend code ARPI. Message DFHME0016 is normally produced containing the symptom string for this problem.

User Response: See the associated CICS messages for problem diagnosis.

Destination:  
Module: DFHRPAS

XMEOUT Parameters: date, time, applid, tranid

DFHRP0144  date time applid tranid A CICS ONC RPC alias is unable to send a reply to the client due to an error in TCP/IP for MVS svc_sendreply processing.  
Client IP address: clientaddr Host IP address: hostaddr Program:  
Socket: socket.

Explanation: The alias cannot send a reply to the client. A problem has occurred in the TCP/IP for MVS svc_sendreply processing.

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: Examine the diagnostics to determine the reason for the error. If message DFHRP0002 was issued to the
The alias received an unexpected response from the RPC caller. The alias abends with abend code ARPJ. Explanation: The alias cannot send a reply back to the client. A problem has occurred in send reply processing. The transport handle was invalid or was not found. System Action: The client request is abandoned, and no reply is sent to the client. The alias abends with abend code ARPJ. User Response: Examine the diagnostics to determine the reason for the error. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Destination: CRPO Module: DFHRPAS XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**DFHRP0147** date time applid tranid A CICS ONC RPC alias is unable to send a reply to the client because CICS ONC RPC is disabling. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket. Explanation: The alias cannot send a reply back to the client. The alias abends with abend code ARPN. Message DFHME0116 is normally produced when an unexpected response was returned from RPC caller. You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Destination: CRPO Module: DFHRPAS XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**DFHRP0148** date time applid tranid A CICS ONC RPC alias is unable to send a reply to the client due to an error in send processing. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket. Explanation: The alias cannot send a reply back to the client. The alias received an unexpected response from the RPC caller. System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPI. User Response: See any associated CICS messages to help with problem diagnosis. If you cannot determine why the TCB mode

**DFHRP0149** date time applid tranid A CICS ONC RPC alias is unable to send a reply to the client. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket. Explanation: The alias cannot send a reply back to the client. The alias abends with abend code ARPI. System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPI. User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. **DFHRP0150** date time applid tranid A CICS ONC RPC alias is unable to send data to the client. Explanation: The alias is unable to send reply to the client. An unexpected response was returned from RPC caller. System Action: The client request is abandoned, and no reply is sent to the client. The alias abends with abend code ARPJ. User Response: See the associated CICS messages for problem diagnosis. Destination: CRPO Module: DFHRPAS XMEOUT Parameters: date, time, applid, tranid

**DFHRP0151** date time applid tranid A CICS ONC RPC alias has encountered a severe internal error while processing this client request. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket. Explanation: The alias is unable to switch TCB modes to allow it to send a reply to the client. The RP TCB is not active. System Action: The client request is abandoned, and no reply is sent to the client. A system dump is taken. The alias abends with abend code ARPN. Message DFHME0116 is normally produced containing the symptom string for this problem. User Response: See any associated CICS messages to help with problem diagnosis. If you cannot determine why the TCB mode
could not be switched, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPAS

**XMEOUT Parameters:** date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**Explanation:** The alias cannot work with a converter located in a remote CICS region. Data pointers are passed to and from the converter, and the referenced data can only be used if the converter runs in the local CICS region.

**System Action:** An svcerr_systemerr call is used to send a reply to the client. A system dump is taken.

**User Response:** Install and define the converter in the same CICS region as CICS ONC RPC.

**Destination:** CRPO

**Module:** DFHRPAS

**XMEOUT Parameters:** date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**Explanation:** The alias cannot access the converter. An authorization error has occurred.

**System Action:** An svcerr_systemerr call is used to send a reply to the client. A system dump is taken.

**User Response:** Either redefine the alias transaction with RESSEC=NO, or change the external security manager to allow the user to access the converter.

**Destination:** CRPO

**Module:** DFHRPAS

**XMEOUT Parameters:** date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**Explanation:** The alias used EXEC CICS LINK for converter converter_program_name to perform the Encode function, but received a PGMDERR response.

**System Action:** An svcerr_systemerr call is used to send a reply to the client.

**User Response:** Use CEDA to check that you have defined your converter program correctly to CICS.

**Destination:** CRPO

**Module:** DFHRPAS

**XMEOUT Parameters:** date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**Explanation:** The alias received an unexpected response when attempting to access the converter converter_program_name, Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

**System Action:** An svcerr_systemerr call is used to send a reply to the client. A system dump is taken.

**User Response:** See the associated messages issued by CICS for problem diagnosis.

**Destination:** CRPO

**Module:** DFHRPAS
DFHRP0161

XMEOUT Parameters: date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X’prognum’, X’versnum’, X’procnum’, protocol, port, socket

Explanation: Encode returned URP_EXCEPTION.

System Action: No reply is sent to the client. A system dump is taken. The alias abends with abend code ARPJ. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, program, clientaddr, hostaddr, X’prognum’, X’versnum’, X’procnum’, protocol, port, socket

Explanation: Encode returned URP_INVALID.

System Action: No reply is sent to the client. The transport handle was invalid or was not found.

User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, program, clientaddr, hostaddr, X’prognum’, X’versnum’, X’procnum’, protocol, port, socket

Explanation: Encode returned an unexpected return code.

System Action: No reply is sent to the client. A system dump is taken. The alias abends with abend code ARPJ. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, program, clientaddr, hostaddr, X’prognum’, X’versnum’, X’procnum’, protocol, port, socket

**DFHRP0164** date time applid tranid A CICS ONC RPC alias is unable to send an error reply to the client due to a logic error. Client IP address: clientaddr Host IP address: hostaddr Program: X’prognum’ Version: X’versnum’ Procedure: X’procnum’ Protocol: protocol Port: port Socket: socket.

Explanation: The alias cannot send an error reply to the client due to a logic error.

System Action: No reply is sent to the client. A system dump is taken. The alias abends with abend code ARPJ. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO

Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, program, clientaddr, hostaddr, X’prognum’, X’versnum’, X’procnum’, protocol, port, socket

**DFHRP0167** date time applid tranid A CICS ONC RPC alias is unable to send an error reply to the client. CICS ONC RPC is disabling. Client IP address: clientaddr Host IP address: hostaddr Program: X’prognum’ Version: X’versnum’ Procedure: X’procnum’ Protocol: protocol Port: port Socket: socket.

Explanation: The alias cannot send a reply to the client because CICS ONC RPC is disabling.

System Action: No reply is sent to the client. The alias abends with abend code ARPJ.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, program, clientaddr, hostaddr, X’prognum’, X’versnum’, X’procnum’, protocol, port, socket
Chapter 1. DFH messages

DFHRP0168 date time applid tranid A CICS ONC RPC alias is unable to send an error reply to the client. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procmnum' Protocol: protocol Port: port Socket: socket.

Explanation: The alias cannot send a reply to the client. The alias received an error response from the RPC caller.

User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. Examine the diagnostics to determine the reason for the error. You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procmnum', protocol, port, socket

Explanation: Encode returned URP_DISASTER.

System Action: An svcerr_systemerr call is used to send a reply to the client.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procmnum', protocol, port, socket

DFHRP0170 date time applid tranid A CICS ONC RPC alias has detected an error.

Explanation: The alias has detected an error.

System Action: A system dump is taken. The alias abends with abend code ARPI. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0171 date time applid tranid A CICS ONC RPC alias has detected a FREEMAIN error.

Explanation: The alias has detected a FREEMAIN error when freeing the communication area used by the CICS program. This FREEMAIN occurs after Encode processing.

System Action: Processing continues.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0172 date time applid tranid A CICS ONC RPC alias has detected a FREEMAIN error.

Explanation: The alias has detected an error while freeing the data area created by Encode processing. The FREEMAIN occurs after outbound XDR processing.

System Action: Processing continues.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0173 date time applid tranid A CICS ONC RPC alias cannot find its alias list entry for deletion at task end. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procmnum' Protocol: protocol Port: X'port' Socket: X'socket'.

Explanation: The alias has attempted to delete its alias list entry at task end. The alias list component has returned a NOT FOUND response. This is because either a connection manager user has started immediate disable processing, or because a connection manager user has deleted the entry.

System Action: The alias abends with abend code ARPJ.

User Response: None.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procmnum', protocol, X'port', X'socket'

DFHRP0174 date time applid tranid A CICS ONC RPC alias received an error response while attempting to delete its alias list entry at task end. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procmnum' Protocol: protocol Port: X'port' Socket: X'socket'.

Explanation: The alias has attempted to delete its alias list entry at task end. It received a response that indicated a severe error had occurred.

System Action: The alias abends with abend code ARPJ.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4
of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO  
**Module:** DFHRPAS  
**XMEOUT Parameters:** date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, X'port', X'socket'

---

**DFHRP0175 date time applid tranid**  
**A CICS ONC RPC alias has detected an abend issued by the resource checker program.**  
**Client IP address:** clientaddr  
**Host IP address:** hostaddr  
**Program:** X'prognum'  
**Version:** X'versnum'  
**Procedure:** X'procnum'  
**Protocol:** protocol  
**Port:** port  
**Socket:** socket.

**Explanation:** The alias has detected an abend by the resource checker.

**System Action:** An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPO.

**User Response:** Examine the diagnostics to determine the reason for the error.

**Destination:** CRPO  
**Module:** DFHRPAS  
**XMEOUT Parameters:** date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket.

**DFHRP0183**

Date Time Applid Tranid: A CICS ONC RPC alias has detected an abend. Client IP address: clientaddr
Host IP address: hostaddr Program: X'prognum'
Version: X'versnum' Procedure: X'procnum'

Explanation: The alias has detected an abend.

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPO.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**DFHRP0184**

Date Time Applid Tranid: A CICS ONC RPC alias has found that the resource checker has rejected this client request. Response: response Reason: reason.

Explanation: The resource checker has returned the response and reason codes to debug it.

System Action: An svcerr_auth call with a why-value of AUTH_TOOWEAK is used to send a reply to the client. The alias abends with abend code ARP.

User Response: If you suspect an error in the resource checker, use the response and reason codes to debug it.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: date, time, applid, tranid, response, reason, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**DFHRP0185**

Date Time Applid Tranid: A CICS ONC RPC alias has detected an error in the resource checker.
Response: response Reason: reason. Client IP address: clientaddr Host IP address: hostaddr

Explanation: The resource checker has returned the response and reason codes to debug it.

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARP.

User Response: If you suspect an error in the resource checker, use the response and reason codes to debug it.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: date, time, applid, tranid, response, reason, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**DFHRP0186**

Date Time Applid Tranid: A CICS ONC RPC alias has detected an error in the resource checker program.
Response: response Reason: reason. Client IP address: clientaddr Host IP address: hostaddr

Explanation: The resource checker has returned the response and reason codes to debug it.

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARP.

User Response: If you suspect an error in the resource checker, use the response and reason codes to debug it.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: date, time, applid, tranid, response, reason, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**DFHRP0187**

Date Time Applid Tranid: A CICS ONC RPC alias has detected an error in the resource checker.
Response: response Reason: reason. Client IP address: clientaddr Host IP address: hostaddr

Explanation: The resource checker has returned the response and reason codes to debug it.

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARP.

User Response: If you suspect an error in the resource checker, use the response and reason codes to debug it.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: date, time, applid, tranid, response, reason, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**DFHRP0188**

Date Time Applid Tranid: A CICS ONC RPC alias has detected an error in the resource checker.
Response: response Reason: reason. Client IP address: clientaddr Host IP address: hostaddr

Explanation: The resource checker has returned the response and reason codes to debug it.

System Action: An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARP. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If you suspect an error in the resource checker, use the response and reason codes to debug it.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: date, time, applid, tranid, response, reason, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket
DFHRP0189

XMEOUT Parameters: date, time, applid, tranid, response, reason, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**DFHRP0189** date time applid tranid A CICS ONC RPC alias is unable to continue processing this client request as it cannot load the CICS program program for security checking. This indicates that the program autoinstall control program has failed.

**Explanation:** The alias has a NOTAUTH response while trying to EXEC CICS LOAD the CICS program program for security checking. This indicates that it is not authorized to access this program. This error may have occurred because the local alias transaction has been defined with RESSEC=YES.

**System Action:** An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPJ.

**User Response:** Use the EIBRESP2 value to determine why the program autoinstall control program failed and correct the problem.

**Destination:** CRPO

**Module:** DFHRPAS

**XMEOUT Parameters:** date, time, applid, tranid, program, eibresp2, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**DFHRP0192** date time applid tranid A CICS ONC RPC alias is unable to continue processing this client request as it cannot load the CICS program program for security checking. This indicates that the program autoinstall control program has failed and correct the problem.

**Explanation:** The alias has a NOTAUTH response while trying to EXEC CICS LOAD the CICS program program for security checking. This indicates that it is not authorized to access this program. This error may have occurred because the local alias transaction has been defined with RESSEC=YES.

**System Action:** An svcerr_systemerr call is used to send a reply to the client. A system dump is taken. The alias abends with abend code ARPI.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPAS

**XMEOUT Parameters:** date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

**DFHRP0193** date time applid tranid A CICS ONC RPC alias is unable to continue processing this client request as it cannot load the CICS program program for security checking. This indicates that it is not authorized to access this program. This error may have occurred because the local alias transaction has been defined with RESSEC=YES.

**System Action:** An svcerr_systemerr call is used to send a reply to the client. The alias abends with abend code ARPJ.

**User Response:** If the alias transaction must run with RESSEC=YES, add a profile to the external security manager that allows users to access the program. If you do not require resource level security, set RESSEC=NO in the alias transaction definition.

**Destination:** CRPO

**Module:** DFHRPAS

**XMEOUT Parameters:** date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket
DFHRP0194 date time applid tranid A CICS ONC RPC alias is unable to continue processing this client request as it cannot load the CICS program program. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

Explanation: The alias has received an incorrect response while trying to load the CICS program program for security checking.

System Action: An svccr_systemerr call is used to send a reply to the client. A system dump is taken. The alias abends with abend code ARPI. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPAS
XMEOUT Parameters: date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0500 date time applid tranid CICS ONC RPC enable processing is complete. Host IP address: hostaddr.

Explanation: The enable process has completed successfully.

System Action: Processing continues.

User Response: None.
Destination: Console and Transient Data Queue CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0501 date time applid tranid CICS ONC RPC normal disable processing has started. Host IP address: hostaddr.

Explanation: The server controller has started normal disable processing following a request by a connection manager user.

System Action: Processing continues.

User Response: None.
Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0502 date time applid tranid CICS ONC RPC immediate disable processing has started. Host IP address: hostaddr.

Explanation: The server controller has started immediate disable processing following a request by a connection manager user.

System Action: Processing continues.

User Response: None.
Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0503 date time applid tranid CICS ONC RPC disable processing is complete.

Explanation: The server controller has completed the disable processing.

System Action: Processing continues.

User Response: None.
Destination: Console and Transient Data Queue CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0508 date time applid tranid The CICS ONC RPC task related user exit (DFHRPTRU) has been disabled before the server controller could start.

Explanation: DFHRPTRU is enabled by the connection manager during enable processing. but DFHRPTRU was found to be disabled when the server controller started. This is probably caused by an operator manually disabling DFHRPTRU.

System Action: The server controller abends with abend code ARP2. CICS ONC RPC remains disabled. A system dump is taken. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Reenable CICS ONC RPC. Consider taking steps to avoid future manual interference with the TRUE.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0509 date time applid tranid CICS ONC RPC has received an incorrect response on a call made to CICS during server controller startup.

Explanation: CICS ONC RPC has received a response indicating an error in CICS.

System Action: The server controller abends with abend code ARP2. CICS ONC RPC remains disabled. A system dump is taken. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated CICS message or messages for problem diagnosis.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0510 date time applid tranid The CICS ONC RPC task related user exit (DFHRPTRU) has been deleted or disabled before the server controller could start.

Explanation: DFHRPTRU is enabled by the connection manager during enable processing, but the server controller received an indication that:
- DFHRPTRU is not defined to CICS, or
- it has no load module, or
- the load module is disabled.

This is probably caused by operator intervention.

System Action: The server controller abends with abend code ARPQ. A system dump is taken.

User Response: Reenable CICS ONC RPC. Consider taking steps to prevent future operator interference.
**DFHRP0513**

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid

**System Action:** An svcerr_systemerr call is used to send a reply to the client.

**User Response:** If the converter name is wrong, use the connection manager to unregister and reregister the 4-tuple with the correct converter name.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid, converter_program_name, resp2val, clientaddr, hostaddr, X’prognum’, X’versnum’, X’procnum’, protocol, port, socket

**Explanation:** The communication area length calculated from the decode_server_data_format, decode_server_input_data_len, and decode_server_output_data_len parameters exceeds the permitted maximum. See the CICS Application Programming Guide for more information about the Decode function and its parameters.

**System Action:** An svcerr_systemerr call is used to send a reply to the client.

**User Response:** Correct and replace the erroneous converter.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X’prognum’, X’versnum’, X’procnum’, protocol, port, socket

**Explanation:** The CICS ONC RPC server controller obtained data length information from the Decode function of converter converter_program_name that gives a communication area length that is too great. Client IP address: clientaddr Host IP address: hostaddr Program: X’prognum’ Version: X’versnum’ Procedure: X’procnum’ Protocol: protocol Port: port Socket: socket.

**System Action:** An svcerr_systemerr call is used to send a reply to the client.

**User Response:** Either define the missing terminal, or change the 4-tuple definition to refer to a terminal ID that is in the terminal control table.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid, alias_termid, converter_program_name, clientaddr, hostaddr, X’prognum’, X’versnum’, X’procnum’, protocol, port, socket

**Explanation:** A client request has arrived, and the corresponding 4-tuple refers to a terminal ID that is not in the terminal control table.

**System Action:** An svcerr_systemerr call is used to send a reply to the client.

**User Response:** Either define the missing terminal, or change the 4-tuple definition to refer to a terminal ID that is in the terminal control table.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid, alias_termid, clientaddr, hostaddr, X’prognum’, X’versnum’, X’procnum’, protocol, port, socket

**Explanation:** This is an internal error.

**System Action:** CICS ONC RPC enters exception disable processing.

**User Response:** If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid, hostaddr

**Explanation:** An internal error has occurred in the server controller while it was accessing an internal table.

**System Action:** Processing continues.
Chapter 1. DFH messages

User Response: None.
Destination: CRPO
Module: DFHRP0522

**DFHRP0522** date time applid tranid The CICS ONC RPC server controller detected an internal error while accessing an internal table. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket

Explanation: An internal error has occurred in the server controller while accessing an internal table.

System Action: Processing continues.
User Response: None.
Destination: CRPO
Module: DFHRPS

**DFHRP0528** date time applid tranid The CICS ONC RPC server controller detected an initialization error.

Explanation: This is an internal error.

System Action: A system dump is taken. The server controller abends with abend code ARP2. CICS ONC RPC remains disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRP0546

**DFHRP0546** date time applid tranid The CICS ONC RPC server controller is unable to send an error reply to the client because CICS ONC RPC is disabling. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

Explanation: The server controller cannot send an error reply to the client because CICS ONC RPC is disabling. The client request is abandoned, and no reply is sent to the client.

User Response: Examine the diagnostics to determine the reason for the error. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO
Module: DFHRP0545

**DFHRP0545** date time applid tranid The CICS ONC RPC server controller is unable to send an error reply to the client due to an error in reply processing. The transport handle was invalid or not found. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

Explanation: The server controller cannot send an error reply to the client because the transport handle is not valid.

System Action: The client request is abandoned, and no reply is sent to the client.
User Response: Examine the diagnostics to determine the reason for the error. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO
Module: DFHRP0540

Explanation: The server controller cannot free storage allocated by the inbound XDR routine. An svc_freeargs returned an error response. This may be because the client associated with the call has timed out and the storage has already been freed by TCP/IP for MVS.

System Action: The server controller continues to process this client request. If the message is not a result of client time-out, MVS storage associated with the request will not be freed; if errors of this kind occur frequently, they may lead to storage problems.

User Response: Examine the diagnostics to determine the reason for the error. If a user-written XDR routine is being used, there may be an error in the code associated with the FREE function. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.

Destination: CRPO
Module: DFHRP0525

**DFHRP0525** date time applid The CICS ONC RPC server controller has timed out and the storage has already been freed by TCP/IP for MVS. The client request is abandoned, and no reply is sent to the client.

Explanation: The client request is abandoned, and no reply is sent to the client.

User Response: Examine the diagnostics to determine the reason for the error. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO
Module: DFHRP0540

**DFHRP0547**

**DFHRP0547** date time applid tranid The CICS ONC RPC server controller is unable to send an error reply to the client. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

**Explanation:** The server controller cannot send a reply to the client, because it received an error response from the RPC caller.

**System Action:** The client request is abandoned, and no reply is sent to the client. The server controller attempts to deal with requests from other clients, but may experience further RPC caller errors.

**User Response:** Examine the exception trace to determine the reason for the error. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPM

**XMEOUT Parameters:** date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

---

**DFHRP0548** date time applid tranid The CICS ONC RPC server controller sent an error reply to the client but cannot free storage associated with the client call. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

**Explanation:** The server controller sent an error reply to the client. After this reply was sent, the server controller received an error response when attempting to free storage associated with the client call.

**System Action:** Processing continues as if the error had not occurred.

**User Response:** Examine the diagnostics to determine the reason for the error. You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPM

**XMEOUT Parameters:** date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

---

**DFHRP0549** date time applid tranid The CICS ONC RPC server controller has encountered an internal error while trying to disable its task related user exit.

**Explanation:** An attempt to disable the task-related user exit during disable processing has failed because of an internal error.

**System Action:** A system dump is taken. Disable processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPM

**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP0570** date time applid tranid The CICS ONC RPC server controller found that the RP task control block is not available. Host IP address: hostaddr.

**Explanation:** The RP TCB is not available.

**System Action:** A system dump is taken. The server controller abends with abend code ARP2. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPM

**XMEOUT Parameters:** date, time, applid, tranid, hostaddr

---

**DFHRP0574** date time applid tranid The CICS ONC RPC server controller has encountered an internal error while waiting for work. Host IP address: hostaddr.

**Explanation:** CICS ONC RPC is unable to continue because of an internal error in the server controller.

**System Action:** In some circumstances, a system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPM

**XMEOUT Parameters:** date, time, applid, tranid, hostaddr

---

**DFHRP0589** date time applid tranid The CICS ONC RPC server controller cannot enable CICS ONC RPC because it is not defined with the authority to access the task-related user exit.

**Explanation:** The server controller cannot access the task-related user exit. This error can arise only if the supplied definitions for the server controller have been changed.

**System Action:** The server controller abends with abend code ARP2. CICS ONC RPC remains disabled.

**User Response:** Ensure that the supplied definitions for the server controller are used, and reenable CICS ONC RPC.

**Destination:** CRPO

**Module:** DFHRPM

**XMEOUT Parameters:** date, time, applid, tranid

---

464 CICS Messages and Codes
Chapter 1. DFH messages

**DFHRP0590** date time applid tranid  The CICS ONC RPC server controller has received an unexpected response on a call to CICS during CICS ONC RPC enable processing.

**Explanation:** CICS ONC RPC enable processing cannot continue because of an error in CICS.

**System Action:** A system dump is taken. The server controller abends with abend code ARP2. CICS ONC RPC remains disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP0591** date time applid tranid  CICS ONC RPC could not be enabled because of an internal error in the server controller.

**Explanation:** The server controller cannot start because of an internal error.

**System Action:** A system dump is taken. The server controller abends with abend code ARP2. CICS ONC RPC remains disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP0592** date time applid tranid  The CICS ONC RPC server controller detected an error while polling for client work. Host IP address: hostaddr.

**Explanation:** The server controller cannot continue because of an internal error.

**System Action:** CICS ONC RPC is disabled.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid, hostaddr

---

**Explanation:** The server controller used EXEC CICS LINK to access the converter for Decode processing, but got an error response that indicated that the converter was defined as remote. Data pointers are passed to and from the converter, and the referenced data can only be used if the converter runs in the local CICS region.

**System Action:** A system dump is taken. An svcerr_systemerr call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Install and define the converter program in the same CICS region as CICS ONC RPC.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

---

**DFHRP0620** date time applid tranid  The CICS ONC RPC server controller received an unexpected response from CICS when attempting to access converter converter_program_name. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

**Explanation:** A client request has failed because of an error in CICS.

**System Action:** A system dump is taken. An svcerr_systemerr call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** See the associated diagnostics issued by CICS for problem determination.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

---

**DFHRP0621** date time applid tranid  The CICS ONC RPC server controller is not authorized to link to converter converter_program_name. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

**Explanation:** The server controller cannot access the converter. This error can arise only if the supplied definitions for the server controller have been changed.

**System Action:** A system dump is taken. An svcerr_systemerr call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Ensure that the supplied definitions for the server controller are used, and reenable CICS ONC RPC.
DFHRP0625

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0625 date time applid tranid The CICS ONC RPC server controller encountered an error during Decode processing in converter converter_program_name.
Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum'

Explanation: Decode returned an unexpected response.
System Action: An svcerr_systemerr call is used to send a reply to the client.
User Response: Correct and replace the converter program in question.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0626 date time applid tranid The CICS ONC RPC server controller encountered an error during Decode processing in converter converter_program_name.
Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum'

Explanation: Decode returned URP_EXCEPTION with a reason of URP_CODRCLIENT_DATA.
System Action: An svcerr_decode call is used to send a reply to the client.
User Response: Compare the client program and the converter program and change one or the other to make the data formats consistent.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0628 date time applid tranid The CICS ONC RPC server controller encountered an error during Decode processing in converter converter_program_name.
Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum'

Explanation: Decode returned URP_EXCEPTION with a reason of URP_AUTH_BADCREDS.
System Action: An svcerr_auth call with a why-value of AUTH_BADCREDS is used to send a reply to the client.
User Response: If the client should be authorized to make this request, compare the client program and the converter, and change one or the other so that authentication requirements match.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, x'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0629 date time applid tranid The CICS ONC RPC server controller encountered an error during Decode processing in converter converter_program_name.
Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum'

Explanation: Decode returned URP_EXCEPTION with a reason of URP_AUTH_TOOWEAK.
System Action: An svcerr_auth call with a why-value of AUTH_TOOWEAK is used to send a reply to the client.
User Response: If the client should be authorized to make this request, compare the client program and the converter, and change one or the other so that authentication requirements match.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0631 date time applid tranid The CICS ONC RPC server controller encountered an error in Decode processing in converter converter_program_name.
The response was URP_EXCEPTION, but the reason decode_reason was not recognized. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum'

Explanation: Decode returned URP_EXCEPTION with an unrecognized reason code.
System Action: An svcerr_systemerr call is used to send a reply to the client.
User Response: If the reason code returned has a user-defined meaning act accordingly. If the reason code does not have a user-defined meaning, fix the problem with the converter and replace it.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0632 date time applid tranid The CICS ONC RPC server controller encountered an error during Decode processing in converter converter_program_name.
Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum'

Explanation: Decode returned URP_INVALID.
System Action: An svcerr_systemerr call is used to send a reply to the client.
User Response: The Decode parameter area will have been traced. If the values passed were correct, and the error is in the
for guidance on how to proceed.

**Destination:** CRPO  
**Module:** DFHRPMS  
**XMEOUT Parameters:** date, time, applid, tranid, clientaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

---

**DFHRP0635** date time applid tranid The CICS ONC RPC server controller encountered an error during Decode processing in converter converter_program_name.  
**Client IP address:** clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum'  
**Procedure:** X'procnum' Protocol: protocol Port: port  
**Socket:** socket.

**Explanation:** Decode returned URP_DISASTER.

**System Action:** An svcerr_systemerr call is used to send a reply to the client.

**User Response:** Correct and replace the converter.

**Destination:** CRPO  
**Module:** DFHRPMS  
**XMEOUT Parameters:** date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

---

**DFHRP0636** date time applid tranid The CICS ONC RPC server controller was unable to process an incoming client request due to lack of storage. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum'  
**Procedure:** X'procnum' Protocol: protocol Port: port  
**Socket:** socket.

**Explanation:** An incoming client request could not be processed because there was insufficient storage available.

**System Action:** An svcerr_systemerr call is used to send a reply to the client.

**User Response:** If this error occurs persistently, you may need to customize your CICS system to cure the lack of storage.

**Destination:** CRPO  
**Module:** DFHRPMS  
**XMEOUT Parameters:** date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

---

**DFHRP0637** date time applid tranid The CICS ONC RPC server controller was unable to process an incoming client request due to an internal error. clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum'  
**Procedure:** X'procnum' Protocol: protocol Port: port  
**Socket:** socket.

**Explanation:** An internal error has forced CICS ONC RPC to abandon a client request.

**System Action:** An svcerr_systemerr call is used to send a reply to the client.

**User Response:** You need further assistance from IBM to resolve this problem.

**Destination:** CRPO  
**Module:** DFHRPMS  
**XMEOUT Parameters:** date, time, applid, tranid, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

---

**DFHRP0640** date time applid tranid The CICS ONC RPC server controller has been started incorrectly.

**Explanation:** The server controller transaction CRPM has been started by a means other than the connection manager program, possibly by a user at a terminal.

**System Action:** The server controller abends with abend code ARP5.

**User Response:** Check that the CRPM transaction id was not entered by a terminal user.

**Destination:** CRPO  
**Module:** DFHRPMS  
**XMEOUT Parameters:** date, time, applid, tranid
**DFHRP0663**

Message DFHRP0663 describes a controller error that prevents starting an alias transaction due to temporary storage being unavailable. The transaction may fail because of a security check. The server controller detects an error while starting an alias transaction. An attempt by a user ID to access an alias failed because of a security check. This may not be an error as you may wish to prevent the client from accessing the alias transaction.

**Explanation:**
An internal error has prevented the server controller from starting the alias transaction.

**System Action:**
A system dump is taken. An svcerr_systemerr call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:**
You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid, alias_tranid, hostaddr, prognum, versnum, protocol, port, socket, clientaddr

**DFHRP0688**

Message DFHRP0688 describes a controller error that prevents starting an alias transaction due to temporary storage being unavailable. The transaction may fail because of a security check. This may not be an error as you may wish to prevent the client from accessing the alias transaction.

**Explanation:**
An internal error has prevented the server controller from starting an alias transaction.

**System Action:**
A system dump is taken. An svcerr_systemerr call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:**
You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid, alias_tranid, hostaddr, prognum, versnum, protocol, port, socket, clientaddr

**DFHRP0687**

Message DFHRP0687 describes a controller error that prevents starting an alias transaction due to temporary storage being unavailable. The transaction may fail because of a security check. This may not be an error as you may wish to prevent the client from accessing the alias transaction.

**Explanation:**
An internal error has prevented the server controller from starting the alias transaction.

**System Action:**
A system dump is taken. An svcerr_systemerr call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:**
Determine why the CICS default temporary storage data set is full. Enlarge the data set, or alter your CICS load to free space on it.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid, alias_tranid, hostaddr, prognum, versnum, protocol, port, socket

**DFHRP0689**

Message DFHRP0689 describes a controller error that prevents starting an alias transaction due to temporary storage being unavailable. The transaction may fail because of a security check. This may not be an error as you may wish to prevent the client from accessing the alias transaction.

**Explanation:**
An attempt by a user ID to access an alias transaction failed because of a security check. This may not be an error as you may wish to prevent the client from accessing the alias transaction.

**System Action:**
An svcerr_auth call with a why-value of AUTH_TOOWEAK is used to send a reply to the client.

**User Response:**
If you wish the user ID to access the alias, reenable CICS ONC RPC with a different value for CRPM Userid, or alter your surrogate user ID tables.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid, alias_tranid, hostaddr, prognum, versnum, X'procnum', protocol, port, socket

**DFHRP0690**

Message DFHRP0690 describes a controller error that prevents starting an alias transaction because the CICS default temporary storage data set is full. The error indicated that the transaction is remote. Client IP address: hostaddr Program: prognum Version: versnum Procedure: procnum Protocol: protocol Port: port Socket: socket.

**Explanation:**
A client request has failed because of an error in CICS.

**System Action:**
A system dump is taken. An svcerr_systemerr call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:**
See the associated diagnostics issued by CICS for problem determination.

**Destination:** CRPO

**Module:** DFHRPMS

**XMEOUT Parameters:** date, time, applid, tranid, alias_tranid, hostaddr, prognum, versnum, protocol, port, socket
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, alias-tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0691 date time applid tranid The CICS ONC RPC server controller found that the user ID attempting to access alias transaction alias-tranid is not known to the external security manager. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

Explanation: The server controller could not start the alias with the user ID because the user ID is not known to the external security manager.

System Action: An svcerr_auth call with a why-value of AUTH_TOOWEAK is used to send a reply to the client.

User Response: If you wish the alias to run under this user ID, define the userid to the external security manager, and change your surrogate user ID tables.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, alias-tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0692 date time applid tranid The CICS ONC RPC server controller found that the external security manager cannot validate the user ID for alias transaction alias-tranid. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

Explanation: An attempt to start the alias with an alias user ID failed as the external security manager cannot determine whether the user ID is valid.

System Action: An svcerr_systemerr call is used to send a reply to the client.

User Response: Determine the reason why the external security manager was unable to perform the request.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, alias-tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0694 date time applid tranid The CICS ONC RPC server controller could not start alias transaction alias_tranid because it is not defined. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

Explanation: The alias transaction alias_tranid is missing or is not correctly defined.

System Action: An svcerr_systemerr call is used to send a reply to the client.

User Response: Define the alias transaction correctly, or change the definitions of the 4-tuples that refer to it.
DFHRP0725  date time applid tranid The CICS ONC RPC server controller has detected an error when attempting to issue a RELEASE for the alias list program.

Explanation: During CICS ONC RPC disable processing, the server controller releases the alias list program, but received an error response.

System Action: Disable processing continues.

User Response: It might not be possible to reenable CICS ONC RPC without restarting CICS. If this error is not associated with others, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0726  date time applid tranid During disable processing, the CICS ONC RPC server controller found that the task-related user exit was already disabled.

Explanation: During disable processing, the server controller found that the task-related user exit was already disabled or that it has not been defined as an exit. This is probably the result of operator intervention.

System Action: Disable processing continues.

User Response: Take steps to prevent operator interference with the task-related user exit.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0727  date time applid tranid During disable processing, the CICS ONC RPC server controller found that the task-related user exit is in use by another task.

Explanation: During disable processing, the server controller found that the task-related user exit is currently invoked by another task. This may be a temporary condition, or it may be that the task related user exit has already been disabled.

System Action: Disable processing continues.

User Response: Investigate whether the operator has disabled the task related user exit DFHRPTRU for any reason.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0728  date time applid tranid The CICS ONC RPC server controller received an unexpected response from CICS while disabling the task-related user exit.

Explanation: An error occurred in CICS when the server controller tried to disable the task-related user exit during CICS ONC RPC disable processing.

System Action: A system dump is taken. Disable processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated diagnostics issued by CICS for problem determination.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0729  date time applid tranid The CICS ONC RPC server controller has detected an internal error during disable processing.

Explanation: CICS ONC RPC has detected an internal error during disable processing.

System Action: Disable processing continues.

User Response: If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0730  date time applid tranid The CICS ONC RPC server controller does not have authorization to access the task-related user exit.

Explanation: During disable processing, the server controller found that it did not have the authorization to access the task-related user exit. This problem arises if the supplied definitions of the server controller are changed. Changes to these definitions are not allowed.

System Action: Disable processing continues.

User Response: Ensure that the supplied definitions for the server controller are used, and reenable CICS ONC RPC.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0731  date time applid tranid The CICS ONC RPC server controller has detected an internal error during disable processing.

Explanation: CICS ONC RPC has detected an internal error during disable processing.

System Action: Disable processing continues.

User Response: If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0732  date time applid tranid The CICS ONC RPC server controller has detected an internal error during disable processing.

Explanation: During disable processing, the server controller attempted to unregister for problem determination, but received an error response.

System Action: Disable processing continues.

User Response: If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem.
Chapter 1. DFH messages

DFHRP0735 date time applid tranid The CICS ONC RPC server controller has encountered an internal error. Host IP address: hostaddr.

Explanation: The server controller has encountered an internal error and cannot continue.

System Action: A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, hostaddr

DFHRP0736 date time applid tranid The CICS ONC RPC server controller has encountered an internal error while processing a client request. Client IP address: clientaddr Host IP address: hostaddr Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol Port: port Socket: socket.

Explanation: An internal error has forced CICS ONC RPC to abandon a client request.

System Action: A system dump is taken. An svcerr_systemerr call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket

DFHRP0737 date time applid tranid The CICS ONC RPC server controller has encountered an internal error. Host IP address: hostaddr.

Explanation: The server controller has encountered an internal error and cannot continue.

System Action: A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, hostaddr

DFHRP0741 date time applid tranid The CICS ONC RPC server controller is abending with abend code ARP4.

Explanation: The server controller encountered an error and cannot continue.

System Action: CICS ONC RPC is disabled. CICS ONC RPC has already issued other diagnostics giving further information about the error. The server controller abends with abend code ARP4.

User Response: See the associated diagnostics and the description of abend code ARP4 for further guidance.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0746 date time applid tranid The CICS ONC RPC server controller is abending with abend code ARP2.

Explanation: The server controller encountered an error and cannot continue.

System Action: The server controller abends with abend code ARP2. CICS ONC RPC is disabled.

User Response: See the associated diagnostics and the description of abend code ARP2 for further guidance.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid

DFHRP0747 date time applid tranid The CICS ONC RPC server controller is abending with abend code ARP2.

Explanation: The server controller encountered an error and cannot continue.

System Action: The server controller abends with abend code ARP2. CICS ONC RPC is disabled.

User Response: See the associated diagnostics and the description of abend code ARP2 for further guidance.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid

Chapter 1. DFH messages 471
The CICS ONC RPC server controller has encountered an internal error when no client request was being processed. Host IP address: hostaddr.

Explanation: An internal error has occurred in the server controller. No client requests are affected.

System Action: A system dump is taken. The server controller continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPMS
XMEOUT Parameters: date, time, applid, tranid, hostaddr

The CICS ONC RPC RPC caller is initializing.

Explanation: The server controller has started initialization of the RPC caller.

System Action: Processing continues.

User Response: None.

Destination: CRPO
Module: DFHRPRP
XMEOUT Parameters: date, time, applid

The CICS ONC RPC RPC caller has been initialized successfully.

Explanation: The RPC caller has been initialized, and it is now ready for use.

System Action: Processing continues.

User Response: None.

Destination: CRPO
Module: DFHRPRP
XMEOUT Parameters: date, time, applid

The CICS ONC RPC RPC caller is shutting down.

Explanation: Termination of the RPC caller has started.

System Action: Processing continues.

User Response: None.

Destination: CRPO
Module: DFHRPRP
XMEOUT Parameters: date, time, applid

The CICS ONC RPC RPC caller has successfully shutdown.

Explanation: Termination of the RPC caller has completed.

System Action: Processing continues.

User Response: None.

Destination: CRPO
Module: DFHRPRP
XMEOUT Parameters: date, time, applid

Invalid data has been entered in field fieldname.

Explanation: Invalid data was entered on a connection manager panel in field fieldname.

System Action: The panel is redisplayed and the field in error is highlighted.

User Response: Enter valid data in the field indicated. See the CICS External Interfaces Guide for further guidance.

Destination: Terminal End User
Module: DFHRPC06, DFHRPC10, DFHRPC0A, DFHRPC1B

The value entered in field fieldname exceeds the maximum allowed.

Explanation: The value entered on a connection manager panel in field fieldname exceeds the maximum allowed.

System Action: The panel is redisplayed and the field in error is highlighted.

User Response: Enter valid data in the field indicated. See the CICS External Interfaces Guide for further guidance.

Destination: Terminal End User
Module: DFHRPC0B

The CICS ONC RPC connection manager has not been started correctly.

Explanation: The connection manager has been started from a non-BMS terminal but is not being used to enable or disable CICS ONC RPC.

System Action: The connection manager terminates.

User Response: The connection manager can be used as follows from a non-BMS terminal:
- If CICS ONC RPC is disabled, the connection manager can be used for automatic enable, either by setting automatic enable to YES on the CICS ONC RPC data set or by entering a fast path command with YES for automatic enable.
- If CICS ONC RPC is enabled, the connection manager can be used for disable by entering a valid disable fast path command.

See the CICS External Interfaces Guide for guidance on how to start the connection manager.

Destination: CRPO
Module: DFHRPC01
XMEOUT Parameters: date, time, applid, tranid
DFHRP1506 date time applid tranid The CICS ONC RPC connection manager detected an error attempting to retrieve any fast path data. EIBRESP: eibresp.

Explanation: The connection manager was attempting to retrieve any fast path commands that may have been specified when it was initiated. The connection manager issued an EXEC CICS GETMAIN command, but received the response eibresp.

System Action: A system dump is taken. The connection manager continues but any fast path commands are ignored. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC01
XMEOUT Parameters: date, time, applid, tranid, eibresp

DFHRP1507 date time applid tranid An invalid CICS ONC RPC fast path command has been entered: fastpath_command

Explanation: The connection manager was started by entering a fast path command, but the format of the command was invalid.

System Action: The connection manager is started, but fast path commands are ignored.

User Response: Enter a valid fast path command. See the CICS External Interfaces Guide for further guidance.

Destination: CRPO
Module: DFHRPC01
XMEOUT Parameters: date, time, applid, tranid, fastpath_command

DFHRP1508 date time applid tranid The CICS ONC RPC connection manager has not been started correctly.

Explanation: The connection manager was attempting to retrieve any fast path commands that may have been specified when it was initiated, but detected an invalid STARTCODE indicator.

System Action: The connection manager continues but any fast path commands are ignored.

User Response: See the CICS External Interfaces Guide for guidance on how to start the connection manager. If the connection manager was started correctly, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO
Module: DFHRPC01
XMEOUT Parameters: date, time, applid, tranid

DFHRP1509 date time applid tranid The CICS ONC RPC connection manager detected an error attempting to retrieve any fast path data. EIBRESP: eibresp.

Explanation: The connection manager was attempting to retrieve any fast path commands that may have been specified when it was initiated using an EXEC CICS START command. The connection manager issued an EXEC CICS RETRIEVE command, but received the response eibresp.

System Action: A system dump is taken. The connection manager continues but any fast path commands are ignored. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC01
XMEOUT Parameters: date, time, applid, tranid, eibresp

DFHRP1510 date time applid tranid The CICS ONC RPC connection manager could not access the CICS ONC RPC data set, CICS file filename. EIBRESP: eibresp.

Explanation: The connection manager could not access the CICS ONC RPC data set, CICS file filename. An EXEC CICS READ was issued, but received the response eibresp. The data set has not been correctly defined to CICS for one of the following reasons:

- No file definition has been found for filename. CICS ONC RPC has therefore not been installed correctly.
- READ operations are not allowed on the file.
- The file is DISABLED, either due to an incorrect file definition, or due to operator intervention.
- The file cannot be opened because it has not been defined correctly, or because it has been closed by operator intervention.
- The connection manager transaction, or the user running it, does not have the necessary level of authority to access the file.

System Action: The requested operation is not performed.

User Response: Use Appendix A of the Application Programming Reference manual to find out what the EIBRESP value means, and take appropriate action.

Destination: CRPO
Module: DFHRPC09
XMEOUT Parameters: date, time, applid, tranid, filename, eibresp

DFHRP1511 date time applid tranid The CICS ONC RPC connection manager has detected a logic error accessing the CICS ONC RPC data set, CICS file filename.

Explanation: The connection manager received an unexpected error when accessing the CICS ONC RPC data set, CICS file filename. This is a logic error. The connection manager has received an unexpected response from CICS following an EXEC CICS command.
DFHRP1512

Explanation: The connection manager could not access CICS ONC RPC data set CICS file filename. The data set has not been correctly defined to CICS for one of the following reasons:

- No file definition has been found for filename. CICS ONC RPC has therefore not been installed correctly.
- READ operations are not allowed on the file.
- The file has been disabled, either due to an incorrect data set definition, or due to operator intervention.
- The file cannot be opened because it has not been defined correctly, or because it has been closed by operator intervention.
- The connection manager transaction, or the user running the connection manager, does not have the necessary level of authority to access the file.

System Action: The message is displayed at the terminal.

User Response: Ensure that all the CEDA groups for CICS ONC RPC have been installed correctly.

Investigate whether the operator has changed the status of the file for any reason.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: date, time, applid, tranid, filename

DFHRP1513

Explanation: The connection manager detected an error in the definition record in the CICS ONC RPC data set, CICS file filename.

System Action: A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that the first record in the data set has been correctly initialized. You can do this by manually updating the record (see the CICS External Interfaces Guide for further guidance), or by deleting the first record in the data set, and rerunning the connection manager. This creates a new definition record using the default settings which can then be updated using the connection manager panels.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: date, time, applid, tranid, filename

DFHRP1514

Explanation: The connection manager detected that the length of the associated global work area is not correct.

System Action: A system dump is taken. CICS ONC RPC is disabled. It is not possible to enable CICS ONC RPC until the problem is resolved. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Make sure that no user-written version of program DFHRPTRU is being used. Only the CICS ONC RPC supplied program can be used with CICS ONC RPC. Similarly, the CICS ONC RPC supplied task-related user exit DFHRPTRU should only be enabled and disabled by the connection manager. It should not be necessary to enable or disable DFHRPTRU in any other way.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: date, time, applid, tranid

DFHRP1515

Explanation: The connection manager could not access the CICS ONC RPC data set, CICS file filename. An EXEC CICS READ was issued, but received the response EIBRESP. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.
- VSAM has returned an unexpected response to CICS.
- An I/O error occurred on the READ.

System Action: A system dump is taken. The requested operation is not performed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use Appendix A of the Application Programming Reference manual to find out what the EIBRESP value means, and take appropriate action.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: date, time, applid, tranid, filename, eibresp

DFHRP1516

Explanation: The connection manager found that the CICS ONC RPC definition record is missing from the CICS ONC RPC data set, CICS file filename, while processing a request to update this record.

System Action: A system dump is taken. The connection manager panel is redisplayed. The CICS ONC RPC definition record cannot be updated. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the reason why this record does not exist. You must create a new CICS ONC RPC definition record with the connection manager.
Destination: CRPO
Module: DFHRPC01
XMEOUT Parameters: date, time, applid, tranid, eibresp2

DFHRP1521 date time applid tranid The CICS ONC RPC connection manager cannot access its task related user exit.

Explanation: The connection manager cannot access the task related user exit. It received an unexpected response to an EXEC CICS EXTRACT EXIT call.

System Action: A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC01
XMEOUT Parameters: date, time, applid, tranid

DFHRP1522 date time applid tranid The CICS ONC RPC connection manager has been started against an invalid terminal.

Explanation: The connection manager has been started against a terminal that is not supported, for example, an LUTYPE6 terminal.

System Action: The connection manager abends with abend code ARPX.

User Response: Start the connection manager against a valid terminal. See the CICS External Interfaces Guide for further guidance on starting the connection manager.

Destination: CRPO
Module: DFHRPC01
XMEOUT Parameters: date, time, applid, tranid

DFHRP1523 date time applid tranid CICS ONC RPC cannot be enabled because the connection manager cannot access the task-related user exit DFHRPTRU.

Explanation: The connection manager could not enable CICS ONC RPC because an error occurred accessing the task related user exit DFHRPTRU.

System Action: A system dump is taken. This instance of connection manager can only be used to inquire on, or update the CICS ONC RPC data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the CRPO transient data queue for messages indicating the nature of the error, and take the appropriate action. Then restart the connection manager transaction and select the enable option again.

Destination: CRPO
Module: DFHRPC01
XMEOUT Parameters: date, time, applid, tranid
DFHRP1524  date time applid tranid  CICS ONC RPC cannot be enabled because the server controller is already running.

Explanation: The connection manager detected that the task-related user exit DFHRPTRU is disabled, but the server controller transaction is still running.

System Action: A system dump is taken. This instance of connection manager can only be used to inquire on, or update, the CICS ONC RPC data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate why the last attempt to disable CICS ONC RPC did not complete successfully. Investigate the possibility of operator intervention.

Once you have established that it is safe to continue, use CEMT SET TASK or EXEC CICS SET TASK to purge the server controller task may have been forcepurged by the operator. Once you have established that it is safe to continue, try running the connection manager again to enable CICS ONC RPC.

Destination: CRPO
Module: DFHRPC01
XMEOUT Parameters: date, time, applid, tranid

DFHRP1525  date time applid tranid The CICS ONC RPC connection manager received an unexpected response from CICS.

Explanation: The connection manager detected a logic error. It received an unexpected response to a CICS command.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC01
XMEOUT Parameters: date, time, applid, tranid

DFHRP1526  date time applid tranid The CICS ONC RPC connection manager found that the task-related user exit is enabled, but the server controller is not running.

Explanation: The connection manager has detected that the task-related user exit DFHRPTRU is enabled, but the server controller is not running. This means that CICS ONC RPC is in an indeterminate state.

System Action: This instance of connection manager can only be used to inquire on, or update, the CICS ONC RPC data set.

User Response: Investigate whether the previous attempt to disable CICS ONC RPC completed successfully. Alternatively, the server controller task may have been forcepurged by the operator. Once you have established that it is safe to continue, try running the connection manager again and enabling CICS ONC RPC.

Destination: CRPO
Module: DFHRPC01
XMEOUT Parameters: date, time, applid, tranid

DFHRP1527  date time applid tranid  CICS ONC RPC cannot be enabled because disable processing has not completed.

Explanation: CICS ONC RPC is being disabled.

System Action: The current instance of CICS ONC RPC is disabled.

User Response: Wait for disable to complete before attempting to enable the CICS ONC RPC again.

Destination: CRPO and Terminal End User
Module: DFHRPC4C
XMEOUT Parameters: date, time, applid, tranid

DFHRP1528  date time applid tranid  The CICS ONC RPC connection manager detected an error while initializing the RPC caller component during CICS ONC RPC enable processing.

Explanation: The RPC caller could not be started.

System Action: The enable attempt is abandoned.

User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO and Terminal End User
Module: DFHRPC4C
XMEOUT Parameters: date, time, applid, tranid

DFHRP1529  date time applid tranid The CICS ONC RPC connection manager detected an error in enable processing. Host IP address hostaddr.

Explanation: The connection manager discovered a storage problem while trying to enable CICS ONC RPC.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated diagnostics issued by CICS for problem determination.

See the CICS Problem Determination Guide for guidance on dealing with storage problems.

Destination: CRPO and Terminal End User
Module: DFHRPC4C
XMEOUT Parameters: date, time, applid, tranid, hostaddr

DFHRP1530  date time applid tranid  The CICS ONC RPC connection manager detected a CICS short on storage condition during initialization of the RPC caller component. Host IP address hostaddr.

Explanation: The connection manager detected a short on storage condition.

System Action: The enable attempt is abandoned.

User Response: See the associated diagnostics issued by CICS for problem determination. See the CICS Problem Determination Guide for guidance on dealing with storage problems.

When the short on storage problem has been resolved, try to enable CICS ONC RPC again.
DFHRP1531

**DFHRP1531 date time applid tranid The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file filename. EIBRESP: eibresp.**

**Explanation:** The connection manager could not access the CICS ONC RPC data set, CICS file filename. An EXEC CICS WRITE was issued, but received the response eibresp. The error can occur for one of the following reasons:

- No file definition has been found for the file, implying that CICS ONC RPC has not been installed correctly.
- Write operations are not allowed, implying that CICS ONC RPC has not been installed correctly.
- The file is DISABLED, either due to an incorrect file definition, or due to operator intervention.
- The file is NOTOPEN, either due to an incorrect file definition or due to operator intervention.
- Write operations are not authorized, implying that security has not been set up correctly.

**System Action:** The requested operation is not performed.

**User Response:** Use Appendix A of the Application Programming Reference manual to find out what the EIBRESP value means, and take appropriate action.

**Destination:** CRPO

**Module:** DFHRPC09

**XMEOUT Parameters:** date, time, applid, tranid, filename, eibresp

---

DFHRP1532

**DFHRP1532 date time applid tranid The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file filename. EIBRESP: eibresp.**

**Explanation:** The connection manager could not access the CICS ONC RPC data set, CICS file filename. An EXEC CICS WRITE was issued, but received the response eibresp. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.
- VSAM has returned an unexpected response to CICS.
- An I/O error occurred on the WRITE.
- There is insufficient space available on the DASD device containing this file.

**System Action:** A system dump is taken. The requested operation is not performed. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Use Appendix A of the Application Programming Reference manual to find out what the EIBRESP value means, and take appropriate action.

**Destination:** CRPO

**Module:** DFHRPC09

**XMEOUT Parameters:** date, time, applid, tranid, filename, eibresp

---

DFHRP1533

**DFHRP1533 date time applid tranid The CICS ONC RPC connection manager has detected a logic error while accessing the CICS ONC RPC data set, CICS file filename.**

**Explanation:** The connection manager used EXEC CICS WRITE to update the CICS ONC RPC data set, but received an unexpected response. This is a logic error.

**System Action:** A system dump is taken. The requested operation is not performed. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC09

**XMEOUT Parameters:** date, time, applid, tranid, filename

---

DFHRP1534

**DFHRP1534 date time applid tranid The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file filename. EIBRESP: eibresp.**

**Explanation:** The connection manager could not access the CICS ONC RPC data set, CICS file filename. An EXEC CICS WRITE was issued, but received the response eibresp. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.
- VSAM has returned an unexpected response to CICS.
- An I/O error occurred on the WRITE.
- There is insufficient space available on the DASD device containing this file.

**System Action:** A system dump is taken. The 4-tuple definition is not saved in the data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Use Appendix A of the Application Programming Reference manual to find out what the EIBRESP value means, and take appropriate action.

**Destination:** CRPO

**Module:** DFHRPC09

**XMEOUT Parameters:** date, time, applid, tranid, filename, eibresp

---

DFHRP1536

**DFHRP1536 date time applid tranid There was no entry for this 4-tuple in the CICS ONC RPC data set, CICS file filename.**

**Explanation:** The connection manager did not find this 4-tuple in the CICS ONC RPC data set.

**System Action:** None.

**User Response:** Enter a 4-tuple that has already been saved in the data set.

**Destination:** Terminal End User

**Module:** DFHRPC09
DFHRP1537  
\textit{date time applid tranid} The CICS ONC RPC connection manager detected an internal error while registering 4-tuples from the CICS ONC RPC data set, CICS file \textit{filename}.

**Explanation:** The connection manager detected an internal error while processing a request to register 4-tuples from the CICS ONC RPC data set.

**System Action:** A system dump is taken. No 4-tuples are registered. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO  
**Module:** DFHRPC09  
**XMEOUT Parameters:** date, time, applid, tranid, filename

---

DFHRP1538  
\textit{date time applid tranid} The CICS ONC RPC connection manager found no records on the CICS ONC RPC data set, CICS file \textit{filename}.

**Explanation:** The connection manager was processing a request to register 4-tuples, but found no records on the CICS ONC RPC data set. The CICS ONC RPC definition record is missing.

**System Action:** A system dump is taken. No 4-tuples are registered. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Investigate the reason why there are no records. You must use the connection manager to create a new one.

**Destination:** CRPO  
**Module:** DFHRPC09  
**XMEOUT Parameters:** date, time, applid, tranid, filename

---

DFHRP1539  
\textit{date time applid tranid} The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file \textit{filename}, while registering 4-tuples from the data set. EIBRESP: eibresp.

**Explanation:** The connection manager could not access the CICS ONC RPC data set. The error occurred while processing a request to register 4-tuples from the data set. Associated message DFHRP1545 may have been issued to indicate the number of 4-tuples that were registered.

An EXEC CICS STARTBR, EXEC CICS READNEXT, or EXEC CICS ENDDBR was issued, but received the response eibresp. The error can occur for one of the following reasons:

- No file definition has been found for the file, implying that CICS ONC RPC has not been installed correctly.
- BROWSE or READ operations are not allowed, implying that CICS ONC RPC has not been installed correctly.
- The file is DISABLED, either due to an incorrect file definition, or due to operator intervention.
- The file is NOTOPEN, either due to an incorrect file definition, or due to operator intervention.
- BROWSE or READ operations are not authorized, implying that security has not been set up correctly.

**System Action:** A system dump is taken. The connection manager cannot register 4-tuples from the data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Use Appendix A of the Application Programming Reference manual to find out what the EIBRESP value means, and take appropriate action.

**Destination:** CRPO  
**Module:** DFHRPC09  
**XMEOUT Parameters:** date, time, applid, tranid, filename, eibresp

---

DFHRP1540  
\textit{date time applid tranid} The CICS ONC RPC connection manager detected a logic error.

**Explanation:** The connection manager received an unexpected response from CICS following an EXEC CICS command.

**System Action:** A system dump is taken. The connection manager abends with abend code ARPV. The other components of CICS ONC RPC continue. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO  
**Module:** DFHRPC4C  
**XMEOUT Parameters:** date, time, applid, tranid

---

---

DFHRP1542  
\textit{date time applid tranid} CICS ONC RPC detected an error while accessing the CICS ONC RPC data set, CICS file \textit{filename}, while registering 4-tuples from the data set. EIBRESP: eibresp.

**Explanation:** The connection manager could not access the CICS ONC RPC data set.

**System Action:** A system dump is taken. The error occurred while processing a request to register 4-tuples from the data set. Associated message DFHRP1545 may have been issued to indicate the number of 4-tuples that were registered.

An EXEC CICS STARTBR, EXEC CICS READNEXT or EXEC CICS ENDDBR was issued, but received the response eibresp. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.
• VSAM has returned an unexpected response to CICS.
• An I/O error occurred on the BROWSE or READ command.

**System Action:** A system dump is taken. The connection manager cannot register 4-tuples from the data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Use Appendix A of the Application Programming Reference manual to find out what the EIBRESP value means, and take appropriate action. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO
**Module:** DFHRPC09
**XMEOUT Parameters:** date, time, applid, tranid, filename, eibresp

---

**DFHRP1543 date time applid tranid The CICS ONC RPC connection manager detected a logic error while accessing the CICS ONC RPC data set, CICS file filename, while registering 4-tuples from the data set.**

**Explanation:** The connection manager has detected an error while accessing the CICS ONC RPC data set. This is a logic error since connection manager has received an unexpected response from CICS following an EXEC CICS STARTBR, EXEC CICS READNEXT or EXEC CICS ENDBR command.

The error occurred while processing a request to register 4-tuples from the data set. Associated message DFHRP1545 may have been issued to indicate the number of 4-tuples that were registered.

**System Action:** A system dump is taken. The connection manager cannot register 4-tuples from the data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO
**Module:** DFHRPC09
**XMEOUT Parameters:** date, time, applid, tranid, filename, count1, count2

---

**DFHRP1544 date time applid tranid The CICS ONC RPC connection manager found no records in the CICS ONC RPC data set, CICS file filename.**

**Explanation:** The connection manager was processing a request to register 4-tuples from the CICS ONC RPC data set, but found no 4-tuple records in it. Associated message DFHRP1545 indicates how many 4-tuples were registered.

**System Action:** A system dump is taken. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Investigate the reason why there are no records. You must use the connection manager to create a new CICS ONC RPC definition record.

**Destination:** CRPO
**Module:** DFHRPC09
**XMEOUT Parameters:** date, time, applid, tranid, filename

---

**DFHRP1545 date time applid tranid The CICS ONC RPC connection manager has completed registration of 4-tuples from the CICS ONC RPC data set, CICS file filename. Successful registers: count1. Unsuccessful registers: count2.**

**Explanation:** The connection manager has finished registering 4-tuples from the CICS ONC RPC data set, CICS file filename. count1 indicates the number of 4-tuples that have been successfully registered. count2 indicates the number of 4-tuples that were not registered.

**System Action:** No further action.
**User Response:** No further action.

**Destination:** CRPO
**Module:** DFHRPC09
**XMEOUT Parameters:** date, time, applid, tranid, filename, count1, count2

---

**DFHRP1546 date time applid tranid The CICS ONC RPC connection manager found no 4-tuple records on the CICS ONC RPC data set, CICS file filename.**

**Explanation:** The connection manager was processing a request to register 4-tuples from the CICS ONC RPC data, but found no 4-tuple records in it.

**System Action:** No 4-tuples are registered.
**User Response:** Store some 4-tuple definitions in the data set before requesting this option.

**Destination:** CRPO
**Module:** DFHRPC09
**XMEOUT Parameters:** date, time, applid, tranid, filename

---

**DFHRP1547 date time applid tranid The CICS ONC RPC connection manager detected an internal error while registering 4-tuples from the CICS ONC RPC data set, CICS file filename.**

**Explanation:** The connection manager detected an internal error while processing a request to register 4-tuple from the CICS ONC RPC data set. Associated message DFHRP1545 indicates how many 4-tuples were registered.

**System Action:** A system dump is taken. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO
**Module:** DFHRPC09
**XMEOUT Parameters:** date, time, applid, tranid, filename
DFHRP1548

**DFHRP1548** date time applid tranid The CICS ONC RPC connection manager detected an error attempting to retrieve any fast path data. EIBRESP: eibresp.

**Explanation:** The connection manager was attempting to retrieve any fast path commands that may have been specified when it was initiated from a terminal. The connection manager issued an EXEC CICS RECEIVE command, but received a response in field eibresp.

**System Action:** A system dump is taken. Start up of CICS ONC RPC continues but any fast path commands are ignored. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC01

**XMEOUT Parameters:** date, time, applid, tranid, eibresp

---

**DFHRP1549** date time applid tranid The CICS ONC RPC connection manager received an error response while registering with CICS for problem determination.

**Explanation:** The connection manager received an unexpected response from CICS when attempting to register for problem determination.

**System Action:** A system dump is taken. CICS feature tracing and dump formatting cannot be used for CICS ONC RPC. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC01

**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP1550** date time applid tranid The CICS ONC RPC connection manager received an error response while registering with CICS for problem determination.

**Explanation:** The connection manager received an unexpected response from CICS when attempting to register for problem determination.

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC01

**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP1551** date time applid tranid The CICS ONC RPC connection manager could not enable CICS ONC RPC because of a CICS short on storage condition.

**Explanation:** The connection manager has made a request for storage during enable processing, but has received a reply indicating that CICS is short on storage.

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** See the associated diagnostics issued by CICS for problem determination. You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP1552** date time applid tranid The CICS ONC RPC connection manager has detected an internal error during enable processing.

**Explanation:** An internal error detected during enable processing has prevented the connection manager from enabling CICS ONC RPC.

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP1554** date time applid tranid The CICS ONC RPC connection manager is not authorized to use the CICS SPI.

**Explanation:** The connection manager has not been defined with the authorization necessary to execute CICS system programming interface commands. It cannot function without this authorization.

**System Action:** A system dump is taken. The enable attempt is abandoned.

**User Response:** Message DFHME0116 is normally produced containing the symptom string for this problem. Redefine the connection manager transaction and its associated program DFHRPC00 with the appropriate level of security to be able to use the CICS SPI.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid
DFHRP1555 date time applid tranid The CICS ONC RPC connection manager is not authorized to use the program DFHRPTRU.

**Explanation:** The connection manager used the EXEC CICS ENABLE PROGRAM command for DFHRPTRU, but it has not been defined with the authorization necessary to use DFHRPTRU. It cannot function without this authorization.

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Redefine the connection manager and its associated programs with the appropriate level of security to be able to use the CICS ONC RPC supplied task-related user exit DFHRPTRU.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

DFHRP1556 date time applid tranid The CICS ONC RPC connection manager has detected an internal error during enable processing.

**Explanation:** An internal error detected by the connection manager during enable processing has prevented CICS ONC RPC from being enabled.

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

DFHRP1557 date time applid tranid The CICS ONC RPC connection manager has detected an internal error during enable processing.

**Explanation:** An internal error detected by the connection manager during enable processing has prevented CICS ONC RPC from being enabled.

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

DFHRP1558 date time applid tranid The CICS ONC RPC connection manager could not find the task-related user exit, program DFHRPTRU.

**Explanation:** The connection manager cannot find the task-related user exit, DFHRPTRU, for one of the following reasons:

- DFHRPTRU has not been defined to CICS
- DFHRPTRU is not in the CICS load library
- DFHRPTRU has been disabled

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Ensure that all the CEDA groups for CICS ONC RPC have been installed correctly, then try the enable request again.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

DFHRP1559 date time applid tranid The CICS ONC RPC connection manager could not enable CICS ONC RPC because of a CICS short on storage condition.

**Explanation:** The connection manager has made a request for storage during enable processing, but has received a reply indicating that CICS is short on storage.

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** See the associated diagnostics issued by CICS for problem determination. See the dfhtm00l for guidance on dealing with CICS storage problems.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

DFHRP1560 date time applid tranid The CICS ONC RPC connection manager has detected an internal error during enable processing.

**Explanation:** An internal error detected by the connection manager during enable processing has prevented CICS ONC RPC from being enabled.

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid
DFHRP1561  
*date time applid tranid*  
The CICS ONC RPC connection manager found that the task-related user exit, program DFHRPTRU, is already enabled.

**Explanation:** The connection manager found that the task-related user exit, DFHRPTRU, is already enabled.

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Take steps to prevent operator intervention with the task related user exit, then try the enable request again.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

DFHRP1564  
*date time applid tranid*  
CICS ONC RPC could not be enabled due to an internal error while starting the server controller. Host IP address: hostaddr.

**Explanation:** The connection manager attempted to start the server controller by issuing an EXEC CICS START command, but could not determine the response that was returned.

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid, hostaddr

DFHRP1565  
*date time applid tranid*  
CICS ONC RPC cannot be enabled because the connection manager is not authorized to start the server controller. EIBRESP: eibresp. Host IP address: hostaddr.

**Explanation:** The connection manager attempted to start the server controller by issuing an EXEC CICS START command, but the NOTAUTH response was returned.

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** See the CICS System Programming Reference for the meaning of the value returned in eibresp. Use CEDA to ensure that the resource definitions for the CICS ONC RPC supplied programs and transactions have been defined with the correct levels of security. The connection manager must have the correct level of authority to start the server controller in order for CICS ONC RPC to be enabled successfully.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid, eibresp, hostaddr

DFHRP1566  
*date time applid tranid*  
CICS ONC RPC cannot be enabled due to an error starting the server controller. EIBRESP: eibresp. Host IP address: hostaddr.

**Explanation:** The connection manager attempted to start the server controller by issuing an EXEC CICS START command, but the TRANSIDERR response was returned.

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Use CEDA to ensure that the resource definitions for the CICS ONC RPC supplied programs and transactions have been defined with the correct levels of security. In order to enable CICS ONC RPC, the connection manager must have the correct level of authority to start the server controller.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid, eibresp, hostaddr

DFHRP1567  
*date time applid tranid*  
CICS ONC RPC could not be enabled due to a security error starting the server controller. User ID userid is unknown. Host IP address: hostaddr.

**Explanation:** The connection manager attempted to start the server controller by issuing an EXEC CICS START USERID command, but the USERIDERR response was returned.

The user ID specified for the server controller is not known to the external security manager.

**System Action:** The enable attempt is abandoned.

**User Response:** Ensure that a valid user ID is specified for CRPM Userid.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid, userid, hostaddr

DFHRP1568  
*date time applid tranid*  
CICS ONC RPC could not be enabled due to a security error starting the server controller. Host IP address: hostaddr.

**Explanation:** The connection manager attempted to start the server controller by issuing an EXEC CICS START USERID command, but the USERIDERR response was returned.

The external security manager is in a state such that it cannot validate the user ID specified for the server controller.

**System Action:** A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Investigate the reason why the external security manager cannot perform this request.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid, hostaddr
DFHRP1569 date time applid tranid The CICS ONC RPC connection manager has detected an internal error during enable processing.

Explanation: An internal error detected by the connection manager during enable processing has prevented CICS ONC RPC from being enabled.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO
Module: DFHRPC4C
XMEOUT Parameters: date, time, applid, tranid

DFHRP1570 date time applid tranid CICS ONC RPC storage subpool token not saved.

Explanation: The connection manager has detected an error while saving the storage subpool token.

System Action: A system dump is taken. CICS ONC RPC continues normally. However if CICS ONC RPC abends, it may not be possible to reenable CICS ONC RPC without restarting CICS. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated diagnostics issued by CICS for problem determination.

Destination: CRPO
Module: DFHRPC4C
XMEOUT Parameters: date, time, applid, tranid

DFHRP1571 date time applid tranid The CICS ONC RPC connection manager is not authorized to load module module.

Explanation: The connection manager has not been defined with the authorization necessary to issue an EXEC CICS LOAD command for the named module.

System Action: The enable attempt is abandoned.

User Response: Redefine the connection manager and its associated programs with the appropriate level of security to be able to issue EXEC CICS LOAD commands for the named CICS ONC RPC program.

Destination: CRPO
Module: DFHRPC4C
XMEOUT Parameters: date, time, applid, tranid, module

DFHRP1572 date time applid tranid The CICS ONC RPC connection manager detected an error while loading module.

Explanation: The connection manager tried to load the module, but the response to EXEC CICS LOAD was PGMDERR.

System Action: The enable attempt is abandoned.

User Response: Use the CEDA transaction to ensure that the connection manager (program DFHRPC00) and the named program are correctly defined. See the CICS External Interfaces Guide for the correct program definitions.

Destination: CRPO
Module: DFHRPC4C
XMEOUT Parameters: date, time, applid, tranid, module

DFHRP1574 date time applid tranid The CICS ONC RPC connection manager load for module returned an unexpected response.

Explanation: The connection manager has not been able to load the module into storage. A response other than NOTAUTH or PGMIDERR was returned to the EXEC CICS LOAD command.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the system dump to determine why the LOAD could not work.

Destination: CRPO
Module: DFHRPC4C
XMEOUT Parameters: date, time, applid, tranid, module

DFHRP1575 date time applid tranid CICS ONC RPC could not be enabled due to an internal error starting the server controller. Host IP address: hostaddr.

Explanation: The connection manager attempted to start the server controller by issuing an EXEC CICS START command, but received an unexpected response.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC4C
XMEOUT Parameters: date, time, applid, tranid, hostaddr

DFHRP1576 date time applid tranid CICS ONC RPC could not be enabled due to an internal error starting the server controller. EIBRESP: eibresp. Host IP address: hostaddr.

Explanation: The connection manager attempted to start the server controller by issuing an EXEC CICS START command, but the INVREQ response was returned.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC4C
XMEOUT Parameters: date, time, applid, tranid, eibresp, hostaddr
DFHRP1577 date time applid tranid The CICS ONC RPC connection manager cannot access its task-related user exit DFHRPTRU.

Explanation: The connection manager was unable to access its task-related user exit DFHRPTRU during enable processing.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Check that the task-related user exit has not been disabled by operator intervention. See the associated diagnostics issued by CICS for problem determination.

Destination: CRPO
Module: DFHRPC42
XMEOUT Parameters: date, time, applid, tranid

DFHRP1579 date time applid tranid The CICS ONC RPC connection manager detected an internal error while registering 4-tuples from the CICS ONC RPC data set, CICS file filename.

Explanation: The connection manager has detected an internal error while processing a request to register 4-tuples from the CICS ONC RPC data set. Associated message DFHRP1545 may have been issued to indicate the number of 4-tuples that were successfully registered.

System Action: A system dump is taken. Registration of 4-tuples from the data set does not continue. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC09
XMEOUT Parameters: date, time, applid, tranid, filename

DFHRP1580 date time applid tranid The CICS ONC RPC connection manager cannot establish whether security is active or obtain the default CICS user ID. EIBRESP: eibresp.

Explanation: The connection manager was unable to retrieve status information about CICS, and therefore cannot establish whether security is active, or obtain the default CICS user ID.

An EXEC CICS INQUIRE SYSTEM was issued but received the response shown in the message.

System Action: Processing continues under the assumption that there is no security active. Panel DFHRP02 is displayed with no user ID in field CRPM Userid, unless a user ID was saved in the CICS ONC RPC data set.

User Response: Ensure that the connection manager has the correct level of security to use CICS system programming interface commands.

Destination: CRPO
Modules: DFHRPC03, DFHRPC05
XMEOUT Parameters: date, time, applid, tranid, filename

DFHRP1581 date time applid tranid The CICS ONC RPC connection manager detected an internal error while accessing the CICS ONC RPC data set, CICS file filename.

Explanation: The connection manager has detected an internal error while accessing the CICS ONC RPC data set.

System Action: A system dump is taken. The panel is redisplayed. No records can be updated. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Modules: DFHRPC03, DFHRPC05
XMEOUT Parameters: date, time, applid, tranid, filename

DFHRP1582 date time applid tranid The CICS ONC RPC connection manager detected an internal error while accessing the CICS ONC RPC data set, CICS file filename.

Explanation: The connection manager has detected an internal error while accessing the CICS ONC RPC data set.

System Action: A system dump is taken. The connection manager panel is redisplayed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Modules: DFHRPC03, DFHRPC05
XMEOUT Parameters: date, time, applid, tranid, filename

DFHRP1583 date time applid tranid The CICS ONC RPC connection manager found no entry for this 4-tuple in the CICS ONC RPC data set, CICS file filename.

Explanation: The connection manager has not found this 4-tuple in the CICS ONC RPC data set.

System Action: None.

User Response: Enter a 4-tuple that has already been saved in the data set.

Destination: Terminal End User
Module: DFHRPC09
DFHRP1584  
connection manager detected an error while accessing the CICS ONC RPC data set, CICS file filename. EIBRESP: eibresp.

**Explanation:** The connection manager could not access the CICS ONC RPC data set. An EXEC CICS DELETE was issued, but received the response eibresp. The data set has not been correctly defined to CICS for one of the following reasons:

- No file definition has been found for filename. CICS ONC RPC has therefore not been installed correctly.
- DELETE operations are not allowed on the file.
- The file has been disabled, either due to an incorrect file definition, or due to operator intervention.
- The file cannot be opened because it has not been defined correctly, or because it has been closed by operator intervention.
- The connection manager, or the user running it, does not have the necessary level of authority to access the file.

**System Action:** The requested operation is not performed. The connection manager cannot perform any operation requiring access to the data set.

**User Response:** Use Appendix A of the Application Programming Reference manual to find out what the EIBRESP value means, and take appropriate action.

Investigate whether the operator has changed the status of the data set for any reason.

**Destination:** CRPO

**Module:** DFHRPC09

**XMEOUT Parameters:** date, time, applid, tranid, filename, eibresp

---

DFHRP1586  
connection manager detected a logic error while accessing the CICS ONC RPC data set filename.

**Explanation:** The connection manager detected an unexpected error when accessing the CICS ONC RPC data set. This is a logic error. The connection manager has received an unexpected response from CICS following an EXEC CICS command.

**System Action:** A system dump is taken. The connection manager cannot perform any function requiring access to the CICS ONC RPC data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC09

**XMEOUT Parameters:** date, time, applid, tranid, filename

---

DFHRP1596  
connection manager cannot continue enable processing because it cannot determine the status of CICS ONC RPC.

**Explanation:** The connection manager was trying to enable CICS ONC RPC, but detected an invalid global work area address, or found that CICS ONC RPC was enabled.

**System Action:** The enable attempt is abandoned.

**User Response:** Investigate whether CICS ONC RPC has been disabled. Investigate whether operator command have been issued against the task-related user DFHRPTRU.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

---

DFHRP1600  
connection manager has completed backout of enable processing.

**Explanation:** CICS ONC RPC cannot be enabled. This may be the result of an error detected by the connection manager during enable processing or it may be due to CICS shutdown. The connection manager has completed backout of enable processing.

**System Action:** Processing continues.

**User Response:** See associated messages for the reason why the enable request failed.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

---

DFHRP1601  
connection manager cannot continue enable processing because it has detected that CICS is shutting down.

**Explanation:** CICS ONC RPC cannot be enabled when CICS is in shutdown.

**System Action:** The connection manager initiates backout of enable processing. If this is an immediate CICS shutdown, then transaction CRPC terminates.
DFHRP1602

**User Response:** Exit transaction CRPC to enable CICS shutdown to continue.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

---

DFHRP1602 date time applid tranid The CICS ONC RPC connection manager has detected an internal error during backout of enable processing.

**Explanation:** The connection manager has detected an error attempting to shut down the RPC caller. This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

**System Action:** CICS ONC RPC continues backout of enable processing.

**User Response:** See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

---

DFHRP1603 date time applid tranid The CICS ONC RPC connection manager has detected an error when attempting to issue a FREEMAIN for the RPC caller program.

**Explanation:** The connection manager has detected an error issuing a FREEMAIN for the RPC caller program to remove it from storage. This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

**System Action:** CICS ONC RPC continues backout of enable processing.

**User Response:** See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

---

DFHRP1604 date time applid tranid The CICS ONC RPC connection manager has detected an error when attempting to issue a RELEASE for the alias list program.

**Explanation:** The connection manager has detected an error issuing a release for the alias list program. This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

**System Action:** CICS ONC RPC continues backout of enable processing.

**User Response:** See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPC4C

**XMEOUT Parameters:** date, time, applid, tranid

---

DFHRP1605 date time applid tranid The CICS ONC RPC connection manager has detected an internal error during backout of enable processing.

**Explanation:** The connection manager has detected an internal error during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

**System Action:** CICS ONC RPC continues backout of enable processing.

**User Response:** See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**XMEOUT Parameters:** date, time, applid, tranid

---

DFHRP1606 date time applid tranid The CICS ONC RPC connection manager has detected an internal error during backout of enable processing.

**Explanation:** The connection manager has detected an internal error during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

**System Action:** CICS ONC RPC continues backout of enable processing.

**User Response:** See associated messages for the reason why the enable request failed. If the problem is not a symptom of a
wider problem, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO
**Module:** DFHRPC4C
**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP1607** date time applid tranid The CICS ONC RPC connection manager has detected an error when attempting to disable the ONC RPC TRUE (DFHRPTRU).

**Explanation:** The connection manager detected an error attempting to disable the task-related user exit (TRUE). This is during backout of enable processing initiated by the connection manager in response to a failed enable request. It may be that the TRUE is already disabled, which may be the result of operator intervention. Alternatively, this could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

**System Action:** CICS ONC RPC continues backout of enable processing.

**User Response:** See associated messages for the reason why the enable request failed. Take steps to prevent operator interference with the TRUE.

**Destination:** CRPO
**Module:** DFHRPC4C
**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP1608** date time applid tranid The CICS ONC RPC connection manager has detected an internal error during backout of enable processing.

**Explanation:** The connection manager has detected an internal error attempting to disable the task-related user exit (TRUE). This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

**System Action:** CICS ONC RPC continues backout of enable processing.

**User Response:** See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO
**Module:** DFHRPC4C
**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP1609** date time applid tranid The CICS ONC RPC connection manager is not authorized to disable the task-related user exit (DFHRPTRU) during backout of enable processing.

**Explanation:** The connection manager transaction does not have the necessary authority to use the CICS system programming interface and cannot disable its task related user exit (TRUE). This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

**System Action:** CICS ONC RPC continues backout of enable processing.

**User Response:** See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO
**Module:** DFHRPC4C
**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP1610** date time applid tranid The CICS ONC RPC connection manager is not authorized to disable the task-related user exit (DFHRPTRU) during backout of enable processing.

**Explanation:** The connection manager transaction does not have the necessary authority to disable its task-related user exit (TRUE). This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

**System Action:** CICS ONC RPC continues backout of enable processing.

**User Response:** See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO
**Module:** DFHRPC4C
**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHRP1611** date time applid tranid The CICS ONC RPC connection manager has detected an internal error during backout of enable processing.

**Explanation:** The connection manager has detected an error attempting to unregister for problem determination. This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.
DFHRP1650

**System Action:** CICS ONC RPC continues backout of enable processing.

**User Response:** See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPC04

**XMEOUT Parameters:** date, time, applid, tranid

DFHRP1650 date time applid tranid The CICS ONC RPC connection manager found that CICS ONC RPC is disabled. Requests to disable CICS ONC RPC are ignored.

**Explanation:** A request has been made to disable CICS ONC RPC, but the current status indicates it is already disabled, or in the process of being disabled.

**System Action:** The request is ignored. The connection manager panel is redisplayed.

**User Response:** Request another option.

**Destination:** Terminal End User

**Modules:** DFHRPC01, DFHRPC04

DFHRP1651 date time applid tranid The CICS ONC RPC connection manager detected a logic error.

**Explanation:** The connection manager has received an unexpected response from CICS following an EXEC CICS command.

**System Action:** A system dump is taken. The connection manager abends with abend code ARPV. The rest of CICS ONC RPC continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC04

**XMEOUT Parameters:** date, time, applid, tranid

DFHRP1652 date time applid tranid The CICS ONC RPC connection manager detected a logic error.

**Explanation:** The connection manager received an unexpected response from CICS following an EXEC CICS command.

**System Action:** A system dump is taken. The requested operation is not performed. The connection manager continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC06

**XMEOUT Parameters:** date, time, applid, tranid

**Explanation:** The 4-tuple has been unregistered.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** CRPO

**Module:** DFHRPC06

**XMEOUT Parameters:** date, time, applid, tranid, hostaddr

DFHRP1751 date time applid tranid The CICS ONC RPC connection manager detected an error while accessing an internal table. Host IP address: hostaddr

**Explanation:** The connection manager detected an error whilst accessing the list of 4-tuples registered with CICS ONC RPC.

**System Action:** The connection manager panel is redisplayed. The requested action is not performed

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPC06

**XMEOUT Parameters:** date, time, applid, hostaddr

DFHRP1752 date time applid tranid The CICS ONC RPC connection manager detected an error while accessing an internal table. Host IP address: hostaddr

**Explanation:** The connection manager detected an internal error while accessing the list of 4-tuples registered with CICS ONC RPC.

**System Action:** The connection manager panel is redisplayed.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPC06

**XMEOUT Parameters:** date, time, applid, hostaddr

DFHRP1753 date time applid tranid A CICS ONC RPC operation could not be performed because CICS is short on storage. Host IP address: hostaddr.

**Explanation:** The connection manager could not to perform an unregister operation because CICS is short on storage.

**System Action:** The connection manager continues.

**User Response:** Retry the unregister operation when the CICS storage problem has been resolved.
DFHRP1754

Date/Time Applid Tranid The CICS ONC RPC connection manager detected an internal error when unregistering a 4-tuple. Host IP address: hostaddr.

Explanation: The connection manager detected an internal error when unregistering a 4-tuple.

System Action: A system dump is taken. The connection manager continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC06
XMEOUT Parameters: date, time, applid, tranid, hostaddr

DFHRP1755

Date/Time Applid Tranid The CICS ONC RPC connection manager could not perform an unregister operation because CICS ONC RPC is not enabled. X'prognum' X'versnum' X'procnum' Protocol: protocol.

Explanation: The connection manager cannot complete the current unregister operation because CICS ONC RPC is not enabled. It might have been disabled by another connection manager.

System Action: The connection manager continues, but the unregister operation is not completed.

User Response: None.
Destination: CRPO
Module: DFHRPC06
XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol

DFHRP1756

Date/Time Applid Tranid CICS ONC RPC is being disabled. Requested operation not performed.

Explanation: The connection manager is unable to complete the current unregister operation because CICS ONC RPC is in disable processing.

System Action: The connection manager continues, but the unregister operation currently being performed is not completed.

User Response: None. The unregister will be performed as part of disable processing.
Destination: CRPO
Module: DFHRPC06
XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

DFHRP1757

Date/Time Applid Tranid The CICS ONC RPC connection manager cannot unregister the requested 4-tuple because it is not registered.

Explanation: The connection manager is unable to complete the current unregister operation because the requested 4-tuple is not registered.

System Action: The connection manager continues, but the unregister operation currently being performed is not completed.

User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.
Destination: CRPO
Module: DFHRPC06
XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

DFHRP1758

Date/Time Applid Tranid The CICS ONC RPC connection manager detected an error when freeing storage associated with the requested 4-tuple.

Explanation: The connection manager is unable to complete the current unregister operation because an error occurred freeing storage associated with the 4-tuple.

System Action: The connection manager continues. If the requested 4-tuple was the only instance of a particular program/version/protocol 3-tuple registered with TCP/IP for MVS, then this 3-tuple has been unregistered with TCP/IP for MVS.

User Response: See the associated diagnostics issued by CICS and TCP/IP for MVS for problem determination.
Destination: CRPO
Module: DFHRPC06
XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

DFHRP1759

Date/Time Applid Tranid The CICS ONC RPC connection manager could not perform an unregister operation because an invalid global work area was detected.

Explanation: The connection manager cannot complete the current unregister operation because it has detected an invalid global work area address. CICS ONC RPC might have been disabled by another connection manager transaction.

System Action: The connection manager continues, but the unregister operation is not completed.

User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.
Destination: CRPO
Module: DFHRPC06
XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol
**DFHRP1760**

**Explanation:** The connection manager detected an error while unregistering a program-version pair with TCP/IP for MVS, and is unable to complete the current unregister operation.

**System Action:** The connection manager continues, but the unregister operation is not completed.

**User Response:** See the associated diagnostics issued by CICS and TCP/IP for MVS for problem determination. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.

**Destination:** CRPO

**XMEOUT Parameters:** date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

**DFHRP1761**

date time applid tranid The CICS ONC RPC connection manager could not unregister a 4-tuple as it was not registered Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol. Host IP address: hostaddr.

**Explanation:** The 4-tuple cannot be unregistered as it is not registered.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** CRPO

**Module:** DFHRPC06

**XMEOUT Parameters:** date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

**DFHRP1762**

date time applid tranid Enter the Program Number, Version Number, Procedure Number and Protocol for the 4-tuple to be unregistered.

**Explanation:** You have not entered all the information needed to identify the 4-tuple to be unregistered.

**System Action:** Processing continues.

**User Response:** Enter the required data.

**Destination:** Terminal End User

**Module:** DFHRPC06

**XMEOUT Parameters:** date, time, applid, tranid, filename

**DFHRP1763**

date time applid tranid The CICS ONC RPC connection manager cannot display the requested 4-tuple because it is not registered with CICS ONC RPC. Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol. Host IP address: hostaddr.

**Explanation:** The 4-tuple is not displayed.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** CRPO

**Module:** DFHRPC06

**DFHRP1764**

date time applid tranid The CICS ONC RPC connection manager detected an internal error while processing 4-tuple definitions on the CICS ONC RPC data set, CICS file filename.

**Explanation:** The connection manager detected an internal error while accessing 4-tuples on the data set.

**System Action:** A system dump is taken. The connection manager panel is redisplayed. The requested operation is not performed. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC0A

**XMEOUT Parameters:** date, time, applid, tranid, filename

**DFHRP1765**

date time applid tranid The CICS ONC RPC connection manager found no records in the CICS ONC RPC data set, CICS file filename, when processing a request to access 4-tuple definitions.

**Explanation:** The connection manager found no records on the data set while processing a request to access 4-tuple definitions. This indicates that the CICS ONC RPC definition record is missing.

**System Action:** A system dump is taken. The connection manager panel is displayed. No 4-tuples are displayed. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Investigate the reason why there are no records. You must use the connection manager to create a new CICS ONC RPC definition record.

**Destination:** CRPO

**Module:** DFHRPC0A

**XMEOUT Parameters:** date, time, applid, tranid, filename

**DFHRP1766**

date time applid tranid The CICS ONC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file filename. EIBRESP: eibresp.

**Explanation:** The connection manager could not access the CICS ONC RPC data set.

The error occurred while processing a request to display 4-tuple definitions from the data set.

An EXEC CICS STARTBR, EXEC CICS READNEXT or EXEC CICS ENDBR was issued, but received the response eibresp. The error can occur for one of the following reasons:

- No file definition has been found for DFHRPCD, implying that CICS ONC RPC has not been installed correctly.
- BROWSE or READ operations are not allowed, implying that CICS ONC RPC has not been installed correctly.
- The file is DISABLED, either due to an incorrect file definition, or due to operator intervention.
- The file is NOTOPEN, either due to an incorrect file definition, or due to operator intervention.
• BROWSE or READ operations are not authorized, implying that security has not been set up correctly.

System Action: A system dump is taken. Without access to the data set, CICS ONC RPC cannot display 4-tuple definitions.
Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use Appendix A of the Application Programming Reference manual to find out what the EIBRESP value means, and take appropriate action.

Destination: CRPO
Module: DFHRPC0A
XMEOUT Parameters: date, time, applid, tranid, filename

DFHRP1769 date time applid tranid The CICS ONC RPC connection manager found no records on the CICS ONC RPC data set, CICS file filename, when processing a request to access 4-tuple information.

Explanation: The connection manager has found no records on the CICS ONC RPC data set when processing a request to access 4-tuple definitions.

System Action: A system dump is taken. The connection manager panel is redisplayed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the reason why there are no records. You must use the connection manager to create a new CICS ONC RPC definition record.

Destination: CRPO
Module: DFHRPC0A
XMEOUT Parameters: date, time, applid, tranid, filename

DFHRP1770 date time applid tranid The CICS ONC RPC connection manager found no 4-tuple definitions in the CICS ONC RPC data set, CICS file filename.

Explanation: The connection manager has found no 4-tuple definitions in the CICS ONC RPC data set while processing a request to access 4-tuple definitions.

System Action: The connection manager panel is redisplayed. No 4-tuple definitions are displayed.

User Response: Use the connection manager to save 4-tuple definitions in the data set.

Destination: CRPO
Module: DFHRPC0A
XMEOUT Parameters: date, time, applid, tranid, filename

DFHRP1771 date time applid tranid The CICS ONC RPC connection manager detected an internal error while accessing 4-tuple definitions in the CICS ONC RPC data set, CICS file filename.

Explanation: The connection manager has detected an internal error while processing a request to access 4-tuple definitions in the CICS ONC RPC data set.

System Action: A system dump is taken. The connection manager panel is redisplayed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC0A
XMEOUT Parameters: date, time, applid, tranid, filename
DFHRP1772 date time applid tranid The CICS ONC RPC connection manager could not complete the requested operation. It could not obtain the required CICS storage.

Explanation: A GETMAIN issued by the connection manager when attempting to build a list of 4-tuples defined in the CICS ONC RPC data set returned an error response.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: CICS may be temporarily short on storage. Retry the operation. If the condition persists, contact your system administrator to see if there are problems with CICS storage. If CICS is not short on storage, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC0A
XMEOUT Parameters: date, time, applid, tranid

DFHRP1773 date time applid tranid The CICS ONC RPC connection manager detected an error when freeing storage.

Explanation: A FREEMAIN issued by connection manager returned an error response. The connection manager was trying to free storage used to build a list of 4-tuples defined in the CICS ONC RPC data set.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC0A
XMEOUT Parameters: date, time, applid, tranid

DFHRP1774 date time applid tranid The CICS ONC RPC connection manager cannot display the requested 4-tuple because it is not saved to the CICS ONC RPC data set. Program: X'prognum' Version: X'versnum'; Procedure: X'procnum' Protocol: protocol.

Explanation: The 4-tuple is not displayed.

System Action: Processing continues.

User Response: None.

Destination: CRPO
Module: DFHRPC0A
XMEOUT Parameters: date, time, applid, tranid, X'versnum', X'prognum', protocol

DFHRP1775 date time applid tranid The CICS ONC RPC connection manager cannot register 4-tuples because CICS ONC RPC is disabled.

Explanation: A request to register a 4-tuple cannot be performed because CICS ONC RPC was not enabled when the request was made.

System Action: Processing continues.

User Response: Enable CICS ONC RPC.

Destination: CRPO
Module: DFHRPC0A
XMEOUT Parameters: date, time, applid, tranid

Explanation: The alias for the 4-tuple has been purged by the connection manager.

System Action: Status indicates the status of the alias task when the purge request was issued. The following actions are taken:

- Running indicates that the alias task was running. The connection manager removes the entry from the alias list. The alias abends with abend code ARPJ and message DFHRP0173 is issued.
- Scheduled indicates that the alias task was scheduled to run and may still do so. The connection manager removes the entry from the alias list. The alias abends with abend code ARPJ and messages DFHRP0113 and DFHRP0173 are issued.

User Response: None.

Destination: CRPO
Module: DFHRPC10
XMEOUT Parameters: date, time, applid, tranid, status, X'versnum', X'prognum', X'procnum', protocol, hostaddr

DFHRP1801 date time applid tranid The CICS ONC RPC connection manager has detected an internal error while processing the alias list.

Explanation: The connection manager has detected an internal error while processing a request to display or purge entries in the alias list.

System Action: A system dump is taken. The connection manager panel is redisplayed. No alias tasks are displayed or purged. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC10
XMEOUT Parameters: date, time, applid, tranid
The CICS ONC RPC connection manager has detected an internal error while processing the alias list.

**Explanation:** The connection manager has detected an internal error while processing a request to display or purge entries in the alias list.

**System Action:** A system dump is taken. The connection manager panel is redisplayed. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC10

**XMEOUT Parameters:** date, time, applid, tranid

---

The CICS ONC RPC connection manager received an error response while attempting to browse the alias list.

**Explanation:** The connection manager attempted to start browsing the alias list, but received a response that indicated a severe error had occurred.

**System Action:** The connection manager panel is redisplayed. No alias tasks are displayed.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPC10

**XMEOUT Parameters:** date, time, applid, tranid

---

The CICS ONC RPC connection manager could not process the alias list. It could not obtain the required CICS storage.

**Explanation:** A GETMAIN issued by the connection manager when attempting to build the alias list returned an error response.

**System Action:** A system dump is taken. The connection manager panel is redisplayed. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** CICS may be temporarily short on storage. Retry the operation. If the condition persists, contact your system administrator to see if there are problems with CICS storage. If CICS is not short on storage, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC10

**XMEOUT Parameters:** date, time, applid, tranid

---

The CICS ONC RPC connection manager received an error response while attempting to complete its browse of the alias list.

**Explanation:** The connection manager attempted to finish browsing the alias list, but received a response that indicated a severe error had occurred.

**System Action:** The connection manager panel is redisplayed.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPC10

**XMEOUT Parameters:** date, time, applid, tranid
**DFHRP1810**

`date time applid tranid` The CICS ONC RPC connection manager received an error response while attempting to delete an entry from the alias list.

**Explanation:** The connection manager tried to delete an entry from the alias list, but received a response that indicated a severe error had occurred.

**System Action:** The connection manager panel is redisplayed.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CRPO

**Module:** DFHRPC010

**XMEOUT Parameters:** `date, time, applid, tranid`

---

**DFHRP1861**

`date time applid tranid` The CICS ONC RPC connection manager has detected an internal error while accessing an internal table. Host IP address: `hostaddr`.

**Explanation:** An internal error has occurred in the connection manager while accessing an internal table.

**System Action:** A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC08

**XMEOUT Parameters:** `date, time, applid, tranid, hostaddr`

---

**DFHRP1862**

`date time applid tranid` The CICS ONC RPC connection manager detected an internal error while accessing an internal table.

**Explanation:** The connection manager detected an error while accessing an internal table.

**System Action:** A system dump is taken. If the error occurs during CICS ONC RPC enable processing, CICS ONC RPC remains disabled. If the error occurs during the processing of a client request, an `svcerr_systemerr` call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC08

**XMEOUT Parameters:** `date, time, applid, tranid`

---

**DFHRP1863**

`date time applid tranid` The CICS ONC RPC connection manager has detected an internal error while accessing an internal table. Host IP address: `hostaddr`.

**Explanation:** An internal error has occurred in the connection manager while accessing an internal table.

**System Action:** A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC08

**XMEOUT Parameters:** `date, time, applid, tranid, hostaddr`

---

**DFHRP1864**

`date time applid tranid` The CICS ONC RPC connection manager has detected an internal error while accessing an internal table. Host IP address: `hostaddr`.

**Explanation:** An internal error has occurred in the connection manager while accessing an internal table.

**System Action:** A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC08

**XMEOUT Parameters:** `date, time, applid, tranid, hostaddr`

---

**DFHRP1865**

`date time applid tranid` The CICS ONC RPC connection manager has detected an internal error while accessing an internal table. Host IP address: `hostaddr`.

**Explanation:** An internal error has occurred in the connection manager while accessing an internal table.

**System Action:** A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CRPO

**Module:** DFHRPC08

**XMEOUT Parameters:** `date, time, applid, tranid, hostaddr`
DFHRP1866 date time applid tranid The CICS ONC RPC connection manager detected an internal error while accessing an internal table. Host IP address: hostaddr.

Explanation: An internal error has occurred in the connection manager while accessing an internal table.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC08
XMEOUT Parameters: date, time, applid, tranid, hostaddr

DFHRP1867 date time applid tranid The CICS ONC RPC connection manager could not complete the requested operation as an invalid CICS ONC RPC global work area address has been detected.

Explanation: The connection manager was attempting to access or initialize the list of registered 4-tuples, but detected an invalid global work area address. This may indicate that CICS ONC RPC is disabled.

System Action: A system dump is taken. The requested operation is not completed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Retry the operation when CICS ONC RPC is enabled. If this occurred during enable processing, check that another connection manager transaction has not disabled CICS ONC RPC.

Destination: CRPO
Module: DFHRPC08
XMEOUT Parameters: date, time, applid, tranid

DFHRP1868 date time applid tranid The CICS ONC RPC connection manager could not complete the requested operation. It could not obtain the required CICS storage. Host IP address: hostaddr.

Explanation: A GETMAIN issued by connection manager when attempting to build a list of registered 4-tuples returned an error response.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: CICS may be temporarily short on storage. Retry the operation. If the condition persists, contact your system administrator to see if there are problems with CICS storage. If CICS is not short on storage, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC08
XMEOUT Parameters: date, time, applid, tranid

DFHRP1869 date time applid tranid The CICS ONC RPC connection manager detected an error when freeing storage. Host IP address: hostaddr.

Explanation: A FREEMAIN issued by connection manager when attempting to free storage used to build a list of registered 4-tuples returned an error response.

System Action: Processing continues.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO
Module: DFHRPC08
XMEOUT Parameters: date, time, applid, tranid, hostaddr

DFHRP1879 date time applid tranid The CICS ONC RPC connection manager has detected an internal error while accessing an internal table. Host IP address: hostaddr.

Explanation: An internal error has occurred in the connection manager while accessing an internal table.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC08
XMEOUT Parameters: date, time, applid, tranid, hostaddr

DFHRP1900 date time applid tranid The CICS ONC RPC connection manager could not find the global work area.

Explanation: The connection manager could not find the global work area. The task related user exit DFHRPTRU has been wrongly defined.

System Action: A system dump is taken. CICS ONC RPC remains disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that all the CEDA groups for CICS ONC RPC have been installed correctly, then try to enable CICS ONC RPC again.

Investigate whether the operator has disabled DFHRPTRU for any reason.

Destination: CRPO
Module: DFHRPC0B
XMEOUT Parameters: date, time, applid, tranid
DFHRP1901 date time applid tranid The CICS ONC RPC connection manager could not find the task-related user exit, program DFHRPTRU.

Explanation: The connection manager cannot find the task-related user exit, DFHRPTRU, for one of the following reasons:

- DFHRPTRU has not been defined to CICS
- DFHRPTRU is not in the CICS load library
- DFHRPTRU has been disabled

System Action: A system dump is taken. CICS ONC RPC remains disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that all the CEDA groups for CICS ONC RPC have been installed correctly, then try the enable request again.

Destination: CRPO
Module: DFHRPC0B
XMEOUT Parameters: date, time, applid, tranid

DFHRP1906 date time applid tranid The CICS ONC RPC connection manager found an error in the length of the CICS ONC RPC global work area.

Explanation: The connection manager found that the length of its global work area is not correct.

System Action: A system dump is taken. CICS ONC RPC is disabled. It is not possible to enable CICS ONC RPC until DFHRPTRU has been correctly defined to CICS. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that DFHRPTRU has not been enabled by an operator command.

Destination: CRPO
Module: DFHRPC0B
XMEOUT Parameters: date, time, applid, tranid

DFHRP1907 date time applid tranid The CICS ONC RPC connection manager found invalid data in the global work area.

Explanation: The connection manager found invalid data in the global work area. This is probably caused by a storage overwrite.

System Action: A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the reason for the storage overwrite

Destination: CRPO
Module: DFHRPC0B
XMEOUT Parameters: date, time, applid, tranid

DFHRP1950 date time applid tranid The CICS ONC RPC connection manager detected a logic error.

Explanation: The connection manager has received an unexpected response from CICS following an EXEC CICS command.

System Action: A system dump is taken. Registration of the 4-tuple currently being processed is not possible. The 4-tuple is not registered. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRPC0E
XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr
Chapter 1. DFH messages

Explanation: The connection manager used EXEC CICS LOAD for the CICS program xdrname, which has been requested as the XDR routine for the 4-tuple being processed, but received an error response.

System Action: The 4-tuple is not registered.

User Response: Use the values provided in eibresp and eibresp2 to identify the reason for the error in the LOAD, and use the CICS CEDA transaction or the connection manager to rectify the problem.

Destination: CRPO
Module: DFHRP0C0E
XMEOUT Parameters: date, time, applid, tranid, xdrname, eibresp, eibresp2, X'prognum', X'versnum', X'procnum', protocol, hostaddr.

Explanation: The connection manager used EXEC CICS LOAD for CICS program with name xdrname, which has been requested as the XDR routine for the 4-tuple being processed, but received an error response.

System Action: The 4-tuple is not registered.

User Response: Use the values provided in EIBRESP and EIBRESP2 to identify the reason for the error in the LOAD.

Destination: CRPO
Module: DFHRP0C0E
XMEOUT Parameters: date, time, applid, tranid, xdrname, eibresp, eibresp2, X'prognum', X'versnum', X'procnum', protocol, hostaddr.

Explanation: The connection manager used EXEC CICS LOAD for the CICS program xdrname, which has been requested as the XDR routine for the 4-tuple being processed, but it received an unexpected response.

System Action: A system dump is taken. The 4-tuple is not registered. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRP0C0E
XMEOUT Parameters: date, time, applid, tranid, xdrname, eibresp, eibresp2, X'prognum', X'versnum', X'procnum', protocol, hostaddr.

Explanation: The connection manager has received an unexpected response from CICS following an EXEC CICS command.

System Action: A system dump is taken. The connection manager abends with abend code ARPV. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO
Module: DFHRP0C0E
XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr.

Explanation: The connection manager could not add an XDR routine name to an internal table.

System Action: The 4-tuple is not registered.

User Response: Try to register the 4-tuple again. If the condition persists, you need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO
Module: DFHRP0C0E
XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr.

Explanation: The connection manager is unable to complete the current register operation because CICS ONC RPC is in disable processing.

System Action: The 4-tuple is not registered.

User Response: Once CICS ONC RPC has completed disable processing, enable it again using the connection manager, and try the register operation again.

Destination: CRPO
Module: DFHRP0C0E
DFHRP1957

**XMEOUT Parameters:** date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

**DFHRP1957** date time applid tranid CICS ONC RPC is not enabled, so the register operation could not be performed. Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol. Host IP address: hostaddr.

Explanation: The connection manager is unable to complete the current register operation because CICS ONC RPC is not currently enabled. It may have been disabled by another connection manager transaction.

System Action: The 4-tuple is not registered.

User Response: Use the connection manager to enable CICS ONC RPC, and try the register operation again.

Destination: CRPO

Module: DFHRPC0E

**XMEOUT Parameters:** date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

---

DFHRP1958

**XMEOUT Parameters:** date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

**DFHRP1958** date time applid tranid The CICS ONC RPC connection manager could not register the 4-tuple because it was already registered. Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol. Host IP address: hostaddr.

Explanation: The connection manager is unable to complete the current register operation because the requested 4-tuple is already registered.

System Action: The connection manager continues, but the 4-tuple is not registered.

User Response: This may be a temporary condition, so try the register again. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. If the condition persists, see the CICS External Interfaces Guide for further guidance on how to proceed.

Destination: CRPO

Module: DFHRPC0E

---

DFHRP1959

**XMEOUT Parameters:** date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

Explanation: The connection manager is unable to complete the current register operation because an error was returned by TCP/IP for MVS. This may be on an svcupd_create or svctcp_create operation.

System Action: The connection manager continues, but the 4-tuple is not registered.

User Response: See the associated diagnostics issued by CICS and TCP/IP for MVS for problem determination. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.

Destination: CRPO

Module: DFHRPC0E

---

DFHRP1960

**XMEOUT Parameters:** date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

Explanation: The connection manager is unable to complete the current register operation because an error was returned by TCP/IP for MVS. This may be on an svcupd_create or svctcp_create operation.

System Action: The connection manager continues, but the 4-tuple is not registered.

User Response: See the associated diagnostics issued by CICS and TCP/IP for MVS for problem determination. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.

Destination: CRPO

Module: DFHRPC0E

---

DFHRP1961

**XMEOUT Parameters:** date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

**DFHRP1961** date time applid tranid Data entered in field **fieldname1** is incompatible with data entered in field **fieldname2**.

Explanation: Data was entered on a connection manager panel in **fieldname1** that is incompatible with data entered in **fieldname2**.

System Action: The connection manager panel is redisplayed and the field in error is highlighted.

User Response: Enter compatible data in the fields indicated.

Destination: Terminal End User

Modules: DFHRPC0D, DFHRPC05

---

DFHRP1962

**XMEOUT Parameters:** date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

**DFHRP1962** date time applid tranid Enter the Program Number, Version Number, Procedure Number and Protocol for the 4-tuple to be displayed.

Explanation: To retrieve information about a 4-tuple in the CICS ONC RPC data set you must supply the program number, version number, procedure number, and protocol.

System Action: None.

User Response: Enter the required data.

Destination: Terminal End User

Modules: DFHRPC0D, DFHRPC03

---

DFHRP1963

**XMEOUT Parameters:** date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

**DFHRP1963** date time applid tranid Enter the following fields before register or save to data set: Program Number, Version Number, Procedure Number, XDR Routines, and Program Name.

Explanation: The following fields are required before registration or saving of the 4-tuple: the Program Number, Version Number, Procedure Number, Inbound XDR Routine, Outbound XDR Routine (if RPC Call Type of blocking), and Program Name.

System Action: The connection manager panel is redisplayed.

User Response: Enter valid data in the field(s) indicated.

Destination: Terminal End User
Chapter 1. DFH messages

DFHRP1964 date time applid tranid Data entered in the Getlengths field is incompatible with data entered in the Server Input Length or Server Output Length fields.

Explanation: Either you have specified YES for Getlengths and put information in Server Input Length or Server Output Length, or you have specified NO for Getlengths but put no information in Server Input Length and Server Output Length.

System Action: The connection manager panel is redisplayed.

User Response: Decide whether the lengths are to be specified on this panel, or to be supplied by the Getlengths function of the converter for this 4-tuple.

Destination: Terminal End User

Modules: DFHRPC0D, DFHRPC05

DFHRP1965 date time applid tranid With Server Data Format of CONTIGUOUS, the Server Input Length and Server Output Length together must not exceed 32767 Bytes.

Explanation: An invalid server data length has been detected on a CRPC panel. The maximum total data length which can pass between the alias and the CICS program that services the client request is 32767. If server data format of CONTIGUOUS is specified, the Server Input Length and the Server Output Length added together must not exceed this value.

System Action: The connection manager panel is redisplayed.

User Response: Enter valid data in the fields.

Destination: Terminal End User

Modules: DFHRPC0D, DFHRPC05

DFHRP1966 date time applid tranid Procedure Number of 0 is not allowed.

Explanation: A value of zero has been entered in the Procedure Number field. This is not allowed.

System Action: The connection manager panel is redisplayed, and the field in error is highlighted.

User Response: Enter valid data in the field indicated.

Destination: Terminal End User

Modules: DFHRPC0D, DFHRPC05, DFHRPC06

Explanation: The connection manager detected an internal error while trying to register a 4-tuple.

System Action: A system dump is taken. The connection manager continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See associated messages to find out whether the 4-tuple was registered. You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

DFHRP1968 date time applid tranid The CICS ONC RPC connection manager has not performed a register operation because it detected an invalid global work area. Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol. Host IP address: hostaddr.

Explanation: The connection manager is unable to complete the current register operation because it has detected an invalid global work area address. CICS ONC RPC may have been disabled by another connection manager transaction.

System Action: The connection manager continues, but the 4-tuple is not registered.

User Response: Use the connection manager to enable CICS ONC RPC, and try the register operation again. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

Explanation: The connection manager is unable to complete the current register operation because it has detected an abend in the converter when invoking it for the Getlengths function.

System Action: The connection manager continues, but the 4-tuple is not registered.

User Response: Use CICS diagnostics to correct the converter.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: date, time, applid, tranid, progname, X'prognum', X'versnum', X'procnum', protocol, hostaddr

Explanation: The 4-tuple has been registered.

System Action: None.

User Response: None.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr

Chapter 1. DFH messages 499
DFHRP1980

date time applid tranid The CICS ONC RPC connection manager cannot register the 4-tuple because it has already been registered. Program: X'prognum' Version: X'versnum' Procedure: X'procmum' Protocol: protocol. Host IP address: hostaddr.

Explanation: The 4-tuple has already been registered.

System Action: The connection manager panel is redisplayed.

User Response: Enter a new 4-tuple for registration.

Destination: CRPO

Module: DFHRP0C0E

XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procmum', protocol, hostaddr

DFHRP1981

date time applid tranid The CICS ONC RPC connection manager detected an internal error while registering a 4-tuple. Program: X'prognum' Version: X'versnum' Procedure: X'procmum' Protocol: protocol. Host IP address: hostaddr.

Explanation: The connection manager has detected an internal error while registering the 4-tuple.

System Action: The 4-tuple is not registered.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO

Module: DFHRP0C0E

XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procmum', protocol, hostaddr

DFHRP1982

date time applid tranid The CICS ONC RPC connection manager detected an internal error detected while registering a 4-tuple. Program: X'prognum' Version: X'versnum' Procedure: X'procmum' Protocol: protocol. Host IP address: hostaddr.

Explanation: The connection manager has detected an internal error while registering the 4-tuple.

System Action: Processing continues.

User Response: You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CRPO

Module: DFHRP0C0E

XMEOUT Parameters: date, time, applid, tranid, X'prognum', X'versnum', X'procmum', protocol, hostaddr

DFHRP1983

Explanation: The connection manager used EXEC CICS LINK for the converter to perform Getlengths processing for the 4-tuple. The response was PGMIDERR.

System Action: The 4-tuple is not registered.

User Response: Use the EIBRESP2 value to identify the problem.

Destination: CRPO

Module: DFHRP0C0E

XMEOUT Parameters: date, time, applid, tranid, converter_program_name, eibresp, resp2val, X'prognum', X'versnum', X'procmum', protocol, hostaddr

DFHRP1984

date time applid tranid The CICS ONC RPC connection manager cannot link to converter converter_program_name because it is remote. EIBRESP: eibresp EIBRESP2: resp2val Program: X'prognum' Version: X'versnum' Procedure: X'procmum' Protocol: protocol. Host IP address: hostaddr.

Explanation: The connection manager used EXEC CICS LINK for the converter to perform Getlengths processing, but the response was TERMERR or SYSIDERR. The connection manager passes pointers to the converter, so the converter must be in the same CICS region as CICS ONC RPC.

System Action: The 4-tuple is not registered.

User Response: Install and define the converter program in the same CICS region as CICS ONC RPC.

Destination: CRPO

Module: DFHRP0C0E

XMEOUT Parameters: date, time, applid, tranid, converter_program_name, eibresp, resp2val, X'prognum', X'versnum', X'procmum', protocol, hostaddr

DFHRP1985

date time applid tranid The CICS ONC RPC connection manager received an unexpected response from CICS while linking to converter converter_program_name. EIBRESP: eibresp EIBRESP2: resp2val Program: X'prognum' Version: X'versnum' Procedure: X'procmum' Protocol: protocol. Host IP address: hostaddr.

Explanation: The connection manager used EXEC CICS LINK for the converter to perform Getlengths processing, but received an unexpected response.

System Action: The 4-tuple is not registered.

User Response: See the associated diagnostics issued by CICS for problem determination.

Destination: CRPO

Module: DFHRP0C0E

XMEOUT Parameters: date, time, applid, tranid, converter_program_name, eibresp, resp2val, X'prognum', X'versnum', X'procmum', protocol, hostaddr

DFHRP1986

date time applid tranid The CICS ONC RPC connection manager is not authorized to link to converter converter_program_name. EIBRESP: eibresp EIBRESP2: resp2val Program: X'prognum' Version: X'versnum' Procedure: X'procmum' Protocol: protocol. Host IP address: hostaddr.

Explanation: The connection manager used EXEC CICS LINK for the converter to perform Getlengths processing, but received a NOTAUTH response.

System Action: The 4-tuple is not registered.
Chapter 1. DFH messages

Explanation: Getlengths returned URP_EXCEPTION.

System Action: The Getlengths parameter area is traced. The 4-tuple is not registered.

User Response: Use the trace information to correct the converter.

Destination: CRPO
Module: DFHRPC0E
XMEOUT Parameters: date, time, applid, tranid, converter_program_name, X'prognum', X'versnum', X'procnum', protocol, hostaddr

Explanation: Getlengths returned URP_INVALID.

System Action: The Getlengths parameter area is traced. The 4-tuple is not registered.

User Response: Use the trace information to correct the converter.

Destination: CRPO
Module: DFHRPC0E
XMEOUT Parameters: date, time, applid, tranid, converter_program_name, X'prognum', X'versnum', X'procnum', protocol, hostaddr

Explanation: Getlengths returned URP_DISASTER.

System Action: The Getlengths parameter area is traced. The 4-tuple is not registered.

User Response: Use the trace information to correct the converter.

Destination: CRPO
Module: DFHRPC0E
XMEOUT Parameters: date, time, applid, tranid, converter_program_name, X'prognum', X'versnum', X'procnum', protocol, hostaddr

DFHRP1991 date time applid tranid The CICS ONC RPC connection manager has detected an invalid server data length returned by the Getlengths function of converter converter_program_name. Program: X'prognum'; Version: X'versnum'; Procedure: X'procnum'; Protocol: protocol. Host IP address: hostaddr

Explanation: The communication area length calculated from the glength_server_output_data_len, glength_server_input_data_len parameters exceeds 32767.

System Action: The Getlengths parameter area is traced. The 4-tuple is not registered.

User Response: Use the trace information to correct the converter.

Destination: CRPO
Module: DFHRPC0E
XMEOUT Parameters: date, time, applid, tranid, converter_program_name, X'prognum', X'versnum', X'procnum', protocol, hostaddr

DFHRP1992 date time applid tranid The CICS ONC RPC connection manager has detected an invalid server data format returned by the Getlengths function of converter converter_program_name. Program: X'prognum'; Version: X'versnum'; Procedure: X'procnum'; Protocol: protocol. Host IP address: hostaddr

Explanation: The glength_server_data_format returned must have a value of URP_CONTIGUOUS or URP_OVERLAID.

System Action: The Getlengths parameter area is traced. The 4-tuple is not registered.

User Response: The glength_server_data_format must be set to URP_CONTIGUOUS or URP_OVERLAID, or left unaltered, in which case the value specified on panel DFHRP5 when the 4-tuple was registered will be used.

Destination: CRPO
Module: DFHRPC0E
XMEOUT Parameters: date, time, applid, tranid, converter_program_name, X'prognum', X'versnum', X'procnum', protocol, hostaddr

DFHRP2000 date time applid tranid A browse of the CICS ONC RPC alias list could not be performed because another browse is active.

Explanation: Only one task can browse the alias list at a time. This is enforced by use of an ENQ in the connection manager. However, the alias list component has been called to start a browse and has found that there is already a browse active. This is due either to a logic error in CICS ONC RPC code, or to a storage overwrite.

System Action: A system dump is taken. The browse request is rejected. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If the problem is due to a storage overwrite, it is almost certain that there are errors in other CICS functions for no apparent reason. If this is not the case, you may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.
DFHRS2110 date time applid Abnormal reply to exchange log name request received from system sysid, netname.

Explanation: An abnormal reply has been received in response to an exchange log name request sent either following a session failure or at first session initiation after system restart. The abnormal reply may indicate that:

- The remote system detected a warm or cold mismatch, or a log name mismatch.
- The remote system failed to interpret the exchange log name data sent to it.

System Action: For APPC protocol, any synclevel 2 attaches are inhibited. This prevents recoverable activity between the two systems.

For IRC protocol, the message indicates that resynchronization was attempted and failed.

User Response: The most likely cause of the message is an initial start (as opposed to emergency restart or its equivalent) of this system when the remote system has resynchronization work outstanding. If it is a cold or warm mismatch or a log name mismatch, other diagnostic messages on the local system may indicate the reason for the error. If it is not, examine the log of the remote system which should have generated diagnostic information describing the reason for the abnormal response.

For APPC protocol where a logname mismatch is suspected, override the error situation by issuing the CEMT SET CONN(sysid) command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

For IRC, the message may indicate an initial start of one system when the other has resynchronization outstanding; the resynchronization was started before the initial start occurred and becomes invalid. The associated unit of work may need to be committed by using CEMT SET UOW. The message should not recur.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: date, time, applid, sysid, netname, protocol

DFHRS2112 date time applid Log name mismatch with system sysid, netname.

Explanation: A failure has occurred in the exchange log names process which is carried out either following a session failure or at first session initiation after system restart. This system's memory of the remote system's log name conflicts with the log name sent by the remote system.

System Action: For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, resynchronization was attempted and failed.

User Response: For APPC, override the error by issuing the CEMT SET CONN(sysid) command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system. The message may indicate a logic error in CICS or the remote system, and you may need assistance from IBM to prevent a recurrence. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

For IRC, the message may indicate the initial start of one system when the other has resynchronization outstanding; the resynchronization was started before the initial start occurred and becomes invalid. The associated unit of work may need to be committed by using CEMT SET UOW. The message should not recur.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: date, time, applid, sysid, netname, protocol, local_logname, remote_logname

DFHRS2111 date time applid Cold/Warm restart mismatch with system sysid, netname.

Explanation: A cold start indication was received from the remote system during an exchange log names sequence. However, this system has units of work that need resynchronizing from the previous run. An exchange log names sequence is started either following a session failure or at first session initiation after system restart; both the local and remote systems may initiate the sequence at the same time.

System Action: Any synclevel 2 attaches are inhibited. This means that recovery activity between the two systems is prevented.

User Response: Override the error by issuing CEMT SET CONN(sysid) command for the failing connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition CICS does not carry out any APPC resynchronization with the remote system.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: date, time, applid, sysid, netname, protocol, local_logname, remote_logname

DFHRS2113 date time applid Log name mismatch with system sysid, netname.

Explanation: This message is issued when a failure has occurred in the exchange log names process which is carried out prior to resynchronization following an earlier session failure. System sysid has sent an exchange log names request which contains the remote system's memory (remote_logname) of this system's log name (local_logname).

This system has detected a log name mismatch. This indicates that system sysid and this system do not have the correct logs for resynchronization.
DFHRS2114 date time applid Abnormal termination of exchange log names sequence received from system sysid, netname protocol protocol.

Explanation: This message is issued when an FMH7 has been received in response to an exchange log name reply. An exchange log names sequence is sent either following a session failure or at first session initiation after system restart. The remote system started the sequence, and the FMH7 reply indicates that the remote system failed to interpret the exchange log name reply data sent to it.

System Action: For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

User Response: Investigate the cause of the error using the system dump. Format the control blocks for the trace domain and the terminal control program. (For guidance on how to do this, see the CICS Problem Determination Guide.)

Determine from the message which session was being used for this exchange log names conversation.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. For IRC, the TIOA contains the equivalent data. Check the data against the format of the exchange log names reply GDS variable. The correct format of this SNA defined field can be found in the SNA Formats manual.

Examine the log of the remote system. If a protocol violation was detected, the remote system may have generated diagnostic information itself which may help to diagnose the cause.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

DFHRS2116 date time applid protocol protocol support mismatch with system sysid, netname protocol. Expected support byte X’ww’, received support byte X’xx’, expected extended support bytes X’yyyyy’, received extended support byte X’zzzz’.

Explanation: This system’s memory of the protocols previously negotiated with the remote system conflicts with the indicators sent in an exchange log names variable.

System Action: For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocols, resynchronization fails. Communications continue normally.

User Response: For APPC protocols, the indicators expected from a CICS Transaction Server system are: basic support, X’70’; extended support, X’0000’. For CICS/ESA 4.1 the expected indicators are: basic support, X’40’; extended support, X’0000’. If this combination of the four indicator fields appears in the message, first check that you have Initial started the partner system at the CICS Transaction Server level during a migration from CICS/ESA 4.1, or Cold started a CICS/ESA 4.1 system after running CICS Transaction Server. If this possibility can be ruled out, the message may indicate a logic error in CICS or in the remote system and you may need assistance from IBM to prevent a recurrence. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

You can override the error situation by issuing CEMT SET CONN(sysid) NORCOVDATA commands for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition CICS does not carry out any APPC resynchronization activity with the remote system.

For IRC protocols, you may need to use the CEMT SET UOW command to resolve the state of any units or work which cannot be resolved by the normal resynchronization process.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

DFHRS2117 date time applid protocol protocol support mismatch with system sysid, netname protocol. Expected support byte X’ww’, received support byte X’xx’, expected extended support bytes X’yyyyy’, received extended support byte X’zzzz’.

Explanation: This system’s memory of the protocols previously negotiated with the remote system conflicts with the indicators sent in an exchange log names variable.

System Action: For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocols, resynchronization fails. Communications continue normally.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY
For IRC protocol, the problem is caused by the failure of the remote system to interpret the exchange log names reply data.

**System Action:** For APPC protocol, any syncl level 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

**User Response:** The most likely cause of the message is an initial start (as opposed to emergency restart or its equivalent) of the system when the other has resynchronization work outstanding. This can be confirmed by examining the message log of the remote system.

For APPC protocol, the connection on the remote system may need to be reset by issuing the CEMT SET CONN(sysid) NOTPENDING command against the connection entry for this system.

**Note:** If this command is issued, CICS unilaterally commits any resources waiting for APPC resynchronization.

For IRC protocol, a protocol violation or logic error is the only possible cause.

If a cold/warm mismatch is eliminated as the cause of the error, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Destination:** Console and Transient Data Queue CSMT

**Module:** DFHCRRSY

**XMEOUT Parameters:** date, time, applid, sysid, netname, protocol

**XMEOUT Parameters:** date, time, applid, sysid, netname, protocol

---

**DFHRS2117**

date applid Abnormal reply to exchange log

names received from system sysid netname protocol.
The connection on this system was in a cold state.

**Explanation:** This message is issued when an abnormal reply has been received in response to an exchange log name request. An exchange log names sequence is sent either following a session failure or at first session initiation after system startup. This system was either started with the SIT parameter START=INITIAL, or CEMT SET CONN(sysid) NORECOVODATA has been issued, and no log name is stored for the remote system. The abnormal reply may indicate one of two causes in the case of APPC protocol:

- The remote system has resynchronization work outstanding following a previous failure of a conversation during sync point processing and has detected a cold/warm mismatch.
- The remote system failed to interpret the exchange log name data sent to it.

For IRC protocol, the problem is caused by the failure of the remote system to interpret the exchange log name data.

**System Action:** For APPC protocol, any syncl level 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

**User Response:** The most likely cause of the message is an initial start (as opposed to emergency restart or its equivalent) of this system when the other has resynchronization work outstanding. This can be confirmed by examining the message log of the remote system.

For APPC protocol, the connection on the remote system may need to be reset by issuing the CEMT SET CONN(sysid) NOTPENDING command against the connection entry for this system.

If a cold/warm mismatch is eliminated as the cause of the error, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Destination:** Console and Transient Data Queue CSMT

**Module:** DFHCRRSY

**XMEOUT Parameters:** date, time, applid, sysid, netname, protocol

---

**DFHRS2118**

date applid Abnormal termination of exchange

log names sequence received from system sysid, netname netname, protocol protocol. There has been previous contact with that system.

**Explanation:** This message is issued when an FMH7 has been received in response to an exchange log name reply. An exchange log names sequence is sent either following a session failure or at first session initiation after system startup. Both systems have records of previous contact and have log names stored which were being verified by the exchange log names protocol, which was initiated by the remote system.

The FMH7 may indicate one of two causes:

- The remote system has detected a mismatch in the log names or protocol support indicated in the exchange log name reply sent to it.
- The remote system failed to interpret the exchange log name reply data sent to it.

**System Action:** A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

For LU6.2 protocol, any syncl level 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

**User Response:** For APPC protocol, the connection may need to be reset by issuing the CEMT SET CONN(sysid) NORECOVODATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

**Note:** If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization.

In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

The cause of the error may be indicated by diagnostic information produced by the remote system. The system dump taken by local system can be used to investigate the possibility of an error in the exchange log names reply GDS.

Format the control blocks for the trace domain and the terminal control program. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Determine from the message which session was being used for this exchange log names conversation.
The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. For IRC, the TIOA contains the equivalent data. Check that the data against the format of the exchange log names reply GDS variable. The correct format of this SNA defined field can be found in the SNA Formats manual.

**Destination:** Console and Transient Data Queue CSMT  
**Module:** DFHCRRSY  
**XMEOUT Parameters:** date, time, applid, sessid, netname, protocol

---

**DFHRS2134**  
**date time applid** An error has occurred while sending an exchange log names request on session sessid to remote system sysid, netname netname, protocol protocol.

**Explanation:** An error has occurred during the transmission of an exchange log names request to a remote system. CICS was attempting to establish the connection on first contact with the partner, or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This message implies a failure of the session used to carry the transmission.

**System Action:** A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

In many cases CICS continues to operate normally, and the resynchronization or connection establishment is retried in an attempt to overcome the session failure. However for APPC protocol, a repeated failure may have resulted in exchange log names flows being unsuccessful preventing any synclevel 2 attaches between the local system and the remote system.

For IRC protocol, resynchronization has failed but the connection continues to operate normally.

**User Response:** Issue CEMT INQUIRE CONN(sysid) and look at the XOK field. If exchange log names has not been done, the exchange log names process can be retried by issuing the CEMT SET CONN(sysid) RESYNC command.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system, and examine the log of the remote system. If a protocol violation was detected, the remote system may have generated diagnostic information itself.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the CICS Problem Determination Guide.)

Determine from the message which session was being used for this exchange log names conversation.

If the internal trace table is available, use it to track the commands issued against that session and check that the state transitions of the User state machine are correct. If any of the state transitions are not valid, it is possible that there has been a CICS logic error.

**Destination:** Console and Transient Data Queue CSMT  
**Module:** DFHCRRSY  
**XMEOUT Parameters:** date, time, applid, sessid, sysid, netname, protocol

---

**DFHRS2135**  
**date time applid** An error has occurred while sending a compare states request on session sessid to remote system sysid, netname netname, protocol protocol.

**Explanation:** An error has occurred during the transmission of a compare states request to a remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This implies one of the following:

- The remote system has detected a protocol violation in the local system’s exchange log names GDS variable.
- Some other error in communications has occurred.

**System Action:** For APPC protocol connections (but not IRC protocol), the failure may have prevented the completion of the exchange log names protocol and this prevents any synclevel 2 attaches between the local system and the remote system.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** For APPC protocol, investigate the state of the connection. Issue CEMT INQUIRE CONN(sysid) and look at the XOK field. If exchange log names has not been done, the exchange log names process can be retried by issuing the CEMT SET CONN(sysid) RESYNC command. If there has been previous successful contact between the systems the connection can be reset to its original state and retried. The state can be reset by issuing CEMT SET CONN(sysid) NORECVDATA. It may be necessary to issue this command on both sides of the connection.

**Note:** If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

The cause of the error may be indicated by diagnostic information produced by the remote system. Use the system dump taken by the local system to investigate the possibility of an error in the GDS variables.

Format the control blocks for the trace domain and the terminal control program. (For guidance on how to do this, see the CICS Problem Determination Guide.)

Determine from the message which session was being used for this exchange log names conversation.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. For IRC, the TIOA contains the equivalent data. Check that the data against the format of the exchange log names and compare states GDS variables. The correct format of this SNA defined field can be found in the SNA Formats manual.

**Destination:** Console and Transient Data Queue CSMT  
**Module:** DFHCRRSY  
**XMEOUT Parameters:** date, time, applid, sessid, sysid, netname, protocol
DFHRS2136  

**Explanation:** An error has occurred during an attempt to receive exchange log names reply data from a remote system.  CICS was attempting to initialize the connection, or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

The message means that:

- The remote system has detected a protocol violation in the local system's exchange log names GDS variable or compare states GDS variable and sent an FMH7 to indicate the error.
- Some other error in communication has occurred in either the local or the remote system.

**System Action:** For APPC protocol the failure of exchange log names may mean that any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** For APPC protocol, investigate the state of the connection. Issue CEMT INQUIRE CONN(sysid) and look at the XOK field. If exchange log names has not been done, the exchange log names process can be retried by issuing the CEMT SET CONN(sysid) RESYNC command. If there has been previous successful contact between the systems the connection may be reset to its original state and retried. The state can be reset by issuing CEMT SET CONN(sysid) NORECOVDATA. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

**Note:** If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition CICS does not carry out any APPC resynchronization activity with the remote system.

The cause of the error may be indicated by diagnostic information produced by the remote system. Use the system dump taken by the local system to investigate the possibility of an error in the GDS variables.

Format the control blocks for the trace domain and the terminal control program. (For guidance on how to do this, see the CICS Problem Determination Guide.)

Determine from the message which session was being used for this exchange log names conversation.

Check the data against the format of the exchange log names and compare states GDS variables. The correct format of this SNA defined data can be found in the SNA Formats manual.

**Destination:** Console and Transient Data Queue CSMT

**Module:** DFHCRRSY

**XMEOUT Parameters:** date, time, applid, sessid, sysid, netname, protocol

---

DFHRS2137  

**Explanation:** An error has occurred during the receipt of a compare states reply from a remote system.  CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This implies one of the following:

- The remote system has detected a protocol violation in the local system’s compare states GDS variable.
- There has been an internal error in CICS APPC processing.

**System Action:** A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

CICS continues to operate normally and the resynchronization attempt is retried at the next opportunity.

**User Response:** Investigate the cause of the error first by examining the log of the remote system which may have produced diagnostic information about the data it received. The problem can be investigated locally using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain and the terminal control program. (For guidance on how to do this, see the CICS Problem Determination Guide.)

Determine from the message which session was being used for this resynchronization conversation.

If the internal trace table is available, use this to track the commands issued against that session and check that the state transitions of the user state machine are correct. If any of the state transitions are not valid, it is possible that there has been a CICS logic error.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. Similar information is contained in the TIOA for IRC sessions. Locate the data for the session in question, and check that the contents of the buffer are correct. The correct format of this SNA defined data can be found in the SNA Formats manual.

**Destination:** Console and Transient Data Queue CSMT

**Module:** DFHCRRSY

**XMEOUT Parameters:** date, time, applid, sessid, sysid, netname, protocol

---

DFHRS2138  

**Explanation:** The local system has received data which it attempted to parse using the exchange log names reply GDS format. Either the data could not be parsed, or invalid data was detected.

This system was attempting to initialize the connection for synclevel 2 work, or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. Exchange log names was sent and an invalid reply received.
This failure implies an error in the remote system or a CICS logic error.

**System Action:** If resynchronization was being attempted it has failed and is retried at the next opportunity.

For APPC protocol connections (but not IRC protocol) the failure prevents the completion of the exchange log names protocol and this may prevent any synclevel 2 attaches between the local system and the remote system.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** For APPC protocol, investigate the state of the connection. Issue CEMT INQUIRE CONN(sysid) and look at the XOK field. If exchange log names has not been done, the exchange log names process can be retried by issuing the CEMT SET CONN(sysid) RESYNC command. If there has been previous successful contact between the systems the connection may be reset to its original state and retried. The state can be reset by issuing CEMT SET CONN(sysid) NORECOV DATA. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

**Note:** If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the CICS Problem Determination Guide.)

An exception trace entry contains the received data, and the reason for the failure is interpreted. Check the format of the exchange log names reply GDS variable. The correct format of this SNA defined field can be found in the SNA Formats manual.

**Destination:** Console and Transient Data Queue CSMT

**Module:** DFHCRRSY

**XMEOUT Parameters:** date, time, applid, sessid, sysid, netname, protocol

---

**DFHRS2139**

**date time applid Invalid compare states reply data has been received on session sessid from remote system sysid, netname, protocol protocol.**

**Explanation:** The local system has received data which it attempted to parse using the compare states reply GDS format. Either the data could not be parsed or invalid data was detected.

The local system was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. Data from the remote system received in reply to the compare states was invalid.

This failure implies an error in the remote system or a CICS logic error.

**System Action:** A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

The failure prevents the completion of the resynchronization of distributed resources.

**User Response:** Investigate any units of work for which resynchronization is outstanding using the CEMT INQUIRE UOWLINK SYSID(sysid) command. Use the same command on the remote system to determine whether to commit or backout the unit of work. Alternatively, for APPC connections, resynchronization can be overridden by issuing the CEMT SET CONN(sysid) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

**Note:** If this command is issued, CICS unilaterally commits any resources which may be waiting for resynchronization. Also, CICS does not carry out any resynchronization activity with the remote system.

Investigate the cause of the error using the system dump. Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the CICS Problem Determination Guide.)

An exception trace entry contains the received data, and the reason for the failure is interpreted. Check the format of the compare states reply GDS variable. The correct format of this SNA defined field can be found in the SNA Formats manual.

**Destination:** Console and Transient Data Queue CSMT

**Module:** DFHCRRSY

**XMEOUT Parameters:** date, time, applid, sessid, sysid, netname, protocol

---

**DFHRS2140**

**date time applid A protocol violation has occurred while resynchronizing with remote system sysid, netname, protocol protocol, via session sessid. The resynchronization was initiated by the local system.**

**Explanation:** The local system has detected a protocol violation while resynchronizing with the remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. The resynchronization was initiated by the local system.

This implies one of the following:

- An error was detected by the remote system and the resynchronization sequence was abnormally terminated.
- A logic error exists in the remote system which caused it to send invalid data.
- A CICS logic error.

**System Action:** CICS continues to operate normally and the resynchronization attempt is retried at the next opportunity.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Diagnostics may have been output by the local CICS system, the access methods, or the operating system. Also, investigate the cause of the error in the remote system. It may have produced diagnostic messages indicating why the resynchronization sequence was terminated.

The resynchronization sequence can be analyzed locally by formatting the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the CICS Problem Determination Guide.)

Determine from the message which session was being used for this resynchronization conversation.
The trace entries for the DFHCRRSY program show the state of the conversation which was being used and the data received. At the point of failure a confirmation was expected from the remote system as the final flow in the sequence but was not received.

Compare the resynchronization flows with those documented in the SNA LU6.2 Reference: Peer Protocols manual. (SC30-6808). A possible cause of this error is that the remote system did not observe the correct protocols. Investigation at the remote system may be necessary.

**Destination:** Console and Transient Data Queue CSMT

**Module:** DFHCRRSY

**XMEOUT Parameters:** date, time, applid, sysid, netname, protocol, sessid

---

**DFHRS2141**

`date time applid` A protocol violation has occurred while resynchronizing with remote system sysid, netname netname, protocol protocol, via session sessid. The resynchronization was initiated by the remote system.

**Explanation:** The local system has detected a protocol violation while resynchronizing with the remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. The resynchronization was initiated by the remote system.

This implies one of the following:

- An error was detected by the remote system and the resynchronization sequence was abnormally terminated.
- A logic error exists in the remote system which caused it to send invalid data.
- A CICS logic error.

**System Action:** CICS continues to operate normally and the resynchronization attempt is retried at the next opportunity.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** See any diagnostics output by the local CICS system, the access methods, or the operating system. Also, investigate the cause of the error in the remote system; it may have produced diagnostic messages indicating why the resynchronization sequence was terminated.

The resynchronization sequence can be analyzed locally by formatting the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the CICS Problem Determination Guide.)

Determine from the message which session was being used for this resynchronization conversation.

The trace entries for the DFHCRRSY program show the state of the conversation which was being used and the data received. At the point of failure a request confirmation message was expected from the remote system as the third flow in the sequence but was not received.

Compare the resynchronization flows with those documented in the SNA LU6.2 Reference: Peer Protocols manual. (SC30-6808). A possible cause of this error is that the remote system did not observe the correct protocols; investigation at the remote system may be necessary.
DFHRS2143 date time applid Do_know confirmation was not received on session sessid from remote system sysid, netname, protocol protocol.

Explanation: The local system sent a Do_know GDS variable to the remote system but did not receive a valid reply. This indicates an earlier failure of a protected conversation during sync point processing and the resolution of the unit of work. This system was using the Do_know GDS variable to cause resynchronization to be started by the remote system. This implies an error in the remote system or a CICS logic error.

System Action: The resynchronization attempt should be retried at the next opportunity by the remote system. A system dump is taken unless you have specifically suppressed dumps in the dump table. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Issue CEMT SET CONN(sysid) RESYNC to cause resynchronization to be retried.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the CICS Problem Determination Guide.)

Locate the exception trace entries for the DFHCRRSY program and examine any data sent by the remote system. Also examine the state of the conversation at the point of failure.

A possible cause is that the remote system did not send valid data or failed to follow the protocol for Do_Know in which case it may be necessary to obtain further diagnostic material from the remote system.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: date, time, applid, sessid, sysid, netname, protocol

DFHRS2145 date time applid Invalid exchange log names data has been received on session sessid from remote system sysid, netname, protocol protocol.

Explanation: The local system has received data which it attempted to parse using the exchange log names GDS format. Either the data could not be parsed or invalid data was detected. The remote system was attempting to initialize the connection for synclevel 2 work or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. Exchange log names is sent in both of these cases. This failure indicates either an error in the remote system or a CICS logic error.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table. Message DFHME0116 is normally produced containing the symptom string for this problem. If resynchronization was being attempted, it has failed and is retried at the next opportunity. For APPC protocol connections (but not IRC protocol), the failure prevents the completion of the exchange log names protocol. This prevents any synclevel 2 attaches between the local system and the remote system.

User Response: For APPC protocol connections, issue CEMT INQUIRE CONN(sysid) and look at the XOK field. If exchange log names has not been done but there has been previous contact between the systems, the error can be overridden by resetting the state of the connection. To do this, issue CEMT SET CONN(sysid) NORECOVDATA commands for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources waiting for APPC resynchronization. Also CICS does not carry out any APPC resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the CICS Problem Determination Guide.)

An exception trace entry contains the received data, and the reason for the failure is interpreted. Check the format of the exchange log names GDS variable. The correct format of this SNA defined field can be found in the SNA Formats manual.
The format of the GDS variable is incorrect and the cause of the error should be located. A likely cause is that the remote system did not send a valid GDS variable in which case it may be necessary to obtain further diagnostic material from the remote system.

**Destination:** Console and Transient Data Queue CSMT  
**Module:** DFHCRRSY  
**XMEOUT Parameters:** date, time, applid, sessid, sysid, netname, protocol

---

**Explanation:** The local system has received data which it attempted to parse using the compare states GDS format. Either the data could not be parsed or invalid data was detected.

The remote system was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This failure indicates either an error in the remote system or a CICS logic error.

**System Action:** A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

The failure prevents the completion of the resynchronization of distributed resources.

**User Response:** Investigate any units of work for which resynchronization is outstanding using the command CEMT INQUIRE UOWLINK SYSID(sysid). Use the same command on the remote system to determine whether to commit or backout the unit of work. Alternatively, resynchronization can be overridden by issuing the CEMT SET CONN(sysid) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

**Note:** If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the **CICS Problem Determination Guide**.)

An exception trace entry contains the received data, and the reason for the failure is interpreted. Check the format of the compare states GDS variable. The correct format of this SNA defined field can be found in the SNA Formats manual.

The format of the GDS variable is incorrect and the cause of the error should be located. A possible cause is that the remote system did not send a valid GDS variable, in which case it may be necessary to obtain further diagnostic material from the remote system.

**Destination:** Console and Transient Data Queue CSMT  
**Module:** DFHCRRSY  
**XMEOUT Parameters:** date, time, applid, sessid, sysid, netname, protocol

---

**Explanation:** An exchange log names request was received from another system and a reply was sent. More data was expected from the other system but this was not recognized as part of the exchange log names protocol.

This implies one of the following:

- The remote system has detected a protocol violation in the local system’s exchange log names reply GDS variable.
- There has been an internal error in CICS processing.

**System Action:** A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

For APPC protocol, the failure may have resulted in no exchange log name flows being successful preventing any syncelevel 2 attaches between the local system and the remote system.

For IRC protocol, resynchronization may fail but communications links remain active.

**User Response:** For links using APPC protocol, issue CEMT INQUIRE CONN(sysid) and look at the XOK field. If exchange log names has not been done, the error situation can be overridden by issuing the CEMT SET CONN(sysid) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

**Note:** If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any diagnostic information provided by CICS, the access methods, or the operating system. The remote system may also have created diagnostic messages if it detected an error in the data it received.

The data sent by the local system can be investigated by formatting the system dump to show the control blocks belonging to the trace domain and the terminal control program. (For guidance on how to do this, see the **CICS Problem Determination Guide**.)

Determine from the message which session was being used for this exchange log names conversation.

If the internal trace table is available, use it to track the commands issued against that session and check that the state transitions of the user state machine are correct. If any of the state transitions are not valid, it is possible that there has been a CICS logic error.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. The TIOA contains similar information for IRC. Locate the send/receive buffer for the session in question and check that the contents of the buffer are correct. The buffer should contain a valid exchange log names GDS reply variable. The correct format of this SNA defined field can be found in the SNA Formats manual.

**Destination:** Console and Transient Data Queue CSMT  
**Module:** DFHCRRSY  
**XMEOUT Parameters:** date, time, applid, sessid, sysid, netname, protocol
Chapter 1. DFH messages

DFHRS2148 data time applid Resynchronization with system sysid, netname netname, protocol protocol was attempted but was terminated because no partner log name was found.

Explanation: CICS has initiated a resynchronization sequence following the failure of a protected conversation during syncpoint processing. No valid log name was found for the partner system. The resynchronization could not continue.

This message indicates that a CEMT SET CONNECTION NORECOVDATA command was issued before the resynchronization with the partner system could be completed. The UOW and UOWLINK describing the outstanding work have also been deleted.

System Action: None
User Response: None. This message is issued for information only.
Destination: CSMT
Module: DFHCRRSY
XMEOUT Parameters: date, time, applid, sysid, netname, protocol

DFHRS2149 data time applid Resynchronization/Exchange log names with system netname (protocol protocol) could not be executed because no suitable connection entry was found.

Explanation: CICS has initiated a resynchronization sequence following the failure of a protected conversation during syncpoint processing. Data exists describing the conversation but no suitable connection definition was found for the partner system. The resynchronization could not continue because communications could not be established.

System Action: Processing continues.
User Response: The condition may be due to the discarding of the connection definition or to a cold start which has caused a connection definition to be deleted by CICS; the definition may have been autoinstalled. An autoinstalled definition may be reinstalled by subsequent activity in the system. Alternatively, a suitable definition can be installed manually using CEDA.
Destination: CSMT
Module: DFHCRRSY
XMEOUT Parameters: date, time, applid, netname, protocol

DFHRS2150 data time applid Invalid data has been received during the resynchronization sequence on session sessid from remote system sysid, netname netname, protocol protocol.

Explanation: The local system has received data which it attempted to parse as one of the following types of SNA GDS data:

- Exchange log names
- Do_know
- System_restart

The data could not be recognized.

The remote system was attempting to initialize the connection for synclevel 2 work or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This failure implies one of the following:
- An error was detected by the remote system and it sent an error indication in an FMH7.
- A CICS logic error has occurred.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

If resynchronization was being attempted, it has failed and is retried at the next opportunity.

For APPC protocol connections (but not IRC protocol), the failure prevents the completion of the exchange log names protocol and this prevents any synclevel 2 attaches between the local system and the remote system.

User Response: For APPC protocol connections, issue CEMT INQUIRE CONN(sysid), and examine the XOK field. If exchange log names has not been done but there has been previous contact between the systems, the error can be overridden by resetting the state of the connection. To do this, issue the CEMT SET CONN(sysid) NORECOVDATA command for the failing connection.

It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on this, see the CICS Problem Determination Guide.)

An an trace entry contains the received data. Check the format of this data. The correct format of the SNA defined field can be found in the SNA Formats manual.

A possible cause is that the remote system did not send a valid GDS variable. In this case, it may be necessary to obtain further diagnostic material from the remote system.

Destination: Console and Transient Data Queue CSMT
Module: DFHCRRSY
XMEOUT Parameters: date, time, applid, sessid, sysid, netname, protocol

DFHRS2151 data time applid Invalid data has been received during the resynchronization sequence on session sessid from remote system sysid, netname netname, protocol protocol.

Explanation: The local system was attempting to receive data as part of a resynchronization sequence but the conversation was in the wrong state or an error FMH was received.

The remote system was attempting to initialize the connection for synclevel 2 work or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

The failure implies one of the following:
- An error was detected by the remote system and it sent an error indication in an FMH7.
- An error occurred in the remote system
- A CICS logic error has occurred.
DFHRS2152  

**System Action:** A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

If resynchronization was being attempted, it has failed and will be retried at the next opportunity.

**User Response:** The sequence of resynchronization can be retried by issuing CEMT SET CONN(syid) RESYNC.

Investigate the cause of the error using the system dump and any diagnostic information already issued by CICS, the access methods or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the CICS Problem Determination Guide.)

The trace entries show the state of the conversation with the remote system and the arrival of any error FMH indicating an error detected in the remote system. If necessary, obtain further diagnostic material from the remote system.

**Destination:** Console and Transient Data Queue CSMT

**Module:** DFHCRRSY

**XMEOUT Parameters:** date, time, applid, sessid, syid, netname, protocol

DFHRS2152 date time applid A conversation error has occurred during resynchronization sequence on session sessid initiated to remote system syid, netname netname, protocol protocol.

**Explanation:** The local system has initiated a sequence of resynchronization exchanges with the partner system and has completed one or more of them. The conversation is not in the right state to continue the process.

The failure indicates either an error in the remote system or a CICS logic error.

**System Action:** A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

If resynchronization was being attempted, it has failed and is retried at the next opportunity.

**User Response:** The sequence of resynchronization can be retried by issuing CEMT SET CONN(syid) RESYNC.

Investigate the cause of the error using the system dump and any diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the CICS Problem Determination Guide.)

The trace entries show the state of the conversation with the remote system. The arrival of any error FMH indicates an error in the remote system. In this case it may be necessary to obtain further diagnostic material from the remote system.

**Destination:** Console and Transient Data Queue CSMT

**Module:** DFHCRRSY

**XMEOUT Parameters:** date, time, applid, sessid, syid, netname, protocol

DFHRS2153 date time applid An error has occurred while sending a system_restart request on session sessid to remote system syid, netname netname, protocol protocol.

**Explanation:** An error has occurred during the transmission of a System_restart request to a remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This implies one of the following:

- The remote system has detected a protocol violation during the preceding exchange log names sequence.
- Some other error in communications has occurred.

**System Action:** A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** The cause of the error may be indicated by diagnostic information produced by the remote system. Diagnostics issued by the local system, the access method, or the operating system may indicate a reason for the failure. Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the CICS Problem Determination Guide.)

Determine from the message which session was being used for this exchange log names conversation.

If the internal trace table is available, use it to track the commands issued against the session reported in the message. Check that the state transitions of the user state machine are correct and that the conversation was in send state at the time of the error. If any of the state transitions are not valid, there may have been a CICS logic error.

**Destination:** Console and Transient Data Queue CSMT

**Module:** DFHCRRSY

**XMEOUT Parameters:** date, time, applid, sessid, syid, netname, protocol

DFHRS2154 date time applid A logic error has occurred during resynchronization with system syid, netname netname.

**Explanation:** A logic error has occurred during resynchronization with the partner system.

The local data associated with the resynchronization was locked at the start of processing but could not be unlocked at the end.

**System Action:** A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

An ASql abend is subsequently issued by the transaction processing the resynchronization, and a transaction dump is taken.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CSMT

**Module:** DFHCRRSY

**XMEOUT Parameters:** date, time, applid, syid, netname

DFHRRS2154 date time applid A logic error has occurred during resynchronization with system syid, netname netname.
DFHRS2155 date time applid Affinity changed by partner resource known as connection sysid, netname
netname. Old LUNAME was old-luname, new LUNAME is new-luname.

Explanation: A change in the generic resource member associated with the partner system has occurred but the local system has resynchronization work to complete.

The local system has previously made contact with the generic resource known as connection sysid (netname netname), and synclevel(2) work has been exchanged with the assigned member, identified by old-luname. Since that time, the affinity with old-luname has been changed to new-luname by action in the remote system. Resynchronization of the synclevel(2) work cannot take place.

System Action: No system action is taken, but subsequent messages may indicate an exchange log names failure which could prevent the connection being used for synclevel(2) work. Alternatively, messages may indicate that resynchronization work has subsequently been erased by CICS as a result of the XLNACTION setting on the connection definition.

Destination: CSMT
Module: DFHCRRSY
XMEOUT Parameters: date, time, applid, sysid, netname, old-luname, new-luname

DFHRS2156 date time applid A logic error has occurred during resynchronization with system sysid, netname
netname.

Explanation: The CLS2 transaction was processing exchange lognames or resynchronization for a connected partner identified by a netname netname. The connection entry associated with this netname is sysid, and was located and locked, but could not be unlocked in subsequent processing. This indicates a CICS internal logic error.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table. A system dump is taken unless you have specifically suppressed dumps in the dump table. A system dump is subsequently issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

Destination: CSMT
Module: DFHCRRSY
XMEOUT Parameters: date, time, applid, sysid, netname, old-luname, new-luname

DFHRS2157 date time applid A logic error has occurred during resynchronization with system sysid, netname
netname.

Explanation: The CLS2 transaction was executing exchange log names and attempted to save a log name received from system sysid (netname netname) by invoking the CICS recovery manager domain. This operation failed because of a CICS internal error in the recovery manager domain or in the resynchronization program.

System Action: The transaction is terminated with a transaction dump. A system dump is taken unless you have specifically suppressed dumps in the dump table. Abend ASQI is subsequently issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT
Module: DFHCRRSY
XMEOUT Parameters: date, time, applid, sysid, netname

DFHRTxxxx messages

DFHRT0001 applid An abend (code aaaa/bbbb) has occurred at offset 'X-offset' in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.
DFHRT0002

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the OS/390 MVS System Codes manual.

Next, look up the CICS abend code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

For further information about code, see the CICS Problem Determination Guide.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Module: DFHRTSU
XMEOUT Parameters: applid, aaaa/bbbb, X’offset’, modname

DFHRT0002 applid A severe error (code X’code’) has occurred in module modname.

Explanation: An error has been detected in module modname. The code X’code’ is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X’code’ in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Module: DFHRTSU
XMEOUT Parameters: applid, X’code’, modname

DFHRT4401 time applid No transaction identification specified. Please try again.

Explanation: The terminal operator has not entered an identifier for this transaction.

System Action: CICS processing continues.

User Response: Enter a valid transaction identifier.

Destination: Terminal End User
Module: DFHRTE

DFHRT4402 time applid You cannot use a Program Function key to start transactions on other systems.

Explanation: Program function keys cannot be used to initiate a transaction on another system using the routing transaction (CRTE).

System Action: CICS processing continues.

User Response: Enter a valid transaction identifier.

Destination: Terminal End User
Module: DFHRTE

DFHRT4403 time applid The routing session to system sysid has been terminated. Further transactions will not be routed to the connected system.

Explanation: The routing session has been terminated. Subsequent transaction identifiers will not be shipped to the connected system.

System Action: CICS processing continues without the connection to system sysid.

User Response: If you need to use system sysid, investigate why the routing session has terminated.

Destination: Terminal End User
Module: DFHRTE

DFHRT4404 time applid Please change format of request to CRTE SYSID=XXX,TRPROF=YYYYYY.

Explanation: The request to the routing transaction CRTE contained incorrect syntax.

System Action: CICS processing continues.

User Response: Reenter the request to the routing transaction CRTE using the correct syntax.

Destination: Terminal End User
Module: DFHRTE

DFHRT4405 time applid System sysid cannot be found. Please check that you have used the correct system name.

Explanation: System sysid is not defined to CICS.

System Action: CICS processing continues.

User Response: Check that you have used the correct system name. Either reenter the request specifying the correct system name, or define system sysid to CICS.

Destination: Terminal End User
Module: DFHRTE
DFHRT4406 time applid System sysid is not in service or is released.

Explanation: The system sysid is not currently in service, or is released.

System Action: CICS processing continues. If a routing session had been established before the connection became unavailable, it remains in force until the user enters CANCEL. If the connection becomes usable before this, transactions are again routed. If this message is in response to the initial CRTE command, no routing session is in force and no routing is attempted for subsequent terminal input.

User Response: Wait until system sysid becomes available. Enter CANCEL to terminate an existing routing session.

Destination: Terminal End User
Module: DFHRTE

DFHRT4407 time applid This system does not include support of intersystem communication.

Explanation: The system has not been generated with support for intersystem communication.

System Action: CICS processing continues without support for intersystem communication.

User Response: Generate the system with support for intersystem communication.

Destination: Terminal End User
Module: DFHRTE

DFHRT4408 time applid Terminal termid is not of the type supported by routing transaction tranid.

Explanation: The routing transaction does not support the type of terminal being used.

System Action: CICS processing continues without support for terminal termid.

User Response: Use a terminal of the type supported by the routing transaction, that is, a 3270 display terminal or a console.

Destination: Terminal End User
Module: DFHRTE

DFHRT4409 time applid The routing session to system sysid has been started.

Explanation: The routing session has been started.

System Action: CICS processing continues.

User Response: None.

Destination: Terminal End User
Module: DFHRTE

DFHRT4410 time applid System sysid is unavailable. The routing session to it is terminated.

Explanation: The routing transaction has been terminated because the system became unavailable. Subsequent transaction identifiers will not be shipped to the connected system.

System Action: CICS processing continues.

User Response: If appropriate, re-enter the transaction when the routing session to system sysid becomes available.

Destination: Terminal End User
Module: DFHRT4TE

DFHRT4411 time applid The Communication Profile cannot be found.

Explanation: The profile, specified for a transaction invoked from the terminal to which the message is directed, is not defined to CICS.

System Action: CICS stops initialization of the transaction.

User Response: Define the communication profile to CICS and reinvoke the transaction. For further information on how to define the profile, refer to the CICS Distributed Transaction Programming Guide.

Destination: Terminal End User
Module: DFHRTE

DFHRT4412 time applid The transaction code is not defined on the remote system.

Explanation: A transaction identification, routed to a remote CICS system, is not an installed transaction definition in the remote system. CICS directs this message to the terminal at which the transaction identification was entered.

This message is similar to DFHAC2001 in a local system.

System Action: CICS stops initialization of the transaction.

User Response: Enter a valid transaction ID, or install the transaction on the remote system.

Destination: Terminal End User
Module: DFHZTSP

DFHRT4413 time applid The transaction has been disabled on the remote system.

Explanation: A transaction, routed to a remote CICS system, is disabled in the installed transaction definition of the remote system. CICS directs this message to the terminal at which the transaction identification was entered.

This message is similar to DFHAC2008 in a local system.

System Action: CICS stops initialization of the transaction.

User Response: Enable the transaction on the remote system.

Destination: Terminal End User
Module: DFHZTSP

DFHRT4414 time applid Transaction tranid cannot run. CICS shutdown is in progress in the remote system.

Explanation: A transaction tranid was routed to a remote CICS system that was being quiesced. CICS directs this message to the terminal at which the transaction identification was entered.

This message is similar to DFHAC2007 in a local system.

System Action: The remote CICS system continues quiescing.

User Response: Reenter the transaction when the remote CICS system is in normal execution mode.

Destination: Terminal End User
Module: DFHZTSP
DFHRT4415  *time applid* Transaction CXRT was invoked directly by terminal input. This is not allowed.

**Explanation:** The transaction code CXRT, which is reserved for an internal CICS transaction, was entered from a terminal.

**System Action:** The transaction is run with no effect.

**User Response:** Do not enter transaction code CXRT at a terminal.

**Destination:** Terminal End User

**Module:** DFHCRT

---

DFHRT4416 *date time applid* Abend abcode has occurred in the {Dynamic | Distributed} Routing Program. Module name: modname.

**Explanation:** Either the dynamic routing program or the distributed routing program has abnormally terminated with abend code abcode.

**System Action:**
1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

**User Response:** See the description of abend code abcode for further guidance.

If the code is not a CICS transaction abend code, it is a user abend code. Request an explanation from the programmer responsible for this area.

**Destination:** CSMT

**Modules:** DFHAPRT, DFHEIIC, DFHEPC, DFHICXM

**XMEOUT Parameters:** date, time, applid, abcode, modname, 

(1=Dynamic, 2=Distributed)

---

DFHRT4417 *date time applid* Abend abcode in modname - {Dynamic | Distributed} routing program must be AMODE=31.

**Explanation:** CICS has failed to link to EITHER the dynamic routing program OR the distributed routing program because it is not AMODE 31.

**System Action:**
1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

**User Response:** Recompile, reassemble, and link edit the dynamic routing program to AMODE 31.

**Destination:** CSMT

**Modules:** DFHAPRT, DFHEIIC, DFHEPC, DFHICXM

---

DFHRT4418 *date time applid* Abend abcode in modname - {Dynamic | Distributed} routing program PPT entry not found.

**Explanation:** CICS was unable to find a PPT entry for EITHER the dynamic routing program OR the distributed routing program.

**System Action:**
1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

**User Response:** Ensure that EITHER
1. the dynamic routing program specified by the system initialization parameter DTRPGM=program name, or specified via the EXEC CICS SET SYSTEM DTRPROGRAM(program name) has been correctly defined to CICS
2. the distributed routing program specified by the system initialization parameter DSRTPGM=program name, or specified via the EXEC CICS SET SYSTEM DSRTPROGRAM(program name) has been correctly defined to CICS

**Destination:** CSMT

**Modules:** DFHAPRT, DFHEIIC, DFHEPC, DFHICXM

**XMEOUT Parameters:** date, time, applid, abcode, modname, 

(1=Dynamic, 2=Distributed)

---

DFHRT4419 *date time applid* Abend abcode in modname - Fetch for (dynamic | distributed) routing program failed.

**Explanation:** CICS was unable to load EITHER the dynamic routing program or the distributed routing program.

**System Action:**
1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

**User Response:** Ensure that EITHER
1. the dynamic routing program specified by the system initialization parameter DTRPGM=program name, or specified via the EXEC CICS SET SYSTEM DTRPROGRAM(program name) has been correctly defined. Ensure that it is also in a load library accessible to CICS.
2. the distributed routing program specified by the system initialization parameter DSRTPGM=program name, or specified via the EXEC CICS SET SYSTEM DSRTPROGRAM(program name) has been correctly defined. Ensure that it is also in a load library accessible to CICS.

**Destination:** CSMT

**Modules:** DFHAPRT, DFHEIIC, DFHEPC, DFHICXM
XMEOUT Parameters: date, time, applid, abcode, modname, [1=dynamic, 2=distributed]

DFHRT4420  date time applid Abend abcode in modname - Link to the [dynamic | distributed] routing program failed.

Explanation: An unexpected return code was returned from the link to the dynamic routing program.

System Action:
1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT
Module: DFHAPRT, DFHEIIC, DFHEPC, DFHICXM
XMEOUT Parameters: date, time, applid, abcode, modname, [1=dynamic, 2=distributed]

DFHRT4421  date time applid Unable to Delete remote Terminal termid that is connected to system sysid.

Explanation: A transaction could not be started because the remote terminal definition for termid, system sysid was flagged for deletion but the DELETE failed. This might indicate a transaction looping on the terminal.

System Action: The user transaction abends with abend code AZT1.
User Response: See the associated DFHZCxxxx messages for further guidance. Once corrected, you can attempt to run the transaction again.

Destination: Console and Transient Data Queue CSMT
Module: DFHHTSP
XMEOUT Parameters: date, time, applid, termid, sysid

DFHRT4422  time applid The connection to system sysid does not support transaction routing. Please check that you have used the correct system name.

Explanation: The connection to system sysid is not an MRO or APPC connection.

System Action: CICS processing continues.
User Response: Check that you have used the correct system name. Either reenter the request specifying the correct system name, or define the connection to system sysid as an MRO or APPC connection.

Destination: Terminal End User
Module: DFHRTCE

DFHRUxxxx messages

DFHRU2816 applid Exit program progname is not available

Explanation: The user-defined global exit program, progname, is not defined, or disabled, or missing from the program library.

System Action: CICS abnormally terminates the recovery control restart task with transaction abend ARCB. CICS then terminates abnormally.
User Response: Make program progname available.
Destination: Console
Module: DFHRCSEX
XMEOUT Parameters: applid, progname

DFHRXxxxx messages

DFHRX0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three
You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Module:** DFHRXDM

**XMEOUT Parameters:** applid, 'code', modname

---

**DFHRX0002**

**applid A severe error (code X'code') has occurred in module modname.**

**Explanation:** An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

**System Action:** An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specified in the dump table.

**CICS continues unless you have specified in the dump table that CICS should terminate.** If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

**Message DFHME0116 is normally produced containing the symptom string for this problem.**

**User Response:** This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

---

**DFHRX0100I applid RX domain initialization has started.**

**Explanation:** This is an informational message indicating the start of RX domain initialization.

**System Action:** Initialization continues.

**User Response:** None. You can suppress this message with the system initialization parameter, MSGLVL=0.

**Destination:** Console

**Module:** DFHRXDM

**XMEOUT Parameter:** applid

---

**DFHRX0101I applid RX domain initialization has ended.**

**Explanation:** RX domain initialization has completed successfully.

**System Action:** Initialization continues.

**User Response:** None. You can suppress this message with the system initialization parameter, MSGLVL=0.

**Destination:** Console

**Module:** DFHRXDM

**XMEOUT Parameter:** applid

---

**DFHRX0102 applid Errors were encountered during initialization of the RX domain. Domain initialization has ended.**

**Explanation:** Errors have been detected by the Resource Recovery Services (RX) domain during CICS initialization. Accompanying messages describe the nature of the errors.

**System Action:** A system dump is taken, unless you have specified in the dump table.

**CICS continues unless you have specified in the dump table that CICS should terminate.**

**User Response:** If your CICS system will not use any services that depend on Resource Recovery Services, no action is necessary. Otherwise, you will need to shut CICS down, and restart it once the problems identified by the earlier messages have been corrected.

**Destination:** Console

**Module:** DFHRXDM

**XMEOUT Parameter:** applid

---

**DFHRX0103 applid An unexpected return code X'rc' was received from RRMS service xxxxxxxx.**

**Explanation:** An unexpected return code was received when CICS issued a request to Recoverable Resource Management Services (RRMS). The name of the RRMS service included in the message indicates the component of RRMS as follows:

- **CRGxxxx** Registration Services
- **CTXxxxx** Context Services
- **ATRxxxx** Resource Recovery Services (RRS)

This message may indicate a problem with RRMS.
DFHRX0104I applid The Resource Recovery Services (RRS) exit manager aaaaaaaaaaaaaaaa is now available.

Explanation: This message is issued when CICS discovers that a Resource Recovery Services (RRS) exit manager is available. The insert aaaaaaaaaaaaaaaa is the name of the exit manager. Transactions which use RRS to coordinate their updates cannot be successfully executed.

System Action: CICS continues. Message DFHRX0104 will be issued when the exit manager becomes available once more.

User Response: None. You can suppress this message with the system initialization parameter, MSGGLVL=0.

Destination: Console

Module: DFHRXDM

XMEOUT Parameters: applid, aaaaaaaaaaaaaaaa

DFHRX0107I applid Restart processing with Resource Recovery Services (RRS) has ended.

Explanation: This message is issued when restart processing with Resource Recovery Services (RRS) ends. If RRS has become unavailable during restart processing (indicated by message DFHRX0105) restart processing may be incomplete.

System Action: CICS continues. If RRS has become unavailable, CICS will resume restart processing when RRS becomes available once more.

User Response: None. You can suppress this message with the system initialization parameter, MSGGLVL=0.

Destination: Console

Module: DFHRXDM

XMEOUT Parameter: applid

DFHRX0108 date time applid Log name mismatch with Resource Recovery Services. Expected Log name logname. Received Log name logname.

Explanation: During the exchange of log names with Resource Recovery Services (RRS), which occurred when RRS restarted, this system's memory of RRS's log name did not match the log name retrieved from RRS. RRS may have performed a cold start.

System Action: CICS execution continues. Units of work that are awaiting resynchronization with RRS will not be resolved automatically.

User Response: The associated units of work may need to be resolved by using CEMT SET UOW. The message should not recur.

Destination: Console and Transient Data Queue CSMT

Module: DFHRXDM

XMEOUT Parameters: date, time, applid, logname, logname

DFHRX0109 date time applid Invalid pass token received on connection sysid session termid.

Explanation: A batch program using the extended External CICS Interface (EXCI) has issued a DPL request which does not include the SYNCONRETURN option. However, the value of the pass token received from the batch region does not match that which was lodged with Recoverable Resource Management Services (RRMS) in the batch region.

System Action: DFHRXUW provides console message DFHRX0002, and possibly a system dump (depending on the options in the dump table). The transactional DPL request will not be processed, and the batch job which issued the request may be suspended until it times out.

User Response: Investigate why the pass token was incorrect. It is possible that an unauthorized user has attempted to guess the value of the pass token in order to influence the outcome of a Unit of Work that has expressed interest in an RRMS Unit of Recovery. If you are satisfied that there has been no attempt to interfere with the pass token, you may need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console and Transient Data Queue CSCS

Module: DFHRXUW

XMEOUT Parameters: date, time, applid, sysid, termid
**DFHRX0110** applid Restart processing with Resource Recovery Services (RRS) was attempted on the wrong system.

**Explanation:** Resource Recovery Services (RRS) has rejected a request to begin restart processing because there is incomplete recoverable work associated with this CICS applid on another system in the sysplex.

**System Action:** CICS execution continues, but CICS services that depend upon RRS will not be available until the problem is corrected.

**User Response:** If your CICS system will not use any services that depend on RRS, no action is necessary. Otherwise, close CICS down and restart it on the correct system in the sysplex. Use the RRS ISPF panels to scan the RRS Resource Manager Data log in order to find the correct system on which to restart CICS.

If, for some reason, you cannot restart CICS on another system in the sysplex, you can take the following steps. However, if you do so, resources may be out of synchronization:

1. Use the RRS Unit of Recovery list panels to force completion of the incomplete recoverable work.
2. Restart CICS or RRS.
3. Force any CICS units of work that are awaiting resolution from RRS.

**Destination:** Console

**Module:** DFHRXDM

**XMEOUT Parameter:** applid

---

**DFHSHxxxx messages**

**DFHSH0001** applid An abend (code code) has occurred at offset X'offset' in module module.

**Explanation:** An unexpected program check or abend occurred with abend code aaaa/bbbb.

The program status word (PSW) at the time of the program check or abend indicated that CICS was executing at offset X'offset' in module modname. This may have been caused by corruption of CICS code or control blocks.

**System Action:** A system dump is taken and the system attempts to continue operation unless otherwise directed by entries in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Investigate the cause of the program check or abend using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHSHT1, DFHSHT2, DFHSHDM, DFHSHPR, DFHSHRQ, DFHSHSY

**XMEOUT Parameters:** applid, code, X'offset', module

**DFHSH0002** applid A severe error (code X'code') has occurred in module module.

**Explanation:** The SH domain has received an unexpected error response from some other part of CICS. The operation requested by recovery manager is described by code X'code'.

For further information about CICS exception trace entries, refer to the CICS Problem Determination Guide.

**System Action:** A system dump is taken and the system attempts to continue operation unless specifically inhibited by dump table entries.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Investigate the cause of the problem as follows:

1. Determine if the problem can be explained by any previous messages issued from some other CICS component.
2. Examine the symptom string.
3. Examine the dump.

If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHSHT1, DFHSHT2, DFHSHDM, DFHSHPR, DFHSHSY, DFHSHRE

**XMEOUT Parameters:** applid, X'code', module
**DFHSH0101**  
*date time applid* The call to invoke the Distributed Routing Program, *program*, has failed. Refer to message DFHSH0105.

**Explanation:** An error occurred when attempting to link to the Distributed Routing Program, identified by the DSRTPGM SIT parameter.

**System Action:** A ASHU dump may be produced depending on type of failure.

**User Response:** Ensure that the Distributed Routing Program is available to the system. It must be defined to Program Manager and it must be present in the DFHRPL library concatenation. Alternatively, name a new Distributed Routing Program using SET SYSTEM DSRTPROGRAM or from CEMT.

**Destination:** CSSH

**Module:** DFHSHT2

**XMEOUT Parameters:** date, time, applid, program

---

**DFHSH0102**  
*date time applid* The Distributed Routing Program, *program*, has returned a bad response. See following message DFHSH0105.

**Explanation:** The Distributed Routing Program, identified by the DSRTPGM SIT parameter, has returned a bad response. The request may not be serviced immediately.

**System Action:** No dumps are taken.

**User Response:** None

**Destination:** CSSH

**Module:** DFHSHT2

**XMEOUT Parameters:** date, time, applid, program

---

**DFHSH0103**  
*date time applid* The call to invoke the Distributed Routing Program, *program*, has failed. The Distributed Routing Program has abnormally terminated with abend Code abcode.

**Explanation:** The Distributed Routing Program has abnormally terminated with abend code abcode.

**System Action:**

1. Transaction Routing - normal transaction abend processing continues.

2. Dynamic Distributed Program Link - an abended condition is returned to the calling program.

**User Response:** See the description of abend code abcode for further guidance.

If the code is not a CICS transaction abend code, it is a user abend code. Request an explanation from the programmer responsible for this area.

**Destination:** CSSH

**Module:** DFHSHT2

**XMEOUT Parameters:** date, time, applid, program, abcode

---

**DFHSH0104**  
*date time applid* The call to invoke the Distributed Routing Program, *program*, has failed due to an invalid AMODE.

**Explanation:** An error occurred when attempting to link to the Distributed Routing Program, identified by the DSRTPGM SIT parameter. The program has an invalid AMODE specified.

**System Action:** No dumps are taken.

**User Response:** Ensure that the Distributed Routing Program definition is correct.

**Destination:** CSSH

**Module:** DFHSHT2

**XMEOUT Parameters:** date, time, applid, program

---

**DFHSH0105**  
*date time applid* Request (Id: *requestid*, Processtype: *processtype*, Processname: *processname*, Activityname: *activityname*, Transaction: *tranid*) cannot be serviced. It will be retried every minute and will be purged after 24 hours if not serviced then.

**Explanation:** A request cannot be serviced immediately. This is either because the Distributed Routing Program, identified by the DSRTPGM SIT parameter, has returned a response which indicates that it is unable to route a request, or a temporary error occurred during an attempt to service the request locally.

The request is identified by the request id *id* (the key of the request on the Local Request Queue data set (DFHLRQ)), the process type *processtype*, the process name *processname*, the activity name *activityname*, and the transaction id *tranid*.

**System Action:** No dumps are taken. The request is marked unserviceable, and is then retried every minute until it is either serviced, or 24 hours have elapsed in which case the request is purged and message DFHSH0107 issued.

Message DFHSH0106 is issued once every hour while the request cannot be serviced. If the request is serviced successfully, message DFHSH0108 is issued.

**User Response:** Investigate why the request cannot be serviced. This may be caused by one of the following:

- The local request queue is unavailable.

- The request refers to a resource (activity or process) which is unavailable.

- The system to which the request is to be routed is down, or the link is down.

- The Distributed Routing Program is failing or is returning an invalid target system.

**Destination:** Console and Transient Data Queue CSSH

**Module:** DFHSHT2

**XMEOUT Parameters:** date, time, applid, requestid, processtype, processname, activityname, tranid

---

**DFHSH0106**  
*date time applid* Request (Id: *requestid*, Processtype: *processtype*, Processname: *processname*, Activityname: *activityname*, Transaction: *tranid*) cannot be serviced. It will be retried every minute and will be purged after 24 hours if not serviced successfully.

**Explanation:** Following message DFHSH0105, this message is issued every hour while a request cannot be successfully serviced.

The request is identified by the request id *requestid* (the key of the
DFHSH0107

Request on the Local Request Queue data set (DFHLRQ), the process type processtype, the process name processname, the activity name activityname, and the transaction id tranid.

**System Action:** No dumps are taken. The request continues to be retried every minute until it is either serviced successfully, or 24 hours have elapsed since message DFHSH0105 was issued, in which case the request is purged and message DFHSH0107 is issued.

**User Response:** See message DFHSH0105.

**Destination:** Console and Transient Data Queue CSSH

**Module:** DFHSHRM

**XMEOUT Parameters:** date, time, applid, requestid, processtype, processname, activityname, tranid, hours

---

**DFHSH0108**

`date time applid` Previously unserviceable request (id: requestid, Processtype: processtype, Processname: processname, Activityname: activityname, Transaction: tranid) has now been unserviceable for 24 hours and has now been purged.

**Explanation:** A request which was previously unserviceable has now been purged. This message will have been preceded by message DFHSH0105 and possibly one or more occurrences of message DFHSH0106.

The request is identified by the request id requestid (the key of the request on the Local Request Queue data set (DFHLRQ)), the process type processtype, the process name processname, the activity name activityname, and the transaction id tranid.

**System Action:** No dumps are taken. The request is deleted.

**User Response:** See message DFHSH0105.

**Destination:** Console and Transient Data Queue CSSH

**Module:** DFHSHRM

**XMEOUT Parameters:** date, time, applid, requestid, processtype, processname, activityname, tranid

---

**DFHSH0109**

`date time applid` An error has occurred when attempting to access the Local Request Queue data set (DFHLRQ). (The file could not be found., 2=The file was closed., 3=The file was disabled., 4=There was insufficient space., 5=An I/O error occurred., 6=The data set is being copied.) The Local Request Queue is now unavailable.

**Explanation:** One of the following errors was detected when attempting to access the Local Request Queue data set (DFHLRQ):

- The file could not be found.
- The file was closed.
- The file was disabled.
- There was insufficient space.
- An I/O error occurred.
- The dataset is being copied.

**System Action:** The Local Request Queue is made unavailable. CICS then attempts to access the data set every minute. If successful, message DFHSH0110 is issued to indicate the data set is now available.

**User Response:** Investigate the error which caused the Local Request Queue to be made unavailable.

**Destination:** Console and Transient Data Queue CSSH

**Modules:** DFHSHRE, DFHSHRQ, DFHSHSY

**XMEOUT Parameters:** date, time, applid, {1=The file could not be found., 2=The file was closed., 3=The file was disabled., 4=There was insufficient space., 5=An I/O error occurred., 6=The data set is being copied.}

---

**DFHSH0110**

`date time applid` The Local Request Queue data set (DFHLRQ) is now available.

**Explanation:** The Local Request Queue data set (DFHLRQ), which was previously unavailable, is now available. See message DFHSH0109.

**System Action:** None.

**User Response:** None.

**Destination:** Console and Transient Data Queue CSSH

**Module:** DFHSHSY

**XMEOUT Parameters:** date, time, applid

---

**DFHSH0111**

`date time applid tranid trannum userid` An error has occurred in Scheduler Services during the prepare phase of syncpoint.

**Explanation:** Scheduler Services domain encountered an error during the prepare phase of syncpoint.

**System Action:** Scheduler Services returns a NO vote to the Recovery Manager. The transaction will be abended with an ASP7 abend.

**User Response:** Check for other Scheduler Services messages that may indicate the cause of the error. For example, message DFHSH0109 indicates problems with the Local Request Queue.

**Destination:** Console and Transient Data Queue CSSH

**Module:** DFHSHRM

**XMEOUT Parameters:** date, time, applid, tranid, trannum, userid
DFHSIxxxx messages

DFHSI0914I applid Unable to initiate transaction CSFU. Files will not be opened at initialization.

Explanation: Module DFHSIJ1 could not start transaction CSFU. Execution of the DFHIC TYPE=INITIATE macro failed. Either CSFU is not an installed transaction definition, or DFHFCU is not an installed program definition.

System Action: CICS does not open any files at initialization time. If a file is defined in the file control table (FCT) to be opened at initialization time, CICS will open it on first reference.

User Response: Make transaction CSFU and program DFHFCU available for execution. Group DFHOPCLS in DFHLIST contains all of the definitions needed for file opening and closing (dynamically as well as at initialization time).

Destination: Console
Module: DFHSIJ1
XMEOUT Parameter: applid

DFHSI1250 applid VSAM error processing SHOWCAT for intrapartition data set dsetname R15=xxxx.

Explanation: During SHOWCAT processing for the intrapartition data set, dsetname, VSAM detected an error and issued return code xxxx.

System Action: CICS writes a dump and terminates abnormally. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Check the return code in the OS/VS VSAM Programmer's Guide, and restart CICS.

Destination: Console
Module: DFHSID1
XMEOUT Parameters: applid, dsetname, xxxx

DFHSI1499 applid Unable to acquire special storage.

Explanation: As part of CICS initialization, an attempt is made to acquire an area of storage from the fetch-protected subpool. The attempt has been unsuccessful.

System Action: CICS terminates abnormally with a dump.

User Response: This error indicates a severe problem with your operating system. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Module: DFHSIB1
XMEOUT Parameter: applid

DFHSI1500 applid element startup is in progress for CICS Transaction Server Version version

Explanation: This is an informatory message indicating that element startup is in progress.

Element is part of CICS Transaction Server Version version.

Element = CICS Version = 1.3.0

System Action: System initialization continues.

User Response: None. This message cannot be suppressed.

Destination: Console
Module: DFHAPSIP
XMEOUT Parameters: applid, element, version

DFHSI1501I applid Loading CICS nucleus.

Explanation: This is an informatory message indicating that the CICS nucleus is being loaded.

System Action: System initialization continues.

User Response: None.

Destination: Console
Modules: DFHSIB1
XMEOUT Parameter: applid

DFHSI1502I applid CICS startup is {Cold | Warm | Emergency | Initial}.

Explanation: During CICS initialization, the type of restart is determined and the operator notified by this message.

System Action: System initialization continues.

User Response: None.

Destination: Console
Modules: DFHSIC1, DFHSII1
XMEOUT Parameters: applid, {1=Cold, 2=Warm, 3=Emergency, 4=Initial}

DFHSI1503I applid Terminal data sets are being opened.

Explanation: This is an informatory message indicating that the terminal data sets are being opened.

System Action: System initialization continues.

User Response: None.

Destination: Console
Module: DFHSIF1
XMEOUT Parameter: applid

DFHSI1506I applid Unable to OPEN the global catalog.

Explanation: During initialization, CICS issued an OPEN for the global catalog DFHGCD data set, but the OPEN failed.

System Action: CICS terminates abnormally with a dump.

User Response: Examine the preceding VSAM message for the reason for the OPEN failure. Note that if you specify START=AUTO, or if you define your system with journal support, you must supply a global catalog data set in the JCL.

Destination: Console
Module: DFHSIC1
XMEOUT Parameter: applid

Chapter 1. DFH messages 523
DFHSI1511I applid Installing group list grplist.
Explanation: Group list grplist is being installed.
System Action: System initialization continues.
User Response: None.
Destination: Console
Module: DFHAMPI
XMEOUT Parameters: applid, grplist

DFHSI1513I applid CICS checking for TCAM MCP.
Explanation: CICS is checking for the presence of a TCAM MCP region during CICS initialization.
System Action: This message is issued three times with a time interval of ten seconds. If the TCAM MCP is still not available, message DFHSI1520 is issued.
User Response: None.
Destination: Console
Module: DFHSIF1
XMEOUT Parameter: applid

DFHSI1517I applid Control is being given to CICS.
Explanation: This is an informatory message indicating that control is being given to CICS.
applid is the VTAM APPLID of the CICS system issuing the message.
System Action: System initialization continues.
User Response: None.
Destination: Console
Module: DFHSIJ1
XMEOUT Parameter: applid

DFHSI1519I applid The interregion communication session was successfully started.
Explanation: This is an informatory message indicating that the interregion communication (IRC) session has been successfully started.
System Action: System initialization continues.
User Response: None.
Destination: Console
Module: DFHSIJ1
XMEOUT Parameter: applid

DFHSI1520I TCAM MCP NOT CURRENTLY AVAILABLE. REPLY 'RETRY' OR 'CANCEL' OR 'CONT'
Explanation: During initialization, CICS discovered that the TCAM message control program (MCP) was required, but was not operational.
System Action: The system waits for a response.
User Response: The operator can respond with ‘RETRY’ (when the TCAM region becomes active), ‘CANCEL’ (to terminate CICS), or with ‘CONT’ (to proceed with CICS initialization without the TCAM MCP).
All DD statements that refer to a TCAM queue must be removed from the startup job stream before a reply of ‘CONT’ is given, otherwise an ABEND occurs.

Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHSIF1

DFHSI1521I applid CICS unable to continue for reasons given above.
Explanation: CICS initialization cannot continue because of one or more serious errors. One or more preceding messages describe these errors.
System Action: CICS terminates with a dump.
User Response: Refer to any preceding messages for further guidance on what the problems may be and how to solve them. Correct the errors and restart CICS.
Destination: Console
Module: DFHSII1
XMEOUT Parameter: applid

DFHSI1522D applid Restart errors reported above. Reply 'GO' or 'CANCEL'.
Explanation: One or more error messages precede this message. CICS can continue initialization but only in degraded mode.
System Action: Depending on your response to this message, CICS terminates or continues initialization in degraded mode.
User Response: Consider the reported errors and their effects, and decide if you want CICS to continue in degraded mode. If you do, reply ‘GO’. If you do not, then reply ‘CANCEL’: Correct the errors and restart CICS.
Destination: Console
Module: DFHSII1
XMEOUT Parameter: applid

DFHSI1530I applid Purge of non-executable ATI request inoperative.
Explanation: CICS is unable to initiate the CRSQ task to delete automatic transaction initiation (ATI) requests from the system when those requests are not honored for longer than the ATI purge delay interval.
System Action: System initialization continues.
User Response: If ATI purge is required, ensure that the CRSQ task is available next time CICS is initialized.
Destination: Console
Module: DFHSIJ1
XMEOUT Parameter: applid

DFHSI1531I applid Terminal control incompatibility. macro VTAM return code: retcode error code: errcode (modname: DFHZRPL).
Explanation: CICS found an inconsistency during the initialization of terminal control.
macro is the name of the failing VTAM macro.
retcode is the VTAM hexadecimal return code in Register 15.
errcode contains the contents of Register 0, which is the associated error code in hexadecimal.
Refer to the ACF/VTAM Programmer’s Reference manual for a complete description of the VTAM return code retcode and the VTAM error code errcode.
The probable cause of this inconsistency is that VTAM=YES was specified (perhaps by default) in the SIT, but the VTAM macros GENCB and SHOWCB are not available.

**System Action:** After issuing this message, CICS system initialization abnormally terminates with a system dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Use the VTAM return code and error code to determine the cause of failure in the VTAM macro. Correct the error using the ACF/VTAM Programmer's Reference manual, and restart CICS.

**Destination:** Console
**Module:** DFHZRPL
**XMEOUT Parameters:** applid, macro, retcode, ercode

--

DFHSI1533 applid modname loaded at X'address'.

**Explanation:** This is an informatory message indicating that CICS has loaded module modname at address address.

**System Action:** System initialization continues.

**User Response:** None.

**Destination:** Console
**Module:** DFHAPSIP
**XMEOUT Parameters:** applid, modname, address

--

DFHSI1534 applid Unable to link to program DFHAMP - GRPLIST parameter ignored.

**Explanation:** The DFHAMP program cannot be found on the load library. The GRPLIST parameter cannot be processed and so is ignored.

**System Action:** System initialization continues.

**User Response:** Ensure that the DFHAMP program is on the load library.

**Destination:** Console
**Module:** DFHSII1
**XMEOUT Parameter:** applid

--

DFHSI1535 applid Severe error detected in DFHAMP - CICS is terminating.

**Explanation:** A severe error was detected while the GRPLIST parameter was being processed.

**System Action:** A dump is provided and CICS is terminated.

**User Response:** This is most probably a logic error in DFHAMP. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console
**Module:** DFHSII1
**XMEOUT Parameter:** applid

--

DFHSI1536D applid GRPLIST grplist does not exist. Enter alternative name, 'GO' or 'CANCEL'.

**Explanation:** Group list grplist cannot be found on the CSD file.

**System Action:** CICS waits for a reply. If you reply CANCEL, CICS terminates. If you reply GO, CICS ignores the specified GRPLIST and tries to install the next one. If you specify a valid list name, CICS initialization continues and the list is installed.

**User Response:** Enter ‘GO’, ‘CANCEL’ or a valid GRPLIST.

**Destination:** Console
**Module:** DFHAMPIL
**XMEOUT Parameters:** applid, grplist

--

DFHSI1537D applid GRPLIST grplist does not exist. Enter alternative name or 'CANCEL'.

**Explanation:** Group list grplist cannot be found on the CSD file.

**System Action:** CICS waits for a reply. If you reply CANCEL, CICS terminates. If you specify a valid list name, CICS initialization continues and the list is installed.

**User Response:** Enter ‘CANCEL’ or a valid GRPLIST.

**Destination:** Console
**Module:** DFHAMPIL
**XMEOUT Parameters:** applid, grplist

--

DFHSI1538D applid Install GRPLIST Errors. Is startup to be continued - Enter ‘GO’ or ‘CANCEL’.

**Explanation:** Errors have been detected in DFHAMP while installing GRPLIST during CICS initialization. Accompanying messages describe the nature of the errors.

**System Action:** CICS waits for a reply. If you reply CANCEL, CICS terminates. If you reply GO, CICS initialization continues.

**User Response:** See the associated messages for further information about these errors. Reply with GO or CANCEL.

**Destination:** Console
**Module:** DFHSII1
**XMEOUT Parameter:** applid

--

DFHSI1539 applid Error attaching the CESC (Terminal Timeout) transaction.

**Explanation:** The CESC transaction failed to start during initialization of an alternate XRF region. Although CICS continues to initialize, terminals left signed on after the takeover are not timed out.

**System Action:** A dump is produced and CICS continues initialization.

**User Response:** Use the dump to investigate why the transaction could not be started. It may be that the system was short on storage or that the transaction has been disabled.

**Destination:** Console
**Module:** DFHSIJ1
**XMEOUT Parameter:** applid
DFHSI1542  applid Takeover by the CICS alternate system has failed. Emergency restart could not be performed.

Explanation: This CICS alternate system is attempting to take over from its associated active CICS system but the recovery manager component has indicated that an initial start is required because of a system log failure.

System Action: CICS is abnormally terminated and a dump is provided.

User Response: Look for console messages issued by the active CICS system which indicate the nature of the log failure. If no such messages have been issued, an internal CICS error may have occurred. In this case you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Module: DFHSI1

XMEOUT Parameter: applid

DFHSI1543  applid Time-Of-Day clock inoperative.

Explanation: System initialization was unable to establish the time-of-day clock values for CICS.

System Action: CICS is abnormally terminated and a dump is provided.

User Response: The time-of-day clock is external to CICS execution and may have been disabled. Enable the time-of-day clock and restart CICS.

Destination: Console

Module: DFHSI11

XMEOUT Parameter: applid

DFHSI1547  applid Notification of a default qualified LUNAME to the recovery manager domain has failed.

Explanation: CICS is running with VTAM=NO, or an attempt to open the VTAM ACB has failed.

If VTAM=NO is specified, CICS uses the UOWNETQL system initialization parameter to form a default qualified LUNAME to pass to the recovery manager. If the VTAM ACB failed to open, CICS uses UOWNETQL to form the default qualified LUNAME. If UOWNETQL has not been specified, CICS sets UOWNETQL to the invalid value ‘UNKNOWN’ to highlight the problem.

An attempt was then made to transfer the default qualified LUNAME of the system to the recovery manager domain for use in constructing unit of work (UOW) identifiers. The attempt failed, indicating a serious error.

System Action: CICS continues. UOW identifiers constructed by the recovery manager domain do not contain a qualified luname.

User Response: Keep the exception trace data produced by the recovery manager domain. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Module: DFHSI1F

XMEOUT Parameter: applid

DFHSI1548  applid After opening the VTAM ACB, CICS has failed to transfer the fully qualified LUNAME to the recovery manager domain.

Explanation: The VTAM ACB was opened by CICS to allow communication via VTAM. An attempt was then made to transfer the fully qualified LUNAME of the system. The LUNAME is provided to the recovery manager domain by VTAM for use in constructing unit of work (UOW) identifiers. The attempt failed, indicating a serious error.

System Action: CICS continues. Unit of work identifiers constructed by the recovery manager domain do not contain a fully qualified LUNAME.

User Response: Keep the exception trace data produced by the recovery manager domain. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Module: DFHZSLS

XMEOUT Parameter: applid

DFHSI1549  applid Logic error when building TCT module list.

Explanation: Either the format of the modules DFHZCA, ZCB, ZCP, ZCW, ZCX, ZCY, ZCZ and ZCXR was not as expected, or the TCT was generated incorrectly.

System Action: CICS is abnormally terminated and a dump is provided.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Possible reasons for this message are:
1. The modules listed were generated without VTAM facilities, but the system initialization table (SIT) specifies VTAM=YES.
2. The TCT does not include ACCESSMETHOD=VTAM, but the system initialization table (SIT) specifies VTAM=YES.
3. The entry points of the listed modules are incorrect.
4. The module list in each of the listed modules is incorrect.

If reason 1 or 2 applies, correct the error. Otherwise, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Module: DFHSI1

XMEOUT Parameter: applid

DFHSI1550  applid A severe error has occurred while making a domain domain call with response (X’reason’) and reason (X’reason’).

Explanation: An unexpected error was returned from the specified domain. The response and reason codes are given.

System Action: A system dump is taken, unless the failing domain has previously taken diagnostics.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system administrator. This failure indicates a serious error in CICS.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
DFHSI1551  applid The CICS region user id user id is not authorized to use the PLTPIUSR parameter user id user id. Initialization cannot continue, so CICS is terminated.

Explanation: The userid specified in the job control statements for the CICS region is not authorized to use the userid specified in the PLTPIUSR system initialization parameter.

System Action: CICS initialization terminates.

User Response: Ensure that the correct userid is specified for PLT processing.

Ensure that the userid for the CICS region has the necessary authorization. This may require the assistance of a security administrator.

When the necessary corrections have been made rerun the CICS job.

DFHSI1552  applid Userid userid specified for the PLTPIUSR parameter has not been defined correctly to the external security manager (ESM). SAF codes are (X'safresp',X'safreas'), ESM codes are (X'esmresp',X'esmreas').

Explanation: The userid specified for the PLTPIUSR initialization parameter has been specified incorrectly.

System Action: CICS terminates abnormally with a dump.

User Response: Ensure that the desired userid is specified for PLT processing and that external security manager (ESM) definitions have been specified correctly.

The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the OS/390 MVS Programming: Authorized Assembler Services Guide and in External Security Interface (RACROUTE) Macro Reference for MVS and VM (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Correct the errors and restart CICS.

DFHSI1553  applid The unit of work network qualifier specified via the UOWNETQL parameter contains invalid characters or begins with a number. A dummy qualifier is substituted.

Explanation: The UOWNETQL system initialization parameter has been specified incorrectly. The UOWNETQL parameter must consist of uppercase letters (A through Z), or numbers in the range 0 through 9. The first character must be a letter.

CICS is running with VTAM=NO, or an attempt to open the VTAM ACB has failed.

When VTAM=NO is specified, CICS uses UOWNETQL to form a default qualified LUNAME to pass to the recovery manager.

If the VTAM ACB fails to open, CICS uses UOWNETQL to form the default qualified LUNAME.

System Action: CICS continues but with the UOWNETQL deliberately set to the invalid value ‘9UNKNOWN’ to highlight the problem.

User Response: Correct the UOWNETQL system initialization parameter.

DFHSI1556  applid SKRP (A / F)x disabled due to extension of PGRET value.

Explanation: The new PGRET value supplied as an initialization option has caused all the single-key retrieval values to be rebuilt. The value shown in the message exceeds 16 bytes. x can be a value 1 through 3 for A and 1 through 12 for F.

System Action: The key given in the message (PA1-PA3 and PF1-PF12 respectively) is disabled.

User Response: If it has been specified (by PARM) that initialization overrides can be entered by means of the console, the opportunity will be given to re-enter the PGRET and/or the SKRxxxxx initialization option.

DFHSI1558  applid Program programe cannot be found.

Explanation: Program programe is essential for CICS to initialize correctly, but was not defined in a group referenced by the group list specified in the startup job stream.

System Action: A dump is provided and CICS is terminated.

User Response: Ensure that the program is defined in a group referenced by the group list specified in the startup job stream.
DFHSI1559  applid Profile DFHCICSE cannot be found.

Explanation: The DFHCICSE profile is essential for CICS to initialize correctly. However, it was not defined in the group list specified in the startup job stream.

System Action: A dump is provided and CICS is terminated.

User Response: Ensure that the DFHCICSE profile is defined in the group list specified in the startup job stream. A definition of DFHCICSE is provided in the DFHSTAND group on the CICS system definition (CSD) file.

Destination: Console

Modules: DFHXCPA, DFHSIJ1

XMEOUT Parameter: applid

DFHSI1562  applid Unable to initialize application domain statistics.

Explanation: During CICS initialization, an error was detected while the application domain (AP) statistics control module, DFHSSI1, was being initialized. This could indicate a problem with the AP component of CICS.

System Action: An exception trace entry is made in the trace table and CICS terminates abnormally with a system dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This error may have occurred because of an earlier error detected by the kernel (KE) domain of CICS. Look for earlier messages from the KE domain beginning DFHKExxxx, CICS trace table entries with the prefix KE and a dump. These indicate the type of error and the action that should be taken.

If no earlier error is detected by the KE component, DFHSSI1 makes an exception entry in the trace table (id=X’0700’) and terminates CICS abnormally with code=1562 and with a system dump. In this case, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Module: DFHSSI1

XMEOUT Parameter: applid

DFHSI1572  applid Unable to OPEN VTAM ACB - RC=xxxxxxxx ACB Code=yy.

Explanation: An error was encountered during system initialization while attempting to open the VTAM ACB. RC=xxxxxxxx is the VTAM error code found in Register 15. yy is the hexadecimal contents of the ACB.

System Action: CICS initialization continues.

User Response: Refer to the ACF/VTAM Programmer’s Reference for a complete description of the values of the ACB error field and the return code.

Use the values and the return code to determine the cause of the problem.

Decide whether to cancel or to continue. (This message appears if you bring up CICS before you bring up VTAM.)

If you want to use VTAM terminals in this CICS run, you must activate VTAM. You can open the VTAM ACB with the CEMT SET VTAM OPEN command.

Destination: Console

Module: DFHSI1

XMEOUT Parameters: applid, xxxxxxxx, yy

DFHSI1573  date time applid Terminal Control is unavailable due to an unsupported access method.

Explanation: An attempt to add a subpool by the storage manager has failed. Module DFHZRPL has failed in an attempt to add a subpool for use by the TCTUA’s associated with non-VTAM terminals. Since it is necessary to have the subpool present for use when needed, this is a serious error.

System Action: Update your access method.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Module: DFHZSLS

XMEOUT Parameters: date, time, applid

DFHSI1577  applid TCTUA Subpool not added in DFHZRPL. CICS initialization cannot continue.

Explanation: An attempt to add a subpool by the storage manager has failed. Module DFHZRPL has failed in an attempt to add a subpool for use by the TCTUA’s associated with non-VTAM terminals. Since it is necessary to have the subpool present for use when needed, this is a serious error.

System Action: The initialization of the CICS system which tried to perform the addition of the subpool abends. If it was not able to add the subpool, then CICS is not able to execute properly.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Module: DFHZRPL

XMEOUT Parameter: applid

DFHSI1575  applid Getmain failed for TCTUA subpool in module DFHZRPL. CICS initialization cannot continue.

Explanation: The module DFHZRPL has failed in an attempt to GETMAIN an area of storage for use by the TCTUA subpool. This subpool has already been added but no storage yet exists for it. This is a serious error.

System Action: As a result of the GETMAIN failure so early in the initialization sequence, it is not possible to continue the CICS initialization. The CICS system which tried and failed to perform the GETMAIN terminates.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Module: DFHZRPL

XMEOUT Parameter: applid
DFHSI1576  applid Unable to find VTAM ACB.

Explanation:  An error was encountered during system initialization while attempting to find the VTAM ACB.

System Action:  CICS continues to initialize, but VTAM is not available.

User Response:  If you do not require VTAM support, this message can be ignored.

If you have VTAM installed on your system, check that VTAM=NO has not been specified as a system initialization parameter.  If VTAM=YES is specified, investigate why VTAM is not currently available on your system.

Destination:  Console
Module:  DFHSIF1
XMEOUT Parameter: applid

DFHSI1578D applid PLTPI specified cannot be found. Reply 'GO' or 'CANCEL'.

Explanation:  The post-initialization program list table (PLTPI) cannot be found because the PLT does not exist in the CICS program library.

System Action:  If the response is 'CANCEL', CICS is terminated.  If the response is 'GO', processing continues without PLT processing.

User Response:  Respond 'GO' or 'CANCEL'.

Destination:  Console
Module:  DFHSIPLT
XMEOUT Parameter: applid

DFHSI1579D applid Module modname| PLT | connection | program proname not found. Reply 'GO' or 'CANCEL'.

Explanation:  This message indicates that either a program defined in the post-initialization program list table (PLTPI) cannot be found, or a connection program used when connecting to DBCTL, DB2 or MQ cannot be found.  The attempt to invoke a connection program results from coding DBCTLCON=YES, or DB2CONN=YES, or MQCONN=YES in the SIT.

For PLT programs, if the message is issued during the first PLT phase in initialization, the program does not exist in the CICS program library.  If the message is produced during the post-initialization PLT phase, the program did not have an installed program entry or was not found in the CICS program library.

For connection programs, the program did not have an installed program entry or was not found in the CICS PDIR.  CICS does not support local DLI.

User Response:  If remote DLI is required, correct the PDIR by removing the local PSBs.  Then reassemble and relinkedit the PSB definitions.  A PDIR is not required for DBCTL.

If remote DLI support is not required, change the system initialization table (SIT) to specify PDIR=NO.

Destination:  Console
Module:  DFHSIH1
XMEOUT Parameter: applid

DFHSI1580D applid| PLT | Connection | program program-name has abended, code abcode. Reply 'GO' or 'CANCEL'.

Explanation:  CICS was processing either the initialization program list table (PLT) when the PLT program program-name abended with abend code abcode, or was processing connection program program-name and it abended with abend code abcode.

System Action:  If the response is 'CANCEL', CICS is terminated.  If the response is 'GO', the program is bypassed.

User Response:  Reply 'CANCEL' or 'GO'.

Destination:  Console
Module:  DFHSIPLT
XMEOUT Parameters: applid, (1=PLT , 2= Connection ), program-name, abcode

DFHSI1582 applid Local DLI PSBs present in the PDIR. CICS does not support local DLI.

Explanation:  CICS has detected that local PSBs are present in the user specified PDIR.  CICS no longer supports local DLI.  A PDIR is only required for remote DLI, and must contain only remote PSB definitions.  A PDIR is not required for DBCTL.

System Action:  A CICS abend dump is produced, and CICS is terminated.

User Response:  If remote DLI is required, correct the PDIR by removing the local PSBs.  Then reassemble and relinkedit the PDIR, and resubmit the CICS job.

If remote DLI support is not required, change the system initialization table (SIT) to specify PDIR=NO.

Destination:  Console
Module:  DFHSIH1
XMEOUT Parameter: applid

DFHSI1589 applid VTAM is not currently active.

Explanation:  CICS initialization cannot OPEN the VTAM access method control block (ACB) because VTAM is not active.

System Action:  If this is an alternate system, CICS waits for 15 seconds and retries the OPEN indefinitely.

If this is not an alternate system, CICS proceeds with the rest of initialization.  The Open VTAM Retry transaction COVR is attached, and retries the OPEN every 5 seconds for ten minutes.

User Response:  In the case of an alternate, check that VTAM is on its way up.  If it is not, you can cancel this alternate.

Destination:  Console
Module:  DFHSIF1
XMEOUT Parameter: applid

DFHSI1590 applid XRF alternate cannot proceed without VTAM.

Explanation:  CICS initialization cannot OPEN the VTAM access method control block (ACB).  The ACB error code may be found in the preceding message DFHSI1572.

System Action:  CICS is terminated with a dump.

User Response:  Refer to DFHSI1572 and use the information to try and resolve the causes of the errors.

Destination:  Console
Module:  DFHSIF1
XMEOUT Parameter: applid
DFHSI1592 applid CICS applid not (yet) active to VTAM.

Explanation: CICS initialization cannot OPEN the VTAM access method control block (ACB) because VTAM does not recognize the APPLID (VTAM error X'5A'). There may be a user error in the value of APPLID (for example, on a SIT override) or the application subarea containing APPLID may not be active in VTAM. Alternatively, it may be possible that VTAM is still coming up. If so, the problem may correct itself when VTAM completes its initialization.

System Action: If this is an alternate CICS, wait for 15 seconds and retry the OPEN indefinitely. If this is not an alternate, CICS proceeds with the rest of initialization.

User Response: In the case of an alternate, check that VTAM is on its way up. If it is, check that the required application sub-area is active in VTAM. If it is, you may cancel this alternate. If this is not an alternate, you can use CEMT to retry the OPEN when CICS has initialized.

Destination: Console
Module: DFHSIF1
XMEOUT Parameter: applid

DFHSI1594 applid A xxxx level of module proiname is being loaded.

Explanation: The system is loading a level of module proiname that was not assembled against the current level of CICS in the CICS Transaction Server product. The level xxxx shows the level of the module being used.

System Action: System initialization continues.

User Response: Ensure that it is valid to use an old level of module proiname. Usually, it will be necessary to reassemble the module for the current level of CICS being used.

Destination: Console
Module: DFHAPSIP
XMEOUT Parameters: applid, xxxx, proiname

DFHSI1596 applid Nucleus module proiname cannot be located.

Explanation: Nucleus module proiname was not found in the CICS library while loading the nucleus.

System Action: The AP domain initialization routines continue to attempt to load the remaining nucleus modules. After trying to load all the nucleus modules, CICS is terminated.

User Response: Add the missing module proiname to the appropriate library and restart CICS.

Destination: Console
Modules: DFHAPSIP, DFHSID1
XMEOUT Parameters: applid, proiname

DFHSI1597 applid VTAM=YES invalid with a non VTAM TCT - VTAM=NO forced.

Explanation: The TCT loaded has not been assembled with ACCESSMETHOD=VTAM but VTAM=YES was specified on the SIT.

System Action: CICS continues but without VTAM support.

User Response: To use VTAM, assemble the TCT with ACCESSMETHOD=VTAM or use the CICS supplied TCT which has a suffix of DY.

Destination: Console
Module: DFHZINT
XMEOUT Parameter: applid

DFHSI1599 applid Region/Partition size insufficient to initialize transient data.

Explanation: Transient data initialization failed, either because an attempt to create Storage Manager subpool failed or because an attempt to get storage failed.

System Action: A system dump is produced, and CICS is abnormally terminated.

User Response: Increase the region size available to CICS.

Destination: Console
Module: DFHSID1
XMEOUT Parameter: applid

DFHSI1784 applid The user shutdown assist transaction tranid has not been defined as a shutdown enabled local transaction.

Explanation: This message is issued during CICS initialization and indicates that the user shutdown assist transaction specified on the system initialization table (SIT) has not been defined as a shutdown enabled local transaction.

System Action: No action is taken. A TRANSIDERR may be returned on PERFORM SHUTDOWN.

User Response: Do one of the following:
- Correct the shutdown transaction definition.
- Change or remove the SIT SDTRAN option.
- Use the CEMT or EXEC CICS PERFORM SHUTDOWN SDTRAN option.

Destination: Console
Module: DFHSIJ1
XMEOUT Parameters: applid, tranid

DFHSI2810 applid CANCEL reply received. CICS is terminating.

Explanation: A CANCEL reply has been received.

System Action: CICS terminates.

User Response: Refer to previous messages to determine what action to take.

Destination: Console
Modules: DFHSJI1, DFHSIPLT, DFHAMPIL
XMEOUT Parameter: applid
DFHSI2813  applid Program DFHRCEX cannot be found.

Explanation: CICS cannot find DFHRCEX in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System Action: CICS initialization terminates with a dump.

User Response: To correct this error, place DFHRCEX in a partitioned data set in the DFHRPL DD statement.

Destination: Console

Module: DFHSIJ1

XMEOUT Parameter: applid

---

DFHSI8420I  applid About to link to PLT programs during the second stage of initialization.

Explanation: CICS is about to link to the user PLT programs defined in the PLTP1 system initialization parameter during the second stage of initialization.

System Action: Control is passed to the user PLT programs.

User Response: None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameters: applid

---

DFHSI8421I  applid Control returned from PLT programs during the second stage of initialization.

Explanation: Control is returned to CICS to continue system initialization.

System Action: Control is returned to CICS.

User Response: None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameter: applid

---

DFHSI8430I  applid About to link to PLT programs during the third stage of initialization.

Explanation: CICS is about to link to the user PLT programs defined in the PLTP1 SIT parameter during the third stage of initialization.

System Action: Control is passed to the user PLT programs.

User Response: None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameter: applid

---

DFHSI8431I  applid Control returned from PLT programs during the third stage of initialization.

Explanation: Control is returned to CICS to continue system initialization.

System Action: Control is returned to CICS.

User Response: None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameter: applid

---

DFHSI8440I  applid Initiating connection to resmanager.

Explanation: CICS is about to connect to the specified resource manager immediately prior to running PLT programs during the third stage of initialization. The resource manager is DBCTL, DB2 or MQ. Connection is initiated because DBCTLCON=YES, or DB2CONN=YES, or MQCONN=YES was specified in the SIT.

System Action: Control is passed to the resource manager connect program.

User Response: None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameters: applid, resmanager

---

DFHSI8441I  applid Connection to resmanager qualifer successfully completed.

Explanation: CICS has successfully connected to the specified resource manager immediately prior to running PLT programs during the third stage of initialization. The resource manager name is shown along with the resource manager qualifier.

System Action: CICS processing continues.

User Response: None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameters: applid, resmanager, qualifier

---

DFHSI8442I  applid Connection to resmanager has failed.

Explanation: CICS was unable to connect to resource manager resmanager immediately prior to running PLT programs during the third stage of initialization. The resource manager is DBCTL, DB2 or MQ. Connection was initiated because DBCTLCON=YES, or DB2CONN=YES, or MQCONN=YES was specified in the SIT.

System Action: CICS processing continues.

User Response: Refer to previous messages issued by CICS or the resource manager adapter to determine why the connection attempt failed.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameters: applid, resmanager

---

DFHSI8443I  applid Connection to resmanager not completed. Adapter is awaiting initialization of resmanager.

Explanation: CICS was unable to complete connection to resource manager resmanager immediately prior to running PLT programs during the third stage of initialization. The resource manager is DBCTL, DB2 or MQ. Connection was initiated because DBCTLCON=YES, or DB2CONN=YES, or MQCONN=YES was specified in the SIT.

The resource manager adapter is waiting for the resource manager to be initialized.

System Action: CICS processing continues. The connection is completed when the resource manager is initialized.
**DFHSKxxxx messages**

**DFHSK1101 applid General purpose subtask terminated abnormally - system completion code = X'xxxx'**

**Explanation:** A subtask attached by DFHSKP has completed abnormally.

**System Action:** CICS continues in degraded mode.

**User Response:** Find out why the subtask failed. xxxx is the operating system completion code.

**Destination:** Console

**Module:** DFHSKP

**XMEOUT Parameters:** applid, X'xxxx'

**DFHSK1102 applid Unable to attach general purpose subtask - system return code = X'xxx'**

**Explanation:** DFHSKP has attempted to attach an operating system subtask. The ATTACH has failed.

**System Action:** CICS continues in degraded mode.

**User Response:** Find out why the attach failed. xxxx is the operating system completion code.

**Destination:** Console

**Module:** DFHSKP

**XMEOUT Parameters:** applid, X'xxx'

**DFHSK1103 applid ESTAE macro failed in general purpose subtask - system return code = X'xxx'**

**Explanation:** A general purpose subtask issued an MVS ESTAE macro. xxxx is the nonzero response from MVS.

**System Action:** CICS continues in degraded mode.

**User Response:** Find out why the macro failed (this is a failure in MVS). Response code is output with the message.

**Destination:** Console

**Module:** DFHSKP

**XMEOUT Parameters:** applid, X'xxx'

**DFHSK1104I applid General purpose subtask terminated because error threshold has been reached**

**Explanation:** A general purpose subtask has failed several times while executing its own code. CICS has terminated the task.

**System Action:** CICS continues in degraded mode.

**User Response:** Find out why the subtask failed.

**Destination:** Console

**Module:** DFHSKP

**XMEOUT Parameter:** applid

**DFHSMxxxx messages**

**DFHSM0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.**

**Explanation:** An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHSMAD, DFHSMAR, DFHSMCK, DFHSMDM, DFHSMGF, DFHSMMC1, DFHSMMMC2, DFHSMMF, DFHSMMG, DFHSMPP, DFHSMPP, DFHSMSR, DFHSMST, DFHSMSU, DFHSMSY

XMEOUT Parameters: applid, aaa/bbbb, X'offset', modname

DFHSM0002 applid A severe error (code X'code') has occurred in module modname.

Explanation: An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies the error is and where the error was detected.

System Action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHSMMC1, DFHSMST

XMEOUT Parameters: applid, X'offset', modname

DFHSM0006 applid Insufficient storage to satisfy Getmain (code X'code') in module modname. MVS code mvscode.

Explanation: An MVS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code mvscode is the MVS GETMAIN return code.

System Action: An exception entry (code X'code') is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.
Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

See the *CICS Trace Entries* for a description of the exception trace point ID, X'code' and the data it contains.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual.

Try decreasing the limits of the CICS dynamic storage areas (DSAs), or increasing the MVS region size. You can vary the CICS DSAs dynamically using the DSALIM and EDSALIM parameters on the CEMT master terminal command. To increase the MVS region size you must bring CICS down and change the MVS JCL REGION parameter.

**Destination:** Console

**Module:** DFHSMDM

**XMEOUT Parameters:** applid, X'code', modname, mvscode

---

**DFHSM0102** applid A storage violation (code X'code') has been detected by module *modname*.

**Explanation:** A storage violation has been detected by module *modname*. The code X'code' is the exception trace point ID which uniquely identifies the type of storage violation.

**System Action:** An exception entry (X'code' in the message) is made in the trace table. Use the exception trace point ID, X'code', to investigate the cause of the storage violation. A description of the exception trace point ID, and the data it contains, is in the *CICS Trace Entries*. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If you have enabled storage recovery (by specifying the system initialization parameter STGRCVY=YES), CICS attempts to repair the storage violation. Otherwise, the storage is left unchanged.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**Note:** Even if CICS is able to repair the storage, the storage violation trap still remains inactive.

**User Response:** Use the exception trace point ID, X'code', to investigate the cause of the storage violation. See the *CICS Trace Entries* for a description of the exception trace point ID and the data it contains.

**Destination:** Console

**Module:** DFHSMCK

**XMEOUT Parameters:** applid, X'code'

---

**DFHSM0103** applid A storage violation (code X'code') has been detected by the storage violation trap. Trap is now inactive.

**Explanation:** A storage violation has been detected by the storage violation trap, which may be enabled via the CHKSTSK or the CHKSTRM system initialization parameters or via the CSFE transaction. The code X'code' is the exception trace point ID which uniquely identifies the type of storage violation detected.

**System Action:** CICS disables the storage violation trap. An exception entry (X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If you have enabled storage recovery (by specifying the system initialization parameter STGRCVY=YES), CICS attempts to repair the storage violation. Otherwise, the storage is left unchanged.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**Note:** Even if CICS is able to repair the storage, the storage violation trap still remains inactive.

**User Response:** Use the exception trace point ID, X'code', to investigate the cause of the storage violation. See the *CICS Trace Entries* for a description of the exception trace point ID and the data it contains.

**Destination:** Console

**Module:** DFHSMCD

**XMEOUT Parameters:** applid, X'code'

---

**DFHSM0113I** applid Storage protection is not active.

**Explanation:** This is an informatory message stating that storage protection has not been requested (STGPROT=NO) and is not in effect for this execution of CICS.

**System Action:** CICS continues.

**User Response:** None. You can suppress this message with the system initialization parameter, MSGGLVL=0. Storage protection can be enabled by specifying the system initialization parameter STGPROT=YES.

**Destination:** Console

**Module:** DFHSMDM

**XMEOUT Parameter:** applid

---

**DFHSM0114I** applid Storage protection was requested but the support is not available. Storage protection is not active.

**Explanation:** This is an informatory message stating that although storage protection was requested, it is not in effect for this execution of CICS because the necessary hardware and/or operating system support is not available.

**System Action:** CICS continues.

**User Response:** None.

**Destination:** Console

**Module:** DFHSMDM

**XMEOUT Parameter:** applid
DFHSM0115I applid Storage protection is active.

**Explanation:** This is an informatory message stating that storage protection is requested (STGPROT=YES) and is in effect for this execution of CICS.

**System Action:** CICS continues.

**User Response:** None. You can suppress this message with the system initialization parameter, MSGGLVL=0.

**Destination:** Console

**Module:** DFHSMDM

**XMEOUT Parameter:** applid

DFHSM0120I applid Reentrant programs will not be loaded into read-only storage.

**Explanation:** This is an informatory message stating that read-only programs will not be loaded into read-only storage for this execution of CICS. This is because RENTPGM=NOPROTECT was specified as a system initialization parameter.

**System Action:** CICS continues.

**User Response:** None.

You should not specify RENTPGM=NOPROTECT unless you wish to deliberately overwrite programs (to set breakpoints while testing, for example).

**Destination:** Console

**Module:** DFHSMDM

**XMEOUT Parameter:** applid

DFHSM0122I applid Limit of DSA storage below 16MB is dsalimitK.

**Explanation:** This message gives the limit dsalimit of the dynamic storage area (DSA) below 16MB.

**System Action:** CICS continues.

**User Response:** None. You can suppress this message with the message level system initialization parameter, MSGGLVL=0.

**Destination:** Console

**Module:** DFHSMDM

**XMEOUT Parameters:** applid, dsalimit

DFHSM0123I applid Limit of DSA storage above 16MB is edsalimitM.

**Explanation:** This message gives the limit edsalimit of the dynamic storage area (DSA) above 16MB.

**System Action:** CICS continues.

**User Response:** None. You can suppress this message with the message level system initialization parameter, MSGGLVL=0.

**Destination:** Console

**Module:** DFHSMDM

**XMEOUT Parameters:** applid, edsalimit

DFHSM0124I applid Transaction isolation was requested but the support is not available or storage protection is not active. Transaction isolation is not active.

**Explanation:** The combination of system initialization parameters STGPROT(NO) and TRANISO(YES) is invalid. During a warm or emergency start of CICS, the catalogued system initialization parameters are incompatible with a SIT override. Although transaction isolation was requested, it is not in effect for this execution of CICS because the necessary hardware and/or operating system support is not available, and/or storage protection is not active.

**System Action:** CICS continues.

**User Response:** None.

**Destination:** Console

**Module:** DFHSMDM

**XMEOUT Parameter:** applid

DFHSM0125I applid Transaction isolation is active.

**Explanation:** Transaction isolation is requested (TRANISO=YES) and is in effect for this execution of CICS.

**System Action:** CICS continues.

**User Response:** None. You can suppress this message with the system initialization parameter, MSGGLVL=0.

**Destination:** Console

**Module:** DFHSMDM

**XMEOUT Parameter:** applid

DFHSM0126I applid Transaction isolation is not active.

**Explanation:** Transaction isolation has not been requested (TRANISO=NO) and is not in effect for this execution of CICS.

**System Action:** CICS continues.

**User Response:** None. You can suppress this message with the system initialization parameter, MSGGLVL=0. Transaction isolation can be enabled by specifying TRANISO=YES as a system initialization parameter.

**Destination:** Console

**Module:** DFHSMDM

**XMEOUT Parameter:** applid

DFHSM0127I applid Insufficient storage to allocate requested size for DSA limit storage below 16MB (dsalimitK).

**Explanation:** CICS has issued an MVS GETMAIN for the requested limit dsalimit of DSA storage below 16MB, but the GETMAIN request failed.

**System Action:** If the requested size is greater than the default, CICS reissues the MVS GETMAIN request using the default size for the DSALIM parameter.

If the requested size is not greater than the default, the storage manager makes an exception entry in the trace table. An error return code is sent to the domain manager DFHDMDM (the caller of the storage manager). The domain manager might then terminate CICS, in which case a message to this effect is issued.

**User Response:** Ensure that the DSALIM system initialization parameter is specified correctly.

Ensure that the REGION parameter for the CICS job is large enough.
DFHSM0128

See the OS/390 MVS JCL Reference for further information about specifying storage on the REGION parameter.

Destination: Console
Module: DFHSMMD
XMEOUT Parameters: applid, dsalimit

DFHSM0128 applid Insufficient storage to allocate requested size for DSA limit storage above 16MB (dsalimit/M).

Explanation: CICS has issued an MVS GETMAIN for the requested limit dsalimit of DSA storage above 16MB, but the GETMAIN request failed.

System Action: If the requested size is greater than the default, CICS reissues the MVS GETMAIN request using the default size for the EDSALIM parameter.

If the requested size is not greater than the default, the storage manager makes an exception entry in the trace table. An error return code is sent to the domain manager DFHDMDM (the caller of the storage manager). The domain manager might then terminate CICS, in which case a message to this effect is issued.

User Response: Ensure that the REGION parameter for the CICS job is large enough.

Ensure that the REGION parameter for the CICS job is large enough.

See the OS/390 MVS JCL Reference for more information about specifying storage on the REGION parameter.

Destination: Console
Module: DFHSMMD
XMEOUT Parameters: applid, dsalimit

DFHSM0129 applid Insufficient storage to allocate default size for DSA limit storage below 16MB (dsalimit/K).

Explanation: Following message DFHSM0127, CICS has reduced the MVS GETMAIN request to the default size for the DSALIM system initialization parameter but the GETMAIN request has still failed.

System Action: The storage manager makes an exception entry in the trace table.

An error return code is sent to the domain manager, DFHDMDM, (the caller of storage manager). The domain manager might then terminate CICS, in which case a message to this effect is issued.

User Response: See DFHSM0127 for further information.

Ensure that the REGION parameter for the CICS job is large enough.

See the OS/390 MVS JCL Reference for more information about specifying storage on the REGION parameter.

Destination: Console
Module: DFHSMMD
XMEOUT Parameters: applid, dsalimit

DFHSM0130 applid Insufficient storage to allocate default size for DSA limit storage above 16MB (dsalimit/M).

Explanation: Following message DFHSM0128, CICS has reduced the MVS GETMAIN request to the default size for the EDSALIM system initialization parameter but the GETMAIN request has still failed.

System Action: The storage manager makes an exception entry in the trace table.

An error return code is sent to the domain manager, DFHDMDM, (the caller of storage manager). The domain manager might then terminate CICS, in which case a message to this effect is issued.

User Response: See DFHSM0128 for further information.

Ensure that the REGION parameter for the CICS job is large enough.

See the OS/390 MVS JCL Reference for more information about specifying storage on the REGION parameter.

Destination: Console
Module: DFHSMMD
XMEOUT Parameters: applid, dsalimit

DFHSM0131 applid CICS is under stress (short on storage below 16MB).

Explanation: This message is produced when there is a shortage of storage in any of the dynamic storage areas (DSAs) below 16MB. Either the largest free area in one of the DSAs is less than the size of the internally defined cushion for that DSA, or there is at least one transaction suspended due to insufficient contiguous free storage.

System Action: An exception entry is made in the trace table to record the event. CICS continues to operate but takes steps to alleviate the situation by, for example, slowing down the rate at which new tasks are started and by releasing storage occupied by programs which are not currently in use.

User Response: No immediate action is required. However, if the problem persists you could increase the value of the DSALIMIT parameter, if possible, or reduce the storage requirements below 16MB of your CICS system. For more information about how to do this, see the CICS Performance Guide.

Destination: Console
Module: DFHSMMSY
XMEOUT Parameter: applid

DFHSM0132 applid CICS is no longer short on storage below 16MB.

Explanation: The short on storage condition reported by message DFHSM0131 has ceased.

System Action: CICS continues.

User Response: None.

Destination: Console
Module: DFHSMMSY
XMEOUT Parameter: applid

DFHSM0133 applid CICS is under stress (short on storage above 16MB).

Explanation: There is a shortage of storage in one of the dynamic storage areas (DSAs) above 16MB. Either the largest free area in one of the DSAs is less than the size of the internally defined cushion for that DSA, or there is at least one transaction suspended due to insufficient contiguous free storage.

System Action: An exception entry is made in the trace table to record the event. CICS continues to operate but takes steps to alleviate the situation by, for example, slowing down the rate at which new tasks are
started and by releasing storage occupied by programs which are not currently in use.

**User Response:** No immediate action is required. However, if the problem persists you could, if possible, increase the value of the EDSALIMIT parameter, or reduce the storage requirements of your CICS system above 16MB. For guidance on how to do this, see the *CICS Performance Guide.*

**Destination:** Console
**Module:** DFHSMSY

---

**DFHSN0004 applid A possible loop has been detected at offset X'offset' in module modname.**

**Explanation:** A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

**System Action:** An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHSNUS, DFHSNAS, DFHSNPU, DFHSNSU, DFHSNTU, DFHSNXR

**XMEOUT Parameters:** applid, X'offset', modname

---

**DFHSN1100 date time applid Signon at {netname | console | terminal | portname} by user userid in group groupid is complete.**

**Explanation:** Terminal portname has been signed on. It now has the security attributes for userid in group groupid.

**System Action:** Processing continues.

**User Response:** The user at terminal portname can now use those CICS transactions permitted for this userid in group groupid.

**Destination:** CSCS

**Module:** DFHSNTU

**XMEOUT Parameters:** date, time, applid, {1=netname, 2=console, 3=terminal}, portname, userid, groupid
**DFHSN1101** date time applid Signon at {netname | console | terminal } portname has failed. User userid not recognized.

Explanation: A signon has been issued from terminal portname which specified a userid userid that is not known to the ESM.

System Action: The signon request is rejected.

User Response: Unless this implies a breach of security that needs investigating, contact your security administrator so that the userid can be made known to the ESM.

Destination: CSCS
Module: DFHSNTU

XMEOUT Parameters: date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid

**DFHSN1102** date time applid Signon at {netname | console | terminal } portname by user userid has failed. Password not recognized.

Explanation: A signon has been issued from terminal portname which specified an incorrect password.

This was probably caused by a misspelling of the password or because the password is not valid for this userid.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security that needs investigating.

Destination: CSCS
Module: DFHSNTU

XMEOUT Parameters: date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid

**DFHSN1103** date time applid Signon at {netname | console | terminal } portname by user userid has failed. OID card damaged or not authorized.

Explanation: A signon has been issued from terminal portname which used an unauthorized or damaged operator identification (OID) card.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security that needs investigating.

Destination: CSCS
Module: DFHSNTU

XMEOUT Parameters: date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid

**DFHSN1104** date time applid Signon at {netname | console | terminal } portname by user userid has failed. New password not allowed.

Explanation: A signon has been issued from terminal portname which attempted to change the password to a value that the external security manager (ESM) does not allow.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security that needs investigating.

Destination: CSCS
Module: DFHSNTU

XMEOUT Parameters: date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid

**DFHSN1105** date time applid Signon at {netname | console | terminal } portname by user userid requires a password.

Explanation: A signon has been issued from terminal portname which did not specify a password. The signon has been rejected because user userid requires a password.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security that needs investigating.

Destination: CSCS
Module: DFHSNTU

XMEOUT Parameters: date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid

**DFHSN1106** date time applid Signon at {netname | console | terminal } portname by user userid requires a new password.

Explanation: A signon has been issued from terminal portname for which the external security manager (ESM) indicates the password has expired.

This does not imply a security breach. It is a normal response indicating that the ESM password has expired.

System Action: The signon request is rejected.

User Response: None.

Destination: CSCS
Module: DFHSNTU

XMEOUT Parameters: date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid

**DFHSN1107** date time applid Signon at {netname | console | terminal } portname by user userid requires an OID card.

Explanation: A signon has been issued from terminal portname which did not use an operator identification (OID) card when the external security manager (ESM) indicates that one should have been used.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security which needs investigating.

Destination: CSCS
Module: DFHSNTU

XMEOUT Parameters: date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid

**DFHSN1108** date time applid Signon at {netname | console | terminal } portname by user userid has failed. SAF codes are (X’safresp’,X’safreas’). ESM codes are (X’esmresp’,X’esmreas’).

Explanation: A signon has been issued from terminal portname and has been rejected by the external security manager (ESM).

System Action: The signon request is rejected.

User Response: The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE
REQUEST=EXTRACT macros. These return codes are described in the OS/390 MVS Programming: Authorized Assembler Services Guide and in External Security Interface (RACROUTE) Macro Reference for MVS and VM (SC28-1366). See these manuals for an explanation of the codes.

Destination: CSCS
Module: DFHSNTU
XMEOUT Parameters: date, time, applid, {1=netname, 2=console, 3=terminal}, portname, userid, X'safresp', X'safreas', X'esmresp', X'esmreas'

DFHSN1112 date time applid Signon at {netname | console | terminal |portname by user userid has failed because the terminal has preset security.

Explanation: A signon has been issued from terminal portname. This terminal has been defined to CICS with fixed security attributes. It does NOT support signon.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security that needs investigating.

Destination: CSCS
Module: DFHSNTU
XMEOUT Parameters: date, time, applid, {1=netname, 2=console, 3=terminal}, portname, userid

DFHSN1113 date time applid Signon at {netname | console | terminal |portname by user userid has failed because the terminal was already signed on.

Explanation: A signon has been issued from terminal portname while a previous signon was still in effect for this terminal.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security which needs investigating.

Destination: CSCS
Module: DFHSNTU
XMEOUT Parameters: date, time, applid, {1=netname, 2=console, 3=terminal}, portname, userid

DFHSN1114 date time applid Signon by user userid has failed because there is no terminal associated with the requesting task.

Explanation: A signon has been issued by user userid from a task that had been started without a terminal.

System Action: The signon request is rejected.

User Response: Investigate why a signon has been issued from a task that is not associated with a terminal.

Destination: CSCS
Module: DFHSNTU
XMEOUT Parameters: date, time, applid, userid

DFHSN1115 date time applid Signon at {netname | console | terminal |portname by user userid has failed. Signon is not allowed at a surrogate terminal except by use of the CRTE transaction.

Explanation: CICS does not support the signing-on of surrogate terminals, except when done during a CRTE routing session.

System Action: Processing continues.

User Response: Investigate how and why users are attempting to use signon via transaction routing.

Destination: CSCS
Module: DFHSNTU
XMEOUT Parameters: date, time, applid, {1=netname, 2=console, 3=terminal}, portname, userid

DFHSN1116 date time applid Signon at {netname | console | terminal |portname by user userid has failed because the national language to be used is not supported in this run of CICS.

Explanation: The national language specified has been recognized as a valid IBM national language. However, either this language cannot be specified as a valid national language for CICS initialization, or CICS has not been initialized with this language in the current run of CICS.

See the CICS Application Programming Reference for a list of national languages that CICS can be initialized to use.

System Action: Signon fails.

User Response: Retry signon with a national language that CICS has been initialized to use.

Destination: CSCS
Module: DFHSNTU
XMEOUT Parameters: date, time, applid, {1=netname, 2=console, 3=terminal}, portname, userid

DFHSN1117 date time applid Signon at {netname | console | terminal |portname by user userid has failed because an invalid national language was selected.

Explanation: Signon failed because the language specified was not recognized as an IBM national language.

System Action: Signon fails.

User Response: Retry signon with a correct language value.

Destination: CSCS
Module: DFHSNTU
XMEOUT Parameters: date, time, applid, {1=netname, 2=console, 3=terminal}, portname, userid

DFHSN1118 date time applid Signon at {netname | console | terminal |portname by user userid has failed because the user is not authorized to use the terminal.

Explanation: A signon has been issued from terminal portname which has failed. The user is not authorized to use the terminal.

System Action: The signon request is rejected.

User Response: Contact your security administrator, who should check if the user should be authorized to use terminal portname.

In particular, check if the user should be able to access the system on this particular day and time and whether the terminal may be used on this day and time.
Chapter 1. DFH messages

DFHSN1119 date time applid Signon at \{netname \ console \ terminal \}portname by user userid has failed because the user is not authorized to use application applname.

Explanation: A signon has been issued from terminal portname which has failed. The user is not authorized to use the application applname.

- If you are using the VTAM generic resource function, applname is the generic resource name specified in the GRNAME system initialization parameter.
- If you are using XRF, applname is the generic applid specified as the first operand of the APPLID system initialization parameter.
- Otherwise, applname is the application identifier specified as the single operand of the APPLID system initialization parameter.

System Action: The signon request is rejected.

User Response: Contact your security administrator, who should check whether the user should have authorization to use application applid.

Destination: CSCS
Module: DFHSNTU
XMEOUT Parameters: date, time, applid, \{1=netname , 2=console , 3=terminal \}, portname, userid, applname

DFHSN1120 date time applid Signon at \{netname \ console \ terminal \}portname by user userid has failed because the \{userid \ group access\} has been revoked.

Explanation: Either the userid, or the user's access to the ESM group containing it, has been revoked by the ESM. This is usually the result of repeated attempts to signon with an invalid password.

System Action: The signon request is rejected.

User Response: For revoked userids, contact your security administrator who can reauthorize the revoked userid by issuing the ALTUSER RESUME function. For revoked group access, contact your security administrator who can restore the user's access to the group by issuing the CONNECT RESUME function.

Destination: CSCS
Module: DFHSNTU
XMEOUT Parameters: date, time, applid, \{1=netname , 2=console , 3=terminal \}, portname, userid, {1=userid, 2=group access}

DFHSN1129 date time applid Signon at \{netname \ console \ terminal \}portname by user userid has failed because the user is already signed on elsewhere.

Explanation: A signon has been issued from terminal portname while the user is already signed on under the restrictions imposed by the current setting of the SNSCOPE system initialization parameter.

System Action: The signon request is rejected.

User Response: Investigate why users are attempting to signon twice within the current signon scope.

See the CICS System Definition Guide for more information about the SNSCOPE parameter.

Destination: CSCS
Module: DFHSNTU
XMEOUT Parameters: date, time, applid, \{1=netname , 2=console , 3=terminal \}, portname, userid

DFHSN1130 date time applid Signon at \{netname \ console \ terminal \}portname by user userid has failed because the userid was not found in the specified group.

Explanation: A signon has been issued from terminal portname which has failed. Either the userid is not in the specified group, or the group specified for this user to be associated with after signon is not known to the ESM.

System Action: The signon request is rejected.

User Response: Check that the groupid specified is correct. If it is, contact your security administrator to ensure that this group is defined properly, and that the user is connected to this group.

Destination: CSCS
Module: DFHSNTU
XMEOUT Parameters: date, time, applid, \{1=netname , 2=console , 3=terminal \}, portname, userid

DFHSN1131 date time applid Signon at \{netname \ console \ terminal \}portname by user userid has failed because security is not active in this CICS region.

Explanation: A signon has been issued from terminal portname which has failed. This is because this CICS region is running without security active.

System Action: The signon request is rejected.

User Response: None.

Destination: CSCS
Module: DFHSNTU
XMEOUT Parameters: date, time, applid, \{1=netname , 2=console , 3=terminal \}, portname, userid

DFHSN1132 date time applid Signon at terminal termid by user userid has failed because the terminal is a session.

Explanation: A signon has been issued from terminal termid which is a session. The security attributes of a session can only be changed on receipt of a valid FMH-5 attach header.

System Action: The signon request is rejected.

User Response: Investigate how and why users are attempting to use signon for a session.

Destination: CSCS
Module: DFHSNTU
XMEOUT Parameters: date, time, applid, \{1=netname , 2=console , 3=terminal \}, portname, userid

DFHSN1133 date time applid Signon at \{netname \ console \ terminal \}portname by user userid has failed because of an error during SNSCOPE checking.

Explanation: A signon has been issued from terminal portname. The SNSCOPE initialization parameter disallows signon to more than one terminal at a time. An internal failure during SNSCOPE checking means that CICS is unable to confirm if the user is already signed on elsewhere. The failure has occurred because the limit of concurrent MVS ENQ requests has been reached.
**DFHSN1150**

**System Action:** The signon request is rejected. Message DFHUS0120 will have been written to the console. See the explanation of this message for further information.

**User Response:** Please report this problem to your CICS systems programmer.

See the CICS System Definition Guide for more information about the SNSCOPE parameter.

**Destination:** CSCS

**Module:** DFHSNTU

**XMEOUT Parameters:** date, time, applid, {1=netname, 2=console, 3=terminal}, portname, userid

DFHSN1150 date time applid Signon at TCAM pool by user userid in group groupid is complete.

**Explanation:** A TCAM pool of terminals has been signed on by user userid. All terminals in this TCAM pool now have the security attributes for user userid in group groupid.

**System Action:** Processing continues.

**User Response:** The user at any of these TCAM terminals can now use those CICS transactions permitted for this userid in group groupid.

**Destination:** CSCS

**Module:** DFHSNTU

**XMEOUT Parameters:** date, time, applid, userid, groupid

DFHSN1200 date time applid Signoff at {netname | console | terminal }portname by user userid is complete. It transactions entered with nn errors.

**Explanation:** Terminal portname has been signed off. It now has the default security attributes. nn indicates the number of errors which have occurred.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** CSCS

**Module:** DFHSNTU

**XMEOUT Parameters:** date, time, applid, userid, portname, tt, nn

DFHSN1211 date time applid Signoff at terminal termid has failed because the terminal is a session.

**Explanation:** A signoff has been issued from terminal termid which is a session. The security attributes of a session can only be changed on receipt of a valid FMH-5 attach header.

**System Action:** The signoff request is rejected.

**User Response:** Investigate how and why users are attempting to use signoff for a session.

**Destination:** CSCS

**Module:** DFHSNTU

**XMEOUT Parameters:** date, time, applid, termid

DFHSN1212 date time applid Signoff at {netname | console | terminal }portname has failed because the terminal has preset security.

**Explanation:** A signoff has been issued from terminal portname which has been defined to CICS with fixed security attributes and so does not support signoff.

**System Action:** The signoff request is rejected.

**User Response:** None, unless this implies a breach of security which needs investigating.

**Destination:** CSCS

**Module:** DFHSNTU

**XMEOUT Parameters:** date, time, applid, {1=netname, 2=console, 3=terminal}, portname

DFHSN1213 date time applid Signoff at {netname | console | terminal }portname has failed because the terminal was not signed on.

**Explanation:** A signoff has been issued from terminal portname while no previous signon was in effect.

**System Action:** The signoff request is rejected.

**User Response:** None, unless this implies a breach of security which needs investigating.

**Destination:** CSCS

**Module:** DFHSNTU

**XMEOUT Parameters:** date, time, applid, {1=netname, 2=console, 3=terminal}, portname

DFHSN1214 date time applid An attempted signoff has failed because there was no terminal associated with the requesting task.

**Explanation:** A signoff has been issued from a task that had been started without a terminal.

**System Action:** The signoff request is rejected.

**User Response:** Investigate why a signoff has been issued from a task that is not associated with a terminal.

**Destination:** CSCS

**Module:** DFHSNTU

**XMEOUT Parameters:** date, time, applid

DFHSN1215 date time applid Signoff at {netname | console | terminal }portname has failed. Signoff is not allowed at a surrogate terminal except by use of the CRTE transaction.

**Explanation:** CICS does not support the signing off of surrogate terminals, except when done during a CRTE routing session.

**System Action:** Processing continues.

**User Response:** Investigate how and why users are attempting to use signoff via transaction routing.

**Destination:** CSCS

**Module:** DFHSNTU

**XMEOUT Parameters:** date, time, applid, {1=netname, 2=console, 3=terminal}, portname
DFHSN1250  
date time applid  
Signoff at TCAM pool is complete.  

Explanation: A TCAM pool of terminals has been signed off. All terminals in this TCAM pool now have default security attributes.  

System Action: Processing continues.  
User Response: None.  
Destination: CSCS  
Module: DFHSNTU  
XMEOUT Parameters: date, time, applid

DFHSN1300  
date time applid  
An attempt to reschedule BMS pages for operator opid at {netname | console | terminal | portname} has failed following a timeout.  

Pages on temporary storage queue X'hexqueueid' may require cleanup.  

Explanation: Operator opid has been timed out on terminal netname while viewing BMS pages. CICS has attempted to reschedule the pages so that they are available when the operator signs on again, but the reschedule has failed.  
The pages are available on temporary storage queue hexqueueid. This queue continues to exist until it is explicitly disposed of.  

System Action: Processing continues.  
User Response: If you still need to view this data, repeat the processing which created the BMS pages.  
Destination: CSCS  
Module: DFHSNTU  
XMEOUT Parameters: date, time, applid, opid, {1=netname, 2=console, 3=terminal, 4=portname}, X'hexqueueid'

DFHSN1400  
date time applid  
Session signon for session session by user userid is complete.  

Explanation: The two CICS systems are connected and the MRO/ISC session is given the security authority of user userid.  

System Action: The MRO/ISC sessions are signed on.  
User Response: None.  
Destination: CSCS  
Module: DFHSNSU  
XMEOUT Parameters: date, time, applid, userid

DFHSN1401  
date time applid  
Session signon for session session by user userid has failed. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas').  

Explanation: An MRO/ISC signon is attempted but the signon has failed for the reason given.  

System Action: The session is not signed on.  
User Response: The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issed by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the OS/390 MVS Programming: Authorized Assembler Services Guide, and in External Security Interface (RACROUTE) Macro Reference for MVS and VM (SC28-1366). Consult the manuals to find the cause of the codes.

`date time applid Signoff at preset {netname | console / terminal | portname has failed. SAF codes are (X'safresp',X'safreas'), ESM codes are (X'esmresp',X'esmreas').

**Explanation:** The preset security terminal `portname`, could not be signed off while the terminal was being deleted.

**System Action:** Processing continues.

**User Response:** The response and reason codes (`safresp` and `safreas`) returned by the system authorization facility (SAF), and the response and reason codes (`esmresp` and `esmreas`) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the OS/390 MVS Programming: Authorized Assembler Services Guide, and in External Security Interface (RACROUTE) Macro Reference for MVS and VM (SC28-1366). Consult the manuals to find the cause of the codes.

**Destination:** CSCS

**Module:** DFHSNPU

**XMEOUT Parameters:** `date, time, applid, {1=netname, 2=console, 3=terminal}, portname, X'safresp', X'safreas', X'esmresp', X'esmreas'`

---

**DFHSOxxxx messages**

**DFHSO0001** `applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

**Explanation:** An abnormal end (abend) or program check has occurred in module `modname`. This implies that there may be an error in the CICS code. Alternatively, unexpected data being input, or storage has been overwritten.

The code `aaa/bbbb` is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphabetic CICS code. The MVS code is a system completion code (for example, OC1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System Action:** An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module `modname`, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Module:** DFHOSDM, DFHSOL, DFHSOCK, DFHSDM, DFHDSOIS.

**XMEOUT Parameters:** `applid, X'code', modname`

---

**DFHSO0002** `applid A severe error (code X'code') has occurred in module modname.'

**Explanation:** An error has been detected in module `modname`. The code `X'code'` is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

**System Action:** An exception entry (code `X'code'` in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module `modname`, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHOSDM, DFHSOL, DFHSOCK, DFHSDM, DFHDSOIS.

**XMEOUT Parameters:** `applid, X'code', modname`

---

**DFHSO0004** `applid A possible loop has been detected at offset X'offset' in module modname.'

**Explanation:** A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module `modname` at offset `X'offset'`. This is the offset of the instruction which happened to be executing at the time when the error was detected.

**System Action:** An exception entry is made in the trace table.

A system dump is taken unless you have specifically suppressed the dump (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.
Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function, and there may not be an error. Usually, CICS purges a CICS function which exceeds the runaway task time interval that you have specified in the ICVR system initialization parameter. This means that execution of module modname is terminated and CICS continues.

If you have specified system initialization parameter ICVR=0 and you consider that module modname is looping, you should bring CICS down in a controlled manner. If the message recurs or if you cannot run without the full use of CICS, you may decide to continue to run and bring CICS down at a suitable time to do this permanently. You can change the ICVR time interval temporarily online using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console
**Modules:** DFHSOCK, DFHSOSE
**XMEOUT Parameters:** applid, X'offset', modname

---

**DFHSO0104** applid Secure sockets program pgmname could not be loaded. Secure Sockets Layer is not available.

**Explanation:** The program module pgmname, which is required to implement the secure sockets layer, could not be loaded.

**System Action:** System initialization continues, but support for the secure sockets layer is not enabled.

**User Response:** If this message is preceded by message DFHSO0103, try restarting CICS with ENCRYPTION=NORMAL.

**Destination:** Console Routecodes 2, 9, 10 and 11
**Module:** DFHSODM
**XMEOUT Parameters:** applid, pgmname

---

**DFHSO0105** date time applid An OpenEdition Assembler Callable Service error (code X'code') has occurred in module modname.

**Explanation:** An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

**System Action:** An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

**User Response:** This indicates a possible error in CICS code or the called Assembler Callable Service routine. The exception trace entry will tell you which service routine was called and the return values that were returned. Refer to the OS/390 OpenEdition Messages and Codes book to determine the cause of the error. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

**Destination:** Console and Transient Data Queue CSOO
**Module:** DFHSOCK
**XMEOUT Parameters:** date, time, applid, X'code', modname
Finally, TCP/IP for OS/390 can be configured with port sharing. This allows multiple servers (TCPIPSERVICES) to use the same port with TCP/IP using load balancing to direct incoming connections to the set of servers on the port. With this enabled, multiple TCPIPSERVICES can each be opened on the same IP address with the same port.

**DFHSO0110** date time applid The TCPIPSERVICE tcpipservice cannot be opened on the IP address ipaddress because the address is unknown to TCP/IP.

**Explanation:** Opening the TCPIPSERVICE has failed because the IP address specified on the definition is not known to TCP/IP.

**System Action:** This message is issued when the bind call fails with the return value of EADDRNOTAVAIL.

**User Response:** Check that the address specified on the TCPIPSERVICE definition is known to TCP/IP. If it is not, then consult the OS/390 TCP/IP OpenEdition: Configuration Guide for information on defining IP address.

**Destination:** CSOO

**Module:** DFHSOCK

**XMEOUT Parameters:** date, time, applid, tcpipservice, portnumber, ipaddress
**Explanation:** Opening the TCPIPSERVICE has failed because TCP/IP is currently not open. Either TCPIP=NO has been specified in the SIT or TCP/IP has been dynamically closed using CEMT or an SPI command.

**System Action:** The TCPIPSERVICE is not opened. If an application has used the EXEC API to open the TCPIPSERVICE, it receives RESP(INVREQ) RESP24(4) values.

**User Response:** Open TCP/IP and re-open the TCPIPSERVICE.

**Destination:** CSOO

**Module:** DFHSORD

**XMEOUT Parameters:** date, time, applid, tcpipservice

---

**Explanation:** CICS has issued the TCP/IP function gethostbyaddr to resolve the IP address ip_address to a host name, but the call failed.

**System Action:** An exception trace entry is made. CICS will continue to attempt to access the name server for subsequent requests.

**User Response:** The gethostbyaddr function will usually perform a name server reverse lookup to resolve the IP address into a host name. This can fail if CICS is unable to contact a name server, or the name server does not know the correct host name to IP address mapping.

Check that the name server defined to TCP/IP in the /etc/resolv.conf file is valid and responding correctly. You can issue the TSO NSLOOKUP command to query the name server. If a SYSTCPD DD name has been defined in the CICS job, check that the file it references correctly defines the name server. If the name server is defined correctly to CICS then contact the administrator to determine why the IP address lookup has failed.

**Destination:** Console

**Module:** DFHSOIS

**XMEOUT Parameters:** applid, ip_address

---

**Explanation:** The TCP/IP listener task has received a connection from a client but the attach for the transaction associated with the TCPIPSERVICE definition has failed. The associated transaction may not have been installed or the TCPIPSERVICE definition could have specified the wrong transaction.

**System Action:** The TCPIPSERVICE that is defined on the port that the connection arrived on is closed. The socket accepted for the client is closed.

**User Response:** Determine why the attach for the transaction has failed. Correct the error and re-open the TCPIPSERVICE.

**Destination:** CSOO

**Module:** DFHSOCK

**XMEOUT Parameters:** date, time, applid, groupname, tcpipservice

---

**Explanation:** The group name has been registered with Work Load Manager. The TCP/IP host name genericname will become available for DNS connection optimization.

**System Action:** CICS has issued the Work Load Manager macro IWMSRSRG to register the specified group name for DNS connection optimization. This only occurs when the name of the TCPIPSERVICE begins with a dot '.'. Work Load manager registration only occurs once for a given group name. If multiple TCPIPSERVICES define the same group name, then registration will only occur once.

The group name registered is taken from a combination of part of the name of the TCPIPSERVICE and the transaction defined for the TCPIPSERVICE. Any characters of the name following a dot '.' are concatenated onto the transaction identifier to form the group name. For example, CICS named with the transaction IOP (The IOP transaction being an alias of the CICS supplied CIOR transaction). The group name generated is 'CICSIOP'. The TCP/IPSERVICES name does not contain a dot, then only the transaction identifier is used. For example, a TCPIPSERVICE with a name of 'DYNWEB' and a transaction of WWW will generate a registration for the group 'WWW'.

The group name registered effectively becomes a new name in the sysplex TCP/IP domain. When multiple CICS systems in a sysplex each register with the same group name, the DNS server uses Work Load Manager to resolve the group name into one of the IP addresses of the associated systems. The IP address returned is that of the system that is most eligible according to Work Load Manager's load balancing rules. For example, two OS/390 systems in a sysplex are mvs1.plex.hursley.ibm.com and mvs2.plex.hursley.ibm.com; and on each system, CICS registers with the group name cicsiop. The new name cicsiop.plex.hursley.ibm.com is dynamically added to the DNS name servers tables. Client TCP/IP applications can use this name instead of the name of one of the specific OS/390 images. When a client resolves the name to an IP address using the DNS, it will get the IP address of the most eligible system. Since the DNS dynamically knows when systems register and deregister, additional CICS systems can be registered as required to expand the list of available IP addresses returned for a group name. If a system fails, its IP address will be removed from the DNS server's list of associated addresses for any groups with which it was registered.

**User Response:** No user action is necessary.

**Destination:** CSOO

**Module:** DFHSOCK

**XMEOUT Parameters:** date, time, applid, groupname, genericname
DFHSRxxxx messages

DFHSR0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in program proname.

Explanation: An abnormal end (abend) or program check has occurred in program proname. Storage protection is active, and CICS was executing in USER key at the time of the abend or program check.

The code aaa is a three digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The four digit code bbbb, which follows aaa, is a user abend code, produced either by CICS or by another product on the user's system. Message DFHME0116 is normally produced containing the symptom string for this problem.

System Action: An exception trace entry is made giving details of the error. System dump SR0001 is taken unless you have specifically suppressed dumps for that dumpcode in the dump table.

CICS continues and abends the transaction, unless you have specified in the dump table that CICS should terminate. The transaction abend code is ASRA, ASRB, ASRD or ASRE.

User Response: As the execution key was USER key, modname is probably a customer application program. Review this program and correct the error.

Note that if the error was an OC4 program check caused by an attempt to overwrite a CICS DSA, the exception trace entry indicates which DSA the program attempted to overwrite. If this is the case, also refer to the explanation for message DFHSR0622.

For advice on problem determination, refer to the CICS Problem Determination Guide.

Report the details of the symptom string given in message DFHME0116.

If you want to suppress system dumps that precede ASRA, ASRB, ASRD or ASRE abends when the execution key is USER, you must specify on an entry in the dump table for system dumpcode SR0001. Use either CEMT or an EXEC CICS command. Further guidance on this can be found in the CICS System Definition Guide.

Destination: Console
Module: DFHSRP
XMEOUT Parameters: applid, aaaa-bbbb, X'offset', proname

DFHSR0601 applid Program interrupt occurred with system task taskid in control

Explanation: A program check has been detected in a system task. taskid is the system task identifier (for example, TCP, III) as set in field TCAKCTTA.

System Action: CICS abnormally terminates with system dump SR0601 and an exception trace entry which gives the kernel error data for the program check.

User Response: Use the dump to determine the cause of the program check. The most likely causes are either an error in a CICS module, or an error in a user-written PLT program.

For advice on problem determination, refer to the CICS Problem Determination Guide.

Destination: Console
Module: DFHSRP

Chapter 1. DFH messages 549
DFHSR0602 applid Abend (code aaa/bbbb) has been detected.

**Explanation:** DFHSRP has detected an abnormal termination which CICS is not able to handle fully (for example, the abend code cannot be found in the SRT). In this instance it is the CICS system and not merely a transaction, that has abnormally terminated.

The code aaa is a three digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The four digit code bbbb, which follows aaa, is a user abend code produced either by CICS or by another product on the user's system.

**System Action:** CICS abnormally terminates. A system dump (dumpcode SR0606) can be taken with this message depending on the abend code. An exception trace entry is produced giving the kernel error data for the abend.

**User Response:** Use the dump to determine the abnormal termination, and to investigate its cause.

**Destination:** Console

**Module:** DFHSRP

**XMEOUT Parameters:** applid, aaa/bbbb

---

DFHSR06012 applid Abend recovery has been entered by same task

**Explanation:** An operating system abnormal termination occurred. CICS started to abend the task with abend code ASRB when another operating system abnormal termination occurred. As this is a potentially recursive situation, DFHSRP terminates CICS.

**System Action:** CICS abnormally terminates with system dump SR0612 and exception trace entries giving the kernel error data for each operating system abend.

**User Response:** The most likely cause of the second operating system abend is an error in a global user exit program running at the XSRAB exit. This is the global user exit that can be invoked when an abend code is found in the SRT. If such a program was running, determine the cause of the second abend and take steps to prevent a recurrence.

Note that this message will also be issued if a global user exit program running at the XSRAB exit gets into a loop (runaway), or issues an unknown XPI call (kernerror). The second exception trace entry should help to diagnose this.

**For advice on problem determination, see the CICS Problem Determination Guide.**

**Destination:** Console

**Module:** DFHSRP

**XMEOUT Parameters:** applid, aaa/bbbb

---

DFHSR0605 applid Error from KE Domain - DFHSRP initialization

**Explanation:** Module DFHSRP has detected a severe error during the initialization phase of CICS. It is unlikely that any recovery functions can run until the error is found and corrected.

**System Action:** CICS abnormally terminates with system dump SR0605.

**User Response:** Use the dump to determine, if possible, the cause of the problem and what must be done to correct it.

**For advice on problem determination, refer to the CICS Problem Determination Guide.**

**Destination:** Console

**Module:** DFHSRP

**XMEOUT Parameter:** applid

---

DFHSR0613 applid Abend has occurred with system task taskid in control

**Explanation:** An operating system abnormal termination has been detected in a system task. taskid is the system task identifier (for example, TOP, III) as set in field TCAKCTTA.

**System Action:** CICS abnormally terminates with system dump SR0613 and an exception trace entry giving the kernel error data for the operating system abend.

**User Response:** Use the dump to determine the cause of the abend, and take action to correct it.

**For advice on problem determination, see the CICS Problem Determination Guide.**

**Destination:** Console
Module: DFHSRP
XMEOUT Parameters: applid, taskid

DFHSR0615 applid Program interrupt has occurred in recovery task

Explanation: An operating system abnormal termination occurred. CICS started to abend the task with an abend code of ASRB when a program check occurred. DFHSRP terminates CICS.

System Action: CICS abnormally terminates with system dump SR0615 and exception trace entries giving the kernel error data for the operating system abend and the program check.

User Response: The most likely cause of the program check is an error in a global user exit program running at the XSRAB exit. This is the global user exit that can be invoked when an abend code is found in the program trace. If such a program was running, determine the cause of the program check and correct it.

For advice on problem determination, refer to the CICS Problem Determination Guide.

Destination: Console
Module: DFHSRP
XMEOUT Parameter: applid

DFHSR0618 applid An illegal macro call or reference to the CSA or TCA has caused the abend which follows

Explanation: A user program was executing which either contains an assembler macro which is no longer supported, or refers illegally to the CICS TCA or CSA. This error appears as an 0C4 program check.

System Action: Either The transaction abends with abend code ASRD. This message is followed by message DFHAP0001 or DFHSR0001 which gives the name of the program in error and the offset into that program at which the error occurred.
Or This is a critical error and CICS is terminated. This message is followed by a DFHSRP06xx message giving the reason for the termination.

User Response: Review the program and correct the error.
If the error is in the module DFHUEHC, ensure that UEPCS and UEPTCA are not being used because these reference fetch-protected storage.

For advice on problem determination, refer to the CICS Problem Determination Guide.

Destination: Console
Module: DFHSRP
XMEOUT Parameter: applid

DFHSR0619 date time applid An illegal reference to the RCT has caused the abend which follows.

Explanation: A user program was executing and referred illegally to the RCT. This error appears as an 0C4 program check.

System Action: The transaction abends with abend code ASRE. This message is followed by message DFHAP0001 or DFHSR0001 which gives the name of the program in error and the offset into that program at which the error occurred.

User Response: Review the program and correct the error by using the CICS supplied SPI commands to retrieve data from the RCT.

For advice on problem determination, refer to the CICS Problem Determination Guide.

Destination: Console and Transient Data Queue CDB2
Module: DFHSRP
XMEOUT Parameters: date, time, applid

DFHSR0622 applid An attempt to [overwrite | access] the dsaname has caused the abend which follows

Explanation: An 0C4 program interrupt (protection exception) has occurred. CICS has diagnosed the cause of the 0C4 as an attempt to either access or overwrite storage in DSA dsaname. The DSA is one of CDSA, RDSA, UDSA, ECDSA, ERDSA or EUDSA for overwrite, or either UDSA or EUDSA for access.

If dsaname is CDSA or ECDSA:
CICS is running with storage protection active. Both the CDSA and the ECDSA therefore contain CICS key storage. They are write protected from user programs executing in User key. The most likely causes of the 0C4 are:
• A program executing in CICS key passed the address of CICS key storage in the CDSA or ECDSA to a user program executing in User key and this user program attempted to write to this storage.
• A user program executing in User key contains an error and accidentally attempted to write to CICS key storage in the CDSA or ECDSA.
• A user program executing in User key deliberately attempted to write to CICS key storage in the CDSA or ECDSA.

If dsaname is ERDSA or RDSA:
CICS may be running with or without storage protection active. The ERDSA or RDSA contains only reentrant CICS and user programs. If RENTPGM=PROTECT was specified as a system initialization parameter, the ERDSA or RDSA is write protected from programs executing in both CICS key and User key. If RENTPGM=NOPROTECT, the ERDSA or RDSA is only protected from user programs executing in User key. The most likely causes of the 0C4 are:
• A user program residing in the ERDSA or RDSA has attempted to modify its own storage, (that is, the program is not reentrant).
• A user program contains an error and accidentally attempted to overwrite program storage in the ERDSA or RDSA.

If dsaname is EUDSA or UDSA:
CICS is running with both storage protection and transaction isolation active. The EUDSA and UDSA contain only USER key non-shared storage. The most likely causes of the 0C4 are:
• If the action is overwrite, a program has attempted to modify the non-shared storage belonging to another transaction.
• If the action is access, a program has attempted to either read storage or execute an instruction within another transaction's non-shared storage.

System Action: Either the transaction abends with abend code ASRA. This message is followed by message DFHAP0001 or DFHSR0001 which gives the name of the program in error and the offset into that program at which the error occurred. Additionally, an exception trace entry is taken which gives program, offset, execution key and the DSA in question.
DFHSTxxxx

Or, this is a critical error and CICS is terminated. This message is followed by a DFHSR06xx message giving the reason for the termination.

User Response: Depending on the cause and dsaname, do one of the following:
- Correct any error in the program.
- Redefine transactions with ISOLATE(NO) where they have to share storage.
- Change the program resource definition so that it executes in CICS key (and the basespace).
- Ensure that the program is not loaded into the ERDSA by not link-editing it with the RENT option.

Destination: Console
Module: DFHSRP
XMEOUT Parameters: applid, {1=overwrite, 2=access}, dsaname

DFHSTxxxx messages

DFHST0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code.

Alternatively, unexpected data has been input, or storage has been overwritten.

Note: There is NO applid for DFHSTUP modules.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHSTS1310).

System Action: An exception entry is made in the trace table.

For modules DFHSTST and DFHSTTI, a dump is taken and the collection interval is set to 24 hours. Message DFHST0101 is also issued.

For module DFHSTDM, the action depends on the initialization error action value which is used by the domain (DM) manager. The usual action is to terminate CICS with a dump.

For module DFHSTUE, processing continues.

For modules DFHSTWR, DFHSTRD, and DFHSTUx (modules within DFHSTUP), the job step is terminated with a dump.

For ALL modules, a system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the OS/390 MVS System Codes manual. Then look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, a runaway or a recovery percolation, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Modules: DFHSTST, DFHSTDM, DFHSTTI, DFHSTUE, DFHSTUx (Modules within DFHSTUP), DFHSTWR, DFHSTRD
XMEOUT Parameters: applid, aaa/bbbb, X'offset', modname

DFHST0002 applid A severe error (code X'code') has occurred in module modname.

Explanation: An error has been detected in module modname. The code X'code' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

For further information about CICS exception trace entries, refer to the CICS Problem Determination Guide.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Modules: DFHSTST, DFHSTDM, DFHSTTI, DFHSTUE
XMEOUT Parameters: applid, X'code', modname

DFHST0003 applid Insufficient storage to satisfy GETMAIN (code X'code') in module modname.

Explanation: A CICS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point id which uniquely identifies the place where the error was detected.

This error has occurred above the 16MB line.

System Action: An exception entry is made in the trace table.
Chapter 1. DFH messages

DFHST0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

Note that no applid is included for DFHSTUP modules.

System Action: An exception entry is made in the trace table.

For modules DFHSTST and DFHSTTI, a system dump is taken and the collection interval is set to 24 hours. Message DFHST0101 will also be issued.

For module DFHSTDM, the action depends on the initialization error action value which is used by the domain (DM) manager. The usual action will be to terminate CICS with a dump.

For module DFHSTUE, processing continues.

For modules DFHSTWR, DFHSTRD, and DFHSTUX (modules within DFHSTUP), the job step is terminated with a dump.

For all modules, a system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHSTST, DFHSTDM, DFHSTTI, DFHSTUE, DFHSTUX (modules within DFHSTUP), DFHSTWR, DFHSTRD

XMEOUT Parameters: applid, X'offset', modname

DFHST0005 applid A hardware error has occurred (module modname, code X'code'). The Time-of-Day clock is invalid.

Explanation: Execution of the STCK machine instruction resulted in a non-zero condition code.

System Action: A system dump is taken and interval collections are cancelled. Message DFHST0102 is also issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. This is in all probability a hardware error and you should in the first instance investigate the MVS Store Clock and find out whether it is working properly. If this is the case, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHSTST, DFHSTDM

XMEOUT Parameters: applid, modname, X'code'

DFHST0101 applid The Statistics Domain has set the collection interval to 24 hours.

Explanation: A problem has been detected by, or has been passed back to, the statistics (ST) domain. As a result, the collection interval has been set to the maximum value. The end-of-day collection time is unchanged.

A message explaining the problem has already been issued by the module in error.

System Action: Other processing continues.

User Response: Refer to the associated message for guidance on resolving the original problem.

Use CEMT SET STATISTICS to reset the interval when the problem has been resolved.

Destination: Console

Modules: DFHSTST, DFHSTDM, DFHSTTI

XMEOUT Parameter: applid
DFHST0102I

DFHST0102I applid The Statistics Domain has cancelled interval collections.

Explanation: A problem has been detected by, or has been passed back to, the statistics (ST) domain. A message explaining the problem may have already been issued by the module in error. To reduce the occurrence of this problem, the interval collections have been cancelled. The end-of-day collection time is unchanged.

System Action: Other processing continues.

User Response: Refer to any associated message for guidance on resolving the original problem.

If no associated message has been issued, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHSTST, DFHSTM, DFHSTTI

XMEOUT Parameter: applid

DFHST0103 applid An SMF error has occurred with return code X'rc'.

Explanation: SMF has returned to the statistics (ST) domain with an error return code X'rc' from the SMFEWTM macro.

System Action: Other CICS processing continues.

User Response: Refer to the OS/390 MVS System Management Facility (SMF) manual for a detailed explanation of the meaning of the return code.

Destination: Console

Module: DFHSTST

XMEOUT Parameters: applid, X'rc'

DFHST0201 S An attempt to open the statistics data set has failed.

Explanation: DFHSTUP has tried to open the unloaded SMF data set but has failed.

System Action: A dump is taken and the job step is terminated.

User Response: Ensure that the JCL for the job is correct. A sample set of JCL to execute the DFHSTUP utility is contained in the CICS Operations and Utilities Guide.

If incorrect JCL is not the cause of the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: SYSPRINT

Module: DFHSTRD

DFHST0202 W The statistics data set is empty.

Explanation: An end-of-file condition was detected during the first attempt to read the unloaded SMF data set, or the unloaded SMF dataset contained no CICS statistics from any CICS system.

System Action: The job step is terminated.

User Response: The most likely cause is an error in the JCL which unloads the SMF dataset. First check that the JCL is correct. A sample set of JCL to unload the SMF dataset is contained in the CICS Operations and Utilities Guide. Also check that you have unloaded the correct SMF dataset. Resubmit the job.

Destination: SYSPRINT

Module: DFHSTIN

DFHST0204 S Invalid record id recid encountered on the statistics data set.

Explanation: An invalid record identifier recid has been encountered in the unloaded SMF data set.

System Action: A dump is taken and the job step is terminated.

User Response: Check that the unloaded SMF data set contains statistics records. CICS statistics records are of SMF record type 110, sub-type 2. For further information, see the CICS Data Areas.

If the SMF data set does contain statistics records, the most likely cause of the problem is a corrupted SMF dataset. Unload the SMF dataset again and rerun the DFHSTUP utility. If the problem persists, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: SYSPRINT

Module: DFHSTUx (modules within DFHSTUP)

DFHST0206 S An invalid parameter (parameter) has been specified for the DFHSTUP utility.

Explanation: One or more of the parameters specified in the SYSIN data set were incorrect.

System Action: The job step is terminated.

User Response: Correct the erroneous parameter as identified in the message and resubmit the job.

Destination: SYSPRINT

Module: DFHSTUP1

DFHST0207 W An incomplete data record has been encountered on the statistics data set.

Explanation: A record input from the unloaded SMF data set specifies that the data it contains is incomplete.

System Action: Processing continues.

User Response: For an incomplete data record to have been encountered, there must have been an error in the running of CICS. This should result in an exception trace and perhaps a dump being issued.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Chapter 1. DFH messages

If you have specified the correct REGION size, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** SYSPRINT  
**Module:** All DFHSTUP modules

### DFHST0212 S Processing terminated. DFSORT message dataset (DD=SYSOUT) is missing.

**Explanation:** The dataset used by the DFSORT utility to output its messages is missing.

**System Action:** A dump is taken and the job step is terminated.

**User Response:** Check the JCL used to execute the DFHSTUP utility to ensure that the SYSOUT DD was correctly specified. A sample set of JCL to execute the DFHSTUP utility is contained in the CICS Operations and Utilities Guide.

**Destination:** SYSPRINT  
**Module:** DFHSTUP1

### DFHST0213 S Processing terminated. Error detected by DFSORT. Check DFSORT messages.

**Explanation:** An error was detected by the DFSORT utility and the DFHSTUP utility terminated.

**System Action:** A dump is taken and the job step is terminated.

**User Response:** The user must inspect the DFSORT message dataset and search for messages indicating the reason for the failure of the DFSORT utility. A detailed explanation of the messages produced by DFSORT can be found in the DFSORT Application Programming Guide (SC33-4035).

After analyzing the DFSORT error message, take the appropriate corrective actions and resubmit the job.

**Destination:** SYSPRINT  
**Module:** DFHSTUP1

### DFHST0214 S Processing terminated. Failure to obtain system time and date.

**Explanation:** The DFHSTUP utility was unable to obtain the system time and date from the CICS kernel.

**System Action:** A dump is taken and the job step is terminated.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** SYSPRINT  
**Module:** DFHSTUP1

### DFHST0216 W An incompatible statistics record version number was detected by module module.

**Explanation:** The statistics utility program has detected that a statistics record has a version number which is incompatible with the version number expected by the DFHSTUP utility.

**System Action:** The statistics record containing the invalid version number is ignored. Statistics records immediately following which are of the same type and which also contain an invalid version number are also ignored. Processing continues.
DFHST0217 S

User Response: Obtain a dump of the SMF data set. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: SYSPRINT
Module: All DFHSTUP modules.

DFHST0217 S An attempt to open the DFHSTWRK data set has failed.

Explanation: The statistics utility program has detected an error while attempting to open the DFHSTWRK data set during non-summary statistics processing.

System Action: The statistics utility program ends abnormally.

User Response: Ensure that the DFHSTWRK data set has been specified on the job, and that the attributes of the data set are correct.

Destination: SYSPRINT
Module: DFHSTU17

DFHST0218 S A write error has occurred on the DFHSTWRK data set.

Explanation: The statistics utility program has detected an error while attempting to write to the DFHSTWRK data set during non-summary statistics processing.

System Action: The statistics utility program ends abnormally.

User Response: Ensure that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

Destination: SYSPRINT
Module: DFHSTU17

DFHST0219 S A read error has occurred on the DFHSTWRK data set.

Explanation: The statistics utility program has detected an error while attempting to read from the DFHSTWRK data set during non-summary statistics processing.

System Action: The statistics utility program ends abnormally.

User Response: Ensure that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

Destination: SYSPRINT
Module: DFHSTU17

DFHST0220 S An attempt to open the DFHSTWRK data set has failed.

Explanation: The statistics utility program has detected an error while attempting to open the DFHSTWRK data set while processing summary statistics.

System Action: The statistics utility program ends abnormally.

User Response: Check that the DFHSTWRK data set has been specified on the job, and that the attributes of the data set are correct.

Destination: SYSPRINT
Module: DFHSTU17

DFHST0221 S A write error has occurred on the DFHSTWRK data set.

Explanation: The statistics utility program has detected an error while attempting to write to the DFHSTWRK data set during summary statistics processing.

System Action: The statistics utility program ends abnormally.

User Response: Check that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

Destination: SYSPRINT
Module: DFHST17X

DFHST0222 S A read error has occurred on the DFHSTWRK data set.

Explanation: The statistics utility program has detected an error while attempting to read from the DFHSTWRK data set during summary statistics processing.

System Action: The statistics utility program ends abnormally.

User Response: Check that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

Destination: SYSPRINT
Module: DFHST17X

DFHST0223 I There are no data table statistics to report.

Explanation: The file subsection of the DFHSTUP report entitled 'Data Table Requests Information' only contains formatted information if the data currently being processed contains statistics records for files accessed as data tables. This message is written to the DFHSTUP report, when the utility program detects that there are no data table statistics in this section of the statistics report.

System Action: Processing continues normally.

User Response: Take no action unless you expect data table statistics in the DFHSTUP report. In this case, ensure that the data tables feature is in use during the time period covered by the statistics being processed.

Destination: SYSPRINT
Modules: DFHSTU17, DFHST17X

DFHST0224 I There are no intrapartition queues to report.

Explanation: The transient data subsection of the DFHSTUP report entitled 'Transient Data - Intrapartition' contains no data.

System Action: Processing continues normally.

User Response: Take no action unless you expect TD intrapartition statistics in the DFHSTUP report.

Destination: SYSPRINT
Modules: DFHSTUTQ, DFHSTTQX
DFHST0225 I There are no extrapartition queues to report.
Explanation: The transient data subsection of the DFHSTUP report entitled 'Transient Data - Extrapartition' contains no data.
System Action: Processing continues normally.
User Response: Take no action unless you expect TD extrapartition statistics in the DFHSTUP report.
Destination: SYSPRINT
Modules: DFHSTUTQ, DFHSTTQX

DFHST0226 I There are no indirect queues to report.
Explanation: The transient data subsection of the DFHSTUP report entitled 'Transient Data - Indirect' contains no data.
System Action: Processing continues normally.
User Response: Take no action unless you expect TD indirect statistics in the DFHSTUP report.
Destination: SYSPRINT
Modules: DFHSTUTQ, DFHSTTQX

DFHST0227 I There are no remote queues to report.
Explanation: The transient data subsection of the DFHSTUP report entitled 'Transient Data - Remote' contains no data.
System Action: Processing continues normally.
User Response: Take no action unless you expect TD remote statistics in the DFHSTUP report.
Destination: SYSPRINT
Modules: DFHSTUTQ, DFHSTTQX

DFHSZxxxx (FEPI) messages

DFHSZ4001 I date time applid FEPI initialization has started.
Explanation: The Front End Programming Interface (FEPI) is being initialized.
This means the CSZI transaction – FEPI – has started its processing. CSZI is started as part of CICS system initialization, if the system initialization parameter FEPI is set to YES.
If you specified FEPI=YES and this message does not appear during CICS initialization, CSZI failed to start; the most common reason for this is that group DFHFEP1 is not included in the list specified by the GRPLIST system initialization parameter.
If message DFHSZ4001 is not followed by message DFHSZ4002, FEPI failed to start. In this case, a DFHSZnnnn message is issued to indicate the error.
System Action: FEPI initialization proceeds.
User Response: None.
Destination: Console and Transient Data Queue CSZL
Module: DFHSZRMP(DFHSZSIP)
XMEOUT Parameters: date, time, applid

DFHSZ4002 I date time applid FEPI initialization has ended.
Explanation: The Front End Programming Interface (FEPI) has finished initialization.
System Action: EXEC CICS FEPI commands are made available.
User Response: None.
Destination: Console and Transient Data Queue CSZL
Module: DFHSZRMP(DFHSZSIP)
XMEOUT Parameters: date, time, applid

DFHSZ4003 I date time applid FEPI termination complete.
Explanation: The Front End Programming Interface (FEPI) has ended.
A DFHSZnnnn message may precede message DFHSZ4003 to indicate what caused FEPI to terminate.
System Action: EXEC CICS FEPI commands are made unavailable.
User Response: Resolve the problem indicated by the messages, then restart CICS.
Destination: Console and Transient Data Queue CSZL
Module: DFHSZRMP(DFHSZSIP)
XMEOUT Parameters: date, time, applid

DFHSZ4004 E date time applid FEPI cannot be started: FEPI=YES not specified in the SIT.
Explanation: The Front End Programming Interface (FEPI) cannot be started because the FEPI system initialization parameter was set to NO indicating that FEPI is not required.
This message usually means that you attempted to start the FEPI transaction (CSZI) manually, but did not set up the correct environment for it to run.
System Action: The FEPI transaction is not run.
User Response: If you require FEPI in the CICS system, restart CICS specifying the system initialization parameter FEPI=YES. You do not need to start the FEPI transaction manually.
Destination: Console and Transient Data Queue CSZL
Module: DFHSZRMP(DFHSZSIP)
XMEOUT Parameters: date, time, applid

DFHSZ4005 E date time applid FEPI cannot be started: FEPI is already active, in state X'sssssss'.
Explanation: The Front End Programming Interface (FEPI) cannot be started because FEPI is already active in the system.
This message usually means that you attempted to start a new instance of FEPI manually by running the FEPI transaction (CSZI), but the previous instance of FEPI failed in some way that caused an ‘active’ indication to be left in error.
The possible FEPI states (X ‘ssssssss‘) are:

<table>
<thead>
<tr>
<th>State</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X‘00000002‘</td>
<td>FEPI is being initialized</td>
</tr>
<tr>
<td>X‘00000003‘</td>
<td>FEPI is active</td>
</tr>
<tr>
<td>X‘00000004‘</td>
<td>FEPI is terminating as CICS is undergoing a normal shutdown</td>
</tr>
</tbody>
</table>
DFHSZ4006 E  date time applid FEPI initialization failed: enqueue failure, code X'rr'.

Explanation: The Front End Programming Interface (FEPI) cannot be initialized because an attempt to enqueue on the FEPI enqueue name SZENQRM failed, indicating that FEPI is already active in the system. FEPI initialization issues this enqueue to prevent a second instance of FEPI being present in the system.

This message usually means that you attempted to start the FEPI transaction (CSZI) manually, but there is a previous instance of CSZI still running.

The possible values of X'rr', the reason for failure, are:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'31'</td>
<td>Duplicate enqueue on SZENQRM attempted.</td>
</tr>
<tr>
<td>X'32'</td>
<td>Failure during enqueue processing.</td>
</tr>
</tbody>
</table>

System Action: The request to start a second instance of FEPI is rejected.

Response Meaning

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'01'</td>
<td>Request completed successfully</td>
</tr>
<tr>
<td>X'02'</td>
<td>Exception response generated</td>
</tr>
<tr>
<td>X'03'</td>
<td>Disaster response generated</td>
</tr>
<tr>
<td>X'04'</td>
<td>Invalid response generated</td>
</tr>
</tbody>
</table>

User Response: None.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: date, time, applid, X'sssssss'

DFHSZ4007 E  date time applid FEPI initialization failed: storage ADD_SUBPOOL failure for subpool pppppppp, reason X'rr' response X'ee'.

Explanation: The Front End Programming Interface (FEPI) cannot be initialized because creating the named storage subpool for FEPI use failed.

The values of X'rr', the reason for failure, are:

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'01'</td>
<td>Insufficient storage available for the subpool</td>
</tr>
<tr>
<td>X'03'</td>
<td>Subpool requested with an invalid fixed length</td>
</tr>
<tr>
<td>X'04'</td>
<td>Subpool requested with an invalid boundary alignment</td>
</tr>
<tr>
<td>X'05'</td>
<td>Subpool requested with an invalid initial number of elements</td>
</tr>
<tr>
<td>X'06'</td>
<td>Subpool requested with an invalid name</td>
</tr>
<tr>
<td>X'08'</td>
<td>Subpool requested already exists</td>
</tr>
<tr>
<td>X'11'</td>
<td>Access to the Storage Manager was denied</td>
</tr>
</tbody>
</table>

The values of X'ee', the response to the failed request, are:

Response Meaning

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'01'</td>
<td>Request completed successfully</td>
</tr>
<tr>
<td>X'02'</td>
<td>Exception response generated</td>
</tr>
<tr>
<td>X'03'</td>
<td>Disaster response generated</td>
</tr>
<tr>
<td>X'04'</td>
<td>Invalid response generated</td>
</tr>
</tbody>
</table>

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: date, time, applid, X'rr', X'ee'

DFHSZ4008 E  date time applid FEPI initialization failed: Non-runaway task setting failure, reason X'rr' response X'ee'.

Explanation: The Front End Programming Interface (FEPI) cannot be initialized because creating the named storage subpool for FEPI use failed.

The value of X'rr', the reason for failure, is always X'00'.

The values of X'ee', the response to the failed request, are:

Response Meaning

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'01'</td>
<td>Request completed successfully</td>
</tr>
<tr>
<td>X'02'</td>
<td>Exception response generated</td>
</tr>
<tr>
<td>X'03'</td>
<td>Disaster response generated</td>
</tr>
<tr>
<td>X'04'</td>
<td>Invalid response generated</td>
</tr>
</tbody>
</table>

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: date, time, applid, X'rr', X'ee'

DFHSZ4009 E  date time applid FEPI initialization failed: change-priority failure, response X'ee'.

Explanation: The Front End Programming Interface (FEPI) cannot be initialized because changing the dispatching priority of the FEPI transaction (CSZI) failed.

Because FEPI runs as a transaction, a high priority is required. The request to set this dispatching priority failed.

The values of X'ee', the response to the failed request, are:

Response Meaning

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'01'</td>
<td>Request completed successfully</td>
</tr>
<tr>
<td>X'03'</td>
<td>Disaster response generated</td>
</tr>
<tr>
<td>X'04'</td>
<td>Invalid response generated</td>
</tr>
</tbody>
</table>
DFHSZ4010 E date time applid FEPI initialization failed: SZ TCB swap failure, response X'ee'.

Explanation: The Front End Programming Interface (FEPI) usually runs under the CICS SZ TCB. Transferring the FEPI transaction (CSZI) from running under the QR TCB to the SZ TCB failed.

The values of X'ee', the response to the failed request, are:

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'01'</td>
<td>Request completed successfully</td>
</tr>
<tr>
<td>X'02'</td>
<td>Exception response generated</td>
</tr>
<tr>
<td>X'03'</td>
<td>Disaster response generated</td>
</tr>
<tr>
<td>X'04'</td>
<td>Invalid response generated</td>
</tr>
<tr>
<td>X'05'</td>
<td>A kernel error was detected</td>
</tr>
</tbody>
</table>

System Action: FEPI initialization ends, and EXEC CICS FEPI commands are made unavailable. An exception trace entry is generated.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: date, time, applid, X'ee'

DFHSZ4012 E date time applid FEPI storage GETMAIN failed in subpool DA, reason X'rr', X'ee'.

Explanation: The Front End Programming Interface (FEPI) issued a GETMAIN storage request in the SZSVP/CDA storage subpool for general usage which failed.

The values of X'rr', the reason for failure, are:

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'01'</td>
<td>Insufficient storage for the request</td>
</tr>
<tr>
<td>X'02'</td>
<td>Invalid subpool token given</td>
</tr>
<tr>
<td>X'04'</td>
<td>Invalid length of element requested</td>
</tr>
<tr>
<td>X'05'</td>
<td>Length of element not specified</td>
</tr>
<tr>
<td>X'08'</td>
<td>Access was denied to the storage subpool</td>
</tr>
<tr>
<td>X'11'</td>
<td>Invalid initial image supplied</td>
</tr>
<tr>
<td>X'12'</td>
<td>An abnormal end occurred in the storage manager</td>
</tr>
<tr>
<td>X'13'</td>
<td>A loop was detected in the storage manager</td>
</tr>
</tbody>
</table>

The values of X'ee', the response to the failed request, are:

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'01'</td>
<td>Request completed successfully</td>
</tr>
<tr>
<td>X'02'</td>
<td>Exception response generated</td>
</tr>
<tr>
<td>X'03'</td>
<td>Disaster response generated</td>
</tr>
<tr>
<td>X'04'</td>
<td>Invalid response generated</td>
</tr>
<tr>
<td>X'05'</td>
<td>A Kernel error was detected</td>
</tr>
<tr>
<td>X'06'</td>
<td>The request was purged.</td>
</tr>
</tbody>
</table>

All these responses indicate that a system error has occurred.

System Action: An exception trace entry is generated.

FEPI tries to recover from this error by retrying the request. However, no action is taken to prevent multiple occurrences.

User Response: If this message occurs frequently, you should take a dump of the CICS system before restarting it.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSNG)

XMEOUT Parameters: date, time, applid, X'rr', X'ee'
**DFHSZ4013 E**

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:**  Console and Transient Data Queue CSZL

**Module:**  DFHSZRM(DFHSZZAG)

**XMEOUT Parameters:**  date, time, applid, X‘rr’, X‘ee’

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X‘01’</td>
<td>Insufficient storage for the request.</td>
</tr>
<tr>
<td>X‘02’</td>

All of these responses indicate that a system error occurred.

**System Action:**  An exception trace entry is generated.

FEPI tries to recover from this error by retrying the request. However, no action is taken to prevent multiple occurrences.

**User Response:**  If this message occurs frequently, you should take a dump of the CICS system before restarting it.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:**  Console and Transient Data Queue CSZL

**Module:**  DFHSZRM(DFHSZZRG)

**XMEOUT Parameters:**  date, time, applid, X‘rr’, X‘ee’

<table>

DFHSZ4109 I date time applid FEPI pool pppppppp discard scheduled, for transaction xxxx.

Explanation: The Front End Programming Interface (FEPI) has scheduled the discard operation for the named pool.

System Action: Processing continues. The pool is discarded when it becomes inactive.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZRID)

XMEOUT Parameters: date, time, applid, pppppppp, xxxx

---

DFHSZ4110 W date time applid FEPI pool pppppppp discard failed, code rrr, for transaction xxxx.

Explanation: The Front End Programming Interface (FEPI) cannot discard the named pool. The code indicates the reason, and is the RESP2 value returned by the EXEC CICS FEPI DISCARD POOL command.

System Action: Processing continues.

User Response: Investigate the failure, and correct it.

Destination: CSZL

Module: DFHSZRMP(DFHSZRID)

XMEOUT Parameters: date, time, applid, pppppppp, rrr, xxxx

---

DFHSZ4111 I date time applid FEPI target tttttttt installed, for transaction xxxx.

Explanation: The Front End Programming Interface (FEPI) has successfully installed the named target.

System Action: Processing continues.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZRII)

XMEOUT Parameters: date, time, applid, tttttttt, xxxx

---

DFHSZ4112 W date time applid FEPI target tttttttt installation failed, code rrr, for transaction xxxx.

Explanation: The Front End Programming Interface (FEPI) cannot install the named target. The code indicates the reason, and is the RESP2 value returned by the EXEC CICS FEPI INSTALL TARGET command.

System Action: Processing continues.

User Response: Investigate the failure, and correct it.

Destination: CSZL

Module: DFHSZRMP(DFHSZRII)

XMEOUT Parameters: date, time, applid, tttttttt, rrr, xxxx

---

DFHSZ4113 I date time applid FEPI target tttttttt discarded, for transaction xxxx.

Explanation: The Front End Programming Interface (FEPI) has successfully discarded the named target.

System Action: Processing continues.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZRDT)

XMEOUT Parameters: date, time, applid, tttttttt, xxxx

---

DFHSZ4114 I date time applid FEPI target tttttttt discard scheduled, for transaction xxxx.

Explanation: The Front End Programming Interface (FEPI) has scheduled the discard operation for the named target.

System Action: Processing continues. The target is discarded when it becomes inactive.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZRID)

XMEOUT Parameters: date, time, applid, tttttttt, xxxx

---

DFHSZ4115 W date time applid FEPI target tttttttt discard failed, code rrr, for transaction xxxx.

Explanation: The Front End Programming Interface (FEPI) cannot discard the named target. The code indicates the reason, and is the RESP2 value returned by the EXEC CICS FEPI DISCARD TARGET command.

System Action: Processing continues.

User Response: Investigate the failure, and correct it.

Destination: CSZL

Module: DFHSZRMP(DFHSZRID)

XMEOUT Parameters: date, time, applid, tttttttt, rrr, xxxx

---

DFHSZ4116 I date time applid FEPI property set yyyyyyyyyy installed, for transaction xxxx.

Explanation: The Front End Programming Interface (FEPI) has successfully installed the named property set.

System Action: Processing continues.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZRII)

XMEOUT Parameters: date, time, applid, yyyyyyyyyy, xxxx

---

DFHSZ4117 W date time applid FEPI property set yyyyyyyyyy installation failed, code rrr, for transaction xxxx.

Explanation: The Front End Programming Interface (FEPI) cannot install the named property set. The code indicates the reason, and is the RESP2 value returned by the EXEC CICS FEPI INSTALL PROPERTYSET command.

System Action: Processing continues.

User Response: Investigate the failure, and correct it.

Destination: CSZL

Module: DFHSZRMP(DFHSZRII)

XMEOUT Parameters: date, time, applid, yyyyyyyyyy, rrr, xxxx

---

DFHSZ4118 I date time applid FEPI property set yyyyyyyyyy discarded, for transaction xxxx.

Explanation: The Front End Programming Interface (FEPI) has successfully discarded the named property set.

System Action: Processing continues.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZRDT)

XMEOUT Parameters: date, time, applid, yyyyyyyyyy, xxxx
Chapter 1. DFH messages

DFHSZ4119 W date time applid FEPI property set yyyyyyyy
    Explanation: The Front End Programming Interface (FEPI) cannot
discard the named property set. The code indicates the
reason, and is the RESP2 value returned by the EXEC CICS FEPI
DISCARD PROPERTYSET command.
    System Action: Processing continues.
    User Response: Investigate the failure, and correct it.
    Destination: CSZL
    Module: DFHSZRMP(DFHSZRID)
    XMEOUT Parameters: date, time, applid, yyyyyyyy, rrr, xxxx

DFHSZ4120 I date time applid FEPI node nnnnnnnn added to pool
    Explanation: The Front End Programming Interface (FEPI) has
successfully added the named node to the named pool.
    System Action: Processing continues.
    User Response: None.
    Destination: CSZL
    Module: DFHSZRMP(DFHSZRII)
    XMEOUT Parameters: date, time, applid, nnnnnnnn, pppppppp, xxxx

DFHSZ4121 W date time applid FEPI node nnnnnnnn not added
to pool pppppppp, code rrr, for transaction xxxx.
    Explanation: The Front End Programming Interface (FEPI) cannot
add the named node to the named pool. The code indicates the
reason, and is the RESP2 value returned by the EXEC CICS FEPI
ADD POOL command.
    System Action: Processing continues.
    User Response: Investigate the failure, and correct it.
    Destination: CSZL
    Module: DFHSZRMP(DFHSZRII)
    XMEOUT Parameters: date, time, applid, nnnnnnnn, pppppppp, rrr, xxxx

DFHSZ4122 I date time applid FEPI node nnnnnnnn deleted from
    Explanation: The Front End Programming Interface (FEPI) has
successfully deleted the named node from the named pool.
    System Action: Processing continues.
    User Response: None.
    Destination: CSZL
    Module: DFHSZRMP(DFHSZRID)
    XMEOUT Parameters: date, time, applid, nnnnnnnn, pppppppp, xxxx

DFHSZ4123 W date time applid FEPI node nnnnnnnn not deleted
    Explanation: The Front End Programming Interface (FEPI) cannot
delete the named node from the named pool. The code indicates the
reason, and is the RESP2 value returned by the EXEC CICS FEPI
DELETE POOL command.
    System Action: Processing continues.
    User Response: Investigate the failure, and correct it.
    Destination: CSZL
    Module: DFHSZRMP(DFHSZRID)
    XMEOUT Parameters: date, time, applid, nnnnnnnn, pppppppp, rrr, xxxx

DFHSZ4124 I date time applid FEPI target ttttttt added to pool
    Explanation: The Front End Programming Interface (FEPI) has
successfully added the named target to the named pool.
    System Action: Processing continues.
    User Response: None.
    Destination: CSZL
    Module: DFHSZRMP(DFHSZRII)
    XMEOUT Parameters: date, time, applid, tttttttt, pppppppp, xxxx

DFHSZ4125 W date time applid FEPI target ttttttt not added to
    Explanation: The Front End Programming Interface (FEPI) cannot
add the named target to the named pool. The code indicates the
reason, and is the RESP2 value returned by the EXEC CICS FEPI
ADD POOL command.
    System Action: Processing continues.
    User Response: Investigate the failure, and correct it.
    Destination: CSZL
    Module: DFHSZRMP(DFHSZRII)
    XMEOUT Parameters: date, time, applid, tttttttt, pppppppp, rrr, xxxx

DFHSZ4126 I date time applid FEPI target ttttttt deleted from pool
    Explanation: The Front End Programming Interface (FEPI) has
successfully deleted the named target from the named pool.
    System Action: Processing continues.
    User Response: None.
    Destination: CSZL
    Module: DFHSZRMP(DFHSZRID)
    XMEOUT Parameters: date, time, applid, tttttttt, pppppppp, xxxx

DFHSZ4127 W date time applid FEPI target ttttttt not deleted
    Explanation: The Front End Programming Interface (FEPI) cannot
delete the named target from the named pool. The code indicates the
reason, and is the RESP2 value returned by the EXEC CICS FEPI
DELETE POOL command.
    System Action: Processing continues.
    User Response: Investigate the failure, and correct it.
DFHSZ4128  W

Destination:  CSZL
Module:  DFHSZRMP(DFHSZRID)
XMEOUT Parameters:  date, time, applid, pppppppp, rrr, xxxx

DFHSZ4128  W  date time applid FEPI delete from pool pppppppp failed, code rrr, for transaction xxxx.
Explanation:  The Front End Programming Interface (FEPI) cannot do a delete operation on the named pool.  The code indicates the reason, and is the RESP2 value returned by the EXEC CICS FEPI DELETE POOL command.
System Action:  Processing continues.
User Response:  Investigate the failure, and correct it.
Destination:  CSZL
Module:  DFHSZRMP(DFHSZRID)
XMEOUT Parameters:  date, time, applid, pppppppp, rrr, xxxx

DFHSZ4151  I  date time applid Unsolicited data received for FEPI pool pppppppp target tttttttt node nnnnnnnn.  Transaction xxxx started.
Explanation:  The Front End Programming Interface (FEPI) received some unsolicited data for the named pool-target-node connection, and started the named transaction to process this data.
System Action:  Processing continues.
User Response:  None.
Destination:  CSZL
Module:  DFHSZRMP(DFHSZBUN)
XMEOUT Parameters:  date, time, applid, pppppppp, tttttttt, nnnnnnnn, xxxx

DFHSZ4152  I  date time applid Begin-session processing required for FEPI pool pppppppp target tttttttt node nnnnnnnn.  Transaction xxxx started.
Explanation:  The Front End Programming Interface (FEPI) invoked begin-session processing for the named pool-target-node connection, by starting the named transaction.
System Action:  Processing continues.
User Response:  None.
Destination:  CSZL
Module:  DFHSZRMP(DFHSZBSI)
XMEOUT Parameters:  date, time, applid, pppppppp, tttttttt, nnnnnnnn, xxxx

DFHSZ4153  I  date time applid STSN processing required for FEPI pool pppppppp target tttttttt node nnnnnnnn.  Transaction xxxx started.
Explanation:  The Front End Programming Interface (FEPI) invoked STSN processing for the named pool-target-node connection, by starting the named transaction.
System Action:  Processing continues.
User Response:  None.
Destination:  CSZL
Module:  DFHSZRMP(DFHSZBST)
XMEOUT Parameters:  date, time, applid, pppppppp, tttttttt, nnnnnnnn, xxxx

DFHSZ4154  W  date time applid FEPI session setup in pool pppppppp to target tttttttt and node nnnnnnnn failed with a reason code of X’rrrrrrrr’.  Setup will be retried later.
Explanation:  The Front End Programming Interface (FEPI) has detected an error during session setup for the named pool-target-node connection.  Refer to VTAM Messages and Codes or to SNA Formats for a description of the reason code (error code or sense code) that describes this error.
System Action:  Processing continues; the session setup is tried again after a short interval, using a different node if one is available.
User Response:  None.
Destination:  CSZL
Module:  DFHSZRMP(DFHSZBLO)
XMEOUT Parameters:  date, time, applid, pppppppp, tttttttt, nnnnnnnn, X’rrrrrrrr’

DFHSZ4155  W  date time applid FEPI session in pool pppppppp to target tttttttt and node nnnnnnnn ended with a reason code of X’rrrrrrrr’.
Explanation:  The Front End Programming Interface (FEPI) has detected this VTAM event for the named pool-target-node connection.  Refer to VTAM Messages and Codes or to SNA Formats for a description of the reason code (error code or sense code) that describes this event.
System Action:  Processing continues.
User Response:  None.  This message can have a reason code of zero.  If a message with a reason code of zero is not wanted, we recommend the use of the XMEOUT global user exit to suppress it.
Destination:  CSZL
Module:  DFHSZRMP(DFHSZBLO)
XMEOUT Parameters:  date, time, applid, pppppppp, tttttttt, nnnnnnnn, X’rrrrrrrr’

DFHSZ4156  I  date time applid End-session processing required for FEPI pool pppppppp target tttttttt node nnnnnnnn.  Transaction xxxx started.
Explanation:  The Front End Programming Interface (FEPI) invoked end-session processing for the named pool-target-node connection, by starting the named transaction.
System Action:  Processing continues.
User Response:  None.
Destination:  CSZL
Module:  DFHSZRMP(DFHSZBFT)
XMEOUT Parameters:  date, time, applid, pppppppp, tttttttt, nnnnnnnn, xxxx

DFHSZ4157  W  date time applid FEPI session setup in pool pppppppp to target tttttttt and node nnnnnnnn failed with a reason code of X’rrrrrrrr’.  Setup will not be retried.
Explanation:  The Front End Programming Interface (FEPI) has detected an error during session setup for the named pool-target-node connection.  Refer to VTAM Messages and Codes or to SNA Formats for a description of the reason code (error code or sense code) that describes this error.  Setting up a session for this connection has failed several times.
**System Action:** Processing continues; the session setup for this connection is not tried again.

**User Response:** None; operator intervention may be needed to make the connection available.

**Destination:** CSZL

**Module:** DFHSZRM/(DFHSZBLO)

**XMEOUT Parameters:** date, time, applid, pppppppp, tttttttt, nnnnnnnnn, X"rrrrrrrr"

---

**DFHSZ4159**

Date time applid The VTAM OPEN request for FEPI node nnnnnnnnn failed with a reason code of X"rrrrrrrr". This operation will not be retried.

**Explanation:** The Front End Programming Interface (FEPI) has detected an error during VTAM OPEN processing for the named node.

The possible values of X"rrrrrrrr", the reason for failure, are:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>VTAM TPEND occurred with error code 0.</td>
</tr>
<tr>
<td>X'00000004'</td>
<td>VTAM TPEND occurred with error code 4.</td>
</tr>
<tr>
<td>X'00000008'</td>
<td>VTAM SETLOGON failed.</td>
</tr>
<tr>
<td>other values</td>
<td>VTAM OPEN failed with error code given.</td>
</tr>
</tbody>
</table>

Refer to VTAM Programming for a description of these error codes.

**System Action:** Processing continues; the VTAM OPEN for the node is repeated after a short interval.

**User Response:** None.

**Destination:** CSZL

**Module:** DFHSZRM/(DFHSZBLO)

**XMEOUT Parameters:** date, time, applid, nnnnnnnnn, X"rrrrrrrr"

---

**DFHSZ4195**

Date time applid The VTAM OPEN request for FEPI node nnnnnnnnn failed with a reason code of X"rrrrrrrr". This operation will not be retried.

**Explanation:** The Front End Programming Interface (FEPI) has detected an error during VTAM OPEN processing for the named node. The reason code is the error code returned by the VTAM OPEN operation. Refer to VTAM Programming for a description of these error codes.

**System Action:** Processing continues; the VTAM OPEN for the node is repeated after a short interval.

**User Response:** None.

**Destination:** CSZL

**Module:** DFHSZRM/(DFHSZBLO)

**XMEOUT Parameters:** date, time, applid, nnnnnnnnn, X"rrrrrrrr"

---

**DFHTCxxxx messages**

**DFHTC1001**

applid Terminal control initialization failed (modname).

**Explanation:** The CICS terminal control restart task could not complete because a necessary step failed. The task has done some essential recovery operations and has abnormally terminated itself with code ATC1.

**System Action:** CICS writes a transaction dump for the terminal control restart task. CICS sends two messages to the console, one to identify the error detected by the terminal control restart task, and one, DFHTC1001, to say that the task has failed. A third message follows, either to say that CICS has terminated abnormally with a dump or to ask you to reply GO or CANCEL. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** First, if CICS has requested a response, you must reply. If you reply 'GO', CICS continues processing, but without terminal control. If you reply 'CANCEL', CICS terminates abnormally with a dump. Use the messages and dumps to find out the cause of the failure. You need further assistance from IBM to...
DFHTC1002 applid Unable to link to program DFHTCRP.

Explanation: The CICS terminal control recovery program, DFHTCRP, is unavailable. CICS cannot find DFHTCRP in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System Action: CICS terminates abnormally with a dump.

User Response: To correct this error, place DFHTCRP in a partitioned data set in the DFHRPL DD statement.

Destination: Console
Module: DFHTCRP
XMEOUT Parameter: applid

DFHTC1004 applid Program DFHTORP cannot be found.

Explanation: The CICS terminal object resolution program, DFHTORP, is not available. CICS cannot find DFHTORP in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System Action: CICS terminates abnormally with a dump.

User Response: To correct this error, place DFHTORP in a partitioned data set in the DFHRPL DD statement.

Destination: Console
Module: DFHTORP
XMEOUT Parameter: applid

DFHTC1011 applid Unable to load xxxxxx During a CICS cold or initial start, CICS could not PC LOAD the CICS module, DFHxxxxxx, probably because it is missing from the library.

System Action: CICS initialization continues, but, even if it completes, VTAM resource initialization will be incorrect in some respect, depending on the function of module DFHxxxxxx.

User Response: If CICS completes initialization, processing of VTAM resources will be invalid. You should cancel CICS, make module DFHxxxxxx available and then restart CICS.

Destination: Console
Module: DFHTCRP
XMEOUT Parameters: applid, xxxxxx

DFHTC1012 applid Failure in installing VTAM resources

Explanation: During a cold or initial start, CICS could not install all the VTAM resources defined by TCT macros. CICS has issued other message(s) identifying which resources could not be installed.

System Action: CICS initialization continues.

User Response: If any of the uninstalled resources is essential, use RDO to make it available, or cancel CICS. The most likely reasons for this message are:

- The output of the DFHTCT assembly was corrupted, or
- A previous CICS message such as DFHTC1011, or
- CICS code contains a logic error.

If you suspect an error in CICS, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT
Module: DFHTCRP
XMEOUT Parameters: date, time, applid, resname, highname

DFHTC1013 applid Restore failed for xxxxxx

Explanation: During a warm or emergency restart, CICS could not restore the resource xxxxxx.

System Action: CICS continues initialization.

User Response: If resource xxxxxx is essential to your system, cancel CICS. This problem is probably caused by a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Module: DFHTCRP
XMEOUT Parameters: applid, xxxxxx

DFHTC1014 date time applid Communication resource definition for (resname) was not restored from the catalog because the resource definition for (highname) was not installed.

Explanation: During an emergency restart, CICS could not restore the resource resname from the catalog, because the definition for another resource highname that it depends on is not present. Usually resname is a session or modegroup and highname is a connection.

System Action: CICS continues restart, and deletes this resource from the CICS catalog. If the definition referred to was being installed when the previous CICS failed, both definitions are restored from the system log later in the restart.

User Response: If resource resname is essential to your system and is not restored later in initialization you can reinstall the resource having first installed the resource that it depends on. This message can be caused by:

- An install which was not complete when CICS failed, in which case it is forward recovered from the system log later, and no action is needed.
- A failure during warm shutdown in the previous run. In this case messages are produced for connections that were autoinstalled and were not uncataloged by the warm shutdown. In this case some auto-installed connections which would have been removed from the catalog if the warm shutdown had completed are recovered, but those which cause these messages are not.
- A corrupted CICS catalog. If large numbers of unrelated resources are missing, and the preceeding CICS run was not warm keypointing at the time of failure, the catalog may have been corrupted. CICS continues, but you may want to initial start in order to get your definitions to a known state.
- A CICS logic error. In this case you need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT
Module: DFHTCRP
XMEOUT Parameters: date, time, applid, resname, highname
DFHTC1015 applid TCT load module contains obsolete entries

**Explanation:** During CICS initialization, the TCT load module DFHTCxx (xx being the suffix) was found to contain entries not generated by the assembly macros for this release of CICS. This table cannot be used.

**System Action:** The bring-up is abandoned.

**User Response:** Either the incorrect TCT suffix was specified or implied, or the TCT has been assembled against the wrong level of CICS macros. Retry the bring-up, specifying a different suffix, or using a TCT assembled against the correct macros, as appropriate.

**Destination:** Console

**Module:** DFHAPSIP

**XMEOUT Parameter:** applid

---

DFHTC1022 applid Error for XRF tracking record - Type: type - Key: key

**Explanation:** An error during XRF tracking prevented a change to a resource from being tracked. The resource is of type type and is associated with key key.

**TCT CONTENTS**

**ZCP SESSIONS**

key is the location of an object in the TCTTE hierarchy.

**System Action:** The associated resource is in an incorrect state, missing, or not deleted at the end of takeover.

**User Response:** Decide whether the named resource is critical and see if you can resolve the problem.

**Destination:** Console

**Module:** DFHTCRP

**XMEOUT Parameters:** applid, type, key

---

DFHTC1023 applid Logic error in tracking condition

**Explanation:** During XRF tracking, a condition was detected which is not possible within the intended design. The insert indicates which of the checked conditions has been detected:

1. No broadcast message accepted outside tracking. The GETMSG routine in DFHTCRP should only accept broadcast messages and those whose id matches that in field GETMSPEC. This field should only be set during tracking.

2. Broadcast message with null key. A null-key record indicates that the catch-up stream that it arrives in is complete. This can only happen to the broadcast tracking stream if the active has just done a normal (warm) shut-down.

**System Action:** The message in question is ignored

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Module:** DFHTCRP

**XMEOUT Parameters:** applid, condition

---

DFHTC1024I applid XRF takeover while catching up.

**Explanation:** The alternate CICS that issued this message has only just started. Apparently the active CICS failed before the alternate could obtain all the information about TCT resources in the active. Please refer to messages DFHTC1034-DFHTC1036 for details of the types of information which may be missing or may be incomplete.

**System Action:** Takeover continues.

**User Response:** Watch for further messages.

**Destination:** Console

**Module:** DFHTCRP

**XMEOUT Parameter:** applid

---

DFHTC1034I applid TCT contents incomplete. Will read catalog.

**Explanation:** DFHTC1024 provides background information for this message. Apparently, the active CICS failed before the alternate CICS could obtain the definitions for all the trackable resources in the active’s TCT. Definitions may be missing at this point. However, the CICS catalog in the active may contain a more complete set of definitions in the restart data set. These will now be read as for a warm or emergency restart.

**System Action:** Takeover continues.

**User Response:** Look out for any errors while reading the CICS catalog.

**Destination:** Console

**Module:** DFHTCRP

**XMEOUT Parameter:** applid

---

DFHTC1035E applid Session states may be incorrect

**Explanation:** DFHTC1024 provides background information for this message. Apparently, the active CICS failed before the alternate CICS could obtain the session-state for all the trackable resources in the active’s TCT. States may be incorrect at this point.

**System Action:** Takeover continues.

**User Response:** Be prepared for some logical units (LUs) that were ACQUIRED in the old active not to be after the takeover.

**Destination:** Console

**Module:** DFHTCRP

**XMEOUT Parameter:** applid

---

DFHTC1036I applid Unimplemented tracking-type incomplete: xxxx

**Explanation:** DFHTC1024 provides background information for this message. Apparently, the active CICS failed before the alternate CICS had been sent all the information regarding a type of resource which has not been implemented. This does not have any serious consequences as the information would have been thrown away. However, it does indicate a level of incompatibility between the old active system and this system.

**System Action:** Takeover continues.

**User Response:** Decide whether the implied level incompatibility exists and is expected. DFHTCRP

**XMEOUT Parameters:** applid, xxxx
DFHTC1040I

applid nnnn Terminal control tracking records received.

Explanation: An alternate is standing by and has received nnnn terminal control tracking messages from the active.

System Action: Tracking continues.
User Response: None.
Destination: Console
Module: DFHTCRP
XMEOUT Parameters: applid, nnnn

DFHTC1041I applid Terminal control tracking started.

Explanation: An alternate is initializing, and is now about to start accepting messages from the active. Message DFHTC1044 should appear shortly.

System Action: Initialization continues.
User Response: None.
Destination: Console
Module: DFHTCRP
XMEOUT Parameter: applid

DFHTC1042I applid Waiting for terminal control tracking to drain.

Explanation: An alternate is taking over and is processing the remaining few tracking records from the active. This message is issued every 15 seconds while the takeover is held up for processing to complete. This is potentially an error, especially if it is repeated an unusual number of times. The likely causes include a delay in STANDBY BIND or UNBIND processing in VTAM, or a CICS logic error. The system issues this message twice and then flushes the outstanding tracking activity as described in message DFHTC1046.

User Response: Look for message DFHTC1046.
Destination: Console
Module: DFHZXQO
XMEOUT Parameter: applid

DFHTC1043I applid Terminal control tracking ended - nnn records received.

Explanation: An XRF alternate system is taking over. The last of the terminal control tracking records from the failing active system has been received and is being processed.

System Action: Takeover continues.
User Response: None.
Destination: Console
Module: DFHTCRP
XMEOUT Parameters: applid, nnn

DFHTC1044I applid Terminal control catch-up started.

Explanation: An XRF alternate system is preparing to standby and has received the first message from the active containing information about terminal control resources installed and/or bound before this alternate was started.

System Action: Initialization continues.
User Response: None.
Destination: Console
Module: DFHTCRP
XMEOUT Parameters: applid, key

DFHTC1045I applid Terminal control catch-up complete.

Explanation: An XRF alternate system is standing by, and has now received all the terminal control information it needs about terminal control resources installed and/or bound in the active before this alternate was started.

System Action: Normal tracking continues.
User Response: None.
Destination: Console
Module: DFHTCRP
XMEOUT Parameter: applid

DFHTC1046I applid Flushing terminal control tracking.

Explanation: An alternate is taking over and is processing the remaining few tracking records from the active. Message DFHTC1042 has been issued twice. DFHZXQO is now doing a controlled flush of the outstanding activity.

System Action: CICS posts one outstanding action every 2 seconds in an attempt to free the hold-up. A system dump is taken for the first action only.
User Response: This processing only occurs when an error or unforeseen circumstance arises. If the problem can be reproduced, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: Console
Module: DFHZXQO
XMEOUT Parameter: applid

DFHTC1047I applid Higher node missing. Record dropped for key

Explanation: An XRF alternate has received a tracking message from the active CICS, but either the associated system entry for this terminal is not present, or the ordering of terminal catalog records on the restart data set is incorrect (in that the terminal in error comes before the associated system entry).

key is the location of an object in the TCTTE hierarchy. This situation occurs if the active CICS was unable to send all of its tracking messages. This sometimes results in the system entry not being sent.

System Action: The tracking message is discarded and so the associated action (an INSTALL or LOGON) is not performed.
User Response: Ensure the CAVM message data set is large enough and restart the alternate. Check that the active CICS job is referring to the correct restart data set.
Destination: Console
Module: DFHTCRP
XMEOUT Parameters: applid, key
Chapter 1. DFH messages

DFHTC1060 applid Insufficient storage - code(X'code') in module DFHTCRP.

Explanation: A request for storage could not be satisfied in module DFHTCRP. The specific error is identified by the X'code' in the message. This implies that the dynamic storage area (DSA) size is too small. The X'code' identifies an exception trace record.

System Action: Terminal control initialization is terminated with a system dump and message DFHTC1001 is issued.

User Response: Since sufficient storage should be obtainable from within the minimum size DSA, this may imply a logic error within CICS. Try to increase the CDSASZE parameter in the system initialization table (SIT). You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Module: DFHTCRP
XMEOUT Parameters: applid, X'code'

DFHTC1575 applid No TCT entry for termid

Explanation: This message is issued when system initialization reads a warm start record for which there is no matching terminal control table (TCT) entry. termid is the TCT name that is missing.

System Action: The record is ignored.

User Response: If TCT termid is required, system initialization should be canceled. Ensure that a matching TCT entry for terminal termid exists and retry.

Destination: Console
Module: DFHTCRP
XMEOUT Parameters: applid, termid

DFHTC2500 date time applid (Line | CU | Terminal) out of service (Term | W/Term) termid

Explanation: This message indicates the OUT-OF-SERVICE conditions on completion of error processing in DFHTACP. It is possible that some of these conditions were true before the error was detected.

System Action: Other processing continues.

User Response: None.

Destination: CSMT
Module: DFHTACP
XMEOUT Parameters: date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans , 2=, dest }, tranid|destid|, rel line=, rr, time

DFHTC2501 Msg too long, please resubmit

Explanation: The terminal operator has keyed in more data than was expected for this READ.

System Action: The transaction in progress is terminated.

User Response: Reset the terminal and restart the transaction after the message TRANSACTION HAS BEEN ABENDED has been received.

Destination: Terminal End User
Module: DFHTACP

DFHTC2502 date time applid TCT search error (on line w/term | at term )termid|, trans |, dest |tranid|destid|, rel line=,rr, time

Explanation: An invalid terminal address was received on the line identified by terminal termid. This error can normally occur only on control unit devices such as a 2980 or a 3270. This is because CICS uses general polling and not all terminals on the control unit may be defined to CICS. All other conditions are undefined.

The optional part of the message "dest|destid" applies only to TCAM. The destination destid is given when it does not match any of the network names (netnames) specified on the TCTTE generation.

System Action: If the control unit is placed out of service or, if it is not a general polled device, the line is placed out of service.

User Response: Ensure that all terminals on the failing control unit are defined in the terminal control table (TCT).

Where applicable, ensure that the TCAM MCP terminal generation names match the CICS DFHTCT TYPE=TERMINAL NETNAME parameter.

Destination: CSMT
Module: DFHTACP
XMEOUT Parameters: date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans , 2=, dest }, tranid|destid|, {1=, rel line=}, rr, time

DFHTC2506 date time applid Output event rejected return code zz (on line w/term | at term )termid|, trans |, rel line=,rr, time

Explanation: An output operation was attempted but was halted by the I/O routines and resulted in the SAM return code zz. If an abnormal condition is detected after a READ or WRITE macro, the operation is not started, and control is returned to the user program at the instruction following the READ or WRITE macro.

System Action: The line is placed out of service.

User Response: Ensure that the system is dumped at shutdown time in order to document the failure. For an explanation of the SAM return codes, zz, refer to the OS/VS SAM manual, (GC27-6980).

Destination: CSMT
Module: DFHTACP
XMEOUT Parameters: date, time, applid, zz, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid|, {1=, rel line=}, rr, time

DFHTC2507 date time applid Input event rejected return code zz (on line w/term | at term )termid|, trans |, rel line=,rr, time

Explanation: An input operation was attempted but was halted by the I/O routines, and resulted in the SAM return code zz. If an abnormal condition is detected after a READ or WRITE macro instruction, the operation is not started, and control is returned to your program at the instruction following the READ or WRITE macro instruction.

System Action: The line is placed out of service.

User Response: Ensure the system is dumped at shutdown time in order to document the failure.

Destination: CSMT
Module: DFHTACP
DFHTC2511

XMEOUT Parameters: date, time, applid, zz, {1=on line w/term, 2=at term}, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time

DFHTC2511 date time applid Invalid write request {on line w/term | at term }termid, {trans |tranid}, rel line=rr, time

Explanation: This message is issued when one of the following has occurred:
1. A transaction has issued a write to its terminal facility that currently has a terminal status of input.
2. A transaction has issued a write to a 3735 during batch transmission prior to receipt of the end-of-file (EOF) condition.

System Action: The write request is not executed, and the transaction terminates abnormally. CICS processing continues.

User Response: The user response depends on the condition that has occurred. For condition
1. ensure that transactions do not issue write requests to terminals in input status.
2. ensure that the 3735 batch transaction does not issue its first write request before it has received the EOF condition.

Destination: CSTL

Module: DFHTACP

XMEOUT Parameters: date, time, applid, {1=on line w/term, 2=at term}, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time

DFHTC2513 date time applid Output length zero {on line w/term | at term }termid, {trans |tranid}, rel line=rr, time

Explanation: The data length in TIOATDL was not positive for a write operation.

System Action: The transaction is abnormally terminated.

User Response: Correct the zero or negative data length specification in the application program.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: date, time, applid, {1=on line w/term, 2=at term}, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time

DFHTC2514 date time applid No output area provided {on line w/term | at term }termid, {trans |tranid}, rel line=rr, time

Explanation: A write was requested on terminal termid by transaction tranid. However, the TCTTEDA field was not initialized.

System Action: The write request is not executed, and the transaction terminates abnormally. CICS processing continues.

User Response: Ensure that transaction tranid obtains the required storage and initializes the TCTTEDA field.

Destination: CSTL

Module: DFHTACP

XMEOUT Parameters: date, time, applid, {1=on line w/term, 2=at term}, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time

DFHTC2515 date time applid Output area exceeded {on line w/term | at term }termid, {trans |tranid}, rel line=rr, time

Explanation: One of the following has occurred:
- The terminal I/O area (TIOA) is not large enough to contain both the data and carrier control characters.
- The TIOA data length is greater than the TCM block size specified in the DFHTCT TYPE=SDSCI macro.
- The application requires a TIOA larger than 32767 bytes.

System Action: The write request is not executed, the terminal write storage is freed (if possible), and the transaction terminates abnormally. CICS processing continues.

User Response: Ensure that application programs do not set the value of TIOATDL greater than the TIOA GETMAIN size, and that the TIOA data length is not greater than the TCM blocksize. Also ensure that the application program does not require a TIOA larger than 32767 bytes.

Destination: CSTL

Module: DFHTACP

XMEOUT Parameters: date, time, applid, {1=on line w/term, 2=at term}, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time

DFHTC2516 date time applid Unit check SNS=ss {on line w/term | at term }termid, {trans |tranid}, rel line=rr, time

Explanation: A unit check error has occurred on the line defined by terminal termid. The sense (SNS=ss) is provided.

D/T 3275 dialed gives an automatic two-minute time out if there is no activity on the line.

System Action: The line is placed out of service on SAM lines.

Intervention on a switched line causes the task to be abnormally terminated and the line to be logically disconnected. Intervention on a non-switched line with a dummy (unidentified) terminal causes the line to be placed out of service. With a real terminal, intervention causes the terminal to be placed out of service and the transaction to be abnormally terminated.

A data check with a dummy terminal causes the line to be placed out of service. With a real terminal, it causes the terminal to be placed out of service and the transaction to be abnormally terminated.

Lost data on a READ,TEXT command causes a MESSAGE TOO LONG response to be sent to the terminal. The transaction is abnormally terminated.

Time-out on a READ,TEXT command causes a MESSAGE TOO LONG response to be sent to the terminal. Time-out with a dummy terminal causes the line to be placed out of service. With a real terminal, it causes the terminal to be placed out of service and the transaction to be abnormally terminated.

User Response: Examine the system console log message generated by SAM for this error and have the unit error corrected.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: date, time, applid, ss, {1=on line w/term, 2=at term}, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time
DFHTC2517 date time applid Unit check SNS=ss, S/N.O. [on line w/term | at term ]termid[, trans ]tranid[, rel line]=rr,time

Explanation: A unit check error has occurred on the line defined by terminal termid. SAM indicates this error as undefined - S/N.O (should not occur). The sense (SNS=ss) is provided.

System Action: The line is placed out of service on SAM lines. A data check with a dummy terminal causes the line to be placed out of service. With a real terminal, it causes the terminal to be placed out of service and the transaction to be abnormally terminated. A time-out on a READ,TEXT command causes a MESSAGE TOO LONG response to be sent to the terminal. Time-out with a dummy terminal causes the line to be placed out of service. With a real terminal, it causes the terminal to be placed out of service and the transaction to be abnormally terminated. A write is halted and the task is abnormally terminated. With a TPURGE(NO) was specified in the CSD definition for this task. The terminal is placed out of service. Real terminal, the terminal is placed out of service. No action is performed by CICS. Control is given to a user-written terminal error program, DFHTEP. Code DFHTEP as dictated by environmental needs.

User Response: Examine the system console log message generated by SAM for this error. Have the unit error corrected.

Destination: CSMT
Module: DFHTACP
XMEOUT Parameters: date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time

DFHTC2521 date time applid Undetermined unit error [on line w/term | at term ]termid[, trans ]tranid[, rel line]=rr,time

Explanation: An I/O error (that was not a unit check, a unit exception, or a negative response) occurred on the line defined by terminal termid.

System Action: The line associated with terminal termid is placed out of service.

User Response: Examine the system console log message generated by SAM for this error. Have the unit error corrected.

Destination: CSMT
Module: DFHTACP
XMEOUT Parameters: date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time

DFHTC2522 date time applid Intercept Required for terminal termid transaction tranid,time

Explanation: The task associated with terminal termid and transaction tranid was to have been abnormally terminated, but TPURGE(NO) was specified in the CSD definition for this task.

System Action: The terminal is placed out of service.

User Response: Use the master terminal facility to intercept or terminate the task.

Destination: CSMT
Module: DFHTACP
XMEOUT Parameters: date, time, applid, termid, tranid, time

DFHTC2529 date time applid Unsolicited input [on line w/term | at term ]termid[, trans ]tranid[, rel line]=rr,time

Explanation: Input has occurred on a control unit (general poll) for which terminal termid is out of service or has a task that has not issued a DFHTC TYPE=READ macro.

System Action: No action is performed by CICS. Control is given to a user-written terminal error program, DFHTEP.

User Response: Code DFHTEP as dictated by environmental needs.

Destination: CSMT
Module: DFHTACP
XMEOUT Parameters: date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time

DFHTC2534 date time applid Invalid destination at term termid, tranid,time

Explanation: An invalid destination was passed to TCAM from terminal termid.

System Action: The write is halted and the task is abnormally terminated with a dump.

User Response: Ensure that the destination is defined in the TCAM message control program (MCP).

Destination: CSMT
Module: DFHTACP

XMEOUT Parameters: date, time, applid, termid, tranid, time

DFHTC2536 date time applid Link to DFHTEP from DFHTACP failed because [module DFHTEP is not AMODE 31 | module DFHTEP could not be loaded | there is no PPT entry for program DFHTEP].

Explanation: While processing an error for a non-VTAM terminal, CICS attempted to link to user replaceable module DFHTEP. The link failed. One or more of the default actions described in message DFHTC2538 have been taken.

System Action: The default action(s) set by DFHTACP are taken.

User Response: Refer to message DFHTC2538 for an explanation of the default action(s) that have been taken.

Possible solutions are:
- Ensure that DFHTEP is linked with AMODE 31.
- Ensure that DFHTEP is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
- Ensure that the PPT entry for module DFHTEP exists and is valid.

Destination: CSMT
Module: DFHTACP

XMEOUT Parameters: date, time, applid, (1=module DFHTEP is not AMODE 31, 2=module DFHTEP could not be loaded, 3=there is no PPT entry for program DFHTEP)

DFHTC2537 date time applid Abend abcode has occurred in module DFHTEP.

Explanation: While processing an error for a non-VTAM terminal, user replaceable module DFHTEP was linked to and the program has abended with abend code abcode. One or more of the default actions described in message DFHTC2538 have been taken.

System Action: Control is passed back to the calling module DFHTACP. DFHTACP reinstates the default action(s) set before DFHTEP was called. The action(s) are then taken.

User Response: Refer to message DFHTC2538 for an explanation of the default action(s) that have been taken. Refer to abend code abcode for details of the original error. Follow the user response given in abend code abcode to solve the problem.

Destination: CSMT
Module: DFHTACP

XMEOUT Parameters: date, time, applid, abcode

DFHTC2538 date time applid Default actions actionshave been taken for message number relatedmessage.

Explanation: A problem has arisen during the processing of an error for a non-VTAM terminal and message msgno has been issued. The explanations for all possible default actions are as follows:

<table>
<thead>
<tr>
<th>Action</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>LINEOS</td>
<td>Place line out of service</td>
</tr>
<tr>
<td>NONPRGT</td>
<td>Non purgeable task</td>
</tr>
<tr>
<td>TERMOS</td>
<td>Place terminal out of service</td>
</tr>
<tr>
<td>ABENDT</td>
<td>Abend task on terminal</td>
</tr>
<tr>
<td>ABORTWR</td>
<td>Abort write and free terminal storage</td>
</tr>
</tbody>
</table>

DFHTC8510 date time applid SNA protocol violation detected in query response at termid termid.

Explanation: CICS has detected a violation of SNA protocols in a query response from device termid.

System Action: DFHQRY runs without effect.

User Response: Find out why an invalid query response is being sent to CICS.

Destination: CSMT
Module: DFHQRY

XMEOUT Parameters: date, time, applid, termid

DFHDxxxx messages

DFHTD0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a three-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; TS1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the OS/390 MVS System Codes manual. Then look up the CICS alphanumeric code. This tells you, for example, whether the error is a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.
Chapter 1. DFH messages

DFHTD0002 applid A severe error (code X'code') has occurred in module modname.

Explanation: An error has been detected in module modname. The code X'code' is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the CICS Problem Determination Guide.

System Action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0016 is normally produced containing the symptom string for this problem.

User Response: The severity of this error depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDA, DFHTDB, DFHTDRM, DFHTDOC

XMEOUT Parameters: applid, aaa/bbbb, X'offset', modname

DFHTD0010I applid Transient Data initialization has ended.

Explanation: This is an informational message indicating that transient data initialization has completed successfully.

System Action: System initialization continues.

User Response: None. The message can be suppressed with the system initialization parameter MSGLEVEL=0.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDRP, DFHTDRM

XMEOUT Parameter: applid

DFHTD0102I applid Transient Data initialization has failed.

Explanation: Transient data initialization has failed.

The SETXIT routine in DFHTDRP has been entered following abnormal termination of the transient data initialization task.

Alternatively an attempt to open the intrapartition data set failed.

System Action: Provided there are no subsequent serious errors which prevent further initialization of CICS, CICS issues one of two messages depending on what other errors, if any, have occurred during initialization.

If DFHS1521 is issued, CICS initialization is terminated. If DFHS1522 is issued, decide if CICS initialization is to be continued in degraded mode or to be terminated.

If, as part of a restart of CICS rather than during an initial start or a cold start, the intrapartition data set fails to open successfully when it was successfully opened on the previous CICS run, message DFHS1521 is issued and CICS is terminated.

User Response: Check previous console messages, one of which should explain why transient data initialization has failed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameter: applid

DFHTD0103I applid Transient Data initialization has been suspended pending takeover.

Explanation: This is an informational message indicating that transient data initialization has been suspended pending takeover. Some transient data initialization can be performed while CICS is operating in standby mode. However the remaining initialization can not be performed until takeover is complete because transient data sets, with the exception of the DFHCXRF data set, are assumed to be passively shared.

System Action: System initialization continues.

User Response: None. The message can be suppressed with the SIT parameter MSGLEVEL=0.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameter: applid
DFHTD0104I applid Transient Data initialization has been resumed following takeover.

**Explanation:** This is an informational message indicating that transient data initialization has been resumed following takeover.

**System Action:** System initialization continues.

**User Response:** None. This message can be suppressed with the system initialization parameter MSGlvl=0.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Module:** DFHTDRP

**XMEOUT Parameter:** applid

---

DFHTD0105I applid Transient Data intrapartition queues will be initialized empty as EMPTY was specified on the TDINTRA SIT parameter.

**Explanation:** This is an informational message indicating that transient data is being initialized with TDINTRA=EMPTY specified on the SIT. This has the effect of initializing all intrapartition TD queues in an empty state. The TDINTRA SIT parameter is ignored during a cold or initial start.

**System Action:** System initialization continues.

**User Response:** None. The message can be suppressed with the system initialization parameter MSGlvl=0.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Module:** DFHTDLP

**XMEOUT Parameter:** applid

---

DFHTD0170 applid The intrapartition data set has been corrupted.

**Explanation:** During a warm or emergency restart, CICS has found that the contents of the intrapartition data set are not consistent with that in the DCTEs. The intrapartition data set could have been corrupted.

**System Action:** CICS terminates after producing a dump and writing an exception trace.

A system dump with dumpcode TD0170 is taken unless you have specifically suppressed dumps in the dump table.

**User Response:** Reinitialize the intrapartition data set. Perform a cold start or an initial start of CICS.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Module:** DFHTDLP

**XMEOUT Parameter:** applid

---

DFHTD0180 applid Unexpected response (code X'response') and reason (code X'reason') from a dfhxxyym call.

**Explanation:** A transient data module cannot continue processing following the failure of a dfhxxyym call to domain xx.

The response (code X' response') and reason (code X' reason') are those returned from the domain call (that is, xxyy_response and xxyy_reason).

**System Action:** This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0180 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHTDA, DFHTDB, DFHTDOC, DFHTDRM

**XMEOUT Parameters:** applid, X'response', X'reason', dfhxxyym

---

DFHTD0182 applid Unexpected response (code X'response') and reason (code X'reason') from a dfhxxyym call.

**Explanation:** Module DFHTDRP cannot continue processing following the failure of a dfhxxyym call to domain xx.

The response (code X' response') and reason (code X' reason') are those returned from the domain call (that is, xxyy_response and xxyy_reason).

**System Action:** This is a critical error.

CICS writes a dump and terminates abnormally.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Module:** DFHTDLP

**XMEOUT Parameters:** applid, X'response', X'reason', dfhxxyym

---

DFHTD0183 applid Unexpected response (code X'response') and reason (code X'reason') from a dfhxxyym call during processing of intrapartition queue queue.

**Explanation:** The trigger level has been reached for intrapartition transient data queue queue.

Module DFHTDB or DFHTDRM could not initiate the associated transaction following the response of a dfhxxyym call to domain xx.

The response (code X' response') and reason (code X' reason') are those returned from the domain call (that is, xxyy_response and xxyy_reason).

Initiation of the associated transaction has failed.
System Action: This is probably a CICS logic error.

Each subsequent write to the transient data queue causes another attempt to initiate the transaction, which will fail. However, this message is only issued the first time the error is detected.

CICS writes a dump and continues processing. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: applid, X'response', X'reason', dfhxxyym, queue

---

**DFHTD0240** applid Queue queue (DD name ddname) is full.

**Explanation:** No more data can be written to extrapartition queue queue.

A system abend, MVS code X'37', has occurred during processing on the data set with ddname ddname.

**System Action:** If the system abend occurs during processing of an EXEC CICS WRITEQ TD command, the NOSPACE condition is returned.

If the system abend occurs during processing of an EXEC CICS SET TDQUEUE CLOSED command, the data set is not closed and the IOERR condition is returned.

Note that a second attempt to close the data set succeeds.

**User Response:** Consider allocating more space to the data set before you bring CICS up again.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHTDA, DFHTDOC

**XMEOUT Parameters:** applid, queue, ddname

---

**DFHTD0241** applid An I/O error has occurred during an output operation to an extrapartition dataset for queue queue. (DD name = ddname).

**Explanation:** An I/O error has occurred during the processing of an output operation to the extrapartition data set ddname on queue queue.

**System Action:** An IOERR condition is returned. Subsequent put requests are returned IOERR.

**User Response:** Close data set ddname via CEMT. If the I/O errors persist after a subsequent open, you probably need to reallocate this data set on a different volume.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHTDA, DFHTDOC

**XMEOUT Parameters:** applid, queue, ddname

---

**DFHTD0242** applid Abend abcode has been detected during processing for queue queue (DD name ddname).

**Explanation:** A system abend, MVS code abcode, has occurred during processing on the extrapartition queue queue (that is, the data set with ddname ddname).

**System Action:** A system dump with dumpcode TD0242 is taken unless you have specifically suppressed dumps in the dump table.

Since this may not be a critical error, CICS is not terminated, and the IOERR condition is returned.

**User Response:** Examine the CICS job log. QSAM issues a message explaining the reason for the system abend. See OS/390 MVS System Messages for a description of this message.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHTDA, DFHTDOC

**XMEOUT Parameters:** applid, abcode, queue, ddname

---

**DFHTD0243** applid An I/O error has occurred during an input operation to an extrapartition dataset for queue queue. (DD name = ddname).

**Explanation:** An I/O error has occurred during the processing of an input operation to the extrapartition data set ddname on queue queue.

**System Action:** An IOERR condition is returned. Subsequent put requests are returned IOERR.

**User Response:** Close data set ddname via CEMT. If the I/O errors persist after a subsequent open, you probably need to reallocate this data set on a different volume.

Check the definition of the extrapartition transient data queue. The specification of an invalid blocksize or recordsize may have caused the I/O error.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHTDA, DFHTDOC

**XMEOUT Parameters:** applid, queue, ddname
DFHTD0250
applid Dynamic allocation of queue queue failed.  
Return code $X'rrrr'$,$X'cccc'$ in module module.

Explanation: While dynamically allocating queue queue, CICS transient data issued an MVS DYNALLOC macro. The DYNALLOC failed with return code $cccc$. $rrrr$ is the additional return code in register 15.

System Action: CICS continues with queue queue closed.

User Response: For the meaning of the DYNALLOC return codes, see the OS/390 MVS Programming: Authorized Assembler Services Guide.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDOC

XMEOUT Parameters: applid, queue, module

DFHTD0251 applid Dynamic deallocation of queue queue failed.  
Return code - $X'rrrr'$,$X'cccc'$ in module module.

Explanation: While closing queue queue, CICS transient data issued the MVS macro, DYNALLOC, to dynamically deallocate the queue. Deallocating failed with the MVS return code, $cccc$. $rrrr$ is the return code in register 15.

System Action: CICS continues with the queue closed, but still allocated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If you change the DSNAME in the DCT, and then re-open the queue in the same CICS run, CICS may open the original data set. For an explanation of the MVS return code, see the OS/390 MVS Programming: Authorized Assembler Services Guide.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDOC

XMEOUT Parameters: applid, queue, module

DFHTD0252 applid Open of queue queue failed. DSNAME not available from JCL or DCTE. Module module.

Explanation: An attempt by CICS to open queue queue failed because neither the JCL nor the DCTE specified the data set name.

CICS transient data has not opened queue queue, for the following reasons:

- At initialization time, the startup JCL did not include a DD statement.
- No user-submitted routine allocated the queue dynamically.
- The DCTE does not contain a DSNAME parameter to enable CICS to allocate the file dynamically.

System Action: CICS continues processing with queue queue closed.

User Response: Before resubmitting the transaction, supply the data set name in the JCL or the DCTE. You can set the name in the DCTE while CICS is running by using CEDA to correct and reinstall the DCT entry.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDOC

XMEOUT Parameters: applid, queue, module

DFHTD0340 applid Transaction tranid initiated when the trigger level is reached for Transient Data queue queue is defined as REMOTE. The transaction initiation has failed.

Explanation: The trigger level has been reached for the transient data queue queue. The transaction associated with the queue is remote, which is invalid for trigger transactions. The initiation of the transaction has, therefore, failed.

System Action: Until the error is corrected, each subsequent write to the transient data queue causes another attempt to initiate the transaction, which fails. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User Response: Perform one of the following, as appropriate:

- If the transid in the DCT is incorrect:
  - Amend the DCT, replacing the transid for the queue with a transid that is local, and reassemble, or
  - Use EXEC CICS SET TDQUEUE(queue) ATITRANID(tranid) to replace the transid for the queue with a local transid. See the CICS System Programming Reference for more information.

- If the transaction definition is incorrect, amend the transaction definition using CEDA to make the transaction local.

- Use CEDA to alter the DCTE definition and reinstall.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDXM

XMEOUT Parameters: applid, tranid, queue

DFHTD0341 applid Transaction tranid associated with the trigger level for Transient Data queue queue has not been initiated.

Explanation: The trigger level has been reached for transient data queue queue. Initiation of the associated transaction has failed due to an error in system setup.

System Action: Until the error is corrected, each subsequent write to the transient data queue causes another unsuccessful attempt to initiate the transaction. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User Response: Check the definition for the queue in the DCT. The queue must have a transaction associated with it that exists, is defined as local, and is installed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: applid, tranid, queue
DFHTD0342  applid Transaction tranid associated with the trigger level for Transient Data queue queue has not been scheduled.

Explanation: The trigger level has been reached for the transient data queue queue. The schedule of the associated transaction has failed due to an error in system set up.

System Action: Until the error is corrected, each subsequent write to the transient data queue causes another attempt to schedule the transaction, which fails. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User Response: Check the following and amend if necessary:
- The queue must have a transaction associated with it that exists, is defined as local, and is installed. The transaction was local since the Remote attributes were not set in the transaction definition, yet the dynamic parm indicated that it could be remote.
- For DESTFAC (destination facility) of SYSTEM or TERMINAL, the named facility must exist, and any required system links must be installed and in service.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Modules: DFHTDB, DFHTDRM
XMEOUT Parameters: applid, tranid, queue

DFHTD0342  applid Transaction tranid associated with the trigger level for Transient Data queue queue has not been scheduled.

Explanation: The trigger level has been reached for the transient data queue queue. The schedule of the associated transaction has failed due to an error in system set up.

System Action: Until the error is corrected, each subsequent write to the transient data queue causes another attempt to schedule the transaction, which fails. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User Response: Check the following and amend if necessary:
- The queue must have a transaction associated with it that exists, is defined as local, and is installed. The transaction was local since the Remote attributes were not set in the transaction definition, yet the dynamic parm indicated that it could be remote.
- For DESTFAC (destination facility) of SYSTEM or TERMINAL, the named facility must exist, and any required system links must be installed and in service.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Modules: DFHTDB, DFHTDRM
XMEOUT Parameters: applid, tranid, queue

DFHTD0342  applid Transaction tranid associated with the trigger level for Transient Data queue queue has not been scheduled.

Explanation: The trigger level has been reached for the transient data queue queue. The schedule of the associated transaction has failed due to an error in system set up.

System Action: Until the error is corrected, each subsequent write to the transient data queue causes another attempt to schedule the transaction, which fails. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User Response: Check the following and amend if necessary:
- The queue must have a transaction associated with it that exists, is defined as local, and is installed. The transaction was local since the Remote attributes were not set in the transaction definition, yet the dynamic parm indicated that it could be remote.
- For DESTFAC (destination facility) of SYSTEM or TERMINAL, the named facility must exist, and any required system links must be installed and in service.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Modules: DFHTDB, DFHTDRM
XMEOUT Parameters: applid, tranid, queue

DFHTD0360  applid Logical I/O error occurred during a GET request to the intrapartition data set (DD name ddname); VSAM return codes are R15=X’retcode’, FDBK=X’fdbkcode’.

Explanation: An attempt to read a control interval from the intrapartition data set with ddname ddname has failed due to a logical I/O error. retcode is the return code in register 15 and fdbkcode is the value of the feedback field in the request parameter list (RPL).

System Action: This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. A system dump with dumpcode TD0360 is taken unless you have specifically suppressed dumps in the dump table.

User Response: Message DFHME0116 is normally produced containing the symptom string for this problem. For the meaning of the codes in the message, refer to the DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets.
You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Modules: DFHTDB, DFHTDRM
XMEOUT Parameters: applid, ddname, X’retcode’, X’fdbkcode’

DFHTD0361  applid Logical I/O error occurred during a PUT request to the intrapartition data set (DD name ddname); VSAM return codes are R15=X’retcode’, FDBK=X’fdbkcode’.

Explanation: An attempt to write or rewrite a control interval to the intrapartition data set with ddname ddname has failed due to a logical I/O error. retcode is the return code in register 15 and fdbkcode is the value of the feedback field in the request parameter list (RPL).

System Action: This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. A system dump with dumpcode TD0361 is taken unless you have specifically suppressed dumps in the dump table.

User Response: Message DFHME0116 is normally produced containing the symptom string for this problem. For the meaning of the codes in the message, refer to the DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets.
You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Modules: DFHTDB, DFHTDRM
XMEOUT Parameters: applid, ddname, X’retcode’, X’fdbkcode’
DFHTD0362 applid Physical I/O error occurred during a GET request to the intrapartition data set (DD name ddname); VSAM return codes are R15=X'retcode', FDBK=X'fdbkcode'.

Explanation: An attempt to read a control interval from the intrapartition data set with ddname ddname has failed due to a physical I/O error. retcode is the return code in register 15 and fdbkcode is the value of the feedback field in the request parameter list (RPL).

System Action: A system dump with dumpcode TD0362 is taken unless you have specifically suppressed dumps in the dump table. This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

User Response: For the meaning of the codes in the message, refer to the DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets.

A copy of the physical error message produced by VSAM appears in (one of) the transient data VSAM error message area(s) in the system dump.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: applid, ddname, X'retcode', X'fdbkcode'

DFHTD0363 applid Physical I/O error occurred during a PUT request to the intrapartition data set (DD name ddname); VSAM return codes are R15=X'retcode', FDBK=X'fdbkcode'.

Explanation: An attempt to write or rewrite a control interval to the intrapartition data set with ddname ddname has failed due to a physical I/O error. retcode is the return code in register 15 and fdbkcode is the value of the feedback field in the request parameter list (RPL).

System Action: A system dump with dumpcode TD0363 is taken unless you have specifically suppressed dumps in the dump table. This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

User Response: For the meaning of the codes in the message, refer to the DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets.

A copy of the physical error message produced by VSAM will appear in (one of) the transient data VSAM error message area(s) in the system dump.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: applid, ddname, X'retcode', X'fdbkcode'

DFHTD0380 applid Illegal attempt to read control interval 0 for the intrapartition data set (DD name ddname).

Explanation: Control interval 0 in the intrapartition data set is reserved for transient data control information. The remaining control intervals are allocated to hold data for queues as determined by transient data processing on behalf of application program requests.

An invalid attempt has been made to read control interval 0 for the intrapartition data set with ddname ddname.

System Action: This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0380 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Each intrapartition DCTE contains pointers which, if the queue is not empty, are relative byte addresses (RBAs) associated with the intrapartition data set with ddname.

Furthermore each allocated control interval, apart from the first, contains one or more user records as well as a queue control record. This latter record, the first in the control interval, contains the forward chain pointer or RBA for the next control interval containing data for the queue.

In each case, transient data assumes that RBAs address record boundaries within the intrapartition data set.

The assumption can be violated in several ways. The type of violation may be determined from:

- a control interval print of the intrapartition data set, or
- using Access Method Services, or
- using the system dump.

Violations include:

- THE WRONG INTRAPARTITION DATA SET WAS USED
  If the wrong data set has been used, that is, the data set used for this CICS start up was not used for the previous CICS start up, then it is highly probable that most of the RBAs in the DCTEs will not address record boundaries in the intrapartition data set.
  A cold start or an initial start of CICS must be carried out.

- THE INTRAPARTITION DATA SET WAS ALTERED
  If the records have been moved, possibly through data set compression, then it is highly probable that control interval 0 will contain more than one record and that most of the RBAs in the DCTEs will not address record boundaries in the intrapartition data set.
  A cold start or an initial start of CICS must be carried out.

- A DCTE WAS CORRUPTED
  If a DCTE has been corrupted, it is highly probable that just one or two RBAs will not address record boundaries in the intrapartition data set.
  A specialized trap may be required to identify the offending program.
  CICS may be restarted. An emergency restart for transient data will result in the RBAs being reconstructed from the system log and the intrapartition data set.
  If an activity keypoint was taken between the occurrence of the error and its detection, it may prove necessary for a cold start or an initial start of CICS to be carried out.

- AN I/O BUFFER WAS CORRUPTED
If an I/O buffer has been corrupted, it is highly probable one of the RBAs in the DCTE will not address record boundaries in the I/O buffer. A specialized trap may be required to identify the offending program.

CICS may be restarted. An emergency restart for transient data results in the RBAs being reconstructed from the system log and the intrapartition data set.

**Note:** If the contents of the I/O buffer were written to the intrapartition data set between the occurrence of the error and its detection, it may prove necessary to perform a cold start or an initial start of CICS.

- A CICS LOGIC ERROR OCCURRED You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**User Response:** Refer to message DFHTD0380.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHTDB, DFHTDRM

**XMEOUT Parameters:** applid, qqqq, ddname

---

**DFHTD0381** applid Invalid attempt to (re)write control interval 0 for the intrapartition data set (DD name ddname).

**Explanation:** Control interval 0 in the intrapartition data set is reserved for transient data control information; the remaining control intervals are allocated to hold data for queues as determined by transient data processing on behalf of application program requests.

An invalid attempt has been made to (re)write control interval 0 for the intrapartition data set with ddname ddname.

**System Action:** This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0381 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Refer to message DFHTD0380.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHTDB, DFHTDRM

**XMEOUT Parameters:** applid, qqqq, ddname

---

**DFHTD0382** applid The output pointer for queue qqqq does not match the contents of the intrapartition data set (DD name ddname).

**Explanation:** The output pointer for queue qqqq does not address a record boundary within the intrapartition data set with ddname ddname.

**System Action:** This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0382 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Refer to message DFHTD0380.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHTDRM, DFHTDB

**XMEOUT Parameters:** applid, qqqq, ddname

---

**DFHTD0383** applid The input pointer for queue qqqq does not match the contents of the intrapartition data set (DD name ddname).

**Explanation:** The input pointer for queue qqqq does not address a record boundary within the intrapartition data set with ddname ddname.

**System Action:** This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0383 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Refer to message DFHTD0380.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHTDB, DFHTDRM

**XMEOUT Parameters:** applid, qqqq, ddname

---

**DFHTD0384** applid A forward chain pointer for queue qqqq does not match the contents of the intrapartition data set (DD name ddname).

**Explanation:** A forward chain pointer for queue qqqq is invalid with respect to the intrapartition data set with ddname ddname.

**System Action:** This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0384 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Refer to message DFHTD0380.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHTDB, DFHTDRM

**XMEOUT Parameters:** applid, qqqq, ddname

---

**DFHTD0385** applid Invalid attempt to allocate/deallocate CI 0 for the intrapartition data set (DD name ddname).

**Explanation:** Control interval (CI) 0 in the intrapartition data set, ddname, is reserved for transient data control information. The remaining control intervals are allocated to hold data for queues as determined by transient data processing on behalf of application program requests.

**System Action:** System dump TD0385 is taken unless you have specifically suppressed dumps in the dump table.

This is a critical error. CICS is terminated even if you have specified in the dump table that CICS should not terminate.
DFHTD0401

User Response: Refer to the User Response of message DFHTD0380.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: applid, ddname

DFHTD0401  date time applid terminal userid tranid TDQUEUE entry for queue name has been deleted.

Explanation: This is an audit log message indicating that transient data queue entry tdqueuename has been deleted from the DCT using the DISCARD command. Where:

- terminal is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- userid is the user identifier of the user associated with the transaction issuing the message.
- tranid is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSQI

Module: DFHTDTM

XMEOUT Parameters: date, time, applid, terminal, userid, tranid, tdqueuename

DFHTD0402  date time applid terminal userid tranid TDQUEUE entry for tdqueuename has been added.

Explanation: This is an audit log message indicating that transient data queue entry tdqueuename has been added to the DCT using the INSTALL command. Where:

- terminal is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- userid is the user identifier of the user associated with the transaction issuing the message.
- tranid is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSQI

Module: DFHTDTM

XMEOUT Parameters: date, time, applid, terminal, userid, tranid, tdqueuename

DFHTD0403  date time applid terminal userid tranid TDQUEUE entry for tdqueuename has been replaced.

Explanation: This is an audit log message indicating that transient data queue entry tdqueuename has been replaced in the DCT using the INSTALL command. Where:

- terminal is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- userid is the user identifier of the user associated with the transaction issuing the message.
- tranid is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: applid, xxxx
DFHTD1212 applid Unrecognizable entry found in the DCT

Explanation: During initialization, CICS found an unrecognizable entry in the destination control table (DCT). This means that the loaded DCT is in error – either a DFHDCT macro was coded incorrectly, or the output of the macro assembly was corrupted.

System Action: CICS ignores the unrecognizable DCT entry and all subsequent DCT entries, and continues initialization.

User Response: Depending on how many DCT entries CICS has ignored, you may have almost all or very few transient data destinations available in the initialized run. You must decide whether or not to terminate CICS. To solve the problem permanently, remove or replace the invalid DCT entry.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Module: DFHTDRP
XMEOUT Parameters: applid, xxxx

DFHTD1217 applid Unable to install entry xxxx into the DCT.

Explanation: During a cold or initial start, CICS was unable to add a particular entry to the destination control table (DCT) for destination xxxx. The definition was provided in a DCT load module which was produced using the DFHDCT assembler macro.

System Action: CICS ignores the definition and continues initialization.

User Response: The cause of this install failure may be indicated in earlier messages issued from the transient data (TD) component. It may be the result of a failure to open the DFHINTRA data set, or a security error associated with any userid included in the definition. In the latter case, it is possible to create an RDO definition for the entry, with the correct userid, once CICS has initialized, and then to install it using the CEDA transaction.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Module: DFHTDRP
XMEOUT Parameters: applid, xxxx

DFHTD1221 applid DCT not restored, xxxx failed

Explanation: During a warm start, while carrying out operation xxxx (STARTBROWSE, GETNEXT or END BROWSE), the transient data recovery program (DFHTDRP) found an error in the destination control table (DCT) catalog.

The most likely reasons for this error are I/O errors in the catalog data set, or a logic error in the CICS module, DFHCCCC.

System Action: CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHS1522 is issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Respond GO or CANCEL to message DFHS1522.

Determine and correct the I/O errors on the catalog data set. If you cannot restore the catalog data set, or suspect that there might be a CICS logic error in DFHCCCC, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Module: DFHTDRP
XMEOUT Parameters: applid, xxxx

DFHTD1260 applid No DD statement for intrapartition data set ddname

Explanation: CICS is unable to open the intrapartition data set ddname because no DD statement has been provided.

System Action: During a cold or initial start, TD initialization continues until any DCT macro entries have been processed. Any intrapartition entries found are not installed and message DFHTD1217 is issued for each install failure encountered. At the end of TD initialization, message DFHTD102 is issued. If no other initialization errors occur, message DFHS1522 is issued.

For all other starts, TD checks the catalog to see if DFHINTRA had opened successfully on the previous CICS run. If it did, initialization is terminated. If it did not, TD initialization continues normally.

User Response: During a cold or initial start, respond GO or CANCEL to message DFHS1522.

Modify the CICS JCL to add a DD statement defining the intrapartition data set (DFHINTRA).

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Module: DFHTDRP
XMEOUT Parameters: applid, ddname

DFHTD1261 applid Intrapartition data set ddname not defined as VSAM ESDS

Explanation: CICS is unable to open the intrapartition data set ddname because it is not defined as VSAM ESDS.

System Action: During a cold or initial start, TD initialization continues until any DCT macro entries have been processed. Any intrapartition entries found are not installed and message DFHTD1217 is issued for each install failure encountered. At the end of TD initialization, message DFHTD102 is issued. If no other initialization errors occur, message DFHS1522 is issued.

For all other starts, TD checks the catalog to see if DFHINTRA had opened successfully on the previous CICS run. If it did, initialization is terminated. If it did not, TD initialization continues normally.

User Response: On a cold or initial start, respond GO or CANCEL to message DFHS1522.

Recreate the intrapartition data set as a VSAM ESDS and restart CICS.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Module: DFHTDRP
XMEOUT Parameters: applid, ddname
DFHTD1262

applid Intrapartition data set ddname not formatted

Explanation: The intrapartition data set ddname is not formatted (it is empty). Initial formatting is done (if necessary) when CICS is cold or initial started.

System Action: CICS continue to initialize until the destination control table has been completed. Any intrapartition definitions being read from the global catalogue will fail to install because of the original failure. When DFHTDRP completes its processing, CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

User Response: Respond GO or CANCEL to message DFHSI1522.

Performance a cold or initial start when CICS is next brought up.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: applid, ddname

DFHTD1263

applid Invalid control record for Intrapartition data set ddname

Explanation: The intrapartition data set ddname was not initialized for intrapartition transient data. The most likely reason for this is data corruption by:

- VSAM export and import
- DFHSM migration and recall.

System Action: CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

User Response: Respond GO or CANCEL to message DFHSI1522.

Reinitialize the intrapartition data set.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: applid, ddname

DFHTD1271

applid VSAM error processing SHOWCB for intrapartition data set ddname, R15=retcode

Explanation: VSAM has detected an error during SHOWCB processing for the intrapartition data set ddname with VSAM return code retcode.

System Action: CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Respond GO or CANCEL to message DFHSI1522.

Check the return code in the DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: applid, ddname, retcode

DFHTD1272

applid VSAM error processing OPEN for intrapartition data set ddname, R15=retcode, RC=errorcode

Explanation: VSAM has detected an error during OPEN processing for the intrapartition data set ddname. retcode is the VSAM return code and errorcode is the VSAM error code.

System Action: CICS writes a dump, then attempts to continue with initialization. If a cold or initial start is taking place, any entries found in a DCT load module are installed, except for any intrapartition entries. If any of these are found, message DFHTD1217 is issued for each install failure. When TDRP completes its processing message DFHTD0102 is issued followed by message DFHSI1522.

For all other types of start, if DFHINTRA had failed during the previous run of CICS, processing continues as normal. If DFHINTRA was open on the previous run, CICS terminates.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: On a cold or initial start, respond GO or CANCEL to message DFHSI1522.

Check the return code and error code in the DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: applid, ddname, retcode, errorcode

DFHTD1273

applid VSAM error processing CLOSE for intrapartition data set ddname, R15=retcode

Explanation: VSAM has detected an error during CLOSE processing for the intrapartition data set ddname. retcode is the VSAM return code.

System Action: CICS writes a dump, then attempts to continue with initialization. If a cold or initial start is taking place, any entries found in a DCT load module are installed, except for any intrapartition entries. If any of these are found, message DFHTD1217 is issued for each install failure. When TDRP completes its processing message DFHTD0102 is issued followed by message DFHSI1522.

For all other types of start, if DFHINTRA had failed during the previous run of CICS, processing continues as normal. If DFHINTRA was open on the previous run, CICS terminates.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: For a cold or initial start, respond GO or CANCEL to message DFHSI1522.

Check the return code in the DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: applid, ddname, retcode
DFHTD1274 applid VSAM error processing PUT for intrapartition data set ddname, R15=retcode, RC=errorcode

Explanation: VSAM has detected an error during PUT processing for the intrapartition data set ddname. retcode is the VSAM return code and errorcode is the VSAM error code.

System Action: CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Respond GO or CANCEL to message DFHSI1522.

Check the return code and error code in the DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Module: DFHTDTP
XMEOUT Parameters: applid, ddname, retcode, errorcode

DFHTD1275 applid VSAM error processing GET for intrapartition data set ddname, R15=retcode, RC=errorcode

Explanation: VSAM has detected an error during GET processing for the intrapartition data set ddname. retcode is the VSAM return code and errorcode is the VSAM error code.

System Action: CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Respond GO or CANCEL to message DFHSI1522.

Check the return code and error code in the DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Module: DFHTDTP
XMEOUT Parameters: applid, ddname, retcode, errorcode

DFHTD1278 applid An error occurred during initialization of intrapartition queue queueame for userid userid. The queue has not been added to the Destination Control Table.

Explanation: Transient data initialization detected an error with userid userid during installation of the intrapartition queue for automatic transaction initiation. The specified userid is not valid for use by this CICS job for non-terminal transactions initiated by the transient data trigger. There may be a previous message which gives the cause of this error.

System Action: Transient data initialization continues. The intrapartition queue definition is not added to the destination control table.

User Response: Notify the system programmer.

If the userid is invalid, correct the userid specified in the resource definition for the intrapartition queue.

If the userid is valid, ensure that it can be used by non-terminal transactions that are initiated by trigger for the intrapartition queue. See the CICS RACF Security Guide for guidance.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Module: DFHTDTP
XMEOUT Parameters: applid, queueame, userid

DFHTD1279 applid Unexpected response (code X'response') and reason (code X'reason') from a dfhxxyym call.

Explanation: Module DFHTDTP detected the failure of a dfhxxyym call to domain xx while attempting to install an intrapartition entry containing a userid.

The response (code X'response') and reason (code X'reason') are those returned from the domain call (that is, xxyy_response' and xxyy_reason').

This can be due to a CICS logic error.

System Action: If the error occurred during transient data initialization, this process will continue if possible. If processing cannot continue then a dump will be taken and an abend ATDY is issued.

User Response: Refer to earlier messages and the dump produced by domain xx.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Module: DFHTDTP
XMEOUT Parameters: applid, X'response', X'reason', dfhxxyym

If the user response is X'fail', the user needs further assistance from IBM.

DFHTD1280 applid An attempt to establish security has failed for userid userid. SAF codes are (X'safresp',X'safreason'), ESM codes are (X'esmresp',X'esmreason').

Explanation: An attempt was made to establish security for userid userid. The attempt was rejected by the external security manager (ESM).

System Action: Security has not been established for the userid.

User Response: The response and reason codes (safresp and safreason) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreason) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the OS/390 MVS Programming: Authorized Assembler Services Guide and in External Security Interface (RACROUTE) Macro Reference for MVS and VM (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console
Module: DFHTDTP
**DFHTFxxxx**

**XMEOUT Parameters:** applid, userid, 'X'safresp', 'X'safreas', 'X'safresp', 'X'safreas'

---

**DFHTFxxxx messages**

**DFHTF0001** applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

**Explanation:** An abnormal end (abend) or program check has occurred in module modname. This may indicate there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System Action:** An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error occurred in a crucial XM domain module. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHTFIQ, DFHZSUP, DFHTFRF, DFHTFAL

**XMEOUT Parameters:** applid, X'code', modname

---

**DFHTF0100** date time applid nnnn AIDs canceled for terminal termid, nnnn AIDs remain.

**Explanation:** AIDs queuing for terminal termid have been canceled. This could be due to the terminal being deleted, or as a result of an SPI or CEMT SET TERMINAL(termid) CANCEL command. Any AIDs remaining after this operation are also enumerated in this message. For programming information about CICS SET TERMINAL, see the CICS System Programming Reference. For information about the equivalent CEMT command, see the CICS Supplied Transactions.

**System Action:** Requests represented as AIDs queuing for the terminal have been purged from the system.

**User Response:** None.

**Destination:** CSMT

**Module:** DFHALP

**XMEOUT Parameters:** date, time, applid, nnnn, termid, nnnn

---

**DFHTF0002** applid A severe error (code X'code') has occurred in module modname.

**Explanation:** An error has been detected in module modname. The code X'code' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

**System Action:** An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error is critical.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHTFIQ, DFHZSUP, DFHTFRF, DFHTFAL

**XMEOUT Parameters:** applid, X'code', modname

---

**DFHTF0101** date time applid nnnn AIDs (canceled | force-canceled) for connection conname, nnnn AIDs remain.

**Explanation:** AIDs queuing for connection conname have been canceled or force-canceled. This could be due to connection reinstall, or as a result of a SPI or CEMT SET CONNECTION(conname) CANCEL or FORCECANCEL command. Any AIDs remaining after this operation are also enumerated in this message. See the CICS System Programming Reference for more information.

**System Action:** Requests represented as AIDs queuing for the connection will have been purged from the system.

**User Response:** None.

**Destination:** CSMT

**Module:** DFHALP

**XMEOUT Parameters:** date, time, applid, nnnn, conname, nnnn
Chapter 1. DFH messages

DFHTIxxxx messages

DFHTI0001  applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation:  An abnormal end (abend) or program check has occurred in module module. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumerical CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

Message DFHME0116 is normally produced containing the symptom string for this problem.

System Action:  An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example the domain manager, DFHDMDM). A message is issued to this effect.

User Response:  Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual. Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  Console

Modules:  DFHTISR, DFHTIDM

XMEOUT Parameters:  applid, aaa/bbbb, X'offset', modname

DFHTI0004  applid A possible loop has been detected at offset X'offset' in module modname.

Explanation:  A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time when the error was detected.

Message DFHME0116 is normally produced containing the symptom string for this problem.

System Action:  An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example the domain manager, DFHDMDM). A message is issued to this effect.

User Response:  If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  Console

Modules:  DFHTISR, DFHTIDM

XMEOUT Parameters:  applid, modname, X'code'

DFHTI0015  applid A hardware error has occurred (module modname, code X'code'). The Time-of-Day clock is invalid.

Explanation:  An error has occurred during the running of module modname. The MVS Store Clock facility is the timing mechanism for the operating system.

The code X'code' is the exception trace point id which uniquely identifies the place where the error was detected.

Message DFHME0116 is normally produced containing the symptom string for this problem.

System Action:  An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues if possible, unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example the domain manager, DFHDMDM). A message is issued to this effect.

User Response:  If CICS is still running, it is necessary to decide whether to terminate CICS. First, investigate the MVS Store Clock and find out whether it is working properly. If this is the case, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  Console

Modules:  DFHTISR, DFHTIDM

XMEOUT Parameters:  applid, modname, X'code'
DFHTMxxxx messages

DFHTM1703 applid product is being terminated by userid userid in transaction tranid{at netname | at terminal }terminal.
Explanation: This message is issued after a PERFORM SHUT IMMEDIATE request.
System Action: The termination process continues.
User Response: None.
Destination: Console and Terminal End User
Module: DFHSTP
XMEOUT Parameters: applid, product, userid, tranid, {1= at netname, 2= at terminal }, terminal

DFHTM1707I applid Program DFHWKP cannot be found. No warm keypoint taken.
Explanation: CICS cannot take a warm keypoint because the CICS module, DFHWKP, cannot be found in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.
System Action: CICS passes control to the user phase 1 PLT program.
User Response: None.
Destination: Console
Module: DFHSTP
XMEOUT Parameter: applid

DFHTM1709I applid About to link to PLT programs.
Explanation: DFHSTP is about to link to the user PLT program PLTSD parameter in the system initialization table.
System Action: Control is passed to the user PLT programs.
User Response: None.
Destination: Console
Module: DFHSTP
XMEOUT Parameter: applid

DFHTM1710I applid Control returned from PLT programs.
Explanation: Control is returned to DFHSTP to continue system termination.
System Action: Control is returned to DFHSTP.
User Response: None.
Destination: Console
Module: DFHSTP
XMEOUT Parameter: applid

DFHTM1711I applid About to link to phase 2 PLT programs.
Explanation: DFHSTP is about to link to the phase 2 PLT programs as defined by the PLTSD parameter in the system initialization table.
System Action: CICS passes control to the phase 2 user PLT programs.
User Response: None.
Destination: Console
Module: DFHSTP
XMEOUT Parameters: applid, programname

DFHTM1712I applid Control returned from phase 2 PLT programs.
Explanation: CICS returns control to DFHSTP so that system shutdown may continue.
System Action: CICS returns control to DFHSTP.
User Response: None.
Destination: Console
Module: DFHSTP
XMEOUT Parameter: applid

DFHTM1715 applid product is being quiesced by userid userid in transaction tranid{at netname | at terminal }terminal.
Explanation: This message is issued after a PERFORM SHUT request.
System Action: Quiesce of CICS continues.
User Response: None.
Destination: Console and Terminal End User
Module: DFHSTP
XMEOUT Parameters: applid, product, userid, tranid, {1= at netname, 2= at terminal }, terminal

DFHTM1752 applid PLT - program programname not available.
Explanation: The program list table (PLT) specified for shutdown contains program programname, but CICS is unable to link to the program because one of the following has occurred:
• An executable copy of the program could not be brought into storage.
• The installed definition for the program is disabled.
• There is no installed definition for the program.
System Action: CICS termination continues without executing program programname.
User Response: In the next execution, check that each program specified in the PLT is contained as a data set concatenated to the DFHRPL DD statement in the startup job stream, and ensure that the program is defined and enabled.
Destination: Console
Module: DFHSTP
XMEOUT Parameters: applid, programname

DFHTM1780 applid Abend has occurred while processing program programname during termination, code=abcode.
Explanation: Program programname specified in the program list table (PLT) for shutdown has abnormally terminated. abcode is the abend code.
System Action: Control is passed to the next program specified in the PLT and a CICS dump is supplied for review.
User Response: Refer to abend code abcode for further information about the error. Try and correct program programname.
Destination: Console
Module: DFHSTP
XMEOUT Parameters: applid, program, abcode
DFHTM1781 `applid` CICS shutdown cannot complete because some non-system user tasks have not terminated.

**Explanation:** This message is issued during shutdown of the CICS session and indicates that one or more CICS tasks are still active, thereby delaying the successful termination of CICS.

**System Action:** CICS shutdown waits until the active task or tasks are successfully terminated.

If the default shutdown transaction (CESD) is active, it attempts, after a delay, to purge and backout all active tasks. This usually leads to a successful termination of CICS within a few minutes without operator intervention.

**User Response:** If the default shutdown transaction (CESD) is not active, determine which CICS tasks are still running, using the CEMT INQUIRE TASK command, and take whatever steps are necessary to terminate them.

**Destination:** Console

**Module:** DFHSTP

**XMEOUT Parameter:** `applid`

---

DFHTM1782I `applid` All non-system tasks have been successfully terminated.

**Explanation:** This message is issued during shutdown of the CICS session after successful termination by the user of any active tasks which had previously prevented termination.

**System Action:** CICS shutdown continues normally.

**User Response:** None

**Destination:** Console

**Module:** DFHSTP

**XMEOUT Parameter:** `applid`

---

DFHTM1783 `applid` CICS shutdown cannot complete because a system task which prevents normal shutdown has not terminated.

**Explanation:** This message is issued during shutdown of the CICS session and indicates that CICS system transaction CLS1 is still active, thereby preventing the successful termination of CICS.

**System Action:** CICS shutdown waits until the active task is successfully terminated.

**User Response:** Determine what is delaying the CLS1 transaction (for example the other CICS job or system being hung), and take whatever steps are necessary to resolve the situation.

**Destination:** Console

**Module:** DFHSTP

**XMEOUT Parameter:** `applid`

---

DFHTM1784 `applid` The user shutdown assist transaction `tranid` cannot be started.

**Explanation:** This message is issued during CICS shutdown and indicates that the user shutdown assist transaction specified on the system initialization table (SIT), or on the CEMT or EXEC CICS PERFORM SHUTDOWN SDTRAN option could not be started.

**System Action:** CICS shutdown continues without starting a shutdown assist transaction.

**User Response:** Do one of the following:
- Determine why the shutdown transaction could not start.
- Change or remove the SIT SDTRAN option.
- Change or remove the CEMT or EXEC CICS PERFORM SHUTDOWN SDTRAN option.

**Destination:** Console and Terminal End User

**Module:** DFHSTP

**XMEOUT Parameters:** `applid, tranid`

---

DFHTM1785 `date time applid` The user shutdown assist transaction `tranid` cannot be started.

**Explanation:** This message is issued during CICS shutdown and indicates that the user shutdown assist transaction specified on the system initialization table (SIT), or on the CEMT or EXEC CICS PERFORM SHUTDOWN SDTRAN option could not be started.

**System Action:** A TRANIDERR is returned and CICS shutdown is not performed.

**User Response:** Do one of the following:
- Correct the shutdown transaction definition.
- Change or remove the SIT SDTRAN option.
- Change or remove the CEMT or EXEC CICS PERFORM SHUTDOWN SDTRAN option.

**Destination:** CSMT

**Module:** DFHEIPSH

**XMEOUT Parameters:** `date, time, applid, tranid`

---

DFHTM1787 `applid` System termination program has abended.

**Explanation:** While terminating CICS, the CICS system termination program DFHSTP has abnormally terminated.

**System Action:** CICS terminates abnormally with a system dump.

**User Response:** Try to find out why DFHSTP terminated. If you cannot resolve the problem, keep the dump and contact your IBM Support Center.

**Destination:** Console

**Module:** DFHSTP

**XMEOUT Parameter:** `applid`

---

DFHTM1798 `applid` Requested dump in progress.

**Explanation:** This message is issued when CICS is terminated before the requested dump has started.

**System Action:** CICS produces a system dump and shutdown continues.

**User Response:** None.

**Destination:** Console

**Module:** DFHSTP

**XMEOUT Parameter:** `applid`
DFHTOxxxx messages

DFHTO6000 E date time applid The definition for TERMINAL termdef refers to an undefined TYPETERM termtype.
Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a TERMINAL definition (termdef) that referenced a nonexistent TYPETERM definition (termtype).
System Action: The TERMINAL definition is not installed.
User Response: Correct the TERMINAL definition or define the named TYPETERM.
Destination: CSMT
Module: DFHTOR
XMEOUT Parameters: date, time, applid, termdef, termtype

DFHTO6001 E date time applid The definition for pooled TERMINAL termdef refers to an undefined TYPETERM termtype.
Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a TERMINAL definition (termdef) that referenced a nonexistent TYPETERM definition (termtype).
System Action: The TERMINAL definition is not installed.
User Response: Correct the TERMINAL definition or define the named TYPETERM.
Destination: CSMT
Module: DFHTOR
XMEOUT Parameters: date, time, applid, termdef, termtype

DFHTO6002 E date time applid The definition for SESSIONs sesdef refers to an undefined CONNECTION condef.
Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a SESSIONS definition (sesdef) that referenced a nonexistent CONNECTION definition (condef).
System Action: The SESSIONS definition is not installed.
User Response: Correct the SESSIONS definition or define the named CONNECTION.
Destination: CSMT
Module: DFHTOR
XMEOUT Parameters: date, time, applid, sesdef, condef

DFHTO6003 E date time applid TERMINAL termdef specifies CONSOLE or CONSNAMe but refers to TYPETERM termtype which does not specify DEVICE=CONSOLE.
Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a TERMINAL definition (termdef), specified with CONSOLE=nn or CONSNAMe=name, which referred to a TYPETERM definition (termtype) specified without DEVICE=CONSOLE.
System Action: The TERMINAL definition is not installed. (The TYPETERM definition is installed and may be referred to by other compatible TERMINAL definitions).
User Response: Correct the TERMINAL or TYPETERM definition.
Destination: CSMT
Module: DFHTOR
XMEOUT Parameters: date, time, applid, termdef, termtype

DFHTO6004 E date time applid TERMINAL termdef does not specify CONSOLE but refers to TYPETERM termtype which specifies DEVICE=CONSOLE.
Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a TERMINAL definition (termdef), specified with CONSOLE=NO, which referred to a TYPETERM definition (termtype) specified with DEVICE=CONSOLE.
System Action: The TERMINAL definition is not installed. (The TYPETERM definition is installed and may be referred to by other compatible TERMINAL definitions).
User Response: Correct the TERMINAL or TYPETERM definition.
Destination: CSMT
Module: DFHTOR
XMEOUT Parameters: date, time, applid, termdef, termtype

DFHTO6005 E date time applid PRINTER or ALTPRINTER for TERMINAL termdef is invalid for the DEVICE specified in TYPETERM termtype.
Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a TERMINAL definition (termdef) specified with PRINTER or ALTPRINTER or both, which referred to a TYPETERM definition (termtype) that did not specify one of these DEVICES: 3270, 3275, 3270P, LUTYPE2, or LUTYPE3.
System Action: The TERMINAL definition is not installed. (The TYPETERM definition is installed and may be referenced by other compatible TERMINAL definitions).
User Response: Correct the TERMINAL or TYPETERM definition.
Destination: CSMT
Module: DFHTOR
XMEOUT Parameters: date, time, applid, termdef, termtype

DFHTO6006 E date time applid PRINTCOPY or ALTPRINTCOPY for TERMINAL termdef is invalid for the DEVICE specified in TYPETERM termtype.
Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected incompatible TERMINAL and TYPETERM definitions. The TERMINAL definition termdef specified PRINTCOPY or ALTPRINTCOPY or both, but referred to a TYPETERM definition termtype which specified an LUTYPE2 or LUTYPE3 device.
System Action: The TERMINAL definition is not installed. (The TYPETERM definition is installed and may be referenced by other compatible TERMINAL definitions).
DFHTO6007  E  date  time  applid  AUTINSTMODEL  YES|ONLY  for  TERMINAL  termdef  is  invalid  for  the  DEVICE  specified  in  TYPETERM  termtype.

Explanation:  While  installing  a  GRPLIST  during  initialization,  or  while  executing  a  CEDA  CHECK,  a  CEDA  INSTALL,  or  an  EXEC  CICS  CREATE  command,  CICS  detected  a  TERMINAL  definition  (termdef)  specified  with  AUTINSTMODEL=[YES|ONLY],  which  referred  to  a  TYPETERM  definition  (termtype)  that  specified  DEVICE=3614|TLX|TWX,  or  was  a  PIPELINE  terminal.

System  Action:  The  TERMINAL  definition  is  not  installed.  (The  TYPETERM  definition  is  installed  and  may  be  referenced  by  other  compatible  TERMINAL  definitions).

User  Response:  Correct  the  TERMINAL  or  TYPETERM  definition.

Destination:  CSMT
Module:  DFHTOR
XMEOUT  Parameters:  date,  time,  applid,  termdef,  termtype

DFHTO6009  E  date  time  applid  The  definition  for  SESSIONs  sesdef  refers  to  CONNECTION  condef  which  specifies  a  different  PROTOCOL.

Explanation:  While  installing  a  GRPLIST  during  initialization,  or  while  executing  a  CEDA  CHECK,  a  CEDA  INSTALL,  or  an  EXEC  CICS  CREATE  command,  CICS  detected  a  SESSIONS  definition  (sesdef)  that  referred  to  a  CONNECTION  definition  (condef)  that  specified  a  different  PROTOCOL.

System  Action:  The  SESSIONS  definition  is  not  installed.

User  Response:  Correct  the  SESSIONS  or  CONNECTION  definition.

Destination:  CSMT
Module:  DFHTOR
XMEOUT  Parameters:  date,  time,  applid,  sesdef,  condef

DFHTO6010  E  date  time  applid  The  definition  for  SESSIONs  sesdef  must  specify  PROTOCOL  LU61  as  it  refers  to  an  MRO  CONNECTION  condef.

Explanation:  While  installing  a  GRPLIST  during  initialization,  or  while  executing  a  CEDA  CHECK,  a  CEDA  INSTALL,  or  an  EXEC  CICS  CREATE  command,  CICS  detected  a  SESSIONS  definition  (sesdef),  specified  without  LU61,  which  referred  to  a  CONNECTION  definition  (condef)  that  specified  ACCESSMETHOD=[IRC|XM]  (MRO).

System  Action:  The  CONNECTION  is  not  installed.

User  Response:  Correct  the  SESSIONS  or  CONNECTION  definition.

Destination:  CSMT
Module:  DFHTOR
XMEOUT  Parameters:  date,  time,  applid,  sesdef,  condef

DFHTO6011  E  date  time  applid  SESSIONs  sesdef  must  specify  both  SENDCOUNT  and  RECEIVECOUNT  as  it  refers  to  an  MRO  CONNECTION  condef.

Explanation:  While  installing  a  GRPLIST  during  initialization,  or  while  executing  a  CEDA  CHECK,  a  CEDA  INSTALL,  or  an  EXEC  CICS  CREATE  command,  CICS  detected  a  SESSIONS  definition  (sesdef),  specified  with  either  SENDCOUNT=0  or  RECEIVECOUNT=0,  which  referred  to  a  CONNECTION  definition  (condef)  that  specified  ACCESSMETHOD=[IRC|XM]  (MRO).

System  Action:  The  SESSIONS  definition  is  not  installed.

User  Response:  Correct  the  SESSIONS  or  CONNECTION  definition.

Destination:  CSMT
Module:  DFHTOR
XMEOUT  Parameters:  date,  time,  applid,  sesdef,  condef

DFHTO6012  date  time  applid  The  catalog  dataset  is  not  available.  RDO  function  is  restricted.

Explanation:  During  initialization  for  a  cold  or  initial  start,  CICS  could  not  find  the  global  catalog  data  set.

System  Action:  CICS  continues,  but  with  the  following  restrictions  to  RDO  function:

- A  TYPETERM  definition  must  be  in  the  same  group  as  the  TERMINAL  definitions  that  refer  to  it.
- AUTOINSTALL  is  not  available,  because  the  MODEL  definitions  cannot  be  stored.

User  Response:  If  you  wish  to  avoid  the  above  restrictions  to  RDO  function  in  future  CICS  runs,  create  a  global  catalog  data  set  and  make  it  available  to  CICS  in  the  DFHGCD  DD  statement  of  the  CICS  startup  job  stream.

Destination:  CSMT
Module:  DFHTORP
XMEOUT  Parameters:  date,  time,  applid

DFHTO6013  E  date  time  applid  No  SESSIONs  definition  refers  to  CONNECTION  condef.

Explanation:  During  installation  of  a  GRPLIST  at  initialization  time,  during  CEDA  INSTALL  of  a  GROUP,  a  CHECK,  or  an  EXEC  CICS  CREATE  command,  a  CONNECTION  definition  was  detected  that  had  no  valid  SESSIONS  definitions.  This  is  valid  only  for  INDIRECT  or  REMOTE  connections.

System  Action:  The  CONNECTION  is  not  installed.

If  the  reason  for  the  failure  is  one  or  more  invalid  SESSIONS  definitions,  CICS  issues  another  message  which  identifies  the  incorrect  definition(s).  If  the  reason  was  a  missing  SESSIONS  definition,  this  is  the  only  message.

User  Response:  Correct  the  CONNECTION  definition,  create  a  SESSIONS  definition,  or  correct  existing  SESSIONS  definition(s),  as  appropriate.

Destination:  CSMT
Module:  DFHTOR
XMEOUT  Parameters:  date,  time,  applid,  condef
DFHTO6014 E date time applid POOL is required for TERMINAL termid as it refers to TYPETERM typedef which specifies SESSIONTYPE=PIPELINE.

Explanation: An attempt has been made to install a terminal whose TYPETERM specified SESSIONTYPE=PIPELINE, but whose terminal definition did not specify POOL.

System Action: CICS initialization continues, but TERMINAL termdef is not installed.

User Response: Correct the TERMINAL definition, or the TYPETERM definition.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: date, time, applid, termid, typedef

DFHTO6015 E date time applid TRANSACTION for TERMINAL termid is invalid for the DEVICE specified in TYPETERM typedef.

Explanation: An attempt has been made to install a TERMINAL definition which specified TRANSACTION, but referred to a TYPETERM specifying device APPC.

System Action: CICS initialization continues, but TERMINAL termdef is not installed.

User Response: Correct the TERMINAL definition, or the TYPETERM definition.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: date, time, applid, termid, typedef

DFHTO6016 E date time applid The MRO CONNECTION condef is referenced by more than one SESSIONS definition, including sesdef.

Explanation: When installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS has detected a CONNECTION definition condef that specified ACCESSMETHOD=(IRC|XM), which implies that it is an MRO connection. This CONNECTION was then referenced by more than one SESSIONS definition, one of which was sesdef. An MRO connection must only have one SESSIONS definition referencing it. Other SESSIONS definition names that reference this CONNECTION are listed in further occurrences of this message.

System Action: The CONNECTION definition is not installed.

User Response: Correct the CONNECTION definition or the SESSIONS definitions.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: date, time, applid, condef, sesdef

DFHTO6017 E date time applid REMOTESYSTEM for TERMINAL termid is invalid for the DEVICE specified in TYPETERM typedef.

Explanation: When installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a CONSOLE that was defined as remote. This is an invalid option.

System Action: The CONSOLE is not installed.

User Response: Correct the CONSOLE that is defined as remote.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: date, time, applid, termid, typedef

DFHTO6018 E date time applid TERMINAL 'termid' refers to TYPETERM 'typedef' which has an invalid ALTSCREEN.

Explanation: A TYPETERM definition includes an invalid ALTSCREEN. ALTSCREEN has two components: width and height. One of these components is zero while the other is nonzero. This is an invalid combination. CICS has detected this problem in a TERMINAL definition while installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command.

System Action: The TERMINAL definition is not installed.

User Response: Correct the TYPETERM that is referenced or reference a different TYPETERM in the TERMINAL definition. See the CICS Resource Definition Guide for details of valid ALTSCREEN values.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: date, time, applid, termid, typedef

DFHTO6019 E date time applid User userid is not authorized to install TERMINAL tttt with preset security.

Explanation: User userid was attempting to install TERMINAL tttt but the userid does not have sufficient authority. This is because the TERMINAL has preset security (the definition for TERMINAL tttt specifies a USERID value). Installing a resource with preset security requires special authorization.

System Action: Resource security violation messages are logged to the CSCS transient data queue and to the system console. The resource is not installed. CICS continues.

User Response: In order to install this resource, do one of the following:

- Use the CESN transaction to sign on with a userid that is permitted to install TERMINALs with preset security.
- Ask your security administrator to authorize user userid to install terminals with preset security.
- Remove the USERID specification from the resource definition and install the resource without preset security.

Destination: CSMT

Module: DFHTOATM

XMEOUT Parameters: date, time, applid, userid, tttt

DFHTO6020 E date time applid SESSIONS sesdef refers to single-session CONNECTION condef but has an invalid MAXIMUM option specified.

Explanation: The value specified for the MAXIMUM option in the SESSIONS definition sesdef is incompatible with the CONNECTION definition condef because condef is defined as single-session. This was detected when sesdef referred to condef during installation of a GRPLIST at initialization, during CEDA INSTALL of a GROUP, or following a CHECK command, or during an EXEC CICS CREATE.
When a SESSION definition refers to a single-session CONNECTION definition, the value of the MAXIMUM option should be (1,0).

**System Action:** The SESSIONS definition is not installed.

**User Response:** There are two ways to solve this problem:
- Correct the SESSIONS definition by specifying MAXIMUM(1,0) using either CEDA or the CSD batch update utility DFHCSDUP.
- Redefine the CONNECTION definition so that it is no longer single-session by specifying SINGLESESS=NO.

**Destination:** CSMT

**Module:** DFHTOR

**XMEOUT Parameters:** date, time, applid, sesdef, condef

---

**DFHTO6023 E date time applid Connection definition @BCH detected. Batch shared database connections are not supported.**

**Explanation:** While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a CONNECTION definition named @BCH. In previous releases this connection definition was reserved for use with batch shared database support, and allowed zero send sessions to be defined for an IRC connection. CICS Transaction Server for OS/390 Release 3 does not support batch shared database and does not allow the associated sessions definition to specify zero send sessions.

**System Action:** Installation of @BCH sessions fails.

**User Response:** Remove the SESSIONS and CONNECTION definitions for batch shared database.

**Destination:** CSMT

**Module:** DFHTOR

**XMEOUT Parameters:** date, time, applid

---

**DFHTPxxxx messages**

**DFHTP4101 Cannot reset from temporary paging to autopaging.**

**Explanation:** A terminal requested that it be reset from temporary paging status to autopaging status. However, the terminal is defined as a paging terminal, or the message is marked to state that the operator must purge it.

**System Action:** Other processing continues.

**User Response:** If the terminal is defined as a purging terminal, use the master terminal program to change the status of the terminal.

If the message is so marked, the operator must purge the message. The system then automatically resets the status to autopaging.

**Destination:** Terminal End User

**Module:** DFHTPR

**DFHTP4102 nnnn messages are queued for immediate delivery.**

**Explanation:** The operator requested the nnnn messages to be delivered via the page retrieve command queue.

**System Action:** The count of messages queued for this operator or terminal is displayed.

**User Response:** None.

**Destination:** Terminal End User

**Module:** DFHTPR

---

**DFHTP4103 Attempting to PURGE, COPY or CHAIN, but no pages are currently connected to this terminal.**

**Explanation:** There are currently no tasks attached to this terminal.

**System Action:** Other processing continues.

**User Response:** None.

**Destination:** Terminal End User

**Module:** DFHTPR
DFHTP4104 A paging request was received but there are no pages for display.

Explanation: The CICS paging command (CSPG) or a request for paging was entered from a terminal in transaction status, but there are no pages to be displayed at the terminal.

System Action: Other processing continues.
User Response: None.
Destination: Terminal End User
Module: DFHTPR

DFHTP4105 The specified message is not recognized.

Explanation: The terminal operator tried to retrieve or purge a specific message using a message identifier (rather than the current or next available message). However, the specified message does not exist, or is not destined for this terminal.

System Action: Other processing continues.
User Response: None.
Destination: Terminal End User
Module: DFHTPR

DFHTP4106 You are not allowed to RETRIEVE or PURGE this message.

Explanation: The terminal operator tried to retrieve or purge a specific message using a message identifier (rather than the current or next available message). However, the specified message is not destined for this operator identifier.

System Action: Other processing continues.
User Response: None.
Destination: Terminal End User
Module: DFHTPR

DFHTP4107 Chain value chain is less than 1 or greater than the level of chaining allowed.

Explanation: The chain value, chain, as indicated by the page retrieval command, is either less than one or is greater than the level of chaining at that terminal.

System Action: Other processing continues.
User Response: None.
Destination: Terminal End User
Module: DFHTPR

DFHTP4108 Requested page pageno does not exist (it is less than 1 or more than the number of pages in the message).

Explanation: The page pageno, as indicated by the page retrieval command, is either less than one or is greater than the number of pages in the message. This can be caused, for example, by requesting the previous page after the first page, or the next page after the last page.

System Action: Other processing continues.
User Response: The paging session can be continued with a valid page value. The last valid page displayed is still the current page. For example, to recall the last valid page displayed, execute the page retrieval command used to get a current page.
Destination: Terminal End User
Module: DFHTPR

DFHTP4109 The requested command command was not recognized. Check that you have the correct value.

Explanation: Transaction CSPG was entered at the terminal, but what follows cannot be identified as a paging command. command represents the first four nonblank characters after CSPG.

System Action: Other processing continues.
User Response: None.
Destination: Terminal End User
Module: DFHTPR

DFHTP4110 function is not valid. Page RETRIEVE function must be A, C, L, N, P, Q, or a number.

Explanation: The page retrieve function represented by function is not one of the following: A, C, L, N, P, Q, or a number that may be preceded by a + (plus) or a – (minus) sign, where:

Function | Meaning
--- | ---
A | All logical messages destined for and being displayed on that terminal.
C | The current (level) logical message.
L | The last page.
N | The next page.
P | The previous page.
Q | (Query) display the identifier of all logical messages destined for this terminal. If the message is security protected, its identifier is displayed only if the operator identifier and class for the signed-on operator match those in the message. The identifier consists of 1-to-6-digit hexadecimal number, and optionally, a message title.

System Action: Other processing continues.
User Response: Use a valid page retrieve function.
Destination: Terminal End User
Module: DFHTPR

DFHTP4111 function is not valid. Page PURGE function must be A, B, C, H, or R.

Explanation: The page purge function represented by function is not A, B, C, H, or R. The functions have the following meanings.

Function | Meaning
--- | ---
A | All logical messages destined for and being displayed on that terminal.
B | The logical message being displayed on that terminal and all logical messages chained to it.
C | The current (level) logical message.
H | All logical messages chained to the base logical message being displayed on that terminal.
R | All logical messages queued for immediate delivery (routed) to the terminal.

System Action: Other processing continues.
User Response: Use a valid page purge function.
Destination: Terminal End User
Module: DFHTPR
The terminal identifier termid is unknown or is not supported.

Explanation: The terminal identifier represented by termid does not exist or is not supported under basic mapping support (BMS).

System Action: Other processing continues.

User Response: Use a valid terminal identifier.

Destination: Terminal End User

Module: DFHTP

Date time applid msgno termtype pageno I/O error on MCR or Page (MODULE NAME: modname).

Explanation: While attempting to retrieve a message control record (MCR) or page of a message, a temporary storage I/O error occurred. msgno represents the message number in hexadecimal; termtype is the terminal type; pageno is zero if the error occurred for the MCR, or is the page number. The message or page noted may be lost for this and/or other terminals.

System Action: If pages are being displayed at an autopaging terminal, the next page if any is displayed. Otherwise no action takes place.

User Response: None.

Destination: CSMT

Module: DFHTP

XMEOUT Parameters: date, time, applid, msgno, termtype, pageno, modname

You must purge messages from the terminal before issuing a new transaction.

Explanation: While messages were being displayed at the terminal, the operator entered data that was not a paging command, either in error or to initiate a new transaction. However, at least one of the messages on the terminal is marked that the operator must specifically purge it before initiating a new transaction.

System Action: Other processing continues.

User Response: Purge all messages being displayed at this terminal (T/A), or chain the desired transaction using the chaining command.

Destination: Terminal End User

Module: DFHTP

You must purge the message from your terminal to continue.

Explanation: A transaction is displaying pages at the terminal. Before the operator can continue with the transaction, the message must be purged.

System Action: Other processing continues.

User Response: Purge the current message (T/C).

Destination: Terminal End User

Module: DFHTP

Your message request cannot be done while another message is being displayed.

Explanation: While viewing a message, the operator entered a request for a specific message (for example, P/1.xxx) or requested the message identifiers of messages waiting to be displayed (P/Q). CICS cannot service this request while another message is being displayed. xxx is the message identifier of one of the messages waiting to be displayed.

System Action: Other processing continues.

User Response: If desired, reenter the request when there are no messages being displayed at the terminal.

Destination: Terminal End User

Module: DFHTP

Purge display % after viewing.

Explanation: The operator at a 3270 has requested a display of message identifiers waiting to be displayed. The reply is constructed as one or more pages stored in temporary storage and can be viewed like any page message. % is the page number indicator.

System Action: Other processing continues.

User Response: Purge the message when viewing is complete.

Destination: Terminal End User

Module: DFHTP

An ID error occurred while retrieving a Message Control Record (MCR) or Message Page. Message bmsid, terminal type termtype, page pageno.

Explanation: CICS was trying to retrieve page pageno of a message from temporary storage when an identifier error was received.

Alternatively, if page pageno is equal to zero, CICS could have been trying to retrieve a message control record (MCR) when the identifier error was received. The probable cause of the error is that temporary storage was cold started after the message was scheduled or after the message was saved. Otherwise the message had already been purged.

The insert bmsid is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page or message. The insert termtype identifies the terminal type.

System Action: The message or page may be lost. Other processing continues.

User Response: None.

Destination: Terminal End User

Module: DFHTP

An invalid request on Message Control Record (MCR) or Page Retrieval has occurred. Message bmsid, terminal type termtype, page pageno.

Explanation: CICS was trying to store or retrieve page pageno of a message when a temporary storage invalid request occurred.

Alternatively, CICS could have been trying to store or retrieve a message control record (MCR) if the page pageno equaled zero when the temporary storage invalid error was received.

The message or page may be lost. The probable cause is that temporary storage was not loaded. bmsid is the BMS logical message identifier, which is a unique hexadecimal identifier used in
the generation of a TS key for saving this page or message. 
termtype is the terminal type.

**System Action:** Other processing continues.

**User Response:** Ensure that the temporary storage program is 
loaded.

**Destination:** Terminal End User

**Module:** DFHTPR

---

**DFHTP4120 Unable to interpret input. Please try again.**

**Explanation:** The operator entered data that could not be interpreted.

**System Action:** Input is discarded.

**User Response:** Verify that input is valid under existing 
conditions.

**Destination:** Terminal End User

**Module:** DFHTPR

---

**DFHTP4121 An I/O error occurred while retrieving a message 
control record or message page. Message bmsid, 
termtype page pageno.**

**Explanation:** CICS was trying to retrieve page pageno of a 
message when a temporary storage I/O error occurred. 
Alternatively, CICS could have been trying to store or retrieve 
a message control record (MCR) if the page pageno equaled zero 
when the temporary storage I/O error occurred.

The message or page may be lost. bmsid is the BMS logical 
message identifier, which is a unique hexadecimal identifier used in 
the generation of a TS key for saving this page or message. 
termtype is the terminal type.

**System Action:** If pages are being displayed at an autopaging 
terminal, the next page, if any, is displayed. Otherwise no action 
takes place.

**User Response:** None.

**Destination:** Terminal End User

**Module:** DFHTPR

---

**DFHTP4122 Requested purge completed successfully.**

**Explanation:** CICS has completed a page purge function 
requested from the terminal.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** Terminal End User

**Module:** DFHTPR

---

**DFHTP4123 Terminal is now Autopaging.**

**Explanation:** The terminal operator has requested that CICS 
reset a terminal that is temporarily in paging status, to autopaging 
status.

**System Action:** The rest of the pages in the message are 
displayed. If there are none left and the message can be purged 
automatically, it is purged.

**User Response:** None.

**Destination:** Terminal End User

**Module:** DFHTPR

---

**DFHTP4124 Page copied from terminal termid (Message number 
msgno).**

**Explanation:** This message appears in the display of messages 
waiting to be displayed (P/Q) and identifies a copied page. msgno 
is the message number of the copied page and termid is the 
terminal for which it is queued.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** Terminal End User

**Module:** DFHTPR

---

**DFHTP4126 msgno has been copied.**

**Explanation:** This message is issued in response to a request to 
copy to another terminal. msgno is the message number of the 
message being displayed.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** Terminal End User

**Module:** DFHTPR

---

**DFHTP4127 nnnn must be a number. Please try again.**

**Explanation:** The characters nnnn are not valid. The system 
expected a decimal value for a page or chain number, or a 
hexadecimal value for a message number.

**System Action:** Other processing continues.

**User Response:** Reenter the paging command. Use a valid 
number.

**Destination:** Terminal End User

**Module:** DFHTPR

---

**DFHTP4128 command is undefined for page retrieval.**

**Explanation:** After a page retrieval (PR) session had been 
started, the operator pressed a PA or PF key for which no PR 
command had been defined in the SIT.

**System Action:** The command is ignored. The display status bit 
is not altered.

**User Response:** Ensure that the PR command in question is 
defined in the SIT.

**Destination:** Terminal End User

**Module:** DFHTPR

---

**DFHTP4130 You have used an unrecognized logical device. The 
valid names are xxx,yyy.**

**Explanation:** A paging command containing an invalid logical 
device mnemonic was entered. xxx,yyy,... indicates the valid logical 
device mnemonics for the requested logical message.

**System Action:** Input is discarded and other processing 
continues.

**User Response:** Reenter the paging command with a logical 
device mnemonic chosen from those listed in the message.

**Destination:** Terminal End User

**Module:** DFHTPR
DFHTP4131 Requested page cannot be copied to that terminal.

Explanation: The operator has tried to copy a page that refers to an outboard format:
- To a terminal that does not support outboard formats, or
- To a terminal that does support outboard formats, but which has a different page width or a smaller page depth than the source terminal.

System Action: The paging request is ignored.

User Response: Carry out whichever one of the following is appropriate:
- Copy the offending page to a terminal that supports outboard formatting
- Make the referenced format nonoutboard
- Copy the offending page to a terminal that does support outboard formatting and which has a page size the same as that of the source terminal.

Destination: Terminal End User
Module: DFHTPR

DFHTP4132 No pages have been built for this partition.

Explanation: This an information message issued during a page retrieval session. It appears in a screen partition for which no pages have been built.

System Action: Processing continues.

User Response: None, unless a display was expected in the affected partition. In this case, check for an operator or application error.

Destination: Terminal End User
Module: DFHTPR

DFHTP4133 date time applid bmsid termtype pageno ID error on MCR or page.

Explanation: CICS was trying to retrieve page pageno of a message when an identifier error was received. Alternatively, CICS could have been trying retrieve a message control record (MCR) if the page pageno equaled zero when the identifier error was received. The message or page may be lost.

The probable cause is that temporary storage was not loaded.

bmsid is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page/message. termtype is the terminal type.

System Action: Other processing continues.

User Response: None.

Destination: CSMT
Module: DFHTPS
XMEOUT Parameters: date, time, applid, bmsid, termtype, pageno

DFHTP4134 date time applid bmsid termtype pageno Invalid request on MCR or page.

Explanation: CICS was trying to store or retrieve page pageno of a message when a temporary storage invalid request error occurred. Alternatively, CICS could have been trying to store or retrieve a message control record (MCR) if the page pageno equaled zero when the temporary storage invalid request error occurred. The message or page may be lost.

The probable cause is that temporary storage was not loaded.

bmsid is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page/message. termtype is the terminal type.

System Action: Other processing continues.

User Response: Ensure that the temporary storage program is loaded.

Destination: CSMT
Module: DFHTPQ
XMEOUT Parameters: date, time, applid, bmsid, termtype, pageno

DFHTP4150 date time applid ID error on MCR.

Explanation: During processing of a delayed delivery message a temporary storage identification error occurred. The message is lost for all destination terminals. Temporary storage was probably cold started after the message was originally scheduled.

System Action: Other processing continues.

User Response: None.

Destination: CSMT
Module: DFHTPS
XMEOUT Parameters: date, time, applid

DFHTP4151 date time applid I/O error on MCR.

Explanation: During processing of a delayed delivery message a temporary storage I/O error occurred. The message is lost for all destination terminals.

System Action: Other processing continues.

User Response: None.

Destination: CSMT
Module: DFHTPS
XMEOUT Parameters: date, time, applid

DFHTP4152 date time applid Invalid request on MCR.

Explanation: During processing of a delayed delivery message, a temporary storage invalid request error occurred. The message is lost for all destination terminals. The system was probably initialized without temporary storage.

System Action: Other processing continues.

User Response: Ensure that the system is initialized with temporary storage.

Destination: CSMT
Module: DFHTPS
XMEOUT Parameters: date, time, applid
DFHTP4160 date time applid Message msgno purged as undeliverable from nnnn terminal(s).

Explanation: The message numbered msgno has been waiting for display at a terminal, but nnnn of these terminals are unable to display the message because they are out of service. This message is sent to the master terminal operator.

System Action: To avoid affecting system performance, messages waiting longer than a time specified by the installation are purged.

User Response: None.

Destination: CSMT

Module: DFHTPQ

XMEOUT Parameters: date, time, applid, msgno, nnnn

DFHTP4161 Message msgno was not delivered. It was purged from terminal(s) termid. Message title was title.

Explanation: The message numbered msgno has been purged because it was not delivered within the system-defined time limit. title is the title of message msgno and appears in this message only if one exists. termid is the terminal from which the message was purged.

System Action: The message is purged from the system. No further attempt is made to deliver the message.

User Response: None.

Destination: Terminal End User

Module: DFHTPQ

DFHTP4162 date time applid nnnn BMS system messages purged as undeliverable from error notification terminal.

Explanation: Basic mapping support (BMS) system messages (for example, DFHTP4161) have been waiting to be displayed at the error notification terminal, but the terminal is unable to display them because its status is not consistent with their status, or because traffic is too heavy.

nnnn is the number of BMS system messages purged and termid is the error notification terminal’s identifier.

System Action: To avoid affecting system performance, messages waiting longer than a time specified by the installation, are purged.

User Response: Either alter the status of the terminal to allow messages to be displayed or increase purge delay time at CICS system initialization.

Destination: CSMT

Module: DFHTPQ

XMEOUT Parameters: date, time, applid, nnnn

DFHTP4164 date time applid termid cannot accept message DFHTP4161. It is undefined or does not support paging.

Explanation: termid is the identifier of a terminal specified to receive notification if a message could not be delivered. However, termid is not in the TCT or is not defined as a terminal supported by BMS. This message is followed by DFHTP4161, which contains the error notification.

System Action: Other processing continues.

User Response: Notify terminal termid of the contents of message DFHTP4161, which is issued following this message.

DFHTP4165 Undeliverable messages are being purged. The terminal is available for use.

Explanation: This message is sent to destination CSMT. It is also sent to the originating terminal if transaction CSPQ is entered from the terminal. Program DFHTPQ has been time-initiated to purge any messages that are considered undeliverable.

System Action: A non-terminal task is initiated to purge undeliverable messages.

User Response: None. The message is displayed at the terminal to indicate that the terminal is available for use.

Destination: Terminal End User

Module: DFHTPQ

DFHTP4166 date time applid BMS has received an error return code retcode from CICS macro {TS PURGE | BMS TEXTBLD | BMS PAGEOUT | TS PUT}.

Explanation: BMS received an error return code after issuing a CICS system macro request. retcode is the return code and macro is the macro request.

System Action: Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT

Module: DFHTPQ

XMEOUT Parameters: date, time, applid, retcode, {1=TS PURGE, 2=BMS TEXTBLD, 3=BMS PAGEOUT, 4=TS PUT}

DFHTP4170 date time applid Request from system sysid to route message number msgno to terminal termid was not executed.

Explanation: BMS received a request from system sysid to route message msgno to terminal termid. The request could not be executed.

System Action: Processing continues.

User Response: Ensure that the TCTs for the two systems are consistent.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: date, time, applid, sysid, msgno, termid

DFHTP4171 date time applid Request from system sysid to route message number msgno to terminal termid was not executed. Terminal not valid.

Explanation: BMS received a request from system sysid to route message msgno to terminal termid. The request could not be executed because terminal termid is not defined on this system.

System Action: Processing continues.

User Response: Ensure that the TCTs for the two systems are consistent.

Destination: CSMT
Chapter 1. DFH messages

DFHTP4172

date time applid Request from system sysid to route message msgno to terminal termid was not executed. Terminal not supported by BMS.

Explanation: BMS received a request from system sysid to route message msgno to terminal termid. The request could not be executed because terminal termid is of a type not supported by BMS.

System Action: Processing continues.

User Response: Ensure that the TCTs for the two systems are consistent.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: date, time, applid, sysid, msgno, termid

DFHTPS

DFHTP4173

date time applid Request from system sysid to route message msgno to terminal termid was not executed. Invalid LDC specified.

Explanation: BMS has received a request from system sysid to route message msgno to terminal termid. The request could not be executed because the LDC specification was invalid.

System Action: Processing continues.

User Response: Ensure that the TCTs for the two systems are consistent.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: date, time, applid, sysid, msgno, termid

DFHTPS

DFHTP4174

date time applid Message routing has failed for terminal termid. The termid was invalid or could not be located.

Explanation: BMS has received a request from system sysid to route message msgno to terminal termid. The request could not be executed because termid is invalid or could not be located.

System Action: Processing continues.

User Response: Ensure that the TCTs for the two systems are consistent.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: date, time, applid, sysid, msgno, termid

DFHTPS

DFHTP4180

date time applid Terminal termid specified as error terminal for message msgno from system sysid invalid and ignored.

Explanation: BMS has received a request from system sysid to route message msgno, specifying terminal termid to be notified in the event of the message not being delivered. Terminal termid is not defined in the terminal control table.

System Action: Processing continues.

User Response: Ensure that the TCTs for the two systems are consistent.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: date, time, applid, termid, msgno, sysid

DFHTPS

DFHTP4190

Please enter your data again in the partition containing the cursor.

Explanation: The terminal operator entered data from a partition other than the expected input partition. The expected input partition is activated (that is, the cursor is moved into it), and the terminal operator should reenter data in this partition.

System Action: Processing continues.

User Response: Ensure that the terminal operator enters data in the correct partition.

Destination: Terminal End User

Module: DFHPHP

DFHTRxxxx messages

DFHTR0001

applid An abend (code abcode) has occurred at offset X'offset' in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code.

Alternatively, unexpected data has been input, or storage has been overwritten.

The code abcode is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, OC1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHSTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHTRSR, DFHTRPT, DFHTRDM, DFHTRFT

XMEOUT Parameters: applid, abcode, X'offset', modname

DFHTR0002
DFHTR0002 applid A severe error (code X'modname'), X'modname') has occurred in module modname.

Explanation: An error has been detected in module modname. The code X'modname' is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the CICS Problem Determination Guide.

System Action: An exception entry (code X'modname') is made in the trace table. A system dump is taken, unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: There may be an error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module modname is not crucial to CICS, CICS may not have been terminated. If module modname was executing at the time of the error, CICS may have been terminated.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Module: DFHTRSR
XMEOUT Parameters: applid, X'modname'

DFHTR0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specified in the dump table that CICS should terminate.

CICS continues unless you have specified in the dump table that CICS should terminate. A possible solution is to increase the table size given by message DFHTR0103.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Module: DFHTSR, DFHTPT, DFHTRDM, DFHTFT
XMEOUT Parameters: applid, X'modname'

DFHTR0101 STORAGE FOR INTERNAL TRACE TABLE NOT AVAILABLE -TRACE INOPERATIVE.

Explanation: During CICS initialization, there was insufficient storage for even the minimum allowable internal trace table size (16KB).

System Action: CICS terminates with a system dump.

User Response: The failure to get even 16KB from MVS at this early stage of initialization almost certainly means that other areas of CICS and other system functions will not be able to acquire the storage they require to operate, so the system is unlikely to initialize completely. A possible solution is to increase the value for the REGION keyword on the EXEC statement for the CICS job.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHTRDM

DFHTR0102 REQUESTED TRACE TABLE SIZE NOT AVAILABLE.

Explanation: CICS issues a variable-type GETMAIN to MVS for the internal trace table storage. This message indicates that the upper limit specified (on the TRTABSZ keyword) was not available, but that at least the lower limit of 16K was obtained.

Message DFHTR0103 which follows this message gives the actual size acquired.

System Action: CICS continues with an internal trace table of the size given by message DFHTR0103.

User Response: There are three possible courses of action:
- Allow CICS to run with the decreased table size if this is thought to be adequate.
- Terminate the system and reinitialize after increasing the region size available to CICS.
- Once the system is initialized, use CETR to increase the table size to the required value.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHTRDM
DFHTR0103 TRACE TABLE SIZE IS \(nnK\).

**Explanation:** The internal trace table acquired during CICS initialization has a table size \(nnKB\).

This is either the same as that specified on the TRTABSZ keyword of the SIT or message DFHTR0101 or DFHTR0102 has preceded this on the console.

**System Action:** CICS continues.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHTRDM

DFHTR0104 **applid** No buffer storage available for auxiliary trace data set. Auxiliary trace is inoperative.

**Explanation:** An attempt to start auxiliary trace failed because there was insufficient storage available from MVS for the 4KB output buffer.

**System Action:** A CICS system dump with dump code TR0104 is taken. CICS then continues with auxiliary trace inactive.

**User Response:** Determine why so little MVS storage is available and retry if possible.

**Destination:** Console

**Module:** DFHTRDM

**XMEOUT Parameter:** **applid**

DFHTR0105 AUXILIARY TRACE DATA SET **dataset** COULD NOT BE OPENED - AUXILIARY TRACE INOPERATIVE.

**Explanation:** An attempt to start auxiliary trace or to switch auxiliary trace extents has failed because the request to BSAM to open data set **dataset** failed.

**System Action:** There are two cases:

- If the error occurs after an explicit request to start auxiliary trace (as opposed to switching extents), a CICS system dump with dump code TR0105 is taken. CICS then continues with auxiliary trace inactive.
- If the error occurs when auxiliary trace is already active, that is, an explicit switch request when auxiliary trace starts or an end-of-extent with autoswitching active, an SDUMP with dump code KERNDUMP is taken. This type of dump is not subject to suppression or modification by use of the dump table.

**User Response:** Check that the DD statement for data set **dataset** is present.

If it is, format the system dump and examine the TR domain information. The DCB for the auxiliary trace data set should be present. Use this to determine the reason for the open failure.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHTRSR, DFHTRSU

DFHTR0106 **applid** DFHTRAO could not be loaded. Auxiliary trace is inoperative.

**Explanation:** An attempt to start auxiliary trace failed because the CICS module, DFHTRAO, which is used to write to the auxiliary trace data set, could not be loaded.

**System Action:** The loader domain (LD) will have issued messages and dumps as necessary. CICS continues with auxiliary trace inactive.

**User Response:** Refer to the associated loader domain messages for further information and guidance.

**Destination:** Console

**Module:** DFHTRSR

**XMEOUT Parameter:** **applid**

DFHTR0107 ABEND X'abcode' ON AUXILIARY TRACE DATA SET **dataset** - AUXILIARY TRACE STOPPED.

**Explanation:** The DCB abend exit for named auxiliary trace data set **dataset** was driven after a request to BSAM.

The 3-digit abend code is indicated as X'abcode'.

**System Action:** CICS continues with auxiliary trace inactive.

**User Response:** Refer to the OS/390 MVS System Codes manual for an explanation of the abend code, X'abcode'.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHTRAO

DFHTR0108 I/O ERROR ON AUXILIARY TRACE DATA SET **dataset** - AUXILIARY TRACE STOPPED.

**Explanation:** The SYNAD exit for the auxiliary trace data set **dataset** was driven after a request to BSAM.

**System Action:** CICS will continue with auxiliary trace inactive.

**User Response:** Use this message and any BSAM messages to determine the source of the error.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHTRAO

DFHTR0109 AUXILIARY TRACE DATA SET **dataset** FULL - AUXILIARY TRACE HAS BEEN STOPPED.

**Explanation:** The auxiliary trace data set **dataset** is full. Auxiliary trace has been stopped because autoswitch is not active.

**System Action:** CICS continues with auxiliary trace inactive.

**User Response:** The auxiliary trace data set **dataset** can now be processed by the print routine DFHTU520.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHTRSU
DFHTR0110 AUXILIARY TRACE DATA SET dataset1 FULL - SWITCHING TO dataset2.

Explanation: The auxiliary trace data set dataset1 is full. Auxiliary trace is continuing on data set dataset2 because autoswitching was requested.

System Action: CICS continues with auxiliary trace active on the data set dataset2.

User Response: Process the full data set if required.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRSU

DFHTR0111 applid Unable to acquire storage for GTF buffer - GTF trace inoperative.

Explanation: An attempt to start CICS tracing to the MVS Generalized Trace Facility (GTF) failed because there was insufficient storage available from MVS for the 256-byte buffer required.

This message can be issued by DFHTRDM during CICS initialization if GTFTR=ON is specified on the SIT or start-up overrides, or by DFHTRSU if the request to start GTF was made after CICS was up and running.

System Action: CICS continues with GTF tracing inactive.

User Response: The failure to acquire even 256 bytes of storage indicates that the CICS region is probably in a stall condition. This can only be relieved by removing some of the users of MVS storage or by restarting CICS, possibly with a larger region size.

Destination: Console

Modules: DFHTRDM, DFHTRSU

XMEOUT Parameters: applid, modname

DFHTR0112 applid Bad data passed for tracing to module modname.

Explanation: Some data passed to the trace (TR) domain for addition to the internal trace table, auxiliary trace data set or GTF trace caused a program check when an attempt was made to access it.

This could either be as a result of a request made by CICS system code or a request made by a user program through the API or XPI.

If transaction isolation is active, this message can be issued if a transaction passes another transaction's storage to CICS. A program check occurs when CICS attempts to trace this storage because the storage is fetch protected.

System Action: A system dump with dump code TR0112 is taken.

If the message was issued by DFHTRPT the dump contains an exception trace entry (point ID TR0102) that includes the erroneous parameter list passed to DFHTRPT.

If the message was issued by DFHTRFT the dump contains an exception trace entry (point ID TR0402) that includes the erroneous parameter list passed to DFHTRFT.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Examine the interpreted exception trace entry to determine the domain that issued the call and the ID of the entry.

Then look at the specified addresses and lengths in the data n fields to see if they contain reasonable values. The fault is in the module that set up these fields for the trace call.

If transaction isolation is active, examine the calling domain's parameter list, data2, for storage that belongs to another transaction. Correct the offending application program. It should not be passing another transaction's storage. Alternatively, alter the definition of the application so that it can validly access another transaction's storage. See the CICS Resource Definition Guide for more information on how to alter the definition.

Destination: Console

Modules: DFHTRPT, DFHTRFT

XMEOUT Parameters: applid, dataset

DFHTR0113 applid Auxiliary trace is being started on data set dataset.

Explanation: A request to start auxiliary trace has been successfully processed. The trace records are being written to data set dataset.

System Action: CICS continues with auxiliary trace active.

User Response: None.

Destination: Console

Module: DFHRSR

XMEOUT Parameters: applid, dataset

DFHTR0114 AN ABEND HAS OCCURRED DURING INITIALIZATION OF TRACE IN MODULE modname.

Explanation: Module modname's recovery routine received control during pre-initialization of the trace (TR) domain. This indicates that a program check has occurred in module modname.

There are three possible causes of this condition.

1. The module has been overwritten in main storage.
2. The module is at an incompatible level with the rest of the CICS modules.
3. There is an error in the module.

System Action: A system dump with dump code KERNDUMP is taken.

User Response: Inform the system programmer.

There may be an error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

Use the dump to determine the cause of the condition.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHTRDM, DFHTRSR
Chapter 1. DFH messages

DFHTR0115 AN ABEND HAS OCCURRED IN THE AUXILIARY TRACE MODULE DFHTRAO.

Explanation: Module DFHTRAO's recovery routine has received control.

This indicates a program check or MVS abend has occurred in DFHTRAO.

There are three possible causes of this condition:
- DFHTRAO has been overwritten in main storage
- DFHTRAO is at an incompatible level with the rest of the CICS modules
- There is an error in DFHTRAO.

System Action: A system dump with dump code KERNDUMP is taken.

User Response: There may be an error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have terminated.

If the message occurs once and module DFHTRAO is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module DFHTRAO, you should bring CICS down in a controlled shutdown.

Use the dump to determine the cause of the condition.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRAO

DFHTR0116 AN ABEND HAS OCCURRED IN THE TRACE SUBROUTINES MODULE DFHTRSU.

Explanation: The recovery routine belonging to the trace domain module DFHTRSU has received control.

This indicates a program check or MVS abend has occurred in that module.

There are three possible causes of this condition:
- DFHTRSU has been overwritten in main storage.
- DFHTRSU is at an incompatible level with the rest of the CICS modules.
- There is an error in DFHTRSU.

System Action: A system dump with dump code KERNDUMP is taken.

User Response: There may be an error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have terminated.

If the message occurs once and module DFHTRSU is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module DFHTRSU, bring CICS down in a controlled shutdown.

Use the dump to determine the cause of the condition.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRSU

DFHTR0117 applid Auxiliary trace on data set dataset has been stopped.

Explanation: An operator or application program request, to stop CICS tracing to the auxiliary trace data set dataset, has been successfully processed.

System Action: CICS continues with auxiliary trace inactive.

User Response: The auxiliary trace data set dataset can now be processed by the print routine DFHTRAP.

Destination: Console

Module: DFHTRSR

XMEOUT Parameters: applid, dataset

DFHTR0118 applid Auxiliary trace is being switched from dataset1 to dataset2.

Explanation: An operator or application program request to switch extents on the auxiliary trace data set while auxiliary trace is active is being processed.

System Action: CICS stops tracing on the first named data set dataset1, and resumes tracing on the second named data set dataset2.

User Response: The first named auxiliary trace data set dataset1 can now be processed by the print routine DFHTRAP.

Destination: Console

Module: DFHTRSR

XMEOUT Parameters: applid, dataset1, dataset2

DFHTR1000 applid CICS abend requested by global trap exit DFHTRAP in module modname.

Explanation: The field engineering global trap exit program (DFHTRAP) requested termination of CICS.

System Action: CICS disables the trap exit so that it will not be reentered, and terminates CICS.

User Response: Determine why DFHTRAP has requested system termination and act accordingly. You should use the global trap exit only in consultation with an IBM support representative.

Destination: Console

Modules: DFHTRPT, DFHTRFT

XMEOUT Parameters: applid, modname

DFHTR1001 applid Program check occurred within global trap exit - DFHTRAP now marked unusable by module modname.

Explanation: After making a trace entry, the CICS trace domain (TR) called the field engineering global trap exit program (DFHTRAP). A program check occurred during execution of DFHTRAP.

System Action: CICS marks the currently active version of DFHTRAP unusable, and will ignore it on future calls to TR domain. CICS then takes a dump with system dump code TR1001, and continues execution.

User Response: Use the dump to find the cause of the program check. To replace the currently active but unusable DFHTRAP by
DFHTR1002

a new version in the CICS program library, issue the following commands in the sequence shown:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSFE DEBUG,TRAP=OFF</td>
<td>(to deactivate the current trap)</td>
</tr>
<tr>
<td>CEMT SET PROGRAM(DFHTRAP) NEWCOPY</td>
<td>(to update the trap disk address known to CICS)</td>
</tr>
<tr>
<td>CSFE DEBUG,TRAP=ON</td>
<td>(to activate the new version of the trap)</td>
</tr>
</tbody>
</table>

You should use the global trap exit only in consultation with an IBM support representative.

Destination: Console
Modules: DFHTRPT, DFHTRFT
XMEOUT Parameters: applid, modname

DFHTR1002 applid Program DFHTRAP is not available - global trap not activated

Explanation: CICS could not activate the field engineering global trap exit program, DFHTRAP, during processing of the TRAP=ON SIT keyword or override in CICS initialization. This is almost certainly because DFHTRAP is not present in the program library.

System Action: CICS takes a system dump with dump code TR1002 and continues with the global trap not activated.
User Response: Ensure that DFHTRAP is defined to RDO and made available in the program library.

You should use the global trap exit only in consultation with an IBM support representative.

Destination: Console
Module: DFHTRDM
XMEOUT Parameter: applid

DFHTR1003 applid CICS system dump requested by global trap exit DFHTRAP in module modname.

Explanation: The user-coded global trap exit program (DFHTRAP) has requested a system dump in its return action settings.

System Action: CICS takes a system dump with dump code TR1003 and continues with the global trap still active.
User Response: Analyse the requested dump.

You should use the global trap exit only in consultation with an IBM support representative.

Destination: Console
Modules: DFHTRPT, DFHTRFT
XMEOUT Parameters: applid, modname

DFHTR2000 INCOMPLETE ENTRY IGNORED.

Explanation: CICS trace entries longer than 256 bytes have to be split into multiple Generalized Trace Facility (GTF) entries because of GTF’s length restriction. The CICS entry becomes a header entry followed by one or more continuation entries. This message in the GTF printout indicates that a CICS entry on GTF longer than 256 bytes has not been printed because a new header entry from the same MVS TCB was encountered before all of the continuation entries from a previous split entry were received.

System Action: The incomplete entry is ignored.

User Response: This situation can arise in one of two ways:
- The MVS TCB making the first split trace entry abnormally terminated while writing the continuation entries. This results in messages and a system dump during the CICS run. Refer to the associated messages for further information and guidance. Use the dump to determine and solve the problem.
- GTF has failed to record one or more of the continuation entries because of an internal error. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHTPRG

DFHTR2001 INSUFFICIENT STORAGE FOR RECONSTRUCTION BUFFER.

Explanation: A CICS entry longer than 256 bytes has been split into a header record and one or more continuation records on the generalized trace facility (GTF). It cannot be formatted because MVS could not allocate sufficient working storage for a buffer to allow reconstruction of the segmented entry.

System Action: The entry is printed in hexadecimal and the print job continues.
User Response: Rerun the GTF print job with a larger region size.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHTPRG

DFHTR2002 INVALID ENTRY PASSED FOR FORMATTING.

Explanation: A GTF entry with the CICS format identifier (X’EF’) has been passed to the CICS GTF print routine but the data it contains is not part of a valid CICS trace entry.

System Action: The invalid entry is printed in hexadecimal and the print job continues.
User Response: Examine the entry for clues to its origin.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHTPRG

DFHTR2003 UNEXPECTED CONTINUATION ENTRY ENCOUNTERED.

Explanation: CICS trace entries longer than 256 bytes have to be split into multiple GTF entries because of GTF’s length restriction. The CICS entry becomes a header entry followed by one or more continuation entries. This message in the GTF printout indicates that a GTF entry has been passed to the CICS GTF print routine that is not the start of a CICS segmented entry and the entry type is not one for which a continuation is currently expected.

System Action: The invalid entry is printed in hexadecimal and the print job continues.
User Response: This situation could arise if the header record for a segmented entry is overwritten because of GTF’s normal cyclic
re-use of space in its data set. In this case the invalid entries would be very close to the start of the printout.

If this is not so, examine the entry for clues to its origin.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Module:** DFHTRPRG

---

**DFHTR2004**

**THE MAXIMUM NUMBER OF BUFFERS (nn) HAVE BEEN ALLOCATED. NONE ARE FREE FOR REUSE.**

**Explanation:** A CICS trace entry longer than 256 bytes has been split into a header record and one or more continuation records on the generalized trace facility (GTF). However, it cannot be formatted because the maximum number of buffers allowed for reconstruction of segmented entries for a specific type has been reached. This maximum is currently set to \( nn \). The number of buffers for a specific type relates directly to the number of regions or systems writing trace entries to the GTF trace data set. During writing, the segmented entries for some of the different regions or systems could become interleaved in the data set. To ensure that the entries are formatted completely and correctly, it is necessary to have a buffer available for each region or system whose trace entries have become interleaved in this way. For further information on trace types and segmented entries see the section on trace formatting in the *CICS Diagnosis Reference*.

**System Action:** The entry is printed in hexadecimal and the print job continues.

**User Response:** None, but if the situation occurs regularly, contact your IBM Support Center to discuss whether the maximum value set is too low.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Module:** DFHTRPRG

---

**DFHTR2005**

**THE LOAD FAILED FOR LOAD MODULE modname. PLACE MODULE IN THE LINK LIST AND TRY AGAIN.**

**Explanation:** The generalized trace facility (GTF) trace formatter tried to load the correct release of trace formatter for the trace entry being processed.

**System Action:** The job continues printing trace entries in hexadecimal only.

**User Response:** Place the named trace formatter load module into the link list and rerun the job. If the named trace formatter is not available, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Module:** DFHTRPRG

---

**DFHTR3001**

**ERROR IN OPENING DFHAXPRT FILE.**

**Explanation:** The auxiliary trace print program DFHTU520 could not open the data set defined to receive the print output.

**System Action:** The print job terminates with a return code of 8.

**User Response:** Ensure that the DD statement for DFHAXPRT is present and correct in the DFHTU520 job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHTRPRG

---

**DFHTR3002**

**ERROR IN OPENING DFHAUXT FILE.**

**Explanation:** The auxiliary trace print program DFHTU520 could not open the auxiliary trace data set to be processed.

**System Action:** The print job terminates with a return code of 8.

**User Response:** Ensure that the DD statement for DFHAUXT is present and correct in the DFHTU520 job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHTRPRG

---

**DFHTR3003**

**ERROR IN OPENING DFHAXPRM FILE.**

**Explanation:** The auxiliary trace print program DFHTU520 could not open the parameter input data set DFHAXPRM.

**System Action:** The print job terminates with a return code of 8.

**User Response:** Ensure that the DD statement for DFHAXPRM is present and correct in the DFHTU520 job, or specify your input parameters on the PARM keyword of the EXEC statement.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHTRPRG

---

**DFHTR3010**

**ERROR IN TRACE DATA - ENTRIES MAY HAVE BEEN LOST.**

**Explanation:** The trace block being formatted contains invalid length and/or pointer fields. This can happen if the trace table is accidentally overwritten.

**System Action:** The trace formatting code scans the block to try and find valid entries. Any that are found are printed. The rest of the data is ignored.

**User Response:** Try and determine what caused the overwriting of the internal trace table.

The trace entries immediately before and after this message in the print out should be viewed with suspicion. They may contain incorrect data, or there may be one or more entries missing altogether at this point.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Module:** DFHTRFPB
DFHTSxxxx messages

DFHTS0001 applid An abend (code aaa/bbbb) has occurred at offset X‘offset’ in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module modname. This may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37).

If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that a system dump is taken, unless you have specifically suppressed dumps in the dump table.

The severity of its impact depends on the importance of the function being executed at the time of the error.

The code X‘code’ in the CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHTSAM, DFHTSBR, DFHTSDM, DFHTSPT, DFHTSOR, DFHTSRM, DFHTSSH, DFHTSSR, DFHTSST, DFHTSWQ.

XMEOUT Parameters: applid, X‘code’, modname

DFHTS0002 applid A severe error (code X‘code’) has occurred in module modname.

Explanation: An error has been detected in module modname. The code X‘code’ is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X‘code’ in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHTSAM, DFHTSBR, DFHTSDM, DFHTSPT, DFHTSOR, DFHTSRM, DFHTSSH, DFHTSSR, DFHTSST, DFHTSWQ.

XMEOUT Parameters: applid, aaa/bbbb, X‘offset’, modname

DFHTS0003 applid About to format the temporary storage data set (numcis control intervals).

Explanation: Temporary storage has been cold-started with a new data set. This message is issued when formatting of the data set commences, and indicates the number numcis of control intervals which will be formatted.

System Action: CICS continues. Message DFHTS0102 is issued when temporary storage initialization has been completed. Note that formatting can take a significant time if the data set is large.

User Response: None. You can suppress this message with the system level system initialization parameter, MSGVLR=0.

Destination: Console
DFHTS0103 applid Invalid attempt to switch between a TST and RDO for Temporary Storage. The attempt is ignored.

Explanation: Temporary storage has detected an implicit attempt to switch between using a TST and RDO for TS queues, but CICS has not been COLD started.

System Action: CICS continues. The attempt to switch is ignored. CICS will use a TST (if specified) or RDO models for TS queues, as for the previous CICS run.

User Response: You may wish to restart CICS specifying an INITIAL or COLD start in order to complete the switch.

Destination: Console
Module: DFHSDAM
XMEOUT Parameter: applid

DFHTS1301 applid [READ | WRITE] Error detected by temporary storage. RPL feedback area is X’yyyyy’.

Explanation: An I/O error has been detected by temporary storage. Either:
- A hardware error occurred while a task was accessing the temporary storage data set, or
- VSAM detected a logic error in the request. The most likely cause of this is that the data set was defined incorrectly.

System Action: An I/O ERROR return code is returned to the application program.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: To determine the cause of the error, check that:
- The correct data set was used.
- The CISIZE of DFHTEMP was not altered between CICS runs (if CISIZE was altered, temporary storage should have been cold started).

Whatever the cause of the error, temporary storage must now be cold started.

See the CICS Problem Determination Guide for more guidance in dealing with temporary storage problems. If an overlay has occurred, you will need further assistance from IBM.

See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Module: DFHTSAM
XMEOUT Parameter: applid

DFHTS1315 applid The temporary storage data set has exceeded the maximum number of control intervals supported.

Explanation: During a temporary storage write request, an attempt has been made to add a new control interval to the temporary storage data set. The temporary storage data set already contains the maximum number of supported control intervals and cannot be extended.

System Action: Processing continues.

User Response: Consider whether you need to increase the control interval size for the temporary storage data set. See the CICS System Definition Guide for guidance on defining the temporary storage data set.

Destination: Console
Module: DFHTSAM
XMEOUT Parameter: applid

DFHTS1340 applid No DD statement provided for temporary storage data set.

Explanation: CICS is unable to open the auxiliary temporary storage data set because no DD statement has been provided.

System Action: A dump is provided and CICS is terminated.

User Response: Correct the error and restart CICS.

Destination: Console
Module: DFHTSDM
XMEOUT Parameter: applid
DFHTS1341 applid VSAM error processing SHOWCAT for temporary storage data set.
Explanation: VSAM has detected an error during SHOWCAT processing for the auxiliary temporary storage data set.
System Action: A dump is provided and CICS is terminated.
User Response: Correct the error and restart CICS.
Destination: Console
Module: DFHTSDM
XMEOUT Parameter: applid

DFHTS1342 applid Invalid VSAM definition for temporary storage data set.
Explanation: CICS is unable to open the auxiliary temporary storage data set because it is not defined as VSAM ESDS.
System Action: A dump is provided and CICS is terminated.
User Response: Correct the error and restart CICS.
Destination: Console
Module: DFHTSDM
XMEOUT Parameter: applid

DFHTS1362 applid Temporary storage data set not formatted
Explanation: The auxiliary temporary storage data set is not formatted. It is empty. If initial formatting is necessary, it is performed when temporary storage is cold started.
System Action: The temporary storage initialization task is abnormally terminated.
User Response: Correct the error and restart CICS.
Destination: Console
Module: DFHTSDM
XMEOUT Parameter: applid

DFHTS1363 applid Invalid control record for temporary storage data set
Explanation: The auxiliary temporary storage data set was not initialized for temporary storage.
System Action: The temporary storage initialization task is abnormally terminated.
User Response: Correct the error and restart CICS.
Destination: Console
Module: DFHTSDM
XMEOUT Parameter: applid

DFHTS1371 applid VSAM error processing SHOWCB for temporary storage data set, RC=X'retcode'
Explanation: VSAM has detected an error during SHOWCB processing for the auxiliary temporary storage data set.
System Action: The temporary storage initialization task is abnormally terminated.
Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response:
Check the return code and error code in the appropriate VSAM publication.
Destination: Console
Module: DFHTSDM
XMEOUT Parameters: applid, X'retcode', X'errorcode'

DFHTS1372 applid VSAM error processing OPEN for temporary storage data set, R15=X'retcode', RC=X'errorcode'
Explanation: VSAM has detected an error during OPEN processing for the auxiliary temporary storage data set. The inserts identify the return code and the error code.
System Action: The temporary storage initialization task is abnormally terminated.
Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response:
Check the return code and error code in the appropriate VSAM publication.
Destination: Console
Module: DFHTSDM
XMEOUT Parameters: applid, X'retcode', X'errorcode'

DFHTS1373 applid VSAM error processing CLOSE for temporary storage data set, R15=X'retcode', RC=X'errorcode'
Explanation: VSAM has detected an error during CLOSE processing for the auxiliary temporary storage data set. The inserts identify the return code and the error code.
System Action: The temporary storage initialization task is abnormally terminated.
Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response:
Check the return code and error code in the appropriate VSAM publication.
Destination: Console
Module: DFHTSDM
XMEOUT Parameters: applid, X'retcode', X'errorcode'

DFHTS1374 applid VSAM error processing PUT for temporary storage data set, R15=X'retcode', RC=X'errorcode'
Explanation: VSAM has detected an error during PUT processing for the auxiliary temporary storage data set. The inserts identify the return code and the error code.
System Action: The temporary storage initialization task is abnormally terminated.
Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response:
Check the return code and error code in the appropriate VSAM publication.
Destination: Console
Module: DFHTSDM
XMEOUT Parameters: applid, X'retcode', X'errorcode'
DFHTS1375 applid VSAM error processing GET for temporary storage data set, R15=X"retcode", RC=X"errorcode"

Explanation: VSAM has detected an error during GET processing for the auxiliary temporary storage data set. The inserts identify the return code and the error code.

System Action: The temporary storage initialization task is abnormally terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Check the return code and error code in the appropriate VSAM publication.

Destination: Console
Module: DFHTSDM
XMEOUT Parameters: applid, X"retcode", X"errorcode"

DFHTS1376 applid VSAM error processing MODCB for temporary storage data set, R15=X"retcode"

Explanation: VSAM has detected an error during MODCB processing for the auxiliary temporary storage data set. The insert identifies the return code.

System Action: The temporary storage initialization task is abnormally terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Check the return code and error code in the appropriate VSAM publication.

Destination: Console
Module: DFHTSDM
XMEOUT Parameters: applid, X"retcode"

DFHTS1390 date time applid TSQUEUE name (X"hexval") not recovered. Time last referenced: hh:mm:ss mm/dd/yy. TSAGE: tsage

Explanation: During an emergency start, the recoverable temporary storage queue (TSQUEUE) name was not recovered. This is because the time elapsed since it was last referenced exceeded the aging limit of temporary storage data as specified in the value of TSAGE tsage in the DFHTST macro.

System Action: The queue is not recovered and processing continues.

User Response: Ensure that the value of TSAGE specified in the DFHTST macro is adequate.

Destination: CSMT
Module: DFHTSRM
XMEOUT Parameters: date, time, applid, name, X"hexval", hh:mm:ss, mm/dd/yy, tsage

DFHTS1576 applid Temporary storage format error

Explanation: A nonzero return code was received from the VSAM macro GENCB when CICS was attempting to build a VSAM request parameter list (RPL).

System Action: CICS terminates abnormally with a system dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Module: DFHTSDM
XMEOUT Parameter: applid

DFHTS1599 applid Region/Partition size insufficient to initialize CICS.

Explanation: The temporary storage domain has been unable to GETMAIN sufficient storage for its own control blocks during initialization.

System Action: CICS terminates with a system dump.

User Response: Increase the region/partition size and retry. You can get information about the size and number of occurrences of relevant control blocks by using the CICS Data Areas in conjunction with the system dump.

Destination: Console

Modules: DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

XMEOUT Parameters: applyid, aaa/bbbb, X'offset', modname
DFHUS0002 applid A severe error (code X'code') has occurred in module modname.

**Explanation:** An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where it was detected.

**System Action:** An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

**XMEOUT Parameters:** applid, X'code', modname

DFHUS0004 applid A possible loop has been detected at offset X'offset' in module modname.

**Explanation:** A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

**System Action:** An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

**XMEOUT Parameters:** applid, X'offset', modname

DFHUS0006 applid Insufficient storage to satisfy Getmain (code X'code') in module modname, MVS code mvscode.

**Explanation:** An MVS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code mvscode is the MVS GETMAIN return code.

**System Action:** An exception entry is made in the trace table (code X'code'). A system dump is taken, unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the User Response for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module modname, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. See the CICS System Definition Guide or the CICS Performance Guide for more information on CICS storage.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console
DFHUS0050

Modules:  DFHUSD, DFHUSAD
XMEOUT Parameters:  applid, X'code', modname, mvrcode

DFHUS0050  applid The default userid userid1 cannot be used by this CICS job with region userid userid2.

Explanation:  The default userid specified in the system initialization parameter DFLTUSER cannot be used by this CICS job.
The region userid for this CICS job is not authorized to use the userid specified in the DFLTUSER system initialization parameter.
System Action:  CICS initialization terminates.
User Response:  Ensure the default userid and the userid for the CICS region are correct.
If the two userids are correct, obtain the necessary authorization for the default userid to be used by the CICS region userid.  This may require the assistance of a security administrator.
Previous messages may have been produced by the job giving additional information.
Destination:  Console
Module:  DFHUSDM
XMEOUT Parameter:  applid, userid1, userid2

DFHUS0120  applid An attempt to establish security has failed for userid userid in group groupid, at portname.

Explanation:  An attempt was made to establish security for userid userid in group groupid with access to resources allowed for the terminal or console portname and the application applid.  The attempt was rejected by the external security manager (ESM).  The transaction tranid cannot be initialized.
System Action:  Security has not been established for the userid.  The attempt to initialize the transaction has failed.
User Response:  The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros.  These return codes are described in the OS/390 MVS Programming: Authorized Assembler Services Guide and in External Security Interface (RACROUTE) Macro Reference for MVS and VM (SC28-1366).  See these manuals for an explanation of the codes.
There may be further messages produced by CICS or the external security manager (ESM) which provide more information.
Note:  Do not attempt to reroute this message to a transient data queue.
Destination:  Console
Module:  DFHUSXM
XMEOUT Parameters:  applid, userid, groupid, {99=netname, 1=netname, 2=console}, portname, tranid, X'safresp', X'safreas', X'esmresp', X'esmreas'

DFHUS0200  date time applid User userid in group groupid has been timed out.

Explanation:  User userid in group groupid (at terminal portname if appropriate) has been removed from this CICS system because the userid has been unused for a period longer than that specified in the USRDELAY system initialization parameter.
System Action:  Processing continues.
User Response:  See the CICS System Definition Guide for more information about USRDELAY.
Destination:  CSCS
Module:  DFHUSDM
XMEOUT Parameters:  date, time, applid, userid, groupid, {1=at netname, 2=at console}, portname
DFHWBxxxx CICS Web Interface messages

Messages in the range 7001-7009 are issued by the CICS-supplied ICAPI (Internet Connection Application Programming Interface) DLL program, which executes under control of the ICSS/390 (Internet Connection Secure Server for OS/390) Web server program.

The messages appear in the log file of the ICSS/390 job.

DFHWB0001 applid An abend (code aaaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, OC1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMOD). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to determine whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Module: DFHWWBWB

XMEOUT Parameters: applid, aaaa/bbbb, X'offset', modname

DFHWB0002 applid A severe error (code X'code') has occurred in module modname.

Explanation: An error has been detected in module modname. The code X'code' is the exception trace point ID, which gives an indication of the cause of the error:

- 4643—DFHWBST was called with an invalid format
- 4644—DFHWBST was called with an invalid function
- 4647—The Web State manager was unable to update the Web state token directory when creating a new state block
- 4654—The Web State manager was unable to browse the Web state token directory during garbage collection
- 4652—the Web State manager was unable to perform a LOCK of the Web state data
- 4653—the Web State manager was unable to perform a UNLOCK of the Web state data
- 4683—DFHWBTC was called with an invalid format
- 4684—DFHWBTC was called with an invalid function
- 4685—An error was returned by the LE/370 pre-initialized environment (CEEPPI)
- 4686—Call to CICS Web 3270 emulator failed

System Action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHWBST, DFHWBTC

XMEOUT Parameters: applid, X'code', modname

DFHWB0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction that was executing at the time the error was detected.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS has not been terminated, it will be necessary to determine whether the problem is serious enough to bring CICS down.

Because some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module modname will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.
If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Modules: DFHWBST, DFHWBTC
XMEOUT Parameters: applid, X'offset', modname

**DFHWB0006** applid Insufficient storage to satisfy Getmain (code X'code') in module modname. MVS code mvscode.

**Explanation:** An MVS GETMAIN was issued by module modname but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code mvscode is the MVS GETMAIN return code.

During initialization, CICS may not have access to the user’s applid coded in the SIT. If CICS produces this message in these circumstances, it uses the default applid value DBDCCICS.

**System Action:** CICS will terminate with a system dump. An exception entry is made in the trace table (code code in the message).

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Inform the system programmer.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the overall size limit of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. If CICS is not already terminated, you will need to bring CICS down to do this. See the CICS System Definition Guide or the CICS Performance Guide for further information on CICS storage.

Destination: Console
Module: DFHWBST
XMEOUT Parameters: applid, X'code', modname, mvscode

**DFHWB0100** date time applid tranid The CICS Web Interface alias program cannot link to program DFHWBBLI. EIBRESP: eibresp EIBRESP2: resp2val. Host IP address: hostaddr. Client IP address: clientaddr. (1= , 2= TCPIPSERVICE: ). tcpipservice

**Explanation:** The alias program used EXEC CICS LINK but was unable to link to program DFHWBBLI.

**System Action:** The link is abandoned. An HTTP response code of 500 (internal server error) is returned to the Web Browser. The alias abends with abend code AWBL.

**User Response:** Use the CEDA transaction to ensure that program DFHWBBLI has been correctly defined and installed.

Destination: CWBO
Module: DFHWBA
XMEOUT Parameters: date, time, applid, tranid, eibresp, resp2val, hostaddr, clientaddr, (1= , 2= TCPIPSERVICE: ). tcpipservice

**DFHWB0101** date time applid tranid The CICS Web Interface alias program DFHWBA detected a failure in program DFHWBBLI. Host IP address: hostaddr. Client IP address: clientaddr. (1= , 2= TCPIPSERVICE: ). tcpipservice

**Explanation:** Program DFHWBBLI has returned an error response to the alias.

**System Action:** The request is abandoned. The error response returned by program DFHWBBLI is returned to the Web Browser in an HTTP response:

403 The userid associated with the request is not authorized to invoke the requested converter program, or the requested server program.

404 A link to the converter program or to the server program failed because CICS could not locate the requested program.

500 A link to the converter program or to the server program failed with an unexpected error.

503 A link to the converter program or to the server program failed for one of the following reasons:

- The server program is defined as remote, but the link to this program failed with a SYSID error, so the remote connection is either not defined correctly, or not active.
- The link to the converter or the server program failed with the ROLLEDBACK response.

The alias abends with abend code AWBM.

**User Response:** Check program DFHWBBLI and the programs which it calls.

Destination: CWBO
Module: DFHWBA
XMEOUT Parameters: date, time, applid, tranid, hostaddr, clientaddr, (1= , 2= TCPIPSERVICE: ). tcpipservice

**DFHWB0102** date time applid tranid The CICS Web Interface alias program has received an incorrect response on a call made to CICS during alias initialization. EIBRESP: eibresp EIBRESP2: resp2val. (1= , 2= TCPIPSERVICE: ). tcpipservice

**Explanation:** The alias program has received an unexpected response on a call made to CICS during alias initialization.

**System Action:** The alias abends with abend code AWBI.

**User Response:** You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CWBO
Module: DFHWBA
XMEOUT Parameters: date, time, applid, tranid, eibresp, resp2val, (1= , 2= TCPIPSERVICE: ). tcpipservice
DFHWB0103 date time applid tranid The CICS Web Interface alias program has received an error response (code X'code') on a call made to CICS during alias initialization.

Explanation: The alias program was unable to locate the START data for this request, or the START data was invalid. The error response code X'code' is the exception trace point id that uniquely identifies which error has occurred. A code of '4565'X means that the START data was missing, and '4566'X means that the START data was invalid.

System Action: The alias abends with abend code AWBF and a trace entry is made in the trace table.

User Response: The alias program DFHWBA is only to be used for alias transactions started by the CICS Web Interface.

User-written applications should not be starting alias transactions, as data passed to the alias will not be in the expected format.

Destination: CWBO
Module: DFHWBA
XMEOUT Parameters: date, time, applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice

DFHWB0106 date time applid tranid The CICS Web Interface program DFHWBA has detected an error.

Explanation: The alias had detected an error.

System Action: A system dump is taken. The alias abends with abend code AWBH. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CWBO
Module: DFHWBA
XMEOUT Parameters: date, time, applid, tranid, {1= , 2= TCPIPSERVICE: }, tcpipservice

DFHWB0108 date time applid tranid The CICS Web Interface alias program has detected an abend. Host IP address: hostaddr. Client IP address: clientaddr.

Explanation: The alias has detected an abend.

System Action: The alias abends with abend code AWBK.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CWBO
Module: DFHWBA
XMEOUT Parameters: date, time, applid, tranid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice

DFHWB0109 date time applid The Web domain initialization has started.

Explanation: This is an informational message indicating the start of Web domain initialization.

System Action: CICS initialization continues.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console
Module: DFHWBDM
XMEOUT Parameters: date, time, applid, {4=Decode, 5=Encode}, {1= , 2= TCPIPSERVICE: }, tcpipservice
DFHWB0118

**DFHWB0118** date time applid tranid The CICS Web Interface program DFHWBBLI has detected an error./

TCPIPSERVICE: }tcpipservice

Explanation: Program DFHWBBLI has detected an error.

System Action: A system dump is taken. The transaction abends with abend code AWBR. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CWBO

Module: DFHWBBLI

XMEOUT Parameters: date, time, applid, tranid, {1= , 2=TCPIPSERVICE: }, tcpipservice

---

**DFHWB0119** date time applid tranid The CICS Web Interface program DFHWBBLI has been started incorrectly./

TCPIPSERVICE: }tcpipservice

Explanation: Program DFHWBBLI has detected an error while validating initialization information. This probably means that the program has been started incorrectly.

System Action: The transaction abends with abend code AWBQ.

User Response: Check that the program was not started by a transient data trigger level or by a CECI user.

Destination: CWBO

Module: DFHWBBLI

XMEOUT Parameters: date, time, applid, tranid, {1= , 2=TCPIPSERVICE: }, tcpipservice

---

**DFHWB0120** date time applid tranid The CICS Web Interface program DFHWBBLI cannot link to program program_name, EIBRESP: eibresp EIBRESP2: resp2val, { | TCPIPSERVICE: }tcpipservice

Explanation: Program DFHWBBLI used an EXEC CICS LINK but was unable to link to the given program and an EIB response was returned.

System Action: The link is abandoned.

User Response: Ensure that the program definition is correct.

Destination: CWBO

Module: DFHWBBLI

XMEOUT Parameters: date, time, applid, tranid, program_name, eibresp, resp2val, {1= , 2=TCPIPSERVICE: }, tcpipservice

---

**DFHWB0121** date time applid tranid The CICS Web Interface program DFHWBBLI encountered an error during Decode processing in the converter program. Response code: respcode, reason code: reasoncode, { | TCPIPSERVICE: }tcpipservice

Explanation: The Decode function of the converter program has returned an error.

System Action: An error message is sent to the client.

User Response: The response code insert gives the RESPONSE code returned by the converter program. The reason code insert gives the REASON code returned by the converter program.

The values defined by CICS for these fields are defined in copybook DFHWBUCD. The CICS defined values for the RESPONSE code are:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>OK</td>
</tr>
<tr>
<td>4</td>
<td>Exception</td>
</tr>
<tr>
<td>8</td>
<td>Invalid data supplied</td>
</tr>
<tr>
<td>16</td>
<td>Disaster</td>
</tr>
</tbody>
</table>

The CICS defined values for the REASON code are:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Security failure</td>
</tr>
<tr>
<td>2</td>
<td>Corrupt client data</td>
</tr>
</tbody>
</table>

Users can architect their own response and reason code values to be returned by the analyzer, but they should use values other than those defined in the CICS supplied copybook DFHWBUCD.

Examine the response and reason codes returned to determine the cause of the error.

converter that was servicing the request during Decode processing.

System Action: The alias returns control to the caller.

User Response: Examine the diagnostics to determine the
reason for the error.

Destination: CWBO
Module: DFHWBBLI
XMEOUT Parameters: date, time, applid, tranid, program, {1= , 2=
TCPIPSERVICE: }, tcpipservice

DFHWB0128  date time applid tranid An error has been detected
by program program. [ | TCPIPSERVICE: ] tcpipservice

Explanation: Program DFHWBBLI has detected an error.

System Action: The alias returns control to the caller.

User Response: Examine the diagnostics to determine the
reason for the error.

Destination: CWBO
Module: DFHWBBLI
XMEOUT Parameters: date, time, applid, tranid, program, {1= , 2=
TCPIPSERVICE: }, tcpipservice

DFHWB0130  date time applid tranid No state token passed to
program DFHWBLT. [ | TCPIPSERVICE: ] tcpipservice

Explanation: Program DFHWBLT was not passed the expected
state token.

System Action: The transaction abends with code AWC2, and an
exception trace entry 410C is written.

User Response: You may need further assistance from IBM to
resolve this problem. See the CICS External Interfaces Guide and
Part 4 of the CICS Problem Determination Guide for guidance on
how to proceed.

Destination: CWBO
Module: DFHWBLT
XMEOUT Parameters: date, time, applid, tranid, {1= , 2=
TCPIPSERVICE: }, tcpipservice

DFHWB0131  date time applid tranid An error code X’code’
occurred in DFHWBLT while accessing the Web
state data for this transaction. [ | TCPIPSERVICE: ] tcpipservice

Explanation: The Web Bridge Exit program, DFHWBLT, has
detected an error when attempting to access the Web state data
held for this transaction.

System Action: An exception trace entry is made in the trace
configuration file using the code X’code’. The transaction
abends with abend code AWCI if the Bridge Exit was trying to establish a partnership with
the CICS Web Interface alias transaction.

User Response: Use the error code code to determine the reason for the failure:

4106 Unable to establish a partnership with the associated
CICS Web Interface alias transaction.
DFHWB0132

4107 A call to terminate the partnership between this instance of DFHWBLT and its associated CICS Web Interface alias transaction failed.

4108 A call to wait for the CICS Web Interface alias transaction associated with this instance of DFHWBLT failed.

4109 A call to reactivate the CICS Web Interface alias transaction associated with this instance of DFHWBLT failed.

4110 A call to suspend this instance of DFHWBLT failed.

4111 A call to update the state data for this transaction failed.

4112 A call to retrieve the state data for this transaction failed.

4113 A call to destroy the state data for this instance of DFHWBLT failed.

The most likely cause of the error is that the timeout interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the timeout interval for the state data is set to a suitable value. You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CWBO
Module: DFHWBLT
XMEOUT Parameters: date, time, applid, tranid, X’code’, {1= , 2= TCPIPSERVICE: }, tcpipservice

---

**DFHWB0134**

**date time applid tranid Error X’code’ occurred**

**resolving the AID from HTTP forms data in the CICS Web terminal translation application.**

**Explanation:** Program DFHWBTTA is unable to resolve an attention identifier from the HTTP forms data returned from a web browser. DFHWBTTA translates the HTTP forms data into the correct 3270 format required by the CICS terminal-oriented transaction that is the target of this request. The attention identifier or AID is a mandatory part of this format. DFHWBTTA cannot locate a name=value pair in the HTTP forms data that adheres to the naming convention defined by the CICS Web Interface to represent an AID, and so cannot return an AID value to the terminal-oriented transaction.

**System Action:** DFHWBTTA returns an internal server error (HTTP response 500) to the HTTP client, and terminates the exchange with the terminal-oriented transaction.

**User Response:** The error code code identifies the CICS trace entry that corresponds to the failure. The HTTP forms data is produced as trace data. Collect the CICS trace output. Examine the HTTP forms data to determine what was returned from the web browser. Identify what HTML input type caused the web browser to submit the HTML form. Corruption of the HTTP forms data may be the cause of the problem. You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CWBO
Module: DFHWBTTA
XMEOUT Parameters: date, time, applid, tranid, X’code’, {1= , 2= TCPIPSERVICE: }, tcpipservice

---

**DFHWB0135**

**date time applid tranid Error X’code’ occurred**

**resolving the next transaction identifier from HTTP forms data in the CICS Web terminal translation application.**

**Explanation:** Program DFHWBTTA is unable to resolve the next transaction identifier from the HTTP forms data returned from a web browser. DFHWBTTA translates the HTTP forms data and extracts the identifier of the next transaction to be executed. DFHWBTTA cannot locate a name=value pair in the HTTP forms data that adheres to the naming convention defined by CICS to represent the next transaction identifier and so it cannot determine which terminal-oriented transaction to start.

**System Action:** DFHWBTTA returns an internal server error (HTTP response 500) to the HTTP client.

**User Response:** The error code code identifies the CICS trace entry that corresponds to the failure. The HTTP forms data is produced as trace data. Collect the CICS trace output. Examine the
HTTP forms data to determine what was returned from the web browser. Corruption of the HTTP forms data may be the cause of the problem. You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CWBO  
**Module:** DFHWBTTA  
**XMEOUT Parameters:** date, time, applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice

---

**DFHWB0136** 
**date time applid tranid** An error code X'code' has occurred as a result of the Web State Garbage Collection process. { } TCPIPSERVICE: tcpipservice

**Explanation:** Program DFHWBLT detected an error when attempting to access the Web state data held for this transaction. The transaction wait time has exceeded the garbage collection limit and the state block has been deleted by the garbage collection process.

**System Action:** If the error occurs in DFHWBLT, a TERMERR condition is returned to the application and processing continues. If the error occurs in DFHWBTTA, an error response is sent to the browser and processing continues.

**User Response:**

Use the error code code to determine which module received the error:

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4108</td>
<td>The error occurred in DFHWBLT.</td>
</tr>
<tr>
<td>420B</td>
<td>The error occurred in DFHWBTTA.</td>
</tr>
</tbody>
</table>

The cause of the error is that the garbage collection interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the garbage collection interval for the state data is set to a suitable value. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CWBO  
**Module:** DFHWBTTA  
**XMEOUT Parameters:** date, time, applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice

---

**DFHWB0137** 
**date time applid tranid** An error code X'code' occurred in DFHWBTTA while accessing the Web state data for this transaction. { } TCPIPSERVICE: tcpipservice

**Explanation:** The Web Terminal Translation Application program, DFHWBTTA, has detected an error when attempting to access the Web state data held for this transaction.

**System Action:** An exception trace entry is made in the trace table using code X'code'.

**User Response:**

Use the error code code to determine the reason for the failure:

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4203</td>
<td>Unable to establish a partnership with the associated CICS Web Interface alias transaction.</td>
</tr>
<tr>
<td>4204</td>
<td>Unable to initialize a partnership with the associated CICS Web Interface alias transaction.</td>
</tr>
<tr>
<td>4205</td>
<td>The alias task associated with this instance of DFHWBTTA was not in the required state.</td>
</tr>
</tbody>
</table>

**DFHWB0150** 
**date time applid tranid** The CICS HTML template manager could not locate template template_name in the HTML template data set. { } TCPIPSERVICE: tcpipservice

**Explanation:** The CICS HTML template manager DFHWBLT could not find template name template_name in the HTML data set.

**System Action:** Because 3270 / HTML conversion cannot be performed without the template, CICS returns a TERMERR condition to the application. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Make sure that the template exists in the template library. See the CICS External Interfaces Guide for guidance on how to create HTML templates. Report the details of the symptom string given in message DFHME0116.

**Destination:** CWBO  
**Module:** DFHWBTTA  
**XMEOUT Parameters:** date, time, applid, tranid, template_name, {1= , 2= TCPIPSERVICE: }, tcpipservice

---

**DFHWB0151** 
**date time applid tranid** The CICS Web Interface 3270 emulation code was unable to process the data it was passed. { } TCPIPSERVICE: tcpipservice

**Explanation:** The CICS Web Interface routine that converts 3270 data streams to HTML, and vice versa, has detected an error. This is probably because it has been passed an invalid 3270 data stream on an EXEC CICS SEND command, or because the browser has returned some data that it is incapable of handling in response to an EXEC CICS RECEIVE command.

**Destination:** CWBO  
**Module:** DFHWBTC  
**XMEOUT Parameters:** date, time, applid, tranid, template_name, {1= , 2= TCPIPSERVICE: }, tcpipservice
**DFHWB0500I**

**System Action:** The transaction is abended with code AEIP (INVREQ). There will be subsequent messages from the Web state management code as it tidies up for the abending task. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Use CEDX or trace to look at the data that was in error and then correct the sending application. Report the details of the symptom string given in message DFHME0116.

**Destination:** CWBO

**Module:** DFHWBTC

**XMEOUT Parameters:** date, time, applid, tranid, {1= , 2= TCPIPSERVICE: }, tcipservice

---

**DFHWB0500I**

**date time applid tranid**

**CICS Web Interface enable processing is complete.**

**Host IP address:** hostaddr.

**Explanation:** The enable process has completed successfully.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** Console and Transient Data Queue CWBO

**Module:** DFHWBM

**XMEOUT Parameters:** date, time, applid, tranid, hostaddr

---

**DFHWB0551**

**date time applid tranid**

**The CICS Web Interface server controller detected an abort ACN1 processing a request from client clientaddr.**

**Host IP address:** hostaddr.

**Explanation:** The HTTP caller detected an error after invoking program DFHCNV to perform data conversion on incoming data.

**System Action:** If there is no DFHCNV table defined, the CICS Web Interface cannot perform data conversion on incoming data. An exception disable of the CICS Web Interface is initiated. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Ensure that there is a valid DFHCNV table link-edited into one of the libraries in the DFHRPL library concatenation.

**Destination:** CWBO

**Module:** DFHWBM

**XMEOUT Parameters:** date, time, applid, tranid, clientaddr, hostaddr

---

**DFHWB0723**

**date time applid tranid**

**The CICS Web analyzer program returned an error response.**

**Program name:** progname. **RESPONSE:** response. **REASON:** reason. **Host IP address:** hostaddr. **Client IP address:** clientaddr. **TCPIPSERVICE:** tcipservice

**Explanation:** As part of its normal processing of a request, CICS Web attach processing invokes the user replaceable analyzer to tailor the required actions. This program returns RESPONSE and REASON values. If a CICS supplied sample analyzer is being used, possible RESPONSE code values are:

- 0 OK
- 4 Exception
- 8 Invalid

---

**DFHWB0724**

**date time applid tranid**

**CICS Web attach processing detected an error linking to the codepage conversion module DFHCNV.**

**Host IP address:** hostaddr. **Client IP address:** clientaddr. **TCPIPSERVICE:** tcipservice

**Explanation:** An error linking to program DFHCNV has forced CICS Web attach processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN" in the message.

**System Action:** An error response is sent to the client and processing of the request is terminated.

**User Response:** Examine the RESPONSE and REASON code values in the message to determine the cause of the error.

**Destination:** CWBO

**Module:** DFHWBXN

**XMEOUT Parameters:** date, time, applid, tranid, progname, reason, response, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcipservice

---

Users can also architect their own response and reason code values to be returned by the analyzer, but they should use values other than those defined in the CICS supplied copybook DFHWBUCD.

If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN" in the message.

**System Action:** A system dump is taken. An error response is sent to the client and the request is terminated. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CWBO

**Module:** DFHWBXN

**XMEOUT Parameters:** date, time, applid, tranid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcipservice
DFHWB0725  date time applid tranid CICS Web attach processing detected an error linking to the analyzer user replaceable module program. Host IP address: hostaddr, Client IP address: clientaddr, {1= , 2= TCPIPSERVICE: }tcpipservice

Explanation: An error linking to the Analyzer user replaceable module forced CICS Web attach processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN."

System Action: An error response is sent to the client and the request is terminated. The tcpipservice remains open but unusable.

User Response: Ensure that the program specified has been correctly installed and defined to CICS. If the user replaceable module (URM) has been set dynamically using CEMT or the SPI command, then ensure that the module is defined to CICS and enabled, or available in the library if autoinstall is active.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: date, time, applid, tranid, programname, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice

DFHWB0726  date time applid tranid CICS Web attach processing cannot link to the analyzer user replaceable program. No analyzer specified. Host IP address: hostaddr, Client IP address: clientaddr, {1= , 2= TCPIPSERVICE: }tcpipservice

Explanation: CICS Web attach processing cannot invoke the analyzer user replaceable module because none was specified for the TCPIPSERVICE associated with the request being processed. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN."

System Action: An error response is sent to the client and the request is terminated. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use CEMT SET TCPIPSERVICE to specify an analyzer name on the URM parameter. CEDA can be used to alter the stored definitions. The URM name for CICS Web TCPIPSERVICEs (those TCPIPSERVICEs which have CWXN specified as the transaction ID) MUST specify a valid analyzer program name for the URM keyword.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: date, time, applid, tranid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice

DFHWB0727  date time applid tranid CICS Web Interface attach processing could not attach the requested alias transaction tranid. Userid: userid. Host IP address: hostaddr, Client IP address: clientaddr, {1= , 2= TCPIPSERVICE: }tcpipservice

Explanation: Web attach processing could not attach a new task with the requested alias transaction ID tranid. An error response is sent to the client and processing of the request is terminated with abend code AWB2. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN."

User Response: Ensure that the alias transaction ID supplied by the Analyzer user-replaceable program has been defined to CICS.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: date, time, applid, tranid, userident, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice

DFHWB0728  date time applid tranid CICS Web attach processing detected a storage error within the Web receive module DFHWBSR. Host IP address: hostaddr, Client IP address: clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice

Explanation: A storage error in program DFHWBSR has forced CICS Web attach processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN."

System Action: An error response is sent to the client and the request is terminated.

User Response: The most probable cause of this error is there being insufficient storage to process the client request. This failure may indicate that you need to increase the size limits of the EDSAs. EDSA storage limits are specified by the EDSALIM system initialization parameter. See the CICS System Definition Guide for more guidance on EDSALIM.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: date, time, applid, tranid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice

DFHWB0730  date time applid tranid CICS Web attach processing encountered an internal error while processing a client request. Client IP address: clientaddr Host IP address: hostaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice

Explanation: An internal error has forced CICS Web processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN."

System Action: A system dump is taken. An error response is sent to the client and the request is terminated. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: date, time, applid, tranid, clientaddr, hostaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice
DFHWB0731

date time applid tranid CICS Web attach processing detected
an HTTP header longer than 32767 bytes.
Host IP address: hostaddr, Client IP address:
clientaddr, \{ | TCPIPSERVICE: |tcpipservice

Explanation: An HTTP request was being received by DFHWBSR
when it detected that the header data of the request exceeded the
currently supported maximum of 32767 bytes. If the host IP
address and the client IP address are not available when this error
occurred, these addresses will be displayed as "UNKNOWN."

System Action: Trace entry 0418 is issued containing the web
request block. The length of the HTTP header data can be inferred
from the user_data_offset field.

User Response: Examine the input HTTP request and reduce the
length of the header information to be within the allowed limit. See
the CICS External Interfaces Guide and Part 4 of the CICS
Problem Determination Guide for guidance on how to proceed.

Destination: CWBO
Module: DFHWBXN
XMEOUT Parameters: date, time, applid, tranid, hostaddr,
clientaddr, \{= , 2= TCPIPSERVICE: |tcpipservice

DFHWB0732
date time applid tranid CICS Web attach processing
encountered a sockets I/O error while receiving a
client request. Client IP address: clientaddr, Host IP
address: hostaddr, \{ | TCPIPSERVICE: |tcpipservice

Explanation: A sockets I/O error has forced CICS Web
processing to abandon a client request. If the host IP address and
the client IP address are not available when this error occurred,
these addresses will be displayed as "UNKNOWN."

System Action: The Web error program DFHWBEP is driven, but
no error response can be sent to the client. The request is
terminated.

User Response: Check for any associated sockets domain error
messages, which may give more details on the error which has
occurred. The error may have been caused by a user terminating
their Web Browser before CICS has been able to process the
request. If the problem persists, there may be a problem with the
TCP/IP network. See the CICS External Interfaces Guide and Part
4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CWBO
Module: DFHWBXN
XMEOUT Parameters: date, time, applid, tranid, hostaddr,
clientaddr, \{= , 2= TCPIPSERVICE: |tcpipservice

DFHWB1008
applid CICS Web environment initialization is
complete.

Explanation: The CICS Web 3270 environment has been
initialized, and it is now ready to process Web-related work.

System Action: Processing continues.

User Response: None.

Destination: Console
Module: DFHWBIP
XMEOUT Parameter: applid

DFHWB1009
applid CICS Web environment initialization failed.
Reason Code: X'rc'.

Explanation: The CICS Web 3270 environment initialization failed
with reason code rc.

System Action: CICS initialization continues. Subsequent calls to
the components of the CICS Web environment may fail.

User Response: Use the reason code rc to determine why
initialization failed. The possible reasons are:

1. Storage for the Web anchor block could not be
obtained.

2. Load for module DFHWBST failed.

3. Load for module DFHWBTC failed.

4. Storage for the State Manager anchor block could not
be obtained.

5. The creation of the State Token anchor block failed.

6. The subpool required for state management could not
be added.

7. The subpool required for HTTP buffers could not be
added.

8. The subpool required for WBST lock could not be
added.

9. The addition of the WBST lock failed.

A. Load for module DFHWBIP failed.

Reason codes 1 to 9 originate in DFHWBIP. Reason code A
originates from DFHSIJ1.

Destination: Console
Modules: DFHWBIP, DFHSIJ1
XMEOUT Parameters: applid, X'rc'

DFHWB1020
date time applid CICS Web State Manager could not
find state data for state token stoken for a
\{destroy | retrieve | store\} request.\{ | TCPIPSERVICE: |tcpipservice

Explanation: The CICS Web State Manager could not find the
state data for the state token stoken or the supplied state token
stoken does not exist.

System Action: The requested state data cannot be destroyed,
updated or retrieved by the Web State Manager. An exception
catch entry is made in the trace table.

User Response: Ensure that the supplied state token stoken is
correct. On a busy CICS region, the most likely cause of this error
is that the state data has been discarded by the Web garbage
collection process before the Web state manager could access it.
Check that the system initialization WEBDELAY parameters are
appropriate values. See the CICS System Definition Guide for
guidance on setting the values of the Web garbage collection interval and the Web terminal timeout interval.

**DFHWB1021** date time applid CICS Web State Manager could not find state data for state token stoken in order to perform the (initialize partnership | make partnership | break partnership | trigger partner | wait for partner | query partner | terminate partnership) request for task number taskid, CICS unit of work id X'cuowid', {1=destroy, 2=retrieve, 3=store}, {1= , 2= TCPIPSERVICE: }, tcpipservice

**Explanation:** The CICS Web State Manager could not find the state data for the state token stoken because the supplied state token stoken does not exist. The running task is task number taskid and the associated CICS unit of work id is cuowid.

**System Action:** The Web State Manager cannot therefore perform the requested partnership function for the running task. An exception trace entry is made in the trace table.

**User Response:** Ensure that the supplied state token stoken is correct. On a busy CICS region, the most likely cause of this error is that the state data has been discarded by the Web garbage collection process before the Web State Manager could access it for the running task. Check that the system initialization WEBDELAY parameters are appropriate values. See the CICS System Definition Guide for guidance on setting the values of the Web garbage collection interval and the Web terminal timeout interval.

**DFHWB1100** date time applid The CICS Web Interface received data from the user application that is longer than expected.

**Explanation:** The environment variables program has received data from a user application. However, the data received was longer than expected.

**System Action:** Exception trace point 4623 is written. The environment variables program abnormally terminates with abend code AWB7.

**User Response:** Examine the data sent to CICS from the application program.

**Destination:** Console Routecodes 2 and 12 and Transient Data Queue CWBO

**Module:** DFHWBENV

**XMEOUT Parameters:** date, time, applid

**DFHWB1200** date time applid tranid The CICS Web Interface analyzer program set parameter WBRA_USER_DATA_LENGTH to more than the maximum. Program name: programname. REASON: response. REASON: reason. Host IP address: hostaddr. Client IP address: clientaddr. Data offset: X'dataoffset'. Data length: X'datalength'. Buffer length: X'bufferlength'.{1= , 2=TCPIPSERVICE: }, tcpipservice

**Explanation:** As part of its normal processing of a request, Web attach processing invokes the user replaceable analyzer to tailor the required actions. This program is passed the length of the user data part of the HTTP request in parameter WBRA_USER_DATA_LENGTH, which it can modify. However, the modified value is greater than the maximum allowable value which represents the available space in the data buffer.

**System Action:** An error response is sent to the client and processing of the request is terminated.

**User Response:** Modify the analyzer program so that it does not set the parameter WBRA_USER_DATA_LENGTH to be greater than the maximum. The sum of the data offset and the data length should not exceed the buffer length.

**Destination:** CWBO

**Module:** DFHWBXN

**XMEOUT Parameters:** date, time, applid, tranid, programname, response, reason, hostaddr, clientaddr, X'dataoffset', X'datalength', X'bufferlength', {1= , 2=TCPIPSERVICE: }, tcpipservice

**DFHWB1525** date time applid tranid The CICS Web Interface connection manager received an unexpected response from CICS.

**Explanation:** The connection manager received an unexpected response to a CICS command. This is a logic error.

**System Action:** A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You may need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

**Destination:** CWBO and Terminal End User

**Module:** DFHWBC01

**XMEOUT Parameters:** date, time, applid, tranid

**DFHWB1551** date time applid The CWBC Transaction is no longer used to manage CICS Web resources.

**Explanation:** An attempt has been made to run the CICS-supplied transaction CWBC. This transaction is no longer used to manage CICS Web resources.

**System Action:** None. Processing continues.

**User Response:** Refer to the CICS Internet and External Interfaces Guide, and the Resource Definition Guide for details of how to manage CICS Web resources. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CWBO and Terminal End User

**Module:** DFHWBC01

**XMEOUT Parameters:** date, time, applid
DFHWB7001 HTTPD_extract for envvar failed. Processing of this request terminated rc=retcode.

Explanation: The CICS GWAPI program received an error response retcode when it executed the HTTPD_extract function to retrieve the specified environment variable envvar.

System Action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User Response: Investigate whether the &ICSS. has been correctly configured to use the CICS GWAPI DLL. Refer to the CICS External Interfaces Guide for further information.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHWBAPI

DFHWB7002 HTTPD_read for HTTP user data failed. Processing of this request terminated rc=retcode.

Explanation: The CICS GWAPI program received an error response retcode when it executed the HTTPD_read function to retrieve the user data sent with an HTTP request.

System Action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User Response: Investigate whether the &ICSS. has been correctly configured to use the CICS GWAPI DLL. Refer to the CICS External Interfaces Guide for further information.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHWBAPI

DFHWB7003 Invalid URL passed to DFHWBAPI: url. Processing of this request terminated rc=retcode.

Explanation: The CICS GWAPI program attempted to analyze the path name section of the Uniform Resource Locator url that it received from the Web browser, but has determined that its syntax is not in the standard format expected to decide which CICS region, transaction, and program should process the request.

The reason for the failure is given by one of the following values for the return code retcode.

1. The path name contains fewer than eight characters.
2. The path name does not begin with a leading slash (/) character.
3. The CICS applid is invalid.
4. The converter name is invalid.
5. The transaction name is invalid.
6. The server program name is invalid.

System Action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User Response: Investigate whether the &ICSS. has been correctly configured to use the CICS GWAPI DLL. Refer to the CICS External Interfaces Guide for further information.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHWBAPI

DFHWB7006 Link to program program_name at applid applid failed for URL url. Processing of this request terminated RESP=resp RESP2=resp2.

Explanation: The CICS GWAPI program has attempted to use the CICS External Call Interface (EXCI) to link to the Business Logic Interface program program_name in the CICS region with applid applid, but the link was unsuccessful. The EIBRESP and EIBRESP2 values from the EXEC CICS LINK command are resp and resp2.

System Action: The CICS GWAPI program terminates and returns an HTTP error response to the Web browser. If resp and resp2 indicate that there is a temporary problem establishing an Inter-Region Communication connection, the HTTP error response is 503 (system not available), otherwise it is 500 (server error).

User Response: Investigate whether the target CICS region has been correctly configured to receive EXCI requests from this &ICSS. address space.

The following must be set up:

- The target CICS region must be active.
- There must be a generic EXCI pipe, or a specific EXCI pipe for applid, installed in the target CICS region.
- Inter-Region Communication must be active in the target CICS region.

Refer to the CICS External Interfaces Guide for further information.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHWBAPI

DFHWB7007 Error detected by program program_name. Processing of this request terminated rc=retcode.

Explanation: The CICS GWAPI program has attempted to use the CICS External Call Interface (EXCI) to link to the Business Logic Interface program program_name in a CICS region, but an error response was returned by the program. The return code retcode is the Business Logic Interface response that was returned in wbbl_response.

System Action: The CICS GWAPI program terminates and returns retcode as the HTTP server response to the Web browser.

User Response: Investigate the reason for the error response.

The values that can be returned in wbbl_response are documented in the CICS External Interfaces Guide, and are generally caused by a programming error in either the converter program or the server application program.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHWBAPI

DFHWB7008 HTTPD_set for variable failed for URL url. Processing of this request terminated rc=retcode.

Explanation: The CICS GWAPI program received an error response retcode when it executed the HTTPD_set function to set a value for the specified variable variable while processing URL url.

System Action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHWBAPI

622 CICS Messages and Codes
DFHXAxxxx messages

DFHXA6521I applid CICS shutdown initiated by CEBT event

Explanation: This is an informational message issued from the CICS TCB.

System Action: CICS terminates normally.

User Response: None.

Destination: Console

Module: DFHXRCP

XMEOUT Parameter: applid

DFHXA6526I applid MESSAGE RECEIVED FOR UNSUPPORTED QUEUE 'X'queue'.

Explanation: This message is issued from the CAVM TCB. A tracking message has been received for a queue with hexadecimal name 'X'queue'. However this queue is not recognized by CICS.

System Action: CICS processing continues, but tracking messages for queue 'X'queue' are ignored.

User Response: Check that the active CICS system and the alternate CICS system are at the same functional level with respect to XRF.

If both CICS systems are at the same level, check why the active CICS system has written data to the alternate system.

Ensure that the queue name has not been corrupted.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHXRB

DFHXA6528I applid Unable to link to program proiname

Explanation: This message is issued from the CICS TCB. CICS is unable to link to program proiname.

System Action: CICS terminates abnormally with a system dump and abend code 0210.

User Response: Examine the dump to determine why CICS was unable to link to program proiname.

Ensure that the named program is not missing from the data sets concatenated in the DFHRPL DD statement. If proiname is missing, obtain a copy of the program and include it in the library. In addition, ensure that enough storage is available for the dynamic storage areas.

Destination: Console

Module: DFHXRE

XMEOUT Parameters: applid, proiname

DFHXA6530 applid START=STANDBY specified. CICS start-up is terminated because XRF=NO is specified

Explanation: START=STANDBY and XRF=NO cannot be specified together.

System Action: CICS terminates abnormally with a dump.

User Response: Correct the conflicting values of the operands START and XRF.

Destination: Console

Module: DFHSIC1

XMEOUT Parameter: applid

DFHXA6540I XRF HAS FAILED. ERROR NUMBER nn ON XRF MESSAGE DATA SET IN CONTROL INTERVAL WITH RBA HEX'xx'.

Explanation: The XRF message manager has encountered a problem with the contents of the given control interval in the message data set. The message includes an error number nn which can take one of the following values:

- 01 The Cl does not contain an XRF message manager control record.
- 02 The XRF message control record contains a cycle number less than that of the current read cycle.
- 03 The XRF message manager did not find a message record boundary where it expected one.
- 04 There is an XRF message sequence number error.
- 05 The CIDF is invalid (for example, the free area length is negative).
- 06 The length in the RDF is less than the length of a message record header, or is inconsistent with the data length in the message record header.
- 07 The end of the record lies outside the data area defined by the data length field of the CIDF.

System Action: Surveillance by the alternate system ceases.

User Response: Check that the active and alternate systems are using the same pair of data sets for XRF surveillance. If they are, this is almost certainly a CICS error affecting either the alternate system, the active system, or both.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
**DFHXA6541I**

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWMRD

---

**DFHXA6541I XRF HAS FAILED. THE XRF MESSAGE READER IN THE ALTERNATE SYSTEM HAS FALLEN TOO FAR BEHIND.**

**Explanation:** The alternate system has been unable to keep up with the messages generated by the active CICS system. Its read position in the wrap-round message data set has been 'lapped' by the active system.

**System Action:** Surveillance by the alternate system ceases.

**User Response:** Try to determine and correct the reason for the delay to the alternate system. It may be that the message data set is too small to allow adequate buffering, or the message data set has been reserved by the active CEC – not necessarily by the active CICS.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWMRD

---

**DFHXA6560I applid TERMINATION COMMAND FAILED:**

**command.**

**Explanation:** The command issued by the alternate CICS during takeover to terminate the active CICS failed. MVS rejected the system operator command command issued under program control as being invalid.

**System Action:** Message DFHXA6581 or DFHXA6582 is also displayed. The alternate CICS continues with its processing to detect termination of the active CICS job.

**User Response:** Ensure that the active CICS job terminates. See messages DFHXA6581 and DFHXA6582. For problem determination, hard copy of the console log may be required.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWTI

---

**DFHXA6561D applid WHEN jesno jobname ENDS REPLY 'JOB' OR WHEN CEC sid HAS FAILED REPLY 'CEC'.**

**Explanation:** During a takeover attempt, the issuing CICS system was unable to determine whether job jobname, running on a different CEC, has terminated. This is for one of the following reasons:

- CICS was unable to issue a system operator command under program control to cancel the named job. In this case message DFHXA6560, DFHXA6569 or DFHXA6570 has been produced.
- CICS has either successfully issued a cancel command, or job jobname is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

If jobname is the active CICS. Takeover cannot continue until jobname has ended. If jobname is a DBCTL subsystem, an alternate DBCTL cannot be started until jobname has ended.

**System Action:** The system waits for a reply. In the meanwhile, the issuing CICS system continues processing to detect termination of the job.

If termination is detected while the reply is still outstanding, this message is deleted and message DFHXA6564 is displayed. In this case, a reply is no longer required.

If the reply is ‘JOB’, then processing continues as if CICS had detected the termination itself.

This also happens if the reply is ‘CEC’, but in addition an internal record is created indicating that the CEC is inoperative at this time.

Other alternate CICS which have issued this message for jobs executing on the CEC specified, and which are still waiting for a reply, will detect the internal record of the failed CEC. Having done so they delete their outstanding replies and issue message DFHXA6563.

**User Response:** The operator should either:

- Ensure that job jobname with JES number jesno terminates, and then reply 'JOB', or
- Ensure that the CEC with MVS system identifier sid is inoperative at this time, for example by selecting SYSTEM RESET on that CEC, and then reply ‘CEC’.

No action is necessary if at any time CICS deletes this message, as described above.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWTI

---

**DFHXA6563I applid jesno jobname ENDED DUE TO FAILURE OF CEC sid.**

**Explanation:** During takeover, the alternate CICS has detected that the CEC with MVS system identifier sid has failed and therefore that the active CICS job with job name jobname and JES job number jesno is regarded to have ended.

**System Action:** The alternate CICS continues with its takeover processing.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWTI

---

**DFHXA6564I applid TERMINATION OF jesno jobname DETECTED.**

**Explanation:** During takeover, the alternate CICS has detected that the active CICS job with specified job name and JES job number has ended.

**System Action:** The alternate CICS continues with its takeover processing.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWTI
DFHXA6566I applid modname NOT LINK-EDITED REENTERABLE.

Explanation: Module modname, the CLT or RST currently in use, was found not to have been link-edited with the reenterable module attribute.

The initialization option CLT=xx or RST=xx specifies the suffix of the CLT or RST currently in use by this alternate CICS.

System Action: Further messages are issued which describe the action taken by CICS.

User Response: The appropriate response is indicated by subsequent messages.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWTI

DFHXA6567I applid APPLID applid2 NOT FOUND IN modname.

Explanation: Module modname, the CLT or RST currently in use by this alternate CICS, was found not to contain the APPLID applid2.

System Action: Further messages are issued which describe the action taken by CICS.

User Response: The appropriate response is indicated by subsequent messages.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWTI

DFHXA6568I applid JOBNAME jobname NOT FOUND IN modname.

Explanation: Module modname is either a CLT or an RST.

If the module is a CLT, it was found not to contain the job name jobname associated with the APPLID of this alternate CICS.

If the module is an RST, it was found not to contain the job name jobname associated with the DBCTL subsystem identified in the message.

jobname is the job name which the alternate CICS would have used to cancel the active CICS job or DBCTL job during a takeover.

System Action: Further messages are issued which describe the action taken by CICS.

User Response: The appropriate response is indicated by subsequent messages.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWTI

DFHXA6569I applid MVS SYSTEM IDENTIFIER sid NOT FOUND IN DFHCLTxx.

Explanation: The CLT currently in use was found not to contain the specified MVS system identifier sid, which identifies the CEC on which the active CICS was executing.

The initialization option CLT=xx specifies the suffix of the CLT currently in use by this alternate CICS.

System Action: Further messages are issued by the alternate CICS to describe the action taken.

User Response: None. For further information about defining CICS as an MVS subsystem, see the CICS Transaction Server for OS/390 Installation Guide.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWTI

DFHXA6570I applid JES SUBSYSTEM NAME jesname NOT FOUND IN DFHCLTxx FOR MVS SYSTEM sid.

Explanation: The CLT currently in use does not contain the JES subsystem name jesname associated with the MVS system sid of the CEC on which the active CICS was executing.

The initialization option CLT=xx specifies the suffix of the CLT currently in use by this alternate CICS.

System Action: Further messages are issued by the alternate CICS to describe the action taken.

User Response: The appropriate response is indicated by subsequent messages.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWTI

DFHXA6571I applid CICS IS NOT DEFINED AS AN MVS SUBSYSTEM.

Explanation: The alternate CICS attempted to access an internal record of CEC failures to determine whether the CEC on which the active CICS job was executing had failed. To access this information CICS has to be defined as an MVS subsystem.

Because it is not, the attempt failed.

System Action: Processing continues.

User Response: None. For further information about defining CICS as an MVS subsystem, see the CICS Transaction Server for OS/390 Installation Guide.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWTI

DFHXA6572I applid UNABLE TO LOAD modname.

Explanation: The module modname, defined by the CLT or RST for use by the alternate CICS that issued this message, cannot be loaded.

System Action: Further messages are issued by the alternate CICS to describe the action taken.

User Response: The appropriate response is indicated by subsequent messages.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWTI
**DFHXA6573I**  
*applied LOAD MODULE  modname IS NOT VALID.*

**Explanation:** Module modname, the CLT or RST defined for use by this CICS system, is not valid.

**System Action:** Further messages are issued by the alternate CICS to describe the action taken.

**User Response:** The appropriate response is indicated by subsequent messages.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWTI

---

**DFHXA6574I**  
*applied ERROR FOUND WITH DFHCLT.xx.*

**Explanation:** The alternate CICS that issued this message is unable to load a CLT, or has performed a check on the CLT contents and has found an error. If the specified CLT is used during a future takeover, the takeover might not be successful. A new or corrected CLT can be made available and loaded at takeover.

**System Action:** Processing continues.

**User Response:** Verify that the alternate CICS job is authorized to perform a takeover of the active CICS. Take appropriate action if not.

Locate the previous message issued by this alternate CICS, which provides details of the CLT error.

Perform the appropriate source edit, assembly and link-edit tasks necessary to make a correct CLT available for this alternate CICS.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWTI

---

**DFHXA6575I**  
*applied SUBSYSTEM NAME subsystem NOT FOUND IN rstname FOR THIS APPLID.*

**Explanation:** This is an informational message indicating that RST rstname, which was selected via the SIT, does not include an entry for DBCTL subsystem subsystem in any RSE containing the specific APPLID applied of this CICS.

**System Action:** No action results directly when this message is issued. Other messages may be issued following this verification failure.

**User Response:** Check the RST suffix specified in the SIT, the RST, and the DBCTL subsystem to which CICS is connected.

Check any other messages that may also have been issued.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWTI

---

**DFHXA6576I**  
*applied CLT PROCESSING NOT POSSIBLE OWING TO ERROR IN DFHCLT.xx.*

**Explanation:** During takeover, the alternate CICS that issued this message performed a check on the CLT contents and found an error.

A previous message specifies the error.

**System Action:** Commands in the CLT are not issued by this alternate CICS. Other takeover processing continues.

**User Response:** Verify that the alternate CICS job is authorized to perform a takeover of the active CICS and take appropriate action if it is not.

If the takeover is to be successful, the system operator should monitor and coordinate execution of the active CICS and alternate CICS jobs in the XRF complex.

Perform the source edit, assembly and link-edit tasks necessary to correct the CLT.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWTI

---

**DFHXA6577I**  
*applied NOT AUTHORIZED TO CANCEL jesno jobname ON CEC sid.*

**Explanation:** The issuing alternate CICS is attempting a cancel of the specified active CICS job. It has been unable to find the data that is needed to fully authorize takeover in the CLT or RST. This may be because the alternate cannot load the table, or because job jobname cannot be found:

- In the CLT, for an active CICS, or
- In the RST, for a DBCTL subsystem, or
- Because the CLT or RST is invalid.

Further messages specify the error with the CLT or RST, or define why the CLT or RST is invalid.

**System Action:** The issuing CICS system cannot issue a CANCEL, but attempts to alert the active CICS system to the takeover request via the XRF control data set. In most cases this causes the active system to initiate termination. The alternate continues processing to detect termination of the job.

When termination is detected, message DFHXA6563 or DFHXA6564 is displayed.

**User Response:** Verify that the alternate CICS job is authorized to perform a takeover of the active CICS. Take appropriate action if the alternate CICS job is not authorized.

Your CLT and/or RST may require some maintenance action.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWTI

---

**DFHXA6578I**  
*applied NOT AUTHORIZED TO CANCEL jesno jobname.*

**Explanation:** The issuing alternate CICS is attempting a cancel of the specified active CICS job. It has been unable to find the data that is needed to fully authorize the cancellation in the CLT or RST. This may be because the alternate cannot load the table, or because job jobname cannot be found:

- In the CLT, for an active CICS, or
- In the RST, for a DBCTL subsystem, or
Chapter 1. DFH messages

DFHXA6580I PROGRAM LOGIC ERROR DETECTED.

Explanation: An internal error has been detected that prevents the CICS XRF CAVM supervisor state processing from continuing. Depending on the CAVM supervisor state service being processed at the time, CICS may or may not abnormally terminate.

The CAVM TCB for processing the service has abnormally terminated.

Job output should include a dump of MVS LSQA associated with the SYSABEND DD statement.

Diagnostics: Register 2 is the base register for DFHWTI global storage. This storage begins with the eye catcher WTISTOR. The format of this storage is defined in DSECT WSTORAGE in source member DFHWTI.

DFHWTI request arguments copied to global storage begin at field WGLODATA.

Source member DFHWTDADS defines the format of global storage arguments.

Field WGLOLOCA contains the address of the first register save area for a routine in DFHWTI.

In the SVRB for the CICS SVC call that invoked DFHWTI, the first fullword in the FEPARM field contains the address of DFHWTI global storage.

Register 4 is the base register for local storage for each routine in DFHWTI. Its format is defined in a DSECT whose name is of the form WLOCxxx where xxx is the short name of the routine (see below for a list of routine names).

These DSECTs are in source member DFHWTI. The first halfword is the internal return code for the routine. The values used for internal return codes are the same as the DFHWTI request reason codes as defined in source member DFHWTDADS field name WTARRC.

In addition, internal return codes of the format X40nnn are used. X40F0 is ‘Internal Logic Error’ variable name, RCLOGERR.

Other internal return codes of this format are defined in the local storage DSECTs.

The DFHWTI request type for the CAVM supervisor state service is copied into local storage associated with the DFHWTI initialization and termination routine, field name WWTIREQ, DSECT WLOCWTI in source member DFHWTI.

Register 6 is the base register for each routine in DFHWTI. When set, it points at a location immediately following an eye catcher of the routine’s long name (see list of routine names).

Register 13 is the base register for a register save area local to a routine in DFHWTI. These save areas are standard MVS format except the first fullword contains the routine’s short name (see list of names). They are chained in the standard way with backward and forward pointers set on entry to a routine and zeroed on return.

Register save areas physically precede the storage local to a routine.

If a routine has to access the CLT, its address is in local storage for the routine. The field name for the CLT address is of the form WxxxxCLTA, where xxx is the short name of the routine.

System Action: In general, the CAVM request issued by this CICS job will fail. For the effect this has on processing by this CICS job, refer to messages issued after this one.

CAVM XRF supervisor state processing issues an MVS abend with system abend code 0214 and an MVS SYSABEND dump is produced.

User Response: Keep the job output and console log for problem determination.

Using the SYSABEND dump of the MVS LSQA, and if available, the MVS symptom dump output, find the DFHWTI routine that detected the error from the value of register 6 or register save area chain fields.

Find the internal return code currently set in local storage for the routine.

Using the reason code value, remaining content of local storage and global storage, try to determine the cause of the action by the routine.

An assembly listing of the CLT assembled with the PRINT NOGEN option may be required.

Routine names

Long names are used for:
- The routine entry point name, and
- The routine entry eye catcher.

Short names are used for:
- The routine register save area eye catcher,
- Characters 2 to 4 of routine local storage field names,
- Characters 5 to 7 of routine local storage DSECT names, and
- Characters 1 to 3 of routine labels.

Routines are as follows:

DFHXA6581I applid UNABLE TO DETERMINE STATUS OF JOB jesno jobname.

Explanation:  The issuing CICS system was unable to determine whether job jobname , running on the same CEC, has terminated.  This is for one of the following reasons:
1. CICS was unable to issue a system operator command under program control to cancel the named job.  In this case, message DFHXA6560 has been produced.
2. CICS has successfully issued a cancel command, but the job still appears to be running after the time period specified by the initialization parameter JESDI.
3. Job jobname is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

If jobname is the active CICS, takeover cannot continue until jobname has ended.
If jobname is a DBCTL subsystem, an alternate DBCTL cannot be started until jobname has ended.

System Action:  Takeover is suspended until the issuing CICS system detects the termination of the named job.

When termination is detected the message DFHXA6583 is displayed.

User Response:  Ensure that the active CICS job terminates.

Note:  This message cannot be changed with the message editing utility.

DFHXCxxxx messages

DFHXC660I applid CAVM DATA SET INITIALIZATION FAILED.

Explanation:  The CICS job which displayed this message attempted to sign on to the CAVM but the signon request failed because the CAVM data sets could not be initialized properly.  This is due to one of the following:
• The data set formatting subtask had not completed its processing in 2 minutes.  This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs cause a CAVM data set’s DASD volume or a VSAM catalogue to remain inaccessible for a protracted period.
• SIGNON found that one of the CAVM data sets had already been formatted by a different CICS job but that the other was either empty or could not be opened because of conflict with another user of the data set.  SIGNON waited for the other CICS job to finish the data set formatting, but 5 minutes later, this still had not been done.  This might occur if a CICS job failed during data set formatting.  A specific error reported in a previous message prevented successful completion of data set initialization.

System Action:  See following message issued by this CICS job.
User Response:  Correct the JCL or redefine the CAVM data sets if necessary and resubmit the CICS job.  See the CICS System Definition Guide for information on CAVM data sets.
DFHXC6601I <applid> DD STATEMENT MISSING FOR CAVM DATA SET <dsname>

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to open the CAVM data sets, but the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Destination: Console
Module: DFHWSSN3

DFHX6616I  applid CAVM CONTROL AND MESSAGE DATA SETS MUST BE DISTINCT.

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to format the CAVM data sets, but the ddnames DFHRMSM and DFHXRCTL refer to the same data set.

System Action: See following message issued by this CICS job.
User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWSSN3

DFHX6617I  applid OBTAIN ERROR WHILE FORMATTING CAVM DATA SET dsname

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to gain exclusive access to a CAVM data set to format it. The CAVM issued a reserve macro specifying the DASD device allocated for the data set and then issued an OBTAIN macro for the volume's Format-4 DSCB to cause a hardware reserve command to be executed if necessary. Possible causes of the OBTAIN failure are:

- Specified volume not mounted
- I/O error
- VTOC is invalid.

System Action: See following message issued by this CICS job.
User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWSSN3

DFHX6618I  applid SPACE ALLOCATED TO CAVM DATA SET dsname IS INADEQUATE.

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM. The CAVM is attempting to format the CAVM data sets, but the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.
User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWSSN3

DFHX6620I  applid SIGNON IS WAITING TO RESERVE OR ACCESS A CAVM DATA SET.

Explanation: The CICS job that displayed this message issued a sign on to the CAVM. CAVM is attempting to reserve the CAVM control data set or access either the control or the message data set, but for some considerable time either the required resource has remained unavailable or an outstanding I/O request has not completed. The reserve attempt should not fail unless another CICS job using the same CAVM data set and executing a sign on, sign-off or takeover request has been held up, possibly by I/O delays, after issuing a successful reserve. I/O delay might be caused by reserves issued by jobs (not necessarily CICS) running in other CECs that have made the CAVM data set's DASD volume temporarily inaccessible.

System Action: See message DFHXC6607.
User Response: See message DFHXC6607.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWSSN2

DFHX6621I  applid CAVM SIGNON CANNOT PROCEED BECAUSE JES IS EITHER NOT RUNNING OR NOT RESPONDING TO JOB STATUS ENQUIRIES.

Explanation: The CICS job that displayed this message issued a sign on to the CAVM. To process the request, CAVM needs to know the status of a job identified by an entry in the control data set, but cannot obtain this information for the reason given in the message text.

System Action: After a one minute delay, the CICS job that displayed this message reissues the failing job status enquiry. If the request is completed successfully this time, normal processing continues. Otherwise, this message is reissued.

User Response: If JES is not running, restart it if possible.

Otherwise, if the condition persists, try to correct the problem that is preventing job status enquiries from being answered. In some cases, just stopping JES and restarting it again may achieve the desired effect. In a JES2 environment, a possible cause of this trouble is that another CEC has failed after reserving the DASD volume containing the check-point data set. See message DFHXC6607. In a JES3 environment, job status enquiries cannot be answered if the global processor has failed.

Note: This message cannot be changed with the message editing utility.

DFHX6622I  applid ERROR IN INQUIRE HEALTH EXIT DURING SIGNON.

Explanation: The CICS job that displayed this message issued a SIGNON to the CAVM, but the return code passed back to CAVM by the INQUIRE HEALTH exit (DFHXRC) when it was called during sign on processing was nonzero. This message always indicates an internal error in CAVM or CICS.

System Action: CAVM SIGNON continues but XRF function is probably degraded.

User Response: Inform your installation's system programmer.

Module: DFHWSSN2

DFHXC6625I applid CAVM SIGNON IMPOSSIBLE BECAUSE CAVM DATA SETS ARE UNUSABLE.

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWSSN2

DFHXC6626D applid POSSIBLE CAVM SIGNON CONFLICT. IS JOB jobname,jesno running on system sid? REPLY 'YES' OR 'NO'.

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM but the CAVM needs the operator’s help in order to decide whether it is safe to accept the request. The CAVM has found that the control data set refers to a job satisfying all the following conditions:

- JES believes that this job is still executing.
- If JES is right, the current sign on request must be rejected because the presence of this job would conflict with it.
- This job is not running in the same CEC as the CICS job which is attempting to sign on.
- This job’s surveillance signals appear to be absent.

Such a situation might have arisen as a result of a failure of the CEC in which the conflicting job was running and if so, the CAVM should not reject the sign on request unless it finds another reason for doing so. If the job which displayed this message is a CICS active, the conflicting job is another active or an alternate which has started a take over. If the job which displayed this message is a CICS alternate, the conflicting job is another alternate. The jobname, JES job identifier and CEC SMF identifier of the conflicting job are specified in the message text.

System Action: The CICS job waits for a reply.

User Response: If the job which displayed this message is a CICS active job, reply NO only if:
1. You are certain that the job referred to in the message text is not executing. It might be necessary to perform a System Reset of the CEC where it was running to guarantee this.
   AND
2. The job which issued this message ought to continue with its CAVM sign on request and become the CICS active job.

Otherwise reply YES.

If the job which displayed this message is a CICS alternate job, reply NO only if:
1. You are certain that the job referred to in the message text is not executing. It might be necessary to perform a System Reset of the CEC where it was running to guarantee this.
   AND
2. The job which issued this message ought to continue with its CAVM sign on request and become the CICS alternate job.

Otherwise reply YES.

Note: This message cannot be changed with the message editing utility.

Module: DFHWSSN2

DFHXC6627I applid CAVM SIGNON IMPOSSIBLE BECAUSE THIS JOB IS CURRENTLY SIGNED ON OR WAS ONCE AN ACTIVE SYSTEM.

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: This message indicates an internal error has occurred.
Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWSSN2

**DFHXC6628I applid CAVM SIGNON IMPOSSIBLE AT PRESENT BECAUSE CONFLICTING JOB(S) HAVE NOT YET SIGNED OFF OR TERMINATED.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.
User Response: None unless the wrong START option has been requested for the new job or the conflicting job(s) were started by mistake. If so, resubmit the failing CICS job with appropriate corrections or after canceling the conflicting job(s).

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWSSN2

**DFHXC6629I applid CAVM SIGNON IMPOSSIBLE BECAUSE REQUESTING JOB AND SIGNED-ON JOB(S) DO NOT SHARE A COMMON JES JOB QUEUE.**

Explanation: The CICS job which issued this message issued a sign on to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.
User Response: If any of the signed on jobs are running under the control of the wrong JES, cancel them. Resubmit the failing job and any that had to be canceled, ensuring that all are running under the control of either a single JES or multiple JESs that share a common job queue.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWSSN2

**DFHXC6630I applid TAKEOVER REJECTED BECAUSE LAST ACTIVE INSTANCE NUMBER DOES NOT MATCH THAT SPECIFIED.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text. This error would occur if a new CICS active job signed on to the CAVM after this CICS alternate job had already made the decision to attempt to take over from the previous CICS active job.

System Action: See following message issued by this CICS job.
User Response: None
Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWSTKV

**DFHXC6631I applid TAKEOVER REJECTED BECAUSE LAST ACTIVE VERSION NUMBER DOES NOT MATCH THAT SPECIFIED.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text.

System Action: See following message issued by this CICS job.
User Response: None
Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWSTKV

**DFHXC6632I applid TAKEOVER REJECTED BECAUSE A TAKEOVER IS ALREADY IN PROGRESS.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text.

System Action: See following message issued by this CICS job.
User Response: None
Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWSTKV

**DFHXC6633I applid TAKEOVER REJECTED BECAUSE NECESSARY TOD CLOCK DIFFERENCE INFORMATION IS NOT AVAILABLE.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text. This error cannot occur unless both the following conditions are satisfied:

- The CICS active and alternate jobs are running in different CECs.
- A TAKEOVER has been attempted before the alternate job has had the chance to observe the active job’s surveillance signals for the short time (less than 1 minute) needed to deduce the maximum possible difference between the respective TOD clocks.
The takeover cannot be performed unless the difference between the CECs' TOD clocks is known because normal CICS processing must not be resumed until the current TOD clock reading is later than the TOD clock reading when the old CICS active job terminated as observed in the CEC where it had been running.

System Action: See following message issued by this CICS job.
User Response: None
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWSTKV

**DFHX6635I applid TAKEOVER PROCESSING TERMINATED BECAUSE ANOTHER BACKUP HAS STARTED A PRE-EMPTIVE TAKEOVER.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM and the request was accepted, but the error condition described in the message text was encountered before the completion of TAKEOVER.

System Action: See following message issued by this CICS job.
User Response: None
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWSTKV

**DFHX6636I applid TAKEOVER PROCESSING TERMINATED BECAUSE STATUS OF ACTIVE JOB CANNOT BE DETERMINED.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM and the request was accepted, but takeover processing could not be completed because of an error encountered in using the CAVM services provided by the CICS SVC.

System Action: See following message issued by this CICS job.
User Response: For problem determination, consult the CICS Problem Determination Guide. The console log and job output may be required.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWSTKV

**DFHX6637I applid TAKEOVER IS WAITING TO RESERVE OR ACCESS THE CAVM CONTROL DATA SET.**

Explanation: The CICS job that issued this message issued a TAKEOVER request to the CAVM. CAVM is attempting to reserve or access the CAVM control data set in order to process the request, but for some considerable time, either the required resource has remained unavailable or an outstanding I/O request has not completed. The reserve attempt should fail unless another CICS job using the same CAVM data set and executing a SIGNON, SIGNOFF or TAKEOVER request has been held up, possibly by I/O delays, after issuing a successful reserve.

System Action: See message DFHX6607.
User Response: See message DFHX6607.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWSSW

**DFHX6638I applid NOTIFY RC= retcode - text**

Explanation: The CICS job that displayed this message has found that the return code passed back to CAVM by the NOTIFY exit (DFHXRB) was non-zero. The message includes the actual return code value retcode (or greater than 99) and some text identifying the type of event which was being processed when the error occurred. This message always indicates either an internal error in CAVM or CICS or that code or data has become corrupted.

System Action: Processing continues but XRF function is probably degraded.
User Response: Inform your installation's system programmer.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWSTKV

**DFHX6640I applid ALL STATUS WRITERS ARE IN I/O WAIT.**

Explanation: The CICS job which displayed this message has found that the writes of its latest status issued to the control data set and the message data set are both taking a long time to complete. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs have made the DASD volumes of both CAVM data sets temporarily inaccessible.

System Action: The CICS job re-issues this warning message at intervals until one of its status writes completes. Meanwhile, it continues to perform any processing which is not dependent on status write completion. If the job which displayed this message is a CICS active and the condition persists for long enough, it is possible that an unwanted takeover will be initiated when the alternate (assuming that it is able to read the CAVM data sets because it is running in a different CEC) notices that the active system's surveillance signals have ceased.

User Response: If this message is issued by an CICS active job which does not seem to be experiencing other problems, it might be advisable to issue a suitable command to the corresponding alternate job to prevent it from initiating an unnecessary takeover. See also message DFHX6607.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWSSW

**DFHX6641I applid STATUS WRITE I/O ERROR ON dsname**

Explanation: The CICS job which displayed this message has encountered an I/O error in writing its latest status to either the control data set or the message data set.

System Action: If the CICS job is able to write its status successfully to either the control data set or the message data set, processing continues. Further writes to the failing data set might be attempted later on because it is possible that the error condition was transient. If both data sets become unusable simultaneously, the CAVM TCB ABENDS.

User Response: Inform your installation's system programmer.
Note: This message cannot be changed with the message editing utility.
Destination: Console
**Module:** DFHWSSW

**DFHX6642I** **applid** ALL STATUS READERS ARE IN I/O WAIT.

**Explanation:** The CICS job which displayed this message has found that the reads it has issued to the control data set and the message data set to obtain the latest available status of its partner system are both taking a long time to complete. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs have made the DASD volumes of both CAVM data sets temporarily inaccessible.

**System Action:** The CICS job reissues this warning message at intervals until one of the status reads completes. Meanwhile, it continues to perform any processing which is not dependent on status read completion. If the job which displayed this message is a CICS alternate, it is possible that a takeover will not be initiated if the active fails, since the alternate cannot detect that the active’s surveillance signals have ceased.

**User Response:** See message DFHX6607.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWSSR

**DFHX6643I** **applid** STATUS READ I/O ERROR ON dsname

**Explanation:** The CICS job which displayed this message has encountered an I/O error in reading the latest available status of its partner system from either the control data set or the message data set. dsname is the name of the data set.

**System Action:** Processing continues but XRF function will be degraded because the affected system might not be able to detect changes in its partner’s status. Further reads from the failing data set might be attempted later on because it is possible that the error condition was transient. If this error is encountered in an alternate system while it is processing a takeover request, the takeover will fail.

**User Response:** Inform your installation’s system programmer.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWSSR

**DFHX6644I** **applid** NOTIFY RC= retcode - text

**Explanation:** The CICS job which displayed this message has found that the return code passed back to CAVM by the NOTIFY exit (DFHXRB) was non-zero. The message includes the actual return code value retcode (or a value greater than 99) and some text identifying the type of event that was being processed when the error occurred. This message always indicates either an internal error in CAVM or in CICS, or that code or data has become corrupted.

**System Action:** Processing continues but XRF function is probably degraded.

**User Response:** Inform your installation’s system programmer.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWSSR

**DFHX6645I** **applid** ERROR IN INQUIRE HEALTH EXIT.

**Explanation:** The CICS job which displayed this message has found that the return code passed back to CAVM by the INQUIRE HEALTH exit (DFHXRC) was nonzero. This message indicates either an internal error in CAVM or in CICS, or that code or data has become corrupted.

**System Action:** Processing continues but XRF function is probably degraded.

**User Response:** Inform your installation’s system programmer.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWSTI

**DFHX6646I** **applid** ERROR CALLING CICS SVC - xxxxxxxxxxxx

**Explanation:** The CICS job which displayed this message has encountered an error calling the CICS supervisor service (SVC) to determine the status of another MVS image in the same XCF sysplex as the calling CICS MVS image.

**System Action:** Processing continues but XRF function is probably degraded.

**User Response:** Ensure that the correct level of CICS SVC has been specified. Also ensure that MVS has issued an acceptable return code as this error can be caused by a change in MVS response codes. If the error is caused by neither of these, it could be the result of an internal error in CAVM. If this is the case, you need further guidance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWSSR

**DFHX6649I** **applid** SIGNOFF IS UNABLE TO RESERVE THE CAVM CONTROL DATA SET.

**Explanation:** The CICS job which issued this message issued a SIGNOFF request to the CAVM or SIGNOFF processing was invoked implicitly by abnormal termination of the CAVM TCB. CAVM attempted to reserve the CAVM control data set in order to process the request, but for some considerable time, the required resource remained unavailable. The reserve attempt should not fail unless another CICS job using the same CAVM data set and executing a SIGNOFF, SIGNOFF or TAKEOVER request has been held up, possibly by I/O delays, after issuing a successful reserve.

**System Action:** The CAVM TCB terminates without updating the CAVM data sets to indicate that this CICS job has signed off. See also any following message issued by this CICS job.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHWSSOF
DFHX6650I applid CAVM HAS FAILED, CODE = code

Explanation:

System Action: An ABEND U0218 is issued with a reason code equal to the code in message DFHX6650. This results in abnormal termination of the CICS XRF job. See also any following messages issued by this CICS XRF job.

User Response: Inform your installation's system programmer.

DFHXGxxxx (XRF general) messages

DFHXG6215 applid progranme operation failure, response code cccc cccc keyrange: rrrr, {1=., 2= key: }key

Explanation: Table builder services (DFHTBSS) failed in an operation on the global catalog (DFHCCCC).

The failing operation is shown in the message, and is a DELETE, WRITE_NEXT, START_WRITE or END_WRITE request.

- cccc cccc are the response and reason codes from the catalog domain.
- rrrr is the internal RO token passed to the catalog domain.
- key appears in the message only for a WRITE or DELETE operation, and usually includes the name of the resource for which CICS failed to record information on the global catalog.

This is normally an internal CICS error, however, it can occur during shut down if one task initiates a normal shut down, and another initiates an immediate shut down shortly afterwards. This is because the immediate shut down closes resources that are being used by the normal shut down task.

This can also occur if the global catalog is not big enough and a large group is being installed.

System Action: CICS terminates.

User Response: Check the size of the global catalog. Redefine a larger one if necessary.

Alternatively this message could be caused by an immediate shutdown of CICS because tasks not yet quiesced may attempt to access a service removed by the shutdown process.

Module: DFHXRF

DFHXG6411I applid Sign off abnormal from the CAVM detected.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that alternate CICS has signed off from the CAVM.

System Action: The system continues with normal processing. However, you should be aware that takeover does not occur if the active CICS fails.

User Response: Determine the reason for the abnormal sign-off.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: applid
DFHXG6415I applid CICS is being taken over. Execution will be terminated.
Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has accepted a takeover request from alternate CICS.
System Action: CICS is terminated abnormally with abend code 206.
User Response: None.
Destination: Console
Module: DFHXRSP
XMEOUT Parameter: applid

DFHXG6416I applid APPARENT FAILURE OF ALTERNATE CICS DETECTED.
Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the alternate CICS appears to have failed.
System Action: The system continues with normal processing. However, you should be aware that takeover may not occur should the active CICS fail.
User Response: Determine the reason for the apparent failure of the alternate CICS.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHXRSP

DFHXG6417I applid Recovery of alternate CICS detected.
Explanation: This is an informational message issued from the CICS TCB. It indicates that alternate CICS has recovered from the apparent failure reported by message DFHXG6416.
System Action: The system continues with normal processing.
User Response: None.
Destination: Console
Module: DFHXRSP

DFHXG6422I applid Sign off normal from the CAVM assumed.
Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has assumed that the alternate CICS has signed off from the CAVM.
This is likely to occur when the active CICS is running on CEC 1 and:
1. the CICS alternate is started on CEC 2, or
2. the CEC 2 initial program load is repeated, or
3. CICS alternate is restarted on CEC 2.
System Action: CICS processing is continued.
User Response: None.
Destination: Console
Module: DFHXRSP

DFHXG6440I I/O ERROR ON XRF MESSAGE DATA SET. RPL ADDRESS = HEX'xx'.
Explanation: VSAM reported a physical I/O error on the XRF message data set. The address 'xx' is that of the VSAM RPL which reported the error.
System Action: Surveillance by the XRF system ceases.
User Response: It is necessary to restart both the active and alternate CICS systems with a fresh pair of surveillance data sets. For diagnostic purposes, the message gives the address of the RPL being used at the time the error was reported. The RPL has an associated VSAM message area.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWMMT

DFHXG6441I LOGICAL ERROR ON XRF MESSAGE DATA SET. VSAM FEEDBACK DATA = HEX'xx'.
Explanation: VSAM reported a logical error on the XRF message data set.
System Action: Surveillance by the XRF system ceases.
User Response: This is an error in the CICS system. For diagnostic purposes the message contains the VSAM feedback data for the error.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWMMT

DFHXG6442I INTERNAL ERROR IN XRF MESSAGE MANAGER.
Explanation: Request chains maintained by the CICS message manager are in an inconsistent state.
System Action: Surveillance by the XRF system ceases.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWMMQS

DFHXG6443I INTERNAL ERROR IN XRF SURVEILLANCE COMPONENT.
Explanation: An invalid internal call has been made to a routine in XRF surveillance component.
System Action: Surveillance by the XRF system ceases.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWCCS

DFHXG6444I VSAM REQUEST REJECTED FOR XRF MESSAGE DATA SET.
Explanation: A VSAM PUT or GET request directed to the XRF message data set has been rejected.
System Action: Surveillance by the XRF system ceases.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWMMT

DFHXG6445I XRF MESSAGE DATA SET FORMATTING STARTED.
Explanation: The XRF message data set is new and must be formatted before it can be used to pass messages from the active to the alternate.
System Action: Normal service continues.
User Response: Depending on the size of the message data set, there will be some delay before the active can send messages to the alternate. It may be advisable to defer starting an alternate system until the corresponding message DFHXG6446 has been received.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWMMT

DFHXG6446I XRF MESSAGE DATA SET FORMATTING COMPLETED.
Explanation: The XRF message data set has now been formatted. It can be used to pass messages from the active to the alternate.
System Action: Normal service continues.
User Response: None. See message DFHXG6445.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWMMT

DFHXG6447I NON CRUCIAL XRF MESSAGE(S) DISCARDED.
Explanation: The XRF message data set is full. Some messages are being discarded in preference to invalidating the alternate system by overwriting messages that it has not yet read.
System Action: Normal service continues.
User Response: This situation is likely to arise in circumstances similar to those described for message DFHXA6541. The alternate has not yet become invalid but is likely to become so and corrective action is warranted. Refer to message DFHXA6541 for further guidance.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWMMWR

Chapter 1. DFH messages 639
DFHXG6450I SVC GETMAIN FAILED IN XRF SURVEILLANCE.
Explanation: An SVC GETMAIN issued by the CICS surveillance component has failed. The GETMAIN may have been issued under either the CICS TCB or the XRF TCB.
System Action: An MVS abend 0190 is issued.
User Response: Since the GETMAIN requests storage above the 16MB line, it is extremely unlikely that the request cannot be satisfied.
A system error may have occurred. If this is the case, you will require further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWCCS

DFHXG6451I SVC GETMAIN FAILED IN XRF SURVEILLANCE.
Explanation: An SVC GETMAIN issued by the CICS surveillance component has failed. The GETMAIN may have been issued under either the CICS TCB or the XRF TCB.
System Action: An MVS abend 0191 is issued.
User Response: Since the GETMAIN requests storage above the 16MB line it is extremely unlikely that the request cannot be satisfied.
A system error may have occurred. If this is the case, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWLGET

DFHXG6452I INTERNAL ERROR IN XRF SURVEILLANCE.
Explanation: A consistency check made by the XRF LIFO storage manager has failed. The failure may have occurred while running under either the CICS TCB or the XRF TCB.
System Action: An MVS abend 0192 is issued.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWLFRM

DFHXG6453I INTERNAL ERROR IN XRF SURVEILLANCE.
Explanation: A consistency check made by the XRF process manager has failed. A process has made an invalid internal lock request.
System Action: An MVS abend 0193 is issued.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWDWAT

DFHXG6454I PROGRAM CHECK IN XRF SURVEILLANCE. PSW = HEX'xx' 'xx'. ADDRESS OF EPJIE COPY = HEX'xx'.
Explanation: A program check occurred from which the XRF process was unable to recover.
System Action: An MVS abend 0194 is issued and a dump is produced.
User Response: This is an error in the CICS system. The message gives the PSW at which the check occurred. Further information is preserved in the dump.
You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Module: DFHWDSRP

DFHXG6475 applid iii Backup simlogon(s) abandoned
Explanation: An XRF alternate is taking over, and is processing the last few session tracking requests.
CICS has issued a SIMLOGON for a standby session, but VTAM has not yet returned the logon request to CICS's VTAM logon exit. Message DFHXG6480 has been issued twice, and CICS has now assumed that the logons will not appear.
Normal processing continues, though the state of the sessions currently pending backup SIMLOGON is unpredictable at the end of CICS initialization.
The reconnection process attempts to BIND these sessions normally.
System Action: Normal takeover processing continues.
User Response: The CSTL log and CICS trace should be collected.
Destination: Console
Module: DFHZXST
XMEOUT Parameters: applid, iii

DFHXG6476I applid XRF catch-up abandoned - all XRF alternates signed off
Explanation: A run of the XRF catch-up transaction has been abandoned because there are no XRF alternates. A failing alternate may have issued some messages.
System Action: Normal processing continues.
User Response: None.
Destination: Console
Module: DFHZXCU
XMEOUT Parameter: applid
DFHXG6477I applid Generic and Specific Ids have same value

Explanation: A CICS system has issued the command to re-assign the VTAM USERVAR representing the XRF complex so that from now on logon requests to the XRF complex are directed to this CICS. However, this system is an XRF primary, and the value of the specific ID is the same as the generic ID for the XRF complex.

System Action: Normal processing continues.

User Response: None. However special care must be taken when using the application ID. You must make it clear whether reference is being made to the CICS system or to the XRF complex.

Destination: Console

Module: DFHZXSTS

XMEOUT Parameter: applid

DFHXG6479 applid Modify USERVAR issued unsuccessfully.

Return code nn

Explanation: A CICS system has unsuccessfully issued a command to re-assign the VTAM USERVAR representing the XRF complex.

System Action: Normal processing continues.

User Response: The system operator can issue the command on CICS’s behalf. The format is as follows:

F procname,USERVAR,VALUE=specific-id

Where:

- ‘procname’ is the procedure name for VTAM,
- ‘generic-ID’ is the VTAM application ID for the whole complex, and
- ‘specific-ID’ is the VTAM application ID for the new CICS

If it is not possible to change the USERVAR, end-user logons which name the generic-ID value continue to be directed to the old specific-applid, with unpredictable results.

(However, logons quoting the specific-ID of the new system are routed to that system.)

Destination: Console

Module: DFHZXSTS

XMEOUT Parameters: applid, nn

DFHXG6480I applid Waiting for backup simlogon processing to drain

Explanation: An XRF alternate is taking over, and is processing the last few session tracking requests.

CICS has issued SIMLOGON for a standby session, but VTAM has not yet returned the logon request to the CICS VTAM logon exit. This message is issued every 5 seconds for 20 seconds while the takeover is being held up.

This indicates either a VTAM error or a CICS logic error.

System Action: This message is issued twice and then message DFHXG6475 is issued.

User Response: If this message is repeated look for other evidence of failure in CICS or VTAM.

Destination: Console

Module: DFHZXQO

DFHXG6481I applid Autoconnect delayed for hh hours, mm minutes, ss seconds.

Explanation: CICS has delayed running the reconnection transaction CXRE for an interval of hh hours, mm minutes, ss seconds, to either:

- acquire AUTOCONNECT terminals after a CICS startup, or
- reacquire terminal sessions after an XRF takeover.

The delay value, hh hours, mm minutes, ss seconds, is taken from the AUTCONN system initialization parameter. In the case of XRF takeover, a value calculated from the number of standby BINDs held at the time of takeover. This extra interval allows the switching of XRF-capable terminals before non-XRF sessions are reconnected by CXRE.

System Action: Normal processing continues.

User Response: None.

Destination: Console

Module: DFHSIJ1

XMEOUT Parameters: applid, hh, mm, ss

DFHXG6482 applid Unable to issue SETLOGON HOLD

(reqcode,reg15,reg0)

Explanation: This message is issued if VTAM SETLOGON START fails during initialization or if in preparation for changing the routing of VTAM logons, this system (which is currently doing an XRF takeover) has attempted to request VTAM to stop passing any more logon requests to it. The attempt failed, and the details of the failure are given in the message, as follows.

The first insert is one of the following.

- ‘S’—The SETLOGON START request failed.
- ‘H’—The SETLOGON HOLD request failed.

The second and third inserts are the values of registers 15 and 0, respectively, at the time of the failure.

See the VTAM Programming manual for your release of VTAM for the interpretation of these values.

Valid logons reaching CICS before message DFHSIJ1517 is issued may be rejected.

System Action: Normal processing continues.

User Response: Note the message.

Destination: Console

Module: DFHZXSTS

XMEOUT Parameters: applid, reqcode, reg15, reg0

DFHXG6483I applid This will be the last pass.

Explanation: The reconnection transaction CXRE is about to scan the VTAM terminals and sessions that were to be (re)connected for the last time. All those found are listed in message DFHXG6486.

System Action: Processing continues

User Response: If any of the VTAM terminals or sessions listed in message DFHXG6486 are crucial, then check whether they are successfully connected as a result of this pass.

Destination: Console

Module: DFHZXRE

XMEOUT Parameter: applid
DFHXG6484I applid Autoconnect processing now complete.

Explanation: The reconnection transaction CXRE has just scanned all the VTAM terminals and sessions, and all those that were to be (re)connected are now connected.

System Action: Processing continues
User Response: None.
Destination: Console
Module: DFHZXRE
XMEOUT Parameter: applid

DFHXG6485 applid Unable to schedule Autoconnection / Reconnection process.

Explanation: CICS initialization attempted to schedule the reconnection process, but was unable to do this as CICS rejected the DFHPC TYPE=LINK call.
See following message DFHXG6487 or DFHXG6488 for the reason.

System Action: The reconnection process is not run.
User Response: CEMT must be used to restore individual terminals to the desired state.
Destination: Console
Module: DFHZOPA
XMEOUT Parameters: applid

DFHXG6486I applid termid may not be acquired after takeover

Explanation: The reconnection transaction, CXRE, is making its last run, but has discovered that terminal or session termid is still not bound in the same status that it was in during the previous failed run of CICS.

System Action: Normal processing continues.
User Response: Note the terminal identification termid in the message, and try to discover why previous reconnection attempts failed. The terminal may not have been physically switched, for example, CEMT may be used to acquire individual terminals after such problems have been cleared.
Destination: Console
Module: DFHZXRE0
XMEOUT Parameters: applid, termid

DFHXG6487 applid Unexpected IC/PC error code 'X'code'. Module modname

Explanation: The reconnection transaction CXRE could not be scheduled or rescheduled, as the DFHIC TYPE=INITIATE or DFHPC TYPE=LINK was rejected with code 'X'code'. This is caused by a CICS logic error.
This message follows either:
- DFHXG6485 if CICS was unable to schedule CXRE, or
- DFHXG6489 if CICS was unable to reschedule CXRE.

System Action: The action taken by CICS depends upon whether the error occurred during scheduling or rescheduling of CXRE.
Refer to the system action for either DFHXG6485 or DFHXG6489 for further details about the action taken by CICS.
Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: Console
Modules: DFHSIJ1, DFHZOPA
XMEOUT Parameters: applid, 'X'code', modname

DFHXG6488 applid Required transaction CXRE is not defined to CICS. Module modname.

Explanation: The reconnection transaction, CXRE, could not be rescheduled. This was because either the transaction code required no longer has an installed transaction definition, or the program required does not have an installed program definition.
This message follows DFHXG6489 or DFHXG6485

System Action: The current run of the reconnection transaction is the last one. Message DFHXG6486 is issued for all terminals and sessions found.
User Response: If non-XRF terminals are to be reconnected, correct the problem.
Destination: Console
Modules: DFHSIJ1, DFHZOPA
XMEOUT Parameters: applid, modname

DFHXG6489 applid Unable to schedule Autoconnection / Reconnection transaction CXRE. Module modname.

Explanation: The reconnection transaction, CXRE, attempted to reschedule itself, but was unable to as CICS interval control rejected the DFHIC TYPE=INITIATE call.
This message is followed either by DFHXG6487 or DFHXG6488, which provides further information about the cause of the error.

System Action: The current run of the reconnection transaction is the last one. Message DFHXG6486 is issued for all terminals and sessions found.
User Response: See the following message. CEMT may be used to acquire individual terminals.
Destination: Console
Module: DFHSIJ1
XMEOUT Parameters: applid, modname

DFHXG6490I applid Reconnecting VTAM session - pass number xxxx

Explanation: Control has recently been given to CICS after an XRF takeover. The reconnection transaction, CXRE, which attempts to start acquire processing for logical units that were in session in the failed active, has just started for the pass number xxxx.

System Action: Normal processing continues.
User Response: Note any error messages arising as CICS attempts to reconnect terminals and sessions.
Destination: Console
Module: DFHZXRE0
XMEOUT Parameters: applid, xxxx
**DFHXG6491 applid Logic error during session tracking. REASON rcode terminal/session event**

**Explanation:** XRF session tracking encountered an unexpected circumstance probably due to a design error. The reason code (rcode) is one of the following:

1. POST called but no pending action for terminal or session.
   - Inserts:
     - name of terminal or session.
2. DFHZXST called with bad request value.
3. XRF-capable session lacks a correlation id.
   - Inserts:
     - name of terminal or session,
     - code for event being tracked.
   The following are valid for DFHSUSX only.
   - X'01'—Send sign on data
   - X'02'—Send sign on data (catchup)
   - X'03'—Receive sign on data
   The following are valid for DFHZXST only.
   - X'F1'—BIND
   - X'F2'—Free LOGON data
   - X'F3'—UNBIND
4. Could not get key to build tracking message.
   - Inserts:
     - name of terminal or session
     - code for event being tracked (see 3 above)
5. Could not get send tracking message.
   - Inserts:
     - name of terminal or session
     - code for event being tracked (see 3 above)
6. Could not find session named in tracking message.
   - Inserts:
     - name of terminal or session
     - code for event being tracked (see 3 above)
7. Illegal entry named in tracking message.
   - Inserts:
     - name of terminal or session
     - code for event being tracked (see 3 above)
8. Bad request code in tracking message.
   - Inserts:
     - name of terminal or session
     - bad request code (see 3 above for valid DFHZXST codes)
9. Correlator in tracking message is longer than 8.
   - Insert:
     - name of terminal or session
10. Unable to schedule standby BIND.
    - Insert:
      - name of terminal or session.

**System Action:** Normal processing continues.

**User Response:** Note the message. Resources and states may be incorrect should the backup take over. If many of these messages are issued, then it is likely that there is a more general problem.

**Destination:** Console

**Modules:** DFHSUSX, DFHZXST

**XMEOUT Parameters:** applid, rcode, terminal/session, event

---

**DFHXG6492I applid XRF catch-up logic error reason length**

**Explanation:** The XRF catch-up program encountered an unexpected circumstance probably due to a CICS design error. The reason, indicated by the first insert, is one of the following:

1. Catalog record internal length value not correct.
2. Catalog record format error. There is no room for a key.
3. Catalog record format error. The key is longer than 16.
4. Catalog record too long for buffer (variable CUBUFFER). The second insert gives the required length.
5. Unexpected ABEND or response from EXEC CICS command.
6. Catalog record format error. There is no resource manager prefix.

**System Action:** In cases 1, 2, 3, and 6 above, normal processing continues.

In case 4, DFHZXCU abends with abend code AZXB. In case 5, DFHZXCU abends with abend code AZXA.

**User Response:** Note the message. Resources and states may be incorrect should the alternate take over. If many of these messages are issued, it is likely that there is a more general problem.

**Destination:** Console

**Module:** DFHZXCU

**XMEOUT Parameters:** applid, reason, length

---

**DFHXG6493 date time applid XRF tracking record could not be sent xxxx xxxx xxxx xxxx xxxx (Module: modname)**

**Explanation:** The XRF catch-up program obtained a bad return code from the XRF message manager and was unable to send a record that the alternate would require to obtain a correct copy of the active. The inserts (internal diagnostic information) are:

1. WMSRETC
   - DFHWMS return code. (For values and meanings of the return codes, refer to the XRF CICS manager request interface block (WMSPS) listing in the CICS Data Areas.)
2. WMSREASN
   - DFHWMS reason code. (For values and meanings of the reason codes, please refer to the XRF CICS manager request interface block (WMSPS) listing in the CICS Data Areas.)
3. XTR-KEY-VALUE is the key of the tracking record.
4. XTR-ID is the record ID, where
   - zero = tracking,
   - non-zero = catch-up.
5. XTR-TYPE is the record type (see DFHZXTR), where
   - X = tracking control,
   - C = TCT contents,
   - S = ZCP session tracking, and
   - U = sign on data

The message is issued from module modname.

**System Action:** Normal processing continues.

**User Response:** Note the message. Resources and states may be incorrect should the alternate take over. If many of these messages are issued, then it is likely that there is a more general problem.

DFHXG6500I applid Signing on to the CAVM as alternate with generic APPLID genericid

Explanation: This is an informational message issued from the CICS TCB. It indicates that the system is about to sign on to the CICS availability manager (CAVM) as alternate. The message insert provides the generic applid.

System Action: CICS initialization is delayed until the sign on request has been processed. In general the delay is insignificant. In those cases where the delay is significant messages are produced by the CAVM to note the reasons.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameters: applid, genericid

DFHXG6501I applid Sign on to the CAVM as alternate accepted

Explanation: This is an informational message issued from the CICS TCB. It indicates that the sign on request has been accepted by the CAVM. (Refer to message DFHXG6500.)

System Action: CICS initialization is resumed.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: applid

DFHXG6502I applid Sign on to the CAVM as alternate rejected

Explanation: This is an informational message issued from the CICS TCB. It indicates that the sign on request has been rejected by the CAVM. (Refer to message DFHXG6500.) Messages are produced by the CAVM to note the reasons for rejecting the request.

System Action: CICS initialization is terminated.

User Response: None.

Destination: Console
DFHXG6503I applid Sign on of specificid to the CAVM as active detected.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the named active CICS has signed on to the CAVM.

System Action: CICS initialization continues.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: applid

DFHXG6504I applid Sign off normal from the CAVM detected.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that active CICS has signed off from the CAVM.

System Action: CICS processing is terminated.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: applid

DFHXG6507I applid Sign off abnormal from the CAVM detected.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that active CICS has signed off from the CAVM.

System Action: The action taken depends on the current value of the takeover option. This is specified in the system initialization table. The CEBT SET TAKEOVER command is used to change the value. A takeover request will be passed to the CAVM if the current value of the takeover option is AUTOMATIC. Message DFHXG6512 will be sent to the console if the current value is MANUAL.

User Response: The user response, if any, is installation dependent.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: applid

DFHXG6512I applid Takeover request passed to the CAVM

Explanation: This is an informational message issued from the CICS TCB. It indicates that the system is about to request the CAVM to initiate takeover.

System Action: CICS initialization continues.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: applid

DFHXG6513I applid Takeover request accepted by the CAVM

Explanation: This is an informational message issued from the CICS TCB. It indicates that the takeover request (refer to message DFHXG6512) has been accepted by the CAVM.

System Action: CICS initialization continues.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: applid

DFHXG6514I applid Takeover request rejected by the CAVM

Explanation: This is an informational message issued from the CICS TCB. It indicates that the takeover request (refer to message DFHXG6512) has been rejected by the CAVM. Messages are produced by the CAVM to note the reasons for rejecting the request.

System Action: CICS initialization continues.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: applid

DFHXG6516I applid Apparent failure of active CICS detected.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that active CICS appears to have failed.

System Action: The action taken depends on the current value of the takeover option. This is specified in the system initialization table. The CEBT SET TAKEOVER command is used to change the value. A takeover request will be passed to the CAVM if the current value of the takeover option is AUTOMATIC. Message DFHXG6518 will be sent to the console if the current value is MANUAL.

User Response: Determine the reason for the apparent failure of active CICS.

DFHXG6517I applid Recovery of active CICS detected.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that active CICS has recovered from the apparent failure reported by message DFHXG6516.

System Action: CICS initialization continues.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: applid
**DFHXG6518A aplid** APPARENT FAILURE OF ACTIVE CICS DETECTED. REPLY ‘TAKEOVER’ OR ‘IGNORE’

**Explanation:** This is an action message issued from the CICS TCB. It is issued when the current value of the active CICS appears to have failed.

**System Action:** If the reply is ‘TAKEOVER’, CICS requests the CAVM to initiate takeover.

If the reply is ‘IGNORE’, CICS assumes one of the following:
- The active CICS system recovers from the apparent failure.
- The active CICS system is restarted.
- The CEBT PERFORM TAKEOVER command is used to initiate takeover.

Subsequent events may mean that the user need not reply to message DFHXG6518A. Examples of this are:
- If CICS is notified that the active CICS system has recovered from the apparent failure reported by message DFHXG6516, messages DFHXG6517 and DFHXG6519 are sent to the console.
- If CICS is notified that the active CICS system has signed off abnormally from the CAVM, messages DFHXG6511 and DFHXG6519 are sent to the console.
- If takeover is initiated (from the alternate CICS system) at the same time as the active CICS recovers from the apparent failure reported by message DFHXG6516, messages DFHXG6513 and DFHXG6539 are sent to the console.

**User Response:** Determine the reason for the apparent failure of the active CICS. If possible, resolve the failure and make the appropriate reply.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHXRSP

---

**DFHXG6519I aplid** The reply to message DFHXG6518 is assumed to be IGNORE.

**Explanation:** This is an informational message issued from the CICS TCB. It indicates that CICS no longer requires the user to respond to message DFHXG6518.

**System Action:** CICS initialization continues.

**User Response:** None.

**Destination:** Console

**Module:** DFHXRSP

**XMEOUT Parameter:** aplid

---

**DFHXG6520I aplid** CICS shutdown initiated by CAVM event.

**Explanation:** This is an informational message issued from the CICS TCB. CICS initiated shutdown occurs in the following situations:

1. CICS is notified that active CICS has signed off normally from the CAVM. Message DFHXG6507 is sent to the console.
2. CICS is notified that active CICS has been restarted “in place”. Message DFHXG6511 is sent to the console.
3. CICS assumes that the active CICS has signed off normally from the CAVM. Message DFHXG6522 is sent to the console.

**System Action:** CICS terminates normally, but note that takeover does not occur if (active) CICS fails.

**User Response:** Consider restarting (alternate) CICS.

**Destination:** Console

**Module:** DFHXRSP

**XMEOUT Parameter:** aplid

---

**DFHXG6522I aplid** Sign off normal from the CAVM assumed.

**Explanation:** This is an informational message issued from the CICS TCB. It indicates that CICS has assumed that the active CICS has signed off from the CAVM. This is likely to occur when the alternate CICS is running on CEC 1 and:

1. Active CICS is started on CEC 2.
2. CEC 2 is reinitialized.
3. Active CICS is restarted on CEC 2.

**System Action:** CICS processing is terminated.

**User Response:** None.

**Destination:** Console

**Module:** DFHXRSP

**XMEOUT Parameter:** aplid

---

**DFHXG6523I aplid** CAVM failure detected. CICS cannot continue as Alternate.

**Explanation:** This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has failed. Messages are produced by the CAVM to note the reasons for failure.

**System Action:** CICS terminates abnormally. The abend code is 207.

**User Response:** Correct the error.

**Destination:** Console

**Module:** DFHXRSP

**XMEOUT Parameter:** aplid

---

**DFHXG6524I aplid** CAVM error detected. CICS cannot continue as Alternate.

**Explanation:** This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has detected an error that prevents CICS from continuing as an alternate.

This would be the case, for example, where the alternate CICS has been unable to keep up with the messages generated by the active CICS.

Messages are produced by the CAVM to note the reasons for failure.

**System Action:** CICS terminates abnormally. The abend code is 213.

**User Response:** Correct the error.

**Destination:** Console

**Module:** DFHXRSP

**XMEOUT Parameter:** aplid
**DFHXG6539I applid** The reply to message DFHXG6518 is assumed to be TAKEOVER.

**Explanation:** This is an informational message issued from the CICS TCB. It indicates that CICS no longer requires the user to respond to message DFHXG6518.

**System Action:** CICS initialization continues.

**User Response:** None.

**Destination:** Console

**Module:** DFHXRSP

**XMEOUT Parameter:** applid

---

**DFHXG6680I applid** TIME-OF-DAY CLOCK DIFFERENCE IS AT LEAST sss SECONDS.

**Explanation:** This is an informational message issued from the CICS TCB. Active CICS and alternate CICS systems are executing on different CECS, and the time-of-day clock on the alternate CEC is earlier than that on the active CEC. If takeover occurs then some CICS processing will have to be delayed until the time-of-day clock on the alternate CEC is later than that on the active CEC. The CAVM has estimated the lower bound to the clock difference and this is at least 15 seconds; the message contains the estimated difference. Note that the lower bound may change as more surveillance signals are processed by the CAVM. This may be the case within the first 3 to 5 surveillance signals of the active CICS starting. An elapsed time of some 10 seconds. This message is repeated as necessary.

**System Action:** CICS processing continues.

**User Response:** Ensure that the time-of-day clocks are synchronized as closely as is possible. Note that takeover times may be increased if the difference in values is significant.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHXRSP

---

**DFHXG6681I applid** TIME-OF-DAY CLOCK DIFFERENCE IS AT MOST sss SECONDS.

**Explanation:** This is an informational message issued from the CICS TCB. Active CICS and alternate CICS systems are executing on different CECS, and the time-of-day clock on the alternate CEC is earlier than that on the active CEC. If takeover occurs then some CICS processing will have to be delayed until the time-of-day clock on the alternate CEC is later than that on the active CEC. The CAVM has estimated the upper bound to the clock difference and this is at least 15 seconds; the message contains the estimated difference. Note that the upper bound may change as more surveillance signals are processed by the CAVM; message DFHXG6681 will be repeated as necessary.

**System Action:** CICS processing continues.

**User Response:** Ensure that the time-of-day clocks are synchronized as closely as possible. Note that takeover times may be increased if the difference in values is significant.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module:** DFHXRSP

---

**DFHXG6682I applid** XRF clock synchronization started

**Explanation:** This is an informational message issued from the CICS TCB. The time-of-day clock on the alternate CEC is earlier than that on the active CEC; time dependent processing must be suspended. Such processing is delayed until the time-of-day clock value on the alternate is later than that on the active CEC when the active job terminated.

**System Action:** Some CICS initialization continues.

**User Response:** Ensure that the time-of-day clocks are synchronized as closely as is possible. Note that takeover times may be increased if the difference in values is significant.

**Destination:** Console

**Module:** DFHXRA

**XMEOUT Parameter:** applid

---

**DFHXG6683I applid** XRF clock synchronization ended

**Explanation:** This is an informational message issued from the CICS TCB. The time-of-day clock on the alternate CEC is now later than that on the active CEC; time dependent processing can be resumed.

**System Action:** CICS initialization continues.

**User Response:** None.

**Destination:** Console

**Module:** DFHXRA

**XMEOUT Parameter:** applid

---

**DFHXMxxxx messages**

**DFHXM0001 applid** An abend (code aaa/bbbb) has occurred at offset 'X'offset' in module modname.

**Explanation:** An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System Action:** An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error occurred in a crucial XM domain module.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual. for further guidance.
DFHXM0002

If module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module `modname` you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: `DFHXMAT`, `DFHXMBD`, `DFHXMLCL`, `DFHXMDD`, `DFHXMMDM`, `DFHXMD`, `DFHXMLD`, `DFHXMLQ`, `DFHXMRC`, `DFHXMSR`, `DFHXMTA`, `DFHXMD`, `DFHXMLXE`

XMEOUT Parameters: `applid`, `aaa/bbbb`, `X'offset'`, `modname`

DFHXM0002 `applid` A severe error (code `X'code'`) has occurred in module `modname`.

Explanation: An error has been detected in module `modname`. The code `X'code'` is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code `X'code'` in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error is critical.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that execution of module `modname` is terminated and CICS continues.

If you have specified ICVR=0 in the SIT and you consider that module `modname` has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module `modname`, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: `DFHXMAT`, `DFHXMBD`, `DFHXMLCL`, `DFHXMDD`, `DFHXMMDM`, `DFHXMD`, `DFHXMLD`, `DFHXMLQ`, `DFHXMRC`, `DFHXMSR`, `DFHXMTA`, `DFHXMD`, `DFHXMLXE`

XMEOUT Parameters: `applid`, `X'code'`, `modname`

DFHXM0004 `applid` A possible loop has been detected at offset `X'offset'` in module `modname`.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module `modname` at offset `X'offset'`. This is the offset of the instruction which happened to be executing at the time when the error was detected.

System Action: An exception entry is made in the trace table.

A system dump is taken unless you have specifically suppressed the dump (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

If you cannot run without the full use of module `modname` you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

XMEOUT Parameters: `date`, `time`, `applid`, `terminal`, `userid`, `tranid`, `transname`

DFHXM0101 `date time` ` applid` terminal `userid` tranid TRANSACTION definition entry for `transname` has been added.

Explanation: This is an audit log message indicating that transaction definition entry `transname` has been added to the system using the INSTALL command.

- `terminal` is the netname or terminal id of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- `userid` is the user identifier of the user associated with the transaction issuing the message.
- `tranid` is the transaction id associated with the transaction.

System Action: The system continues normally.

User Response: None.

Destination: CSKL

Module: `DFHXMLD`

XMEOUT Parameters: `date`, `time`, `applid`, `terminal`, `userid`, `tranid`, `transname`
Chapter 1. DFH messages

DFHXM0103 date time applid terminal userid tranid TRANSACTION definition entry for transname has been deleted.

Explanation: This is an audit log message indicating that transaction definition entry transname has been deleted from the system using the DISCARD command.

- terminal is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- userid is the user identifier of the user associated with the transaction issuing the message.
- tranid is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSKL
Module: DFHXMXD

XMEOUT Parameters: date, time, applid, terminal, userid, tranid, transname

DFHXM0105 date time applid terminal userid tranid TRANSACTION definition entry for transname has been replaced.

Explanation: This is an audit log message indicating that transaction definition entry transname has been replaced in the system using the INSTALL command.

- terminal is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- userid is the user identifier of the user associated with the transaction issuing the message.
- tranid is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSKL
Module: DFHXMXD

XMEOUT Parameters: date, time, applid, terminal, userid, tranid, transname

DFHXM0110 date time applid Transaction definition tranid1 has been installed with the same REMOTENAME and REMOTESYSTEM as existing definition tranid2.

Explanation: Transaction definition tranid1 has been installed with the same REMOTENAME and REMOTESYSTEM as transaction definition tranid2.

If this CICS system routes a transaction to the CICS system named as the REMOTESYSTEM of both the definitions and that transaction issues an EXEC CICS START request for the transaction-id named as the REMOTENAME of tranid1 and tranid2, CICS can either attach tranid1 or tranid2 on the local system to satisfy the START request.

System Action: The install of transaction definition tranid1 continues normally.

If an EXEC CICS START request is issued on a remote system as described in the message explanation, CICS attaches tranid1 and not tranid2 on the local system.

CICS does not always resolve this ambiguity in the same way after a warm or emergency restart, however.

User Response: This situation usually causes no problems because the correct transaction is attached in the remote system. However, the correct transaction in the local system may not have been attached and this can manifest itself in the following ways:

- Inconsistent statistics being accumulated in the local system.
- The incorrect TRPROF being used when routing the START request back over to the remote system.
- CEMT INQUIRE TASK showing the wrong set of transactions running in the local system.

Although these are not necessarily problems, you may want to check the definitions of the remote transactions in this system in case they have been defined incorrectly.

If remote START requests are issued as described, and it does matter which transaction CICS attaches in the local system, you should modify and reinstall the transaction definition that should not be attached. This removes any ambiguity.

Destination: CSMT
Module: DFHXMXD

XMEOUT Parameters: date, time, applid, tranid1, tranid2

DFHXM0111 date time applid Catalog failure while processing (INSTALL | SET | DISCARD) request for transaction definition tranid.

Explanation: An error has occurred while altering the catalog during the processing of an install, set, or discard request for transaction definition tranid.

System Action: The request continues as normal.

Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the image of transaction definition tranid and the following problems may occur only on a warm or emergency restart.

INSTALL
   If it is a reinstall, the old version of the transaction definition is recovered. If it is an install, the transaction definition is not recovered.

SET
   The change requested by the SET is not recovered. Instead the transaction definition is recovered to the state prior to the SET request being issued.

DISCARD
   The transaction definition is recovered on the restart even though it is currently discarded.

User Response: No immediate action is required. Consider performing a cold or initial start the next time CICS is restarted to remedy the problem. If a cold or initial start is not appropriate and the problem is only localized to transaction definition tranid, remedy the effects outlined for each case previously.

For example,

INSTALL Reinstall the tranclass definition after the restart.

SET Reissue the SET command after CICS has been restarted.

DISCARD Reissue the DISCARD command after CICS has been restarted.
DFHXM0112  

`date time applid` The install of transaction definition `transid1` has removed ALIAS `alias` of `transid2`.

**Explanation:** Transaction definition `transid1` has been installed with an ALIAS `alias` of `transid2`. However, `alias` currently invokes transaction definition `transid2`.

**System Action:** The install of `transid1` continues as normal.

**User Response:** If removal of transaction definition `transid2`'s ALIAS was expected, no action is required. However, transaction definition `transid2` should be modified on the CSD so that it no longer specifies the ALIAS.

DFHXM0113  

`date time applid` The install of transaction definition `transid1` has removed TASKREQ `taskreq` of `transid2`.

**Explanation:** Transaction definition `transid1` has been installed with a TASKREQ `taskreq` of `transid2`. However, TASKREQ `taskreq` currently invokes transaction definition `transid2`.

**System Action:** The install of `transid1` continues as normal.

**User Response:** If removal of transaction definition `transid2`'s TASKREQ was expected, no action is required. However, transaction definition `transid2` should be modified on the CSD so that it no longer specifies the TASKREQ.

DFHXM0114  

`date time applid` The install of transaction definition `transid1` has removed XTRANID `xtranid` of `transid2`.

**Explanation:** Transaction definition `transid1` has been installed with a XTRANID of `xtranid` of `transid2`. However, XTRANID `xtranid` currently invokes transaction definition `transid2`.

**System Action:** The install of `transid1` continues as normal.

**User Response:** If removal of transaction definition `transid2`'s XTRANID was expected, no action is required. However, transaction definition `transid2` should be modified on the CSD so that it no longer specifies the XTRANID.

DFHXM0115  

`date time applid` The install of transaction definition `transid1` has removed TPNAME `tpname` of `transid2`.

**Explanation:** Transaction definition `transid1` has been installed with a TPNAME of `tpname` of `transid2`. However, TPNAME `tpname` currently invokes transaction definition `transid2`.

**System Action:** The install of `transid1` continues as normal.

**User Response:** If removal of transaction definition `transid2`'s TPNAME was expected, no action is required. However, transaction definition `transid2` should be modified on the CSD so that it no longer specifies the TPNAME.

DFHXM0116  

`date time applid` PROGRAM parameter missing from transaction definition `transid1`.

**Explanation:** Transaction definition `transid1` has been installed without a PROGRAM parameter. Since it has been defined with a REMOTESYSTEM equal to the local system, a program is required if the transaction is executed on this system.

**System Action:** The install of `transid1` continues as normal. Any attempt to run the transaction `transid1` will fail because there is no program to link to.

**User Response:** This message is issued for information only. There is no problem if transaction `transid1` is not executed on this system. If it is to be executed, the definition of `transid1` needs to be modified and then reinstalled.
If the transaction is not executed, you may wish to investigate why the transaction definition has been installed. It could be that the transaction is defined in an RDO group that is shared between a number of different CICS systems. For example transid may be TTT1 in the following pair of definitions used to implement transaction routing to this local system CICB.

```
Transaction RemoteSystem Remotename Program
TTT1 CICB TTT2 -
TTT2 - - PROGA
```

In this example, a single definition would suffice if the transaction was made to have the same name on this system.

```
Transaction RemoteSystem Remotename Program
TTT1 CICB TTT1 PROGA
```

Destination: CSMT
Module: DFHXM021

XMEOUT Parameters: date, time, applid, transid

DFHXM0205 date time applid userid transid TRANCLASS definition entry for tranclassname has been replaced.

Explanation: This is an audit log message indicating that tranclass definition entry tranclassname has been replaced in the system using the INSTALL command.
- **terminal** is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- **userid** is the user identifier of the user associated with the transaction issuing the message.
- **transid** is the transaction issuing the message.

System Action: The system continues normally.
User Response: None.
Destination: CSKL
Module: DFHXM021

XMEOUT Parameters: date, time, applid, terminal, userid, transid, tranclassname

DFHXM0211 date time applid Catalog failure while processing (INSTALL | SET | DISCARD) request for tranclass definition tranclassname.

Explanation: An error has occurred while altering the catalog during the processing of an install, set, or discard request for tranclass definition tranclassname.

System Action: The request continues normally. Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the image of tranclass definition tranclassname and the following problems may occur only on a warm or emergency restart.

**INSTALL** If it is a reinstall, the old version of the tranclass definition is recovered. If it is an install, the tranclass definition was not recovered.

**SET** The change requested by the SET is not recovered. Instead the tranclass definition is recovered to the state it was in before the SET request was issued.

**DISCARD** The tranclass definition is recovered on the restart even though it is currently discarded.

User Response: No immediate action is required. To fully resolve the problem, consider performing a cold or initial start the next time CICS is restarted. If a cold or initial start is not appropriate and the problem is only localized, to tranclass definition tranclassname, you can resolve each of the symptoms separately. For example:

**INSTALL** Reinstall the tranclass definition after CICS has been restarted.

**SET** Reissue the SET command after CICS has been restarted.

**DISCARD** Reissue the DISCARD command after CICS has been restarted.
DFHXM0212

If the catalog problem persists after the restart, you may need further assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console and Transient Data Queue CSMT

**Module:** DFHXMCL

**XMEOUT Parameters:** date, time, applid, {1=INSTALL, 2=SET, 3=DISCARD}, tranclassname

---

**DFHXM0212 applid Transaction transid has been attached with unknown tranclass tranclassname.**

**Explanation:** Transaction transid has just been attached. It is defined as belonging to tranclass tranclassname but tranclassname does not exist.

This message is only issued the first time transaction transid is attached with the unknown tranclass.

**System Action:** The attach of transaction transid proceeds as normal but without being subject to any tranclass scheduling constraints.

**User Response:** If transaction transid should belong to tranclass tranclassname, install that tranclass. If not, modify the transaction definition for transid as appropriate, and reinstall.

The CEDA CHECK command can be used to ensure that each of the tranclasses referenced by transaction definitions are defined within the same startup GRPLIST.

**Note:** Do not attempt to reroute this message to a transient data queue.

---

**DFHXM0213 applid Insufficient storage for system attach of transaction transid.**

**Explanation:** There is insufficient storage for a new task to be created for the attach of transaction transid.

Since the majority of the storage required for the new task is obtained from DSA storage, CICS is probably short on storage in one of the DSAs.

**System Action:** The attach request is queued. It is retried later when more storage should have become available. If the retried attach fails, it is queued and retried repeatedly until it succeeds.

**User Response:** If CICS is short on storage, message DFHSM0133 is also issued. Refer to that message for advice on how to resolve the condition.

If message DFHSM0133 has not been issued, the problem has been caused by insufficient MVS storage. In this case consider lowering the EDSALIM of the system to increase the amount of available MVS storage.

**Note:** Do not attempt to reroute this message to a transient data queue.

---

**DFHXM0301 date time applid An attempt to link to the user-replaceable transaction restart program (DFHREST) has failed for task number tasknum. Transaction restart is not performed for transaction tranid.**

**Explanation:** A restartable transaction abended and the transaction manager attempted to link to the user-replaceable transaction restart program (DFHREST) but the link has failed. Likely reasons are:

- DFHREST is not defined (and not autoinstalled)
- DFHREST is not present in any library specified in the DFHRPL concatenation.
- DFHREST has been linked with AMODE(24).

**System Action:** The transaction is not restarted.

**User Response:** If the problem is not rectified, a message is issued each time the link to DFHREST fails. To avoid this, ensure that DFHREST is properly defined and present in a library specified in the DFHRPL concatenation.

See the CICS Customization Guide for more information about user-replaceable programs.

**Destination:** Console and Transient Data Queue CSMT

**Module:** DFHXMTC

**XMEOUT Parameters:** date, time, applid, tasknum, tranid

---

**DFHXM0302 applid An abend abcode occurred in the user-replaceable transaction restart program (DFHREST) under task number tasknum. Transaction restart is not performed for transaction tranid.**

**Explanation:** A restartable transaction abended and the transaction manager linked to the user-replaceable transaction restart program (DFHREST). DFHREST abended.

**System Action:** The transaction is not restarted.

**User Response:** If the problem is not rectified, a message is issued each time DFHREST abends. To avoid this, fix the problem in DFHREST and ensure that it is properly defined and present in a library specified in the DFHRPL concatenation.

See the CICS Customization Guide for more information about user-replaceable programs.

**Destination:** Console

**Module:** DFHXMTC

**XMEOUT Parameters:** applid, abcode, tasknum, tranid

---

**DFHXM0303 applid A severe error (code X'code') has occurred while initializing task number tasknum with transaction identifier tranid. Terminal termid has not been released. The task is suspended indefinitely.**

**Explanation:** An internal error has prevented the initialization of task number tasknum with identifier tranid.

The task cannot run and cannot be abended. The principal facility of the task is a terminal. No message may be sent to the terminal and it is unusable by CICS. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated. Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running.
from running because they also need access to the same resources. You may wish to add a dump table entry to always terminate CICS on this message.

**System Action:** The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

The terminal principal facility of the task is unusable by CICS until CICS is canceled.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

**User Response:** You must cancel CICS if you need to release the terminal associated with the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code X'code'. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Module:** DFHXMTA.

**XMEOUT Parameters:** applid, X'code', tasknum, tranid, tdqueue

---

**DFHXM0304**

*predicate A severe error (code X'code') has occurred while initializing task number tasknum with transaction identifier tranid. Transient data queue tdqueue has not been released. The task is suspended indefinitely.*

**Explanation:** An internal error has prevented the initialization of task number tasknum with identifier tranid.

The task cannot run and cannot be abended. The principal facility of the task is an interval control element. Any start data associated with the ICE will not be retrieved. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry always to terminate CICS on this message.

**System Action:** The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

**User Response:** You must cancel CICS if you need to destroy the ICE. Any start data will remain in temporary storage until it is deleted unless it is nonrecoverable in which case it will disappear on the next cold, initial or emergency restart of CICS. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code X'code'. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Module:** DFHXMTA.

**XMEOUT Parameters:** applid, X'code', tasknum, tranid

---

**DFHXM0305**

*predicate A severe error (code X'code') has occurred while initializing task number tasknum with transaction identifier tranid. The interval control element has not been released. The task is suspended indefinitely.*

**Explanation:** An internal error has prevented the initialization of task number tasknum with identifier tranid.

The task cannot run and cannot be abended. The principal facility of the task is an interval control element. Any start data associated with the ICE will not be retrieved. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry always to terminate CICS on this message.

**System Action:** The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

**User Response:** You must cancel CICS if you need to destroy the ICE. Any start data will remain in temporary storage until it is deleted unless it is nonrecoverable in which case it will disappear on the next cold, initial or emergency restart of CICS. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code X'code'. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Module:** DFHXMTA.

**XMEOUT Parameters:** applid, X'code', tasknum, tranid

---

**DFHXM0306**

*predicate A severe error (code X'code') has occurred while initializing task number tasknum with transaction identifier tranid. The task is suspended indefinitely.*

**Explanation:** An internal error has prevented the initialization of task number tasknum with identifier tranid.

The task cannot run and cannot be abended. The task has no principal facility bound to it. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry always to terminate CICS on this message.
DFHXM0307

**System Action:** The task is suspended indefinitely. First failure
diagnostics should be produced by the component which first
detects the error. The transaction manager also takes a dump.
Message DFHME0116 is normally produced containing the
symptom string for this problem.

The task is suspended with a resource type of FOREVER and a
resource name of DFHXMTA.

**User Response:** You must cancel CICS if you need to destroy
the task. You cannot quiesce CICS since this task will not
terminate. You cannot purge or force purge the task.

Note the error code X'code'. You need further assistance from
IBM to resolve this problem. See Part 4 of the CICS Problem
Determination Guide for guidance on how to proceed.

**Destination:** Console

**Module:** DFHXMTA.

**XMEOUT Parameters:** aplid, X'code', tasknum, tranid

---

DFHXM0308 aplid A severe error (code X'code') has occurred
while terminating task number tasknum with
transaction identifier tranid. The terminal termid has
not been released. The task is suspended indefinitely.

**Explanation:** An internal error has prevented the termination
of task number tasknum with identifier tranid. It is not possible to
abend the task. The principal facility of the task is a transient data
queue. The TD queue will not trigger another task until CICS is
terminated. Rather than terminate CICS, the transaction manager
keeps CICS running and preserves its integrity by suspending the
task.

The suspended task will hold its MXT slot until CICS is terminated.

Note: Do not attempt to reroute this message to a transient data
queue.

**Destination:** Console

**Module:** DFHXMTA.

**XMEOUT Parameters:** aplid, X'code', tasknum, tranid, tdqueue

---

DFHXM0309 aplid A severe error (code X'code') has occurred
while terminating task number tasknum with
transaction identifier tranid. The interval control
element has not been released. The task is
suspended indefinitely.

**Explanation:** An internal error has prevented the termination
of task number tasknum with identifier tranid. It is not possible to
abend the task. The principal facility of the task is an interval control
element. Rather than terminate CICS, the transaction manager
keeps CICS running and preserves its integrity by suspending the
task.

The suspended task will hold its MXT slot until CICS is terminated.

Note: Do not attempt to reroute this message to a transient data
queue.

**Destination:** Console

**Module:** DFHXMTA.

**XMEOUT Parameters:** aplid, X'code', tasknum, tranid, tdqueue

---
DFHME0116 is normally produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

**User Response:** You must cancel CICS if you need to destroy the ICE associated with the task. Any start data remains in temporary storage until it is deleted unless it is nonrecoverable, in which case it disappears on the next cold, initial or emergency restart of CICS. You cannot quiesce CICS since this task does not terminate. You cannot purge or force-purge the task.

Note the error code X'code'. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Module:** DFHXMTA.

**XMEOUT Parameters:** applid, X'code', tasknum, tranid

---

**DFHXM0310** applid A severe error (code X'code') has occurred while terminating task number tasknum with transaction identifier tranid. If the task had a principal facility, it has been released. The task is suspended indefinitely.

**Explanation:** An internal error has prevented the termination of task number tasknum with identifier tranid. It is not possible to abort the task. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated. Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry always to terminate CICS on production of this message.

**System Action:** If the task had a principal facility, it has been released. If this was a terminal, the terminal should be usable by CICS.

The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

**User Response:** You must cancel CICS if you need to release the resources associated with the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Module:** DFHXMTA.

**XMEOUT Parameters:** applid, X'code', tasknum, tranid

---

**DFHXM0311** applid A severe error (code X'code') has occurred while initializing task number tasknum with transaction identifier tranid. Scheduler resources associated with the task have not been released. The task is suspended indefinitely.

**Explanation:** An internal error has prevented the initialization of task number tasknum with identifier tranid. The task cannot run and cannot be abended. The principal facility of the task is the scheduler. The scheduler will not initiate another task until CICS is terminated. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated. Note that the task may hold resources (for example, locks and enqueues), so you should cancel CICS at your earliest convenience. Otherwise, you risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry always to terminate CICS on production of this message.

**System Action:** The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

**User Response:** You must cancel CICS if you need to release the resources associated with the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Module:** DFHXMTA.

**XMEOUT Parameters:** applid, X'code', tasknum, tranid

---

**DFHXM0501** applid CICS cannot satisfy request for MXT. Value mxtvalue has been used instead.

**Explanation:** The value entered for MXT cannot be handled by the system. mxtvalue is the largest value for which CICS has been able to acquire task storage.

The majority of the task storage required is now acquired from CICS DSAs.

**System Action:** The system continues to run with a MXT value of mxtvalue.

**User Response:** Check that the original value entered for MXT was correctly typed. If the value is mistyped, use CEMT to amend the MXT value (you are unlikely to be able to force the value higher). Remember that MXT now only includes user tasks and so it should not need to be set to a value as high as in previous releases.

If the value mxtvalue is acceptable, no action is necessary.

If the value mxtvalue is too small, check to see which programs, apart from CICS, are running in this region. To relieve the storage constraint, either increase the DSALIM or EDSALIM of the system to give CICS more storage for its own use. For further details...
about storage allocation at initialization, see the CICS Transaction Server for OS/390 Installation Guide.

Destination: Console
Module: DFHXMSR
XMEOUT Parameters: applid, mxtvalue

DFHXM0502 applid A catalog failure has occurred while saving the MXT setting.

Explanation: An error has occurred while saving the requested MXT setting on the catalog.

System Action: The requested MXT change request continues as normal.

Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the MXT value and only it may not be recovered on a warm or emergency restart.

User Response: No immediate action is required. Consider performing a cold or initial start, with the required MXT value specified in the SIT the next time CICS is restarted. If a cold start is not appropriate, add MXT as a SIT override specifying the required MXT value.

Destination: Console
Module: DFHXMSR
XMEOUT Parameter: applid

DFHXM0503 applid CICS cannot support minimum MXT value of minmxt. CICS is terminated.

Explanation: A severe lack of storage has resulted in CICS not being able to acquire enough task storage to satisfy even the minimum MXT value of minmxt.

CICS cannot perform any useful work without minmxt number of user tasks.

System Action: CICS is terminated.

User Response: Investigate why there is insufficient storage for CICS to support such a low number of user tasks.

To relieve the storage constraint, either increase the DSALIM or EDSALIM of the system to give CICS more storage for its own use. For further details about storage allocation at initialization, see the CICS Transaction Server for OS/390 Installation Guide.

Destination: Console
Module: DFHXMSR
XMEOUT Parameters: applid, minmxt

DFHXOxxxx messages

DFHXO6700 OPTION STARTING xxx HAS ILLEGAL SYNTAX.

Explanation: The option xxx has illegal syntax.

System Action: The overseer program is abnormally terminated after completion of parameter analysis.

User Response: Correct the error and resubmit the overseer program.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWOSA

DFHXO6702 JOB STEP IS NOT APF-AUTHORIZED.

Explanation: Part of CICS initialization must be done in an APF-authorized state. The kernel has detected that DFHSIP is not APF-authorized.

System Action: The overseer program is abnormally terminated.

User Response: Ensure that the job step is APF-authorized. All libraries concatenated in the STEPLIB concatenation should be APF-authorized, and DFHSIP should be link-edited with an authorization code of 1.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWOSA

DFHXO6703 UNABLE TO SET UP AUTHORIZED FACILITY.

Explanation: Insufficient storage is available to initialize the authorized facility required by the overseer.

System Action: The overseer program is abnormally terminated.

User Response: Ensure that the REGION parameter is sufficiently large.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWOSA

DFHXO6704 UNABLE TO OPEN DFHLIB.

Explanation: A DD statement for (ddname) DFHLIB was missing from the batch job stream.

System Action: The overseer program is abnormally terminated.

User Response: Correct the JCL.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Module: DFHWOS

DFHXO6705 xxx OPTION IS MISSING.

Explanation: The option xxx may not be omitted.

System Action: The overseer program is abnormally terminated after completion of parameter analysis.

User Response: Correct the error and resubmit the overseer program.

Note: This message cannot be changed with the message editing utility.
DFHXO6706 CYTIM OPTION MUST BE IN RANGE 20 TO 32767.

Explanation: The CYTIM option must fall within the range 20 through 32767.

System Action: The overseer program is abnormally terminated after completion of parameter analysis.

User Response: Correct the error and resubmit the overseer program.

Note: This message cannot be changed with the message editing utility.

DFHXO6712 xxx IS AN INVALID OPTION KEYWORD.

Explanation: The specified keyword xxx is an invalid option.

System Action: Option xxx is ignored.

User Response: Correct the error.

Note: This message cannot be changed with the message editing utility.

DFHXO6707 VALUE OF xxx OPTION IS LONGER THAN 5 DIGITS.

Explanation: The value of the given numeric option must occupy no more than five digits.

System Action: The overseer program is abnormally terminated after completion of parameter analysis.

User Response: Correct the error and resubmit the overseer program.

Note: This message cannot be changed with the message editing utility.

DFHXO6708 VALUE OF xxx OPTION IS NON-NUMERIC.

Explanation: The value of the option xxx must be numeric.

System Action: The overseer program is abnormally terminated after completion of parameter analysis.

User Response: Correct the error and resubmit the overseer program.

Note: This message cannot be changed with the message editing utility.

DFHXO6709 VALUE OF xxx OPTION IS LONGER THAN 8 CHARACTERS.

Explanation: The value of option xxx must occupy no more than eight characters.

System Action: The overseer program is abnormally terminated after completion of parameter analysis.

User Response: Correct the error and resubmit the overseer program.

Note: This message cannot be changed with the message editing utility.

DFHXO6720 THE CICS XRF OVERSEER HAS RECEIVED AN INVALID RESPONSE TO A SUBSYSTEM INTERFACE REQUEST.

Explanation: Overseer services has received an inconsistent response to an MVS subsystem interface request for job status. The response indicates insufficient storage although more than the indicated necessary amount is provided.

System Action: A dump is taken and the overseer job abnormally terminates with MVS user abend code 224.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

DFHXO6721 THE CICS XRF OVERSEER HAS BEEN UNABLE TO GET STORAGE FOR A SUBSYSTEM INTERFACE REQUEST.

Explanation: The XRF overseer application program has issued a DFHWOSM FUNC=JJC, JJS or QJJS macro. The MVS subsystem interface request issued by the overseer services program while processing this request has failed. The response indicates that the reply area is too small. The MVS GETMAIN request to obtain a larger area is not satisfied.

System Action: The subsystem options block (SSOB), indicating 'status array too small' (SSOBRETN=SSCSMALL), is returned to the caller in the 256 byte SSOB return area specified in the DFHWOSM macro.

User Response: Since the areas involved are small, the condition should not normally occur. If it persists, or disrupts the effectiveness of your overseer application, you may need to cancel the overseer job with a dump to investigate the reason for the shortage of storage.

Note: This message cannot be changed with the message editing utility.

Chapter 1. DFH messages
DFHXQxxxx messages

DFHXQ0101I Shared TS queue server initialization is in progress.
Explanation: The queue server program has started execution.
System Action: Initialization continues.
User Response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console and SYSPRINT
Module: DFHXQMN

DFHXQ0102I Shared TS queue server for pool poolname is now active.
Explanation: The queue server for the named pool has completed initialization and is now ready to accept connections.
System Action: The server waits for connection requests or operator commands.
User Response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console and SYSPRINT
Module: DFHXQMN

DFHXQ0103 The pool name parameter is missing.
Explanation: The shared TS queue server program needs to know the name of the queue pool in order to complete initialization but no pool name was specified in the SYSIN or PARM field parameters.
System Action: The queue server is terminated.
User Response: Ensure that the parameter POOLNAME=name is specified either in the SYSIN parameters or in the PARM field of the JCL for the queue server.
Note: This message cannot be changed with the message editing utility.
Destination: Console and SYSPRINT
Module: DFHXQMN

DFHXQ0104 Shared TS queue server initialization failed because program DFHXQMN is not APF authorized.
Explanation: The queue server main program DFHXQMN cannot complete initialization because it is not running with APF authorization.
System Action: The queue server is terminated.
User Response: Ensure that the queue server program DFHXQMN is loaded from an APF authorized library and has been linked with the option AC(1).
Note: This message cannot be changed with the message editing utility.
Destination: Console and SYSPRINT
Module: DFHXQMN

DFHXQ0111I Shared TS queue server for pool poolname is terminating.
Explanation: The queue server has started termination processing, so no further requests will be processed.
System Action: Termination continues.
User Response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console and SYSPRINT
Module: DFHXQMN

DFHXQ0112I Shared TS queue server has terminated, return code retcode, reason code rsncode.
Explanation: The queue server has completed termination processing. If the termination was caused by an error, the return code will be non-zero and the reason code will normally be the number of a previous DFHXQnnnn message giving the reason for termination.
System Action: The queue server program returns control (via the AXM termination routines) to MVS for job step termination.
User Response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console and SYSPRINT
Module: DFHXQMN

DFHXQ0113 Shared TS queue server completion code is cmpcode, reason code rsncode.
Explanation: The queue server has terminated after intercepting an abnormal termination (ABEND) request. If the completion code is a system completion code, it is shown as three hexadecimal digits, otherwise it is shown as four decimal digits for a user completion code.
System Action: The queue server program returns control (via the AXM termination routines) to MVS for job step termination.
User Response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console and SYSPRINT
Module: DFHXQMN

DFHXQ0201I Processing type parameters
Explanation: The queue server parameter processing routine is interpreting the specified parameter string. The first word gives the type of parameter (SYSIN/PARM/SET/DISPLAY/PRINT) and the rest is the specified parameters optionally followed by descriptive comment text after one or more spaces. If the parameters start with an asterisk or a space, the whole line is taken as descriptive comments.
System Action: Any specified parameters will be processed.
User Response: None.
Note: This message cannot be changed with the message editing utility.
Destination: SYSPRINT
Module: DFHXQPR
DFHXQ0202 Unknown parameter keyword: \textit{keyword}

\textbf{Explanation}: This parameter keyword did not match any of the defined parameter keywords for the queue server.

\textbf{System Action}: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

\textbf{User Response}: Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

\textbf{Note}: This message cannot be changed with the message editing utility.

\textbf{Destination}: Console and SYSPRINT

\textbf{Module}: DFHXQPR

DFHXQ0203 \textbf{Value} \textit{value} for parameter \textit{POOLNAME} is incorrect. It must be a 1 to 8 character name.

\textbf{Explanation}: The value specified for the queue server \textit{POOLNAME=} parameter was either empty or exceeded the maximum length of 8 characters.

\textbf{System Action}: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

\textbf{User Response}: Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

\textbf{Note}: This message cannot be changed with the message editing utility.

\textbf{Destination}: Console and SYSPRINT

\textbf{Module}: DFHXQPR

DFHXQ0204 \textbf{Value} \textit{value} for parameter \textit{keyword} is incorrect. It must be a decimal number.

\textbf{Explanation}: The value of this queue server parameter should have been specified as a decimal number but was not in a valid format. (Numeric parameters can optionally be followed by the letter K, M or G to denote the appropriate powers of 1024).

\textbf{System Action}: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

\textbf{User Response}: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

\textbf{Note}: This message cannot be changed with the message editing utility.

\textbf{Destination}: Console and SYSPRINT

\textbf{Module}: DFHXQPR

DFHXQ0205 \textbf{Value} \textit{value} for parameter \textit{keyword} is greater than the maximum allowed value \textit{maximum}.

\textbf{Explanation}: The value of this queue server parameter exceeded the maximum allowed value \textit{maximum}.

\textbf{System Action}: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

\textbf{User Response}: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

\textbf{Note}: This message cannot be changed with the message editing utility.

\textbf{Destination}: Console and SYSPRINT

\textbf{Module}: DFHXQPR

DFHXQ0206 \textbf{Value} \textit{value} for parameter \textit{keyword} is less than the minimum allowed value \textit{minimum}.

\textbf{Explanation}: The value of this queue server parameter was less than the minimum allowed value \textit{minimum}.

\textbf{System Action}: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

\textbf{User Response}: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

\textbf{Note}: This message cannot be changed with the message editing utility.

\textbf{Destination}: Console and SYSPRINT

\textbf{Module}: DFHXQPR

DFHXQ0207 \textbf{Value} \textit{value} for parameter \textit{keyword} is incorrect. It should be a time hh:mm:ss or hh:mm or a number of seconds.

\textbf{Explanation}: The value of this queue server parameter did not conform to the correct syntax for a time interval.

\textbf{System Action}: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

\textbf{User Response}: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

\textbf{Note}: This message cannot be changed with the message editing utility.

\textbf{Destination}: Console and SYSPRINT

\textbf{Module}: DFHXQPR
DFHXQ0208 Parameter keyword *keyword* is not supported for command.

Explanation: A queue server parameter keyword was specified in a context where it is not valid, usually indicating an attempt to SET dynamically a parameter which can only be specified at initialization time.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQPR

DFHXQ0209 Parameter text contains invalid character: *text*

Explanation: The queue server parameter processing routine found some unexpected text when attempting to process parameters.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Correct the parameters (or remove the incorrect parameter) and reenter the command or restart the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQPR

DFHXQ0210 Parameter keyword *keyword* should not have a value for command.

Explanation: A queue server parameter keyword was specified in the form *keyword=value* in a context where it was not expected, for example on a DISPLAY command.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Reenter the command without specifying a value for the parameter to be displayed.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQPR

DFHXQ0211 Parameter value *keyword=value*

Explanation: This message is issued to show the current value of a queue server parameter setting in response to a DISPLAY or PRINT command.

System Action: Processing continues normally.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHXQOP

DFHXQ0212 Value *value* for parameter *keyword* is incorrect. It must be one of *validlist*.

Explanation: The value of this queue server parameter was not recognized. It should have been specified as one of the indicated list of values.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQPR

DFHXQ0213 Value for parameter *keyword* is missing. The correct form is *keyword=value*.

Explanation: A parameter keyword was specified without an associated parameter value on a queue server SET command or in a SYSIN or PARM parameter string. Note that the only character which should appear between the parameter keyword and its intended value is the equals sign, without any extra spaces.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Reenter the parameter specification in the correct form *keyword=value*.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQPR

DFHXQ0301 Console operator *consname* issued command: *command*

Explanation: A queue server operator command has been issued via the MVS MODIFY or STOP command. This message identifies the console name (or TSO userid) from which the command was issued and the text of the command.

System Action: Processing continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHXQPR
Chapter 1. DFH messages

DFHXQ0302I COMMAND command ignored because no valid parameters were given.

**Explanation:** A queue server command was issued which had no valid parameters on it but was otherwise syntactically valid. The command has had no effect.

**System Action:** Processing continues normally.

**User Response:** Ensure that the command was entered correctly.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQOP

DFHXQ0303I COMMAND command has been processed.

**Explanation:** A queue server command has been processed successfully.

**System Action:** Processing continues.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQOP

DFHXQ0304I STOP command is waiting for connections to be closed. Number of active connections = connections.

**Explanation:** A queue server STOP command has been issued (either via an MVS STOP command or via an MVS MODIFY command with the text STOP) but there are still active connections to the server, so the STOP command has not yet taken effect.

**System Action:** The server rejects any further attempts to establish new connections, but continues processing requests for existing connections. Each time a connection is terminated, this message is repeated for as long as there are more active connections.

**User Response:** Further information about the connections which are still active can be obtained using the command DISPLAY CONNECTIONS.

If the server needs to be shut down without waiting for connections to be closed, issue the queue server CANCEL command. Note that this immediately terminates any active connections, causing any further requests for that server to be given a SYSIDERR indication. (The MVS CANCEL command can also be used, but should preferably be avoided because it prevents the server from producing its normal closedown statistics and reports).

Note that if a CICS region is abnormally terminated while server connect or disconnect processing is in progress, or is terminated without going through end of task processing (for example using the FORCE command) there is a slight chance that the server will not be notified that the connection has been terminated. In this case the server is not able to be closed down with the server STOP command, but only with the server CANCEL command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQOP

DFHXQ0305I STOP command has been processed.

**Explanation:** Processing of a queue server STOP command has now been successfully completed. This means that there are no longer any active connections and the server is ready to close down.

**System Action:** The queue server starts termination processing.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQOP

DFHXQ0306I Shared TS queue server does not support this command: command.

**Explanation:** An operator command was addressed to the queue server using the MVS MODIFY command, but the first word of the MODIFY text is not a recognized queue server command (SET, DISPLAY, PRINT, STOP or CANCEL).

**System Action:** The command is ignored.

**User Response:** Correct and reenter the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQOP

DFHXQ0307I CANCEL command has been processed. Number of active connections = connections.

**Explanation:** A queue server CANCEL command has been issued, either from an operator console or internally by the queue server in response to a severe error. This message includes the number of active connections which may be affected by this command.

**System Action:** The queue server terminates immediately, without waiting to close connections.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQOP

DFHXQ0351I Connection: Job jobname Appl applid Idle idletime

**Explanation:** This describes a single connection in response to the command DISPLAY CONNECTIONS or PRINT CONNECTIONS. The information shows the job name, the specific APPLID and the time in hours, minutes and seconds since the most recent queue request or inquire call was issued using the connection.

**System Action:** This message is issued for each active connection then message DFHXQ0352I is issued to show the total number of active connections.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQCN
DFHXQ0352I

DFHXQ0352I  Queue pool poolname total active connections:  
connections.  

Explanation: This describes the total number of active  
connections to the queue pool server, in response to the server  
command DISPLAY CONNECTIONS or PRINT CONNECTIONS.  

System Action: Processing continues.  

User Response: None.  

Note: This message cannot be changed with the message editing  
utility.  

Destination: Console and SYSPRINT  
Module: DFHXQCN

DFHXQ0401I  Connected to CF structure strname.  

Explanation: The queue server has successfully established a  
connection to the coupling facility list structure for the queue pool,  
using the IXLCONN macro.  

System Action: Processing continues.  

User Response: None.  

Note: This message cannot be changed with the message editing  
utility.  

Destination: Console and SYSPRINT  
Module: DFHXQCF

DFHXQ0402I  CF structure strname was allocated by this  
connection.  

Explanation: The list structure did not previously exist and was  
allocated as part of the connection process.  

System Action: List structure initialization will be performed if  
necessary.  

User Response: None.  

Note: This message cannot be changed with the message editing  
utility.  

Destination: Console and SYSPRINT  
Module: DFHXQCF

DFHXQ0403I  Connection to CF structure strname failed.  
IXLCONN return code retcode, reason code rsncode.  

Explanation: The IXLCONN macro to connect the queue server  
to its coupling facility list structure failed.  

System Action: The queue server is terminated.  

User Response: See the IXLCONN macro in MVS/ESA  
Programming: Sysplex Services Reference (GC28-1496) for the  
explanation of the return and reason code. If the reason code is of  
the form xxxx0C08, indicating structure allocation failure, this  
message is followed by message DFHXQ0409 giving the facility  
reason code for each CF in which allocation was attempted.  

Note: This message cannot be changed with the message editing  
utility.  

Destination: Console and SYSPRINT  
Module: DFHXQCF

DFHXQ0404I  CF structure strname cannot be used because it has  
been allocated with attribute attribute.  

Explanation: The queue server has successfully connected to its  
list structure but has found that the structure has been allocated  
using an IXLCONN structure attribute keyword which is not  
supported by the queue server.  

System Action: The queue server is terminated.  

User Response: This probably indicates that the structure has  een allocated or modified by some program other than the queue  
server. In this case, the incorrect structure should be deleted (for  
example using the SETXCF FORCE command) so that it will be  
reallocated correctly when the queue server is restarted.  

Note: This message cannot be changed with the message editing  
utility.  

Destination: Console and SYSPRINT  
Module: DFHXQCF

DFHXQ0405I  CF structure strname element size elemsize is  
incorrect. It should be a power of 2 in the range 256 to 4096.  

Explanation: The queue server list structure element size  
(specified via the ELEMSIZE initialization parameter) is not a power  
of two, or is outside the range supported by the list structure  
hardware.  

System Action: The queue server is terminated (without  
attempting to connect to the list structure).  

User Response: Correct the ELEMSIZE parameter and restart  
the queue server.  

Note: This message cannot be changed with the message editing  
utility.  

Destination: Console and SYSPRINT  
Module: DFHXQCF

DFHXQ0406I  Initialization failed for CF structure strname with  
response response.  

Explanation: Queue server processing to initialize the list  
structure failed with an abnormal internal response code.  

System Action: The server is terminated.  

User Response: If the response code is 8 (I/O error), it indicates  
that an IXLLIST macro gave an abnormal return code, in which  
case a previous DFHXQ0441 message will have been issued  
giving the IXLLIST return code and reason code. If this response  
code is any other value, this indicates that the list structure is in a  
state which should not occur, probably indicating that it was  
allocated or modified by a program other than the queue server. In  
this case the structure may need to be deleted (using SETXCF  
FORCE) so that it will be reallocated when the server is restarted.  

Note: This message cannot be changed with the message editing  
utility.  

Destination: Console and SYSPRINT  
Module: DFHXQCF
Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQCF

DFHXQ0410 CF structure strname cannot be used, coupling facility maintenance level is too low.

Explanation: Initialization test routines executed against the allocated list structure gave incorrect results, indicating that the coupling facility control code does not include all maintenance necessary to support shared temporary storage.

System Action: The queue server is terminated.

User Response: Ensure that the required level of coupling facility maintenance is applied.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQCF

DFHXQ0411I CF structure strname now has percentage% of entries in use.

Explanation: This message is issued by the queue server when the percentage of list entries in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after an ALTER request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio.

System Action: The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

User Response: Note that the structure may soon become full, preventing queues from being created. If the structure was allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be altered dynamically using the MVS SETXCF command with the START,ALTER options.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQCF

DFHXQ0412I CF structure strname now has percentage% of elements in use.

Explanation: This message is issued by the queue server when the percentage of list data elements in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after an ALTER request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio.

System Action: The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not
making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

**User Response:** Note that the structure may soon become full, preventing queues from being created. If the structure was allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be altered dynamically using the MVS SETXCF command with the START ALTER options.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQCF

**DFHXQ0413I Starting ALTER to adjust CF structure strname entry/element ratio to entries/elements.**

**Explanation:** The queue server has determined that the ratio of free entries to free elements is significantly different from the ratio of entries to elements actually in use. It is issuing an IXLALTER macro to request the coupling facility to adjust the ratio to make better use of the coupling facility storage.

**System Action:** The server continues by issuing the IXLALTER macro. A further message will be issued when the ALTER request is accepted or rejected by MVS.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQCF

**DFHXQ0414I ALTER started for CF structure strname.**

**Explanation:** The queue server has successfully started an ALTER request to change the entry to element ratio for the list structure.

**System Action:** The queue server event exit will be notified by MVS when the ALTER request completes and a further message will then be issued.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQCF

**DFHXQ0415I ALTER rejected for CF structure strname, ALTER already active.**

**Explanation:** The queue server attempted to start an ALTER to change the entry to element ratio for the list structure, but this was rejected by the system because another ALTER was already active.

**System Action:** The queue server event exit will be notified by MVS when the ALTER request completes and a further message will then be issued.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQCF

**DFHXQ0416 ALTER request failed for CF structure strname, IXLALTER return code retcode, reason code rsncode.**

**Explanation:** The queue server attempted to start an ALTER to change the entry to element ratio for the list structure, but this was rejected by the system with an unexpected return code.

**System Action:** The current ALTER attempt is abandoned. Another attempt may be made when the minimum alter interval has expired.

**User Response:** See the IXLALTER macro in MVS/ESA Programming: Sysplex Services Reference (GC28-1496) for the explanation of the return and reason code.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQCF

**DFHXQ0417I ALTER completed normally for CF structure strname.**

**Explanation:** The queue server has been notified by the system that an ALTER request has completed normally.

**System Action:** New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHXQ0411 and DFHXQ0412 to indicate the new usage percentages.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQCF

**DFHXQ0418I ALTER ended abnormally for CF structure strname with status status.**

**Explanation:** The queue server has been notified by the system that an ALTER request has ended abnormally. The two bytes of status information in this message are taken from EEPLALTERENDSTATEFLAGS in the event exit parameter list (defined in the IXLYEEPL macro).

**System Action:** No action is taken as a result of this notification, but the problem which caused the ALTER to fail will probably result in other related problems.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQCF

**DFHXQ0419I ALTER ended normally for CF structure strname but target was not attained.**

**Explanation:** The queue server has been notified by the system that an ALTER request has ended normally but that the target ratio or target size was not attained.

**System Action:** New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHXQ0411 and DFHXQ0412 to indicate the new usage percentages.

**User Response:** None.
Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0424 Connectivity has been lost to CF structure `strname`.
The shared TS queue server cannot continue.

Explanation: The queue server has been notified by the system that connectivity has been lost to its list structure.

System Action: The server issues an internal CANCEL command to terminate itself immediately.

User Response: Restart the server when connectivity to the server from the current system has been reestablished. If connectivity is still available from other systems, CICS transactions which require access to the affected queue pool should be diverted to those systems if possible.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0425 CF structure `strname` has failed. The shared TS queue server cannot continue.

Explanation: The queue server has been notified by the system that its list structure has been lost due to coupling facility failure. All data in the queue pool has been lost.

System Action: Each queue server for the affected pool issues an internal CANCEL command to terminate itself immediately.

User Response: If another coupling facility is available and is included in the CFRM preference list for the failed structure, delete the failed structure and restart the servers to cause a fresh copy of the list structure to be allocated on the alternate coupling facility. If no other coupling facility is available, wait until the original coupling facility has been made available again before restarting the servers.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0431I Access statistics for CF structure `strname`:

Explanation: This message gives a summary of coupling facility access statistics. It is issued in response to a DISPLAY or PRINT command which includes the CFSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

```
Index: Wrt Adj n Write n Delet n Delet n Reread n Read Adj n
Data: Create n Wrt n Read n Delet n Delet n Reread n Rewrites n
Responses: Asynch n Normal n Len err n Not fnd n Vers chk n List chk n
List full n Str full n I/O err n
```

System Action: Processing continues.

User Response: The statistics are described in detail in the DFHXOS1D data area. For queues which do not exceed 32K bytes, the data is included in the queue index, otherwise it is stored as a separate list. The individual fields have the following meanings:

- **Index access counts**:
  - *Wrt Adj*: Number of index writes to update adjunct area only. (This area contains the read adjunct area including last used data).
  - *Wrt*: Number of queue writes (new or update) including data.
  - *Read*: Number of queue index reads.
  - *Delete*: Number of queue deletes.
  - *Reread*: Number of reads which had to be repeated because the data was larger than the default data transfer size.
  - *Read Adj*: Number of index reads for the status area only. This is used for inquire processing, and also to read the queue details if necessary during delete processing.

- **Data access counts**:
  - *Create*: Number of times a separate data list was created.
  - *Write*: Number of writes to add items to separate data lists.
  - *Read*: Number of reads from separate data lists.
  - *Delete*: Number of times a separate data list was deleted.
  - *Reread*: Number of reads which had to be repeated because the data was larger than the default data transfer size.
  - *Rewrite*: Number of writes to replace items in separate data lists.

- **Response counts**:
  - *Asynch*: Number of requests for which completion was asynchronous.
  - *Normal*: Number of normal responses.
  - *Len err*: The input buffer was too small to contain the data. The server often tries a buffer size of only 4K in order to use a synchronous read if possible. If this response occurs, the server sets up the maximum sized buffer and reissues the read.
  - *Not fnd*: The specified entry (queue or item) was not found.
  - *Vers chk*: A version check failed for an entry being updated or created, indicating that another task had updated it first.
  - *List chk*: A list authority comparison failed, usually meaning that the queue is in the process of being deleted.
  - *List full*: A queue reached the maximum number of items, causing the relevant list to be marked as full.
  - *Str full*: The list structure became full.
  - *I/O err*: Some other error code was returned by IXLLIST.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF
DFHXQ0432I Queue pool statistics for CF structure strname:

Explanation: This message gives a summary of the usage statistics for the queue pool list structure. It is issued in response to a DISPLAY or PRINT command which includes the POOLSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

<table>
<thead>
<tr>
<th>Structure: Size</th>
<th>Max size</th>
<th>Elem size</th>
<th>Queues: Current</th>
<th>Highest</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lists:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total Entries:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total Lists:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Elements:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Free</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Min Free</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

System Action: Processing continues.

User Response: The statistics are described in detail in the DFHXQ01D area data. Pool usage statistics are calculated from information returned by coupling facility requests, and are not always very accurate, especially if the relevant information has not been accessed recently by the current server. The individual fields have the following meanings:

- Structure:
  - Size: Current allocated size of the list structure.
  - Max size: Maximum size to which this structure could be altered.
  - Elem size: Data element size used for the structure.
- Queues:
  - Current: Number of queues currently in existence.
  - Highest: Highest number of queues at any time (since last reset).
- Lists:
  - Total: Maximum number of list headers in the structure.
  - In Use: Number currently in use.
  - Max Used: Maximum number in use (since last reset).
  - Control: Number of lists in use for control information.
  - Data: Number of lists in use for queue data.
- Entries:
  - Total: Total entries in the currently allocated structure. (Obtained at connection time, may be updated by ALTER).
  - In Use: Number of entries currently in use.
  - Max Used: Maximum number in use (since last reset).
  - Free: Number of entries currently free (total minus used).
  - Min Free: Minimum number of free entries (since last reset).
- Elements:
  - Total: Total data elements in the currently allocated structure. (Obtained at connection time, may be updated by ALTER).
  - In Use: Number of elements currently in use.
  - Max Used: Maximum number in use (since last reset).

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0441 CF structure strname request failed, IXLLIST return code retcode, reason code rsncode.

Explanation: A coupling facility access request issued via the IXLLIST macro gave an abnormal return code.

System Action: The failing request is given an I/O error indication, giving an IOERROR condition if it originated from a CICS API request.

User Response: See the IXLLIST macro in MVS/ESA Programming: Sysplex Services Reference (GC28-1496) for the explanation of the return and reason code.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0442 CF structure strname request failed, structure is full.

Explanation: A coupling facility access request issued via the IXLLIST macro failed because there are insufficient free entries or elements to store the new data in the structure.

System Action: The failing request is given a NOSPACE indication if it originated from a CICS API request. For reload processing, if an automatic ALTER is in progress, the request may be suspended until the outcome of the ALTER is known, then retried. This message will not be issued again for further failures until the used numbers of elements and entries fall well below the warning threshold.

User Response: Any queues which are no longer in use should be deleted so that the space can be reused. If the structure is not at its maximum size, it may be possible to start an ALTER request to increase the size using the MVS SETXCF command.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0443 CF structure strname request failed, all lists are in use.

Explanation: A coupling facility access request issued via the IXLLIST macro failed because all list headers defined in the structure are now in use. The number of list headers is determined by the MAXQUEUES server initialization parameter when the structure was allocated.

System Action: The failing request is given a NOSPACE indication if it originated from a CICS API request. This message will not be issued again for further failures while the shortage of list entries remains.

User Response: Any queues of total size greater than 32K bytes which are no longer in use should be deleted to free up data lists. As the number of lists is fixed when the structure is allocated, the only way to increase the number of lists is to unload the structure,
use SETXCF FORCE to delete it then reload it with a larger MAXQUEUES parameter.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQCF

DFHXQ0444I CF request has been suspended to await ALTER completion.

Explanation: A coupling facility access request issued from the server address space (during reload processing) ran out of space in the list structure, but an automatic ALTER attempt to free up more space is either already active or is being started at this point. The request is therefore being suspended to await the outcome of the ALTER attempt.

System Action: The request is suspended until either the ALTER request completes (normally or abnormally), then the request is retried.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQCF

DFHXQ0445I CF request is being retried after ALTER completion.

Explanation: A request which was suspended to await the completion of an ALTER request is now being retried because the ALTER has either completed or failed.

System Action: The suspended request will be restarted.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQCF

DFHXQ0451 Purge for CF structure strname failed, IXLPURGE return code retcode, reason code rsncode.

Explanation: A queue access request was terminated abnormally and the queue server issued an IXLPURGE macro to ensure any active IXLLIST request was purged before releasing the I/O buffer, but the IXLPURGE macro gave a non-zero return code.

System Action: The error is ignored because this only occurs when a request is already being terminated abnormally.

User Response: See the IXLPURGE macro in MVS/ESA Programming: Sysplex Services Reference (GC28-1496) for the explanation of the return and reason code.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQCF

DFHXQ0461I Disconnected from CF structure strname.

Explanation: The server has successfully disconnected from the CF structure (using the IXLDISC macro).

System Action: Processing continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQCF

DFHXQ0462 Disconnect from CF structure strname failed, IXLDISC return code retcode, reason code rsncode.

Explanation: The IXLDISC macro to disconnect the queue server from its coupling facility list structure failed.

System Action: The error is ignored, as disconnection only occurs when the server is already terminating.

User Response: See the IXLDISC macro in MVS/ESA Programming: Sysplex Services Reference (GC28-1496) for the explanation of the return and reason code.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQCF

DFHXQ0501 Insufficient storage, only actual of requested data buffers allocated.

Explanation: The queue server was unable to allocate the specified number of data buffers (of 32K bytes) during initialization because the relevant storage pool (AXMPGANF) was exhausted.

System Action: The server is terminated.

User Response: Decrease the BUFFERS initialization parameter to a value less than the number which were successfully allocated (to leave plenty of storage for request processing) and restart the server. Alternatively, increase the region size for the queue server to allow more buffers to be allocated.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQB

DFHXQ0511I Queue index buffer pool statistics:

Explanation: This message gives a summary of the usage statistics for the queue index buffer pool, which is used to read and write queue index entries and their associated data, and to save recently accessed index entries in storage to reduce coupling facility I/O. It is issued in response to a DISPLAY or PRINT command which includes the BUFSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

<table>
<thead>
<tr>
<th>Buffers:</th>
<th>Total</th>
<th>Max used</th>
<th>Active</th>
<th>On LRU</th>
<th>Empty</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requests:</td>
<td>Gets</td>
<td>Puts</td>
<td>Keeps</td>
<td>Frees</td>
<td>Purges</td>
</tr>
<tr>
<td>Results:</td>
<td>Got hit</td>
<td>Got free</td>
<td>Got new</td>
<td>Got LRU</td>
<td>No buf</td>
</tr>
<tr>
<td>Errors:</td>
<td>Not freed</td>
<td>No purge</td>
<td>Not owned</td>
<td>Waits: Pool lock</td>
<td>Buf lock</td>
</tr>
</tbody>
</table>
System Action: Processing continues.
User Response: The statistics are described in detail in the DFHXQ0601I

Module: DFHXQST

Note: This message cannot be changed with the message editing
utility.

Destination: SYSPRINT

DFHXQ0602I Statistics collection completed, reset performed.
Explanation: Queue server statistics have been collected and

counters have been reset. This occurs for interval or end of day

statistics.

System Action: Processing continues.
User Response: None.

Note: This message cannot be changed with the message editing
utility.

Destination: SYSPRINT

Module: DFHXQST

DFHXQ0603I Statistics collection completed.
Explanation: Queue server statistics have been collected but

counters have not been reset. This normally occurs at server
closedown.

System Action: Processing continues.
User Response: None.

Note: This message cannot be changed with the message editing
utility.

Destination: SYSPRINT

Module: DFHXQST

DFHXQ0604 Timer SET failed, return code retcode, reason code

rsncode.
Explanation: An attempt by the queue server statistics subtask to

set up a timer wait interval failed.

System Action: The interval statistics function is terminated with

message DFHXQ0606.
User Response: Check the return code and reason code. A

return code of 4 indicates an attempt to set up more than one
concurrent timer interval, which indicates a logic error in the server.
A return code of 8 indicates that the MVS STIMERM macro failed,
in which case the reason code indicates the return code received
from STIMERM SET.

Note: This message cannot be changed with the message editing
utility.

Destination: Console and SYSPRINT

Module: DFHXQST

DFHXQ0605 Timer CANCEL failed, return code retcode, reason code

rsncode.
Explanation: An attempt by the queue server statistics subtask to
cancel a timer wait interval failed.

System Action: The interval statistics function is terminated with
message DFHXQ0606.
User Response: Check the return code and reason code. A

return code of 4 indicates an attempt to cancel a nonexistent timer
interval, which indicates a logic error in the server. A return code
of 8 indicates that the MVS STIMERM macro failed, in which case
the reason code indicates the return code received from STIMERM
CANCEL.

Note: This message cannot be changed with the message editing
utility.

Destination: Console and SYSPRINT

Module: DFHXQST

DFHXQ0601I Starting statistics collection for interval since

lasttime.
Explanation: The queue server is about to collect interval, end of
day or closedown statistics. This message identifies the start of the
time interval to which the statistics apply, which is either the time
that the server was started up or the time of the last reset, which
occurs whenever interval or end of day statistics are produced.

System Action: The queue server proceeds with statistics

collection.
User Response: None.
DFHXQ0606 Statistics collection function is no longer available.

Explanation: The queue server statistics collection subtask was unable to continue processing and has terminated. The reason will have been indicated by an earlier message.

System Action: The interval statistics subtask terminates and no further interval statistics or end of day statistics will be produced for this run of the server.

User Response: See the earlier message indicating the reason for the termination of the subtask.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQST

DFHXQ0606I Statistics written to SMF, return code was retcode.

Explanation: Queue server statistics have been sent to SMF. The return code from the SMFEWTM macro is indicated in this message. A non-zero return code usually indicates that SMF recording was suppressed because of current SMF options or an installation exit.

System Action: Processing continues.

User Response: If the return code is non-zero but SMF statistics were expected to be successfully written, see the SMFEWTM macro in MVS/ESA System Management Facilities (SMF) (GC28-1457) for more information about return codes.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Module: DFHXQST

DFHXQ0701I Shared TS queue pool poolname is to be unloaded.

Explanation: The server program has been started with the UNLOAD option requesting that the queue pool is unloaded to a sequential data set.

System Action: The server starts to process the unload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQUL

DFHXQ0702I Shared TS queue pool poolname has been successfully unloaded.

Explanation: The queue pool has been unloaded successfully.

System Action: The server closes down normally.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQUL

DFHXQ0703I Number of unloaded queues: queues. Blocks written: blocks.

Explanation: This message provides additional information about the results of the unload process, giving the number of queues which were unloaded and the number of 4K data blocks written to the unloaded queue pool data set.

System Action: Server termination continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQUL

DFHXQ0704 DFHXQUL data set for unload could not be opened.

Explanation: The data set to contain the unloaded queue pool could not be opened.

System Action: Unload processing is terminated and the server is closed down with message DFHXQ0706.

User Response: Check that the DFHXQUL DD statement is present in the JCL for the unload job.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQUL

DFHXQ0705 Unload access to CF structure strname failed with response response.

Explanation: The unload process failed because of a problem with coupling facility access.

System Action: Unload processing is terminated and the server is closed down with message DFHXQ0706.

User Response: If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous error message will have been issued. Any other response code indicates an internal logic error.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQUL

DFHXQ0706 Unload for shared TS queue pool poolname was unsuccessful.

Explanation: The queue pool unload process failed. The reason will have been described in a previous message.

System Action: The server is terminated.

User Response: See the previous message giving the reason for the unload failure. Note that any unload data set produced in this case will be incomplete and will not be valid for reload purposes.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQUL
DFHXQ0801I Shared TS queue pool poolname is to be reloaded.

Explanation: The server program has been started with the RELOAD option requesting that the queue pool is to be reloaded from a sequential data set produced using the UNLOAD option.

System Action: The server starts to process the reload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQRL

DFHXQ0802I Shared TS queue pool poolname has been successfully reloaded.

Explanation: The queue pool has been reloaded successfully.

System Action: The server closes down normally.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQRL

Explanation: This message provides additional information about the results of the reload process. Queues on the unloaded data set are bypassed during reload processing if they already exist in the pool (for example as a result of a previous reload which could not be completed due to lack of space).

System Action: Server termination processing continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQRL

DFHXQ0804 DFHXQRL data set for reload could not be opened.

Explanation: The data set containing the queue pool to be reloaded could not be opened.

System Action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User Response: Check that the DFHXQRL DD statement is present in the JCL for the reload job.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQRL

DFHXQ0805 Reload access to CF structure strname failed with response response.

Explanation: The reload process failed because of a problem with coupling facility access.

System Action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User Response: If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous message DFHXQ0441 will have been issued. Any other response code indicates an internal logic error.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQRL

DFHXQ0806 Unexpected end of file encountered on reload data set.

Explanation: End of file was encountered on the unloaded data set before the logical end of the unloaded data was encountered.

System Action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User Response: This indicates that the unloaded data set is incomplete, perhaps because the unload process was abnormally terminated.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQRL

DFHXQ0807 Reload data set contains incorrect data near block block, offset offset.

Explanation: The reload process failed because the unloaded queue pool data set is not in the correct format.

System Action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User Response: Check that the correct data set is being used and that the unload process completed normally.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQRL

DFHXQ0808 Reload for shared TS queue pool poolname was unsuccessful.

Explanation: The queue pool reload process could not be completed. The reason will have been described in a previous message.

System Action: The program is terminated.

User Response: See the previous message giving the reason for the reload failure.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Module: DFHXQRL
DFHXQ0809 Reload for CF structure strname failed, structure is full.

**Explanation:** Reload processing failed because there are insufficient free entries or elements to store the new data in the structure.

**System Action:** Reload processing is terminated and the server is closed down with message DFHXQ0808.

**User Response:** If the structure is not at its maximum size, use the MVS SETXCF FORCE to delete the structure, then change the reload parameters to specify a larger POOLSIZE parameter and rerun the reload job. The approximate amount of information which could not be reloaded can be estimated by comparing the numbers of blocks read and queues reloaded, as described by following message DFHXQ0803, with the corresponding numbers from message DFHXQ0703 in the unload job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Module:** DFHXQRL

---

DFHXQ0810 Reload for CF structure strname failed, all lists are in use.

**Explanation:** Reload processing failed because all list headers defined in the structure are now in use.

**System Action:** Reload processing is terminated and the server is closed down with message DFHXQ0808.

**User Response:** Use the MVS SETXCF FORCE to delete the structure, then change the reload MAXQUEUES parameter to a large value and rerun the reload job.

**Note:** This message cannot be changed with the message editing utility.

DFHXSxxxx messages

DFHXS0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHXSAD, DFHXSL, DFHXSDM, DFHXSFL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: applid, aaa/bbbb, X'offset', modname

DFHXS0002 applid A severe error (code X'code') has occurred in module modname.

Explanation: An error has been detected in module modname. The code X'code' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated.
by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHXSD, DFHXSL, DFHXSM, DFHXML, DFHXSN, DFHSIS, DFHXSL, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: applid, 'Xoffset', modname

**dfhxs0004 applid A possible loop has been detected at offset X'offset' in module modname.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**dfhxs0006 applid Insufficient storage to satisfy Getmain (code X'code') in module modname. MVS code mvscode.**

Explanation: An MVS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code mvscode is the MVS GETMAIN return code.

System Action: An exception entry is made in the trace table (code X'code'). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager, DFHDMDM), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module modname, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. See the CICS System Definition Guide or the CICS Performance Guide for further information on CICS storage.

Destination: Console

Modules: DFHXSD, DFHXSL, DFHXSM, DFHXML, DFHXSN, DFHSIS, DFHXSL, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: applid, 'Xcode', modname, mvscode

**dfhxs0200i date time applid External security initialization has been successfully tracked.**

Explanation: An external security initialization performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD) has been tracked to the XRF alternate system, and has completed successfully.

System Action: None.

User Response: None. You can suppress this message with the system initialization parameter, MSGLEVEL=0.
DFHSX0201I

Destination: Console
Module: DFHXSWM
XMEOUT Parameters: date, time, applid

DFHSX0201I date time applid External security initialization has been tracked, and has failed with return code X'xx' and reason code X'yy'.

Explanation: An external security initialization was performed on an active CICS system by use of a CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD.
The external security initialization has been tracked to the XRF alternate system, but has failed with return code xx and reason code yy.

xx and yy are the values placed in registers 15 and 0 by the external security manager.

System Action: CICS provides a system dump of the XRF alternate system, and continues tracking security initializations.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

DFHSX0202 date time applid An attempt to track external security initialization has failed, tracking data could not be sent.

Explanation: An external security initialization was performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD).

It has not been tracked to an alternate system because the tracking data could not be sent.

System Action: CICS provides a system dump of the active, and continues tracking security initializations.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: The security characteristics of the alternate will no longer match those of the active. Either shut down the alternate, perform a security rebuild at takeover, or accept the difference.

Destination: CSCS
Module: DFHXSWM
XMEOUT Parameters: date, time, applid, X'xx', X'yy'

DFHSX0203 date time applid An attempt to track external security initialization has failed, tracking data could not be received.

Explanation: An external security initialization was performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD).
The external security initialization has not been tracked to an alternate system because the tracking data could not be received.

Message DFHME0116 is normally produced containing the symptom string for this problem.

System Action: CICS provides a system dump of the alternate system, and ceases to track the security initializations.

User Response: The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

Destination: CSCS
Module: DFHXSWM
XMEOUT Parameters: date, time, applid

DFHSX0204 date time applid An attempt to track external security initialization has failed, tracking data was corrupted.

Explanation: An external security initialization was performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD).

It has been tracked to an alternate system but the tracking data was corrupted in transit.

System Action: CICS provides a system dump of the alternate systems, and ceases to track the security initializations.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

Destination: CSCS
Module: DFHXSWM
XMEOUT Parameters: date, time, applid

DFHSX1100I applid Security initialization has started.

Explanation: This is an informational message indicating that security domain initialization has started.

System Action: System initialization continues.

User Response: None.

This message can be suppressed with the system initialization parameter MSGLEVEL=0.

Destination: Console
Module: DFHXSDM
XMEOUT Parameter: applid
DFHXS1101I applid Security initialization has ended.

**Explanation:** This is an informational message indicating that security domain initialization has completed successfully.

**System Action:** System initialization continues.

**User Response:** None.

This message can be suppressed with the system initialization parameter MSGVLVL=0.

**Destination:** Console

**Module:** DFHXSDM

**XMEOUT Parameter:** applid

---

DFHXS1102I applid Security is inactive.

**Explanation:** This is an informational message indicating that security is not active.

**System Action:** System initialization continues.

**User Response:** None.

This message can be suppressed with the system initialization parameter MSGVLVL=0.

**Destination:** Console

**Module:** DFHXSDM

**XMEOUT Parameter:** applid

---

DFHXS1103I applid Default security for userid dfltuser has been established.

**Explanation:** CICS has established a security environment for the default userid dfltuser.

**System Action:** The authorities that are assigned to this userid by the external security manager will be used in CICS resource checks whenever no other userid has been established.

**User Response:** None.

**Destination:** Console Routecodes 2, 9 and 11

**Module:** DFHXSDM

**XMEOUT Parameters:** applid, dfltuser

---

DFHXS1104I applid Default security could not be established for userid dfltuser. The security domain cannot continue, so CICS is terminated. SAF codes are (X’esmresp’, X’esmreas’), ESM codes are (X’esmresp’,X’esmreas’).

**Explanation:** CICS could not establish a security environment for the default userid dfltuser. The security domain cannot continue without a default user. The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY macro.

**System Action:** CICS terminates.

**User Response:** Use the external security manager codes to determine why the RACROUTE REQUEST=VERIFY operation failed. Rectify the problem in the external security manager, then restart CICS.

**Destination:** Console Routecodes 2, 9, 10 and 11

**Module:** DFHXSDM

**XMEOUT Parameters:** applid, dfltuser

---

DFHXS1105I applid Resource profiles for class classname have been built.

**Explanation:** The security resource profiles for the class classname have been successfully loaded into storage by the external security manager.

**System Action:** The profiles are used in subsequent resource checks to determine users’ authorizations to access resources in the named class.

**User Response:** None.

**Destination:** Console Routecodes 2, 9, 10 and 11

**Module:** DFHXSRC

**XMEOUT Parameters:** applid, classname

---

DFHXS1106I Resource profiles could not be built for class classname. CICS is terminated. SAF codes are (X’esmresp’,X’esmreas’), ESM codes are (X’esmresp’,X’esmreas’).

**Explanation:** The security resource profiles for the class classname could not be loaded into storage by the external security manager. The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=LIST macro.

The build of the profiles was requested by one of the following:
- The initialization of the security domain
- The CEMT command PERFORM SECURITY REBUILD
- A user-supplied transaction invoking the EXEC CICS PERFORM SECURITY REBUILD command.

**System Action:** CICS is unable to provide reliable resource security, so it terminates.

**User Response:** Use the external security manager codes to determine why the RACROUTE REQUEST=LIST operation failed. Rectify the problem in the external security manager, then restart CICS.

**Destination:** Console Routecodes 2, 9, 10 and 11

**Module:** DFHXSRC

**XMEOUT Parameters:** applid, classname

---

DFHXS1107I applid Partner-LU profiles for class APPCLU have been built.

**Explanation:** The partner-LU profiles for the class APPCLU have been successfully loaded into storage by the external security manager.

**System Action:** The profiles are used in subsequent bind authorization checks for LU6.2 sessions whose CONNECTION definition specifies BINDSECURITY(YES).

**User Response:** None.

**Destination:** Console Routecodes 2, 9, 10 and 11

**Module:** DFHXSRC

**XMEOUT Parameter:** applid
**DFHXS1108**

**Explanation:** The partner-LU profiles for the class APPCLU could not be built for class APPCLU. SAF codes are \( (X'safresp', X'safreas') \). ESM codes are \( (X'esmresp', X'esmreas') \).

DFHXS1108 **applid** Partner-LU profiles could not be built for class APPCLU. SAF codes are \( (X'safresp', X'safreas') \). ESM codes are \( (X'esmresp', X'esmreas') \).

DFHXS1108 **applid** Partner-LU profiles could not be built for class APPCLU. SAF codes are \( (X'safresp', X'safreas') \). ESM codes are \( (X'esmresp', X'esmreas') \).

**Explanation:** The partner-LU profiles for the class APPCLU could not be loaded into storage by the external security manager. CICS therefore has no APPCLU security profiles. The response and reason codes \( (safresp \text{ and } safreas) \) returned by the system authorization facility (SAF), and the response and reason codes \( (esmresp \text{ and } esmreas) \) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=LIST macro.

The build of the profiles was requested by one of the following:
- The initialization of VTAM support in terminal control
- The CEMT command SET VTAM OPEN
- The CEMT command PERFORM SECURITY REBUILD
- A user-supplied transaction invoking the EXEC CICS SET VTAM OPEN command.
- A user-supplied transaction invoking the EXEC CICS PERFORM SECURITY REBUILD command.

**System Action:** If the failure occurs during CICS initialization or PERFORM SECURITY REBUILD, CICS terminates. If the failure occurs during SET VTAM OPEN, the VTAM ACB is closed and CICS continues.

**User Response:** Use the external security manager codes to determine why the RACROUTE REQUEST=LIST operation failed. Rectify the problem in the external security manager, then restart CICS.

**Destination:** Console Routecodes 2, 9, 10 and 11

**Modules:** DFHXSIS, DFHXSRC

**XMEOUT Parameters:** applid, \( X'safresp' \), \( X'safreas' \), \( X'esmresp' \), \( X'esmreas' \)

**DFHXS1110**

**applid** Security is requested, but the external security manager is inactive.

**Explanation:** Security was requested for this region, but the external security manager (ESM) was found to be inactive. The SEC system initialization parameter was specified as YES or left as its default value. CICS cannot initialize its security manager unless the ESM is active.

**System Action:** CICS terminates.

**User Response:** If you have an ESM installed on your system, ensure that it is active before attempting to start CICS. Otherwise, restart CICS without security by specifying SEC=NO as a system initialization parameter. Note that the SEC parameter cannot be entered as a console override.

**Destination:** Console Routecodes 1, 9, 10 and 11

**Module:** DFHXSSB

**XMEOUT Parameter:** applid

**DFHXS1111**

```

date time applid tranid Security violation by user
userid[ at netname ] at console ]portname for
resource resource in class classname. SAF codes
are \( (X'safresp', X'safreas') \). ESM codes are
\( (X'esmresp', X'esmreas') \).
```

**Explanation:** CICS has detected a security violation by user \( \text{userid} \) while performing an authority check for resource \( \text{resource} \) in resource class \( \text{classname} \).

If the userid causing the violation is signed on at a VTAM terminal, the phrase “at netname portname” reports the netname at which the violation occurred. If the userid causing the violation is signed on at a console, the phrase “at console portname” reports the console name at which the violation occurred. If the userid causing the violation is not signed on or this is a non terminal task, the entry port does not appear in this message as it is not available.

The response and reason codes \( (safresp \text{ and } safreas) \) returned by the system authorization facility (SAF), and the response and reason codes \( (esmresp \text{ and } esmreas) \) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=FASTAUTH or RACROUTE REQUEST=AUDIT macros. These return codes are described in the **OS/390 MVS Programming: Authorized Assembler Services Guide** and in **External Security Interface (RACROUTE) Macro Reference for MVS and VM** (SC28-1366).

CICS can also issue this message when you use the EXEC CICS QUERY SECURITY command with the LOGMESSAGE(LOG) option.

**System Action:** CICS abnormally terminates the task requesting the invalid access except under one of the following conditions:
- The command is issued within the scope of an EXEC CICS HANDLE NOTAUTH command.
Chapter 1. DFH messages

DFHXS1112 applid The CICS region userid and groupid could not be determined. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas').

Explanation: CICS could not determine the userid and groupid for this CICS region.

The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=EXTRACT macro.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

User Response: Use the external security manager codes to determine why the RACROUTE REQUEST=EXTRACT operation failed. Then, either correct the errors for the failing region userid and groupid, and restart CICS, or restart CICS with a different userid and groupid.

Destination: Console Routecodes 2, 9, 10 and 11
Module: DFHXSPW
XMEOUT Parameters: applid, X'safresp', X'safreas', X'esmresp', X'esmreas'

DFHXS1113 applid The region userid cannot access system transaction tranid. CICS will terminate. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas').

Explanation: The region userid for this CICS system is not authorized to attach the system transaction tranid. It is a CICS requirement that the region userid must be able to access this transaction.

The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=FASTAUTH or AUTH macro.

System Action: CICS terminates.

User Response: Authorize the CICS region userid to access all the required CICS system transactions, or specify a different region userid that does have the required authority. (The required transactions are documented as the 'Category 1' transactions in the CICS RACF Security Guide. To authorize the region userid to use these transactions, you should execute the sample clist DFHSCAT1, as described in the CICS Transaction Server for OS/390 Installation Guide.)

Then restart CICS.

Destination: Console Routecodes 2, 9, 10 and 11
Module: DFHXSRC
XMEOUT Parameters: applid, tranid, X'safresp', X'safreas', X'esmresp', X'esmreas'

DFHXS1201 date time applid The password supplied in the verification request for userid userid was invalid. This occurred in transaction tranid when userid userid was signed on at netname netname.

Explanation: An invalid password was supplied for user verification.

System Action: The external security manager also issues a message on the MVS/ESA security console.

CICS continues. No dump is taken.

User Response: Supply the correct password, or contact your security administrator for assistance. If you continue to supply incorrect passwords, the userid may be revoked by the external security manager. A revoked userid can only be reinstated by a security administrator.

Destination: CSCS
Module: DFHXSPW
XMEOUT Parameters: date, time, applid, userid, tranid, userid, netname

DFHXS1202 date time applid The password supplied in the verification request for userid userid has expired. This occurred in transaction tranid when userid userid was signed on at netname netname.

Explanation: An expired password was supplied for user verification.

System Action: CICS continues. No dump is taken.

User Response: Change the password using the CICS signon process, the EXEC CICS CHANGE PASSWORD API, or any other method available to you. Alternatively, contact your security administrator for assistance.

Destination: CSCS
Module: DFHXSPW
XMEOUT Parameters: date, time, applid, userid, tranid, userid, netname

DFHXS1203 date time applid The userid supplied in the verification request for userid userid is revoked. This occurred in transaction tranid when userid userid was signed on at netname netname.

Explanation: A revoked userid was supplied for user verification.

System Action: CICS continues. No dump is taken.

User Response: Contact your security administrator for assistance.

Destination: CSCS
Module: DFHXSPW
XMEOUT Parameters: date, time, applid, userid, tranid, userid, netname
DFHXS1205  
**date time applid** The userid userid supplied in a verification request is not defined in the ESM. This occurred in transaction tranid at netname netname.

**Explanation:** An undefined userid was supplied for user verification.

**System Action:** CICS continues. No dump is taken.

**User Response:** Contact your security administrator for assistance.

**Destination:** CSCS

**Module:** DFHXSPW

**XMEOUT Parameters:** date, time, applid, userid, tranid, userid, netname

DFHXS1211  
**date time applid** The password supplied in a change password request for userid userid was invalid. This occurred in transaction tranid when userid userid was signed on at netname netname.

**Explanation:** An invalid password was supplied for change password processing.

**System Action:** The external security manager also issues a message on the MVS security console.

CICS continues. No dump is taken.

**User Response:** Supply the correct password or contact your security administrator for assistance. If you continue to supply incorrect passwords, the userid may be revoked by the external security manager. A revoked userid can only be reinstated by a security administrator.

**Destination:** CSCS

**Module:** DFHXSPW

**XMEOUT Parameters:** date, time, applid, userid, tranid, userid, netname

DFHXS1213  
**date time applid** The userid userid supplied in a change password request for userid userid was revoked. This occurred in transaction tranid when userid userid was signed on at netname netname.

**Explanation:** A revoked userid was supplied on a password change request

**System Action:** CICS continues. No dump is taken.

**User Response:** You should have the userid reinstated before it can be used. Contact your security administrator for assistance.

**Destination:** CSCS

**Module:** DFHXSPW

**XMEOUT Parameters:** date, time, applid, userid, tranid, userid, netname

DFHXS1214  
**date time applid** The new password supplied in a change password request for userid userid was not accepted. This occurred in transaction tranid when userid userid was signed on at netname netname.

**Explanation:** An invalid new password was supplied on a password change request.

**System Action:** CICS continues. No dump is taken.

**User Response:** Select a suitable new password and try again. If necessary, contact your security administrator for assistance.

**Destination:** CSCS

**Module:** DFHXSPW

**XMEOUT Parameters:** date, time, applid, userid, tranid, userid, netname

DFHXS1217  
**date time applid** When userid userid was revoked in the ESM connection to the default group.

**Explanation:** The userid supplied on a password change request has been revoked in the ESM connection to the default group.

**System Action:** CICS continues. No dump is taken.

**User Response:** Contact your security administrator for assistance.

**Destination:** CSCS

**Module:** DFHXSPW

**XMEOUT Parameters:** date, time, applid, userid, tranid, userid, netname

**DFHZCxxxx messages**

Messages that are generated because the VTAM SYNAD and LERAD exits have been entered are followed by VTAM RETURN CODE xxyy where xx is the VTAM recovery action return code and yy is the VTAM specific error return code, each obtained from fields of the RPL.

Messages that are generated because system or user sense data has been received, are followed by SENSE RECEIVED xxyy zzzz where xx is the VTAM system sense information byte, yy is the VTAM system sense modifier byte, and zzzz represents 2 bytes of user sense information.

Values for xx, yy, and zzzz are hexadecimal. The VTAM system sense information byte, xx, can have the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X’00’</td>
<td>User sense data only (see zzzz)</td>
</tr>
<tr>
<td>X’08’</td>
<td>Request reject</td>
</tr>
<tr>
<td>X’10’</td>
<td>Request error</td>
</tr>
<tr>
<td>X’20’</td>
<td>State error</td>
</tr>
<tr>
<td>X’40’</td>
<td>Request header (RH) usage error</td>
</tr>
<tr>
<td>X’80’</td>
<td>Path error</td>
</tr>
</tbody>
</table>

For the meaning of yy, see the SNA Formats manual.

The sense insert is not included in DFHZCxxxx messages when no meaningful feedback is available.

The instance field on some DFHZCxxxx messages is for IBM internal use only.
DFHZC0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, OCl or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the OS/390 MVS System Codes manual.

Next, look up the CICS abend code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

For further information about code, see the CICS Problem Determination Guide.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHZGBM, DFHZGCA, DFHZGCC, DFHZGCN, DFHZGDA, DFHZGPC, DFHZGRP, DFHZGSL, DFHZGUB

XMEOUT Parameters: applid, X'code', modname

DFHZC0003 applid Insufficient storage (code X'code') in module modname.

Explanation: A CICS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request.

The code X 'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

System Action: An exception entry is made in the trace table (code X 'code' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller. A message will be issued to this effect. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Inform the system programmer.

Try increasing the size of the DSA or EDSA. See the CICS System Definition Guide or the CICS Performance Guide for more information on CICS storage.

Destination: Console

Modules: DFHTCRP, DFHZGRP

XMEOUT Parameters: applid, X'code', modname

DFHZC0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X' offset'. This is the offset of the instruction which was executing at the time the error was detected.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.
Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module `modname` in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module `modname` has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module `modname`, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Module:** DFHZNCA

**XMEOUT Parameters:** `applid, X'offset', modname`

---

**DFHZC0101I**

`date time applid` A predatory takeover has forced VTAM to allow another application to open the ACB which CICS was using.

**Explanation:** A predatory takeover is occurring. This means that a job is initializing which has the same applid as the CICS system. This initiates a takeover of the network. As a normal part of this process, VTAM drives the TPEND exit.

**System Action:** All requests on VTAM sessions are abnormally terminated and the sessions closed. The VTAM ACB is then opened by the application which is using the same APPLID as the CICS region. The new system recovers any persisting sessions.

**User Response:** If this takeover of the network was unintentional, you can prevent it happening in future by using RACF to protect the APPLID. Refer to the VTAM application security section in the VTAM Network Implementation Guide, SC31-6434 for details of how to do this.

**Destination:** Console and Transient Data Queue CSNE

**Module:** DFHZNCA

**XMEOUT Parameters:** `date, time, applid`

---

**DFHZC0111**

`date time applid` No session TCTTE is available to match `sysid` `sysid` for `modname` `modname` because VTAM has returned more NIBs than the CNOS session limit values require.

**Explanation:** During persistent sessions restart VTAM has returned more node initialization blocks (NIBs) than the current CNOS session limit values require. This is probably because a CNOS from a high session limit to a lower session limit was in progress when CICS failed.

**System Action:** The process NIB function is terminated. The session is unbound. CICS ignores this session and continues with the next session if there is one.

This situation has no effect on the restored CICS. The last catalogued CNOS values are restored.

**User Response:** None.

**Destination:** CSNE

**Module:** DFHZGPC

**XMEOUT Parameters:** `date, time, applid, sysid, modname`

---

**DFHZC0112**

`date time applid` No TCTME was found for `sysid` `sysid` for `modname` `modname` during a persistent sessions restart.

**Explanation:** An error has occurred during persistent sessions restart. VTAM passed a NIB to CICS containing the named modename, but CICS was unable to locate the corresponding TCTME.

**System Action:** The attempt to match the NIB to a TCTTE is terminated. The session is unbound.

A system dump is produced.

The CNOS values not related to this modegroup are restored, but the named modegroup cannot be recovered.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CSNE

**Module:** DFHZGPC

**XMEOUT Parameters:** `date, time, applid, sysid, modname`
**DFHZC0120I** applid VTAM sessions persisted for a cold or initial start. Sessions terminated. Inquire issued icount, sessions persisting spcount, sessions terminated stcount.

**Explanation:** CICS is initializing with a cold or initial start, but some VTAM sessions have persisted from a previous CICS with a nonzero PSDI value.

CICS has attempted to terminate all persisting sessions. The message inserts are as follows:

- **icount** is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- **spcount** is the number of VTAM sessions that persisted.
- **stcount** is the number of sessions that CICS has terminated with a CLSDST or TERMSESS macro. This should be equal to **spcount**. If it is not, persistent session recovery probably failed. Earlier messages explain why.

If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

**System Action:** CICS continues.

**User Response:** None.

**Destination:** Console

**Module:** DFHZGRP

**XMEOUT Parameters:** applid, icount, spcount, stcount

**DFHZC0121I** applid VTAM sessions persisted for a WARM start. Sessions terminated. Inquires issued icount, sessions persisting spcount, sessions terminated stcount.

**Explanation:** CICS is initializing with a WARM start, but some VTAM sessions unexpectedly persisted from a previous CICS with a nonzero PSDI value.

CICS has attempted to terminate all persisting sessions. The message inserts are as follows:

- **icount** is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- **spcount** is the number of VTAM sessions that persisted.
- **stcount** is the number of sessions that CICS has terminated with a CLSDST or TERMSESS macro. This should be equal to **spcount**. If it is not, persistent session recovery probably failed. Earlier messages explain why.

If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

**System Action:** CICS continues.

**User Response:** Examine the JOBLOG from the previous run to determine why sessions persisted despite a WARM shut down.

**Destination:** Console

**Module:** DFHZGRP

**XMEOUT Parameters:** applid, icount, spcount, stcount

**DFHZC0122I** applid VTAM sessions persisted for an EMERGENCY, XRF=YES start. Sessions terminated. Inquires issued icount, sessions persisting spcount, sessions terminated stcount.

**Explanation:** CICS is initializing with an EMERGENCY start, but XRF=YES has been specified and some VTAM sessions persisted unexpectedly from a previous CICS with a nonzero PSDI value.

CICS has attempted to close all persisting sessions. The message inserts are as follows:

- **icount** is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- **spcount** is the number of VTAM sessions that persisted.
- **stcount** is the number of sessions that CICS has terminated with a CLSDST or TERMSESS macro. This should be equal to **spcount**. If it is not, persistent session recovery probably failed. Earlier messages explain why.

If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

**System Action:** CICS continues.

**User Response:** You should not mix XRF and persistent sessions. If you wish to use XRF, do a cold or initial start.

**Destination:** Console

**Module:** DFHZGRP

**XMEOUT Parameters:** applid, icount, spcount, stcount

**DFHZC0123I** applid VTAM sessions persisted when OPEN VTAM ACB issued. Sessions terminated. Inquires issued icount, sessions persisting spcount, sessions terminated stcount.

**Explanation:** The VTAM ACB has been opened while CICS is running, however some VTAM sessions persisted either from a previous CICS with a nonzero PSDI value, or when the VTAM ACB was closed.

Persisting sessions have been terminated. The message inserts are as follows:

- **icount** is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- **spcount** is the number of VTAM sessions that persisted.
- **stcount** is the number of sessions that CICS has terminated with a CLSDST or TERMSESS macro. This should be equal to **spcount**. If it is not, persistent session recovery probably failed. Earlier messages explain the reason.

If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

**System Action:** CICS continues.

**User Response:** None.

**Destination:** Console

**Module:** DFHZGRP

**XMEOUT Parameters:** applid, icount, spcount, stcount
DFHZC0124I applid VTAM sessions persisted for an EMERGENCY start. Inquires issued icount, sessions persisting spcount, sessions terminated stcount, sessions OPNDSTed socount, sessions in error secount.

Explanation: CICS was initializing with an EMERGENCY start and some VTAM sessions persisted from a previous CICS with a nonzero PSDI value.

Each of the persisting sessions has been restored or terminated. The message inserts are as follows:
- icount is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- spcount is the number of VTAM sessions that persisted.
- stcount is the number of sessions that CICS terminated with a CLSDST or TERMSESS macro. If an OPNDST failure occurred for an entire NIBLIST (see message DFHZC0129), the sessions in the NIBLIST have been terminated and this count includes these sessions.
- socount is the number of VTAM sessions that CICS restored successfully with an OPNDST OPTCD=RESTORE macro.
- secount is the number of sessions that CICS failed to restore.

System Action: CICS continues.

User Response: None.

Destination: Console

Module: DFHZGRP

XMEOUT Parameters: applid, icount, spcount, stcount, socount, secount

DFHZC0125 date time applid netname persistent session will be terminated. sense ([instance] Module name: (DFHZGRP))

Explanation: CICS was initializing with an EMERGENCY start and some VTAM sessions persisted from a previous CICS with a nonzero PSDI value.

However, the session with a NETNAME of netname is terminated for one of the following reasons as indicated by the instance in the message. An AP exception trace entry is made for each instance as follows.

<table>
<thead>
<tr>
<th>Instance</th>
<th>Point ID and Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>X'FB21'  There is not enough storage to recover an APPC session.</td>
</tr>
<tr>
<td>2</td>
<td>X'FB22'  There is not enough storage to recover a terminal session.</td>
</tr>
<tr>
<td>3</td>
<td>X'FB25'  The NIB and the TCTTE with the same NETNAME were not of the same LU TYPE.</td>
</tr>
</tbody>
</table>

System Action: An AP exception trace with a point ID as above is issued. The session is terminated and CICS continues.

User Response: The exception trace point identifies where the message was issued and determines the action to take.

Destination: CSNE

Module: DFHZGRP

XMEOUT Parameters: date, time, applid, netname, sense, instance, {1=DFHZGRP, 2=DFHZGRP, 3=DFHZGRP}

DFHZC0126I applid No VTAM sessions persisted for an EMERGENCY restart.

Explanation: CICS was initializing with an EMERGENCY start but no VTAM sessions persisted from a previous CICS run. Possible reasons are:
- No persistence was specified in the previous run.
- CICS crashed with the ACB open but no sessions were in use.
- The PSDI value expired.
- An error occurred before DFHZGRP could determine if any sessions persist.

System Action: CICS continues.

User Response: None.

Destination: Console

Module: DFHZGRP

XMEOUT Parameter: applid

DFHZC0127 applid Cannot reestablish persisting sessions - VTAM ACB is closed. Code: X'code'; Module name: module

Explanation: The VTAM ACB has been opened and CICS is processing VTAM persisting sessions, however the ACB was closed, or is being closed by operator action before all the sessions could be restored or terminated.

System Action: CICS continues to close the VTAM ACB and then runs without VTAM support.

User Response: Determine why the operator closed the ACB and either continue without VTAM, dynamically open the ACB, or shut CICS down normally and restart it.

X'code' is the AP exception trace entry that determines which VTAM macro diagnosed the ACB as being closed and where it was issued.

Destination: Console

Modules: DFHZGRP DFHZGUB

XMEOUT Parameters: applid, X'code', module

DFHZC0128 applid Cannot reestablish persisting sessions - VTAM not responding. Module name: module

Explanation: CICS is processing VTAM persisting sessions. However it has issued a VTAM macro and has waited for 8 minutes for the response.

System Action: If this occurs during start up, CICS terminates. If this occurs during dynamic open, the VTAM ACB is closed and CICS continues without VTAM.

A dump is taken for this message in both cases.

User Response: You can restart CICS again immediately, or wait for the persistent sessions to time out and then restart CICS.

If this problem recurs you need to find out why VTAM is not responding to the INQUIRE or OPNDST macro (if the message is issued by DFHZGRP), or the CLSDST or TERMSESS macro (if the message is issued by DFHZGUB).

You can determine which macro is not responding by examining the TCP section of the dump and looking at the RPLs in the PS POOL labeled PS_RPL. The first RPL is for use by INQUIRE or OPNDST, the next 10 by CLSDST or TERMSESS.

Destination: Console
DFHZC0129 applid VTAM OPNDST RESTORE failed. All sessions in the NIBLIST will be terminated instead.
RTNCD,FDB2: X'rc',X'fd'. Code: X'code'

Explanation: CICS is processing VTAM persistent sessions during an EMERGENCY restart but VTAM returned a RTNCD,FDB2 of rc,fd in response to the OPNDST OPTCD=RESTORE macro.

System Action: An AP exception trace entry, 'X'code", is made.
A system dump is taken unless dumps have been specifically suppressed in the dump table.
CICS attempts to terminate all the sessions in the NIBLIST instead of restoring them.

User Response: Use the dump taken on the first occurrence of this problem or the exception trace entry and the VTAM programming manual to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

Destination: Console
Module: DFHZGRP
XMEOUT Parameters: applid, X'rc', X'fd', X'code'

DFHZC0130 applid VTAM INQUIRE PERSESS failed. Cannot restore any persisting sessions. RTNCD,FDB2: X'rc',X'fd'. Code: X'code'

Explanation: CICS is processing VTAM persistent sessions but VTAM returned a RTNCD,FDB2 of rc,fd in response to an INQUIRE OPTCD=PERSESS macro.

System Action: An AP exception trace entry, 'X'code", is made.
A system dump is taken unless dumps have been specifically suppressed in the dump table.

If this occurs during initialization, CICS terminates.
If this occurs during a dynamic open of the ACB, CICS closes the ACB and continues to run without VTAM.
The sessions persist until the PSDI value times out or until VTAM operator commands are issued to terminate the sessions.

User Response: Use the dump or the exception trace entry and the VTAM programming manual to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

If the problem occurs during initialization, try to correct the error and then retry the start up, or wait until the PSDI value expires and restart CICS.
If the problem occurs when the ACB was opened dynamically, you can repeat the command to open the VTAM ACB, or wait until the PSDI value expires and then repeat it.

Destination: Console
Module: DFHZGRP
XMEOUT Parameters: applid, X'rc', X'fd', X'code'

DFHZC0131 date time applid netname termid VTAM OPNDST RESTORE failed.

Explanation: CICS is processing VTAM persistent sessions and has issued an OPNDST OPTCD=RESTORE against a NIBLIST. However, the NIB identified by netname and a session or termid of termid failed to open successfully. This is probably because the session was terminated by the VTAM operator after INQUIRE OPTCD=PERSESS was issued.

System Action: CICS continues.
User Response: Reopen the session in the normal way.
Destination: CSNE
Module: DFHZGRP
XMEOUT Parameters: date, time, applid, netname, termid

DFHZC0132 applid VTAM INQUIRE PERSESS failed. Cannot restore some persisting sessions. Network only partially restored. RTNCD,FDB2: X'rc',X'fd'. Code: X'code'

Explanation: CICS is processing VTAM persistent sessions but VTAM returned a RTNCD,FDB2 of rc,fd in response to a subsequent INQUIRE OPTCD=PERSESS macro.

System Action: An AP exception trace entry, 'X'code", is made.
A system dump is taken unless you have specifically suppressed dumps in the dump table.
CICS continues with a partial network. Some of the sessions are usable, others are not until the PSDI value times out or the VTAM operator terminates the sessions that failed.

User Response: Use the dump or the exception trace entry and the VTAM programming manual to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

If enough of the network is available, wait until the PSDI value expires or use VTAM operator commands to terminate the sessions.
If the network is unusable, either close and reopen the VTAM ACB, or restart CICS.

Destination: Console
Module: DFHZGRP
XMEOUT Parameters: applid, X'rc', X'fd', X'code'

DFHZC0133A applid Persistent session recovery failed.

Explanation: CICS was initializing when an attempt to process VTAM persistent session failed. The reasons are given in earlier messages.

System Action: CICS terminates.
User Response: Examine earlier messages and exception trace entries to determine the reason for failure.

Destination: Console
Module: DFHSSII1
XMEOUT Parameter: applid
DFHZC0134I appid VTAM sessions persisted when OPEN ACB issued. Inquires issued icount, sessions persisting spcount, sessions terminated stcount, sessions OPNDSTed socount, sessions in error secount.

Explanation: The VTAM ACB has been opened while CICS is running, and some VTAM sessions persisted after VTAM abended. Each of the persisting sessions has been restored or terminated. The message inserts are as follows:

- icount is the number of VTAM INQUIRE OPTCD=PERSIST commands issued.
- spcount is the number of VTAM sessions that persisted.
- stcount is the number of sessions that CICS terminated with a CLSDST or TERMSESS macro. If an OPNDST failure occurred for an entire NIBLIST (see message DFHZC0129), the sessions in the NIBLIST have been terminated and this count includes these sessions.
- socount is the number of VTAM sessions that CICS restored successfully with an OPNDST OPTCD=RESTORE macro.
- secount is the number of sessions that CICS failed to restore.

System Action: CICS continues.
User Response: None.
Destination: Console
Module: DFHZGSL
XMEOUT Parameters: appid, icount, spcount, stcount, socount, secount

DFHZC0136 appid PSDI value indicated persistence but the run time VTAM does not support persistent sessions.

Explanation: The PSDI value is nonzero. This specifies that VTAM sessions are to persist across CICS failures. However, this release of VTAM does not support persistent sessions.

System Action: CICS sets the PSDI value to 0 and continues without persistent session support.
User Response: ACF/VTAM Release 3 Version 4 Modification 1 or higher must be used in order to take advantage of CICS persistent session support.

To prevent this message being issued when using an earlier release of VTAM, set the PSDINT system initialization parameter to zero, and when using the EXEC CICS SET VTAM command, either omit, or specify a value of zero for the PSDINTERVAL operand.

Destination: Console
Module: DFHZGSL
XMEOUT Parameters: appid, Xrc', Xfd', X'code'

DFHZC0140 appid SETLOGON PERSIST failed. RTNCD,FDB2: X'rc',X'fd', Code: X'code'

Explanation: CICS was opening the VTAM ACB, setting the PSDI value from an operator command or doing a WARM shut down. It attempted to issue the VTAM command SETLOGON OPTCD=PERSIST or OPTCD=NPERSIST. However, VTAM returned a RTNCD,FDB2 of rc,fd.

System Action: An AP exception trace entry, code, is made.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

If the ACB was being opened, no VTAM sessions persist and the PSDI value is set to 0.

If just the PSDI value was being changed, either by the operator or during termination, the value is unchanged, both to CICS and to VTAM.

If this occurs during a VTAM shut down and some sessions are not closed, sessions may exist on VTAM start-up and are terminated then.

User Response: Use the dump taken or the exception trace entry code and the VTAM programming manual to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

Destination: Console
Module: DFHZGSL
XMEOUT Parameters: appid, Xrc', Xfd', X'code'

DFHZC0144 date time appid sysid termid Synclevel 2 conversation started by netname before completion of exchange lognames.

Explanation: CICS has received an attach FMH5 for a synclevel 2 conversation from a partner with netname netname before exchange lognames processing is complete.

System Action: A Deallocate(Abend) with sense code 08640001 is issued for the conversation.

User Response: No further APPC synclevel 2 conversations can be started by the partner until exchange lognames has completed. Use CEMT to inquire on the status of the connection in order to determine whether exchange lognames has completed (see the CICS Supplied Transactions for more information).

Destination: CSNE
Module: DFHZGDA
XMEOUT Parameters: date, time, appid, sysid, termid, netname, sense, instance, (1=DFHZGDA)
**DFHZC0145** date time applid netname termid Synclevel 2 APPC conversation started before Exchange Lognames completed. Error occurred executing Deallocate(Abend). sense {instance} Module name: {DFHZGDA})

**Explanation:** The APPC session termid with netname persisted during a CICS persistent sessions restart. The partner initiated a new synclevel 2 conversation before Exchange Lognames processing had completed. CICS attempted to issue a Deallocate(Abend) for the conversation. The Deallocate(Abend) could not be completed for the reason indicated by the instance in the message as follows.

<table>
<thead>
<tr>
<th>Instance</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>DFHZGDA called with chain Finite State Machine in unexpected state.</td>
</tr>
<tr>
<td>02</td>
<td>DFHZGDA called with bracket Finite State Machine in unexpected state</td>
</tr>
</tbody>
</table>

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The state of the session after the persistent sessions restart cannot be determined, and the session is deactivated in order to reset the states. The sessions are reactivated.

**User Response:** If the session is not successfully reactivated, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

**Destination:** CSNE

**Module:** DFHZGDA

**XMEOUT Parameters:** date, time, applid, netname, termid, sense, instance, {1=DFHZGDA, 2=DFHZGDA}

**DFHZC0146** date time applid VTAM session for termid successfully recovered following a persistent sessions restart sense {instance} Module name: {DFHZXRC})

**Explanation:** CICS has restored the VTAM persistent session for terminal termid following a persistent sessions restart. The equivalent message for APPC sessions is DFHZC0156.

**System Action:** If recovery notification is specified for this terminal, the recovery message is sent to the terminal, or the transaction requested to run at recovery notification time is started.

**User Response:** If required, code an NEP to override the recovery notification option originally specified in the TYPETERM definition for this session. See the CICS Resource Definition Guide and the CICS Customization Guide for more information.

**Destination:** CSNE

**Module:** DFHZXRC

**XMEOUT Parameters:** date, time, applid, termid, sense, instance, {1=DFHZXRC}

**DFHZC0147** date time applid sysid termid Error occurred recovering persisting session. sense {instance} Module name: {DFHZGDA})

**Explanation:** An error has prevented the recovery of an APPC conversation which persisted across an emergency restart.

The session with a termid of termid is terminated. The reason and the corresponding AP exception trace entry are indicated by the instance in the message;

<table>
<thead>
<tr>
<th>Instance</th>
<th>Point ID and explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>X 'FB79' SEND not executed due to invalid bracket state.</td>
</tr>
<tr>
<td>2</td>
<td>X 'FB7B' Insufficient storage for session recovery.</td>
</tr>
<tr>
<td>3</td>
<td>X 'FB76' Recovery status byte TCTE_PRSS contains an unexpected value.</td>
</tr>
<tr>
<td>4</td>
<td>X 'FB7A' RECEIVE not executed due to invalid bracket state.</td>
</tr>
<tr>
<td>5</td>
<td>X 'FB78' Unexpected sense received during persistent sessions recovery.</td>
</tr>
</tbody>
</table>

**System Action:** An AP exception trace with a point ID as above is issued. The session is terminated and CICS continues.

**User Response:** If recovery failed due to insufficient storage, try increasing the DSA or EDSA size limits (see the CICS Customization Guide). If any of the other instances occur, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CSNE

**Module:** DFHZGDA

**XMEOUT Parameters:** date, time, applid, sysid, termid, sense, instance, {1=DFHZGDA, 2=DFHZGDA, 3=DFHZGDA, 4=DFHZGDA, 5=DFHZGDA}

**DFHZC0148** date time applid sysid termid VTAM send or receive failed during persistent sessions recovery. sense {instance} Module name: {DFHZGDA})

**Explanation:** As part of session recovery following a persistent session restart CICS issued a VTAM SEND or RECEIVE. The VTAM request failed leaving the session in an unknown state.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The session is terminated.

**User Response:** To determine the cause of the problem, see the associated DFHZCnnnn message in the CSNE log. This message gives further diagnostic information on the failing VTAM request.

**Destination:** CSNE

**Module:** DFHZGDA

**XMEOUT Parameters:** date, time, applid, sysid, termid, sense, instance, {1=DFHZGDA, 2=DFHZGDA}
DFHZC0149  

**DFHZC0149** date applid termid Connection failure occurred during a persistent sessions restart sense ((instance) Module name: (DFHZNSP))

**Explanation:** During a persistent sessions restart, CICS has been notified of the failure of a session initiation request issued during the previous instance of CICS. For the meaning of the sense data, see the explanation on page 678.

**System Action:** Processing continues.

**User Response:** None

**Destination:** CSNE

**Module:** DFHZNSP

**XMEOUT Parameters:** date, applid, termid, sense, instance, (1=DFHZNSP)

---

DFHZC0150  

**DFHZC0150** date applid termid Error processing the session state data returned after a persistent sessions restart. sense ((instance) Module name: (DFHZXR))

**Explanation:** The VTAM session for terminal termid persisted during a CICS persistent sessions restart, but an error occurred while processing the session state data returned by VTAM. The reason is indicated by the instance in the message as follows.

**Instance Explanation**

1. DFHZXR called with an invalid request.
2. TCTTEDA contains null characters instead of the expected address.
3. Reserved
4. The vector key of the data passed by VTAM is not correct.
5. The length of the vector_29 data is too short.
6. Unidentified cleanup action detected.
7. Unidentified recovery option detected.
8. Invalid cleanup action for RECOVOPTION(NONE).
9. Invalid cleanup action for RECOVOPTION(MESSAGE).
10. Invalid cleanup action for RECOVOPTION(TRANSACTION).
11. Reserved.
12. DFHZXR has been driven to process an LU6 session.
13. Neither XRF nor persistent sessions recovery is in progress DFHZXR has been called in error.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The state of the session after the persistent sessions restart cannot be determined, and the session is terminated in order to reset the states. Non-APPC sessions are restarted.

**User Response:** If the session is not successfully restarted, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

**Destination:** CSNE

**Module:** DFHZXR

**XMEOUT Parameters:** date, applid, termid, sense, instance, (1=DFHZXR, 2=DFHZXPS, 3=DFHZXR, 4=DFHZXR, 5=DFHZXPS, 6=DFHZXPS, 7=DFHZXPS, 8=DFHZXPS, 9=DFHZXPS, 10=DFHZXPS, 11=DFHZXPS, 12=DFHZXPS, 13=DFHZXRC)

---

DFHZC0155  

**DFHZC0155** date applid sysid termid Error occurred during processing of session state data returned after restart of persisting session. sense ((instance) Module name: (DFHZXPS))

**Explanation:**

**System Action:** An AP exception trace with a point ID is issued. The state of the session after the restart cannot be determined, and the session is terminated in order to reset the states. The session is restarted. A system dump is produced for all instances except 04.

**User Response:** If the session is not successfully restarted, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

**Destination:** CSNE

**Module:** DFHZXPS

**XMEOUT Parameters:** date, applid, sysid, termid, sense, instance, (1=DFHZXPS, 2=DFHZXPS, 3=DFHZXPS, 4=DFHZXPS, 5=DFHZXPS, 6=DFHZXPS, 7=DFHZXPS, 8=DFHZXPS, 9=DFHZXPS, 10=DFHZXPS, 11=DFHZXPS, 12=DFHZXPS, 13=DFHZXPS, 14=DFHZXPS, 15=DFHZXPS, 16=DFHZXPS, 17=DFHZXPS, 18=DFHZXPS, 19=DFHZXPS, 20=DFHZXPS, 21=DFHZXPS, 22=DFHZXPS, 23=DFHZXPS, 24=DFHZXPS, 25=DFHZXPS, 26=DFHZXPS, 27=DFHZXPS, 28=DFHZXPS, 29=DFHZXPS, 30=DFHZXPS, 31=DFHZXPS, 32=DFHZXPS, 33=DFHZXPS, 34=DFHZXPS, 35=DFHZXPS, 36=DFHZXPS, 37=DFHZXPS, 38=DFHZXPS, 39=DFHZXPS, 40=DFHZXPS, 41=DFHZXPS, 42=DFHZXPS, 43=DFHZXPS, 44=DFHZXPS, 45=DFHZXPS, 46=DFHZXPS, 47=DFHZXPS, 48=DFHZXPS, 49=DFHZXPS, 50=DFHZXPS, 51=DFHZXPS, 52=DFHZXPS, 53=DFHZXPS, 54=DFHZXPS, 55=DFHZXPS, 56=DFHZXPS, 57=DFHZXPS, 58=DFHZXPS, 59=DFHZXPS, 60=DFHZXPS, 61=DFHZXPS, 62=DFHZXPS, 63=DFHZXPS, 64=DFHZXPS, 65=DFHZXPS)

---

DFHZC0156  

**DFHZC0156** date applid sysid termid VTAM APPC session termid successfully recovered following a persistent sessions restart. sense ((instance) Module name: (DFHZXPS))

**Explanation:** CICS has restored the VTAM APPC persisting session for sysid termid following a persistent sessions restart. The equivalent message for non-APPC sessions is DFHZC0146. Note that the RECOVNOTIFY option that applies to message DFHZC0146 is not applicable to APPC sessions.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** CSNE

**Module:** DFHZXPS

**XMEOUT Parameters:** date, applid, sysid, termid, sense, instance, (1=DFHZXPS, 2=DFHZXPS)
DFHZC0157 date time applid sysid VTAM APPC session termid could not be recovered following a persistent sessions restart. The session will be unbound. sense (instance) Module name: (DFHZXPS)

Explanation: CICS was unable to restore the APPC persisting session for sysid termid following a persistent sessions restart. There are three possible reasons for this:

1. The BIND processing was incomplete when CICS failed.
2. Resynchronization was in progress for the session when CICS failed.
3. The recovery data returned by VTAM for the session was capable of more than one interpretation.

The TCTTE and TIOA are output for information only.

System Action: The session is unbound and rebound.

User Response: None.

Destination: CSNE

Module: DFHZXPS

XMEOUT Parameters: date, time, applid, sysid, termid, sense, instance, (1=DFHZXPS)

DFHZC0160 date time applid tranid CNOS changes for modename modename to node netname connection sysid are incomplete.

Explanation: CICS has made two attempts to implement the change number of sessions (CNOS) command for the modename on the APPC connection sysid. The command was not successful because of other activity on the modegroup. This only happens on modegroups which are very busy. The state of one or more of the sessions has changed during the processing of the CNOS request.

The CNOS command results from a connection acquire, a connection release, or a request for a specific modename on this system or the connected system. If the connected system is not CICS, commands specific to that system may have been used.

System Action: The modegroup is left in the state reached after the second attempt to implement the changes.

User Response: Use the CEMT INQUIRE MODENAME command to determine the current state of the modegroup. The command may show the modegroup as you expect for successful CNOS completion. This is because the command only shows data for available and active sessions. CICS may have had problems with CNOS values for loser sessions, which would not be apparent by using CEMT. If the values are not as required, re-issue the original command.

Destination: CSNE

Module: DFHZGCA

XMEOUT Parameters: date, time, applid, tranid, modename, netname, sysid

DFHZC0161 date time applid tranid CNOS command for modename modename to node netname connection sysid has failed with code X'code'.

Explanation: CICS has encountered an error while attempting to execute a change number of sessions (CNOS) command for the modename on the APPC connection sysid. The failure code X'code' is one of the following:

- X'FBA2': The request to create a lock manager lock for modename failed.
- X'FBA3': CICS could not allocate a session for the CNOS negotiation conversation.
- X'FBA6': The request to obtain a lock manager lock for modename failed.
- X'FBA6': modename was not found or has been defined with one of the reserved names SNASVCMG or CPSVCMG.
- X'FBA8': sysid is known, but not as a connection.
- X'FBA8': The specified connection sysid has no modegroups. This is probably caused by a storage overwrite.
- X'FBA8': The first modegroup on the specified connection sysid has no sessions. This is probably caused by a storage overwrite.
- X'FBAF': The receive command for the CNOS reply failed.
- X'FBB1': The send command for the CNOS command or CNOS reply failed.
- X'FBB2': The session for the single-session connection could not be found. This is probably caused by a storage overwrite.
- X'FBB3': sysid is not a known connection name.
- X'FBB4': The connection is defined to CICS as not supporting CNOS. This is probably caused by a storage overwrite.

System Action: CICS makes an exception trace with ID AP xxxx; where xxxx is the code in the message. CICS takes a system dump for all failure codes except X'FBA2', X'FBA3', X'FBA6', X'FBA6', and X'FBB1'. CICS continues without completing the request. The task does not abend. Message DFHME0161 is normally produced containing the symptom string for this problem.

User Response: This depends on the error code as follows:

- X'FBA2': Follow the guidance given for the lock manager console message that precedes this.
- X'FBA3': If all the sessions are busy, make one available and retry.
- X'FBA6': Follow the guidance given for the lock manager message that precedes this.
- X'FBA6': Reissue the request with the correct modename.
- X'FBA6': Reissue the request with the correct connection name.
- X'FBA8': See the CICS Problem Determination Guide for further guidance on storage problems.
- X'FBB1': Same as for X'FBA1'.
- X'FBB2': Same as for X'FBA1'.
- X'FBB3': Reissue the request with the correct connection name.
- X'FBB4': Same as for X'FBA1'.

Destination: CSNE

Module: DFHZGCG

XMEOUT Parameters: date, time, applid, tranid, modename, netname, sysid, X'code'
DFHZC0162

DFHZC0162 date time applid tranid CNOS transaction for connection sysid has failed with code X'code' subcode X'subcode'.

Explanation: The change number of sessions (CNOS) transaction program DFHZLS1 could not complete successfully. The error code X'code' is one of the following:

X'FB92' The transaction was not started as an IC request with data or by an attach flow from a connected system. The insert subcode is the start code from XMIQ_START_CODE.

X'FB93' The transaction was started with data, but no data was found.

X'FB94' The transaction was started with data, but the data was not in the form of the correct parameter list.

X'FB95' The transaction was started with the correct format parameter list, but the function code was invalid.

X'FB96' The transaction was started by an attach from a connected system but there was no CNOS data.

X'FB97' The transaction was started by an attach from a connected system but the associated data was not a CNOS command.

System Action: CICS produces an exception trace, and except for in the case of an invalid start, a system dump is taken. The task terminates. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This depends on the error code as follows:

X'FB92' The transaction was probably started by entering the transaction ID at a terminal. This is not allowed.

X'FB93' Analyze the dump to determine why IC could not find the data.

X'FB94' Analyze the dump to determine what the data was.

X'FB95' Analyze the dump to determine what the data was.

X'FB96' Analyze the dump to determine why no data was available.

X'FB97' Analyze the dump to determine why the correct data was not sent with the attach.

Destination: Console
Module: DFHZGSL
XMEOUT Parameters: applid, grname, X'code', X'subcode'

DFHZC0171 applid CICS registration as a VTAM generic resource in the group grname failed. VTAM return code: X'rc', FDB2: X'fd'.

Explanation: CICS failed to register as a VTAM generic resource in the group grname.

VTAM returned a RTNCD,FDB2 of rc,fd in response to the SETLOGON OPTCD=GNAMEADD macro.

System Action: An AP exception trace entry is output with trace point FB8E.

CICS continues without generic resource support.

User Response: Use the VTAM programming manual to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct the problem.

When the problem has been corrected a further attempt may be made to register CICS as a generic resource by closing and reopening the VTAM ACB.

Destination: Console
Module: DFHZGSL
XMEOUT Parameters: applid, grname, X'rc', X'fd'

DFHZC0172 applid CICS deregistered successfully from VTAM generic resource name grname.

Explanation: CICS has deregistered from VTAM generic resource group grname.

System Action: None. CICS will not reregister to the generic resource until the VTAM ACB has been closed and opened again.

User Response: None.

Destination: Console
Module: DFHZGSL
XMEOUT Parameters: applid, grname

DFHZC0173 applid CICS deregistration from VTAM generic resource name grname failed. VTAM return code: X'rc', FDB2: X'fd'.

Explanation: CICS failed to deregister from VTAM generic resource group grname.

VTAM returned a RTNCD,FDB2 of rc,fd in response to the SETLOGON OPTCD=GNAMEDELD macro.

This may be due to a hardware failure in another part of the sysplex or to corruption of the TCT prefix causing CICS to attempt to deregister with the wrong name.

System Action: An AP exception trace entry is output with a trace point of X'FB8E'.

User Response: Use the VTAM Programming Manual to determine the meaning of the register 15 and register 0 values output by VTAM. If the problem is not caused by use of the wrong version of VTAM, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Module: DFHZGSL
XMEOUT Parameters: applid, grname, X'rc', X'fd'
**DFHZC0174**  
**applid** Control block initialization has failed. Generic resource registration or deregistration will not be attempted. Return codes r15,r0.

**Explanation:** A call to a VTAM macro to initialize the node initialization block (NIB) before registering or deregistering as a VTAM generic resource has failed.

A possible explanation is that the wrong level of VTAM is being used.

**System Action:** The values of register 15 and register 0 returned by VTAM are output. An exception trace is output with trace point X'FBED'.

If registration was about to be attempted, CICS continues without generic resource support.

If deregistration was about to be attempted, ACB shutdown continues. VTAM removes CICS as a member for the generic resource name when the ACB is closed.

**User Response:** Use the VTAM Programming Manual to determine the meaning of the register 15 and register 0 values output by VTAM. If the problem is not caused by the use of the wrong version of VTAM, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console  
**Module:** DFHZ2GLS  
**XMEOUT Parameters:** applid, r15, r0

---

**DFHZC0175**  
**applid** A value was specified for GRNAME but the assemble time or run time VTAM does not support generic resource registration.

**Explanation:** A value was specified for the GRNAME system initialization parameter. This indicates that CICS is to register as a VTAM generic resource. However, either DFHTCTxx was assembled against a release of VTAM that cannot support generic resource registration, or CICS is running on a VTAM earlier than release 4 version 2.

**System Action:** CICS sets the generic resource name to blanks and continues without attempting generic resource registration.

**User Response:** If you are running with ACF/VTAM Release 4 Version 2 or higher, reassemble the TCT against this level of VTAM in order to take advantage of CICS support for generic resource registration.

To prevent this message being issued when using an earlier release of VTAM, do not specify a value for the GRNAME system initialization parameter.

**Destination:** Console  
**Module:** DFHZSLS  
**XMEOUT Parameter:** applid

---

**DFHZC0176**  
**date time applid** VTAM was unable to execute a CHANGE OPTCD=ENDAFFINITY macro to end an affinity between this application, which is a member of generic resource *grname*, and a remote LU with *netid* *netname* *netname*. VTAM return code: X'rc', FDB2: X'fd', R15: X'r15'.

**Explanation:** An attempt was made to end an affinity between this CICS, which is a member of generic resource *grname*, and a remote LU with netid *netid* and netname *netname* by means of a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. The attempt has failed because a problem with VTAM prevented the VTAM CHANGE OPTCD=ENDAFFINITY macro from being issued.

VTAM has issued the return code-feedback (RTNCD,FDB2) X'rc',X'fd' in response to the CHANGE OPTCD=ENDAFFINITY macro.

R15 r15 is the register 15 value returned by VTAM.

**System Action:** Processing continues. VTAM has made no attempt to end the affinity.

**User Response:** See the VTAM programming manual for the meaning of the RTNCD,FDB2 and for guidance on correcting the problem.

**Explanation:** A call to a VTAM macro to initialize the node initialization block (NIB) before registering or deregistering as a VTAM generic resource has failed.

**System Action:** The values of register 15 and register 0 returned by VTAM are output. An exception trace is output with trace point X'FBED'.

If registration was about to be attempted, CICS continues without generic resource support.

If deregistration was about to be attempted, ACB shutdown continues. VTAM removes CICS as a member for the generic resource name when the ACB is closed.

**User Response:** Use the VTAM Programming Manual to determine the meaning of the register 15 and register 0 values output by VTAM. If the problem is not caused by the use of the wrong version of VTAM, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**XMEOUT Parameters:** date, time, applid, grname, netid, netname, X'rc', X'fd', X'r15'

---

**DFHZC0177**  
**date time applid** Connection *sysid* has created an affinity between this application, which is a member of generic resource *grname*, and a remote LU with *netid* *netid* *netname*.

**Explanation:** A generic resource member has established an APPC synclevel 2, APPC limited resource, or LU6.1 connection with another LU. For connections of these types VTAM creates affinities which are owned by CICS and have to be ended by the CICS operator using the SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. The message is output whenever the connection is acquired but the affinity is not recreated for each acquire unless it has been ended in the meantime.

**System Action:** Processing continues.

**User Response:** None, but note that the affinity has to be ended before the partner LU can establish a connection with another generic resource member.

The affinity may be ended automatically by the connection quiesce transaction when the connection is released. However, it is not done if the system crashes or is shut down 'immediate' whilst the connection is still acquired.

**Destination:** CSNE  
**Module:** DFHZNAC  
**XMEOUT Parameters:** date, time, applid, sysid, grname, netid, netname

---

**DFHZC0178**  
**date time applid** An attempt to end an affinity between this application, which is a member of generic resource *grname*, and a remote LU with *netid* *netid* *netname* was rejected by VTAM. VTAM return code: X'rc', FDB2: X'fd'.

**Explanation:** An attempt was made to end an affinity between this CICS, which is a member of generic resource *grname*, and a remote LU with netid *netid* and netname *netname* using a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. The request has been rejected by VTAM.

VTAM has issued the return code-feedback (RTNCD,FDB2) X'rc',X'fd' in response to the CHANGE OPTCD=ENDAFFINITY macro.

**System Action:** Processing continues.

**User Response:** See the VTAM programming manual for the meaning of the RTNCD,FDB2 code and for guidance on correcting the problem.
DFHZC0179

When the problem has been corrected, retry the command if appropriate.

**Destination:** CSNE  
**Module:** DFHZGCH

| XMEOUT Parameters: date, time, applid, grname, netid, netname, X'rc', X'fd' |

DFHZC0180

A connection **sysid** from **netname** to **netid** has ended successfully.

**Explanation:** VTAM has responded positively to an attempt to end an affinity with a remote LU. The affinity was ended implicitly by the connection quiesce transaction when the connection was released or explicitly by a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** CSNE  
**Module:** DFHZGCH

| XMEOUT Parameters: date, time, applid, grname, netid, netname |

DFHZC0181

No affinity exists between this application, which is a member of a generic resource **grname**, and a remote LU with netid **netid**. The request has been rejected by VTAM.

**Explanation:** An unsuccessful attempt was made to end an affinity between this CICS and a remote LU. The request has been rejected by VTAM.

**System Action:** Processing continues.

**User Response:** Ensure that the values input to the SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command are correct.

**Destination:** CSNE  
**Module:** DFHZGCH

| XMEOUT Parameters: date, time, applid, grname, netid, netname |

DFHZC0182

**Explanation:** CICS has attempted to determine the network qualified name of the logical unit **luname**. The attempt has failed because a problem with VTAM prevented the VTAM INQUIRE OPTCD=NQN macro from being issued.

**System Action:** The CICS component which requires the network qualified name of the logical unit determines whether any further action is called for.

**User Response:** See the VTAM Programming manual for the meaning of the RTNCD,FDB2 and for guidance on correcting the problem.

**Destination:** CSNE  
**Module:** DFHZGIN

| XMEOUT Parameters: date, time, applid, luname, X'rc', X'fd', X'r15' |

DFHZC0183

**Explanation:** CICS has attempted to determine the network qualified name of the logical unit **luname**. The request has been rejected by VTAM.

**System Action:** The CICS component which requires the network qualified name of the logical unit decides whether further action is called for.

**User Response:** See the VTAM Programming manual for the meaning of the RTNCD,FDB2 and for guidance on correcting the problem.

**Destination:** CSNE  
**Module:** DFHZGIN

| XMEOUT Parameters: date, time, applid, luname, X'rc', X'fd' |

DFHZC0184

**Explanation:** CICS has attempted to determine the member of a generic resource set **grname** to which logical unit **netid** is logged on. The attempt has failed because a problem with VTAM prevented the VTAM INQUIRE OPTCD=SESSNAME macro from being issued.

**System Action:** The CICS component which needs to know where the logical unit is logged on determines whether any further action is called for.

**User Response:** See the VTAM Programming manual for the meaning of the RTNCD,FDB2 and for guidance on correcting the problem.
Chapter 1. DFH messages

1. Use the CEMT INQUIRE CONNECTION API to see which generic resource has the same membername. Since this problem should not occur under normal circumstances, you may need further assistance from IBM.

2. Investigate why the LU name of the partner is the same as the LU name of a terminal and remove one of the definitions.

DFHZC0185 date time applid An attempt to determine the member of generic resource set gname to which logical unit netid.luname is logged on was rejected by VTAM. VTAM return code: X'rc', FDB2: X'fd'.

Explanation: CICS has attempted to determine the member of generic resource set to which gname logical unit netid.luname is logged on. The request has been rejected by VTAM.

VTAM has issued the return code-feedback (RTNCD,FDB2) X'rc',X'fd' in response to the INQUIRE OPTCD=SESSNAME macro.

System Action: The CICS component which requires the member name decides whether further action is called for.

User Response: See the VTAM Programming manual for the meaning of the RTNCD,FDB2 code and for guidance on correcting the problem.

Destination: CSNE
Module: DFHZGIN
XMEOUT Parameters: date, time, applid, grname, netid, luname, X'rc', X'fd', X'15'

DFHZC0186 date time applid Connection sysid which is a member of generic resource gname has a duplicate remote LU netname netname. sense ((instance) Module name: (DFHZOPN))

Explanation: Node nodeid attempted to log on to CICS but the logon is invalid.

The nodeid in the message always starts with the netname of the node attempting to connect to CICS. For some instances of the message resulting from an APPC log on, the modename of the session is concatenated to the netname with a dot separator. Since a string consisting of eight blanks is the default modename, this can lead to idiosyncratic formatting of the message.

If the message is issued by DFHZATA, CICS has failed in its attempt to autoinstall the terminal or connection.

The instance instance is one of the following:

1. During the acquire process for a secondary session CICS attempted to add the membername of the partner to a table but this name already exists for a different generic resource connection.

2. During the acquire process for a secondary session CICS attempted to add the membername of the partner to a table but this name has just been used as the netname of a terminal by an install occurring at the same time as the install of this connection.

System Action: The acquire of the connection continues.

User Response: Use the instance number to determine why the netname already exists:

1. Use the CEMT INQUIRE CONNECTION API to see which generic resource has the same membername.

2. Investigate why the LU name of the partner is the same as the LU name of a terminal and remove one of the definitions.

Destination: CSNE
Module: DFHZGIN
XMEOUT Parameters: date, time, applid, grname, netid, luname, X'rc', X'fd', X'15'

DFHZC0187 date time applid Reset of connection sysid failed following the ending of an affinity between this application and a remote LU with generic resource name gname member name applid. The connection was locked by task taskid, transaction tranid.

Explanation: CICS has failed to reset connection sysid after an affinity was ended successfully. A lock was held by task taskid, transaction tranid.

System Action: Processing continues but the state of the connection is undetermined.

User Response: If appropriate, use the information in the message to find out why there was a lock on the connection. If the connection is left in a state where it cannot be acquired, delete and reinstall it.

Destination: CSNE
Module: DFHZGIN
XMEOUT Parameters: date, time, applid, sysid, grname, netid, luname, X'rc', X'fd', X'r15'

DFHZC0199 CICS has recovered after a system failure.

Execute recovery procedures. ( Already signed on. | Please sign on.)

Explanation: This message is sent to a terminal when the associated VTAM session is successfully recovered following a persistent sessions restart of CICS.

This is the default message issued by CICS if RECOVNOTIFY(MESSAGE) is specified on the TYPETERM for a device (see the CICS Resource Definition Guide), or in the node error program (see the CICS Customization Guide). If RECOVNOTIFY(MESSAGE) is used, it is recommended that the CICS supplied sample mapset DFHXMSG be tailored to meet the installation recovery requirements.

System Action: Processing continues.

User Response: Sign on if required, and take any recovery actions required.

Note: This message cannot be changed with the message editing utility.

Destination: Terminal End User
Module: DFHZZNAC
DFHZC0200  applid  An attempt by the COVR transaction to OPEN VTAM has failed with return code X'retcode'; CICS will retry.

Explanation: The COVR transaction has attempted an EXEC CICS SET VTAM OPEN, but the operation failed with the return code retcode from the OPEN ACB.

System Action: CICS continues. The COVR transaction retries the operation every 5 seconds. This message is reissued every minute until the operation succeeds, or until 10 minutes has passed, in which case message DFHZC0201 is issued.

User Response: Investigate the reason for VTAM being unavailable. See the VTAM Programming manual for an explanation of the ACB return code.

Destination:  Console
Module:  DFHZCOVR
XMEOUT Parameters:  applid, X'retcode'

DFHZC0201  applid  An attempt by the COVR transaction to OPEN VTAM has failed with return code X'retcode'; the COVR transaction will terminate.

Explanation: The COVR transaction has repeatedly attempted an EXEC CICS SET VTAM OPEN, but the operations have failed. The OPEN ACB has issued the return code retcode.

System Action: CICS continues. The COVR transaction terminates and the SET VTAM OPEN is not retried.

User Response: Investigate the reason for VTAM being unavailable. See the VTAM Programming manual for an explanation of the ACB return code.

Destination:  Console
Module:  DFHZCOVR
XMEOUT Parameters:  applid, X'retcode'

DFHZC2109  E  date time applid termid tranid  Unexpected response from Recovery Manager following resynchronization of LU6.1 session termid with remote system sysid.

Explanation: Recovery manager was invoked during resynchronization of an LU6.1 session, but gave an unexpected response. This is due to an internal logic error.

System Action: A system dump is taken unless dumps have been specifically suppressed in the dump table.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CSNE
Module:  DFHZNAC
XMEOUT Parameters:  date, time, applid, termid, sysid

DFHZC2114  E  date time applid termid tranid  A SEND response failed during receive-any processing. sense {1=DFHZRAC}

Explanation: A SEND response issued on a receive-any RPL failed, or was not accepted by VTAM.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: A subsequent message in the log indicates the reasons for the failure. Refer to this message for further information and guidance.

Destination:  CSNE
Module:  DFHZRAC
XMEOUT Parameters:  date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC}

DFHZC2115  applid termid  Potential CICS hang detected following a SEND to node netname, CID X'cid'. Investigation is required. {instance name: (DFHZRAC)}

Explanation: CICS has issued a VTAM SEND macro to send a response but no notification has been received that the response has completed. Until this SEND operation completes, one of the limited number of receive-any RPLs remains unusable (the number of receive-any RPLs is defined by the RAPOOL system initialization parameter).

This is a serious condition. If all the receive-any RPLs become unusable in this way, CICS is unable to accept any new requests from VTAM. Similarly, a reduction in the number of available receive-any RPLs can adversely affect terminal performance and transaction throughput.

Additionally, while the RPL is hanging, a normal CICS shutdown might be unable to complete.

The CID is the 32-bit VTAM communication identifier which was assigned when the session was established.

System Action: CICS continues to monitor for the SEND operation to complete. Until this happens, CICS reissues this message at approximately three minute intervals.

User Response: This problem is usually caused by a failure in the network which stops the SEND completing. Check the session and the associated logical unit to ensure that there is no error condition which stops VTAM completing the SEND request.

Destination:  CSNE
Module:  DFHZRAC
XMEOUT Parameters:  applid, termid, netname, X'cid', instance, {1=DFHZRAC}

DFHZC2116  E  date time applid termid tranid  Resynchronization of LU6.1 session termid with remote system sysid failed.

Explanation: Resynchronization of an LU6.1 session with a remote system has failed to complete for one of the following reasons:

1. There is an apparent inconsistency between the sequence numbers in the two systems
2. There was a protocol error during the exchange of the sequence numbers
Chapter 1. DFH messages

3. Neither system requested resynchronization, but there was a shunted unit of work associated with the session.

**System Action:**

1. A system dump is taken unless dumps have been specifically suppressed in the dump table.
2. The TCTTE for the session on which the error occurred is printed. The local system's sequence numbers, and the numbers or responses received from the remote system can be found in the TCTTE.
3. The failure of resynchronization is reported to recovery manager. Recovery manager issues diagnostics relating to any unit of work affected by the failure.

**User Response:**

1. Determine whether changes to data in the local and remote system are synchronized. Diagnostics issued by recovery manager will help you to do this. If necessary, take action to resynchronize the data.
2. Determine why the resynchronization failure happened. You will normally need assistance from IBM to do this. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CSNE

**Modules:** DFHZRSY, DFHZSCX, DFHZSEX

**XMEOUT Parameters:** date, time, applid, sysid, termid, tranid, instance

---

**DFHZC2117 E**

**Message:** date, time, applid, termid, tranid, Data received on pipeline session exceeds RAIA size. (instance) Module name: (DFHZRAC)

**Explanation:** CICS has received data on a pipeline session which is larger than the initial I/O area allocated for the receive any RPL. The size of the receive any input area (RAIA) is specified on the RAMAX system initialization parameter.

**System Action:** CICS ends the session which sent the data and marks it out of service. CICS will also attempt to abnormally terminate any running transactions which were initiated from this session.

**User Response:** Increase the value of the RAMAX system initialization parameter so that it is at least equal to the largest RUSIZE (from the CINIT) specified for a pipeline session.

**Destination:** CSNE

**Module:** DFHZRAC

**XMEOUT Parameters:** date, time, applid, termid, tranid, instance, \{1=DFHZRAC\}

---

**DFHZC2118 applid Receive Any stall for netname netname.**

**Explanation:** All the CICS Receive Any RPLs have been posted but the TCTTE for each one is waiting for a response from a VTAM terminal or session. All the Receive Any RPLs have been stalled for 10 dispatches of the TCP task (CSTP). This message is produced for each session that is in this situation. A VTAM session has not responded to a command such as BID or SHUTD sent by CICS. This is typically caused by a protocol error.

**System Action:** CICS is NOT running with system initialization parameter RAPOOL=(n,n,FORCE) so CICS VTAM activity is held up until one of the commands completes.

**User Response:**

Issue the VTAM command V NET,INACT,ID=netname,I for one or more of the sessions indicated by netname, to try and free a Receive Any RPL. Note - if the sessions are LU6.2 then the above command will inactivate the partner APPLID to VTAM.

Investigate why the CICS terminal control commands that have caused the stall have not completed. If this is due to a protocol error from the partner or device, attempt to get the protocol error corrected.

Consider increasing the number of Receive Any RPLs specified in the RAPOOL System Initialization parameter. For instance, if you were using the old default of 2, increase this to the new default of 50.

If you still get this message after changing the RAPOOL value consider running CICS with system initialization parameter RAPOOL=(n,n,FORCE), which attempts to issue CLSDST for all the offending sessions or terminals and to re-issue the Receive Any RPLs.

**Destination:** Console

**Module:** DFHZRAC

**XMEOUT Parameters:** applid, netname

---

**DFHZC2300 applid Recovery action requested for connection sysid.**

**Explanation:** The XZIQUE global user exit program has been invoked by CICS because of a potential problem with the connection. The global user exit has used return code UERCAKLL indicating that throughput on the connection is abnormally low and some exceptional action is required. The poor performance of the connection can be caused by:

- Poor response on the receiving end
- Increased load on the sending end

The condition may be intermittent. Message DFHZC2301 may follow indicating that the connection has recovered.

**System Action:** CICS cancels all transactions which have outstanding queued requests to use the connection.

**User Response:** Investigate the cause of the poor performance of the connection. Check the availability and condition of the connected system.

**Destination:** Console

**Module:** DFHZISP

**XMEOUT Parameters:** applid, sysid

---

**DFHZC23011 applid Connection sysid operating normally following recovery action.**

**Explanation:** Message DFHZC2300 has been issued for this connection. The connection has now recovered and is operating normally.

**System Action:** Processing continues.

**User Response:** None

**Destination:** Console

**Module:** DFHZISP

**XMEOUT Parameters:** applid, sysid
**DFHZC2302 applid SETLOGON start command rejected**

**Explanation:** CICS issues the SETLOGON START command after a successful OPEN VTAM ACB. The SETLOGON START command is rejected in the following cases:

- The CICS OPEN VTAM ACB was successful, but VTAM subsequently terminated abnormally, or
- The CICS OPEN VTAM ACB was successful, but insufficient system storage was available to satisfy the SETLOGON START command, or
- The CICS OPEN VTAM ACB was successful, but VTAM was subsequently terminated by a VTAM HALT QUICK command.

**System Action:** If the error occurs during CICS initialization, CICS abnormally terminates with a U2302 abend and a system dump.

If the error occurs as a result of a CEMT or EXEC CICS SET VTAM OPEN, CICS terminates the task abnormally with abend code ATC2 and a transaction dump, and the VTAM ACB is closed.

**User Response:** The VTAM return code can be found in RTNCD-FDBK2 in the first RPL in the RA pool addressed from TCTVRVRA in the system dump or the transaction dump.

Use the VTAM Programming manual, (SC31-6436), to determine the cause of the error and the actions necessary to correct it.

After correcting the error, either reinitialize CICS or reopen the VTAM ACB.

**Destination:** Console

**Module:** DFHZGRP

**XMEOUT Parameters:** applid, X'code'

---

**DFHZC2303 applid No storage available when initiating RECEIVE-ANY's. Code: X'code'**

**Explanation:** While trying to acquire receive-any I/O areas, the SETLOGON START VTAM command found that storage was not available.

**System Action:** CICS terminates with a dump. An exception entry code is made in the trace table.

A system dump is taken unless dumps have been specifically suppressed in the dump table.

Message DFHZC0133 is issued.

**User Response:** Reduce the size of the RAMAX value in the system initialization table (SIT).

For further information, see the CICS Performance Guide.

**Destination:** Console

**Module:** DFHZSLS

**XMEOUT Parameters:** applid

---

**DFHZC2304 applid RECEIVE-ANY command rejected. Code: X'code'**

**Explanation:** This message is issued when the ACB has been opened either during initialization or dynamic open. DFHZGRP was initiating the VTAM RECEIVE-ANY's but VTAM was short on storage or the VTAM HALT QUICK command was issued.

**System Action:** An exception entry code is made in the trace table.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

If the error occurs during CICS initialization, CICS issues message DFHZC0133 and terminates.

If the error occurs as a result of a CEMT or EXEC CICS SET VTAM OPEN, CICS closes the VTAM ACB.

**User Response:** The VTAM return code can be found in RTNCD-FDBK2 in the RPL, which is either in the exception trace entry code, or in the RA pool addressed from TCTVRVRA in the system dump.

Use the VTAM Programming manual, (SC31-6436), to determine the cause of the error and the actions necessary to correct it.

After correcting the error, either reinitialize CICS or reopen the VTAM ACB.

**Destination:** Console

**Module:** DFHZGRP

**XMEOUT Parameters:** applid, X'code'

---

**DFHZC2305i applid Termination of VTAM sessions beginning**

**Explanation:** Either CICS or VTAM is being terminated, or a dynamic close of the VTAM ACB has been requested.

**System Action:** All CICS-VTAM sessions are closed and the ACB is closed. If termination is not orderly, active transactions are abnormally terminated.

**User Response:** When VTAM is active, communication may be resumed by using the master terminal operator command CEMT SET VTAM OPEN.

**Destination:** Console

**Module:** DFHZSHU

**XMEOUT Parameter:** applid

---

**DFHZC2307 applid CICS VTAM ABNORMALLY QUIESCING (modname).**

**Explanation:** An RPL request has completed without a TCTTE token, for other than a VTAM storage shortage.

**System Action:** CICS performs a FORCECLOSE of the ACB.

CICS may produce this message twice as both module DFHZRAC and module DFHZSYX may detect the condition.

**User Response:** When VTAM has been restarted, issue a CEMT SET VTAM OPEN.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHZRAC, DFHZSYX

---

**DFHZC2308 applid TCP Task WAIT failed. Unexpected response from DSSR WAIT_OLDW call (RESPONSE X'xx', REASON X'yy').**

**Explanation:** The TCP task wait has failed.

The TCP dispatcher module, DFHZDSP, has received an unexpected response, with response code X'xx' and reason code X'yy' from the DSSR WAIT_OLDW call.

**System Action:** CICS abends with abend U1800 and a system dump is produced.

**User Response:** Determine the cause of the TCP task wait failure. Investigate the dump in conjunction with any other
accompanying error messages or exception trace entries which may have been issued by dispatcher domain.

**Destination:** Console  
**Module:** DFHZDSP  
**XMEOUT Parameters:** applid, X'xx', X'yy'

DFHZC2309 **applid** Recovery action requested for connection  
**sysid** using mode group **modename**.

**Explanation:** The XZIQUE global user exit program has been invoked by CICS because of a potential problem with the connection. The global user exit has used return code UERCAKLM indicating that throughput on the connection is abnormally low and some exceptional action is required. The poor performance of the connection can be caused by:
- Poor response on the receiving end  
- Increased load on the sending end.

The condition may be intermittent. Message DFHZC2310 may follow indicating that the mode group has recovered.

**System Action:** CICS cancels all transactions which have outstanding queued requests to use this mode group.

**User Response:** Investigate the cause of the poor performance of the mode group. Check the availability and condition of the connected system.

**Destination:** Console  
**Module:** DFHZISP  
**XMEOUT Parameters:** applid, sysid, modename

DFHZC2310I **applid** Connection **sysid** using mode group **modename** operating normally following recovery action.

**Explanation:** Message DFHZC2309 has been issued for this mode group. The mode group has now recovered and is operating normally.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** Console  
**Module:** DFHZISP  
**XMEOUT Parameters:** applid, sysid, modename

DFHZC2312 *** WELCOME TO CICS ***

**Explanation:** This is the CICS default good morning message for VTAM LUs. It is displayed unless an alternative GMTEXT has been specified as a system initialization parameter, or the typeterm definition logon message (LOGONMSG) has been set to NO.

**System Action:** Processing continues.

**User Response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Terminal End User  
**Module:** DFHSIT

DFHZC2316 **applid** VTAM ACB is closed

**Explanation:** CICS and VTAM have been disconnected. This may be because:
- CICS is terminating, or  
- VTAM is terminating, or  
- The CICS master terminal operator has issued  

```plaintext
SET VTAM {CLOSED|IMMCLOSE|FORCECLOSE}
```

**System Action:** The VTAM ACB is closed.

**User Response:** If VTAM has not terminated, connection with VTAM can be reestablished by using master terminal operator commands.

**Destination:** Console  
**Module:** DFHZSHU  
**XMEOUT Parameter:** applid

DFHZC2318 **applid** The autoinstall user program **progname** is not enabled. Module **modname**.

**Explanation:** While opening the VTAM ACB, CICS found that no installed program definition exists for the autoinstall user-program **progname** specified in the SIT.

**System Action:** Other processing continues.

**User Response:** If you want to use autoinstall, produce an installed program definition for the autoinstall user-program **progname** specified in the SIT.

**Destination:** Console  
**Modules:** DFHSIJ1, DFHZOPA  
**XMEOUT Parameters:** applid, progname, modname

DFHZC2319 **applid** Unable to close VTAM ACB RC=xx error code=yy

**Explanation:** The VTAM ACB CLOSE request failed.

**System Action:** CICS continues as if the ACB is closed. (It is not really closed.)

**User Response:** Refer to the VTAM Programming manual for an explanation of the return and error codes.

The return code **xx** is the VTAM return code in Register 15. The error code **yy** is the ACB error flag 'ACBERFLG'.

**Destination:** Console  
**Module:** DFHZSHU  
**XMEOUT Parameters:** applid, xx, yy

DFHZC2320 CORRUPTED TCTTE ADDRESS FOUND DURING SHUTDOWN.

**Explanation:** A DFHTC CTYPE=LOCATE macro has returned an error indication while shutting down VTAM. This implies that the TCTTE chain has been corrupted, possibly by an overlay of the table manager control blocks.

**System Action:** CICS is abnormally terminated with a system dump.

**User Response:** Investigate the dump to determine the cause of the problem.

**Note:** This message cannot be changed with the message editing utility.
DFHZC2350A

**Explanation:** CICS' attempt to shut down the network has not been completed within the time period allowed. This time period, the terminal control shutdown wait threshold, is specified by the TC SWAIT system initialization parameter.

In the message, *mm* is the value of TC SWAIT, and *sesslist* is the VTAM network names of the first 10 (if there are that many) hung VTAM terminals.

**System Action:**
CICS issues this message to both the CSNE transient data queue and the operating system console. This message is issued to the operating system console with an MVS write to operator (WTO) message descriptor code of 2. This means that the message is held by the operating system (that is, it does not roll off the screen) until the operator deletes it. For each hung VTAM terminal, a message DFHZC2351 is also issued. DFHZC2351 gives further details of the session and is issued only to the CSNE transient data queue. CICS may attempt a FORCECLOSE on the session (see message DFHZC2351 for further details) but otherwise CICS terminal control shutdown continues as normal.

This message, DFHZC2350, is not processed by DFHZNAC (node abnormal condition program), so the condition cannot be intercepted by the installation’s DFHZNEP (node error program). Note, however, DFHZC2351 is processed by DFHZNAC and may be intercepted by the installation’s DFHZNEP.

**User Response:** Note the message, then delete it from the operating system console using the MVS CONTROL E (or K E) system command. See message DFHZC2351 for further guidance.

**Destination:** Console and Transient Data Queue CSNE

**Module:** DFHZSHU

**XMEOUT Parameters:** date, time, applid, mm, sesslist, instance, {1=DFHZSHU}

DFHZC2351

**Explanation:** CICS' attempt to shut down the network has not been completed within the time period allowed. The time period, the terminal control shutdown wait threshold, is specified by the TC SWAIT system initialization parameter. This message is issued for each VTAM terminal that is still active (not shut down) after the time period has expired.

In the message, *termid* and *netname* are respectively, the CICS terminal identifier, and the VTAM network name of the hung terminal. One of the following is also included in the message to indicate the reason for the hang:

<table>
<thead>
<tr>
<th>Code</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>Request in progress</td>
</tr>
<tr>
<td>02</td>
<td>Task still active</td>
</tr>
<tr>
<td>03</td>
<td>Waiting for SHUTC</td>
</tr>
<tr>
<td>04</td>
<td>Waiting for BIS</td>
</tr>
<tr>
<td>05</td>
<td>Waiting for UNBIND</td>
</tr>
<tr>
<td>06</td>
<td>Waiting for RTR</td>
</tr>
<tr>
<td>07</td>
<td>BID in progress</td>
</tr>
<tr>
<td>08</td>
<td>Other TC work pending</td>
</tr>
<tr>
<td>99</td>
<td>Undetermined</td>
</tr>
</tbody>
</table>

**System Action:**
If either of the following conditions is true:
- TC ACTN=UNBIND, and this action is not changed by DFHZNAC.
- TC ACTN=NONE, and this action is changed to FORCECLOSE (UNBIND) by DFHZNAC.

CICS terminal control issues a VTAM CLSDST and sends an SNA UNBIND command. If neither of the conditions is true, no special action is taken.

**Note:** CLSDST is not guaranteed to work in all circumstances. The first 10 terminals (if there are that many) reported by this message are also included in message DFHZC2350.

**User Response:** Check the state of the terminal. Check whether the associated DFHZC3437 message includes CLSDST. If DFHZC3437 does not include CLSDST, or it does but the CLSDST still fails to complete, take appropriate action outside of CICS to shut down the terminal.

If after a reasonable interval, terminal control shutdown still fails to complete (message DFHZC2316 is not displayed), take one of the following actions:
- FORCECLOSE the CICS/VTAM ACB.
- Perform a CICS CEMT PERFORM SHUTDOWN IMMEDIATE.
- Cancel the CICS job from the operating system console.

**Warning:** Do not perform one of these actions unless there are no other suitable actions to take.

The reason why the terminal does not shutdown is more likely to be a problem with the terminal device or the network, than with CICS.

If messages DFHZC2350, DFHZC2351, and DFHZC2352 are issued too early or too late in the shutdown process, take appropriate steps to change the TC SWAIT system initialization parameter on future runs of CICS. Once CICS has initialized, TC SWAIT cannot be changed.

**Destination:** CSNE

**Module:** DFHZSHU

**XMEOUT Parameters:** date, time, applid, termid, netname, {1=DFHZSHU}
DFHZC2352 date time applid sysid netname Intersystem parallel connection still active after TC shutdown threshold expired. (instance Module (DFHZSHU)).

Explanation: CICS' attempt to shut down the network has not been completed within the time period allowed. The time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter. This message is issued for the first VTAM intersystem parallel session in each connection (LU Type 6.1 and LU Type 6.2, but not LU Type 6.2 single-session APPC terminals) that is still active (not shut down) after the time period has expired.

In the message sysid and netname are respectively, the CICS system identifier and the VTAM LU identifier.

System Action:
CICS terminal control shutdown continues as normal. Unlike terminals (see message DFHZC2351), terminal control does not attempt a FORCECLOSE on hung parallel connections. This message is not processed by DFHZNAC (node abnormal condition program), so the condition cannot be intercepted by the installation's DFHZNEP (node error program). Parallel connections reported by this message are not included in message DFHZC2352.

User Response: Check the state of the connection. Take appropriate action outside of this CICS system to shut down the connection.

If messages DFHZC2350, DFHZC2351, and DFHZC2352 are issued too early or too late in the shutdown process, take appropriate steps to change the TCSWAIT system initialization parameter on future runs of CICS. Once CICS has initialized TCSWAIT cannot be changed.

Destination: Console and Transient Data Queue CSNE
Module: DFHZSHU
XMEOUT Parameters: date, time, applid, sysid, netname, instance,

DFHZC2401 date time applid termid tranid Error not supported. sense (instance Module name: (DFHZSYX))

Explanation: CICS received an unexpected error code from VTAM.

System Action: CICS terminates the session. If a task is attached, it is abnormally terminated with a transaction dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the symptom string, and if necessary, the transaction dump to determine the source of the error.

Destination: CSNE
Module: DFHZSYX
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, sense, (instance Module name: (DFHZSYX))

DFHZC2402 date time applid termid tranid netname VTAM has returned error on synchronous receive. sense (instance Module name: (DFHZRVS))

Explanation: VTAM has indicated that a synchronous receive issued by DFHZRVS during receive-any slow-down processing did not complete successfully. This indicates a serious mismatch between CICS's view of the state of the session and that of VTAM.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is ignored. CICS prints the associated session TCTTE on the CSNE transient data destination. The RPL returned by VTAM is included in exception trace entry AP FC2.

User Response: Determine from the RPL in the exception trace why VTAM raised the error.

Destination: CSNE
Module: DFHZRVS
XMEOUT Parameters: date, time, applid, termid, tranid, netname, sense, instance, sense, (instance Module name: (DFHZRVS))

DFHZC2403 date time applid termid tranid Bind failure. sense (instance Module name: (DFHZSYX))

Explanation: An attempt to establish a session has failed. This could be because a physical path to the device could not be found, because the device does not exist or has been defined incorrectly, or because the device has rejected the bind.

For the meaning of the sense data, see the explanation on page 678.

If this is an LU62 or LU61 session and the partner LU has sent sense bytes of X'08350000' and oooo is the offset of the NETNAME in the BIND, this indicates that the partner LU was unable to find a suitable session.

If the sense bytes are X'08010000', this may mean that the partner LU has failed to autoinstall a connection.
If the VTAM RETURN CODE FEEDBACK is X'1018' then Generic Resource is in use but the coupling facility is unavailable.

Instance 1 with sense code '0805' - If this system (TOR2) is a member of a generic resource (GR) and the partner (AOR) is not and an affinity already exists between another member (TOR1) of the same generic resource (GR) and the AOR then this indicates that it is not valid to acquire this connection. This message is normally accompanied by DFHZC2411 instance 36 for the equivalent sessions in the AOR. The DFHZC2411 message is saying that the AOR cannot find a connection defined with the real name of TOR2. The AOR connection is defined with the Generic Resource name of the TOR.

System Action: Because communication cannot be established with a node, a VTAM CLSDST macro is issued to release any control blocks previously built, and the node could be placed out of service.

User Response: Use the VTAM sense code given in the message to determine the cause of failure. If appropriate, ensure that the node name was included in the network control program/virtual storage (NCP/VS) generation deck and investigate for a possible bad communication line.

If the sense bytes were X'08350000' (where oooo is the offset of the NETNAME in the BIND), the partner LU has been unable to find a suitable session. If the partner LU is CICS, look in the partner LU's log for DFHZC2411 and previous messages for the same session. This should give some indication as to why no session could be found.

If LU62 autoinstall is in use and the sense bytes were X'08010000' look in the partner LU's log for message DFHZC2411 and message DFHZ69xx which should indicate the reason for failure to autoinstall a connection.

If the VTAM RETURN CODE FEEDBACK is X'1018' the logon can be retried once the coupling facility becomes available.

Instance 1 sense '0805x' - Determine if TOR2 was started intentionally with a different APPLID and the same Generic Resource name and if not, correct the problem. If it was and you need a connection between these two systems then you need to end the affinity between AOR and TOR1. The affinity can be ended by:
1. Bring up TOR1, acquire the connection and release it or
2. bring up TOR1 and use ENDAFFIN via CEMT or EXEC CICS or
3. use a batch program described in 'Writing a batch program to end affinities' in the CICS Intercommunication Guide.

However, if the AOR is within the same sysplex as the TOR you should be using MRO connections rather than APPC - you then get no problems with affinities.

If the AOR is outside the sysplex and the connection is acquired from the TOR then you need to use a HUB as described in 'Using a HUB' in the CICS Intercommunication Guide to prevent two TORs from attempting to connect to one AOR using the generic resource name.

Alternatively you can change the AOR connection to address TOR2 by its real name as opposed to its generic resource name and always acquire the connection from the AOR. This implies that you must not use AUTOCONNECT in the TOR connection.

You should release the connection as soon as possible.

Destination: CSNE

Module: DFHZLEX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSYY, 2=DFHZSYY}

DFHZC2404 E date time applid termid tranid VTAM Detected Logic Error. sense ((instance) Module name: (DFHZLEX))

Explanation: VTAM detected an error in a request. The request was either incomplete or not executable.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS breaks communication with the node (CLSDST), abnormally terminates any attached task, places the node out of service and produces a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that all application programs running concurrently have proper addressability, thereby avoiding alteration of CICS control blocks such as the TCTTE or the RPL. If this message occurs during normal system execution, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

This message may also occur if VTAM is terminating. Under these conditions it is not a serious problem, and usually no response is necessary.

Destination: CSNE

Module: DFHZLEX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZLEX, 2=DFHZLEX, 3=DFHZLEX, 4=DFHZLEX, 5=DFHZLEX, 6=DFHZLEX}

DFHZC2405 E date time applid termid tranid Node netname not activated. sense ((instance) Module name: (DFHZSIM | DFHZSIX | DFHZSXY))

Explanation: The node was not activated, or was deactivated by the network operator, or a generic resource affinity already exists with another system in the same generic resource.

Instance 6 - If the partner is a member of a generic resource (TOR2) and this system (AOR) is not and an affinity already exists between the AOR and another member of the same generic resource (TOR1) because TOR1 crashed, then VTAM has indicated that you cannot acquire this connection.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding SEND and RECEIVE requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A VTAM CLSDST macro is issued to halt communication with the node, and internal LOGONs are prevented.

If this message is issued during takeover, the acquire is retried at intervals of 1, 2, 4 and 8 minutes after the first attempt. This allows time for sessions which require manual intervention before the acquire can succeed.

User Response: Use the VTAM VARY command to activate the node before using it in the network. Alternatively, for ISC with IMS, enable IMS for LOGONs.

It is possible that the node in question has previously been used as a generic APPLID (or in VTAM terms – a USERVAR). Use the VTAM operator command DISPLAY USERVAR to see if this is the case. If it is, you can use MODIFY USERVAR,OPTION=DELETE,ID=node to delete the USERVAR.

Instance 6 - Determine if TOR2 was started intentionally with a different APPLID and the same GR name and if not, correct the problem. If it was and you need a connection between these two
systems then you need to end the affinity between the AOR and
TOR1. The affinity can be ended by:

1. Bring up TOR1, acquire the connection and release it cleanly or
2. Bring up TOR1 and use ENDAFFIN via CEMT or EXEC CICS or
3. Use a batch program described in ‘Writing a batch program to
terminate self’ in the CICS Intercommunication Guide.

However, if the AOR is within the same sysplex as the TOR you
should be using MRO connections rather than APPC - you then get
no problems with affinities.

If the AOR is outside the sysplex and the connection is acquired
from the TOR then you need to use a HUB as described in ‘Using a
HUB’ in the CICS Intercommunication Guide to prevent two TORs
from attempting to connect to one AOR using the generic resource
name.

Alternatively you can change the AOR connection to address TOR2
by its real name as opposed to its generic resource name and
always acquire the connection from the AOR. This implies that you
must not use AUTOCONNECT in the TOR2 connection.

Modules: DFHZSYX, DFHZSIX, DFHZSIM
XMEOUT Parameters: date, time, applid, termid, tranid, netname,
sense, instance, {1=DFHZSIM, 2=DFHZSIM, 3=DFHZSIM, 4=DFHZSIM, 5=DFHZSIM, 6=DFHZSYX, 7=DFHZSYX, 8=DFHZSYX, 9=DFHZSIX, 10=DFHZSYX, 11=DFHZSYX}

DFHZC2406 E date time applid termid tranid Terminate self command received. sense (instance) Module name: (DFHZSYX)

Explanation: The logical unit (LU) has requested termination of
the session.
For the meaning of the sense data, see the explanation on page 678.

System Action: The VTAM CLSDST macro is issued to stop
communications with the node. If a task is attached, it is
abnormally terminated with a transaction dump.

User Response: None.

Destination: CSNE
Module: DFHZSYX
XMEOUT Parameters: date, time, applid, termid, tranid, sense,	instance, {1=DFHZSYX}

DFHZC2407 E date time applid termid tranid Permanent channel failure. sense (instance) Module name: (DFHZSYX)

Explanation: Network Control Program/Virtual Storage (NCP/VS)
was either shut down by the network operator or was abnormally
terminated. Alternatively, there could have been a channel failure.
For the meaning of the sense data, see the explanation on page 678.

System Action: Since communication with the logical unit was
broken, the VTAM CLSDST macro instruction is issued to release
control blocks previously built by VTAM. If a task is attached, it is
abnormally terminated with a transaction dump.

User Response: Use the supplied dump to check for a possible
NCP/VS or channel problem.
**DFHZC2411 E**

date time applid termid tranid nodeid attempted invalid logon. sense ((instance) Module name: (DFHTFP | DFHZATA | DFHZBLX | DFHZLGX | DFHZSCX | RESERVE))

**Explanation:** Node **nodeid** attempted to log on to CICS but the logon is invalid.

The **nodeid** in the message will always start with the ‘netname’ of the node attempting to connect to CICS. For some instances of the message resulting from an LU6.2 log on, the modename of the session will be concatenated to the ‘netname’ with a dot separator. Since a string consisting of eight blanks is the default modename, this can lead to idiosyncratic formatting of the message.

If the message is issued by DFHZATA, CICS has failed in its attempt to autoinstall the terminal or connection.

The instance **instance** is one of the following:

1. For LU6.1 no suitable TCTTE can be found, or no session TCTTE exists. This could occur for one of the following reasons:
   1. The bind did not contain a modename.
   2. There is an RDO definition for a member name connection in a generic resource communicating with another generic resource over an LU6.1 link.
2. No PLUNAME has been found in the LU6.2 bind processed by CICS.
3. An attempt to autoinstall a member name connection in a generic resource system has failed because the bind was not for a SNA service manager.
4. Autoinstall is not allowed because the system is terminating.
5. Autoinstall is not allowed because the VTAM ACB is closing.
6. ISC support is not present because ISC=NO specified in the SIT.
7. Used by DFHZATA for several reasons, for example BIND bad and user exit bad.
8. The TCTTE address restored and the address found by NIBSEARCH do not agree.
9. The system is terminating.
10. VTAM is terminating.
11. RESERVED.
12. RESERVED.
13. No address is present in the RPL.
14. LU6.1 cannot autoinstall.

If both CICS systems are registered as different generic resources, the LU61 connections must be defined with each other’s generic resource netnames; they cannot communicate by member name. In this case CICS looked for the generic resource netname and was unable to find it.

15. ISC support is not present.
16. A CINIT arrived for an APPC parallel session. This is not supported. All input for an APPC parallel session should be via a BIND. Also, no connection exists with this NETNAME.
17. Session is not bound.
18. Not used.
19. LU is not enabled. Typically it is an XRF alternate CICS.
20. A second CINIT with the same netname has arrived.
21. Logon rejected due to CATA abend.
22. A CINIT initiated by SIMLOGON occurred for an APPC parallel session. A matching connection exists, but it is being deleted. This should not occur because either the delete should have been cancelled (if it had been scheduled but not started) or the SIMLOGON should have been queued until the delete was attempted and fails because there is SIMLOGON activity.
23. A BIND was received for an LU6.1 connection. This CICS is registered as a generic resource but the partner addressed CICS by its MEMBER name instead of its generic resource name.
24. Change the partner’s connection definition for this system to use a NETNAME of this system’s generic resource name.
25. An unsolicited APPC parallel session CINIT was received by the logon exit. CICS does not support this.
26. A CINIT was received for an LU6.1 connection. This CICS is registered as a generic resource but the partner addressed CICS by its MEMBER name instead of its generic resource name.
27. Change the partner’s connection definition for this system to use a NETNAME of this system’s generic resource name.
28. A BIND was received for an LU6.1 connection. This CICS is registered as the same generic resource as the partner. However, the partner addressed CICS by the generic resource name rather than the member name which it should use for intra-plex communication.
29. Change the partner’s connection definition for this system to use a NETNAME of this system’s member name.
30. An LU62 binding was received for the netname specified. CICS has found a connection with the relevant netname but the connection was not defined as APPC.
31. A system entry for the connection indicated by the bind has been found but none of its sessions are usable.
32. No modename field UDSS02 was found in the bind.
33. Examination of the session tctte has indicated it to be out of control blocks previously built for the node. If a task is attached, it is abnormally terminated with a transaction dump.
34. An attempt to autoinstall a GR name or XRF connection has failed because the bind was not for a SNA service manager.
This bind is a SNA service manager request for an existing partner.

There is a problem with the user data supplied in the bind. Specifically one of the following.
- There is no user data.
- The user data supplied is too short.
- The user data is not architected.

A delete is pending for the connection found. This delete is for a non-transient terminal definition and has been requested explicitly.

For a non-generic resource request, examination of the bind has indicated that it is not for a SNA service manager.

This instance also indicates that you should not acquire this connection if the partner is a member of a generic resource, and this system is not, and an affinity already exists between this system and another member of the same generic resource. See message DFHZC2403, which is issued for the partner's equivalent sessions, for how you correct the situation.

The current session count has exceeded the maximum session count indicated in the mode group entry.

An attempt to acquire a generic resource connection failed because there is a member name connection defined for the generic resource member to which VTAM has chosen to route it.

This CICS has deregistered from a generic resource but a remote partner is attempting to bind an LU6.1 session using a generic resource name. This indicates that VTAM affinities have not been ended on both sides.

This CICS has deregistered from a generic resource but a remote partner is attempting to bind an APPC session using a generic resource name. This indicates that VTAM affinities have not been ended on both sides.

For the meaning of the sense data, see the explanation on page 678.

If ????????? is displayed in the second half of the nodeid field, the BIND may contain a SESSION QUALIFIER or MODENAME with an invalid length.

System Action: The logon is rejected. If the reject is from DFHZHSCX via the dummy TCTTE, an attempt is made to print the failing BIND and sense code with which it was rejected as part of the message.

User Response: Use the instance number to determine why the attempted logon has been rejected and take the appropriate action.

Destination: CSNE

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZSCX, 3=DFHTFP, 4=DFHZBLX, 5=DFHZBLX, 6=DFHZBLX, 7=DFHZATA, 8=DFHZLGX, 9=DFHZLGX, 10=DFHZLGX, 11=DFHZSCX, 12=RESERVE, 13=DFHZLGX, 14=DFHZLGX, 15=DFHZLGX, 16=DFHZLGX, 17=DFHZLGX, 18=DFHZLGX, 19=DFHZLGX, 20=DFHZLGX, 21=DFHTFP, 22=DFHZLGX, 23=DFHZSCX, 24=DFHZLGX, 25=DFHZLGX, 26=DFHZSCX, 27=DFHZLGX, 28=DFHZBLX, 29=DFHZBLX, 30=DFHZBLX, 31=DFHZBLX, 32=DFHZBLX, 33=DFHZBLX, 34=DFHZBLX, 35=DFHZBLX, 36=DFHZBLX, 37=DFHZBLX, 38=DFHZLGX, 39=DFHZBLX, 40=DFHZSCX}
DFHZC2415 E date time applid termid tranid Node netname out of service. sense (instance) Module name: (DFHZNAC)

Explanation: A node error condition has occurred on node nodeid.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS places the node out of service.

User Response: Use the sense data to determine the nature of the error.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZNAC}

DFHZC2416 E date time applid termid tranid VTAM is halting. sense (instance) Module name: (DFHZSYX)

Explanation: A VTAM HALT command was entered by the network operator while a SIMLOGON or OPNDST request was in progress. The instance number indicates what type of halt was requested:

1  Orderly shutdown
2  Quick shutdown.

For the meaning of the sense data, see the explanation on page 678.

System Action: The VTAM network is quiesced to prevent further requests and the node is placed out of service.

User Response: None.

Module: DFHZSAX
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZSAX)

User Response: An invalid command or request indicates inconsistencies or errors in the definitions of the named terminals/sessions in CICS, VTAM or the connected system for LU6 sessions. Ensure that these definitions are consistent and correct for the device or session characteristics.

Destination: CSNE
Modules: DFHZRAC, DFHZRVC, DFHZRLP
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZRLP, 2=DFHZRLP, 3=DFHZRVC, 4=DFHZRVC, 5=DFHZRAC, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC)

DFHZC2422 E date time applid termid tranid ZCP Logic Error.

Explanation: During terminal processing, CICS detected an invalid internal state in DFHZCP.

Instance 1 of the message could be caused by a loss of data following a persistent sessions restart in a partner system. In this case, no logic error has occurred because any updates are backed out. This normally follows an AZCD for the same session and the message DFHZC0144 for the partner session.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged, and the task is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to the CSMT destination for debugging purposes.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that the application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the dump to locate the source of the error.
It may be useful to examine the debugging data printed on the CSMT log for clues about what possibly went wrong.

DFHC2421 E date time applid termid tranid Unsupported command received. sense (instance) Module name: (DFHZRAC | DFHZRLP | DFHZRVC)

Explanation: An unknown command or request was detected, or the RPL contains logical unit (LU) status.

For the meaning of the sense data, see the explanation on page 678.

System Action: If an invalid command or request was detected, all outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A VTAM CLSDST macro is issued to halt communication with the node.

For ISC sessions, this error may be caused by specifying incompatible session types. It may be used to refer to the VTAM Programming manual, (SC23-0115), while carrying out problem determination.

For the device or session characteristics.

User Response: Ensure that the application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the dump to locate the source of the error.

Destination: CSNE
Module: DFHZSAX
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZSAX)

DFHC2421 E date time applid termid tranid Unsupported command received. sense (instance) Module name: (DFHZRAC | DFHZRLP | DFHZRVC)

Explanation: An unknown command or request was detected, or the RPL contains logical unit (LU) status.

For the meaning of the sense data, see the explanation on page 678.

System Action: If an invalid command or request was detected, all outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A VTAM CLSDST macro is issued to halt communication with the node.

For ISC sessions, this error may be caused by specifying incompatible session types at each node. (For example, SESSIONTYPE=SEND in one node and SESSIONTYPE=FASTRECV in the other node.)
If the RPL contains logical unit (LU) status, one of the following messages is issued: DFHZC2461, DFHZC2462, DFHZC2464, DFHZC2465, or DFHZC2466.

Message DFHME0116 is normally produced containing the symptom string for this problem.
DFHZC2423 E date time applid tranid Attempted to send unsupported command. sense ((instance) Module name: (DFHZSDS))

Explanation: A request to send data synchronously was incomplete. Possible reasons are as follows:

1. The TCTTE was altered.
2. A logic error was encountered.
3. The TCTTE was inadvertently placed on the send-synchronous queue.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User Response: For reasons 1 to 3 listed above, ensure that application programs running concurrently do not alter the TCTTE.

If you suspect a logic error (2), check that the VTAM RPL has not been corrupted. If you still cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSNE
Module: DFHZSDS
XMEOUT Parameters: date, time, applid, tranid, sense, instance, {1=DFHZSDS}

DFHZC2424 E date time applid tranid SESSIONC command request invalid. sense ((instance) Module name: (DFHZSES | RESERVE))

Explanation: A SESSIONC request is incomplete or invalid. Possible reasons are as follows:

1. The TCTTE was altered.
2. The command request bits are incomplete. DFHZSES checks TCTEISDT for a Start Data Traffic (SDT) command, TCTEISTS for a Set and Test Sequence Number (STSN) command, and TCTEICLR for a CLEAR command. If it does not find any of these, DFHZSES causes the message to be issued.
3. The wrong request was queued to SESSIONC.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User Response: Check the TCTTE. Ensure that application programs running concurrently do not alter the TCTTE.

Destination: CSNE
Module: DFHZSATT
XMEOUT Parameters: date, time, applid, tranid, sense, instance, {1=DFHZSDS, 2=DFHZSDS, 3=DFHZSDS}

DFHZC2425 E date time applid tranid ASYNC command request invalid. sense ((instance) Module name: (DFHZSDA))

Explanation: A request to send data asynchronously was incomplete or invalid. This condition can be caused by the TCTTE being altered.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User Response: Check the TCTTE. Ensure that application programs running concurrently do not alter the TCTTE.

Destination: CSNE
Module: DFHZSDA
XMEOUT Parameters: date, time, applid, tranid, sense, instance, {1=DFHZSDA, 2=DFHZSDA}

DFHZC2426 E date time applid tranid Node Status Error. Node is out of service or receive only. sense ((instance) Module name: (DFHZATT))

Explanation: Input was received from a node identified either as output-only or as permanently out of service.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Change the terminal entry in the TCT to indicate that the node is not an output-only device. If the node is out of service, the master terminal operator should place the node back into service.

Destination: CSNE
Module: DFHZATT
XMEOUT Parameters: date, time, applid, tranid, sense, instance, {1=DFHZATT, 2=DFHZATT, 3=DFHZATT}

DFHZC2427 I date time applid tranid NCP Restarted. sense ((instance) Module name: (DFHZSYX))

Explanation: Network Control Program/Virtual Storage (NCP/VS) has been restarted after failing during an OPNDST.

For the meaning of the sense data, see the explanation on page 678.

System Action: The OPNDST request is reissued.

User Response: None.

Destination: CSNE
Module: DFHZSYX
XMEOUT Parameters: date, time, applid, tranid, sense, instance, {1=DFHZSYX}
Chapter 1. DFH messages

**DFHZC2428** E date time applid termid tranid Send DFSYN request incomplete. sense ((instance) Module name: (DFHZSDS))

Explanation: A send-synchronous request was issued without indicating that either a command or data was to be sent.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Check the VTAM RPL for obvious errors. Ensure that application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the dump to determine the source of the error.

Destination: CSNE
Module: DFHZSDS
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS}

**DFHZC2429** E date time applid termid tranid RESETSR request invalid. RTYPE. sense ((instance) Module name: (DFHZRST))

Explanation: An invalid RESETSR request was made in the VTAM macro issued by CICS. The invalid request can be because an RTYPE was not specified or was incorrectly specified, or the TCTTE was altered.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Check the VTAM RPL for obvious errors. Ensure that application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the symptom string, and if necessary, the dump to determine the source of the error.

Destination: CSNE
Module: DFHZRST
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRST}

**DFHZC2430** E date time applid termid tranid Send response command request invalid. sense ((instance) Module name: (DFHZSDR))

Explanation: A send-response request was invalid. Either the request did not specify the response level (DR1 or DR2), or the TCTTE was altered.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump and the node is placed out of service.

User Response: Check the VTAM RPL for obvious errors. Ensure that application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the dump to determine the source of the error.

Destination: CSNE
Module: DFHZSDR
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSDR}

**DFHZC2431** E date time applid termid tranid Request to a released node. sense ((instance) Module name: (DFHZSYX))

Explanation: CICS requested VTAM to perform a close destination for a node currently “owned” by CICS.

For the meaning of the sense data, see the explanation on page 678.

System Action: If the CICS ACB is open, all outstanding requests are purged, the task is abnormally terminated with a transaction dump if a task is attached, and the node is placed out of service. If however, the ACB is already closed, the only action taken is to place the node out of service.

User Response: If the CICS ACB is open, use the dump to determine the source of the error. Check that the TCTTE is valid.

Destination: CSNE
Module: DFHZSYX
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}

**DFHZC2432** E date time applid termid tranid Exception response received. sense ((instance) Module name: (DFHZRAC | DFHZRVX | DFHZSSX))

Explanation: CICS has received an exception response.

For the meaning of the sense data, see the explanation on page 678.

System Action: Another CICS message is issued in conjunction with this message.

User Response: Perform the action specified for the associated CICS message.

Destination: CSNE
Module: DFHZRAC, DFHZRVX, DFHZSSX
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRVX, 3=DFHZSSX, 4=DFHZRVX, 5=DFHZRVX, 6=DFHZRVX, 7=DFHZSSX, 8=DFHZSSX, 9=DFHZSSX, 10=DFHZSSX, 11=DFHZSSX, 12=DFHZSSX, 13=DFHZRAC, 14=DFHZRAC, 15=DFHZRAC, 16=DFHZRAC, 17=DFHZRAC, 18=DFHZRAC, 19=DFHZRAC, 20=DFHZRAC, 21=DFHZRAC, 22=DFHZRAC, 23=DFHZRAC}

**DFHZC2433** E date time applid termid tranid Logon has failed because autoinstall is disabled. sense ((instance) Module name: (DFHZBLX | DFHZLGX))

Explanation: Node nodeid attempted to log on to CICS. The logon has failed because autoinstall is disabled. Possible reasons are:

- Autoinstall system initialization parameters have been incorrectly defined.

Logon has attempted to log on to CICS. The logon has failed because autoinstall is disabled. possible reasons are:

- Autoinstall system initialization parameters have been incorrectly defined.

Logon has attempted to log on to CICS. The logon has failed because autoinstall is disabled. possible reasons are:

- Autoinstall system initialization parameters have been incorrectly defined.
• An error has been detected in CICS terminal attach processing.
• The system is short on storage. Autoinstall is reenabled once the SOS condition ends.

System Action: The logon is rejected.
User Response: Ensure that the value for the AIQMAX system initialization parameter is greater than zero. If an autoinstall user program has been specified for system initialization parameter AIEXIT, check that the program name has been defined to CICS. See the CICS System Definition Guide for further information about autoinstall parameters.

If the system is short on storage, see the associated messages for further guidance.

Destination: CSNE
Modules: DFHZLXG, DFHZSCX, DFHZBLX
XMEOUT Parameters: date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZLXG, 2=DFHZLXG, 3=DFHZBLX, 4=DFHZBLX}
**DFHZC2439 E** date time applid termid tranid Invalid RESUME request. sense ([instance] Module name: (DFHZACT))

**Explanation:** An invalid resume request was received. The CICS activate-scan function detected a resume request in a TCTTE, but the TCTTE was not part of any transaction.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The TCTTE is printed and logged to the CSNE destination for debugging purposes.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Use the symptom string to determine the cause of this problem. Check the TCTTE data printed and logged to the CSNE destination for obvious alterations and errors.

**Destination:** CSNE

**Module:** DFHZACT

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, (1=DFHZACT)

---

**DFHZC2440 I** date time applid termid tranid CICS quiesced by node. sense ([instance] Module name: (DFHZASX))

**Explanation:** A VTAM logical unit has requested CICS to quiesce all I/O activity with that node.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All data transmission to the node is halted until CICS receives a release-quiesce indicator.

**User Response:** None.

**Destination:** CSNE

**Module:** DFHZASX

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, (1=DFHZASX)

---

**DFHZC2441 I** date time applid termid tranid CICS released by node. sense ([instance] Module name: (DFHZASX))

**Explanation:** CICS received a release-quiesce indicator from a VTAM logical unit that had previously quiesced CICS.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** Data transmission to the node is resumed by CICS.

**User Response:** None.

**Destination:** CSNE

**Module:** DFHZASX

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, (1=DFHZASX)

---

**DFHZC2442 E** date time applid termid tranid Exception response received to a definite response send. sense ([instance] Module name: (DFHZRVX))

**Explanation:** An exception response was received when a definite response protocol was requested.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** CICS issues a second message in conjunction with this message that explains the reason for the exception response.

**User Response:** Perform the action specified for the second CICS message received.

**Destination:** CSNE

**Module:** DFHZRVX

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, (1=DFHZRVX, 2=DFHZRVX)

---

**DFHZC2443 E** date time applid termid tranid Request outstanding when node released. sense ([instance] Module name: (DFHZRVL | DFHZRV | DFHZSDL | DFHZSDS | DFHZSHU))

**Explanation:** CICS received a request from an application program, when its node was either not in session or queued to be CLSDSTeed.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All outstanding requests are ignored. If a task is attached, it is abnormally terminated with a transaction dump.

**User Response:** None.

**Destination:** CSNE

**Modules:** DFHZSDS, DFHZRVL, DFHZRV, DFHZSDL, DFHZSHU

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, (1=DFHZRVL, 2=DFHZRV, 3=DFHZSDL, 4=DFHZSDS, 5=DFHZSHU, 6=DFHZSHU, 7=DFHZSHU, 8=DFHZRVL, 9=DFHZSHU)

---

**DFHZC2444 E** date time applid termid tranid CICS bracket state error. sense ([instance] Module name: (DFHZRV | DFHZSDS))

**Explanation:** A CICS application program violated bracket protocol. It is possible that the application program issued an I/O request following a write (last) request.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

**User Response:** Correct the application program.

**Destination:** CSNE

**Modules:** DFHZRV, DFHZSDS

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, (1=DFHZRV, 2=DFHZSDS)
DFHZC2445 E date time applid termid tranid Output area exceeded. sense ((instance) Module name: (DFHZSDS))

Explanation: The TIOA was not large enough to hold all the output data. The application program either set up the TIOA incorrectly or it overran the TIOA.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Correct the application program to acquire a larger TIOA.

Destination: CSNE

Module: DFHZSDS

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS, 2=DFHZSDS}

DFHZC2446 E date time applid termid tranid Invalid response to a bid. sense ((instance) Module name: (DFHZRAC | DFHZRVX | DFHZSSX))

Explanation: An invalid response was received for a bid request. A normal response was received in response to a bid indicator while the transaction was in bracket state. The controller application program is in error.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro instruction, and the node is placed out of service.

User Response: Correct the controller application program to return an exception response to a bid indicator when in the bracket state, followed by a ready-to-receive indicator when ready to honor the bid.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX, DFHZSSX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZSSX, 3=DFHZRAC}

DFHZC2447 E date time applid termid tranid A severe error has occurred as a result of a previous failure. sense ((instance) Module name: (DFHZACT | DFHZFRE | DFHZGET | DFHZOPN | DFHZRAC | DFHZRLP | DFHZRVX | DFHZSDA))

Explanation: A domain call failed and the response could not be handled by module modname because of a previous failure. The domain concerned should have issued a message to the console which gives further information about the failure.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests for terminal termid are purged. If a task is attached, it is abnormally terminated with a transaction dump. Terminal termid is placed out of service and the TCTTE is logged to the CSNE destination.

User Response: Refer to the message issued by the domain that is in error. It indicates the source of the original error.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX, DFHZSSA, DFHZOPN, DFHZFRE, DFHZRLP, DFHZACT, DFHZGET

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZOPN, 2=DFHZRVX, 3=DFHZSDA, 4=DFHZRAC, 5=DFHZRLP, 6=DFHZOPN, 7=DFHZOPN, 8=DFHZFRE, 9=DFHZRLP, 10=DFHZACT, 11=DFHZGET, 12=DFHZGET, 13=DFHZOPN}

DFHZC2448 E date time applid termid tranid Invalid response requested. sense ((instance) Module name: (DFHZRAC | DFHZRVX))

Explanation: An invalid response was requested. An application program transmitted data to CICS without requesting a response from CICS.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User Response: Correct the application program.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRAC, 3=DFHZRAC}

DFHZC2449 E date time applid termid tranid Bracket Error. sense ((instance) Module name: (DFHZRAC | DFHZRVX))

Explanation: The application program either sent a begin-bracket indicator while the transaction was in bracket state, or sent an end-bracket indicator.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro, and the node is placed out of service.

User Response: Correct the application program.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRAC, 3=DFHZRAC}

DFHZC2450 E date time applid termid tranid Bid issued but ATI cancelled. sense ((instance) Module name: (DFHZRAC | DFHZRVX | DFHZSSX))

Explanation: An automatic task initiation (ATI) request was issued without an ATI pending for that terminal.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS will satisfy the BB pending condition by sending a standalone BB-EB.

User Response: If ATI is time-initiated, increase the timer value.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX, DFHZSSX
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, \{1=DFHZRVRX, 2=DFHZRVRX, 3=DFHZRVRX, 4=DFHZSSX, 5=DFHZSSX, 6=DFHZSSX, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC\}

**DFHZC2451 E** date time applid termid tranid Outstanding request when clear was issued. sense ((instance) Module name: (DFHZSYX))

**Explanation:** A request was outstanding when clear was issued. A receive-specific request was pending when a clear indicator was issued. A clear indicator is sent when any of the following occurs:

- The logical unit is lost (LOSTERM).
- CICS issues a VTAM CLSDST macro.
- CICS issues the clear during message resynchronization.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All outstanding requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

**User Response:** None.

**Destination:** CSNE

**Module:** DFHZSYX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, \{1=DFHZSYX\}

**DFHZC2452 E** date time applid termid tranid Invalid command received. sense ((instance) Module name: (DFHZSYX))

**Explanation:** CICS received an invalid command (VTAM indicator). The CICS session-control input exit-routine (SCIP) encountered an indicator other than request-recovery. This routine should be scheduled only when a request-recovery indicator is received from the controller application program.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** If a task is attached, it is abnormally terminated with a transaction dump. The session is terminated and the node is placed out of service.

**User Response:** Check the VTAM RPL for obvious errors. Use the dump to help determine the source of the problem.

**Destination:** CSNE

**Module:** DFHZSYX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, \{1=DFHZSYX\}

**DFHZC2453 E** date time applid termid tranid Request recovery received. sense ((instance) Module name: (DFHZSCX))

**Explanation:** A request for recovery was received. The secondary logical unit requested message resynchronization by sending a request-recovery indicator, but a message sequence number is inconsistent with the sequence number maintained by the 3601 application program.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Message resynchronization is then initiated by CICS.

**User Response:** None.

**Destination:** CSNE

**Module:** DFHZSCX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, \{1=DFHZSCX\}

**DFHZC2454 E** date time applid termid tranid Exception in chain. sense ((instance) Module name: (DFHZSYX))

**Explanation:** An exception response was returned on a POST=RESP chain-data send. CICS normally does not send chained data using POST=RESP.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** Use the symptom string, and if necessary the transaction dump, to determine the source of the error.

**Destination:** CSNE

**Module:** DFHZSYX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, \{1=DFHZSYX\}

**DFHZC2455 E** date time applid termid tranid In CA mode - Task attached. sense ((instance) Module name: (DFHZATT))

**Explanation:** An attempt to attach a task to a logical unit (LU) was made, despite the task being in continue-any (CA) mode. However, terminal termid already had a task attached to it.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task that is already attached to terminal termid is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem. Communication with the node is terminated by issuing the VTAM CLSDST macro. CICS then reestablishes communication with the node by issuing the SIMLOGON macro.

**User Response:** Use the symptom string, and if necessary the dump, to determine the source of the error. Try to determine why there was an attempt to attach a task to terminal termid while it already had a task attached to it.

**Destination:** CSNE

**Module:** DFHZATT

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, \{1=DFHZATT\}
DFHZC2456 E date time applid tranid Exception response received to a command. sense (instance) Module name: (DFHZRAC | DFHZSYX)

Explanation: CICS received an exception response to a command (VTAM indicator) that it sent to a logical unit.

For the meaning of the sense data, see the explanation on page 678.

System Action: In conjunction with this message, CICS issues a second message that explains the reason for the exception response.

User Response: Perform the action specified in the second CICS message received.

Destination: CSNE

Modules: DFHZSYX, DFHZSSX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX, 3=DFHZSYX, 4=DFHZRAC}

DFHZC2457 E date time applid tranid Multiple Errors Encountered. sense (instance) Module name: (DFHZEMW | DFHZRAC | DFHZSYX)

Explanation: A node encountered consecutive errors. That is, the node abnormal condition program, NACP, encountered a second error while processing the first error.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is purged. If a task is attached, it is abnormally terminated with a transaction dump. The send is purged.

User Response: Use the dump to determine the source of the errors. Refer to the error message produced by the first problem and to any VTAM messages that may have been issued.

Destination: CSNE

Modules: DFHZRAC, DFHZSYX, DFHZEMW

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZEMW, 2=DFHZSYX, 3=DFHZSYX, 4=DFHZRAC, 5=DFHZRAC}

DFHZC2458 E date time applid tranid Exception response received to an exception response send. sense (instance) Module name: (DFHZRAC | DFHZRVX)

Explanation: CICS received an exception response to a send for which an exception response was requested.

For the meaning of the sense data, see the explanation on page 678.

System Action: In conjunction with this message, CICS issues a second message that explains the reason for the exception response.

User Response: Perform the action specified in the second CICS message received.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRVX, 4=DFHZRVX, 5=DFHZRAC, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZRAC, 11=DFHZRAC, 12=DFHZRAC}

DFHZC2459 E date time applid tranid No TIOA available for send. sense (instance) Module name: (DFHZSDS)

Explanation: TCTTEDA was not loaded before issuing a DFHTC TYPE=WRITE, or it was inadvertently cleared.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. The send is purged.

User Response: Ensure that TCTTEDA is loaded with the TIOA address before issuing the write.

Destination: CSNE

Module: DFHZSDS

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS, 2=DFHZSDS}

DFHZC2460 E date time applid tranid Sense receive not supported. sense (instance) Module name: (DFHZNAC)

Explanation: Sense codes not supported by CICS were received from the logical unit.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User Response: The user’s node error program (DFHZNEP) can process the sense codes.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC2461 E date time applid tranid Intervention required. sense (instance) Module name: (DFHZNAC)

Explanation: Operator action is requested for a physical component of terminal termid before a request can be completed.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is retried, unless the device is one that sends a logical unit status message after intervention is required. In the latter case, the relevant system action is taken.

User Response: Correct the problem with the device.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}
Chapter 1. DFH messages

DFHZC2462  E date time applid termid tranid Bracket Error. sense (instance) Module name: (DFHZNAC)

Explanation: The secondary logical unit and CICS both sent a begin-bracket indicator concurrently.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro.

User Response: Correct the controller application program so that it cannot send a begin-bracket indicator.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC2463  E date time applid termid tranid Node nodeid resource pending deletion, connection request rejected. sense (instance) Module name: (DFHZBLX | DFHZLGX)

Explanation: Node nodeid tried to connect to CICS. CICS rejected the request because it was deleting the terminal definition for termid.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS continues with the resource alteration, or for instance 3 of the message, the autoinstall delete transaction, CATD, is restarted.

User Response: When the resource alteration is complete, retry the connection or logon request.

Destination: CSNE
Modules: DFHZSCX, DFHZBLX, DFHZLGX
XMEOUT Parameters: date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZBLX, 2=DFHZBLX, 3=DFHZLGX}

DFHZC2464  E date time applid termid tranid Terminate chain. sense (instance) Module name: (DFHZNAC)

Explanation: The secondary logical unit asked CICS to terminate transmission of further data in the current chain.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A cancel indicator is issued to the logical unit permitting discard of the data in the current chain.

User Response: Use the supplied dump to determine why the logical unit requested the chain to be discarded.

For the meaning of the sense data, refer to the explanatory paragraph in message DFHZC2461.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC2465  E date time applid termid tranid Insufficient resources. sense (instance) Module name: (DFHZNAC)

Explanation: The subsystem controller application program has insufficient resources to handle the request. For instance, in the case of 3601, the 3601 diskette might be full, or the data segment in the 3601 might not be large enough to handle the data set.

For the meaning of the sense data, see the explanation on page 678.

System Action: The subsystem is temporarily suspended.

User Response: Determine why the controller application program encountered this condition. For the meaning of the sense data, refer to the explanatory paragraph in message DFHZC2461.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC2466  E date time applid termid tranid Function not executable, sense (instance) Module name: (DFHZNAC)

Explanation: The controller application program cannot transmit a message to terminal termid. Either a data check occurred, or the node is not available.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Terminal status remains unchanged.

User Response: Use the supplied dump to determine why the application program could not execute the request.

For the meaning of the sense data, refer to the explanatory paragraph in message DFHZC2461.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC2467  E date time applid termid tranid Invalid communications ID (CID) detected. sense (instance) Module name: (DFHZLEX)

Explanation: CICS issued a VTAM request containing a communications identifier (CID) which VTAM did not recognize. This may be due to the TCTCEDID field having been altered. Alternatively, it may mean that the session is in the process of being closed down by VTAM and that CICS has tried to use it before the process was complete.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. If the failing request is not a CLSDST, the node is placed out of service. If the losterm exit was driven with return code X’0C’, X’10’, or X’14’, CICS issues a CLSDST to VTAM and reset action flag 23, “keep node out of service”.

User Response: Ensure that application programs running concurrently do not alter the TCTECID field in the TCTTE. Also
check that the session is still active; that is, that the system being communicated with is still functioning.

**Destination:** CSNE

**Module:** DFHZLEX

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, \{1=DFHZLEX\}

**Explanation:** Either the node has not been activated by VARY ACTIVATE or CICS issued a VTAM request containing an invalid symbolic node name where:

- The name may have been altered in the node initialization block (NIB)
- The name was specified during VTAM definition and does not agree with the name in the TCT.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service.

**User Response:** Either issue VARY ACTIVATE for the node, or ensure that application programs running concurrently do not alter the NIB name. Names specified during VTAM definition must agree with those in the TCT.

**Destination:** CSNE

**Module:** DFHZLEX

**XMEOUT Parameters:** date, time, applid, termid, tranid, netname, sense, instance, \{1=DFHZLEX\}

**Explanation:** The function management header (FMH) length was greater than that of the data received from the logical unit.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All data received is purged. If a task is attached, it is abnormally terminated with a transaction dump.

**User Response:** Correct the application program in the logical unit.

**Note:** The first 16 bytes of the I/O area in error are put to the CSNE log data set to aid in error determination.

**Destination:** CSNE

**Module:** DFHZRAC, DFHZATT

**XMEOUT Parameters:** date, time, applid, termid, tranid, netname, sense, instance, \{1=DFHZATT, 2=DFHZATT, 3=DFHZATT, 4=DFHZATT, 5=DFHZATT, 6=DFHZRAC\}

**Explanation:** The receive request for the remainder of data in excess of the input area for the receive-any module was not accepted by VTAM.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All associated data is purged.
**User Response:** A subsequent message follows in the log, indicating reasons for the request failing. Refer to this message for further information and guidance.

**Destination:** CSNE  
**Module:** DFHZNAC  
**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC}

DFHZC2473 E date time applid termid tranid Outbound chaining not supported. sense ((instance) Module name: (DFHZNAC))

**Explanation:** The application program has attempted to send more data than the generated maximum allowable length.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

**User Response:** Correct the application program so that it is sensitive to the maximum allowable length of data that can be sent to the terminal (such as checking the device type), providing the terminal does not support outbound chaining of data (such as a pipeline session).

**Note:** The generated maximum allowable length is specified in the TCTTE.

**Destination:** CSNE  
**Module:** DFHZSDDS  
**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZSDDS, 2=DFHZSDDS}

DFHZC2475 E date time applid termid tranid Function cancelled by LU device. sense ((instance) Module name: (DFHZNAC))

**Explanation:** The logical unit (LU) has terminated all processing connected with one of its components.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

**User Response:** Correct the problem with the LU component and bring it back online. Possible causes of the problem include the following:

- Power for the device is switched off
- A line that is down
- A hardware problem

**Note:** The logical unit (LU) is no longer available.

**Destination:** CSNE  
**Module:** DFHZZNAC  
**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZZNAC}

DFHZC2477 E date time applid termid tranid Chaining not supported. sense ((instance) Module name: (DFHZNAC))

**Explanation:** The logical unit (LU) does not support chaining of data from the host.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

**User Response:** Ensure that the maximum amount of data being transmitted to the LU does not exceed the length specified in the buffer parameter of the DFHTCT macro instruction.

**Note:** The buffer parameter value can be increased only to the maximum acceptable limit of the LU.

**Destination:** CSNE  
**Module:** DFHZZNAC  
**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZZNAC}

DFHZC2478 E date time applid termid tranid Invalid FMH. sense ((Instance) Module name: (DFHZNAC))

**Explanation:** The function management header (FMH) transmitted to the logical unit (LU) had no counterpart on the translate table.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All send and receive requests are purged. If the batch data interchange program is not being used, the transaction is abnormally terminated with a transaction dump. The first part of the TIOA, containing the FMH, is written to the CSNE log.

**User Response:** Correct the application program so that the LU has a counterpart on the translate table.

**Destination:** CSNE  
**Module:** DFHZZNAC  
**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZZNAC}
**DFHZC2479** E date time applid termid tranid Function not supported. sense {(instance) Module name: (DFHZNAC)}

Explanation: The response unit (RU) received by the logical unit (LU) contains a request that this device does not support.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Ensure that the terminal control table (TCT) generation specifications for the device are valid as well as able to accommodate the application requests. (For example, a read-only device being defined as transceive, yet having a bid sent to it.)

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)

---

**DFHZC2480** E date time applid termid tranid Retry requested. sense {(instance) Module name: (DFHZNAC)}

Explanation: The logical unit (LU) has indicated, via sense codes contained in an exception response or an LU status message, that it requires the data to be retransmitted.

For the meaning of the sense data, see the explanation on page 678.

System Action: Retransmission of data will be attempted only in the case of protected tasks (message integrity). If the exception response containing the retry sense codes is received for an unprotected task while in chain processing, a cancel command will be sent to the LU and the task will be resumed. If CICS is not in chain processing, the transaction will be resumed.

User Response: If message retransmission is necessary for the LU, ensure that the retry sense codes are imbedded in the exception response. Also ensure that the host transaction is defined as a protected task (message integrity).

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)

---

**DFHZC2481** E date time applid termid tranid RU Error. sense {(instance) Module name: (DFHZNAC)}

Explanation: The response unit (RU) received by the logical unit (LU) was either not translatable or had an invalid length.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Retrying the request a number of times by use of the node error program (NEP) mechanism may be necessary. This is because this type of error may stem from a bad communication line. If this fails, check for possible invalid or inappropriate terminal specifications at terminal control table (TCT) generation time.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)

---

**DFHZC2482** E date time applid termid tranid Pipeline session bracket error. sense {(instance) Module name: (DFHZATT)}

Explanation: Terminal termid was defined in the terminal control table (TCT) as running in pipeline session mode. However, the BRACKET operand in that definition was either omitted or was specified as BRACKET=NO. Bracket protocol is not enforced on a pipeline session terminal.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send and receive requests are purged and the session is terminated. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Correct the TCT entry by inserting the BRACKET=NO operand.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZATT)

---

**DFHZC2483** E date time applid termid tranid Receiver in transmit mode. sense {(instance) Module name: (DFHZNAC)}

Explanation: Normal data flow has been interrupted.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: Retry the WRITE.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZATT)

---

**DFHZC2484** E date time applid termid tranid Component not available. sense {(instance) Module name: (DFHZNAC)}

Explanation: An application request could not be satisfied because the required component was not available.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. All outstanding send and receive requests are purged.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Check the terminal environment, or use the symptom string, and if necessary the dump, to determine the cause of the error.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)
Chapter 1. DFH messages

DFHZC2485  E date time applid termid tranid Cancel received in 'CS'-mode. sense {((instance) Module name: (DFHZRVRX))}

Explanation: A CANCEL indicator was received while a task was active.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. All outstanding send and receive requests purged.

User Response: None.

Destination: CSNE

Module: DFHZRVRX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRVRX}

DFHZC2486  E date time applid termid tranid Cancel received in 'CA'-mode. sense {((instance) Module name: (DFHZRAC))}

Explanation: A CANCEL indicator was received while no task was active.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: None.

Destination: CSNE

Module: DFHZRAC

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC}

DFHZC2487  E date time applid termid tranid Session connection failed. Node unavailability return code returncode, sense {((instance) Module name: (DFHZBLX | DFHZLGX | DFHZSCX))}

Explanation: A connection request was rejected. CICS is temporarily unable to carry out the connection request. The TCTTE for node nodeid indicated that the session could not be established. returncode gives the reason, as follows:

1. The CLSDST macro has been scheduled for this node
2. The node is in an abnormal condition
3. The node has an error condition raised against it
4. The node is already in use
5. CICS is terminating
6. VTAM is terminating.

For the meaning of the sense data, see the explanation on page 678.

System Action: The connection request is rejected.

User Response: Retry the connection request when the node becomes available. See the CICS Customization Guide for more information on the CLSDST macro and for an explanation of abnormal node conditions.

Destination: CSNE

Module: DFHZRAC

XMEOUT Parameters: date, time, applid, termid, tranid, nodeid, returncode, sense, instance, {1=DFHZBLX, 2=DFHZLGX, 3=DFHZSCX}

DFHZC2488  E date time applid termid tranid nodeid logon request rejected as terminal recovery is in progress. sense {((instance) Module name: (DFHZBLX | DFHZLGX | DFHZSCX))}

Explanation: A connection request was rejected because the CICS terminal recovery program was still executing.

For the meaning of the sense data, see the explanation on page 678.

System Action: The connection request is rejected.

User Response: Retry the connection request. Message DFHRU2800 is produced when the recovery program has completed processing.

Destination: CSNE

Modules: DFHZLGX, DFHZSCX, DFHZBLX

XMEOUT Parameters: date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZLGX, 2=DFHZSCX, 3=DFHZBLX}

DFHZC2489  E date time applid termid tranid 3270 - Invalid copy request. sense {((instance) Module name: (DFHZARQ))}

Explanation: The terminal control table terminal entry (TCTTE) of the device from which the information is to be copied ("from" device) did not specify the COPY feature. Alternatively, the "from" device:

- Is not defined in the TCT, or
- Is not a 3270, or
- Is not connected to CICS via VTAM.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Ensure that the application program is aware of the device configuration. Furthermore, ensure that the "from" device is defined in the TCT as a 3270 device AND is connected to CICS.

Destination: CSNE

Module: DFHZARQ

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZARQ, 2=DFHZARQ, 3=DFHZARQ}

DFHZC2490  E date time applid termid tranid Request for TOLTEP. sense {((instance) Module name: (DFHZSYX))}

Explanation: On a request for TOLTEP, a receive request completes in error.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a transaction is currently attached, it is abnormally terminated. The terminal is disconnected from CICS by a VTAM CLSDST macro, and is queued for logon to CICS when TOLTEP has finished.

User Response: None.

Destination: CSNE
DFHZC2492 E  date time applid termid tranid Intervention required on 3270 printer. sense ((instance) Module name: (DFHZNAC))

Explanation: This message is sent to the CSNE message log when an INTERVENTION REQUIRED condition is detected on a 3270 printer. This condition could occur for any of the reasons listed below.

- A printer has requested the use of a printer that does not exist.
- The printer adapter feature is not present.
- There is no paper in the printer.
- The printer cover is open.
- The printer is offline.

For the meaning of the sense data, see the explanation on page 678.

System Action: No action is performed except printing of the RPL and the TCTTE.

User Response: Check that the terminal control table (TCT) is properly defined and that the transaction requests proper printer operations. If this is correct, check that the printer itself is in proper working order.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)

DFHZC2493 E  date time applid termid tranid Error status sense received from 3270. ((instance) Module name: (DFHZNAC))

Explanation: An error status message sense was received from a 3270 Information Display System. An INTERVENTION REQUIRED condition causes an “intervention requested” message to be output instead of this message.

System Action: If a task is attached, it is normally terminated with a transaction dump. If bad data, sent by Basic Mapping Support (BMS), causes an operation check, the bad data is purged.

User Response: Analyze the error status codes to determine the proper course of action required to correct the unit error or program error.

For non-SNA 3270 devices, the sense code is 0000 xxxx, where xxxx is sense data returned by the control unit to which the 3270 device is attached. Datastream errors are rejected with an Operation Check, and commands with a Command Reject. Details of error status codes are given in the IBM 3270 Information Display System 3274 Control Unit Description and Programmer’s Guide.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)

DFHZC2494 E  date time applid termid tranid IC put to printer failed) / IOERROR / TRNIDER / TRMIDER / INVREQ. sense ((instance) Module name: (DFHZNAC))

Explanation: DFHZNAC has attempted to perform a DFHIC PUT macro as the result of a DFHZC2497 “unavailable printer” condition. The printer is:

- Out of service,
- Has an intervention situation, or
- Does not have a RECEIVE or TRANSCEIVE status.

For the meaning of the sense data, see the explanation on page 678.

System Action: Other processing continues.

User Response: Determine why the printer is unavailable. If the terminal is out of service, put it back into service. If the terminal has an intervention situation, determine what this situation is and correct it. If the terminal does not have a RECEIVE or TRANSCEIVE status, place it into RECEIVE or TRANSCEIVE status.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)

DFHZC2495 E  date time applid termid tranid Printer Outserv/int reqd/ ineligible. Req queued. sense ((instance) Module name: (DFHZNAC))

Explanation: DFHZNAC has performed an interval control PUT to a 3270 printer on behalf of a DFHZC2497 “unavailable printer” condition. The printer is:

- Out of service,
- Has an intervention situation, or
- Does not have a RECEIVE or TRANSCEIVE status.

For the meaning of the sense data, see the explanation on page 678.

System Action: Other processing continues.

User Response: Determine why the printer is unavailable. If the terminal is out of service, put it back into service. If the terminal has an intervention situation, determine what this situation is and correct it. If the terminal does not have a RECEIVE or TRANSCEIVE status, place it into RECEIVE or TRANSCEIVE status.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)
Chapter 1. DFH messages

DFHZC2497 E date time applid termid tranid Unavailable printer.
  sense {instance} Module name: {DFHZARQ}

Explanation: A print function was requested on a 3270 display device. Neither the PRINTTO or the ALTPRT printer was available to receive the information.

For the meaning of the sense data, see the explanation on page 678.

System Action: If no NEP action is specified, the print request is halted.

User Response: A possible solution is to route the data available at TCTTEDA in the provided terminal entry to a transient data queue that causes automatic task initiation later to a printer. This would be done in DFHZNEP. For more information, see the CICS Customization Guide.

Destination: CSNE
Module: DFHZARQ
XMEOUT Parameters: date, time, applid, netname, codepage

DFHZC2498 E date time applid termid tranid IC put to printer failed. sense {instance} Module name: {DFHZARQ}

Explanation: A 3270 print request has failed because transaction CSPP could not be initiated. Either transaction CSPP is not an installed transaction definition, or the message to be printed cannot be written to temporary storage.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: Check that transaction CSPP is an installed transaction definition and that you have sufficient temporary storage to accommodate the data to be printed.

Destination: CSNE
Module: DFHZARQ
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZARQ}

DFHZC2499 E date time applid The following message was destined for a read only terminal. The text is ‘msgtext’

Explanation: The user has entered an invalid entry, the entry is rejected, and the request is backed out.

System Action: Terminal Control backs out the request and issues this message with the error information contained in msgtext.

User Response: Read the error information that is contained in msgtext and reenter the request.

XMEOUT Parameters: date, time, applid, msgtext

DFHZC3202 E date time applid Transaction CCIN - VTAM netname netname. The value codepage parameter is not supported.

Explanation: A CCIN transaction has been run from a CICS client. One of the parameters which must be supplied is the codepage which the CICS client intends to use. This parameter is missing.

netname is the VTAM netname of the CICS client.

System Action: CICS cannot perform the translations required to support the CICS client with the requested character set and codepage. CICS continues but uses a default codepage instead of the supplied one. For details of the default codepage, see the CICS Family: Communicating from CICS on System/390 manual.

The request to install the CICS client continues, but uses the default codepage. A response code of EXCEPTION and a reason code of INVALIDCODEPAGE is sent to the client.

User Response: See the CICS Family: Communicating from CICS on System/390 manual for a list of the client codepage values which are supported. It may be necessary to reconfigure the client locale.

Destination: CSCC
Module: DFHZCN2
XMEOUT Parameters: date, time, applid, netname, codepage

DFHZC3203 E date time applid Transaction CCIN - VTAM netname netname. The capabilities parameter is not valid.

Explanation: A CCIN transaction has been run from a CICS client. The capabilities which have been received are not valid. The CICS client has specified that it supports features which no CICS client is supposed to support. The CICS client is violating the CICS client communications architecture.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP301A is written.

The request to install the CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSCC
Module: DFHZCN2
XMEOUT Parameters: date, time, applid, netname

DFHZC3204 E date time applid Transaction CCIN - VTAM netname netname. The codepage parameter has not been specified.

Explanation: A CCIN transaction has been run from a CICS client. One of the parameters which must be supplied is the codepage which the CICS client intends to use. This parameter is missing.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP301B is written.

The request to install the CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSCC
Module: DFHZCN1
XMEOUT Parameters: date, time, applid, netname
DFHZC3205 E date time applid Transaction CTIN - virtual terminal termid VTAM netname netname. CICS cannot support the {n.a. | n.a. | n.a.} combination of client and virtual terminal codepage. | virtual terminal codepage. |

**Explanation:** A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CICS was checking the codepage specified by the CICS client and the codepage specified by the virtual terminal. However one of the following occurred:

1 – 3  n.a. - not applicable and should not occur.

4  unsupported combination of CICS client and virtual terminal codepage. indicates that the two codepages above are known about but CICS does not support data conversion between the CICS client codepage and the virtual terminal codepage.

5  unsupported CICS client codepage indicates that CICS is unable to support the codepage supplied by the CICS client in the CCIN or CTIN transaction.

6  unsupported virtual terminal codepage indicates that the CGCSGID parameter defining the virtual terminal codepage is not supported for CICS data conversion. If the virtual terminal was autoinstalled, CGCSGID was specified in the autoinstall model requested by the CICS client. If the virtual terminal was defined, CGCSGID was defined in the TYPETERM named by the virtual terminal definition.

CICS cannot perform the translations required to support the CICS client with the requested codepage.

netname is the VTAM netname of the CICS client.

**System Action:** Exception trace point AP3035 is written.

4  unsupported combination of CICS client and virtual terminal codepage.

A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client. The virtual terminal is NOT installed.

5  unsupported CICS client codepage.

The request to install the virtual terminal continues and the invalid codepage is replaced by a default as specified in the CICS Family: Communicating from CICS on System/390 manual.

A response code of EXCEPTION and a reason code of INVALIDCODEPAGE is sent to the client.

6  unsupported virtual terminal codepage.

A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client. The virtual terminal is NOT installed.

**User Response:** See the CICS Family: Communicating from CICS on System/390 manual and check the list of the client codepage values then reconfigure the workstation locale or correct the virtual terminal TYPETERM definition.

The exception trace point AP3035 contains the CICS client codepage and the virtual terminal CGCSGID values.

**Destination:** CSCC

**Module:** DFHZCT1

**XMEOUT Parameters:** date, time, applid, termid, netname, {1=n.a., 2=n.a., 3=n.a., 4=combination of client and virtual terminal codepage, 5=client codepage, 6=virtual terminal codepage.}

DFHZC3206 E date time applid Transaction CTIN - virtual terminal termid VTAM netname netname. The client’s terminal install limit has been exceeded.

**Explanation:** A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the CICS client whose VTAM netname is netname already has 512 virtual terminals. termid is the name that would have been given to the new virtual terminal. If the CICS client did not supply the name it is blank.

**System Action:** The request to install the virtual terminal is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

**User Response:** Check why the CICS client has sent so many CTIN installs without corresponding CTIN uninstall functions.

To correct the problem the CICS client must send a CTIN uninstall for each virtual terminal that needs to be deleted.

**Destination:** CSCC

**Module:** DFHZC3T1

**XMEOUT Parameters:** date, time, applid, termid, netname

DFHZC3207 E date time applid Transaction CTIN - VTAM netname netname. The request has failed because CCIN has not been run.

**Explanation:** A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However there was no previous CCIN install request for the CICS client with the VTAM netname of netname. CCIN must always run before CTIN.

This may have been caused by a CICS restart.

netname is the VTAM netname of the CICS client.

**System Action:** The CTIN transaction abnormally terminates with abend code AZAI.

**User Response:** The CICS client must carry out CCIN uninstall/install before the next CTIN install.

**Destination:** CSCC

**Module:** DFHZCT1

**XMEOUT Parameters:** date, time, applid, netname

DFHZC3208 E date time applid Transaction CTIN - virtual terminal termid VTAM netname netname. Model modelid cannot be found.

**Explanation:** A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However CICS was unable to find the model modelid which was specified in the CICS_EpiAddTerminal DEVTYPE parameter or terminal emulator ModelId parameter.

netname is the VTAM netname of the CICS client.

**System Action:** The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of UNKNOWNMODEL is sent to the client.

**User Response:** Either correct the DevType in the CICS_EpiAddTerminal function or terminal emulator parameter or install a model of this name using RDO to define the autoinstall model with the RDO TERMINAL and TYPETERM definitions.

**Destination:** CSCC

**Module:** DFHZCT1
Chapter 1. DFH messages

DFHZC3209  E date time applid Transaction CTIN - VTAM
netname netname. CICS cannot supply a terminal name because all available names are in use.

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. The parameter list did not supply a NetName indicating that CICS should supply the name. However there are only 46,656 possible names available and they are all currently in use.

netname is the VTAM netname of the CICS client.

System Action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User Response: As CICS clients issue CTIN uninstalls for autoinstalled virtual terminals these terminals will be freed.

It is possible that some of the CICS clients were switched off leaving autoinstalled virtual terminals around. When these are switched back on again they should issue CCIN install which will free the virtual terminals if they are not in use.

DISCARD can be used to delete a virtual terminal - but this should be done with discretion.

If the SIT VTPREFIX coincides with the first character of the termid allocated to a normal autoinstall terminal by the autoinstall URM (default DFHZATDXX), there may be some names reserved because the autoinstall terminal existed when CTIN install tried to use the same name. Avoid doing this if possible because the only way to free these names is to restart CICS.

Destination: CSCC
Module: DFHZCT1
XMEOUT Parameters: date, time, applid, netname

DFHZC3210  E date time applid Transaction CTIN - virtual
terminal termid VTAM netname netname. CICS cannot attach the CITS transaction.

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. As part of the installation process the CITS transaction is called to create a virtual terminal termid. However CICS was unable to attach the CITS transaction.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3025 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User Response: Check that the CITS transaction and the DFHZATS program are defined correctly as specified in the DFHSPI IBM supplied group and are installed.

Destination: CSCC
Module: DFHZCT1
XMEOUT Parameters: date, time, applid, termid, netname

DFHZC3211  E date time applid Transaction CTIN - virtual
terminal termid VTAM netname netname. The NetName parameter starts with an invalid character.

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. The NetName parameter termid starts with a character that conflicts with CICS standards.

netname is the VTAM netname of the CICS client.

System Action: The request to install the virtual terminal is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User Response: Change the NetName to start with a different character. It can start with any character that is valid for a normal terminal name except for <,> or -. If the NetName was specified correctly, check the input to the CTIN transaction.

Destination: CSCC
Module: DFHZCT1
XMEOUT Parameters: date, time, applid, termid, netname

DFHZC3212  E date time applid Transaction CTIN - virtual
terminal termid VTAM netname netname. The transaction has timed out waiting for CITS to run.

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. As part of the installation process the CITS transaction is called to create virtual terminal termid. However the CTIN transaction has waited for two minutes for the CITS transaction to run.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3027 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User Response: Investigate why the CITS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CITS TRANCCLASS allocation.

Destination: CSCC
Module: DFHZCT1
XMEOUT Parameters: date, time, applid, termid, netname

DFHZC3213  E date time applid Transaction CTIN - virtual
terminal termid VTAM netname netname. CICS cannot attach the CDTDS transaction.

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. As part of the delete process the CDTDS transaction is called to delete virtual terminal termid. However CICS was unable to attach the CDTDS transaction.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3028 is written. The attempt to delete the virtual terminal is rejected.

User Response: Check to see if the CDTDS transaction and the DFHZATS program are defined correctly as specified in IBM supplied group DFHSPI and that they are installed.

Destination: CSCC
Module: DFHZCT1
DFHZC3214 E date time applid Transaction CTIN - virtual terminal
		termid VTAM netname netname. The CTIN transaction has timed out waiting for
	CDTS to run.

Explanation: A CTIN uninstall request has been received from a CICS client as
a result of a CICS_EpiDelTerminal function or
terminal emulator operation. As part of the installation process the
CDTS transaction is called to delete virtual terminal termid.
However the CTIN transaction has waited for the CDTS transaction for
two minutes and so ends with this message.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3029 is written. The
CDTS attempt to delete the virtual terminal continues and will occur
when the CDTS transaction starts or is 'unsuspended'.

User Response: Check to see why the CDTS transaction was
unable to start or was hanging.

You may need to increase MAXTASK or the CDTS TRANCLASS
allocation.

Destination: CSCC
Module: DFHZCT1
XMEOUT Parameters: date, time, applid, termid, netname

DFHZC3215 E date time applid Transaction CTIN - virtual
	terminal termid VTAM netname netname. The terminal is in use by another transaction.

Explanation: A CTIN install request has been received from a CICS client as
a result of a CICS_EpiAddTerminal function or
terminal emulator operation. However the virtual terminal termid is
in use, that is the surrogate TCTTE indicates that a transaction is
still running against this terminal.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP302E is written. The
request to install the virtual terminal is rejected. A response
code of ERROR and a reason code of ALREADYINSTALLED is
sent to the client.

User Response: Investigate why a transaction is still running for
the virtual terminal.

Destination: CSCC
Module: DFHZCT1
XMEOUT Parameters: date, time, applid, termid, netname

DFHZC3216 E date time applid Transaction CTIN - virtual

terminal termid VTAM netname netname. CICS cannot find the terminal.

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or
terminal emulator operation. CICS specified that a predefined virtual terminal termid should be used, but CICS cannot find it and
no ModelId was provided (DevType) so an autoinstall was not attempted.

netname is the VTAM netname of the CICS client.

System Action: The request to install the virtual terminal is
rejected. A response code of ERROR and a reason code of
UNKNOWNTERMINAL is sent to the client.

User Response: Ensure that there is an installed predefined
terminal for termid that has a remote system parameter
(REMOTESYSTEM) specifying the name of this CICS clients
connection and that the VTAM NETNAMEs match. Then install the
definition with the correct parameters.

Destination: CSCC
Module: DFHZCT1
XMEOUT Parameters: date, time, applid, termid, netname

DFHZC3217 E date time applid Transaction CTIN - VTAM
netname netname. The specified function is not valid.

Explanation: A CTIN request has been received from a CICS client with a VTAM netname of netname. However the function
specified was not INSTALL or UNINSTALL.

System Action: Exception trace point AP3034 is written. The
CTIN transaction abnormally terminates with abend code AZAI.

User Response: Determine where the request originated. Ensure
that the input has not been corrupted. You may need further
assistance from IBM. See Part 4 of the CICS Problem
Determination Guide for guidance on how to proceed.

Destination: CSCC
Module: DFHZCT1
XMEOUT Parameters: date, time, applid, netname

DFHZC3218 E date time applid Transaction CTIN - virtual

terminal termid VTAM netname netname. A resource
with the same name as the terminal is already installed.

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or
terminal emulator operation. CTIN specified that a virtual terminal
termid should be autoinstalled. However another resource was
installed with the same name after the CTIN transaction had
ensured that the name was free.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3026 is written. The
request to install the virtual terminal is rejected. A response
code of ERROR and a reason code of ALREADYINSTALLED is
sent to the client.

User Response: Investigate where the duplicate resource came
from. It is possible that the terminal/APPC autoinstall URM created
the name dynamically. If NetName was specified in the CTIN
parameters, ensure that the CICS client names do not conflict with
existing CICS terminal or connection names. If NetName was not
specified, examine the SIT VTPREFIX override to check that the
URM does not create names starting with the VTPREFIX character.

Destination: CSCC
Module: DFHZCT1
XMEOUT Parameters: date, time, applid, termid, netname

DFHZC3219 E date time applid Transaction CTIN - virtual

terminal termid VTAM netname netname. The terminal is already in use.

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or
terminal emulator operation. CTIN supplied a NetName termid but
CICS found a resource with the same name which is either an
existing virtual terminal for this client, an existing virtual terminal for
another client or another CICS terminal or connection resource.
netname is the VTAM netname of the CICS client.
**System Action:** The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

**User Response:** Investigate where the duplicate resource came from. It is possible that the terminal/APPC autoinstall URM created the name dynamically and that the CICS client used a name that clashes with the URM.

It is also possible that a client created the virtual terminal and then tried to reuse it without an intervening uninstall, via CCIN or CTIN.

**Destination:** CSCC
**Module:** DFHZCT1
**XMEOUT Parameters:** date, time, applid, termid, netname

---

**Explanation:** A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that the virtual terminal termid should be autoinstalled. However, the virtual terminal was already installed.

netname is the VTAM netname of the CICS client.

**System Action:** The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

**User Response:** The CICS client should issue CTIN uninstall before any attempt to issue another CTIN install for the same NetName.

**Destination:** CSCC
**Module:** DFHZCT1
**XMEOUT Parameters:** date, time, applid, termid, netname

---

**Explanation:** A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that the virtual terminal termid should be autoinstalled. However, the virtual terminal was already installed.

netname is the VTAM netname of the CICS client.

**System Action:** The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

**User Response:** The CICS client should issue CTIN uninstall before any attempt to issue another CTIN install for the same NetName.

**Destination:** CSCC
**Module:** DFHZCT1
**XMEOUT Parameters:** date, time, applid, termid, netname

---

**Explanation:** A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. However, the surrogate TCTTE attached to the virtual terminal is still in use and cannot be deleted.

netname is the VTAM netname of the CICS client.

**System Action:** Exception trace point AP3030 is written. The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

**User Response:** Investigate where the duplicate resource came from. It is possible that the terminal/APPC autoinstall URM created the name dynamically.

**Destination:** CSCC
**Module:** DFHZCT1
**XMEOUT Parameters:** date, time, applid, termid, netname

---

**Explanation:** A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. However, the surrogate TCTTE attached to the virtual terminal is still in use and cannot be deleted.

netname is the VTAM netname of the CICS client.

**System Action:** Exception trace point AP302F is written. The attempt to delete the virtual terminal is rejected.

**User Response:** Either wait for the transaction to finish or PURGE the transaction. Once the transaction has ended the virtual terminal will be deleted when the client issues CCIN install or uninstall.

**Destination:** CSCC
**Module:** DFHZCT1
**XMEOUT Parameters:** date, time, applid, termid, netname

---

**Explanation:** A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. However, the surrogate TCTTE attached to the virtual terminal is still in use and cannot be deleted.

netname is the VTAM netname of the CICS client.

**System Action:** Exception trace point AP302F is written. The attempt to delete the virtual terminal is rejected.

**User Response:** Either wait for the transaction to finish or PURGE the transaction. Once the transaction has ended the virtual terminal will be deleted when the client issues CCIN install or uninstall.

**Destination:** CSCC
**Module:** DFHZCT1
**XMEOUT Parameters:** date, time, applid, termid, netname

---

**Explanation:** A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. However, the virtual terminal termid does not exist as a remote terminal for this CICS client.

netname is the VTAM netname of the CICS client.

**System Action:** Exception trace point AP302F is written. The attempt to delete the virtual terminal is rejected.

**User Response:** Either wait for the transaction to finish or PURGE the transaction. Once the transaction has ended the virtual terminal will be deleted when the client issues CCIN install or uninstall.

**Destination:** CSCC
**Module:** DFHZCT1
**XMEOUT Parameters:** date, time, applid, termid, netname
DFHZC3225 E
date time applid Transaction CTIN - VTAM
netname netname. The terminal cannot be deleted
because the NetName parameter is missing.
Explanation: A CTIN uninstall request has been received from a
CICS client as a result of a CICS_EpiDelTerminal function or
terminal emulator operation. However the NetName parameter,
defining which virtual terminal is to be deleted, is missing.
netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3037 is written – data 2
contains the data received. The attempt to delete the virtual
terminal is rejected.
User Response: Examine the input to CTIN. You may need
further assistance from IBM. See Part 4 of the CICS Problem
Determination Guide for guidance on how to proceed.

Destination: CSCC
Module: DFHZCT1
XMEOUT Parameters: date, time, applid, netname

DFHZC3226 E date time applid Transaction CTIN - virtual
terminal termid VTAM netname netname. CICS
cannot access the builder parameter set.
Explanation: A CTIN install request has been received from a
CICS client as a result of a CICS_EpiAddTerminal function or
terminal emulator operation. CICS is attempting to extract the
details from the virtual terminal that has just been created and
return them back to the CICS client. However the attempt to
extract the details in the form of a builder parameter set (BPS)
failed.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3031 is written.
The request to install the virtual terminal is rejected. A response
code of ERROR and a reason code of INSTALLCANCELED is
sent to the client.
User Response: You need further assistance from IBM to resolve
this problem. See Part 4 of the CICS Problem Determination
Guide for guidance on how to proceed.

Destination: CSCC
Module: DFHZCT1
XMEOUT Parameters: date, time, applid, termid, netname

DFHZC3227 E date time applid Transaction CTIN - VTAM
netname netname. The client data is longer than
expected.
Explanation: A CTIN install request has been received from a
CICS client as a result of a CICS_EpiAddTerminal function or
terminal emulator operation. However the data received was
longer than expected. netname is the VTAM netname of the CICS
client.

System Action: Exception trace point AP302D is written – data 2
contains the length that was received. The CTIN transaction
abnormally terminates with abend code AZAI.
User Response: Examine the data sent to CICS from the CICS
client. You may need to contact IBM for assistance. See Part 4 of
the CICS Problem Determination Guide for guidance on how to
proceed.

Destination: CSCC
Module: DFHZCT1
XMEOUT Parameters: date, time, applid, netname

DFHZC3228 E date time applid Transaction CTIN - VTAM
netname netname. The client header data contains
an invalid group.
Explanation: A CTIN install request has been received from a
CICS client as a result of a CICS_EpiAddTerminal function or
terminal emulator operation. However the header contains an
invalid group. netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3024 is written – data 2
contains the data received. The CTIN transaction abnormally
terminates with abend code AZAI.
User Response: Examine the data sent to CICS from the CICS
client. You may need to contact IBM for assistance. See Part 4 of
the CICS Problem Determination Guide for guidance on how to
proceed.

Destination: CSCC
Module: DFHZCT1
XMEOUT Parameters: date, time, applid, netname

DFHZC3229 E date time applid Transaction CTIN - VTAM
netname netname. CICS has received invalid data
from the client.
Explanation: A CTIN install request has been received from a
CICS client as a result of a CICS_EpiAddTerminal function or
terminal emulator operation. CICS attempted to parse this data but
found a discrepancy between the number of parameters, the length
of the parameters and the length of the data received. netname is
the VTAM netname of the CICS client.

System Action: Exception trace point AP3033 is written – data 2
contains the data received. The CTIN transaction abnormally
terminates with abend code AZAI.
User Response: Examine the data sent to CICS from the CICS
client. You may need further assistance from IBM. See Part 4 of
the CICS Problem Determination Guide for guidance on how to
proceed.

Module: DFHZCN1

XMEOUT Parameters: date, time, applid, netname

DFHZC3246 date time applid Transaction CCIN - virtual terminal termid VTAM netname netname. CICS cannot attach the CDTS transaction.

Explanation: A CCIN request has been received from a CICS client. As part of the processing, the CDTS transaction is called to delete virtual terminal termid. However CICS was unable to attach the CDTS transaction.

netname is the VTAM netname of the CICS client.

System Action: The attempt to delete the virtual terminal fails. If this is a CCIN install request, the install continues.

User Response: Ensure that the CDTS transaction and the DFHZATS program are defined correctly as specified in IBM supplied group DFHSPI and that they are installed.

Destination: CSCC

Module: DFHZCN2

XMEOUT Parameters: date, time, applid, termid, netname

DFHZC3247 date time applid Transaction CCIN - virtual terminal termid VTAM netname netname. The CCIN transaction has timed out waiting for CDTS to run.

Explanation: A CCIN request has been received from a CICS client. As part of the processing, the CDTS transaction is called to delete virtual terminal termid. However the CCIN transaction has waited for the CDTS transaction for two minutes and has timed out.

netname is the VTAM netname of the CICS client.

System Action: The CDTS attempt to delete the virtual terminal continues and occurs when the CDTS transaction starts or is 'unsuspended'.

If this is a CCIN install request, the install continues.

User Response: Check to see why the CDTS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CITS TRANCLASS allocation.

Destination: CSCC

Module: DFHZCN2

XMEOUT Parameters: date, time, applid, termid, netname

DFHZC3248 E  date time applid Transaction CCIN - virtual terminal termid VTAM netname netname. The surrogate TCTTE is in use and cannot be deleted.

Explanation: A CCIN request has been received from a CICS client. There should not be any virtual terminals installed, however, one or more were located. The surrogate TCTTE attached to the virtual terminal is still in use and cannot be deleted. If this was caused by an immediate shut down of the client the transaction abend might not have completed before CICS attempted to delete the client.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP301C is written. The attempt to delete the virtual terminal is rejected.

If this is a CCIN install request, the install continues.

User Response: Determine why the virtual terminal was installed when CCIN was run.

Either wait for the transaction to finish or PURGE the transaction. Once the transaction completes the virtual terminal will be deleted at the next CCIN install/uninstall.

Destination: CSCC

Module: DFHZCN2

XMEOUT Parameters: date, time, applid, termid, netname

DFHZC3249 E  date time applid Transaction CCIN - VTAM netname netname. CICS has received invalid data from the client.

Explanation: A CCIN install request has been received from a CICS client. CICS attempted to parse this data but found a discrepancy between the number of parameters, the length of the parameters, and the length of the data received. netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP300E is written – data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User Response: Examine the data sent to CICS from the CICS client. You may need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSCC

Module: DFHZCN1

XMEOUT Parameters: date, time, applid, termid, netname

DFHZC3400 E  date time applid termid tranid Chain exceeds max chain size. sense (instance) Module name: (DFHZRAC | DFHZRVS | DFHZRVX)

Explanation: If chain assembly (BUILDCHAIN) has been specified in the TCTTE, the chain being assembled does not fit into the IOAREALEN for a maximum chain (IOAREALEN Value 2). The remaining space in the IOAREALEN for a maximum chain is smaller than the maximum RECEIVESIZE.

If chain assembly (BUILDCHAIN) has been specified in the TCTTE, but maximum chain value equals zero, either the maximum chain value has been set incorrectly at build time or the value has been overwritten.

For the meaning of the sense data, see the explanation on page 678.
Chapter 1. DFH messages

DFHZC3401  I date time applid termid tranid Resource now available, sense ((instance) Module name: (DFHZNAC))

Explanation: A resource of the logical unit (LU) is now available. It had previously been temporarily unavailable or had required intervention.

For the meaning of the sense data, see the explanation on page 678.

System Action: Any outstanding read or write operation is retried.

User Response: None.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)

DFHZC3402  E date time applid termid tranid Invalid READ with outbound chain control. sense ((instance) Module name: (DFHZNAC))

Explanation: A DFHTC TYPE=READ request is being processed, although the previously issued DFHTC TYPE=WRITE request did not complete a chain.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Correct the application program.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)

DFHZC3405  E date time applid termid tranid Catastrophic bracket error. sense ((instance) Module name: (DFHZNAC))

Explanation: The logical unit detected a failure of CICS to enforce bracket rules.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The session is terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the symptom string, a VTAM trace, and if necessary the dump, to determine the source of the problem.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)

DFHZC3406  E date time applid termid tranid Parameter error. sense ((instance) Module name: (DFHZNAC))

Explanation: The request/response unit (RU) received by the logical unit (LU) contains a control function with invalid parameters.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A portion of the TIOA is put to the CSNE log.

User Response: Correct the application program.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)

DFHZC3407  E date time applid termid tranid READ command does not carry change direction indicator. sense ((instance) Module name: (DFHZNAC))

Explanation: A request for input (for example, a READBUF command) sent to a logical unit (LU) type 2 (3270 compatibility mode logical unit) must carry the SNA change direction indicator. The LU has received such a request, but the indicator is not set.

Since the setting of the change direction indicator is controlled by terminal control, this message indicates that an internal logic error may have occurred. The error is not necessarily in terminal control, but may be in the logical unit or some other element of the network.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task and the VTAM session for the logical unit are abnormally terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Identify the request that caused the error, and locate the element of the network responsible.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)

DFHZC3408  E date time applid termid tranid Presentation space integrity lost. sense ((instance) Module name: (DFHZNAC))

Explanation: The contents of data for screen presentation by a logical unit has been altered. This is usually due to operator action. For example, the TEST/NORMAL key may have been used or the 3270 SYS REQ key may have been pressed.

It may also have been caused by factors other than operator action, for example, 3270 regeneration buffer failure.

For the meaning of the sense data, see the explanation on page 678.
DFHZC3409 E  date time applid termid tranid Unexpected negative response received. sense ((instance) Module name: (DFHZRNAC))

Explanation: CICS received a negative response to a command for which a negative response would not normally be expected.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to CSNE.

User Response: Ensure that the application programs running concurrently do not alter the TCTTE. Check that the SNA flows on the session are valid and that the logical unit is not violating SNA protocols.

Destination: CSNE
Module: DFHZRNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZRNAC)

DFHZC3410 E  date time applid termid tranid Invalid input when LU status expected. sense ((instance) Module name: (DFHZRVX))

Explanation: Input (other than a logical unit status message) was received after a request was rejected with a system sense code indicating a possibly rectifiable error condition at the terminal node: for example, Intervention Required. The subsequent LU status message indicates that the error situation has now been corrected, or that the request is permanently not executable.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Conform to SNA protocol by ensuring that the next transmission is an LUSTATUS message with a system sense for either Resource Available (0001) or Function Not Executable (081C).

Destination: CSNE
Module: DFHZRVX
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZRVX, 2=DFHZRVX, 3=DFHZRVX)

DFHZC3411 E  date time applid termid tranid Resource temporarily unavailable. sense ((instance) Module name: (DFHZNAC))

Explanation: A terminal resource required to complete a request is temporarily unavailable.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is retried unless the device is one that sends an LUSTATUS message after receiving a "resource temporarily unavailable" notification.

If "resource temporarily unavailable" notification is received, an associated VTAM message is usually issued.

User Response: Refer to the associated VTAM message, if applicable, and follow the guidance provided.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)

DFHZC3412 E  date time applid termid tranid Intervention required on secondary resource. sense ((instance) Module name: (DFHZNAC))

Explanation: Operator action is requested for the secondary resource of a logical unit (LU). However, no such resource is immediately available. In the case of a 3270-compatible LU, this message means that the printer most likely to be available for a PRINT request has an Intervention Required status.

For the meaning of the sense data, see the explanation on page 678.

System Action: The system waits for a logical unit status message and, when this is received, takes appropriate system action.

User Response: Correct the problem that relates to the device.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)

DFHZC3413 E  date time applid termid tranid Logical Unit busy. sense ((instance) Module name: (DFHZNAC))

Explanation: The logical unit has rejected a request because its resources are busy (for example, it is communicating with the system services control point (SSCP)), and thus is unable to process the request.

For the meaning of the sense data, see the explanation on page 678.

System Action: The system waits for a logical unit status message and then takes appropriate action.

User Response: None.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZNAC)
DFHZC3414  E date time applid termid tranid Request not executable. Secondary resource unavailable. sense ((instance) Module name: (DFHZNAC))

Explanation: The secondary resource of a logical unit is permanently unavailable to complete a request. For a 3270-compatible LU, this means that a printer was not available for a PRINT request.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Determine the reason why the resource is not available at the remote terminal.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC3415  E date time applid termid tranid No data available. sense ((instance) Module name: (DFHZNAC))

Explanation: A receive request has been rejected by the logical unit because it has no data to send for one of the following reasons:

- The device is not capable of input (for instance, it is a printer)
- The logical unit is not capable of sending data at the time. For example, a requested 3790 data set is not available at the time.

For the meaning of the sense data, see the explanation on page 678.

System Action: The receive request is halted. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Verify that the request was issued to the correct logical unit and that the device is capable of data transmission.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC3416  E date time applid termid tranid Session failure. A connection request for an invalid node nodeid could not be terminated. sense ((instance) Module name: (DFHZSCX))

Explanation: The requested logon was to be rejected, but the attempt to send a negative response was rejected by VTAM.

For the meaning of the sense data, see the explanation on page 678.

System Action: No further attempts are made to communicate with the invalid node.

User Response: Inspect the CSNE, CSMT and CSTL logs for an indication of a VTAM storage problem or error message. Determine whether the node was invalid. If it was valid, update the CICS TCT for that node.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZSCX}

DFHZC3417  E date time applid termid tranid Session processing error. A request for synchronization has been ignored. sense ((instance) Module name: (DFHZSDR))

Explanation: A logon request was rejected because the TCTTE for the ISC session had been generated with an incompatible SESSIONTYPE.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is rejected.

User Response: Change the TCTTE generation to specify a secondary logical unit at one end of the connection, and a primary logical unit at the other end.

A primary logical unit should have SESSIONTYPE=SEND or SESSIONTYPE=FASTSEND, and a secondary logical unit should have SESSIONTYPE=RECEIVE or SESSIONTYPE=FASTRECV.

Destination: CSNE
Modules: DFHZSCX, DFHZLGX, DFHZBLX
XMEOUT Parameters: date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZSDR}

DFHZC3418  E date time applid termid tranid System generation error. The netname logon request was rejected. sense ((instance) Module name: (DFHZBLX | DFHZLGX | DFHZSCX))

Explanation: A logon request was rejected because the TCTTE for the ISC session had been generated with an incompatible SESSIONTYPE.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is rejected.

User Response: Change the TCTTE generation to specify a secondary logical unit at one end of the connection, and a primary logical unit at the other end.

A primary logical unit should have SESSIONTYPE=SEND or SESSIONTYPE=FASTSEND, and a secondary logical unit should have SESSIONTYPE=RECEIVE or SESSIONTYPE=FASTRECV.

Destination: CSNE
Modules: DFHZSCX, DFHZLGX, DFHZBLX
XMEOUT Parameters: date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZBLX, 2=DFHZLGX, 3=DFHZSCX}

DFHZC3419  E date time applid termid tranid Session failure. The bind parameter for node netname is unacceptable. sense ((instance) Module name: (DFHZBLX | DFHZSCX | RESERVE))

Explanation: A connection request was rejected because the characteristics specified for the connecting system were unacceptable.

Possible reasons for the rejection are:

- For a MEMBER name connection, the network identifier (NETID) passed to CICS is different from that already stored in the system entry (instance 39).
- For a MEMBER name connection, the GRNAME specified in the sessions bind - UDSS04 - is different from that already stored in the system entry (instance 40).

Chapter 1. DFH messages 727
For a GR name connection, the network identifier (NETID) passed to CICS is different from that already stored in the connections system entry (instance 41).

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The request is rejected. The bind parameter is printed on the CSNE log.

**User Response:** Determine whether the connecting system has specified its characteristics correctly. If it has not, correct the requesting system.

**Destination:** CSNE

**Module:** DFHZSCX

**XMEOUT Parameters:** date, time, applid, termid, tranid, netname, sense, instance, {1=RELSET, 2=DFHZBLC, 3=DFHZSCX, 4=DFHZSCX, 5=DFHZBLC, 6=DFHZBLC, 7=DFHZSCX, 8=DFHZBLC, 9=DFHZBLC, 10=DFHZBLC, 11=DFHZBLC, 12=DFHZBLC, 13=DFHZBLC, 14=DFHZBLC, 15=DFHZBLC, 16=DFHZBLC, 17=DFHZBLC, 18=DFHZBLC, 19=DFHZSCX, 20=DFHZBLC, 21=DFHZBLC, 22=DFHZBLC, 23=DFHZBLC, 24=DFHZBLC, 25=DFHZBLC, 26=DFHZBLC, 27=DFHZBLC, 28=DFHZBLC, 29=DFHZSCX, 30=DFHZBLC, 31=DFHZBLC, 32=DFHZBLC, 33=DFHZBLC, 34=DFHZBLC, 35=DFHZBLC, 36=DFHZBLC, 37=DFHZBLC, 38=DFHZBLC, 39=DFHZBLC, 40=DFHZBLC, 41=DFHZBLC}

---

**DFHZC3420 E** date time applid termid tranid Session connection error. Node netname is out of service. sense (instance) Module name: (DFHZBLC | DFHZSCX)

**Explanation:** A logon request was rejected because the TCTTE is out of service.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The request is rejected.

**User Response:** Place the terminal in service by using the master terminal program and reissuing the connecting system request.

**Destination:** CSNE

**Modules:** DFHZSCX, DFHZOPN, DFHZBLC

**XMEOUT Parameters:** date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPN, 2=DFHZBLC, 3=DFHZBLC}

---

**DFHZC3421 E** date time applid termid tranid Session shutdown request received. Node netname is receiving orderly shutdown. sense (instance) Module name: (DFHZASX)

**Explanation:** A shutdown request was received for the system. An orderly termination procedure has begun.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** Orderly termination of the session is started. Access to the remote system is stopped after the current transaction has finished.

**User Response:** None.

**Destination:** CSNE

**Module:** DFHZASX

**XMEOUT Parameters:** date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZASX}

---

**DFHZC3422 E** date time applid termid tranid Session failure. Request rejected before a session could be started. sense (instance) Module name: (DFHZNSP)

**Explanation:** An error occurred while trying to connect the two systems. The request was terminated before a session had been established.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The request is terminated.

**User Response:** Determine the cause of the problem by inspecting the VTAM logs. If the problem is due to a shortage of storage or another temporary error, reissue the request when the system is less heavily loaded.

**Destination:** CSNE

**Module:** DFHZNSP

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZNSP, 2=DFHZNSP}

---

**DFHZC3423I** date time applid termid tranid FM function not supported. A function requested in an FMD RU is not supported by the receiver. sense (instance) Module Name: (DFHZNAC)

**Explanation:** CICS has received a negative response (VTAM sense code 0826). The receiver does not support the function requested by the sender.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All outstanding SENDs and RECEIVEs are purged. If a task is attached, it is abnormally terminated with a transaction dump.

**User Response:** Investigate the reason for issuing a request for a function that the receiver does not support.

**Destination:** CSNE

**Module:** DFHZNAC

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

---

**DFHZC3424 E** date time applid termid tranid Session failure. Session terminated immediately. sense (instance) Module name: (DFHZNSP)

**Explanation:** Communication with a node was interrupted during a session because a session outage was detected, or because a VTAM VARY INACT command was issued.

Error messages produced for the same session after this message may be caused by the session failure and may not be the reason for it. If this is the case, they can be ignored.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The session is canceled. The session may be recovered later by VTAM. See also messages DFHZC2409 and DFHZC2410.

**User Response:** Check if the failure was caused by an operator-issued VTAM VARY INACT. If this is not the case, use the sense data and any associated messages to investigate the reason for the failure.

**Destination:** CSNE

**Module:** DFHZNSP

---
Chapter 1. DFH messages

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNSP, 2=DFHZNSP, 3=DFHZNSP}

DFHZC3426 E date time applid termid tranid Resource unknown.
   sense (instance) Module name: (DFHZNAC)

Explanation: During intersystem connection, no matching TCTTE could be found.
For the meaning of the sense data, see the explanation on page 678.

System Action: The request is terminated.
User Response: Ensure that the name of the requested TCTTE is correctly specified in the requesting system.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC3427 E date time applid termid tranid Invalid parameter in bind area.
   sense (instance) Module name: (DFHZNAC)

Explanation: During intersystem connection, either one or more parameters contained in the bind area of the request were invalid, or were not supported.
For the meaning of the sense data, see the explanation on page 678.

System Action: The request is terminated.
User Response: Determine which parameters in the bind area are incorrect, and correct them.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC3429 E date time applid termid tranid Resynch error - CICS did not resynchronize, other logical unit was expecting resynch.
   sense (instance) Module name: (DFHZRSY | DFHZSYX)

Explanation: CICS did not go through a resynchronization process that was expected to occur by the other LU.
For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.
User Response: Check whether this resynchronization mismatch is acceptable.

Destination: CSNE
Modules: DFHZRSY, DFHZSYX
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRSY, 2=DFHZRSY, 3=DFHZRSY, 4=DFHZRSY, 5=DFHZSYX}

DFHZC3433 E date time applid termid tranid FMH7 was received on ISC session. Sense code is : xxxxxxxx
   Error log data is : | No error log data received. | No error log data available. | xxxxxxxx sense (instance) Module name: (DFHZZERH | DFHZZRX | DFHZRSY)

Explanation: The transaction is communicating with a logical unit (LU) type LU6.1 or LU6.2.
The logical unit sent an FMH7 which may carry error log data. If error log data is included, then the text is inserted in this message.
For the meaning of the sense data, see the explanation on page 678.

System Action: The action taken depends upon the sense code.
User Response: If the receiving transaction is designed to handle this situation, no action is necessary. However, if this is not the case, use the sense code and any error log data to determine why the connected logical unit sent the FMH7.
If the connected LU is another CICS system, the error log data is a CICS message.
If the connected LU is not a CICS system, see that product's documentation for details of error log data. Some products permit the user to define the contents of error log data.

Destination: CSNE
Modules: DFHZRVX, DFHZRAC, DFHZZERH
XMEOUT Parameters: date, time, applid, termid, tranid, xxxxxxxx,
   {1= Error log data is : , 2=No error log data received. , 3=No error log data available. }xxxxxxxx sense, instance, {1=DFHZRVX, 2=DFHZRAC, 3=DFHZZERH, 4=DFHZZRSY}

DFHZC3434 E date time applid termid tranid Unbind received while session still active.
   sense (instance) Module name: (DFHZSCX)

Explanation: One side of the intersystem link (secondary) received an unbind command without normal termination protocol being observed. This means an abnormal termination of the session was performed, possibly caused by the other side of the intersystem link abnormally terminating.
For the meaning of the sense data, see the explanation on page 678.

System Action: The session is terminated.
User Response: Determine the cause of the termination by using CICS Trace and the diagnostic information available on the CSNE log. Try to reestablish the session.

Destination: CSNE
Module: DFHZSCX
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX, 2=DFHZSCX, 3=DFHZSCX, 4=DFHZRSY, 5=DFHZSCX, 6=DFHZSCX, 7=DFHZSCX, 8=DFHZSCX, 9=DFHZSCX, 10=DFHZSCX}

DFHZC3435 E date time applid termid tranid Path error detected.
   Device cannot be contacted. sense (instance) Module name: (DFHZNAC)

Explanation: VTAM can no longer transmit to a device because there is no access path to that device. This usually occurs because the device or 3270 has been powered off.
For the meaning of the sense data, see the explanation on page 678.
System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service. The session is terminated.

User Response: Determine the cause of the termination. Try to reestablish the session.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC3436 E date time applid termid tranid End user not authorized. sense ((instance) Module name: (DFHZNAC))

Explanation: A sense code has been received specifying that an unauthorized request was made to the remote node. The request was rejected.

For the meaning of the sense data, see the explanation on page 678.

System Action: The session is terminated.

User Response: Determine why the end user is not authorized to perform the request.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC3437 I date time applid termid tranid Node netname action taken: action ((instance) Module name: (DFHZNAC))

Explanation: After an error has been processed by DFHZNAC, certain actions may be taken to correct the error. This message indicates the actions that were set. The actions taken can differ from the actions set, depending on the type and state of the node at the time of the error.

System Action:

<table>
<thead>
<tr>
<th>Action</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABRECV</td>
<td>Cancel receive.</td>
</tr>
<tr>
<td>ABSEND</td>
<td>Cancel send.</td>
</tr>
<tr>
<td>ABTASK</td>
<td>Abend task.</td>
</tr>
<tr>
<td>CLSDST</td>
<td>Close session.</td>
</tr>
<tr>
<td>GMM</td>
<td>Send good morning message.</td>
</tr>
<tr>
<td>OUTSRV</td>
<td>Place session out of service.</td>
</tr>
<tr>
<td>CREATE</td>
<td>Allow ATI to acquire the session if required.</td>
</tr>
<tr>
<td>NOCREATE</td>
<td>Do not allow ATI to acquire the session.</td>
</tr>
<tr>
<td>NEG RESP</td>
<td>Send an exception response.</td>
</tr>
<tr>
<td>SIMLOGON</td>
<td>Generate SIMLOGON request for the session.</td>
</tr>
<tr>
<td>CNTASK</td>
<td>Cancel the task.</td>
</tr>
<tr>
<td>SYSDUMP</td>
<td>Take a system dump.</td>
</tr>
<tr>
<td>PURGEBMS</td>
<td>Purge any BMS pages.</td>
</tr>
</tbody>
</table>

User Response: The user action depends on what action has been taken by the system. This is indicated by action in the message text.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC, 2=DFHZEMW}

DFHZC3438 E date time applid termid tranid Device powered off. sense ((instance) Module name: (DFHZNAC))

Explanation: A request has been rejected by the logical unit because the associated device has been powered off. This message may be caused by operator action. For example, the TEST/NORMAL key may have been used.

For the meaning of the sense data, see the explanation on page 678.

System Action: The system waits for a logical unit status message and, when the message has been received, takes appropriate system action.

User Response: Correct the problem that relates to the device.

For the meaning of the sense codes, refer to the explanatory paragraph in message DFHZC2461.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC3439 E date time applid termid tranid Negative response received to SDT. sense ((instance) Module name: (DFHZNAC))

Explanation: A negative response has been received to the START DATA TRAFFIC (SDT) command.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: None.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC3440 E date time applid termid tranid Unable to send error message - session in free status. sense ((instance) Module name: (DFHZEMW))

Explanation: DFHZEMW was attempting to write a message to another node, but was unable to do so because the session was in "between bracket" status.

In this state, it is not possible to send the message in the normal way. The session was in free status, probably because the application program had issued a SEND command with the LAST option.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: Check to see why the other node sent its request EXCEPTION response mode. Change the response mode to DEFINITE if error messages are to be sent.

Destination: CSNE

Module: DFHZEMW

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZEMW, 2=DFHZEMW}
DFHZC3441  I date time applid Orderly termination of VTAM sessions requested. sense ((instance) Module name: (DFHZSHU))

Explanation: A request for an orderly close of VTAM sessions and subsequent close of CICS VTAM ACB has been received. The request may have been initiated by the CICS master terminal command or by the VTAM network closing down.

For the meaning of the sense data, see the explanation on page 678.

System Action: All nodes are quiesced and each session is closed as it becomes inactive. When all sessions have been closed, the ACB is closed.

User Response: None.

Destination: CSNE

Module: DFHZSHU

XMEOUT Parameters: date, time, applid, sense, instance, {1=DFHZSHU}

DFHZC3442  I date time applid Immediate termination of VTAM sessions requested. sense ((instance) Module name: (DFHZSHU | DFHZTPX | RESERVE))

Explanation: A request for an immediate close of all VTAM sessions and subsequent close of CICS VTAM ACB has been received. The request may have been initiated by the CICS master terminal command or by the VTAM network closing down.

This message is also issued if V NET,ID=...,INACT is issued by the VTAM operator.

For the meaning of the sense data, see the explanation on page 678.

System Action: All requests on a VTAM session are abnormally terminated and the session is closed. The VTAM ACB is then closed.

If V NET,ID=...,INACT was issued by the VTAM operator, VTAM waits for all sessions to be closed before informing CICS. In this case there are no sessions to be abnormally terminated. This message may be issued twice, once by DFHZTPX and once by DFHZSHU. The messages will have different instance numbers.

User Response: None.

Destination: CSNE

Modules: DFHZSHU, DFHZTPX

XMEOUT Parameters: date, time, applid, sense, instance, {1=DFHZSHU, 2=RESERVE, 3=RESERVE, 4=DFHZTPX, 5=DFHZSHU}

DFHZC3443  I date time applid VTAM has been cancelled or the ACB has been forceclosed. VTAM sessions terminated. sense ((instance) Module name: (DFHZSHU | DFHZSYX | DFHZTPX))

Explanation: VTAM has been cancelled or force closed by the CICS/VTAM operator.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS will close its ACB. All transactions running on VTAM sessions are abnormally terminated.

User Response: None.

Destination: CSNE

Modules: DFHZSHU, DFHZTPX, DFHZSYX

XMEOUT Parameters: date, time, applid, sense, instance, {1=DFHZSHU, 3=DFHZSYX, 4=DFHZTPX, 5=DFHZSHU}

DFHZC3444  E date time applid termid tranid Unexpected condition detected during RECEIVE processing. sense ((instance) Module name: (DFHZRVS))

Explanation: CICS has detected a data runaway condition while receiving data from terminal termid.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS terminates the session and places the terminal out of service. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: To determine the cause of this error,

- Check for a terminal malfunction, for example the device may be sending the same data repeatedly, or
- Check for a network problem.

Destination: CSNE

Module: DFHZRVS

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS}

DFHZC3445  E date time applid termid tranid State error. sense ((instance) Module name: (DFHZNAC))

Explanation: CICS has received a state error negative response (VTAM sense code 20yy).

For the meaning of the sense data, see the explanation on page 678.

System Action:

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User Response: Determine the reason for the error before restarting the session.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC3446  E date time applid termid tranid Request error. sense ((instance) Module name: (DFHZNAC))

Explanation: CICS has received a request error negative response (VTAM sense code 10yy) for which it does not recognize the minor code yy.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

Destination: CSNE
DFHZC3447 E date time applid termid tranid Request reject error.
  sense (instance) Module name: (DFHZNAC))
Explanation: CICS has received a request reject negative response (VTAM sense code 08yy) for which it does not recognize the minor code yy.
For the meaning of the sense data, see the explanation on page 678.
System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.
User Response: Determine the reason for the error.
Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC3448 E date time applid termid tranid Security identification error. sense (instance) Module name: (DFHZNAC))
Explanation: CICS has received a negative response to a request to access a resource because it was not authorized. If it was an OPNDST (BIND) request, CICS did not send the authorization sequence expected by a logical unit. CICS does not support the security feature in the bind.
For the meaning of the sense data, see the explanation on page 678.
System Action: The logical unit is placed out of service and the session is closed.
User Response: CICS does not support the security feature in the bind. Modify the authorization parameters in the remote logical unit so that it does not require authorization to initiate a session.
Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC3449 I date time applid termid tranid Leaving unattended mode. sense (instance) Module name: (DFHZNAC))
Explanation: CICS has received a status message from a logical unit indicating that the terminal is now attended.
Note that this is the default mode of operation.
For the meaning of the sense data, see the explanation on page 678.
System Action: The mode of operation bit TCTEMOPU is reset in the TCTTE.
User Response: Ensure that no more receive requests are issued to the terminal.
Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC3450 I date time applid termid tranid Entering unattended mode. sense (instance) Module name: (DFHZNAC))
Explanation: CICS has received a status message from a logical unit indicating that the terminal is no longer attended.
For the meaning of the sense data, see the explanation on page 678.
System Action: The mode of operation bit TCTEMOPU is set in the TCTTE.
User Response: For logical units that can operate in unattended mode, the application programmer should test the mode of operation before starting a conversational sequence with the terminal operator. If the bit is on, no operator action can be expected.
For command level, use the EXEC CICS ASSIGN UNATTEND (data area) command to obtain the value of TCTEMOPU.
Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

DFHZC3451 I date time applid termid tranid Currently no data to send. sense (instance) Module name: (DFHZNAC))
Explanation: Following the issue of a READ command to a logical unit, or the completion of a transaction associated with the logical unit, CICS has received a status message from the logical unit indicating that it currently has no data to send.
For the meaning of the sense data, see the explanation on page 678.
System Action: If a data interchange (DFHDI) receive request is outstanding, it will complete with DSSTAT condition and a response code X'15'.
If no task is active and no work is outstanding for the terminal, the soft CLSDEST action flag is set and DFHZNEP is called. Unless it is reset by DFHZNEP, the session is terminated.
User Response: Ensure that no more receive requests are issued to the terminal.
Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}
**Chapter 1. DFH messages**

**DFHZC3452 E**

Date time applid termid tranid Signal received -

**Code xxxx, sense (** (instance) Module name: (DFHZASX))**

**Explanation:** CICS has received a SIGNAL command from a logical unit. The SIGNAL codes received with the SIGNAL command are made available to the DFHZNEP user program.

If a task is active, the SIGNAL condition is raised on return to the application program. This message is produced only when SIGNAL codes are passed to the node abnormal condition program (DFHZNAC). CICS does this for Type 4 logical units only.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** If the SIGNAL code is 0001 0000 (request change direction), any further output request will cause the IGREQCD condition to be raised. All SIGNAL codes will cause the SIGNAL condition to be raised.

**User Response:** For logical units for which CICS enforces SIGNAL request change direction, if the code is 0001 0000, issue a receive request or terminate transaction tranid.

If the code is NOT 0001 0000, terminate transaction tranid and refer to the VTAM Programming manual for further guidance.

**Destination:** CSNE

**Module:** DFHZASX

**XMEOUT Parameters:** date, time, applid, termid, tranid, xxxx, sense, instance, {1=DFHZASX, 2=DFHZASX}

---

**DFHZC3453 E**

Date time applid termid tranid RH usage error.

sense (** (instance) Module name: (DFHZNAC))

**Explanation:** CICS has received a request header (RH) usage error negative response for which it does not recognize the minor code yy.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

**User Response:** None.

**Destination:** CSNE

**Module:** DFHZNAC

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

---

**DFHZC3454 E**

Date time applid termid tranid Session initiation failure. Bind response from node netname contains an invalid session qualifier pair. sense (** (instance) Module name: (DFHZOPX))

**Explanation:** A remote secondary’s response to a negotiable bind contained an invalid session qualifier pair in the user data field. Either it had an invalid format, or the primary SQ had been altered.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** Session initialization fails. The sent and received bind images are printed on the CSNE log.

**User Response:** Correct the error in the remote system. If there is an invalid format, change it to LEN PSQ LEN SSQ.

**Destination:** CSNE

**Module:** DFHZOPX

**XMEOUT Parameters:** date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX}

---

**DFHZC3455 E**

Date time applid termid tranid No outboard formats loaded. sense (** (instance) Module name: (DFHZNAC))

**Explanation:** An outboard format has been referenced, but no outboard formats are loaded on this logical unit.

**System Action:** Transaction tranid is abnormally terminated with a transaction dump.

**User Response:** Load the necessary outboard formats.

**Destination:** CSNE

**Module:** DFHZNAC

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}

---

**DFHZC3456 E**

Date time applid termid tranid Requested outboard format not loaded. sense (** (instance) Module name: (DFHZNAC))

**Explanation:** An outboard format has been referenced, but the requested format is not loaded on this logical unit.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** Transaction tranid is abnormally terminated with a transaction dump.

**User Response:** Load the requested outboard format.

**Destination:** CSNE

---

**Chapter 1. DFH messages**
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, \{1=DFHZNAC\}

**DFHZC3458**  E  date time applid termid tranid Requested format group not loaded. sense ((instance) Module name: {DFHZNAC})

Explanation: An outbound format group has been referenced, but that format group is not loaded on this logical unit. For the meaning of the sense data, see the explanation on page 678.

System Action: Transaction tranid is abnormally terminated with a transaction dump.

User Response: Load the required format group.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, \{1=DFHZNAC\}

**DFHZC3459**  E  date time applid termid tranid Unsupported data stream. sense ((instance) Module name: {DFHZNAC})

Explanation: The data stream sent to the device contains control data for functions that the device does not support. For the meaning of the sense data, see the explanation on page 678.

System Action: Transaction tranid is abnormally terminated.

User Response: Either ensure that transaction tranid is not run against the terminal, or change the terminal to one that supports the data stream.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, \{1=DFHZNAC\}

**DFHZC3460**  E  date time applid termid tranid Requested character set not present. sense ((instance) Module name: {DFHZNAC})

Explanation: The Referenced Logical Character Set Identifier (LCID) specified in the define alternate character set is not known. For the meaning of the sense data, see the explanation on page 678.

System Action: Transaction tranid is abnormally terminated with a transaction dump.

User Response: Ensure that the character set referenced by the LCID is loaded.

Destination: CSNE
Module: DFHZNAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, \{1=DFHZNAC\}

**DFHZC3461**  I  date time applid termid tranid Node netname session started. sense ((instance) Module name: {DFHZEV1 | DFHZEVE2 | DFHZOPX})

Explanation: CICS has successfully issued or received a bind to the node netname.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: None.

Destination: CSNE
Modules: DFHZOPX, DFHZEV1, DFHZEVE2
XMEOUT Parameters: date, time, applid, termid, tranid, netname, sense, instance, \{1=DFHZOPX, 2=DFHZOPX, 3=DFHZEV1, 4=DFHZEVE2\}

**DFHZC3462**  I  date time applid termid tranid Node netname session terminated. sense ((instance) Module name: {DFHZCLS})

Explanation: A session with node netname has been closed.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: None.

Destination: CSNE
Module: DFHZCLS
XMEOUT Parameters: date, time, applid, termid, tranid, netname, sense, instance, \{1=DFHZCLS, 2=DFHZCLS\}

**DFHZC3463**  I  date time applid VTAM ACB opened. VTAM Return Code = X'rc'. Time = time sense ((instance) Module name: {DFHZOPA})

Explanation: The master terminal operator issued a CEMT or CSMT command to open the VTAM ACB.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: This depends on the return code:

- If the value is zero, VTAM sessions can be enabled.
- If the value is 1, this is not a VTAM return code. It is inserted by DFHZOPA if a VTAM OPEN is received when the ACB is already open.
- If the return code is some other value, the operation has failed. See the section on Open Macroinstructions in the VTAM Programming manual to determine why the VTAM ACB was not opened.

Destination: CSNE
Module: DFHZOPA
XMEOUT Parameters: date, time, applid, X'rc', time, sense, instance, \{1=DFHZOPA\}
Chapter 1. DFH messages

DFHZC3464 E date time applid termid tranid Node netname released by MT Operator/LU Services Manager.
   sense ((instance) Module name: (DFHZSTU))

Explanation: The master terminal operator issued a CEMT command to release the logical unit (LU).
For the meaning of the sense data, see the explanation on page 678.

System Action: The LU is closed. Any task associated with the LU is terminated either abnormally (if the master terminal operator so desired) or normally.

User Response: None.

Destination: CSNE

Module: DFHZSTU

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSTU}

DFHZC3465 E date time applid termid tranid Unexpected response received. sense ((instance) Module name: (DFHZZAC | DFHZRLP | DFHZVRX))

Explanation: CICS received a positive response in one of the following circumstances:
- The response was to data sent with exception response
- The response was to a command sent with exception response
- The response was to a send to which a response has already been sent.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to CSNE.

User Response: Ensure that the application programs running concurrently do not alter the TCTTE. Check that the SNA flows on the session are valid and that the logical unit is not violating SNA protocols.

Destination: CSNE

Modules: DFHZVRX, DFHZRAC, DFHZRLP

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZZAC, 2=DFHZRLP, 3=DFHZVRX, 4=DFHZVRX, 5=DFHZVRX, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZRAC, 11=DFHZRAC, 12=DFHZRAC}

DFHZC3466 E date time applid termid tranid Out of session during session start up. sense ((instance) Module name: (DFHZSEX | DFHZSKR))

Explanation: A CICS master terminal command was used to put terminal termid out of service while session startup was taking place.
For the meaning of the sense data, see the explanation on page 678.

System Action: The session is terminated and the TCTTE for terminal termid is left out of service.

User Response: To establish the session for use, the master terminal operator should issue the command CEMT SET TER (XXX) INS ACQ. This puts the terminal back in service, and start up the session for use.

Destination: CSNE

Modules: DFHZSEX, DFHZSKR

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSEX, 2=DFHZSKR}

DFHZC3467 E date time applid termid tranid Permanent insufficient resource. sense ((instance) Module name: (DFHZSNAC))

Explanation: The PS buffer resource required by load PS is not available.
For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Look at the CSNE log. A second message with a sense received code of 084C should have been issued. Refer to this message in the VTAM Programming manual for full details.

Destination: CSNE

Module: DFHZSNAC

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSNAC}

DFHZC3468 E date time applid termid tranid CLEAR command received. sense ((instance) Module name: (DFHZSCX))

Explanation: An SNA clear command was received by the node. The other end of the session was unable to handle the current requests for some reason, and purged any outstanding messages on the session.
For the meaning of the sense data, see the explanation on page 678.

System Action: The session is canceled immediately, and any transaction executing on that session is also abnormally terminated and a transaction dump is produced.

User Response: Check the other end of the session to determine why the clear command was sent. It may be due to a lack of buffers in the VTAM region attached to the other session.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}

DFHZC3469 E date time applid termid tranid Session re-establishment being awaited. sense ((instance) Module name: (DFHZSCX))

Explanation: The secondary LU is being passed to a new application program via CLSDST(PASS).
For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump.

User Response: None.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}
DFHZC3470 E date time applid termid tranid LU session failure
caused by: (restart/takeover. LU does not support
ACTLU(ERP), | route extension to cluster failed. | LU
abend, disconnect, DACTPU or ANS. )sense ((instance)
Module name: (DFHZSCX))
Explanation: An LU session has failed because an UNBIND
command has been received.
Possible reasons are:
• Restart or takeover. LU does not support ACTLU(ERP)
• Route extension to cluster failed
• Session failed due to LU abend, disconnect, DACTPU, or ANS.
For the meaning of the sense data, see the explanation on page
678.
System Action: If a task is attached, it is abnormally terminated
with a transaction dump.
User Response: Use the symptom string, a VTAM trace, and the
dump, if available, to determine the source of the UNBIND before
attempting to reestablish the session.
Destination: CSNE
Module: DFHZSCX
XMEOUT Parameters: date, time, applid, termid, tranid, sense,
instance, {1=DFHZSYX, 2=DFHZSCX, 3=DFHZSCX, 4=DFHZSCX
5=DFHZSCX, 6=DFHZSCX)

DFHZC3471 E date time applid termid tranid Virtual route
inoperative. sense ((instance) Module name:
(DFHZSCX))
Explanation: The session has been broken because the virtual
route it was using has failed.
For the meaning of the sense data, see the explanation on page
678.
System Action: If a task is attached, it is abnormally terminated
with a transaction dump. For APPC sessions, CICS attempts to
reestablish the failing session.
User Response: None.
Destination: CSNE
Module: DFHZSCX
XMEOUT Parameters: date, time, applid, termid, tranid, sense,
instance, {1=DFHZSCX}

DFHZC3472 E date time applid termid tranid Device end received.
sense ((instance) Module name: (DFHZSYX))
Explanation: Device end was received from a non-SNA VTAM
supported 3270
For the meaning of the sense data, see the explanation on page
678.
System Action: The good morning message is displayed, unless
the terminal is associated with an active task.
User Response: None.
Destination: CSNE
Module: DFHZSYX
XMEOUT Parameters: date, time, applid, termid, tranid, sense,
instance, {1=DFHZSYX}

DFHZC3474 E date time applid termid tranid Virtual route
deactivated. sense ((instance) Module name:
(DFHZSCX))
Explanation: The session has had to be deactivated because of a
forced deactivation of the virtual route being used.
For the meaning of the sense data, see the explanation on page
678.
System Action: If a task is attached, it is abnormally terminated
with a transaction dump. Afterwards CICS attempts to reestablish
the session.
User Response: Determine the cause of the session failure and
attempt to reestablish the session.
Destination: CSNE
Module: DFHZSCX
XMEOUT Parameters: date, time, applid, termid, tranid, sense,
instance, (1=DFHZSCX)

DFHZC3475 E date time applid termid tranid Unrecoverable LU
failure. sense ((instance) Module name: (DFHZSCX))
Explanation: The session has had to be deactivated because of an
abnormal termination of an LU.
For the meaning of the sense data, see the explanation on page
678.
System Action: If a task is attached, it is abnormally terminated
with a transaction dump. Session reinitiation is not attempted.
User Response: None.
Destination: CSNE
Module: DFHZSCX
XMEOUT Parameters: date, time, applid, termid, tranid, sense,
instance, (1=DFHZSCX)

DFHZC3476 E date time applid termid tranid Recoverable LU
failure. sense ((instance) Module name: (DFHZSCX))
Explanation: The session has had to be deactivated because of an
abnormal termination of an LU; recovery of the session may be
possible.
For the meaning of the sense data, see the explanation on page
678.
System Action: If a task is attached, it is abnormally terminated
with a transaction dump. CICS attempts to reinitiate the session.
User Response: None.
Destination: CSNE
Module: DFHZSCX
XMEOUT Parameters: date, time, applid, termid, tranid, sense,
instance, (1=DFHZSCX)

DFHZC3477 E date time applid termid tranid Cleanup received.
sense ((instance) Module name: (DFHZSCX))
Explanation: The sending LU has reset its half-session before
receiving a response from CICS; recovery of the session may be
possible.
For the meaning of the sense data, see the explanation on page
678.
System Action: If a task is attached, it is abnormally terminated
with a transaction dump. CICS attempts to reinitiate the session.
User Response: None.
Chapter 1. DFH messages

DFHZC3479 E date time applid termid tranid Unbind received after session failure detected. sense ((instance) Module name: {DFHZSCX})

Explanation: The logical unit in session with CICS has detected a session failure, and has unbound the session with CICS.

For the meaning of the sense data, see the explanation on page 678.

System Action: The session is terminated, and the transaction using it is abnormally terminated or informed by return code.

User Response: Determine the reason for the session failure by using Trace. Check the CSNE log for a second error message associated with DFHZC3479. This message should be located immediately after DFHZC3479.

Refer to the sense code shown in the associated message.

Destination: CSNE
Module: DFHZSCX
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}

DFHZC3480 E date time applid termid tranid Session could not be started due to insufficient CICS nucleus function - ISC not loaded. sense ((instance) Module name: {DFHZBLX | DFHZLGX | DFHZSIM})

Explanation: A session initiation has been attempted to an APPC system or terminal. The session cannot be established because the CICS ISC nucleus modules are required.

For the meaning of the sense data, see the explanation on page 678.

System Action: The session initiation request is rejected.

User Response: If APPC connections are to be used, ensure that ISC=NO is not used for CICS initialization.

Destination: CSNE
Modules: DFHZSCX, DFHZLGX, DFHZSIM
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSIM, 2=DFHZBLX, 3=DFHZLGX}

DFHZC3481 E date time applid termid tranid 3270 Data Stream protocol error. sense ((instance) Module name: DFHZVRX)

Explanation: CICS has received zero length data from a device defined in the TCT as a 3270 terminal. This violates the protocol for 3270 devices.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS cancels the session and any transactions attached to the terminal.

User Response: Determine why zero length data was received from a device purporting to be a 3270 terminal, and correct the error.

The most likely reasons are an incorrect TCT definition for the terminal, or incorrect programming of a terminal that is simulating 3270 protocols.

Destination: CSNE
Modules: DFHZRC, DFHZRVX
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRC}

DFHZC3482 E date time applid termid tranid Logon from node nodeid rejected. Insufficient storage for autoinstall request. sense ((instance) Module name: DFHZBLX | DFHZLGX | DFHZSCX)

Explanation: A node nodeid, unknown to CICS, attempted to logon. CICS could not obtain sufficient storage to complete autoinstall processing.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the logon request.

User Response: Retry the logon.

Destination: CSNE
Modules: DFHZLGX, DFHZSCX, DFHZBLX
XMEOUT Parameters: date, time, applid, termid, nodeid, sense, instance, {1=DFHZLGX, 2=DFHZLGX, 3=DFHZBLX, 4=DFHZSCX}

DFHZC3484 I date time applid netname is now connected to applid. sense ((instance) Module name: DFHZNSP)

Explanation: By successful execution of an ISSUE PASS command, a VTAM logical unit whose network name is netname has been passed to the VTAM application whose VTAM APPLID (netname) is applid.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS processing continues.

User Response: None.

Destination: CSNE
Module: DFHZNSP
XMEOUT Parameters: date, time, applid, netname, applid, sense, instance, {1=DFHZNSP}

DFHZC3485 E date time applid netname A CLSDST Pass Procedure error occurred at applid. Status byte xx Reason byte yy. sense ((instance) Module name: DFHZNSP)

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is netname, to a system whose VTAM APPLID (netname) is applid.

VTAM has notified CICS of an error at applid.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS saves the status byte xx and reason byte yy passed by VTAM in the Notify Request Unit. CICS processing continues.

User Response: The reason for the error can be determined by investigating the status byte xx and reason byte yy given in the message. These bytes are documented in the NSEXIT routine section of VTAM Programming (SC23-0115).
Destination: CSNE
Module: DFHZNSP
XMEOUT Parameters: date, time, applid, netname, applid, xx, yy, sense, instance, {1=DFHZNSP}

DFHZC3486  E  date time applid netname The named LU cannot be connected for sessions at applid. sense ((instance) Module name: (DFHZSXY))

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is netname, to a system whose VTAM APPLID is applid. VTAM has notified CICS that applid is currently not available. For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.
User Response: None.
Destination: CSNE
Module: DFHZSXY
XMEOUT Parameters: date, time, applid, netname, applid, sense, instance, {1=DFHZSXY, 2=DFHZSXY}

DFHZC3487  E  date time applid netname Unable to PASS to node nodeid. CLSDST PASS is not authorized. sense ((instance) Module name: (DFHZLEX))

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is netname. VTAM has notified CICS that CICS is not authorized to use this function. For the meaning of the sense data, see the explanation on page 678.

System Action: CICS continues.
User Response: To use the ISSUE PASS command, you must code AUTH=PASS on the VTAM definition of the CICS APPL, then reactivate the APPL.
Destination: CSNE
Module: DFHZLEX
XMEOUT Parameters: date, time, applid, netname, nodeid, sense, instance, {1=DFHZLEX, 2=DFHZLEX}

DFHZC3488  E  date time applid netname ISC session connection failure. sense ((instance) Module name: (DFHZSIX))

Explanation: A simlogon request to an ISC system was rejected because the netname was not known. CICS has now issued the INQUIRE OPTCD=USERVAR command in order to determine if netname had been defined as a user variable. That INQUIRE command has been rejected because the user variable does not exist in the USERVAR table. This may be because the USERVAR is either not known or invalid, or the MODIFY USERVAR command has not been issued to define the user variable.

For the meaning of the sense data, see the explanation on page 678.

System Action: CLSDST is issued to reset the session.
User Response: Determine if the netname has been defined correctly to CICS. If the netname is to be used as a user variable then determine why the MODIFY USERVAR command has not been issued to set it.
Destination: CSNE
Module: DFHZSIX
XMEOUT Parameters: date, time, applid, netname, sense, instance, {1=DFHZSIX}

DFHZC3489  E  date time applid netname The LU is inhibited for sessions. sense ((instance) Module name: (DFHZSXY))

Explanation: CICS has attempted to acquire a session to the logical unit (LU), but VTAM has rejected the request because the LU is inhibited for sessions.

User Response: After the partner LU has enabled itself, it can initiate the session request to CICS. Alternatively, the CICS master terminal operator could reset the NOINTLOG state and allow CICS to initiate the session request.
Destination: CSNE
Module: DFHZSXY
XMEOUT Parameters: date, time, applid, netname, sense, instance, {1=DFHZSXY}

DFHZC3490  E  date time applid netname Unable to pass to node nodeid. sense ((instance) Module name: (DFHZCLX | DFHZLEX | DFHZSIX))

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of the named VTAM logical unit to a system identified as node nodeid. VTAM has notified CICS that this request has failed.

This may occur if the LUNAME specified is a generic resource name and this CICS is the only system registered under this name. You are effectively passing the terminal to yourself.
However, if there is more than one CICS registered under the generic resource name, the terminal should pass successfully to another member (chosen by VTAM) in the same resource.
For the meaning of the sense data, see the explanation on page 678.

System Action: A VTAM CLSDST macro is issued to halt communication with the node.
User Response: Ensure that the node nodeid is defined and active to VTAM.
Destination: CSNE
Modules: DFHZSXY, DFHZLEX, DFHZCLX
XMEOUT Parameters: date, time, applid, netname, nodeid, sense, instance, {1=DFHZLEX, 2=DFHZSXY, 3=DFHZCLX}
**DFHZC3491 E** date time applid netname Unable to make session XRF capable. sense (instance) Module name: (DFHZLEX)

**Explanation:** The active CICS system has attempted to OPNDST the session as "XRF capable", but has been refused because the Network Control Program (NCP) has insufficient space to hold the control blocks for a future backup session from the alternate CICS system.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** CICS performs a SIMLOGON, but does not deem the session to be "XRF capable". CICS therefore treats the terminal as class 2.

**User Response:** No immediate action is necessary. You may need to increase the number of buffers in the NCP.

**Destination:** CSNE

**Module:** DFHZLEX

**XMEOUT Parameters:** date, time, applid, netname, sense, instance, \(\{\text{DFHZLEX}\}\)

---

**DFHZC3492 E** date time applid tranid Logon for node nodeid contained invalid NIBUSER token. sense (instance) Module name: (DFHZLGX)

**Explanation:** DFHZLGX has been driven for SIMLOGON with a token that is no longer a valid TCTTE address.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** An unexpected condition has occurred during SIMLOGON. CICS will continue processing normally.

**User Response:** None.

**Destination:** CSNE

**Module:** DFHZLGX

**XMEOUT Parameters:** date, time, applid, tranid, nodeid, sense, instance, \(\{\text{DFHZLGX}\}\)

---

**DFHZC3493 E** date time applid tranid Error received for a print request. sense (instance) Module name: (DFHZZARQ)

**Explanation:** A print function was requested on a 3270 information display system. However, the print function was unable to find an eligible printer because the function does not support the device type.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** If no other action is specified in the Network Error Program (NEP), the print request is halted. CICS processing continues.

**User Response:** Check that the printers specified for the information display system are valid. Valid devices are 3270P and LUTYPE3.

**Destination:** CSNE

**Module:** DFHZZARQ

**XMEOUT Parameters:** date, time, applid, tranid, sense, instance, \(\{\text{DFHZZARQ}\}\)

---

**DFHZC3494 E** date time applid tranid Request error sense (instance) Module name: (DFHZZAC)

**Explanation:** The request unit (RU) received by the secondary logical unit (LU) contains a request which terminal termid cannot handle.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** All send and receive requests are purged and transaction tranid is abnormally terminated with a dump.

**User Response:** Check that the TYPETERM specifications for terminal termid are valid. This error could occur if, for example, QUERY was sent to a nonqueriable 3270 defined with QUERY=COLD|ALL.

**Destination:** CSNE

**Module:** DFHZSYX

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, \(\{1=\text{DFHZZAC}\}\)

---

**DFHZC3495 E** date time applid Logon occurred for terminal with netname netname before Notify received sense (instance) Module name: (DFHZLGX)

**Explanation:** A terminal with netname netname has logged on before a NOTIFY request was received for an outstanding CLSDST PASS with CLSDST=NOTIFY.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** CICS processing continues. Any subsequent NOTIFY requests for the terminal identified will be ignored.

**User Response:** It is recommended that any user processing for CLSDST PASS messages incorporates this message.

**Destination:** CSNE

**Module:** DFHZLGX

**XMEOUT Parameters:** date, time, applid, netname, sense, instance, \(\{1=\text{DFHZLGX}\}\)

---

**DFHZC3496 E** date time applid System dump has been taken for terminal termid (instance) Module name: (DFHZZAC)

**Explanation:** Terminal termid has been found to be in error by terminal control.

As terminal termid had no task attached to it at the time of the error, DFHZZAC was unable to cause a transaction abend with a transaction dump.

The TWAOJNTA flag in the DFHZZAC-DFHZNEP commarea is set ON and DFHZZAC produces a system dump for terminal termid instead.

**System Action:** An exception trace entry is made in the trace table at trace point FC73.

A system dump is produced unless you have specifically suppressed dumps in the dump table.

**User Response:** To determine the nature of the problem that caused the dump to be taken, refer to the CSNE log. There should be an associated CICS message which will provide further information.

For more information about TWAOJNTA, refer to the *CICS Customization Guide*.

**Destination:** CSNE

---
DFHZC3497 E  
**date time applid**  
Link to module DFHZNEP from DFHZNAC failed because [module DFHZNEP is not AMODE 31. | module DFHZNEP could not be loaded. | module DFHZNEP could not be autoinstalled. | of an unexpected error.] ((instance) Module name: (DFHZNAC))  
**Explanation:**  
While processing an error for a VTAM terminal, CICS attempted to link to user-replaceable module DFHZNEP. The link failed.  
See message DFHZC3437 for the default action or actions taken.  
**System Action:** The default action or actions set by DFHZNAC are taken.  
**User Response:**  
The reason for the failure is specified in the message. Possible solutions are:  
- Ensure that DFHZNEP is linked with AMODE 31.  
- Ensure that DFHZNEP is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.  
- Ensure that there is a valid entry for DFHZNEP in the PPT, and that DFHZNEP can be successfully autoinstalled.  
**Destination:** CSNE  
**Module:** DFHZNAC  
**XMEOUT Parameters:**  
- date, time, applid, (1=module DFHZNEP is not AMODE 31., 2=module DFHZNEP could not be loaded., 3=module DFHZNEP could not be autoinstalled., 4=of an unexpected error.), instance, (1=DFHZNAC)  

DFHZC3498 E  
**date time applid**  
Abend abcode has occurred in module DFHZNEP. ((instance) Module name: (DFHZNAC))  
**Explanation:**  
While processing an error for a VTAM terminal, user-replaceable module DFHZNEP was linked and the program aborted with abend code abcode. See message DFHZC3437 for the default action or actions that are taken.  
**System Action:** Control is passed back to the calling module, DFHZNAC. DFHZNAC reinstates the default actions set before DFHZNEP was called. The actions are then taken.  
**User Response:** Refer to abend code abcode for details of the original error. Follow the user response given in the abend code to solve the problem.  
**Destination:** CSNE  
**Module:** DFHZNAC  
**XMEOUT Parameters:**  
- date, time, applid, abcode, instance, (1=DFHZNAC)  

DFHZC3499 E  
**date time applid**  
Abend abcode has occurred in module DFHZNEP. ((instance) Module name: (DFHZNAC))  
**Explanation:**  
While processing an error for a VTAM terminal, user-replaceable module DFHZNEP was linked and the program aborted with abend code abcode. See message DFHZC3437 for the default action or actions that are taken.  
**System Action:** Control is passed back to the calling module, DFHZNAC. DFHZNAC reinstates the default actions set before DFHZNEP was called. The actions are then taken.  
**User Response:** Refer to abend code abcode for details of the original error. Follow the user response given in the abend code to solve the problem.  
**Destination:** CSNE  
**Module:** DFHZNAC  
**XMEOUT Parameters:**  
- date, time, applid, abcode, instance, (1=DFHZNAC)  

DFHZC4900 I  
**date time applid termid tranid**  
CNOS [sent to | received from] Node netname System sysid  
**Modename modename, Max = n1, Win=n2, [race detected | successful | values amended | modename not recognized | modename closed], (instance) Module name: (DFHZGCN))  
**Explanation:**  
A CHANGE-NUMBER-OF-SESSIONS command has been sent or received. The inserts are identified as follows:  
- sysid is the system identifier.  
- modename is the modename.  
- n1 is the maximum session count.  
- n2 is the maximum source contention winner sessions.  
If the “values amended” option is displayed, the values of the n1 (maximum session count) and n2 (maximum source contention winner sessions) have been renegotiated by the target system.  
If the “race detected” option is displayed, the CNOS command could not be implemented because the modename modename was already locked for a CNOS command from the other system.  
**System Action:** The negotiated values are applied.  
**User Response:** None.  
**Destination:** CSNE  
**Module:** DFHZGCN  
**XMEOUT Parameters:**  
- date, time, applid, termid, tranid, (1=sent to, 2=received from), netid, sysid, modename, n1, n2, (1=race detected, 2=successful, 3=values amended, 4=modename not recognized | modename closed), (instance) Module name: (DFHZGCN)
This message follows message DFHZC4900 when the maximum session count (n1) and the maximum source contention winner sessions (n2) have been renegotiated.

**System Action:** The negotiated values are applied.

**User Response:** None.

**Destination:** CSNE

**Module:** DFHZGCN

**XMEOUT Parameters:** date, time, applid, termid, tranid, netname, sysid, modename, n1, n2, instance, {1=DFHZGCN}

---

**DFHZC4902 E date time applid termid tranid Attach FMH or subfield length error. sense ((instance) Module name: (DFHZATT))**

**Explanation:** A request to attach a task has been received across an APPC link. However, there is an error in the function management header (FMH) length or in the length of one of the subfields. As a result, CICS is unable to determine which task to attach.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated with a dump.

**User Response:** The remote APPC system is sending an invalid attach header (FMH type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

**Destination:** CSNE

**Module:** DFHZATT

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZATT, 2=DFHZATT, 3=DFHZATT, 4=DFHZATT, 5=DFHZATT, 6=DFHZATT, 7=DFHZATT}

---

**DFHZC4903 E date time applid termid tranid Attach FMH not found. sense ((instance) Module name: (DFHZATT))**

**Explanation:** A request to attach a task has been received across an APPC link. However, no APPC attach header has been found at the start of the input data stream.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated with a dump.

**User Response:** The remote APPC system is failing to send a valid attach header (FMH type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

**Destination:** CSNE

**Module:** DFHZATT

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZATT, 2=DFHZATT}

---

**DFHZC4904 E date time applid termid tranid Bracket FSM error. sense ((instance) Module name: (DFHZRAC | DFHZRLP | DFHZSDL | DFHZSLX))**

**Explanation:** The bracket finite state machine (FSM) has reported an error in the use of APPC bracket protocols.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated with a dump.

**User Response:** If this message occurs after a persistent sessions restart, look for associated messages for more guidance. The problem might be temporary.

If this message occurs during normal system execution, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CSNE

**Modules:** DFHZRAC, DFHZRLP, DFHZSDL, DFHZSLX

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC, 3=DFHZRAC, 4=DFHZRAC, 5=DFHZRAC, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZRAC, 11=DFHZRAC, 12=DFHZRAC, 13=DFHZRAC, 14=DFHZRAC, 15=DFHZRAC}

---

**DFHZC4905 E date time applid termid tranid Chain FSM error. sense ((instance) Module name: (DFHZDET | DFHZERH | DFHZRAC | DFHZRLP | DFHZSDL | DFHZSLX))**

**Explanation:** The chain finite state machine (FSM) has reported an error in the use of APPC chaining protocols.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** If this message occurs after a persistent sessions restart, look for associated messages for more guidance. The problem might be temporary.

If this message occurs during normal system execution, investigate any transactions running on the session at the time of failure because the error can be caused by using both the LAST and WAIT options on an EXEC CICS SEND command in an APPC DTP application. This combination of parameters is not recommended. See the CICS Distributed Transaction Programming Guide for more information. If this is not the cause of the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CSNE

**Modules:** DFHZRAC, DFHZRLP, DFHZSDL, DFHZSLX, DFHZERH, DFHZDET

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC, 3=DFHZRAC, 4=DFHZRAC, 5=DFHZRAC, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZRAC, 11=DFHZRAC, 12=DFHZRAC, 13=DFHZRAC, 14=DFHZRAC, 15=DFHZRAC, 16=DFHZRAC, 17=DFHZRAC, 18=DFHZRAC, 19=DFHZRAC, 20=DFHZRAC, 21=DFHZRAC, 22=DFHZRAC, 23=DFHZRAC, 24=DFHZRAC, 25=DFHZRAC, 26=DFHZRAC, 27=DFHZRAC, 28=DFHZRAC}

---

**DFHZC4906 E date time applid termid tranid Contention FSM error. sense ((instance) Module name: (DFHZCLS | DFHZDET | DFHZRAC | DFHZRLP))**

**Explanation:** The contention finite state machine (FSM) has reported an error in the use of APPC contention protocols.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated with a dump.
Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** If this message occurs after a persistent sessions restart, look for associated messages for more guidance. The problem might be temporary.

If this message occurs during normal system execution, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CSNE

**Modules:** DFHZRAC, DFHZRRLP, DFHZDET, DFHZCLS, DFHZCC

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRRLP, 3=DFHZDET, 4=DFHZRAC, 5=DFHZRRLP, 6=DFHZRRLP, 7=DFHZRRLP, 8=DFHZRRLP, 9=DFHZRRLP, 10=DFHZRRLP, 11=DFHZRRLP, 12=DFHZRRLP, 13=DFHZRRLP, 14=DFHZRRLP, 15=DFHZRRLP, 16=DFHZRRLP, 17=DFHZCLS}

---

**DFHZC4907 E**

**date time applid termid tranid Invalid request to send data routine. sense ((instance) Module name: (DFHZSDL))**

**Explanation:** DFHZSDL was entered, but no valid request was passed to it.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CSNE

**Module:** DFHZSDL

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZSDL, 2=DFHZSDL, 3=DFHZSDL, 4=DFHZSDL, 5=DFHZSDL}

---

**DFHZC4909 E**

**date time applid termid tranid Invalid request to receive data routine. sense ((instance) Module name: (DFHZRRLP))**

**Explanation:** DFHZRRLP was entered, but no valid request was passed.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CSNE

**Module:** DFHZRRLP

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRRLP}

---

**DFHZC4910 E**

**date time applid termid tranid Receive buffer too small. sense ((instance) Module name: (DFHZRRLP))**

**Explanation:** The receive buffer passed to DFHRVL is too small to accommodate a maximum size request unit.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task will be abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CSNE

**Module:** DFHZRRLP

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRRLP, 2=DFHZRRLP, 3=DFHZRRLP, 4=DFHZRRLP}

---

**DFHZC4911 E**

**date time applid termid tranid LU6.2 exception response received. sense ((instance) Module name: (DFHZRLP))**

**Explanation:** A non-process-level exception response has been received.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated with a dump.

**User Response:** Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. Try to recreate the error by running a VTAM trace TYPE=IO/BUF to obtain complete details of the line flow.

**Destination:** CSNE

**Module:** DFHZRLP

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP}

---

**DFHZC4912 E**

**date time applid termid tranid BID received with invalid DFC indicators. sense ((instance) Module name: (DFHZRAC | DFHZRLP))**

**Explanation:** BID with data received, but not OIC.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated.

**User Response:** Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

**Destination:** CSNE

**Modules:** DFHZRAC, DFHZRLP

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRAC, 3=DFHZRAC}
DFHZC4913 E date time applid termid tranid BID with data received with invalid DFC indicators. sense (((instance) Module name: {DFHZRLP})

**Explanation:** A BID with data was received in an invalid state for rejection.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated.

**User Response:** Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

**Destination:** CSNE

**Module:** DFHZRLP

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP, 3=DFHZRLP, 4=DFHZRLP}

DFHZC4914 E date time applid termid tranid Data length exceed max RU size. sense (((instance) Module name: {DFHZRLP})

**Explanation:** The record length received exceeds the buffer length.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated.

**User Response:** Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

**Destination:** CSNE

**Module:** DFHZRLP

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP}

DFHZC4915 E date time applid termid tranid EOC received with invalid DFC indicators. sense (((instance) Module name: {DFHZRLP})

**Explanation:** An end chain was received with invalid DFC indicators.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated.

**User Response:** Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

**Destination:** CSNE

**Module:** DFHZRLP

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP}

DFHZC4916 E date time applid termid tranid Send response failed. sense (((instance) Module name: {DFHZRLP})

**Explanation:** A response, sent to acknowledge successful receipt of data, was rejected by VTAM.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CSNE

**Module:** DFHZRLP

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP}

DFHZC4917 E date time applid termid tranid BIS received with invalid DFC indicators. sense (((instance) Module name: {DFHZRLP})

**Explanation:** Bracket initiation stopped (BIS) received with invalid DFC flags.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated.

**User Response:** Incorrect flows have been received on an APPC session. The CICS trace will give further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

**Destination:** CSNE

**Module:** DFHZRLP

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP}

DFHZC4918 E date time applid termid tranid Unexpected response received. sense (((instance) Module name: {DFHZRLP})

**Explanation:** An unexpected response was received that was either a positive response to data of a previous bracket, or a response to a command that cannot be accepted when the logical unit is in “continue specific” mode.

For the meaning of the sense data, see the explanation on page 678.

**System Action:** The task is abnormally terminated.

**User Response:** Incorrect flows have been received on an APPC session. The CICS trace will give further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

**Destination:** CSNE

**Module:** DFHZRLP

**XMEOUT Parameters:** date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP, 3=DFHZRLP, 4=DFHZRLP, 5=DFHZRLP}

Chapter 1. DFH messages 743
DFHZC4919 E date time applid termid tranid Invalid indicators received. sense ((instance) Module name: (DFHZARER | DFHZARL))

Explanation: An indicator other than CD, CEB, RQD2, or error response has been received.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSNE
Modules: DFHZARL, DFHZARER, DFHZARL
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZARL, 2=DFHZARER, 3=DFHZARL}

DFHZC4920 E date time applid termid tranid Invalid data received. sense ((instance) Module name: (DFHZARER | DFHZARL | DFHZERH))

Explanation: Data received from the remote system or terminal is not in correct generalized data stream (GDS) format.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSNE
Modules: DFHZARL, DFHZARER, DFHZERH
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZARL, 2=DFHZARER, 3=DFHZERH, 4=DFHZARL, 5=DFHZARER}

DFHZC4921 E date applid sysid LU services manager failure. R15 =X'xxxxx' R0 =X'yyyyy'

Explanation: An error situation has been detected during the operation of the LU services manager transaction program (DFHLUP).

Registers 15 and 0 are set to indicate the nature of the error as shown below:

Register 15 = X'0' Task invalidly started ...
Register 0 = X'3' ... via a perm transid.
Register 0 = X'4' ... by a TD trigger.
Register 0 = X'5' ... without data.
Register 0 = X'6' ... or is out of range of a valid start code for this service.

Register 15 = X'4' Call code did not match a supported function (1-5).
Register 0 = call code
Register 15 = X'8' Invalid parameters passed for this function.
Register 0 = keyword #
Register 15 = X'OC' Function-specific checks failed for this keyword.
Register 0 = keyword #
Register 15 = X'10' No input data supplied.
Register 0 = call code
Register 15 = X'14' The GDS-ID is not for XLN.
Register 0 = GDS-ID

System Action: The task is allowed to complete but the required function is not executed.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If one of the errors mentioned above has occurred, try to discover the reason for the failure. If you fail in this, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSNE
Module: DFHLUP
XMEOUT Parameters: date, time, applid, sysid, X'xxxxx', X'yyyyy'

DFHZC4922 E date time applid termid tranid Single session shutdown with DRAIN=CLOSE. sense ((instance) Module name: (DFHZERH | DFHZGDQ | DFHZRAC))

Explanation: The connected logical unit has sent Bracket Initiation Stopped (BIS) and can accept no more work.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a conversation was active, it is treated as though rollback had occurred on it for full syncpoint (syncpoint level 2), or as session failure for confirm-level syncpoint (syncpoint level 1).

If there was no conversation, it is treated as a BID failure (as for 0813 sense code).

User Response: None.

Destination: CSNE
Modules: DFHZRAC, DFHZGDQ, DFHZERH
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZGDQ, 3=DFHZERH}
Chapter 1. DFH messages

DFHZC4923 E date time applid termid tranid Conversation abnormally terminated by transaction end in system sysid

Explanation: Transaction tranid, engaged in an SNA session with a CICS system, issued a command that was inconsistent with the transaction's current state in the conversation.

System Action: The conversation terminates and CICS sends this message to the connected logical unit at the nonfailing end of the conversation.

User Response: Correct the application program. To find the command in error, use the state diagrams in the CICS Intercommunication Guide.

Destination: CSNE
Module: DFHZARL
XMEOUT Parameters: date, time, applid, termid, tranid, sysid

DFHZC4924 E date time applid termid tranid Bind security password missing or invalid. sense ((instance) Module name: (DFHZBLX | DFHZOPX | DFHZSCX))

Explanation: Bind-time security data sent to CICS by its partner LU is missing or invalid. CICS’s password for the partner LU system differs from the partner’s password for CICS. This can be caused by an attempt to sign on to CICS by an unauthorized user.

For the meaning of the sense data, see the explanation on page 678.

System Action: The bind is rejected.

User Response: Check that an unauthorized user has not tried to log on to CICS. Ensure that the unsuccessful connection is correctly defined to CICS (using RDO or the DFHTCT macro) and to its partner LU system. Ensure that the security requirements are equal at both partners, that is, both have security off, or both have security on. A mismatch is one cause of this message.

Destination: CSNE
Modules: DFHZSCX, DFHZOPX, DFHZBLX
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZOPX, 2=DFHZBLX, 3=DFHZZLC, 5=DFHZBLX, 6=DFHZOPX, 7=DFHZOPX, 8=DFHZOPX, 9=DFHZOPX, 10=DFHZSCX}

DFHZC4925 E date time applid termid tranid Inconsistent attach security required. sense ((instance) Module name: (DFHZOPX | DFHZZLC))

Explanation: This message can be issued for any of the reasons listed below.

1. CICS has received a bind request specifying attach time security requirements different from those specified in the first bind.
2. CICS has received a bind requesting persistent verification.
3. CICS has received a bind which does not include an SNA functional management header (FMH12).

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: CICS does NOT allow subsequent binds to specify different security requirements from the first bind. It will not support persistent verification on input either.

Where applicable, alter your applications to meet these requirements.

Destination: CSNE
Modules: DFHZARL
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZOPX, 2=DFHZZLC, 3=DFHZOPX, 4=DFHZZLC}

DFHZC4926 E date time applid termid tranid Bind security encryption error. sense ((instance) Module name: (DFHZEV1 | DFHZRAC))

Explanation: CICS detected an error while verifying an encrypted bind security password.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: Investigate the CSNE and CSMT logs.

Find out whether an unauthorized user tried to log on to CICS, or whether an authorized user entered his password incorrectly.

Destination: CSNE
Modules: DFHZEV1, DFHZRAC
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZEV1, 2=DFHZRAC, 3=DFHZEV1}

DFHZC4927 E date time applid termid tranid Bind FMH response error. sense ((instance) Module name: (DFHZRAC))

Explanation: CICS received a bind with bind security without an FMH12.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This is an error either in CICS or in SNA. Keep the CSNE and CSMT logs. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSNE
Module: DFHZARL
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC, 3=DFHZRAC, 4=DFHZRAC}

DFHZC4928 E date time applid termid tranid Bind security GETMAIN of a TIOA failed. sense ((instance) Module name: (DFHZEV1))

Explanation: CICS required a TIOA work area for bind security validation, but the GETMAIN failed because insufficient storage was available.

System Action: CICS rejects the bind.

User Response: Consider increasing the size of the CICS region or reducing the number of concurrent CICS tasks (MXT parameter in the system initialization table).

**System Action:** CICS rejects the logon request. The BIND being validated is printed with this message.

**User Response:** Use the response and reason codes and the printed BIND, together with the VTAM definition of the BIND for the relevant LOGMODE to determine the reason for the rejection.

Either change the logmode or use a different one that matches CICS requirements.
Chapter 1. DFH messages

DFHZC4933 E date time applid termid tranid Invalid DBA requested. sense ((instance) Module name: (DFHZSUP))
Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the DBA field.
For the meaning of the sense data, see the explanation on page 678.
System Action: The task abends and a dump is produced. The session is unbound.
User Response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.
Destination: CSNE
Module: DFHZSUP
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZSUP)

DFHZC4934 E date time applid termid tranid Invalid syncpoint level requested. sense ((instance) Module name: (DFHZSUP))
Explanation: A request to attach a task has been received across an APPC link. However, the synchronization level requested is invalid.
For the meaning of the sense data, see the explanation on page 678.
System Action: The task abends and a dump is produced.
User Response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.
Destination: CSNE
Module: DFHZSUP
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZSUP)

DFHZC4935 E date time applid termid tranid Invalid UOWID supplied. sense ((instance) Module name: (DFHZSUP))
Explanation: A request to attach a task has been received across an APPC link and either the unit of work ID is invalid, or no UOWID was received when the sync point level required it.
For the meaning of the sense data, see the explanation on page 678.
System Action: The task abends and a dump is produced. The session is unbound.
User Response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.
Destination: CSNE
Module: DFHZSUP
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZSUP)

DFHZC4936 E date time applid termid tranid Attach FMH or subfield length error. sense ((instance) Module name: (DFHZSUP))
Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the FMH length or in the length of one of the sub-fields. This results in CICS being unable to determine which task to attach.
The instance instance is one of the following:
1 The FMH Length is not equal to the length of the fixed length portion + the length of all the sub fields.
2 The Conversation Correlator length within the FMH is greater than 8.
For the meaning of the sense data, see the explanation on page 678.
System Action: The task abends and a dump is produced.
User Response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.
Destination: CSNE
Module: DFHZSUP
XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, (1=DFHZSUP, 2=DFHZSUP)

DFHZC4937 E date time applid SAF request for LU6.2 bind has been rejected. Return Codes from the Security Manager are: RF= X'r' and RO= X'r' sense ((instance) Module name: (DFHZEV1 | DFHZEV2 | DFHZOPN))
Explanation: A security authorization facility (SAF) request to extract APPC bind-time security information from the external security manager (ESM) has been rejected with return code RF=X‘r’ and RO=X‘r’.
This is due either to the ESM being inactive or to the appropriate APPC profile not being defined to the ESM.
For the meaning of the sense data, see the explanation on page 678.
System Action: CICS rejects the bind.
User Response: Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes which may have been produced by the ESM.
If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the System Programming Library RACF manual for the meaning of the return codes.
If the appropriate APPC profile had not been defined to the ESM, define the profile, perform a CICS security rebuild and then attempt to reestablish the APPC connection.
Destination: CSNE
DFHZC4938  E  date time applid SAF request for LU6.2 bind has failed with ESM return code RF=x'rf' and reason code R0=x'r0' sense {(instance) Module name: (DFHZEV1 | DFHZEV2 | DFHZC4938)}

Explanation: The external security manager (ESM) was attempting to process a security authorization facility (SAF) request. Processing has failed with return code RF=x'rf' and reason code R0=x'r0'.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes or reason codes produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the System Programming Library RACF manual for the meaning of the return code and the reason code.

Destination: CSNE

Modules: DFHZEV1, DFHZEV2, DFHZC4938

DFHZC4938  E  date time applid Extraction of LU6.2 security data has failed with ESM returncode RF=x'rf' and reason code R0=x'r0' sense {(instance) Module name: (DFHZEV1 | DFHZEV2 | DFHZC4938)}

Explanation: A request to extract APPC bind-time security information has failed with return code RF=x'rf' and reason code R0=x'r0'. The profile information which was requested had not been previously defined to the external security manager (ESM).

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: Check the profiles defined to the ESM. Create the missing APPC profile entry. Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes or reason codes produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the System Programming Library RACF manual for the meaning of the return code and the reason code.

Destination: CSNE

Modules: DFHZEV1, DFHZEV2, DFHZC4938

DFHZC4940  E  date time applid Bind time failure. No session key found in LU6.2 profile. sense {(instance) Module name: (DFHZEV1 | DFHZEV2 | DFHZC4940)}

Explanation: APPC bind-time validation has failed. No session key has been found in the requested APPC profile information. When bind-time security has been defined between two logical units (LUs), a valid session key must have been defined for the encryption process. A null session key (that is, when no key is defined) is regarded as an error.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: Check the profiles defined to the external security manager (ESM). Create a valid session key for the appropriate APPC profile entry. DO NOT use the NOSESSKEY ESM option for XAPPC security profiles when using RACF.

Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return and reason codes which produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the System Programming Library RACF manual for the meaning of the return code and the reason code.

Destination: CSNE

Modules: DFHZEV1, DFHZEV2, DFHZC4940

DFHZC4941  E  date time applid Bind time failure. LU6.2 profile locked. sense {(instance) Module name: (DFHZEV1 | DFHZEV2 | DFHZC4941)}

Explanation: The external security manager (ESM) has requested profile information during bind-time validation but the requested profile is locked. When a profile is locked no sessions can be established.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: Check the profiles defined to the ESM. The system administrator may have locked the profile. Request that the profile be unlocked. Try once more when the profile has been unlocked.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the System Programming Library RACF manual for further information.

Destination: CSNE

Modules: DFHZEV1, DFHZEV2, DFHZC4941

DFHZC4942  E  date time applid Bind time failure. Expired LU6.2 profile found. sense {(instance) Module name: (DFHZEV1 | DFHZEV2 | DFHZC4942)}

Explanation: The external security manager (ESM) has requested profile information during bind-time validation but the requested profile has expired.

For the meaning of the sense data, see the explanation on page 678.
System Action:  CICS rejects the bind.

User Response:  Check the profiles defined to the ESM.  The system administrator needs to update the required profile.  Request that the profile be updated.  Try once more when the profile has been updated.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the System Programming Library RACF manual for further information.

Destination:  CSNE

Modules:  DFHZEV1, DFHZEV2, DFHZOPN

XMEOUT Parameters:  date, time, applid, sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZEV1, 4=DFHZEV2}

DFHZC4943 E date time applid termid tranid RPL B FSM error. sense {=DFHZSDL)

Explanation:  The finite state machine (FSM), for the APPC alternate RPL (RPL 'B'), has detected an error in the use of the RPL.

For the meaning of the sense data, see the explanation on page 678.

System Action:  The task is abnormally terminated with abend code ATNI and a dump is produced.

User Response:  If this message occurs when VTAM is terminating, it is not a serious problem and usually no response is necessary.

If this message occurs during normal system execution, you will need further assistance from IBM.  See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CSNE

Module:  DFHZARER

XMEOUT Parameters:  date, time, applid, termid, tranid, sense, instance, {1=DFHZARER}

DFHZC4946 E date time applid termid tranid Invalid attach parameter was received. sense {=DFHZSUP)

Explanation:  A request to attach a task has been received across an APPC link.  However there is an error in the FMH attach parameters.  An attach parameter is present that is not authorized by the bind security indicators.

The sense data can take the following values:

Sense Meaning

1  The bind security indicators show that the connection is defined as ATTACHSEC(LOCAL) indicating that this LU does not accept any security parameters in an attach from the partner LU.  One or more of the following security parameters has been found: Userid, Password, Profile, AV, PV1 and PV2.

2  An already-verified (AV) indicator has been received in an attach from the partner LU, but the bind security indicators show that this LU does not support the receipt of the AV indicator.

3  A persistent verification signon (PV2) indicator, or a persistent verification signed-on (PV1) indicator, has been received in an attach from the partner LU, but the bind security indicators show that this LU does not support the receipt of the PV indicators.

System Action:  The task abends and a dump is produced and the session is unbound.  An exception trace point (number 1737) for component TF is issued, tracing the invalid attach header (FMH type 5).

User Response:  Investigate the cause of the error which is in the remote system.  Use the FMH5 in the exception trace to determine why the remote system sent an invalid attach request.

Destination:  CSNE

Module:  DFHZSUP

XMEOUT Parameters:  date, time, applid, termid, tranid, sense, instance, {1=DFHZSUP, 2=DFHZSUP, 3=DFHZSUP, 4=DFHZSUP, 5=DFHZSUP}

DFHZC4944 E date time applid termid tranid Protocol Violation detected within bind security indicators. sense {=DFHZBLX | DFHZOPX)

Explanation:  CICS has detected an error while validating the bind security specification.  LOCAL security has been specified, but the bind contains data that indicates NON LOCAL security.

For the meaning of the sense data, see the explanation on page 678.

System Action:  CICS rejects the bind.

User Response:  Ensure that the correct data is sent in the bind for the required type of security.

Destination:  CSMT

Modules:  DFHZSCX, DFHZOPX, DFHZBLX

XMEOUT Parameters:  date, time, applid, termid, tranid, sense, instance, {1=DFHZBLX, 2=DFHZBLX, 3=DFHZOPX, 4=DFHZOPX}
DFHZC4947 E date time applid termid tranid Attach time security check has failed. Security not valid. sense (instance) Module name: {DFHZGXA | DFHZSUP}

Explanation: A request to attach a task has been received over an APPC link. However the FMH5 attach parameters do not conform to the APPC protocol.

The instance data can take the following values:

Sense Meaning
1 Unrecognized access security subfield
2 Multiple userid access security subfields present
3 Multiple profile access security subfields present
4 Multiple password access security subfields present
5 Userid required in FMH but not received
6 PV1 and PV2 security indicators both present in FMH5
7 Password received when AV indicator set
8 Password received when PV1 indicator set
9 Password required for PV2 but not received.

System Action: The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued tracing the invalid attach header (FMH type 5).

User Response: Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace, to determine why the remote system sent an invalid attach request.

If the remote system has an earlier release of CICS or CICS on another platform and the sense value given is 5 then you may need to set USEDFLTUSER. See ‘Attach Time Security and the USEDFLTUSER option’ in chapter 12 of the CICS RACF Security Guide.

Destination: CSNE

Modules: DFHZSUP, DFHZGXA

XMEOUT Parameters: date, time, applid, termid, tranid, sense, instance, {1=DFHZSUP, 2=DFHZSUP, 3=DFHZSUP, 4=DFHZSUP, 5=DFHZSUP, 6=DFHZSUP, 7=DFHZSUP, 8=DFHZSUP, 9=DFHZSUP, 10=DFHZSUP, 11=DFHZSUP, 12=DFHZSUP, 13=DFHZSUP, 14=DFHZGXA, 15=DFHZGXA, 16=DFHZGXA, 17=DFHZGXA, 18=DFHZGXA, 19=DFHZGXA, 20=DFHZGXA, 21=DFHZGXA, 22=DFHZGXA, 23=DFHZGXA, 24=DFHZGXA, 25=DFHZGXA, 26=DFHZGXA, 27=DFHZGXA, 28=DFHZGXA, 29=DFHZGXA}

DFHZC4948 E date time applid termid tranid An error has been detected when processing an/unknown | inbound | outbound| request, | Persistent Verify Signoff request, | Persistent Verify Timeout request.) Transaction tranid is{continuing, | terminating, | terminating abnormally.} Error code: X’xx’ Connection: yyy

Explanation: An error has been detected during the execution of transaction CLS3. The error code indicates the nature of the error:

X’01’ Transaction CLS3 issued an unsuccessful communications request on an APPC session.
X’02’ Transaction CLS3 was started by a START command with data, but the format of the data was incorrect.
X’04’ Transaction CLS3 is attempting to send a signoff request to a remote system, but the connection to the remote system is not an APPC connection.

DFHZC4949 E date time applid termid tranid netname Receive Any stall – (data lost | response lost | command lost.) | CLSDST return code X’rc’ sense (instance) Module name: {DFHZRAC}

Explanation: All the CICS Receive Any RPLS have been posted but the TCTTE for each one is waiting for a response from a VTAM terminal or session. All the Receive Any RPLs have been stalled for 10 dispatches of the TCP task (CSTP). This message is produced for each session that is in this situation. A VTAM session has not responded to a command such as BID or SHUTD sent by CICS. This is typically caused by a protocol error.

System Action: CICS is running with system initialization parameter RAPOOL=(n,FORCE) causing CICS to issue a VTAM CLSDST against the session, which causes the TCTTE’s RPL to be completed and the session to be unbound.

The default NEP action is CLSDST, which causes CICS to clean up the TCTTE after the pending command has been terminated.
The Receive Any data received is discarded and the RA RPL is reissued.

**User Response:** Investigate the reason why the command has not completed. The TCTTE RPL is printed with the message.

It is important to look at any earlier DFHZC4949 messages because of the asynchronous nature of DFHZNAC. If the CLSDST has not completed, the RPL printed will be active and will show the RPL that can not complete. If the CLSDST has completed when DFHZNAC runs, the RPL printed will have a RTNCD/FDB2 of X'0C0B' but RPLREQ still shows what command would not complete.

If the CLSDST return code rc is non 0, the CLSDST macro has failed in DFHZRAC and the session remains hung. You may be able to free the session by using VTAM command V NET,INACT,ID=netname,l. You can find the reason for the CLSDST failure by looking at the RPL in the AP FC90 trace point for the CLSDST.

**Destination:** CSNE

**Module:** DFHZRAC

**XMEOUT Parameters:** date, time, applid, termid, tranid, netname, (1=data lost., 2=response lost., 3=command lost.), X’tc’, sense, instance, (1=DFHZRAC, 2=DFHZRAC, 3=DFHZRAC)

**Explanation:** An error has been detected during the execution of the Connection Quiesce Protocol transaction CQPO on session termid. Release of connection sysid is continuing. ((instance) Module name: (DFHZCLS))

**System Action:** The release of the connection continues, but the Release of connection completes only if the partner system successfully initiates it.

**User Response:** Determine why transaction CQPO failed to attach. If you have installed the correct definition for the transaction, you should never see this message, and you may need to contact your IBM Support Center for assistance.

If the partner system did not initiate the Connection Quiesce Protocol, you may need to determine if there are units of work awaiting resync, or VTAM affinities to be ended before you can INITIAL start either of the connected systems.

**Destination:** CSNE

**Module:** DFHZCLS

**XMEOUT Parameters:** date, time, applid, termid, sysid, instance, (1=DFHZCLS)

DFHZC4951 E date time applid An error has been detected when processing an [unknown | inbound | outbound] Connection Quiesce Protocol request. Transaction tranid is [continuing., terminating., terminating abnormally.]. Error code: X’xxxx’ Connection: yyyy

**Explanation:** An error has been detected during the execution of transaction tranid. The error code indicates the nature of the error:

X’01’ Transaction tranid was not started by terminal input, nor by an internal CICS command.

X’02’ Transaction tranid was started by an inbound FMH5, but the TPN was not the correct value for the Connection Quiesce Protocol.

X’03’ Transaction tranid issued an unsuccessful communications request on an APPC session.

X’04’ Transaction tranid has been attached by an inbound FMH5. The format of the data received from the remote system did not comply with the architecture for the Connection Quiesce Protocol.

X’05’ Transaction tranid has received an unexpected response from the Recovery Manager.

X’06’ Transaction tranid has been attached by an internal CICS command and has sent a Connection Quiesce Protocol request to the remote system. The format of the reply received from the remote system did not comply with the architecture for the Protocol.

X’07’ Transaction tranid was started, but its principal facility is not a terminal or session.

**System Action:** Depending upon the nature of the event that gave rise to the message, the transaction continues execution, terminates normally, or terminates abnormally. The message text indicates which action is being taken.

**User Response:** This depends upon the error code:

X’01, 02, 07’ Ensure that transaction tranid was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.

X’03’ Determine why the communications request on the APPC session failed. Possible reasons are:

- There has been a session failure.
- The connected transaction has abended.

This error produces an exception trace, which helps to determine the cause of the problem.

In other cases, contact your IBM Support Center.

**Destination:** CSNE

**Module:** DFHCLS5

**XMEOUT Parameters:** date, time, applid, (1= unknown, 2= inbound, 3= outbound), tranid, (1=continuing., 2=terminating., 3=terminating abnormally.), X’xxxx’, yyyy

**Explanation:** CICS has received definitions from remote system sysid, but cannot find a connection named cccc.

**System Action:** CICS continues.

**User Response:** If you want these definitions to be accepted, install the necessary connection using CEDA, and retransmit the definitions from the remote system.

**Destination:** CSMT

**Modules:** DFHBSTZ1, DFHBSTZ2

**XMEOUT Parameters:** date, time, applid, sysid, cccc
DFHZC5901 E date time applid Install for resource failed. xxxx could not obtain yyyy storage

Explanation: When installing resource resource, CICS module xxxx could not get storage for the extent specified by the value of yyyy.

System Action: CICS continues.

User Response: If possible, increase the size of your CICS address space. Otherwise, consider reducing the number of resources used in one CICS run.

Destination: CSMT

Modules: DFHBSMIR, DFHBSMPP, DFHBSM62, DFHBS6, DFHBSZM, DFHBSB3, DFHBSCT, DFHBSZB, DFHBSZ0, DFHBSZ1, DFHBSZ2, DFHBSZS

XMEOUT Parameters: date, time, applid, resource, xxxx, yyyy

DFHZC5902 E date time applid Deletion of terminal termid failed. BMS Paging session still active

Explanation: CICS cannot delete terminal termid because a BMS paging session is still active for the terminal.

System Action: CICS continues.

User Response: Sign on to terminal termid and purge the pages.

Destination: CSMT

Module: DFHBSB

XMEOUT Parameters: date, time, applid, termid

DFHZC5903 E date time applid Deletion of terminal termid failed. CICS logic error

Explanation: CICS cannot delete the terminal termid, because the CICS batch data attach function (DIP) is still active for this terminal.

System Action: CICS continues. A system dump is taken with dumpcode ZC5903. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT

Module: DFHBSB

XMEOUT Parameters: date, time, applid, termid

DFHZC5904 E date time applid Deletion of terminal termid failed. CEDF is still active

Explanation: CICS cannot delete the terminal termid because an EDF session is still active for this terminal.

System Action: CICS continues.

User Response: Deactivate EDF for the terminal, and reinstall the group.

Destination: CSMT

Module: DFHBSB

XMEOUT Parameters: date, time, applid, termid

DFHZC5905 E date time applid Deletion of terminal termid failed. CICS logic error

Explanation: CICS cannot delete terminal termid because the command level interface is still active for this terminal.

System Action: CICS continues. A system dump is taken with dumpcode ZC5905. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT

Module: DFHBSB

XMEOUT Parameters: date, time, applid, termid

DFHZC5906 E date time applid Install failed because ‘xxxx’ is not a permitted value for a terminal or connection name

Explanation: A name of hexadecimal zeros has been used for a TERMINAL or CONNECTION definition.

This is a reserved value. CICS has failed to install the terminal or connection.

xxxx is the reserved value converted to printable hexadecimal. The error has probably been made using autoinstall.

System Action: CICS continues.

User Response: Correct the definition to use a valid name and reinstall the group.

Destination: CSMT

Module: DFHBSB

XMEOUT Parameters: date, time, applid, xxxx

DFHZC5907 E date time applid Deletion of remote shipped terminal failed for connection cccc

Explanation: During the deletion of connection cccc, the connection was found to have shipped remote terminals. The deletion of one or more of these shipped remote terminals has failed.

System Action: CICS continues.

User Response: See message DFHZC5915 for further information.

Use CEMT to release the connection and put it OUT OF SERVICE, then retry the install of the connection.

Destination: CSMT

Module: DFHBSB

XMEOUT Parameters: date, time, applid, cccc

DFHZC5908 E date time applid Install for terminal termid failed. The security manager gave return code retcode

Explanation: CICS cannot install terminal termid. DFHXSMN gave the return code retcode.

System Action: CICS continues.

User Response: Check the value of the return code retcode in the CICS Customization Guide.

Destination: CSMT

Module: DFHBSB

XMEOUT Parameters: date, time, applid, termid
Chapter 1. DFH messages

DFHZC5909 E date time applid Install of resource resource failed. Call to DFHIRP irp_function did not succeed, See DFHIRSDS for return code.

**Explanation:** When installing resource resource, the CICS module DFHBSSZR made a call to an IR service irp_function which failed due to the specified return code.

**System Action:** CICS continues. The MR0 connection resource is not installed.

**User Response:** For an explanation of the return code, see DFHIRSDS in the CICS Data Areas manual.

Also see the user response section of message DFHIR3780. This gives a list of reasons why starting IRC can fail. However, some of the reasons are now also applicable when adding an IRC connection when cross memory is requested on the new connection but is not being used on any existing connection and when the CICS DB2 attachment has been initialized.

**Destination:** CSMT

**Module:** DFHBSSZR

**XMEOUT Parameters:**
- date, time, applid, resource, irp_function, Return_code

---

DFHZC5911 E date time applid Install for resource resource failed. Connection cccc not found

**Explanation:** CICS could not find the connection cccc associated with resource resource.

**System Action:** CICS continues.

**User Response:** Install connection cccc.

**Destination:** CSMT

**Module:** DFHBSSMR

**XMEOUT Parameters:**
- date, time, applid, resource, cccc

---

DFHZC5912 E date time applid Install for terminal termid failed. It is incompatible with connection cccc

**Explanation:** The terminal termid and the connection cccc are mutually incompatible.

**System Action:** CICS continues.

**User Response:** Modify your definition of termid or cccc.

**Destination:** CSMT

**Modules:** DFHBSTZ, DFHBSTZ2

**XMEOUT Parameters:**
- date, time, applid, termid, cccc

---

DFHZC5913 E date time applid Deletion of node id failed. [The table entry is locked. | A table entry was not found. | There was a logic error.] Table=tabname Key=key

**Explanation:** CICS cannot delete node id. The message explains the reason for the failure.

1. One of its TMP table entries is locked by other tasks.
2. A TMP table entry could not be found, possibly because the node was already deleted by another task.

3. There was a CICS logic error. A DFHTM0002 error message may have been issued as well.

The TMP table entry is identified by tabname. The key used in the table has a value key. The module that issued the message is identified by modname and the instance of the message in that module by inst.

**System Action:** The resource is not deleted. If the entry was locked, CICS issues one or more message DFHZC5980.

**User Response:** Choose the action which corresponds to the reason identified in the message:

1. See message DFHZC5980 for further information and guidance.
2. If the node is deleted, no action is needed. If the node exists, determine whether it was replaced while this request was running. If the entry exists and has not been replaced, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CSMT

**Modules:** DFHBSS, DFHBSSZ, DFHBSTZ, DFHBSTZ1, DFHBSTZ2, DFHBSTZV, DFHBSTZS, DFHBSTZZ

**XMEOUT Parameters:**
- date, time, applid, id, 
  - 1=A table entry is locked., 2=A table entry was not found., 3=There was a logic error., tabname, key, modname, inst

---

DFHZC5914 E date time applid Deletion of terminal termid found another deletion of it in progress

**Explanation:** CICS has failed to delete terminal termid because it is already marked as pending deletion.

It is likely that a CEDA user is installing this terminal.

**System Action:** CICS continues.

**User Response:** Check if a CEDA user is installing the terminal.

**Destination:** CSMT

**Modules:** DFHSBMR, DFHBSSMPP, DFHBSS, DFHBSTZ

**XMEOUT Parameters:**
- date, time, applid, termid

---

DFHZC5915 E date time applid Deletion of node id failed. [The node is still in service. | The system entry is still in service. | The node has a task attached.]

**Module:** (modname).

**Explanation:** CICS cannot delete node id. The reason is identified in the message.

1. The terminal or session is still in service.
2. The system entry of this session is still in service.
3. A task is still attached to this terminal or session.

The module issuing the message is identified as modname.

**System Action:** CICS continues and does not delete the node.

**User Response:** Before retrying the deletion or replacement, perform the action which corresponds to the reason given in the message.

1. Set the node OUT OF SERVICE
2. Set the system entry OUT OF SERVICE.
3. Wait for activity to cease for this node.

**Destination:** CSMT
DFHZC5916 E date time applid Deletion of terminal termid failed. It has pending DFHZCP activity

Explanation: CICS cannot delete resource termid because DFHZCP activity is pending for this terminal. The resource could be a session belonging to a connection or a terminal TCTTE.

System Action: CICS continues.

User Response: Use exception trace point AP FCDE to determine what sort of activity is pending.

If this indicates that the VTAM CLSDST command is in progress, VTAM could be trying to contact a nonexistent or unavailable resource (indicated by NETNAME in the CEDA definition for the resource). In this case, wait for a few minutes and retry the reinstall or discard. If you have access to the JOBLOG, message DFHZC3462 for the resource in question indicates that the CLSDST has finished.

If the resource is a terminal, put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT
Module: DFHBSTZA
XMEOUT Parameters: date, time, applid, termid

DFHZC5917 E date time applid Deletion of terminal termid failed. Error message writer still active

Explanation: CICS cannot delete terminal termid because the error message writer is still active for this terminal.

System Action: CICS continues.

User Response: Put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT
Module: DFHBSTZE
XMEOUT Parameters: date, time, applid, termid

DFHZC5918 E date time applid Deletion of terminal termid Console consname failed. It has pending DFHZCP activity.

Explanation: The MVS console consname has outstanding activity that prevents its deletion.

System Action: CICS continues.

User Response: After replying to any outstanding replies requested of this console, put the console briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT
Module: DFHBSTZ2
XMEOUT Parameters: date, time, applid, termid, consname

DFHZC5919 E date time applid Deletion of terminal termid failed. CICS logic error

Explanation: CICS cannot delete terminal termid because of an error in disconnecting remote terminals.

System Action: CICS continues. A system dump is taken with dumpcode ZC5919. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT
Module: DFHBSSZ
XMEOUT Parameters: date, time, applid, termid

DFHZC5920 E date time applid Install of terminal termid failed. CICS logic error

Explanation: This CICS system failed to install terminal termid. No terminals can be accepted yet because the system does not have a local system entry. There was probably a failure during CICS initialization.

System Action: CICS continues. A system dump is taken with dumpcode ZC5920. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT
Modules: DFHBSTZ, DFHBSTZ2
XMEOUT Parameters: date, time, applid, termid

DFHZC5921 E date time applid Install of terminal termid failed. VTAM support not loaded.

Explanation: CICS failed to install terminal termid because CICS was initialized without VTAM support.

System Action: CICS continues processing.

User Response: To use VTAM, shut down CICS and restart with the system initialization parameter VTAM=YES, a TCT assembled with ACCESSMETHOD=VTAM, and appropriate RDO terminal definitions.

Destination: CSMT
Module: DFHBSSZ
XMEOUT Parameters: date, time, applid, termid

DFHZC5923 E date time applid Install for terminal termid failed. CICS logic error

Explanation: CICS failed to install terminal termid because the bind-image was invalid.

System Action: CICS continues. A system dump is taken with dumpcode ZC5923. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT
DFHZC5924 E date time applid Install for terminal termid failed.
CICS logic error
Explanation: CICS failed to install terminal termid because the TCTTE contained no node information block (NIB) descriptor.
System Action: CICS continues. A system dump is taken with dumpcode ZC5924. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Module: DFHBSZZV
XMEOUT Parameters: date, time, applid, termid

DFHZC5925 E date time applid Deletion of connection cccc failed. Its AID-Chains are not empty
Explanation: CICS did not delete connection cccc because the AID-chains for the remote system cccc are not empty.
System Action: CICS continues.
User Response: Using the CEMT transaction, put the connection into service to allow the outstanding AIDs to be processed. Then take the connection out of service to allow deletion.
Destination: CSMT
Module: DFHBSSA
XMEOUT Parameters: date, time, applid, cccc

DFHZC5926 E date time applid Install for connection cccc failed. CICS logic error
Explanation: CICS did not install the connection cccc because DFHZCP received no DATASTREAM operand.
System Action: CICS continues. A system dump is taken with dumpcode ZC5926. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Module: DFHBSZZV
XMEOUT Parameters: date, time, applid, cccc

Chapter 1. DFH messages 755

DFHZC5927 E date time applid Install for connection cccc failed. CICS logic error
Explanation: CICS did not install the connection cccc because DFHZCP did not receive a RECORDFORMAT operand.
System Action: CICS continues. A system dump is taken with dumpcode ZC5927. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Module: DFHBSZZV
XMEOUT Parameters: date, time, applid, cccc

DFHZC5930 E date time applid Remote connection (sysid) could not be deleted because it was in use by number sessions.
Explanation: When remote connection sysid was being deleted, it was still in use by number sessions.
System Action: The resource is not deleted. CICS continues.
User Response: Wait until access to this remote connection has quiesced and then retry the deletion.
Destination: CSMT
Module: DFHBSTZ2
XMEOUT Parameters: date, time, applid, sysid, number

DFHZC5931 E date time applid Install for modename modename failed. Maximum number of APPC sessions would have been exceeded
Explanation: CICS did not install a SESSIONS definition using MODENAME modename because it would have exceeded the maximum number of permitted sessions.
System Action: CICS continues.
User Response: Either wait for the system to become less busy, or delete some APPC sessions.
Destination: CSMT
Module: DFHBSSS61
XMEOUT Parameters: date, time, applid, modename

DFHZC5932 E date time applid Install for modename modename failed. Connection cccc not found
Explanation: CICS did not install a SESSIONS definition using MODENAME modename because of an unknown name cccc in the CONNECTION parameter.
System Action: CICS continues.
User Response: Install connection cccc.
Destination: CSMT
Module: DFHBSS62
XMEOUT Parameters: date, time, applid, modename, cccc

DFHZC5933 E date time applid Install for modename modename failed. Connection cccc is not valid here
Explanation: CICS did not install a SESSIONS definition using MODENAME modename because the CONNECTION is not valid in this context.
System Action: CICS continues.
User Response: Modify your definition of remote system cccc.
Destination: CSMT
Module: DFHBSS62
XMEOUT Parameters: date, time, applid, modename, cccc
DFHZC5934 E date time applid Install for modename modename failed. Single-session connection cccc is already in use.

Explanation: CICS did not install a SESSIONS definition using MODENAME modename because the single-session CONNECTION cccc is already in use.

System Action: CICS continues.

User Response: Modify the definition of cccc.

Destination: CSMT

Modules: DFHBSM61, DFHBSM62

XMEOUT Parameters: date, time, applid, modename, cccc

DFHZC5936 E date time applid Install for modename modename failed. Connection cccc has active modegroup xxxx

Explanation: CICS has not installed a SESSIONS definition with MODENAME modename because the connection cccc already has an active MODEGROUP, xxxx.

System Action: CICS continues.

User Response: Modify the definition of cccc because an addition to a TMP table failed. CICS was trying to add the key key to the table tablename.

Destination: CSMT

Module: DFHBSM62

XMEOUT Parameters: date, time, applid, modename, cccc, xxxx

DFHZC5937 I date time applid Deletion of modename modename found another deletion of it in progress

Explanation: CICS has not deleted a SESSIONS definition with MODENAME modename because the definition is already pending deletion.

System Action: CICS continues.

User Response: Check if a CEDA user was installing the SESSIONS definition.

Destination: CSMT

Module: DFHBSM62

XMEOUT Parameters: date, time, applid, modename

DFHZC5938 E date time applid Deletion of modename modename failed. Unable to delete session(s)

Explanation: CICS is unable to delete a SESSIONS definition with MODENAME modename because of one or more errors reported in previous messages.

System Action: CICS continues.

User Response: Refer to any preceding messages for further information and guidance. Correct the reported errors.

Destination: CSMT

Module: DFHBSM61

XMEOUT Parameters: date, time, applid, modename

DFHZC5939 E date time applid Install for name failed. Duplicate session- or modegroup-name for connection sysid

Explanation: CICS is unable to install a session or modegroup as the session-name or modegroup-name name is duplicated. The duplicate might be another connection, session, modegroup or terminal. However it might also be the local connection which has the name specified by SYSIDNT in the system initialization table.

System Action: CICS continues processing, but the session or modegroup is not installed.

User Response: Change the duplicated session-name or modegroup-name.

Destination: CSMT

Modules: DFHBSTMIR, DFHBSM62

XMEOUT Parameters: date, time, applid, name, sysid

DFHZC5940 E date time applid Install for terminal termid failed. Error console cannot be deleted

Explanation: You have tried to replace the error console, CERR. CICS does not allow this.

System Action: CICS continues with original error console.

User Response: Note this restriction.

Destination: CSMT

Module: DFHZCQDL

XMEOUT Parameters: date, time, applid, termid

DFHZC5941 E date time applid Install for terminal termid failed. Console consname has a conversation outstanding

Explanation: CICS was unable to install terminal termid because the console consname has posted an ECB.

System Action: Processing continues.

User Response: Put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT

Module: DFHBSTZO

XMEOUT Parameters: date, time, applid, termid, consname

DFHZC5942 E date time applid Node nodeid was not installed.

The addition of key key to table tablename failed.

RC=X'return'. Module(modname).

Explanation: CICS cannot install the definition of node nodeid because an addition to a TMP table failed. CICS was trying to add the key key to the table tablename.

The return code from TMP is given in return. If the return code is 4, the entry was a duplicate. It is possible that another entry was added at the same time as this entry and used the same key. If this is not the case, CICS has suffered a logic error. The module that issued the message is indicated by modname.

System Action: CICS does not install the definition.

User Response: If the entry was not overlapped by another definition which conflicted with its key, or if the return code is not 4, you will need assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT
Chapter 1. DFH messages

DFHZC5943 E date time applid MRO connection conname could not be deleted because IRC is open.
Explanation: CICS cannot delete the connection conname because it is an MRO connection and interregion communication (IRC) is open.
System Action: The connection is not deleted.
User Response: Close the IRC definition and retry the Delete or Replace.
Destination: CSMT
Module: DFHBSS
XMEOUT Parameters: date, time, applid, conname

DFHZC5944 E date time applid Install for type(id) has failed. It would make a loop of connection definitions. Module(modname).
Explanation: CICS cannot install definition of type called id because it would make a loop of connection definitions. The connection type may be an indirect connection or a remote connection. Indirect connections point to other connections with the INDSYS field, and remote connections point to other connections with the REMOTESYSTEM field. The module that issued the message is identified by modname.
System Action: CICS does not install the definition.
User Response: Determine the source of the loop either in the already installed definitions or in this definition, and change it before attempting to reinstall this definition.
Destination: CSMT
Modules: DFHBSSZI, DFHBSTZ2
XMEOUT Parameters: date, time, applid, type, id, modname

DFHZC5945 E date time applid Deletion of sessions ssss failed. Connection cccc is defined to IRC
Explanation: CICS has not deleted the SESSIONS definition, ssss, because the CONNECTION specified is not suitable for IRC.
System Action: CICS continues.
User Response: Issue a CEMT SET IRC CLOSED command.
Destination: CSMT
Module: DFHBSTZ2
XMEOUT Parameters: date, time, applid, ssss, cccc

DFHZC5946 E date time applid Install for sessions ssss failed. Connection cccc is defined to IRC
Explanation: CICS has not installed the SESSIONS definition, ssss, because the CONNECTION name is not specified.
System Action: CICS returns.
User Response: Modify your definition of cccc.
Destination: CSMT
Modules: DFHBSTZ2, DFHBSTZ1, DFHBSTZ2
XMEOUT Parameters: date, time, applid, ssss

DFHZC5947 E date time applid Install for terminal termid failed. Console consname already exists
Explanation: CICS has not installed the CONSOLE definition termid because the console ID, consname, already exists.
System Action: CICS continues without installing the terminal.
User Response: Use the CEDA transaction to define a different console ID and reinstall the terminal.
Destination: CSMT
Modules: DFHBSS, DFHBSTZ, DFHBSTZO
XMEOUT Parameters: date, time, applid, termid, consname
DFHZC5951  E  date time applid Deletion of connection ssss failed. Unable to delete sessions
Explanation:  CICS has not deleted the CONNECTION definition, ssss, because it cannot delete one or more sessions. A preceding message or messages should explain this failure.
System Action:  CICS continues.
User Response:  Refer to the preceding message for further information and guidance.
Destination:  CSMT
Modules:  DFHBSSZR, DFHBSSZ6
XMEOUT Parameters:  date, time, applid, ssss

DFHZC5952  E  date time applid Deletion of terminal termid failed. It needs to be SET RELEASED
Explanation:  CICS cannot delete terminal termid because of its current state.
System Action:  CICS continues.
User Response:  Use the CEMT transaction to set terminal termid released and out of service.
Destination:  CSMT
Module:  DFHBSTZV
XMEOUT Parameters:  date, time, applid, termid

DFHZC5953  E  date time applid CICS logic error
Explanation:  An object being installed did not have a bind-image.
System Action:  CICS continues. A system dump is taken with dumpcode ZC5953. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response:  You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination:  CSMT
Module:  DFHBSSZL
XMEOUT Parameters:  date, time, applid

DFHZC5954  E  date time applid Install for resource resource failed. Unable to install sessions component
Explanation:  CICS has failed to install resource resource. Previous message(s) should give the reason for the failure.
System Action:  CICS continues.
User Response:  Refer to any preceding messages for further information and guidance.
Destination:  CSMT
Module:  DFHBSTZC
XMEOUT Parameters:  date, time, applid, resource

DFHZC5955  E  date time applid Arch. User-Data ID X’xx occurs in bind. CICS logic error
Explanation:  The APPC SESSIONS object being installed is invalid because architected user-data IDs greater than X’02’ occur in bind.
System Action:  CICS does not install the object. A system dump is taken with dumpcode ZC5955. Message DFHME0116 is normally produced containing the symptom string for this problem. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
User Response:  Destination:  CSMT
Module:  DFHBSSZL
XMEOUT Parameters:  date, time, applid, xx

DFHZC5956  E  date time applid Install for resource resource failed. Modename parameter not found
Explanation:  CICS has failed to install resource resource because the MODENAME parameter is missing.
System Action:  CICS continues.
User Response:  Supply the missing parameter.
Destination:  CSMT
Module: DFHBSTZS
XMEOUT Parameters: date, time, applid, resource

DFHZC5963 E date time applid operation RUSIZE xxxx from
terminal termid was greater than TYPETERM
RUSIZE yyyy.

Explanation: An autoinstall has been attempted with terminal
termid that has a VTAM RECEIVESIZE greater than the
corresponding TYPETERM RECEIVESIZE|SENDSIZE.

System Action: CICS continues. The autoinstall is rejected.

User Response: Increase the TYPETERM RECEIVESIZE or the
TYPETERM SENDSIZE, OR decrease the RECEIVESIZEs in the
VTAM LOGMODE table.

Destination: CSMT
Module: DFHBSZSV
XMEOUT Parameters: date, time, applid, operation, xxxx, termid,
yyyy

DFHZC5964 E date time applid INSTALL for sessions ssss failed.
CICS logic error.

Explanation: CICS has failed to install SESSIONS ssss because
the length of the BINDPASSWORD exceeds the limit of 8.

System Action: CICS continues. A system dump is taken with
dumpcode ZC5964. Message DFHME0116 is normally produced
containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve
this problem. See Part 4 of the CICS Problem Determination
Guide for guidance on how to proceed.

Destination: CSMT
Module: DFHBSSZS
XMEOUT Parameters: date, time, applid, ssss

DFHZC5965 date time applid DELETE for pool poolid failed.
Terminal termid was being replaced at the same
time.

Explanation: CICS failed in an attempt to install or delete POOL
definition poolid. A terminal termid in the pool was being deleted at
the same time as the pool was being installed or deleted. This
probably due to changing the terminal from a pooled terminal to a
non-pooled terminal, or changing the pool name for a terminal in the
same group. CICS cannot continue to modify the pool until the
change to the terminal has completed.

System Action: CICS continues.

User Response: Once the deletion or modification of the terminal
has succeeded, retry the installation.

Destination: CADL
Module: DFHBSMPP
XMEOUT Parameters: date, time, applid, poolid, termid

DFHZC5966 I date time applid INSTALL | DELETE | RESTORE
started for resource (termid) (Module name: modname).

Explanation: CICS is starting to install, delete or restore resource.
The resource may be either a terminal, a connection, a modegroup,
as a session, or a pool_entry. Other messages are issued after this
one if this installation, deletion or restoration fails.

System Action: CICS continues.

User Response: None.

Destination: CADL
Modules: DFHBSTZ, DFHBSMPP, DFHBSSZS, DFHBSMIR
XMEOUT Parameters: date, time, applid, {1=INSTALL,
2=DELETE, 3=RESTORE}, resource, termid, modname

DFHZC5967 E date time applid Install for modname modname
failed. Unable to install sessions

Explanation: CICS has failed to install a SESSIONS definition
using MODENAME modname. Previous message(s) should give
the reason for the failure.

System Action: CICS continues.

User Response: Refer to the preceding message for further
information and guidance.

Destination: CSMT
Module: DFHBSSM61
XMEOUT Parameters: date, time, applid, modname

DFHZC5968 E date time applid Unable to install LU Services
Manager for modname modname

Explanation: CICS has failed to install a CONNECTION definition
for MODEGROUP modname. Previous message(s) should give
the reason for the failure.

System Action: CICS continues.

User Response: Refer to any preceding messages for further
information and guidance.

Destination: CSMT
Module: DFHBSSZP
XMEOUT Parameters: date, time, applid, modname

DFHZC5969 E date time applid Deletion of dependent
modname(s) failed for connection modname

Explanation: CICS has failed to replace a CONNECTION
definition for MODEGROUP modname. Previous message(s)
should give the reason for the failure.

System Action: CICS continues.

User Response: Refer to any preceding messages for further
information and guidance.

Destination: CSMT
Module: DFHBSSZS
XMEOUT Parameters: date, time, applid, modname
DFHZC5971  E  date time applid  Delete of resource resource failed.
CICS logic error

Explanation:  CICS failed to delete resource resource because of an unexpected signon state during the destroy operation.

System Action:  CICS continues.  A system dump is taken with dumpcode ZC5971.  Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response:  You need further assistance from IBM to resolve this problem.  See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CSMT
Module:  DFHBSTS
XMEOUT Parameters:  date, time, applid, resource

DFHZC5972  E  date time applid  Delete of resource resource failed.
   It is still signed on

Explanation:  CICS failed to delete a TERMINAL or SESSIONS resource resource because a terminal or session is still signed on.

System Action:  CICS continues.

User Response:  Run the signoff transaction CESF and retry.

Destination:  CSMT
Module:  DFHBSTS
XMEOUT Parameters:  date, time, applid, resource

DFHZC5973  E  date time applid  Install for sessions ssss failed.
   Max session-count reached for modename modename

Explanation:  CICS failed to install a SESSIONS definition ssss because the maximum session-count was reached for MODENAME modename.

System Action:  CICS continues.

User Response:  Delete some sessions in modename, or redefine modename with a higher maximum session-count.

Destination:  CSMT
Module:  DFHBSTZS
XMEOUT Parameters:  date, time, applid, ssss, modename

DFHZC5974  E  date time applid  Deletion of pool pppp failed.
   Unable to delete pool entries

Explanation:  CICS failed to delete a POOL pppp.  Previous messages(s) should explain the cause of this failure.

System Action:  CICS continues.

User Response:  Refer to any previous messages for further guidance and information.

Destination:  CSMT
Module:  DFHBSMPP
XMEOUT Parameters:  date, time, applid, pppp

DFHZC5975  E  date time applid  Install for resource pppp failed.
CICS logic error

Explanation:  CICS failed to install the POOL definition pppp because the required POOLID parameter was missing.  This is a CICS logic error (probably in DFHTRZPP).

System Action:  CICS continues.  A system dump is taken with dumpcode ZC5975.  Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response:  You need further assistance from IBM to resolve this problem.  See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CSMT
Modules:  DFHBSMPP, DFHBSTZP
XMEOUT Parameters:  date, time, applid, pppp

DFHZC5976  E  date time applid  CICS logic error

Explanation:  CICS failed to install a POOL definition because the required POOLCNT parameter was missing.  This is a CICS logic error (probably in DFHTRZPP).

System Action:  CICS continues.  A system dump is taken with dumpcode ZC5976.  Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response:  You need further assistance from IBM to resolve this problem.  See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CSMT
Module:  DFHBSMPP
XMEOUT Parameters:  date, time, applid

DFHZC5977  E  date time applid  Failure building pool entries

Explanation:  CICS failed to install a POOL definition, because of a failure in building pool entries.  Previous messages should explain the cause of this failure.

System Action:  CICS continues.

User Response:  Refer to any previous messages for further information and guidance.

Destination:  CSMT
Module:  DFHBSMPP
XMEOUT Parameters:  date, time, applid

DFHZC5978  E  date time applid  Unable to replace pool pppp

Explanation:  CICS failed in an attempt to install or delete a POOL definition.  Previous messages should explain the cause of this failure.

System Action:  CICS continues.

User Response:  Refer to previous messages for further information and guidance.

Destination:  CSMT
Module:  DFHBSMPP
XMEOUT Parameters:  date, time, applid, pppp
DFHZC5979 E date time applid Deletion of pool pppp failed. It still has session termid

Explanation: CICS has failed to delete pool pppp because the pool still has an active session for terminal termid.

System Action: CICS continues.

User Response: Put the terminal out of service (using the CEMT transaction) and retry.

Destination: CSMT

Module: DFHBSTZP

XMEOUT Parameters: date, time, applid, pppp, termid

DFHZC5980 E date time applid Resource resource is in use by task taskid Transaction tranid

Explanation: The resource resource is in use. taskid is the task number, and tranid is the transaction ID.

System Action: CICS continues.

User Response: Wait for the termination of task taskid, and retry the operation.

Destination: CSMT

Modules: DFHBSS, DFHBSSZ, DFHBSTZ, DFHBSTZ1, DFHBSTZ2, DFHBSTZ2V

XMEOUT Parameters: date, time, applid, resource, taskid, tranid

DFHZC5981 E date time applid Pool pppp not found

Explanation: CICS has failed to install a resource because POOL pppp does not exist. Previous messages should explain the cause of this failure.

System Action: CICS continues.

User Response: Refer to the previous messages for further information and guidance.

Destination: CSMT

Module: DFHBSTZP

XMEOUT Parameters: date, time, applid, pppp

DFHZC5982 E date time applid Deletion of pool pppp failed. Pool entry is in use for termid

Explanation: CICS has failed to delete POOL pppp because the pool still has an entry in use for terminal termid.

System Action: CICS continues.

User Response: Put the terminal out of service (using the CEMT transaction) and retry.

Destination: CSMT

Module: DFHBSSMPP

XMEOUT Parameters: date, time, applid, pppp, termid

DFHZC5983 E date time applid Unable to replace resource

Explanation: CICS failed to install resource resource either because it already exists, or for reasons explained in previous messages.

Possible causes are:
- Non-VTAM and VTAM terminals defined with the same name. If a non-VTAM terminal is installed, CICS will not autoinstall a VTAM terminal with the same name.
- An attempt to replace your own terminal, or a terminal with the same name as the terminal being used to issue the CEDA command.
- An attempt to replace a terminal with the same REMOTENAME and REMOTESYSTEM as an earlier definition in the same group.

System Action: CICS continues.

User Response: Refer to previous messages for further information and guidance.

If no previous messages were issued, check your terminal identifiers.

Destination: CSMT

Modules: DFHBSS, DFHBSTZ, DFHBSS2, DFHBSTZ1, DFHBSTZ2, DFHBSTZ2

XMEOUT Parameters: date, time, applid, resource

DFHZC5984 E date time applid The installation or deletion of restype1 resname1 has failed. Task taskname taskid is updating related system definition sysname. Module modname.

Explanation: The installation or deletion of the communications resource, resname1 of resource type restype1 has failed. This resource refers to a system entry, sysname, which is being updated by another task. The other task is identified by taskname and taskid. The resource type restype1 can be terminal, remote terminal, connection, remote connection, or indirect connection. The message is issued by module modname.

System Action: CICS continues but reverses the effects of the installation or deletion.

User Response: Wait until the other task has completed then retry the action.

Destination: CSMT

Modules: DFHBSTZ, DFHBSTZ1, DFHBSTZ2, DFHBSSZI

XMEOUT Parameters: date, time, applid, restype1, resname1, taskname, taskid, sysname, modname

DFHZC5985 E date time applid Install for resource resource failed. Unable to install connection component

Explanation: CICS has failed to install resource resource. Previous message(s) should give the reason for the failure.

System Action: CICS continues.

User Response: Refer to previous messages for further information and guidance.

Destination: CSMT

Module: DFHBSTZC

XMEOUT Parameters: date, time, applid, resource
DFHZC5986 E date time applid CICS logic error

Explanation: Either the warm keypoint program (DFHWKP), or the query transaction (DFHQR), made an invalid request which could not be implemented.

System Action: CICS continues. A system dump is taken with dumpcode ZC5986. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT
Module: DFHZCQCH
XMEOUT Parameters: date, time, applid

DFHZC5987 E date time applid The install or delete of restype1 resname1 has failed. Task taskname taskid is changing a definition which uses the restype2 resname2. Module modname.

Explanation: The installation or deletion of communications resource resname1 of resource type restype1 has failed. Table builder services cannot complete the change because another task is updating a definition which uses the resource resname2 of resource type restype2. The other task is identified by taskid and taskname. Restype2 can be a termid, netname, a unique network-qualified ID, or a pipeline terminal pool_name Restype1 can be a terminal, a session, a remote terminal, a connection, a remote connection, or a pipeline terminal. The message was issued by module modname.

System Action: CICS continues but reverses this install or delete.

User Response: Wait until the other task has completed and then retry the action.

Destination: CSMT
Modules: DFHBSS, DFHBSTZ, DFHBSTZS, DFHBSTZV, DFHBSTZZ, DFHBSTZ1, DFHBSTZ2, DFHBSMP, DFHBSTZP
XMEOUT Parameters: date, time, applid, restype1, resname1, taskname, taskid, restype2, resname2, modname

DFHZC5988 E date time applid Install for resource resource failed. VTAM support not generated

Explanation: CICS failed to install resource resource because CICS was initialized without VTAM support.

System Action: CICS continues.

User Response: If you want to install VTAM resources urgently, shut down CICS, and restart it with the system initialization parameter ACCESSMETHOD=VTAM, and appropriate TCT or RDO terminal definitions.

Destination: CSMT
Modules: DFHBSSZ, DFHBSSZ6, DFHBSTZV
XMEOUT Parameters: date, time, applid, resource

DFHZC5989 E date time applid Deletion of resource resource failed. Remote deletion in connection cccc failed

Explanation: CICS failed to delete resource resource because a remote delete in system cccc failed.

Previous messages should explain the cause of this failure.

System Action: CICS continues.

User Response: Refer to the previous message for further information and guidance.

Destination: CSMT
Modules: DFHBSTZ1, DFHBSTZ2
XMEOUT Parameters: date, time, applid, resource, cccc

DFHZC5990 E date time applid CICS logic error

Explanation: CICS rejected an INSTALL or DELETE request because it does not recognize the request code.

System Action: CICS continues. A system dump is taken with dumpcode ZC5990. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT
Module: DFHZCQ00
XMEOUT Parameters: date, time, applid

DFHZC5991 E date time applid CICS logic error

Explanation: CICS rejected a VALIDATE BIND request because no BIND was supplied.

System Action: CICS continues. A system dump is taken with dumpcode ZC5991. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT
Module: DFHZCQ00
XMEOUT Parameters: date, time, applid

DFHZC5992 E date time applid Resource Types Table does not support recovery record

Explanation: CICS rejected a RESTORE request because the resource types table (DFHZCQRT) in DFHZCQ is incompatible with the recovery record from the log or CICS catalog.

System Action: CICS continues. A system dump is taken with dumpcode ZC5992. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: CICS is unable to warm start correctly. You should therefore shut CICS down and perform a cold or initial start.

Destination: CSMT
Module: DFHZCQRS
XMEOUT Parameters: date, time, applid
DFHZC5993 E date time applid CICS logic error
Explanation: CICS rejected a RESTORE request because the recovery record from the log or CICS catalog is incompatible with the request.
System Action: CICS continues. A system dump is taken with dumpcode ZCS993. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Module: DFHZCQRS
XMEOUT Parameters: date, time, applid

DFHZC5994 E date time applid CICS logic error
Explanation: CICS rejected a RESTORE request because no recovery record was passed.
System Action: CICS continues. A system dump is taken with dumpcode ZCS994. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Module: DFHZCQRS
XMEOUT Parameters: date, time, applid

DFHZC5995 E date time applid CICS logic error. Resource Type Code xxxx Subtype yyyy not recognized with associated bind image
Explanation: CICS failed to install or update a resource with resource type code (RTC) xxxx and subtype yyyy because a resource with type code xxxx, sub-type yyyy, and the associated BIND-image, is not a builder resource type. The RTC and subtype are defined in module DFHZCQRT. This is a CICS logic error (probably in DFHTRZxP).
System Action: CICS continues. A system dump is taken with dumpcode ZCS995. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Module: DFHZCQIS
XMEOUT Parameters: date, time, applid, xxxx, yyyy

DFHZC5996 E date time applid CICS logic error
Explanation: CICS has rejected an INSTALL request because the resource type code in the request is zero.
System Action: CICS continues. A system dump is taken with dumpcode ZCS996. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT

DFHZC5997 E date time applid CICS logic error
Explanation: CICS has rejected an INQUIRE request because no TCT entry was passed.
System Action: CICS continues. A system dump is taken with dumpcode ZCS997. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Module: DFHZCQIQ
XMEOUT Parameters: date, time, applid

DFHZC5998 E date time applid Install specified a resource that cannot be replaced
Explanation: CICS rejected a DELETE request because the entry passed is of a type that cannot be deleted, for example, a non-VTAM terminal.
System Action: CICS continues.
User Response: The failing delete/replace was necessitated by an INSTALL request. Correct the resource type in that request.
Destination: CSMT
Modules: DFHZCQCH, DFHZCQDL
XMEOUT Parameters: date, time, applid

DFHZC5999 E date time applid CICS logic error
Explanation: If DFHZCQCH issues this message, CICS has rejected a CATALOG request because the required entry parameter was not passed.
If DFHZCQDL issues this message, CICS has rejected a DELETE request because the required entry parameter was not passed.
System Action: CICS continues. A system dump is taken with dumpcode ZCS999. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Module: DFHZCQCH, DFHZCQDL
XMEOUT Parameters: date, time, applid

DFHZC6201 E applid CICS table builder services has detected a severe error in module modname code X'code'.
Explanation: While executing a request, CICS table builder services detected a severe error. The error is identified by the error code code and the module modname.
System Action: CICS rejects the request and takes a dump. CICS writes an exception trace record identified by code, then issues message DFHZC6208 either to the user of the CEDA transaction, or if the request did not originate from CEDA, to the CSMT transient data queue.
DFHZC6202  E date time applid Pattern pattern not valid for builder
Explanation: While executing a request, CICS table builder services has detected that the pattern pattern cites a builder that is not declared with DFHBSHDR(ENTRY). pattern is the name of the pattern as coded in the DFHBSPTE macro.
System Action: CICS rejects the request. A system dump is taken with dumpcode ZC6202. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Modules: DFHTBSBP, DFHTBSD
XMEOUT Parameters: date, time, applid, pattern

DFHZC6204  E date time applid Illegal subpattern definition pattern
Explanation: While executing a request, CICS table builder services has detected that the subpattern pattern is invalidly defined. pattern is the name of the subpattern as coded in the DFHBSPTE macro.
System Action: CICS rejects the request. A system dump is taken with dumpcode ZC6204. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Modules: DFHTBSBP, DFHTBSD
XMEOUT Parameters: date, time, applid, pattern

DFHZC6205  E date time applid Illegal subpattern definition pattern
Explanation: While executing a request, CICS table builder services has detected that the subpattern pattern is invalidly defined. pattern is the name of the subpattern as coded in the DFHBSPTE macro.
System Action: CICS rejects the request. A system dump is taken with dumpcode ZC6205. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Modules: DFHTBSBP, DFHTBSD
XMEOUT Parameters: date, time, applid, pattern

DFHZC6206  E date time applid Pattern pattern not valid for destroy
Explanation: While executing a DESTROY request, CICS table builder services has detected that the pattern pattern is not valid for a DESTROY request. pattern is the name of the pattern as coded in the DFHBSPTE macro.
System Action: CICS rejects the request. A system dump is taken with dumpcode ZC6206. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Module: DFHTBSD
XMEOUT Parameters: date, time, applid, pattern

DFHZC6207  E date time applid Catalog key too long or zero. Pattern pattern
Explanation: While executing a request, CICS table builder services has detected that builder cited in the pattern pattern has returned an invalid CC key on MAKEKEY. pattern is the name of the pattern as coded in the DFHBSPTE macro.
System Action: CICS rejects the request. A system dump is taken with dumpcode ZC6207. Message DFHME0116 is normally produced containing the symptom string for this problem.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Modules: DFHTBSBP, DFHTBSD, DFHTBSL
XMEOUT Parameters: date, time, applid, pattern

DFHZC6208  E date time applid CICS table builder services has detected a severe error in module modname, code(X’code’).
Explanation: While executing a request, CICS table builder services detected a severe error. The error is identified by the error code code and the module modname.
System Action: CICS rejects the request. It has already issued message DFHZC6201, written an exception trace record identified by code, and taken a dump.
User Response: This failure indicates either an error in CICS, or a storage overlay. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Modules: DFHTBSB, DFHTBSD, DFHTBSBP, DFHTBSDP, DFHTBSL, DFHTBSLP, DFHTBS
XMEOUT Parameters: date, time, applid, modname, X’code’
DFHZC6209 E date time applid Invalid ZC catalog request code xxx

**Explanation:** While executing a request, CICS table builder services has detected that the code, xxx, for a catalog request is invalid.

**System Action:** CICS rejects the request. A system dump is taken with dumpcode ZC6209. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CSMT

**Module:** DFHTBSL

**XMEOUT Parameters:** date, time, applid, xxx

DFHZC6210 E date time applid Table builder could not obtain storage for control block code X'code', module modname.

**Explanation:** While executing a BUILD, a DESTROY or a RESTORE request, CICS table builder services could not obtain storage for a control block. The control block could be a RRAB, a RABN, an action_block, a recovery record, or a recovery segment. The error code code identifies the element that could not be obtained by the module modname.

**System Action:** CICS rejects the request. It has already written an exception trace record identified by code.

**User Response:** This failure may be a symptom of a expanded dynamic storage area (EDSA) that is too small. If so, you can solve the problem by increasing the size of your CICS region. For guidance on estimating the size of the DSA and the CICS region, see the CICS System Definition Guide and the CICS Performance Guide. You can identify which control block that could not be obtained by formatting the exception trace record.

The failure may also be caused by an error in another transaction, for example, a looping program with an EXEC CICS GETMAIN within the loop.

**Destination:** CSMT

**Modules:** DFHTBSB, DFHTBSD, DFHTBSL, DFHTBSBP, DFHTBSDP, DFHTBSLP, DFHTBSS

**XMEOUT Parameters:** date, time, applid, X’code’, modname

DFHZC6212 E date time applid Level mismatch with catalog record. DFHBS xxx

**Explanation:** While executing a request during a warm or emergency start, CICS Table Builder Services has detected that the CC record is not compatible with the pattern it names. xxx is the builder ID.

**System Action:** CICS rejects the request.

**User Response:** The CC record was probably written by an earlier level of CICS. That is, you have applied one or more PTF maintenance fixes to the system since the CC record was written. Assuming this is the case, you must either:

- Cold or initial start CICS, or
- Remove the maintenance to enable a warm start or emergency restart.

**Destination:** CSMT

**Module:** DFHTBSB

**XMEOUT Parameters:** date, time, applid, X’code’, modname

DFHZC6213 E date time applid Recovery record abandoned. Key is key

**Explanation:** While processing a RESTORE request, CICS Table Builder Services detected an error reported in a previous message. key is the catalog key for the abandoned record, or, if the key is unknown to CICS, key is the single character ?.

**System Action:** See the previously issued message for the cause of the problem, and follow the recommended user action.

**Destination:** CSMT

**Module:** DFHTBSR

**XMEOUT Parameters:** date, time, applid, key

DFHZC6214 E date time applid Unable to obtain recovery record storage

**Explanation:** While processing a CATALOG request, CICS Table Builder Services could not obtain recovery record storage.

**System Action:** CICS rejects the request.

**User Response:** This failure may be a symptom of a dynamic storage area (DSA) that is too small. If so, you can solve the problem by increasing the size of your CICS region. For advice on estimating the size of the DSA and the CICS region, see the CICS System Definition Guide and the CICS Performance Guide. The failure may also be caused by an error in another transaction, for example, a looping program with an EXEC CICS GETMAIN within the loop.

**Destination:** CSMT

**Module:** DFHTBSLP

**XMEOUT Parameters:** date, time, applid

DFHZC6216 E date time applid Install for restype1 (resname1) failed and caused the backout of the whole set of RDO resources for restype2 (resname2).

**Explanation:** The RDO definition for a resource of type restype1 named resname1 could not be installed because of an error. This causes the installable set of RDO definitions associated with restype2 named resname2 to be backed out.

The resource type of the definition that failed restype1 can be connection, session, modgroup, pool, or pooled terminal. The resource type of the associated definition restype2 can be connection, or a pool_name for pipeline terminals.

**System Action:** CICS backs out the installation of the set of associated RDO definitions and continues without them.

**User Response:** Correct the reason for the failure of the definition, identified by previous DFHZXnnnn messages, and then retry the install.

**Destination:** CSMT

**Module:** DFHTBSB

**XMEOUT Parameters:** date, time, applid, restype1, resname1, restype2, resname2
DFHZC6301  E date time applid Install for tttt failed. Duplicate netname netname for resource rrrr found.

Explanation: A resource tttt was being installed but was found to have the same network name netname as resource rrrr.

System Action: The resource is not installed, CICS continues.

User Response: If you want the definitions to be installed, use CEDA to correct the network name and reinstall the definition.

Destination: CSMT
Module: DFHBSTZV
XMEOUT Parameters: date, time, applid, tttt, netname, rrrr

DFHZC6302  E date time applid Install for connection cccc failed. Duplicate netname netname for resource rrrr found.

Explanation: A connection cccc was being installed but was found to have the same network name netname as resource rrrr.

System Action: The resource is not installed, CICS continues.

User Response: You cannot have an APPC connection with the same network name as another APPC connection or an LU6.1 connection. That is, you cannot have more than one APPC connection between two systems and an APPC connection cannot be installed with an LU6.1 connection between two systems. Neither APPC or LU6.1 network names can be the same as a terminal's network name.

Also you cannot have an IRC (or XM) connection with the same network name as another IRC (or XM) connection. However, an IRC network name can be the same as any VTAM network name (APPC or LU61 connection or terminal).

If you want the definitions to be installed, use CEDA to correct the network name and then reinstall the definition.

If you need to replace a connection with a different network name, it must have the same connection name as the one you are replacing.

Destination: CSMT
Module: DFHBSS
XMEOUT Parameters: date, time, applid, cccc, netname, rrrr

DFHZC6303  E date time applid Install for tttt failed. Duplicate netname netname found.

Explanation: A resource tttt was being installed but was found to have a duplicate network name netname.

This message occurs:
- If the duplicate NETNAME occurred in the same group as this definition, or
- If two CEDA transactions were run at the same time and the other CEDA transaction added a NETNAME between the BUILD and CONNECT routines of DFHBSTZV.

System Action: The resource is not installed; CICS continues.

User Response: If you want the definitions to be installed, use CEDA to correct the network name and then reinstall the definition.

Destination: CSMT
Module: DFHBSTZV

DFHZC6304  W date time applid Deletion of remote terminal termid failed because it is in use by another transaction.

Explanation: CICS has issued a logoff transaction to the remote terminal termid but this terminal cannot be deleted because it is in use by another transaction.

System Action: The remote terminal can be reused. CICS continues.

User Response: This situation usually occurs because the remote CICS is under stress. Consider allocating more resources. For example, you might need to allocate more storage.

Destination: CSMT
Module: DFHBSTZ
XMEOUT Parameters: date, time, applid, termid

DFHZC6305  E date time applid Install for EXCI generic connection cccc failed. Duplicate EXCI generic connection rrrr found.

Explanation: A connection cccc specifying protocol(exci) and conntype(generic) was being installed but an existing EXCI generic connection rrrr was found.

System Action: The resource is not installed. CICS continues.

User Response: There can be only one EXCI generic connection installed in a CICS system. Determine which EXCI generic connection definition is required and remove the duplicate definition.

If you need to replace the EXCI generic connection definition, it must have the same connection name as the one you are replacing.

Destination: CSMT
Module: DFHBSS
XMEOUT Parameters: date, time, applid, cccc, rrrr

DFHZC6307  E date time applid Install for connection cccc failed. Netname netname is the same as the generic resource name.

Explanation: A connection cccc was being installed but the netname netname is the same as the generic resource name for this CICS (as defined in the SIT GRNAME parameter).

Communication within a SYSPLEX (intra-plex) must be done using member names.

System Action: The resource is not installed, CICS continues.

User Response: If this connection is for communication within a sysplex, use CEDA to change the NETNAME to the member name of the connection with which you wish to communicate.

If this is for communication between two sysplexes, change the NETNAME to the generic resource name of the partner sysplex.

Destination: CSMT
Module: DFHBSS
XMEOUT Parameters: date, time, applid, cccc, netname
DFHZC6308  E date time applid Restore for connection cccc failed. Netname netname is the same as the generic resource name.

Explanation: During an emergency or warm restart CICS tried to restore connection cccc. However its netname netname is the same as the generic resource name for this CICS (as defined in the GRNAME system initialization parameter).

This is probably because the GRNAME specified in the SIT has been changed. It should only be changed at INITIAL start time.

System Action: Processing continues. The resource is not installed.

User Response: If this connection is for communication within a sysplex, use CEDA to change the NETNAME to the member name of the connection with which you wish to communicate.

If this is for communication between two sysplexes, change the NETNAME to the generic resource name of the partner sysplex.

If you need to change the GRNAME parameter, remember to do so only during an INITIAL start.

Destination: CSMT
Module: DFHBSS
XMEOUT Parameters: date, time, applid, cccc, netname

DFHZC6310  E date time applid Install for terminal termid failed. Console consname must be defined by ID not name.

Explanation: CICS has not installed the CONSOLE definition termid because the console consname is defined by name. The console must be defined by ID, as CICS is running under a release of MVS that does not support console names.

System Action: CICS continues without installing the terminal.

User Response: Use the CEDA transaction to define the console by ID and reinstall the terminal.

Destination: CSMT
Module: DFHBSTZO
XMEOUT Parameters: date, time, applid, termid, consname

DFHZC6311  E date time applid Install for terminal termid failed. Console ID conslid does not map to a console name known to MVS.

Explanation: CICS has not installed the CONSOLE definition termid because the console ID conslid does not map to a console name known to MVS.

System Action: CICS continues without installing the terminal.

User Response: Use the CEDA transaction to define a different console ID, or a console name, and reinstall the terminal.

Destination: CSMT
Module: DFHBSTZO
XMEOUT Parameters: date, time, applid, termid, conslid

DFHZC6315  E date time applid User userid is not authorized to install terminal tttt with preset security.

Explanation: User userid was attempting to install terminal tttt but the userid does not have sufficient authority. This is because the terminal has preset authority (the definition for terminal tttt specifies a userid value.) Installing a resource with preset security requires special authorization.

System Action: Resource security violation messages are logged to the CSCS transient data queue and to the system console. The resource is not installed. CICS continues.

User Response: In order to install this resource, do one of the following:

- Use the CESN transaction to sign on with a userid that is permitted to install terminals with preset security.
- Ask your security administrator to authorize userid userid to install terminals with preset security. See the CICS System Definition Guide for guidance.
- Remove the USERID specification from the resource definition and install the resource without preset security.

Destination: CSMT
Module: DFHBSTZS
XMEOUT Parameters: date, time, applid, userid, tttt

DFHZC6330  E date time applid Install for tttt failed. LDCLIST parameter ldclist not found.

Explanation: A resource tttt was being installed but was found to have an invalid LDCLIST ldclist.

System Action: The resource is not installed, CICS continues.

User Response: If you want the definition to be installed, use the DFHTCT TYPE=LDCLIST macro to define the listname.

Destination: CSMT
Module: DFHBSTBL
XMEOUT Parameters: date, time, applid, tttt, ldclist

DFHZC6331  E date time applid Install for connection tttt failed. Non-VTAM terminal with same name already exists.

Explanation: A connection tttt was being installed but a non-VTAM terminal with the same name already exists.

System Action: The resource is not installed; CICS continues.

User Response: Change the name of the connection and reinstall.

Destination: CSMT
Module: DFHBSS
XMEOUT Parameters: date, time, applid, tttt

DFHZC6332  E date time applid Install for terminal tttt failed. Non-VTAM terminal with same name already exists.

Explanation: A terminal tttt was being installed but a non-VTAM terminal with the same name already exists.

System Action: The resource is not installed; CICS continues.

User Response: Change the name of the terminal and reinstall.

Destination: CSMT
Module: DFHBSTZ
XMEOUT Parameters: date, time, applid, tttt
DFHZC6333 E date time applid INSTALL for modename
modename failed. Zero sessions specified

Explanation: CICS has not installed a mode group modename
because the maximum number of sessions specified was 0. The
CEDA SESSION MAXIMUM parameter cannot be set to 0, so this
was possibly caused by a storage overwrite, or by an invalid builder
parameter set being shipped into CICS.

System Action: The install fails, but CICS continues.

User Response: Find the offending builder parameter set and set
ZC_MAXSESS_1 to a minimum value of 1.

Destination: CSMT
Module: DFHBSM62
XMEOUT Parameters: date, time, applid, modename

DFHZC6340 E date time applid CICS has detected an error in
delete processing for termid. Module name:
modename.

Explanation: CICS has found terminal input output areas (TIOAs)
chained to a TCTTE during deletion of a terminal. This is a CICS
logic error.

System Action: A system dump is taken, the TCTTE is deleted and
CICS continues. Message DFHME0116 is normally produced
containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve
this problem. See Part 4 of the CICS Problem Determination
Guide for guidance on how to proceed.

It would aid IBM support if you used the system dump to determine
why TIOAs are still chained to the TCTTEs. The TIOAs
are normally freemained before deletion.

Answers to the following questions would also be helpful:

- Is this a shipped TCTTE?
- Why is the TCTTE being deleted?
- Is the correct TCTTE being deleted?

Destination: CADL
Module: DFHBST
XMEOUT Parameters: date, time, applid, termid, modname

DFHZC6341 E date time applid Loop or ABEND has been
detected in inmodule by module bymodule.

Explanation: CICS has previously detected a loop or abend.
Module bymodule called module inmodule which looped or
abended.

System Action: CICS issues message DFHZC0001 if an abend
is detected or DFHZC0004 if a loop is detected. The install or
delete being performed is backed out. CICS continues. Message
either CDSA. However, subsequent messages can be issued if storage
for a message set.

Explanation: A ZCP install has failed. This would normally result
in a message being issued. However, the GETMAIN attempting to
obtain storage from the CDSA for use as a message area has
failed. This means that there is no more free storage available in
the CDSA.

System Action: The message which should have reported the
ZCP install failure cannot be issued. Subsequent messages also
cannot be issued while there is no free storage available in the
CDSA. However, subsequent messages can be issued if storage
becomes available on subsequent GETMAIN attempts.

Message DFHME0116 is normally produced containing the
symptom string for this problem.

User Response: Use trace to determine the source of the
problem. Trace point AP FCDD, the TBSM entry, gives the
message number which should have been issued and the message
insert data. Refer to the description of this message for further
guidance.

Destination: CSMT
Module: DFHGBM
XMEOUT Parameters: date, time, applid, type

DFHZC6360 W date time applid A GETMAIN failed to obtain
storage for a message set.

Explanation: A ZCP install has failed. This would normally result
in a message being issued. However, the GETMAIN attempting to
obtain storage from the CDSA for use as a message area has
failed. This means that there is no more free storage available in
the CDSA.

System Action: The message which should have reported the
ZCP install failure cannot be issued. Subsequent messages also
cannot be issued while there is no free storage available in the
CDSA. However, subsequent messages can be issued if storage
becomes available on subsequent GETMAIN attempts.

Message DFHME0116 is normally produced containing the
symptom string for this problem.

User Response: Use trace to determine the source of the
problem. Trace point AP FCDD, the TBSM entry, gives the
message number which should have been issued and the message
insert data. Refer to the description of this message for further
guidance.

Destination: CSMT
Module: DFHBST
XMEOUT Parameters: date, time, applid

DFHZC6361 E date time applid (Install | Signon) for {netname | console | terminal} portname with userid userid failed
because the preset userid is invalid.

Explanation: The resource could not be installed or signed on
with preset userid userid because the userid is not known to the
external security manager (ESM).

System Action: CICS continues.

User Response: Correct the userid, or contact your security
administrator to have the unknown userid added to your ESM.

Then either reinstall the resource definition, or attempt to send a
command to CICS via this console.

Destination: CSMT
Module: DFHBST
DFHZC6362 E date time applid (Install | Signon) for {netname | console | terminal} portname with userid userid failed because the preset userid has been revoked.

Explanation: The resource could not be installed or signed on with preset userid userid because the userid has been revoked by the external security manager (ESM).

System Action: CICS continues.

User Response: Contact your security administrator, who can reauthorize the revoked userid by issuing the ALTUSER RESUME function. Then reinstall the resource definition or try another command from the affected console.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: date, time, applid, {1=Install, 2=Signon}, {1=netname, 2=console, 3=terminal}, portname, userid

DFHZC6363 E date time applid (Install | Signon) for {netname | console | terminal} portname with userid userid failed because the preset userid’s group access has been revoked.

Explanation: The resource could not be installed or signed on with preset userid userid because the access of that userid to the group containing it has been revoked by the external security manager (ESM).

System Action: CICS continues.

User Response: Contact your security administrator who can restore the access of the preset userid to its group by issuing the CONNECT RESUME function. Then reinstall the resource definition or try another command from the console.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: date, time, applid, {1=Install, 2=Signon}, {1=netname, 2=console, 3=terminal}, portname, userid

DFHZC6364 E date time applid (Install | Signon) for {netname | console | terminal} portname with userid userid failed because the external security manager returned an unrecognized response.

Explanation: The resource could not be installed or signed on with preset userid userid because of unexpected return codes from the external security manager (ESM).

System Action: CICS continues. Either message DFHSN1401 or DFHSN1801 is issued.

User Response: See the accompanying message for further guidance. Reinstall the resource definition or try another command from the console when you have corrected the problem.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: date, time, applid, {1=Install, 2=Signon}, {1=netname, 2=console, 3=terminal}, portname, userid

DFHZC6365 E date time applid (Install | Signon) for {netname | console | terminal} portname with userid userid failed because the external security manager is inactive.

Explanation: The resource could not be installed or signed on with preset userid userid because the external security manager (ESM) is no longer active.

System Action: CICS continues.

User Response: Contact your security administrator to restart the ESM. Reinstall the resource definition or try the command from a console again when the ESM is active again.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: date, time, applid, {1=Install, 2=Signon}, {1=netname, 2=console, 3=terminal}, portname, userid

DFHZC6366 E date time applid (Install | Signon) for {netname | console | terminal} portname with userid userid failed because the userid is not authorized to access this CICS system.

Explanation: The resource could not be installed or signed on with a preset userid because the preset userid is not authorized to use application applid.

System Action: CICS continues.

User Response: Contact your security administrator who can authorize the preset userid to access the application applid by issuing the PERMIT function for the APPL resource class. Then reinstall the resource definition or try the command again from the console.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: date, time, applid, {1=Install, 2=Signon}, {1=netname, 2=console, 3=terminal}, portname, userid

DFHZC6367 E date time applid (Install | Signon) for {netname | console | terminal} termid with userid userid failed because the SECLABEL check failed.

Explanation: The resource could not be installed or signed on with preset userid userid because the security label associated with the userid in the external security manager (ESM) does not have the necessary authority.

System Action: CICS continues.

User Response: Contact your security administrator to assign a new security label to the preset userid. Then reinstall the resource definition or try the command from the console again.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: date, time, applid, {1=Install, 2=Signon}, {1=netname, 2=console, 3=terminal}, termid, userid

DFHZC6368 E date time applid (Install | Signon) for {netname | console | terminal} portname with userid userid failed because the external security manager is quiesced.

Explanation: The resource could not be installed or signed on with preset userid userid because the external security manager (ESM) has been placed in a "tranquil" state and is not allowing new users to be added to the system.

System Action: CICS continues.
DFHZC6369  E  date time applid Install for connection ccccc failed.
  Netname netname is the same as the member name of a generic resource
collection grcon which is already in use.

Explanation: A connection ccccc was being installed but the
netname netname is the same as the member name of a generic
resource collection grcon which is already in use.

System Action: The resource is not installed. CICS continues.

User Response: If the NETNAME is incorrect, CICS continues.
Alternatively if you wish to communicate with the
generic resource member by its member name, discard the generic
resource connection after ending the VTAM affinity and try again.

Destination: CSMT
Module: DFHBSS
XMEOUT Parameters: date, time, applid, ccccc, netname, grcon

DFHZC6370  E  date time applid Install | Signon for {netname |
  console | terminal }portname failed because national
  language langcode is invalid.

Explanation: The resource could not be installed or signed on
because the national language langcode specified in the resource
definition is not recognized.

System Action: CICS continues.

User Response: Change the national language on the resource
definition to a valid value and reinstall the resource definition.

Destination: CSMT
Modules: DFHBSTS, DFHZCNA
XMEOUT Parameters: date, time, applid, (1=Install, 2=Signon),
(1=netname, 2=console, 3=terminal), portname, langcode

DFHZC6371  E  date time applid Install | Signon for {netname |
  console | terminal }portname with userid userid failed because the userid
is not authorized to use this portname.

Explanation: The resource could not be installed or signed on
with preset userid userid because the specified userid is not
authorized to use that resource.

System Action: CICS continues. Either message DFHSN1401 or
DFHSN1801 is issued.

User Response: See the accompanying message for further
guidance. Reinstall the resource definition or retry the command
from the console when you have corrected the problem.

Destination: CSMT
Modules: DFHBSTS, DFHZCNA
XMEOUT Parameters: date, time, applid, (1=Install, 2=Signon),
(1=netname, 2=console, 3=terminal), portname, userid

DFHZC6380  E  date time applid Install for connection ccccc failed.
  Netname netname is the same as the member name of a generic resource
collection grcon which is already in use.

Explanation: A connection ccccc was being installed but the
netname netname is the same as the member name of a generic
resource collection grcon which is already in use.

System Action: The resource is not installed. CICS continues.

User Response: If the NETNAME is incorrect, CICS continues.
Alternatively if you wish to communicate with the
generic resource member by its member name, discard the generic
resource connection after ending the VTAM affinity and try again.

Destination: CSMT
Module: DFHBSS
XMEOUT Parameters: date, time, applid, ccccc, netname, grcon

DFHZC6590  I  date time applid termid tranid Node netname
collection restarted. sense ((instance) Module
name: (DFHZXRC))

Explanation: The node specified has been switched to this
system following an XRF takeover.

For the meaning of the sense data, see the explanation on page
678.

System Action: Processing continues.

User Response: None.

Destination: CSNE
Module: DFHZXRC
XMEOUT Parameters: date, time, applid, termid, tranid, netname,
sense, instance, (1=DFHZXRC, 2=DFHZXRC, 3=DFHZXRC,
4=DFHZXRC, 5=DFHZXRC)

DFHZC6591  E  date time applid termid tranid Error processing
  XRF switch command. sense ((instance) Module
name: (DFHZXRC))

Explanation: The terminal has been switched to this CICS system
following an XRF takeover, but an error was encountered
processing the response data.

For the meaning of the sense data, see the explanation on page
678.

System Action: The state of the session at takeover is uncertain
and the session is unbound in order to reset the states. The
session is simlogged on, and proceeds as a normal emergency
restart.

User Response: Proceed as for a normal emergency restart.

Destination: CSNE
Module: DFHZXRC
XMEOUT Parameters: date, time, applid, termid, tranid, sense,
instance, (1=DFHZXRC, 2=DFHZXRC, 3=DFHZXRC, 4=DFHZXRC,
5=DFHZXRC, 6=DFHZXRC, 7=DFHZXRC, 8=DFHZXRC,
9=DFHZXRC, 10=DFHZXRC, 11=DFHZXRC)
DFHZC6593  I date time applid termid tranid Node netname backup session started. sense ((instance) Module name: (DFHZOPX))

Explanation: Node netname has successfully issued an OPNDST OPTCD=BACKUP command to the connected LU.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: None.

Destination: CSNE

Module: DFHZOPX

XMEOUT Parameters: date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX}

DFHZC6594  I date time applid termid tranid Node netname backup session reset - active session ended. sense ((instance) Module name: (DFHZSCX))

Explanation: The backup system has received a “hierarchical reset” UNBIND on the backup session to the named terminal. This implies that the active session has ended normally.

For the meaning of the sense data, see the explanation on page 678.

System Action: CLSDST the backup session.

User Response: None.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZSCX}

DFHZC6595  I date time applid termid tranid Node netname backup session not attempted. sense ((instance) Module name: (DFHZOPN))

Explanation: Before the OPNDST is issued, the backup system has abandoned the attempt to establish a backup session for one of the following reasons:

- There is no XRF support in VTAM (TCTVXRFs), or
- the TCTTE is flagged as a secondary. This CICS receives the BIND, but does not send it (TCTE2RY), or
- the TCTTE indicates that the LOGMODE keyword was specified on the terminal definition.

For the meaning of the sense data, see the explanation on page 678.

System Action: If this system takes over, the autoconnect process attempts to acquire a session. In this case, it probably takes longer for the session to become available for use.

User Response: Do not attempt a backup session.

Rectify error, or downgrade the recovery option specified for this terminal.

Destination: CSNE

Module: DFHZOPN

XMEOUT Parameters: date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZOPN}

DFHZC6596  applid CICS terminal control program cannot support XRF functions. sense ((instance) Module name: (DFHZSEX | DFHZSLS))

Explanation: The VTAM ACB has been opened, and the function level of the terminal control program (ZCP) and VTAM has been examined. It has been determined that XRF terminal functions cannot be supported in this execution of CICS.

This can be because one of the DFHZCxx modules, or the TCT, was assembled against a version of VTAM earlier than 3.1, or because the level of VTAM that has just been opened is pre-3.1.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues. Processing continues, but no VTAM XRF functions can be supported.

User Response: If VTAM XRF functions are required, check the assembly of each of the DFHZCxx modules and the TCT.

If a pre-3.1 release of VTAM was used in the assembly process, then a warning MNOTE will have been issued.

The relevant modules should then be reassembled against the correct level of VTAM.

If the assembly of all modules is correct, then the VTAM used in this execution is at a pre-3.1 level.

Destination: Console

Module: DFHZSEX,DFHZSLS

XMEOUT Parameters: applid, sense, instance, {1=DFHZSEX, 2=DFHZSLS}

DFHZC6598  applid VTAM Shutdown in XRF Alternate system. CICS will abend. sense ((instance) Module name: (DFHZTPX))

Explanation: The TPEND exit has been driven because VTAM has been shutdown. This is an XRF Alternate system and it cannot continue without VTAM.

For the meaning of the sense data, see the explanation on page 678.

System Action: The system is abnormally terminated.

User Response: Determine why and how VTAM was shutdown.

Destination: Console

Module: DFHZTPX

XMEOUT Parameters: applid, sense, instance, {1=DFHZTPX}

DFHZC6901  W date time applid Autoinstall BIND for NETNAME netname is invalid. Internal RC: X'response'.

Explanation: The bind passed for AUTOINSTALL of a resource has shown an error in the bind image check call. The fixed part of the BIND is printed (this is the part on which the validation code operates — see the SNA Network Protocol Formats for details of the BIND RU). The internal return code X'response' identifies the location within the module that invalidated the BIND.

System Action: CICS continues but the session is not installed. The request is rejected and message DFHZC2411 is issued. The terminal is not usable until a VTAM LOGOFF command is issued.

User Response: Investigate the fixed part of the BIND data to determine the reason for the rejection. The internal return code gives more information that can be used by IBM to help you to determine the cause of the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
DFHZC6902 E date time applid Autoinstall failed because no {terminal | console} models are defined.

Explanation: An attempt was made to autoinstall either a VTAM device or a console; however, there are no appropriate autoinstall models defined.

System Action: CICS processing continues, but the autoinstall logon attempt is rejected.

User Response: Use CEDA to define autoinstall model(s). For further information, refer to the CICS Resource Definition Guide.

Destination: CADL
Modules: DFHZATA, DFHZATA2
XMEOUT Parameters: date, time, applid, {1=terminal, 2=console}

DFHZC6903 W date time applid Autoinstall for resource resid, {netname | consolename} id using model model failed.

Explanation: The connection or terminal or console build process failed. The reason is given in a following DFHZC59xx, DFHZC62xx or DFHZC63xx message referring to the same resid. These messages are followed by message DFHZC6942.

System Action: Processing continues.

User Response: Refer to following messages for further information.

Modules: DFHZATA, DFHZATA2
XMEOUT Parameters: date, time, applid, resource, resid, {1=netname, 2=consolename}, id, model

DFHZC6904 W date time applid Autoinstall for {netname | consolename} id failed. CATA task abended (abend abend).

Explanation: Transaction CATA was autoinstalling a terminal or console, id, when the task abended with abend abend. If the resource being autoinstalled was a terminal, then the issuing module was DFHZATA. Otherwise, the issuing module was DFHZATA2 if the resource was a console. The id can be either a netname or a consolename.

System Action: CICS continues but the resource is not installed.

User Response: Retry the logon attempt. If the abend indicates a TIMEOUT and this occurs frequently, increase the CATA DTIMOUT value. If you do not want the CATA transaction to time out, remove the DTIMOUT parameter from the CATA DEFINE TRANSACTION command. However, if you do this, and if the system is short on storage, a large number of CATA transactions running at the same time with no purgeable transactions present could cause a deadlock.

Destination: CADL
Modules: DFHZATA, DFHZATA2
XMEOUT Parameters: date, time, applid, {1=netname, 2=consolename}, id, abend

DFHZC6905 W date time applid Autoinstall delete for resource resid, {netname | consolename} id failed. CATD task abended (abend abend).

Explanation: Transaction CATD, program DFHZATD was deleting an autoinstalled resource resid, when the task abended with abend abend.

System Action: CICS continues. If the resource still exists, it is reused next time the same TERMD or SYSID is used.

User Response: See the description of abend abend for further guidance.

If the abend indicates a TIMEOUT and this occurs frequently, increase the CATD DTIMOUT value. If you do not want the CATD transaction to time out, remove the DTIMOUT parameter from the CATD DEFINE TRANSACTION command. However, a large number of CATD tasks running at the same time with no purgeable tasks present could cause a deadlock if the system is also short on storage.

Destination: CADL
Module: DFHZATD
XMEOUT Parameters: date, time, applid, resource, resid, {1=netname, 2=consolename}, id, abend

DFHZC6906 date time applid Install or delete of remote terminal termid failed. tranid task abended (abend abend).

Explanation: One of the functions of DFHZATS (transaction CITS, CDTS, CMTS or CFTS) has abended with abend abend.

System Action: CICS continues.

For CITS (remote install), if the remote terminal (skeleton) was actually built, CICS might use it.

For CDTS (remote delete), If the remote terminal (skeleton) has not been deleted, it might be reused.

For CMTS (remote mass delete), terminals which have not been deleted by CMTS might be deleted at a later stage.

For CFTS (remote mass flag), terminals which have been flagged for deletion might be deleted at a later stage. If any terminals have not been flagged, attempts might be made to reuse them. This can have unpredictable results.

User Response: See the description of abend abend for further guidance.

The most likely reason for this message is a timeout of CITS or CDTS. In the case of CITS, reissue your transaction if necessary.

If the TIMEOUTs occur frequently, consider increasing the CITS or CDTS DTIMOUT values. If you do not want the transactions to time out, remove the DTIMOUT parameter from the CITS or CDTS DEFINE TRANSACTION command. However, a large number of CITS tasks running at the same time with no purgeable tasks present could cause a deadlock if the system is also short on storage.

Note that CFTS and CMTS do not have a DTIMOUT parameter and should not be given one because they only run once after a warm or emergency restart and should not be allowed to time out.

Destination: CADL
Module: DFHZATS
XMEOUT Parameters: date, time, applid, termid, tranid, abend
DFHZC6910  W date time applid Install for remote terminal termid failed.

**Explanation:**  An INSTALL for the remote terminal termid has failed. The reason for the failure is specified in associated DFHZC59xx and DFHZC62xx messages.

**System Action:**  DFHZATS terminates abnormally with a CICS transaction dump.

**User Response:**  See the associated messages for further guidance.

**Destination:**  CADL

**Module:**  DFHZATS

**XMEOUT Parameters:**  date, time, applid, termid

DFHZC6911  W date time applid Delete for remote terminal termid failed.

**Explanation:**  A DELETE for remote terminal termid has failed. Possible causes are that the terminal has already been deleted or that it is in use by another task.

If this message is repeated a number of times, there could be a more serious problem.

**System Action:**  If the message is associated with message DFHZC6912, CICS continues normally. If message DFHZC6912 is not issued, DFHZATS is abnormally terminated with a transaction dump.

**User Response:**  If the message is associated with message DFHZC6912, no action is necessary. If DFHZC6912 is not issued, see the associated DFHZC59xx, DFHZC62xx and DFHZC63xx messages for the reason for the DELETE failure.

**Destination:**  CADL

**Module:**  DFHZATS

**XMEOUT Parameters:**  date, time, applid, termid

DFHZC6912  I date time applid Unable to delete remote terminal.

**Explanation:**  This message is issued during a mass delete of remote terminals following a warm or emergency restart. A terminal which had been flagged for deletion could not be deleted. The most likely explanation is that the terminal has already been deleted by another task.

An associated DFHZC6911 message gives the identity of the terminal. This might be associated with one or more DFHZC59xx and DFHZC62xx messages giving the reason for the failure.

**System Action:**  Processing continues normally.

**User Response:**  See the associated messages for further information.

**Destination:**  CADL

**Module:**  DFHZATS

**XMEOUT Parameters:**  date, time, applid

DFHZC6913  I date time applid Remote delete of terminal termid failed. Terminal not found.

**Explanation:**  A remote DELETE has been attempted for a terminal which has already been deleted by another task.

**System Action:**  Processing continues normally.

**User Response:**  None.

**Destination:**  CADL

**Module:**  DFHZATS

**XMEOUT Parameters:**  date, time, applid

DFHZC6914  E date time applid Autoinstall for resource termid, (netname | consolename) id failed. Bad Return Code (RC = X'retcode') from an internal function call.

**Explanation:**  The TCTTE build process failed due to the failure of an internal function call.

**System Action:**  The terminal autoinstall process fails. CICS processing continues.

**User Response:**  Retry the logon attempt.

**Destination:**  CADL

**Modules:**  DFHZATA, DFHZATA2

**XMEOUT Parameters:**  date, time, applid, termid, (1=netname, 2=consolename), id, X'retcode'

DFHZC6915  E date time applid Unable to sign off remote terminal termid. Bad Return Code (RC = X'SNUS_RESPONSE') from signon domain call.

**Explanation:**  An unexpected response (INVALID, DISASTER or EXCEPTION) has been received on a call by DFHZATS to function SIGNOFF_TERMINAL_USER during sign-off processing for a remote terminal session running under CRTE.

**System Action:**  The terminal sign-off process fails to complete and the terminal user remains signed on. CICS processing continues.

**User Response:**  See the related message produced by the domain that detected the original error.

**Destination:**  CADL

**Module:**  DFHZATS

**XMEOUT Parameters:**  date, time, applid, termid, X'SNUS_RESPONSE'

DFHZC6920  E date time applid APPC autoinstall for NETNAME netname failed. RC x

**Explanation:**  An autoinstall attempt to install APPC NETNAME netname has failed. The autoinstall program call to the autoinstall control program failed with return code x.

The return codes are mapped from the program manager LINK URM response and reason. More precise reasons for failure can be obtained from trace point PG 0A02.

**System Action:**  CICS continues.

**User Response:**  The appropriate response depends on the return code as follows:

1. The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.
2. The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.
3. The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFRHRPL DD statement and has the correct name.
4. The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.
DFHZC6921 \( W \)

5. Loading of the user exit program failed for some other reason. Check the DFHPGLU exit trace entry (PG 0A02) to see why the program manager was unable to load the program.

**Destination:** CADL

**Module:** DFHZGAI

**XMEOUT Parameters:** date, time, applid, netname, x

---

DFHZC6921 \( W \) date time applid Autoinstall for NETNAME netname has been disallowed by the autoinstall control program. Code X'code'

**Explanation:** An APPC connection not known to CICS has attempted to connect to CICS. However, the autoinstall control program has given a nonzero return code indicating that the install cannot go ahead.

If you do not support APPC autoinstall, the autoinstall control program (DFHZATDX is the default name) automatically returns a nonzero return code to disallow this function.

**System Action:** The exception trace entry code shows the parameter list for the autoinstall control program. The session is terminated. CICS continues.

**User Response:** The failure code X'code' is as follows:

- **X'FA07':** If APPC autoinstall is not supported, use the netname to determine which device is attempting autoinstall. If APPC autoinstall is supported, examine the autoinstall control program to determine why it has not set the return code to allow the install.

**Destination:** CADL

**Module:** DFHZGAI

**XMEOUT Parameters:** date, time, applid, netname, X'code'

---

DFHZC6922 \( E \) date time applid Parameter list error during autoinstall for NETNAME netname. Code X'code'

**Explanation:** An APPC connection not known to CICS has attempted to connect to CICS. However, the autoinstall control program has returned an invalid parameter, or a parameter that has led to an invalid template being used.

**System Action:** The exception trace entry code shows the parameter list for the autoinstall control program. The session is terminated. CICS continues.

**User Response:** The failure code X'code' is one of the following:

- **X'FA08':** No netname or sysid was supplied for the template. Change the autoinstall control program to supply either the netname or the sysid.

- **X'FA09':** The sysid for the new connection has invalid characters. It can only contain A-Z a-z 0-9 and #@ (where # is X'5B'). Redefine the connection name in the autoinstall control program.

- **X'FA0A':** The sysid for the new connection already exists. Change the autoinstall control program to supply a unique name.

- **X'FA0B':** CICS is unable to locate the supplied template netname. Change the autoinstall control program to supply the correct template name, or use CEDA to install the template connection.

- **X'FA0C':** CICS is unable to locate the supplied template sysid. Change the autoinstall control program to supply the correct template sysid or use CEDA to install the template connection.

**Destination:** CADL

**Module:** DFHZGAI

**XMEOUT Parameters:** date, time, applid, netname, X'code'

---

X'FA0D': The template is not an APPC connection. Change the autoinstall control program to supply the correct template name, or use CEDA to reinstall the template correctly.

X'FA0E': The bind indicates that a parallel session connection is required. The template is a single session connection. Change the autoinstall control program to supply the correct template name, or use CEDA to reinstall the template correctly.

X'FA0F': The bind indicates that a single session connection is required. The template is a parallel session connection. Change the autoinstall control program to supply the correct template name or use CEDA to reinstall the template correctly.

X'FA10': The modename in the bind does not match the modename in the connection.

For parallel sessions, the SNASVCMG modegroup is missing. The install for the template may have failed - check for any CADL messages mentioning the template name. The template connection may have been corrupted. Try and re-install the template.

For single sessions, the user modegroup name does not match. Change the autoinstall control program to supply the correct template name or use CEDA to reinstall the template correctly.

X'FA11': The program that attempted to INQUIRE on the template has detected an error in the template and is unable to create a BPS with which to install the new connection. This problem may be caused by a failure in the initial install of the template. Check the console and CADL log to determine whether the template installed correctly. Also, use CEMT to ensure that the CONNECTION is correct.

X'FA12': The program that attempted to INQUIRE on a user modegroup for the named template has detected an error in the template and is unable to create a BPS with which to install a user modegroup. This problem may be caused by a failure in the initial install of the template. Check the console and CADL log to determine whether the template installed correctly. Also use CEMT to ensure that the MODEGROUP is correct.

X'FA13': The template connection has no user modegroup. This problem may be caused by a failure in the initial install of the template. Check the console and the CADL log to determine whether the template installed correctly. Also, use CEMT to ensure that the MODEGROUP is correct.

X'FA14': The template connection is out of service so this install cannot continue. If the install should have been allowed to continue, put the relevant template connection INSERVICE using CEMT.

X'FA15': The incoming bind user data does not have a PLUNAME Network Name subfield (id 04). This is required and should have been supplied by the PLU.

X'FA16': The incoming bind user data does not have a MODENAME Network Name subfield (id 02). This is required and should have been supplied by the PLU.
Chapter 1. DFH messages

DFHZC6923 E date time applid Unacceptable bind parameter during autoinstall for NETNAME netname. Code 'X'code'

Explanation: CICS has received a BIND from an unknown APPC node. The autoinstall process was initiated, but an invalid bind parameter has been detected. The parameter in error is indicated by the failure code 'X'code' which is one of the following:

- X'FA18': There was no session instance ID field in the bind user data.
- X'FA19': There was no primary logical unit (PLU) name in the bind user data.
- X'FA1A': The PLU name in the bind user data is the same as the LU name of this CICS.
- X'FA1B': Security information (an encryption seed) was expected, but not present, in the bind user data.
- X'FA1C': Security information (an encryption seed) was found in the bind user data but its length was too high for it to be valid.
- X'FA1D': Security information (an encryption seed) was found in the bind user data when none was expected.
- X'FA1E': The received bind indicated that it was not negotiable. This is not acceptable for an APPC connection.
- X'FA1F': The received bind specified a primary RU size of zero.
- X'FA20': The received bind specified a secondary RU size of zero.
- X'FA21': The received bind contained inconsistent access security indicators.
- X'FA22': Two security information fields (seed and nonce field) were found in the received BIND where only one was expected.
- X'FA23': The received BIND contained a nonce field with an incorrect length.
- X'FA24': The received BIND did not contain a nonce field.
- X'FA25': The received BINDs security mechanisms field length was smaller than the minimum defined by the Architecture.
- X'FA26': The received BINDs security mechanisms field contained an invalid length for the mechanism identifier field.

System Action: The exception trace entry with trace point ID 'AP xxxx' (where xxxx is 'X'code') shows the bind that was received. The session is terminated. CICS continues.

User Response: Change the definitions on the connecting LU so that the bind parameters are acceptable to CICS.

Destination: CADL
Module: DFHZC6923

XMEOUT Parameters: date, time, applid, netname, 'X'code'

DFHZC6935 I date time applid Autoinstall for restype resid with {netname | consolename} id using model or template model successful.

Explanation: CICS has successfully installed resource restype resid, with id id, using model or template model. The restype can be TERMINAL or CONNECTION or CONSOLE depending on whether a terminal, an APPC connection, or a console has just been autoinstalled.

System Action: CICS continues.

User Response: None.

Destination: CADL
Modules: DFHZA, DFHZATA2

XMEOUT Parameters: date, time, applid, restype, resid, {1=netname, 2=consolename}, id, model

DFHZC6936 I date time applid Autoinstall for NETNAME netname, model modelname in MTS control vector not known to CICS.

Explanation: The VTAM MTS control vector contained a model name modelname not defined to CICS.

System Action: CICS continues. This message is informational.

User Response: There are four possible ways of correcting this problem:

- Use the CEDA transaction to define and install the autoinstall model
- Change the VTAM MTS MDTAB MODEL= entry to the name of an existing autoinstall model.
- Logon to CICS with a MODEL= parameter that defines an existing autoinstall model.
- Code an Autoinstall User Program. Examples are given in the Customization Guide in the Sample Programs and Copybooks section.

Destination: CADL
Module: DFHZC6936

XMEOUT Parameters: date, time, applid, netname, modelname

DFHZC6937 I date time applid Autoinstall for NETNAME netname, MTS model modelname and bind image mismatch.

Explanation: An autoinstall attempt occurred using the modelname printed. The MODEL BIND (from the CICS model definition) did not match with the incoming bind in CINIT. The MISMATCH_BITS show which bind bits did not match.

System Action: CICS continues.

User Response: There are four possible ways of correcting this problem:

- Change the CICS autoinstall MODEL modelname to produce a bind that matches the incoming CINIT.
- Change the VTAM LOGMODE for this terminal to match the CICS ModelBIND.
- Change the VTAM MTS MDTAB MODEL= entry to a model name defined to CICS whose bind matches the CINIT defined in the LOGMODE for this terminal.
- Code an autoinstall user program. Examples are given in the Sample Programs and Copybooks section of the CICS Customization Guide.
**XMEOUT Parameters:** date, time, applid, netname, modelname

**DFHZC6943**  
**W date time applid Autoinstall for NETNAME**  
netname: Invalid length nn found in cinit control vector at offset offset  
**Explanation:** CICS verification checks on the format of the control vectors in the CINIT have failed. offset indicates the first point of failure. This is either a length field greater than 128, or a length field which would cause CICS to overrun the end of a CINIT vector or subvector.  
This is either due to incorrect format of the CINIT RU (and therefore probably a VTAM logic error), or due to incorrect parsing of the CINIT RU by DFHZATD, which is a CICS logic error.  
**System Action:** CICS continues. The logon request is rejected.  
**User Response:** Inspect the format of the CINIT RU as captured by the autoinstall program for all rejected logon requests. The first point of failure may be at offset or before it since CICS verification checks are permissive.  
If the format is incorrect, the origin of the invalid CINIT should be tracked and the problem resolved there.  
If the format is correct, this is a CICS logic error. In this case you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.  
**Destination:** CADL  
**Module:** DFHZATA  
**XMEOUT Parameters:** date, time, applid, netname, nn, offset

Module: DFHZATMD

XMEOUT Parameters: date, time, applid, termid, x
**DFHZC6958**  
**W date time applid Autoinstall for** {netname | consolename} id, resource X'termid' failed.  
**{RESOURCE | PRINTER | ALTPRINTER} ID is invalid. RC=n.**  

**Explanation:** The RESOURCE, PRINTER, or ALTPRINTER ID supplied by the AUTOINSTALL exit program is invalid. The return code n can be one of the following:

- n Meaning
  - 1 Invalid blank in column one
  - 2 Invalid imbedded blank
  - 3 Invalid character used.

**System Action:** CICS continues but does not install the object.  
**User Response:** Change the AUTOINSTALL exit program to create IDs that contain only valid characters. These are specified in the CICS Customization Guide.

**Destination:** CADL  
**Modules:** DFHZATA, DFHZATA2  
**XMEOUT Parameters:** date, time, applid, {1=netname, 2=consolename}, id, X'termid', {1=RESOURCE, 2=PRINTER, 3=ALTPRINTER}, n

**DFHZC6966** I date time applid Autoinstall delete for restype resid with {netname | consolename} id was successful.  
**Explanation:** CICS has successfully deleted the autoinstalled resource restype resid. The restype can be a terminal, an APPC connection, or a console.

**System Action:** CICS continues.  
**User Response:** None.

**Destination:** CADL  
**Module:** DFHZATD  
**XMEOUT Parameters:** date, time, applid, restype, resid, {1=netname, 2=consolename}, id

**DFHZC6987** W date time applid Autoinstall best failure for NETNAME netname was model model.  
**Explanation:** An autoinstall attempt has failed for lack of an exact match.

- netname is the netname of the LU which failed to logon,
- model is the name of the model that gave the best failure (that is, the one that had the fewest bits different from the BIND image supplied by VTAM).

The following associated information is also written to CADL:

- xxxxxxxx... is a string of hexadecimal digits, where xx represents one byte, and each byte position represents the corresponding byte position in the BIND image.
- CINIT BIND: xxxxxxxx is the bind image supplied by VTAM.
- MODEL BIND: xxxxxxxx is the best model.
- MISMATCH BITS: xxxxxxxx represents a comparison of the relevant bits from above. A bit set to ‘1’ indicates a mismatch in that position between the BIND image from VTAM and the BIND image associated with the model.

**System Action:** CICS continues.  
**User Response:**
1. Determine whether the model model is suitable. If there are several models which have options, such as TRANSECKEYS, then only the first such model is named in the above message. It will be up to the user-program to make the choice, when the logmode table entry is corrected.
2. Identify the entry in the VTAM logmode table that is being used.
3. Check that this logmode table entry is not successfully in use with other applications, so that to change it might cause this other use of it to fail.
4. Amend the logmode table entry by switching the bits corresponding to ‘1’ bits in the mismatch string. That is, if the bit in the VTAM bind image corresponding to the bit position set to ‘1’ in xxxxxxxx... is ‘1’, set it to ‘0’. If it is ‘0’, set it to ‘1’.

For further information, refer to the CICS Customization Guide. More on the meaning of the various bits in a bind image may be found in ACF/VTAM Programming manual, (SC27-0611).

Details of the preparation of VTAM logmode table entries are given in ACF/VTAM Customization manual, (SC27-0613).

Chapter 1. DFH messages

DFHZNxxxx messages

DFHZN2130 date time applid A unit of work has been shunted but the connection with the remote system does not support the shunt protocols. Resources on the remote system may be out of sync with those on this CICS after the UOW is resynchronized. Failure date mm/dd/yy failure time hh:mm:ss remote system netname transaction tranid task number trannum operator terminal termid user userid network UOW netuwid local UOW X'localuow'.

Explanation: This message is preceded by message DFHAC2231. An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

System Action: In accordance with the transaction definition, the unit of work is not completed. It is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

As part of this processing, CICS has attempted to pass on the shunt request to another partner system. However, this partner does not support the shunting protocols, and so this partner may backout or commit changes to its resources independently of this shunted unit of work.

User Response: Following resynchronization with the coordinator system, determine whether the remote function shipped resources are out of synchronization. The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the CICS Intercommunication Guide for information on design considerations in a distributed environment.

Destination: CSMT
Module: DFHCR2U
XMEOUT Parameters: date, time, applid, mm/dd/yy, hh:mm:ss, netname, tranid, trannum, termid, userid, netuwid, X'localuow'.

DFHZN2131 date time applid Intersystem session failure during CICS synclevel one commit. Local resources may be out of sync with those on the remote system. Failure date mm/dd/yy failure time hh:mm:ss remote system netname transaction tranid task number trannum operator terminal termid user userid network UOW netuwid local UOW X'localuow'.

Explanation: A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, a session failure occurred at a critical time during the synclevel 1 commit processing, and the synclevel 1 function shipped resources may have committed successfully or may have backed out.

System Action: CICS synclevel 1 commit processing continues, with the intention of committing as many synclevel 1 resources as possible. For APPC synclevel 1, CICS does not attempt to resolve the situation any further.

On completion of the syncpoint, CICS abends the user task.

User Response: Determine whether the remote function shipped resources are out of synchronization. The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the CICS Intercommunication Guide for information on design considerations in a distributed environment.

Destination: CSMT
Module: DFHCR2U
XMEOUT Parameters: date, time, applid, mm/dd/yy, hh:mm:ss, netname, tranid, trannum, termid, userid, netuwid, X'localuow'.

DFHZN2132 date time applid Rollback received in response to CICS synclevel one commit. Local resources are out of sync with those on the remote system. Failure date mm/dd/yy failure time hh:mm:ss remote system netname transaction tranid task number trannum operator terminal termid user userid network UOW netuwid local UOW X'localuow'.

Explanation: A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, when a commit message was sent to a synclevel 1 function shipped resource, the resource voted to backout.

System Action: Synclevel 1 commit processing continues with the intention of committing as many synclevel 1 resources as possible. For APPC synclevel 1, CICS does not attempt to resolve the situation any further.

On completion of the syncpoint, CICS abends the user task.

User Response: The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the CICS Intercommunication Guide for information on design considerations in a distributed environment.

Destination: CSMT
Module: DFHCR2U
XMEOUT Parameters: date, time, applid, mm/dd/yy, hh:mm:ss, netname, tranid, trannum, termid, userid, netuwid, X'localuow'.

DFHZN2133 date time applid Error detected during CICS synclevel one commit. Reason code rc. Local resources may be out of sync with those on the remote system. Failure date mm/dd/yy failure time hh:mm:ss remote system sysid transaction tranid task number trannum operator terminal termid user userid network UOW netuwid local UOW X'localuow'.

Explanation: A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, when a commit message was sent to a synclevel 1 function shipped resource, the reply indicated that an error has occurred. The reason code provides details of the error and has the following values:

01 Protocol violation by partner system – unexpected FMH data
02 Protocol violation by partner system – unexpected syncpoint message data
03 Abend received
DFHZN2701

04 Deadlock or read timeout.

**System Action:** CICS synclevel 1 commit processing continues, with the intention of committing as many synclevel 1 resources as possible.

For reason code 01, a transaction dump with dump code ASPI is taken. For reason code 02, a transaction dump with dump code ASPJ is taken. On completion of the syncpoint, CICS abends the user task.

**User Response:** The action to take depends on local procedures. For reason codes 01 and 02, examine the dump to determine what message data was received from the partner. This information is held in one of the terminal input/output areas. A failure in the communication system might have caused corruption of the data.

Reason code 03 indicates that the partner system has sent an abend. There is an error in the partner system which may need to be investigated.

Reason code 04 indicates that the partner system took too long to respond to the synclevel 1 commit. There could be a problem with the remote system, or the communication system. It may be necessary to increase the deadlock timeout or read timeout values to prevent this recurring.

**Destination:** CSMT

**Module:** DFHCR2U

**XMEOUT Parameters:** date, time, applid, rc, mm/dd/yy, hh:mm:ss, sysid, tranid, trannum, userid, netuowid, x'localuowid'

**DFHZN2701 date time applid Log data sent on ISC session is xxxxxxxx**

**Explanation:** This is an informational message. The transaction is communicating with a logical unit type LU6.2. It has sent an FMH (function management header) which carries log data.

**System Action:** The transaction continues processing.

**User Response:** None.

**Destination:** CSNE

**Module:** DFHZERH

**XMEOUT Parameters:** date, time, applid, xxxxxxxx
Chapter 2. AXM server environment messages

The following messages are issued by the authorized cross-memory (AXM) server environment, which is a package of run-time services used by the CICS shared temporary storage (TS) queue pool server. See the CICS System Definition Guide for more information about AXM and the CICS TS queue pool server.

Notes:

1. AXM messages are not issued by a CICS region and hence do not use the CICS message domain. They cannot be viewed with the CMAC transaction, suppressed with the XMEOUT user exit, or changed with the message editing utility.
2. These messages are normally displayed in mixed case English. If your terminals cannot display lowercase English characters, see the CICS Customization Guide for guidance on converting the messages to uppercase.

AXM error recovery messages

AXMER0001 ABEND xxx-rr occurred at address, data word1 word2 word3.

Explanation: The AXM error recovery routine has intercepted an abend in a task running under an AXM server region TCB. The abend code is shown as three hexadecimal digits for a system completion code or four decimal digits for a user completion code. The data consists of the twelve bytes around the PSW address as provided by MVS in the SDWA.

System Action: The error recovery routine will first call AXMWH which attempts to identify the module and procedure in which the abend occurred and writes out a further message if successful. After this, if recovery is allowed, the error recovery routine terminates the affected AXM internal task and resumes normal processing, otherwise it percolates the error, causing the server region to be abnormally terminated.

The system will normally produce a symptom dump message on the job log, and a full dump may be produced if an appropriate DD statement (SYSUDUMP, SYMDUMP or SYSABEND) is present in the server region JCL.

User Response: Look up the completion code to identify the cause of the abend.

Destination: Console and print file

Module: AXMER

AXMER0002 TRAP occurred at offset offset in procname.

Explanation: An internal logic error in a server resulted in a TRAP macro being executed at the specified location.

The system will normally produce a symptom dump message on the job log, and a full dump may be produced if an appropriate DD statement (SYSUDUMP, SYMDUMP or SYSABEND) is present in the server region JCL.

System Action: The AXM task is abnormally terminated.

User Response: This probably indicates a logic error in server code, or an attempt to use some internal component of the server outside its correct context.

If the procedure name in the message begins with AXM, this probably indicates that the server code which called it has passed inconsistent parameters, such as an invalid address when releasing main storage.

Destination: Console and print file

Module: AXMER

AXM event management messages

AXMEV0001 AXM only supports operating system WAIT on MVS.

Explanation: An attempt has been made to issue an operating system WAIT within an AXM server, but the server is not running on MVS. In this case, the MVS POST exit mechanism used by AXM is unavailable and operating system waits cannot be supported.

System Action: The program is abnormally terminated.

User Response: None.

Destination: Console

Module: AXMEV

AXMEV0003 The AXM POST exit could not be created because AXM system services are not available.

Explanation: AXM server region initialization needed to define the MVS POST exit used by AXM for operating system waits, but AXM system services were not available within the current MVS image.

System Action: The server region is terminated with return code 8.

User Response: Start up AXM system services first then restart the server region. AXM system services are normally started at IPL using a subsystem definition in IEASSNxx specifying AXM as the subsystem name and AXMSI as the initialization routine. They can also be started up without an IPL by defining the subsystem dynamically using the SETSSI command.

Destination: Console and print file

Module: AXMEV

AXMEV0004 The AXM POST exit could not be created, return code was rc.

Explanation: The MVS POST exit used by AXM for operating system waits could not be created because the AXM system services routine gave a non-zero return code. The only known reason for this is that AXM system services have been withdrawn, which should not be possible in a production environment.

System Action: The server region is terminated with return code 8.

User Response: None.

Destination: Console and print file

Module: AXMEV
AXMEV0005I The AXM POST exit had already been created for this address space.

Explanation: During server initialization, AXM system services found that the MVS POST exit used by AXM for operating system waits had already been created for this address space. AXM therefore bypassed trying to create the same POST exit again as this would have resulted in an abend 702-04.

This can occur when a previous server execution in the same address space was terminated abnormally.

System Action: Processing continues
User Response: None.
Destination: Console and print file
Module: AXMEV

AXMEV0006I The AXM POST exit could not be deleted, return code was rc.

Explanation: The MVS POST exit used by AXM for operating system waits could not be deleted because the AXM system services routine gave a non-zero return code. The only known reason for this is that AXM system services have been withdrawn, which should not be possible in a production environment.

System Action: Processing continues.
User Response: None.
Destination: Console.
Module: AXMEV

AXM operating system interface messages

AXMOS0001I The main procedure entry point is name at address address.

Explanation: This message is written to the print file during AXM initialization to indicate the name and entry point address of the server main procedure. This is primarily for debugging purposes.

System Action: Processing continues.
User Response: None.
Destination: Print file
Module: AXMOS

AXMOS0002 The main procedure is missing, or the END statement does not name the entry point.

Explanation: The AXM server load module which is being executed does not contain a procedure which has been identified as the AXM main procedure.

System Action: The server region is terminated with return code 16.
User Response: Check that the main procedure was correctly included in the link edit. If it was, make sure that its entry point name was correctly specified on the END statement and that it was assembled using AXM macros with the macro AXMSET appearing before the MODULE statement and the option ENVIRON=AXM specified on the MODULE statement.
Destination: Console and SYSPRINT
Module: AXMOS
AXM storage page pool management messages

AXMPG0001I The main free area above 16M was at address xxxxxx, size nnnnK.

Explanation: This message is written to the print file during AXM initialization to indicate the size of the largest area of 31-bit addressable private region storage available at that time.

System Action: Processing continues.

User Response: None.

Destination: Print file

Module: AXMPG

AXMPG0002I The main free area below 16M was at address xxxxxx1, size nnnnK.

Explanation: This message is written to the print file during AXM initialization to indicate the size of the largest area of 24-bit addressable private region storage available at that time.

System Action: Processing continues.

User Response: None.

Destination: Print file

Module: AXMPG

AXMPG0003I Storage page pool areaname created, address xxxxxx, size nnnnK.

Explanation: This message is written to the print file during AXM initialization to show the size and address of each storage page pool as it is created. Once this has been done, most AXM storage requests are allocated from this page pool rather than with MVS GETMAIN.

System Action: Processing continues.

User Response: None.

Destination: Print file

Module: AXMPG

AXMPG0004I Usage statistics for storage page pool areaname:

<table>
<thead>
<tr>
<th>Size</th>
<th>In Use</th>
<th>Max Used</th>
<th>Free</th>
<th>Min Free</th>
</tr>
</thead>
<tbody>
<tr>
<td>nK</td>
<td>nK</td>
<td>nK</td>
<td>nK</td>
<td>nK</td>
</tr>
</tbody>
</table>

Explanation: This message shows statistics for the named storage page pool (since the most recent statistics reset, if any). It is automatically written to the print file at AXM region termination, and may also be requested at other times by the server.

The detailed message layout is as follows:

- Size: Total size of the storage pool.
- In Use: The amount of storage which is currently in use.
- Max Used: The highest amount of storage which has been in use.
- Free: The amount of storage within the pool which is current free.
- Min Free: The lowest amount of storage which has been free.
- Gets: The number of requests to obtain storage within the pool.
- Frees: The number of requests to release storage within the pool.
- Retries: The number of times that a storage request initially failed and was retried after merging any adjacent small free areas to form larger areas.
- Fails: The number of times that a storage request was unable to obtain the requested amount of storage even after a retry.

System Action: Processing continues.

User Response: None.

Destination: Print file

Module: AXMPG

AXM resource tracking messages

AXMRS0001 Tidy-up routine at address failed to free resource tracking cell.

Explanation: A server routine established an AXM resource tracking element specifying that a procedure was to be called to release the resource if the task was terminated without releasing the resource. The AXM task is now terminating, and the procedure identified in the tracking element was called, but the resource tracking element was still in existence when it returned. The entry point address of the relevant procedure is indicated in the message.

System Action: The tracking element is released on the assumption that the resource has now been deleted, and AXM task termination continues.

User Response: The server programmer needs to ensure that the procedure to release the resource also frees the resource tracking element.

Destination: Console and print file

Module: AXMRS

AXM server connection and system services messages

AXMSC0011I AXM system services initialization is in progress.

Explanation: AXM system services are being started up, normally as a result of being called by the AXM subsystem initialization routine.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: AXMSC
AXMSC0012I AXM system services initialization has completed.
Explanation: AXM system services are now fully available in the current MVS image.
System Action: AXM cross-memory server connection requests and requests for the POST exit system services will now be accepted.
User Response: None.
Destination: Console
Module: AXMSC

AXMSC0013 AXM system services have already been initialized.
Explanation: An attempt was made to set up AXM system services again when they are already active in the current MVS image.
System Action: The attempt is ignored.
User Response: None.
Destination: Console
Module: AXMSC

AXMSC0021I AXM system services termination is in progress.
Explanation: AXM system services are being withdrawn. This is only possible if they were initialized using the AXM system region program AXMSR instead of being set up via subsystem initialization.
System Action: The AXM system services program call table is deleted and all entry points in the AXM system services anchor are replaced with dummy routines which return an indication that the service are not available.
User Response: Note that the results of attempting to call any AXM system service around this time are unpredictable. AXM system services should never be withdrawn in a production environment at any time when it is possible that they could be in use.
Destination: Console
Module: AXMSC

AXMSC0022I AXM system services termination has completed.
Explanation: AXM system services have been closed down for this MVS image.
System Action: AXM system services are no longer available.
User Response: None.
Destination: Console
Module: AXMSC

AXMSC0031I Connection to server prefix.name has been opened.
Explanation: The current region has established an AXM connection to the AXM server prefix.name.
System Action: Processing continues.
User Response: None.
Destination: Console
Module: AXMSC

AXMSC0032 Connection to server prefix.name failed because the server was not found.
Explanation: The current region tried to establish an AXM connection to the AXM server prefix.name but could not do so because there is no active server of that name enabled for AXM connections.
System Action: The connection attempt is rejected with return code 8, reason code 32.
User Response: Ensure that the server is started and that its name was specified correctly.
Destination: Console
Module: AXMSC

AXMSC0033 Connection to server prefix.name was rejected by the security system.
Explanation: The current region tried to establish an AXM connection to the AXM server prefix.name but the request was rejected by the security system.
System Action: The connection attempt is rejected with return code 8, reason code 33.
User Response: See the previous AXM message giving details of the results of the security check.
Destination: Console
Module: AXMSC

AXMSC0034 Connection to server prefix.name failed because all AXM connections are in use.
Explanation: The current region tried to establish an AXM connection to the AXM server prefix.name but the maximum number of AXM connections supported within an MVS image (currently 4096) has been reached.
System Action: The connection is rejected with return code 8, reason code 34.
User Response: If you anticipate a need for more than 4096 AXM server connections within a single MVS image, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: Console
Module: AXMSC

AXMSC0035 Connection to server prefix.name failed because request limit reqs exceeds 9999.
Explanation: The current region tried to establish an AXM connection to the AXM server prefix.name but the connection parameter specifying the maximum number of concurrent requests to be supported exceeds 9999.
System Action: The connection is rejected with return code 8, reason code 35.
User Response: Check whether the server interface program is specifying the correct value for the maximum number of concurrent requests.
Destination: Console
Module: AXMSC
AXMSC0036 Connection to server prefix.name was rejected by the server.

**Explanation:** The current region tried to establish an AXM connection to the AXM server prefix.name but the server-defined connection exit rejected the request.

**System Action:** The connection is rejected with return code 8, reason code 36.

**User Response:** The reason for the rejection depends on the server code, but this typically occurs if the server is preparing to close down or has insufficient resources to accept another connection.

**Destination:** Console

**Module:** AXMSC

AXMSC0037 Connection to server prefix.name failed because the server is terminating.

**Explanation:** The current region tried to establish an AXM connection to the AXM server prefix.name but the server entered termination processing while the connection request was in progress.

**System Action:** The connection is rejected with return code 8, reason code 37. The instance of the server that was being terminated will no longer be visible to any new connection attempts.

**User Response:** Retry the connection when the server has been restarted.

**Destination:** Console

**Module:** AXMSC

AXMSC0038 Connection to server prefix.name failed because this address space is already connected to it.

**Explanation:** The current region tried to establish an AXM connection to the AXM server prefix.name but it already has a connection to the same server region. AXM does not support multiple connections from the same region to the same server region.

**System Action:** The connection is rejected with return code 8, reason code 38.

**User Response:** None.

**Destination:** Console

**Module:** AXMSC

AXMSC0041I Connection to server prefix.name has been closed.

**Explanation:** An AXM connection from the current region to the named server has been terminated, either as a result of being explicitly closed by this region or as a result of the termination of the MVS TCB which originally established the connection.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** Console

**Module:** AXMSC

AXMSC0042 Connection close failed for token xxxxxxxx, reason is n.

**Explanation:** An attempt was made to close an AXM connection explicitly but the specified connection token did not refer to an active connection owned by the current region, or the connection could not be closed for some other reason.

The reason code indicates which validity check failed within procedure AXMSCCLS. Reason code 9 indicates that a request issued via the connection has not yet completed. Any other reason code probably indicates an incorrect token.

**System Action:** The attempt is rejected with return code 8, reason code 42.

**User Response:** Check that the connection close request is specifying the correct connection token and that there are no incomplete requests for the connection.

**Destination:** Console

**Module:** AXMSC

AXMSC0051I Server prefix.name is now enabled for connections.

**Explanation:** This AXM server has completed initialization and is now available for connections from other address spaces.

**System Action:** Processing continues.

**User Response:** None.

**Destination:** Console

**Module:** AXMSC

AXMSC0052 Server prefix.name cannot be enabled because it is already active in another address space.

**Explanation:** Only one instance of a given AXM server name can be active in an MVS image at a time.

**System Action:** The attempt to enable the server interface is rejected with return code 8, reason code 52.

**User Response:** None.

**Destination:** Console

**Module:** AXMSC

AXMSC0053 Server prefix.name cannot be enabled because caller is not APF authorized.

**Explanation:** AXM requires that an AXM server region must be running APF authorized in order to be allowed to enable its server interface.

**System Action:** The attempt to enable the server interface is rejected with return code 8, reason code 53.

**User Response:** Ensure that the server program is executed from an APF authorized library and is link-edited with AC(1).

**Destination:** Console

**Module:** AXMSC
AXMSC0054 Server prefix.name cannot be enabled because the security system rejected the request.

Explanation: The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System Action: The attempt to enable the server interface is rejected with return code 8, reason code 54.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0057 Server prefix.name cannot be enabled because the security system rejected the request.

Explanation: The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System Action: The attempt to enable the server interface is rejected with return code 8, reason code 54.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0058 Server prefix.name cannot be enabled because the security system rejected the request.

Explanation: The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System Action: The attempt to enable the server interface is rejected with return code 8, reason code 54.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0059 Server prefix.name cannot be enabled because the security system rejected the request.

Explanation: The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System Action: The attempt to enable the server interface is rejected with return code 8, reason code 54.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0061 Server prefix.name is now disabled for connections.

Explanation: This AXM server is terminating and is no longer available for connections from other address spaces. This occurs either when the server explicitly disables its interface or when the server job step task terminates.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0062 Server disable failed for token xxxxxxxx, reason is n.

Explanation: An attempt to disable the server interface failed because the specified server interface token did not correctly identify an active server interface established by the current address space.

The reason code provides an internal indication of which validity check failed within procedure AXMSCDIS. All reason codes probably indicate an incorrect token.

System Action: The attempt to disable the server interface is rejected with return code 8, reason code 62. If the server interface is still enabled, it will be disabled automatically when the job step task terminates.

User Response: As the server interface token is stored internally by AXM, the only known possible reason for this message is storage overwriting within the server region.

Destination: Console

Module: AXMSC

AXMSC0063 Server prefix.name cannot be disabled because caller is not APF authorized.

Explanation: AXM requires that an AXM server region must be running APF authorized in order to be allowed to disable its server interface.

System Action: The attempt to disable the server interface is rejected with return code 8, reason code 63.

User Response: Ensure that the server program is executed from an APF authorized library and is link-edited with AC(1).

Destination: Console

Module: AXMSC

AXMSC0064 Server prefix.name cannot be disabled because caller is not APF authorized.

Explanation: AXM requires that an AXM server region must be running APF authorized in order to be allowed to disable its server interface.

System Action: The attempt to disable the server interface is rejected with return code 8, reason code 63.

User Response: Ensure that the server program is executed from an APF authorized library and is link-edited with AC(1).

Destination: Console

Module: AXMSC

AXMSC0065 Server prefix.name cannot be enabled because the security system rejected the request.

Explanation: The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System Action: The attempt to enable the server interface is rejected with return code 8, reason code 54.

User Response: See the previous AXM message giving details of the results of the security check.

Destination: Console

Module: AXMSC

AXMSC0066 Server prefix.name cannot be enabled because the security system rejected the request.

Explanation: The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System Action: The attempt to enable the server interface is rejected with return code 8, reason code 54.

User Response: See the previous AXM message giving details of the results of the security check.

Destination: Console

Module: AXMSC

AXMSC0067 Server prefix.name cannot be enabled because the security system rejected the request.

Explanation: The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System Action: The attempt to enable the server interface is rejected with return code 8, reason code 54.

User Response: See the previous AXM message giving details of the results of the security check.

Destination: Console

Module: AXMSC

AXMSC0068 Server prefix.name cannot be enabled because the security system rejected the request.

Explanation: The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System Action: The attempt to enable the server interface is rejected with return code 8, reason code 54.

User Response: See the previous AXM message giving details of the results of the security check.

Destination: Console

Module: AXMSC

AXMSC0069 Server prefix.name cannot be enabled because the security system rejected the request.

Explanation: The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System Action: The attempt to enable the server interface is rejected with return code 8, reason code 54.

User Response: See the previous AXM message giving details of the results of the security check.

Destination: Console

Module: AXMSC

AXMSC0070 Server prefix.name cannot be enabled because the security system rejected the request.

Explanation: The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System Action: The attempt to enable the server interface is rejected with return code 8, reason code 54.

User Response: See the previous AXM message giving details of the results of the security check.

Destination: Console

Module: AXMSC

AXMSC0071 Server name prefix.name has incorrect syntax for access checks.

Explanation: The security checking routine has detected that the AXM server name specified on a connection request or on a server enable request is not in the correct form, for example because either the prefix or name is blank. This means that the security check cannot be performed.

System Action: A return code is set to indicate that the security check failed.

User Response: Check that the server prefix and name are specified correctly. The prefix is normally defined by the server, but the name may be set from a user-specified server parameter.

Destination: Console

Module: AXMSC

AXMSC0072 level access authorization was denied for FACILITY facility.

Explanation: The external security manager has indicated that the current region is not authorized for the required level of access to the specified facility.

System Action: A return code is set to indicate that the security check failed.

User Response: Check whether the userid for the region has been authorized to access the specified facility resource name.

Destination: Console

Module: AXMSC

AXMSC0073 level access authorization is unavailable for FACILITY facility.

Explanation: The external security manager has indicated that it is unable to determine whether the current region is authorized for the required level of access to the specified facility. This message is only issued if it is not possible for the security routine to determine whether security checking is actually required. In cases where it is obvious that no security check is required (for example because no external security manager is installed), access is granted anyway.

System Action: A return code is set to indicate that the security check failed.

User Response: Check whether the external security manager is available and whether the security definitions for the specified facility have been provided.

Destination: Console

Module: AXMSC

AXMSC0074 RACROUTE REQUEST=AUTH gave R15=xxxxxxxx, SAFPRRET=xxxxxxxx, SAFPRREA=xxxxxxxx.

Explanation: This message provides additional details about the results of a security check in any case where access is not granted. See the documentation of the RACROUTE macro for further information.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: AXMSC
AXMSC0075 RACROUTE REQUEST=STAT gave R15=xxxxxxxx, SAFPRRET=xxxxxxxx, SAFPRREA=xxxxxxxx.

Explanation: This message provides additional details about the results of a security check in any case where access is not granted. See the documentation of the RACROUTE macro for further information.

System Action: Processing continues.
User Response: None.
Destination: Console
Module: AXMSC

AXMSC0991I Creating new AXM system services anchor at address.

Explanation: This message is issued during AXM system services initialization to enable the system services anchor to be located if necessary for diagnostic purposes.

System Action: AXM system services initialization processing continues.
User Response: None.
Destination: Console
Module: AXMSC

AXMSC0992I Deleting old AXM system services anchor at address.

Explanation: This message is issued during AXM system services initialization if AXM system services were previously active but had been terminated (which is not possible in normal production environment). The old system services anchor is retained after AXM termination because it contains the system LX to be used if AXM is restarted. This message gives the address of the old system services anchor for diagnostic purposes.

System Action: AXM system services initialization processing continues.
User Response: None.
Destination: Console
Module: AXMSC

AXM subsystem initialization messages

AXMSI0001I AXM subsystem initialization is in progress.

Explanation: The AXM subsystem initialization program has been started in order to initialize AXM system services.

System Action: AXM system services will be loaded and initialized.
User Response: None.
Destination: Console
Module: AXMSI

AXMSI0002I AXM subsystem initialization has completed.

Explanation: The AXM subsystem initialization program has completed execution.

System Action: The program returns control to MVS.
User Response: None.
Destination: Console
Module: AXMSI

AXMSI0003 AXM subsystem initialization return code retcode, reason code rsncode.

Explanation: The AXM subsystem initialization routine has not completed normally. This message indicates the final return code and reason code. This is normally the return code from AXM system services initialization.

System Action: The subsystem initialization routine returns control to MVS.
User Response: See the previous AXM message describing the cause of the problem. The reason code will normally be the number of an error message issued by AXMSC.
Destination: Console
Module: AXMSI

AXMSI0004 AXM subsystem initialization can only run in Master Scheduler address space.

Explanation: An attempt has been made to invoke the AXM subsystem initialization program AXMSI in some other way than as an MVS subsystem initialization program running in the Master Scheduler region (ASID 0001).

System Action: The subsystem initialization program is abnormally terminated.
User Response: None.
Destination: Console
Module: AXMSI

AXM system region messages

AXMSR0001I AXM system region initialization is in progress.

Explanation: An AXM system region is being started. This is used to initialize AXM system services in a testing environment for development purposes, and allows AXM system services to be closed down and restarted without an IPL.

System Action: Processing continues.
User Response: None.
Destination: Console
Module: AXMSR

AXMSR0002I AXM system region initialization has completed.

Explanation: AXM system services have been successfully initialized from the AXM system region.

System Action: Processing continues.
User Response: The system region may be closed down again using the MVS STOP command but this should only be done when it is certain that no AXM services are being used within the MVS image.
AXMSR0003I

Destination: Console
Module: AXMSR

AXMSR0003I AXM system region termination is in progress.
Explanation: The operator has requested termination of the AXM system region using the MVS STOP command.
System Action: AXM system services are terminated.
User Response: None.

Destination: Console
Module: AXMSR

AXMSR0004I AXM system region termination has completed.
Explanation: The AXM system region has completed termination.
System Action: Control is returned to MVS and the job step ends.
User Response: None.

Destination: Console
Module: AXMSR

AXMSR0011 AXM system region can only run under MVS/ESA.
Explanation: An attempt was made to execute the AXM system region program AXMSR in a non-MVS environment.
System Action: The system region program terminates.
User Response: None.

Destination: Console
Module: AXMSR

AXMSR0012 AXM system region program AXMSR needs to be APF authorized.
Explanation: An attempt was made to execute the AXM system region program AXMSR without APF authorization.
System Action: The system region program terminates.
User Response: Ensure that the module AXMSR is stored in an APF-authorized library and is link-edited with AC(1).

Destination: Console
Module: AXMSR

AXMSR0013 AXM system region LOAD for name failed with completion code xxx-nn.
Explanation: The attempt to LOAD the system services module (AXMSC) failed.
System Action: The system region program terminates.
User Response: See the description of the system completion code xxx in MVS/ESA System Codes for the reason that the LOAD failed.

Destination: Console
Module: AXMSR

AXMSR0021 AXM system region does not support this command: text
Explanation: An attempt was made to issue a command to the AXM system region using the MVS MODIFY command. The AXM system region only supports the MVS STOP command, and does not support commands entered via MODIFY.
System Action: The command is ignored.
User Response: If the intention was to close down the system region, use the MVS STOP command instead.

Destination: Console
Module: AXMSR

AXMSR0022I AXM system region STOP command has been accepted.
Explanation: An operator has issued a STOP command to close down the AXM system region.
System Action: AXM system services will be terminated.
User Response: None.

Destination: Console
Module: AXMSR

788 CICS Messages and Codes
AXM trace and print file management messages

AXMTR0001 The ddname print file could not be opened.
Explanation: The AXM trace and print file with the specified ddname (usually AXMPRINT or SYSPRINT) could not be opened during AXM initialization.
System Action: Print file output requests will be ignored.
User Response: Ensure that the appropriate DD statement is present. The default ddname is AXMPRINT, but this may be overridden to SYSPRINT by an AXMTRDEF definition within the server code if the server does not need to reserve the name SYSPRINT for any other purpose.
Destination: Console
Module: AXMTR

AXM address lookup (WHERE) messages

AXMWH0001I Address address is at +offset in modtype module modname.
Explanation: This message may be produced after an abend or TRAP message to identify the module containing the error address, if the module is known to MVS. The information about the module and type is obtained using the MVS macros CSVQUERY or NUCLKUP.
System Action: Processing continues.
User Response: None.
Destination: Console and print file
Module: AXMWH

AXMWH0002I Address address is at +offset in procedure procname.
Explanation: This message may be produced after an abend or TRAP message to identify the procedure containing the error address, if the storage is within a known module and a standard SAVE sequence including a procedure identifier appears at some point before the error address.
System Action: Processing continues.
User Response: None.
Destination: Console
Module: AXMWH

AXM cross-memory interface messages

AXMXM0011 Server prefix.name cannot be enabled because AXM system services are not available.
Explanation: An attempt has been made to enable a server interface but AXM system services have not been initialized within this MVS image.
System Action: The server enable request is rejected.
User Response: Ensure that AXM system services are started then start the server again.
Destination: Console and SYSPRINT
Module: AXMXM

AXMXM0012 Enable failed for server prefix.name, return code retcode, reason rsncode.
Explanation: The server interface could not be enabled. The specific reason will have been indicated by an earlier AXMSC message.
System Action: The server enable request is rejected.
User Response: None.
Destination: Console and SYSPRINT
Module: AXMXM

AXMXM0021 ABEND xxx-rr occurred at address, data word1 word2 word3.
Explanation: The ARR routine for an AXM cross-memory program call routine has intercepted an abend in a cross-memory mode AXM task and has passed the associated SDWA to a task in the server address space to issue the appropriate diagnostic messages. The abend code is shown as three hexadecimal digits for a system completion code or four decimal digits for a user completion code. The data consists of the twelve bytes around the PSW address as provided by MVS in the SDWA.
System Action: The ARR will already have completed processing when this message is issued, as the message is written out by the server region. If recovery is allowed, the ARR terminates the affected AXM internal task, in which case the return code from the cross-memory request will consist of the completion code in the usual MVS format but with the high-order bit set to indicate an abend. If recovery is not allowed, the ARR percolates the error, passing the abend to the requesting region.
The diagnostic routine which writes this message will call AXMWH which attempts to identify the module and procedure in which the abend occurred and writes out a further message if successful. It then releases the MVS SDWA. Server execution is not directly affected by an abend in cross-memory mode.
User Response: Look up the completion code to identify the cause of the abend.
Destination: Console and SYSPRINT
Module: AXMXM

AXMXM0022 TRAP occurred at offset offset in procname.
Explanation: An internal logic error in a server module or invalid parameters on a server request resulted in a TRAP macro being executed at the specified location in cross-memory mode.
The system will normally produce a symptom dump message on the job log, and a full dump of the connected region may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the JCL for the connected region.
System Action: The AXM task is abnormally terminated.
User Response: This probably indicates a logic error in server code, or an attempt to use some internal component of the server outside its correct context.
If the procedure name in the message begins with AXM, this probably indicates that the server code which called it has passed inconsistent parameters, such as an invalid address when releasing main storage.
Destination: Console
Module: AXMXM
Chapter 3. Transaction abend codes

When abnormal conditions occur, CICS can send a message to the CSMT transient data destination containing the transaction ID, the program name and the abend code. Here is an example:

```
DFHAC2236 date time applid Transaction tranid abend primary abcode in program program name term termid backout successful
{ batchid = }batchid. message
```

Alternatively, the application can intercept abends by including an active EXEC CICS HANDLE ABEND command. The actual abend code can be determined by issuing the EXEC CICS ASSIGN command with the ABCODE option.

The transaction identification code `tranid` usually consists of the 4 characters defined to CICS. However, when a transaction is initiated by using a light pen, an operator identification (OPID) card reader, or 3270 PA or PF keys (specified in the TASKREQ= operand), CICS creates an internal transaction identification in the form of a 1-byte 3270 attention identification (AID) code followed by 3 bytes of X'FF'.

The code that may actually appear in the message in place of the internally-created transaction identification will be "xx", where `xx` is the character translation of the 3270 AID code. To prevent ambiguity, the user should avoid using these codes as transaction identifiers.

The keys, the light pen (LPA), and OPID, and their corresponding printed AID codes are given in the following list:

```
PF1   "F1"     PF13  "C1"     LPA    "7E"
PF2   "F2"     PF14  "C2"     OPID   "6E"
PF3   "F3"     PF15  "C3"     PA1    "6C"
PF4   "F4"     PF16  "C4"     PA2    "6E"
PF5   "F5"     PF17  "C5"     PA3    "6B"
PF6   "F6"     PF18  "C6"
PF7   "F7"     PF19  "C7"
PF8   "F8"     PF20  "C8"
PF9   "F9"     PF21  "C9"
PF10  "7A"     PF22  "4A"
PF11  "7B"     PF23  "4B"
PF12  "7C"     PF24  "4C"
```

An abend code indicates the cause of an error that may have been originated by CICS or by a user program. For most of the abend codes described, a CICS transaction dump is provided at abnormal termination.

All CICS transaction abend codes `abcode` are 4-character alphanumeric codes of the form `Axx`, where:

- `A` is the IBM-assigned designation of a CICS transaction abend.
- `xx` is the 2-character code assigned by CICS to identify the module that detected an error.
- `y` is the 1-character alphanumeric code assigned by CICS.

**Format of information**

For each transaction abend code, the following information is given:

- An explanation of events leading to or following the message.
- The action that has been or will be taken by CICS (system action).
- The action recommended for the user (console or terminal operator).
- The module or modules that can determine that the message should be sent (not necessarily the module or modules that can issue the macro to write the message.)
Abends

AACA
Explanation: An invalid error code has been passed to the DFHTFP or DFHACP programs.
System Action: CICS terminates the task abnormally with a dump.
User Response: Notify the system programmer.
Module: DFHTFP,DFHACP

AALM
Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the log manager (LM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options specified in the dump table).
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: See the related message produced by the domain that detected the original error.
Module: DFHAMLML

AALN
Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the TD manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.
Module: DFHAMTD

AALO
Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the CICS/DB2 table manager DFDHDTM. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.
Module: DFHAMDTD

AALP
Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Program Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.
Module: DFHAMPG

AALQ
Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Business Application Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.
Module: DFHAMBA

AALR
Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Temporary Storage Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.
Module: DFHAMBA

AALS
Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Global Enqueue Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.
Module: DFHAMBA

AALT
Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Internet Inter-Orb Protocol Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.
Module: DFHAMOP

AALU
Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Sockets Domain Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.
AAL1

**Explanation:** DFHALP was processing a request that deadlocked. The most likely reason for the abend is that an ALLOCATE QUEUE request has been suspended because there are no contention-winning links available.

**System Action:** CICS terminates the task abnormally. A dump is taken only if the abend is nontime-out related. A dump is not taken for stall purges and deadlock time-outs.

**User Response:** Ensure that there are enough contention-winning sessions available to satisfy the ALLOCATE QUEUE request.

If you are running with modegroups, ensure that there are contention-winning sessions available to satisfy the ALLOCATE request in that modegroup.

It might be necessary to increase the deadlock timeout (DTIMEOUT) value for the transaction to prevent this abend from recurring.

**Module:** DFHALP

AAL2

**Explanation:** Either an incorrect response (other than PURGED) was returned from the suspend of the allocated task, or an incorrect response was returned from the resume.

**System Action:** The transaction is abnormally terminated with a dump.

**User Response:** Check the return code from the resume or the suspend to determine the cause of the error.

**Module:** DFHALP

AAL3

**Explanation:** The task has been purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition provides an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of a deadlock timeout.

**Module:** DFHALP

AAL4

**Explanation:** An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to SIGNOFF_TERMINAL_USER by DFHALP during sign-off for a surrogate terminal session running CRTE. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related message produced by the domain that detected the original error.

**Module:** DFHALP

AAL6

**Explanation:** An error (INVALID, DISASTER or EXCEPTION response) has occurred on a call to SIGNOFF_TERMINAL_USER by DFHALP during sign-off for a surrogate terminal session running CRTE. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related message produced by the domain that detected the original error.

**Module:** DFHALP

AAL7

**Explanation:** An error (INVALID, DISASTER or EXCEPTION response) has occurred on a call to schedule a remote terminal delete by DFHALP during sign-off for a surrogate terminal session running CRTE. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related message produced by the domain that detected the original error.

**Module:** DFHALP

AAMA

**Explanation:** There is an internal logic error in DFHAMP.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHAMP

AAMC

**Explanation:** The task was purged before a GETMAIN request to the storage manager domain was able to complete successfully.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate the reason the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

**Module:** DFHAMP

AAMD

**Explanation:** An unexpected return code has been received from DFHDMPI. This is due to an internal logic error.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHAMP
AAMF

**Explanation:** An unexpected return code has been received following a call to the kernel (KE) domain. This might be due to an internal logic error.

**System Action:** CICS terminates the task abnormally with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHAMP

AAMG

**Explanation:** An unexpected return code has been received following a call to DFHAFMT. This might be due to an internal logic error.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHAMP

AAMH

**Explanation:** An unexpected return code has been received following a call to DFHFCMT. This might be due to an internal logic error.

**System Action:** CICS terminates the task abnormally with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHAMP

AAMJ

**Explanation:** While installing a file, using RDO, a call was made to DFHFCFS to enable the file. An irrecoverable error was returned from DFHFCFS.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

At the time the error is detected, CICS writes a message to the console, records an exception trace entry and takes a system dump.

**User Response:** Inform the system programmer. Examine the trace and dump to identify the point of error.

**Module:** DFHAMP

AAMO

**Explanation:** An invalid return code was returned from DFHTOR, the CICS terminal object resolution program.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHAMP

AAMP

**Explanation:** An unexpected return code has been received from DFHPUP. This might be due to an internal logic error.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHAMP

AAMQ

**Explanation:** An attempt has been made to install a partner using RDO. However, the partner resource manager (PRM) is unavailable having failed to initialize during CICS initialization.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** If you need to use the PRM, correct the problem which prevented the PRM from initializing, and restart CICS.

**Module:** DFHAMP
AAMS

**Explanation:** There has been an unexpected return code following a GETMAIN request to the storage manager. This is due to an internal logic error.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHAMP

AAMT

**Explanation:** There is an internal logic error in DFHAMP due to an unexpected return code from DFHTMP.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHAMP

AAMZ

**Explanation:** An unexpected return code has been received from DFHZCP. This is due to an internal logic error.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHAMP

AAM1

**Explanation:** DFHXMCCL has returned an unexpected response during the install of a transaction class. This can be caused by the task being purged during the install.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

If an error has occurred, at the time the error is detected, CICS issues a DFHXMnnnnn console message, records an exception trace entry and takes a system dump.

**User Response:** Determine why the task has failed. If there is a system dump, use it together with the trace entry and the console message to resolve the problem. If there is no system dump, the task has been purged either by the master terminal operator or as a result of deadlock timeout.

**Module:** DFHAMP

AAM2

**Explanation:** DFHXMD has returned an unexpected response during the install of a transaction definition. This can be caused by the task being purged during the install.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

If an error has occurred, at the time the error is detected, CICS issues a DFHXMnnnnn console message, records an exception trace entry and takes a system dump.

**User Response:** Determine why the task has failed. If there is a system dump, use it together with the trace entry and the console message to resolve the problem. If there is no system dump, the task has been purged either by the master terminal operator or as a result of deadlock timeout.

**Module:** DFHAMP

User Response: Determine why the task has failed. If there is a system dump, use it together with the trace entry and the console message to resolve the problem. If there is no system dump, the task has been purged either by the master terminal operator or as a result of deadlock timeout.

**Module:** DFHAMP

AAOA

**Explanation:** An application has issued a CPI verb which CICS does not support. The entry point referenced in the application program was resolved in the link edit stub, but the function requested could not be resolved when control passed to CICS.

There are two possible reasons for this:

- You have linkedited your application program with a CPI stub which supports more function than this release of CICS.
- The linkedit stub has been corrupted.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump. An exception trace entry is also written.

**User Response:** At the time of the error, general register 0 points to an 8-byte character string which should match the name of the issued CPI call. Use the trace or the dump to verify that this character string is the name of a CPI function which is supported. If the character string is not an intelligible character string, the stub has probably been corrupted.

**Module:** DFHCPI

AAOB

**Explanation:** An application has issued a CPI verb which specifies more than eight parameters.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump and an exception trace entry is also written.

**User Response:** Change your application program so that the correct number of parameters is specified on the CPI call.

**Module:** DFHCPI

AAOC

**Explanation:** CPI Communications is invoked with an invalid number of parameters for call

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** The exception trace point produced with this abend contains the incorrectly issued CPI Communications verb name. Use this to determine where the application program was in error and amend it accordingly.

The SAA CPI Communications Reference manual, SC26-4399, provides a detailed description of all the CPI Communications verbs and how they should be called.

**Module:** DFHCPARH

AAOD

**Explanation:** The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate the reason the task was purged. It...
AAOE

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHCPCBA

AAOF

Explanation: During the processing of CMACCP (accept conversation), CPI Communications detected that the application was attached with an unsupported sync level.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This condition is caused by a back-end CPI Communications transaction being attached with a sync level that is not CM_NONE (0) or CM_CONFIRM (1).

Change the front-end transaction, (that is, the initiator of the conversation in the other system) so that it defines the sync level correctly.

Module: DFHCPCBS

AAOG

Explanation: The journaling of data received on a CPI Communications mapped conversation has failed. This condition is caused by a nonzero response from the CICS log manager.

Problem Determination: Register 12 addresses the current TCA and field TCAJCAAD and register 4 address the JCA. The CICS log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are:
X'8001' - WRITE
X'8003' - PUT

Possible response codes are:
X'01' - IDERROR - Journal identification error
X'02' - INVREQ - Invalid request
X'03' - STATERR - Status error
X'05' - NOTOPEN - Journal not open
X'06' - LERROR - Journal record length error
X'07' - IOERROR - I/O error.

The address of the TIOA is contained in register 8 and its data length is in TIOATDL.

Analysis:

Register Label Description
R4=0JCA TCZARQPJ JCAJCRC is nonzero.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the dump to ascertain why the journal or log record could not be written correctly. If a journal record length error is indicated, TIOATDL may have been corrupted.

Module: DFHCPCOJ

AAOI

Explanation: The journaling of data sent on a CPI Communications mapped conversation has failed.

Problem Determination: Register 12 addresses the current TCA and field TCAJCAAD and register 4 address the JCA. The CICS log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are:
X'8001' WRITE
X'8003' PUT

Possible response codes are:
X'01' IDERROR - Journal identification error
X'02' INVREQ - Invalid request
X'03' STATERR - Status error
X'05' NOTOPEN - Journal not open
X'06' LERROR - Journal record length error
X'07' IOERROR - I/O error.

The address of the TIOA is contained in register 8 and its data length is in TIOATDL.

Analysis:

Register Label Description
R4=0JCA TCZARQPJ JCAJCRC is nonzero.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This condition is caused by an invalid response from the log manager. Use the dump to ascertain why the journal or log record could not be written correctly. If a journal record length error is indicated, TIOATDL may have been corrupted.

Modules: DFHCPCRI, DFHCPCRW
Chapter 3. Transaction abend codes

AAOJ
Explanation: CPI Communications has detected an unexpected response from one of its internal routines.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: This is a CICS internal logic error.
A level 2 trace for ‘CP’ of the transaction shows the course of events prior to this error. For example, the modules called and their parameters. The level 2 trace also provides details of the error itself.
You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCPIC

AAOK
Explanation: CPI Communications has detected an unexpected call to one of its internal routines.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: This is a CICS internal logic error.
A level 2 trace for ‘CP’ of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.
You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCPIC

AAOL
Explanation: CPI Communications has made an invalid call to DFHLUC.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: This is a CICS internal logic error.
A level 2 trace for ‘CP’ of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.
You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCPIC

AAOO
Explanation: CPI Communications has detected an unexpected response from DFHLUC.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: This is a CICS internal logic error.
A level 2 trace for ‘CP’ of the transaction shows the course of events prior to this error. For example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

Modules: DFHCPCLR, DFHCPSRH

AAON
Explanation: CPI Communications has been invoked with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: A level 2 trace for ‘CP’ of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself.
You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCPCLR, DFHCPCLC

AAOP
Explanation: The CPI Communications state machine has been requested to perform a state transition request that is considered to be an ‘impossible’ situation. (The SAA CPI Communications Reference manual, (SC26-4399) documents all these situations.)
There are two possible causes of this error:
- The CPC (conversation control block) has been overwritten in such a way that the conversation state has been altered, or
- There is an error in the CPI Communications state machine.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: A level 2 trace for ‘CP’ of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.
The transaction dump shows the CPC. You may need further assistance from IBM to fully resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCPARH

AAOQ
Explanation: The CPI Communications and the DFHZUSR state machines are out of synchronization.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: This is a CICS internal logic error.
A level 2 trace for ‘CP’ of the transaction shows the course of events prior to this error. For example, the modules called and their parameters. The level 2 trace also provides details of the error itself.
You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCPARH

AAOR
Explanation: The CPI Communications state machine has been requested to perform a state transition request that is considered to be an ‘impossible’ situation. (The SAA CPI Communications Reference manual, (SC26-4399) documents all these situations.)
There are two possible causes of this error:
- The CPC (conversation control block) has been overwritten in such a way that the conversation state has been altered, or
- There is an error in the CPI Communications state machine.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: A level 2 trace for ‘CP’ of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.
The transaction dump shows the CPC. You may need further assistance from IBM to fully resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCPCFS
AAOQ

**Explanation:** The return code generated by CPI Communications does not have an entry in the state table against the current CPI Communications verb. This error is detected by the CPI Communications state machine.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** This is a CICS internal logic error.

A level 2 trace for ‘CP’ of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCPCFS

AAOR

**Explanation:** CPI Communications has detected an invalid value in the CPC (conversation control block).

There are 2 possible causes of this error:

- The CPC (conversation control block) has been overwritten, or
- There is an error in CPI Communications which causes it to reject valid values.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** A level 2 trace for ‘CP’ of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

**Module:** DFHCPCIC

AAOS

**Explanation:** CPI Communications has detected that the conversation state is RESET for a situation where this should not occur. That is, the conversation control block (CPC) is about to be deleted.

There are two possible causes of this error:

- The CPC has been overwritten, or
- There is an error in CPI communications.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** A level 2 trace for ‘CP’ of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

**Module:** DFHCPCIC

AAOT

**Explanation:** While chaining through the CPCs (conversation control blocks) for a given conversation, CPI Communications detected that the chain was broken.

There are two possible causes of this error.

1. The CPC chain has been overwritten, or
2. There is an error in the CPI Communications chaining mechanism.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Determine which of the above caused the error.

A level 2 trace for ‘CP’ of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCPCIC

AAOU

**Explanation:** CPI Communications has detected an error in the TP_name or partner_LU_name while processing an initialize conversation request. The TP_name or partner_LU_name is obtained by lookup of the sym_dest_name in the partner resource table (PRT).

There are two possible causes of this error.

1. The entry in the PRT contains invalid data, or
2. There is an error in the mechanism that returns the data from the PRT and interprets it.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** A level 2 trace for ‘CP’ of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCPCIC

AAOV

**Explanation:** CPI Communications has detected that its internal state table is corrupted. This error is detected by the CPI Communications state machine.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** This is a CICS internal logic error.

A level 2 trace for ‘CP’ of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCPCFS
**AAOW**

*Explanation:* CPI Communications has detected an internal logic error in DFHCPCLC.

*System Action:* The transaction is abnormally terminated with a CICS transaction dump.

*User Response:* This is a CICS internal logic error. A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCPCLC

---

**AAOX**

*Explanation:* CPI Communications has detected a bad syncpoint return code which has been set on a synclevel 0 or 1 conversation. The bad return code is only expected on a synclevel 2 conversation.

*System Action:* The transaction is abnormally terminated with a CICS transaction dump.

*User Response:* This is a CICS internal logic error. A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCPIC

---

**AAOY**

*Explanation:* CPI Communications detected an invalid LL field in the GDS records from which it was receiving on a mapped conversation. Although it is possible that the remote system is sending invalid records, it is more likely to be an error in the receive logic because DFHZARRC (a lower level receive module) also checks the LLs before passing them to CPI Communications.

*System Action:* The transaction is abnormally terminated with a CICS transaction dump.

*User Response:* Use CICS traces and, possibly, a VTAM trace to determine the data that was sent between both systems. A level 2 CICS trace for 'CP' of the transaction documents the course of events prior to this error (such as the modules called and their parameters). The level 2 trace also provides details of the error itself.

You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCPIC

---

**AAO2**

*Explanation:* CPI Communications has detected an unexpected response from DFHLUC.

*System Action:* The transaction is abnormally terminated with a CICS transaction dump. An exception trace entry is also written when this event occurs.

*User Response:* This is a CICS internal logic error. A level 2 CICS trace for 'CP' of the transaction documents the course of events prior to this error (such as the modules called and their parameters). The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCPCRB

---

**AAO3**

*Explanation:* The CPI interface detected that a call was made to a CPI Communications function without CPI Communications being initialized. This implies that CPI Communications initialization failed while CICS was initializing.

*System Action:* The transaction is abnormally terminated with a CICS transaction dump. An exception trace entry is also written when this event occurs.

*User Response:* Check the console listing to determine the reason why CPI Communications failed to initialize during CICS initialization. Correct the problem and restart CICS. If the console listing indicates that CPI Communications initialized successfully, you need further assistance to resolve the problem. Collect the console listing, the traces and the transaction dump. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCPI
**AAO4**

**Explanation:** DFHZARL, or a module called by DFHZARL, has detected a logic error. This error is almost certainly caused by the module receiving invalid data or indicators from VTAM.

**System Action:** Before returning to the CPI Communications layer, DFHZARL calls DFHZNAC to clean up the session and put out messages on the CSNE log. CPI Communications abnormally terminates the transaction with a CICS transaction dump, and produces an exception trace entry.

**User Response:** Check the CSNE log to determine the type of error. You may need further assistance from IBM to fully resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCPCCLR

---

**AAO5**

**Explanation:** The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

**Modules:** DFHCPCBA, DFHCPCBI, DFHCPCBS

---

**AAO7**

**Explanation:** The CPI Communications syncpoint request handler has been passed an invalid DFHLUC parameter list. This is a CICS internal logic error.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** A level 2 trace for ‘CP’ of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCPSRH

---

**AAO8**

**Explanation:** The CPI Communications syncpoint request handler has been passed an invalid conversation control block (CPC). This is a CICS internal logic error.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** A level 2 trace for ‘CP’ of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

---

**AAO9**

**Explanation:** A task has been purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why the task was purged. If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

**Module:** DFHCPCCLR

---

**ABAC**

**Explanation:** An activity issued EXEC CICS RETURN (without the ENDACTIVITY option) but no events were processed during the activation. The activity was executed with a RUN command.

**System Action:** The task is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

**User Response:** Investigate why the activity did not process any events.

**Module:** DFHBASP

---

**ABAD**

**Explanation:** An activity issued EXEC CICS RETURN ENDACTIVITY while there were activity completion events pending. The activity was executed with a RUN command.

**System Action:** The task is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

**User Response:** Investigate why the activity had pending activity completion events.

**Module:** DFHBASP

---

**ABAE**

**Explanation:** An activity issued EXEC CICS RETURN (without the ENDACTIVITY option) but no events were processed during the activation. The activity was executed with a LINK command.

**System Action:** The task which issued the LINK is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

**User Response:** Investigate why the activity did not process any events.

**Module:** DFHEIBAM
Chapter 3. Transaction abend codes

**ABAF**

**Explanation:** An activity issued EXEC CICS RETURN ENDACTIVITY while there were activity completion events pending. The activity was executed with a LINK command.

**System Action:** The task which issued the LINK is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

**User Response:** Investigate why the activity had pending activity completion events.

**Module:** DFHEIBAM

---

**ABLA**

**Explanation:** The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

**Modules:** DFHMCP, DFHMCPE, DFHM32, DFHPBP, DFHRLR

---

**ABLB**

**Explanation:** An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Please see the related message produced by the domain that originally detected the error.

**Modules:** DFHMCP, DFHMCPE, DFHM32, DFHPBP, DFHRLR

---

**ABMA**

**Explanation:** The user has supplied a terminal I/O area (TIOA) with an invalid data length that was either equal to zero or greater than the storage accounting length minus 12.

Alternatively, the length field of a header or trailer area provided by the application program is invalid (that is, not positive).

**Problem Determination:** The output services work area (OSPWA) is in user storage and will be printed in a transaction dump. It is addressed by register 2 at the time of the abend. Relevant fields are:

- **OSPTR7**
- **OSPHDRA**
- **OSPTRLA**

Register 4 or OSPTIOA points to the TIOA. In the TIOA, the following fields are relevant:

<table>
<thead>
<tr>
<th>Register</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R4=0TIOA</td>
<td>PBCKTDL</td>
<td>TIOATDL is zero or greater</td>
</tr>
<tr>
<td></td>
<td></td>
<td>than TIOASAL-12.</td>
</tr>
<tr>
<td>R2=0OSPA</td>
<td>PB20680</td>
<td>R0 (= first halfword of</td>
</tr>
<tr>
<td></td>
<td></td>
<td>trailer) is zero.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>R8=OSPTRLA.</td>
</tr>
<tr>
<td>R8=@trailer</td>
<td></td>
<td>OSPTR7 has X’20’ bit set.</td>
</tr>
<tr>
<td>R2=@OSPWA</td>
<td>PBD2/zerodot/zerodot8/zerodot</td>
<td>(= first halfword of</td>
</tr>
<tr>
<td></td>
<td></td>
<td>header) is zero.</td>
</tr>
<tr>
<td>R2=0OSPNA</td>
<td>PBOTXHDR</td>
<td>R0 (= first halfword of</td>
</tr>
<tr>
<td></td>
<td></td>
<td>header) is zero.</td>
</tr>
<tr>
<td>R0=length</td>
<td></td>
<td>R8=OSPHDRA.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>OSPTR7 has X’40’ bit set.</td>
</tr>
</tbody>
</table>

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Correct the program that supplied the erroneous data length.

Check the TIOA. If either of the conditions described is present, check the application program. For programs using command-level interface, the TIOA is obtained by CICS using the length of the data item passed in the FROM option on an EXEC CICS SEND MAP or EXEC CICS SEND TEXT command, or in the TRAILER or HEADER option on an EXEC CICS SEND TEXT or an EXEC CICS SEND PAGE command. Check the data item for zero length.

Header and trailer records have a special format described in the CICS Application Programming Reference. An ABMA abend occurs if the first halfword (the length) is not positive. Check the remainder of the header/trailer record for validity when the length is checked.

**Modules:** DFHPBP, DFHMCPE

---

**ABMB**

**Explanation:** The user has specified a cursor position in the BMS output request. It is larger than the current screen size for the 3270 for which output is being built.

**Problem Determination:** If the abend occurs in DFHPBP:

At the time of the abend, register 2 points to the OSPWA and register 1 to the TTP. Relevant fields are:

- **OSPTR3** has X’10’ bit set to indicate a user-specified cursor position
- **OSPCP** contains a halfword cursor position specified by user
- **TPSCSZ** contains the halfword value of the screen size to compare against.

If the abend occurs in DFHMCP or DFHM32:

- Register 6 points to the OSPWA (in LIFO storage)
- **OSPCP** contains a halfword cursor position specified by user
- **OSPTR3** has X’10’ bit set to indicate a user-specified cursor position
- **TPSCSZ** contains the halfword value of the screen size to compare against.

**Analysis:**
### Register Label Description

<table>
<thead>
<tr>
<th>Register</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>In DFHPBP:</td>
<td>R2=OSPWA PBDBADC OSPTR3 X'1/zerodot' bit set indicates the user-specified cursor position.</td>
<td>TPPSzs halfword screen size. OSPCP halfword cursor position.</td>
</tr>
<tr>
<td></td>
<td>R1=TTP</td>
<td></td>
</tr>
<tr>
<td>In DFHKCP or DFHMCX:</td>
<td>R6=OSPWA MCENEAU2 OSPTR3 X'1/zerodot' bit set indicates the user-specified cursor position.</td>
<td>OSPSZSz halfword screen size. OSPCP halfword cursor position.</td>
</tr>
</tbody>
</table>

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Correct the program that specified the incorrect cursor location.

Use trace to identify the statement issuing the request. Check that the cursor position is being correctly set. The program may have been designed to run in alternate screen size mode but is being run in default screen size mode, or it may have been designed to run on a 3270 model different from the one in use. If the program is routing a message, the route list should be checked. If the program is to run with various 3270 models, the cursor position should be within the size of the smallest screen.

**Modules:** DFHPBP, DFHMCP (for minimum-function BMS), DFHMCX

### ABME

**Explanation:** DFHTPR or DFHTPP has detected an invalid datastream while processing a basic mapping support (BMS) request.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump in which register 7 indicates the location at which the abend was detected.

**User Response:** Examine the transaction dump for bad data in the TIOA. If the origin of the bad data is an application program, correct the program.

**Modules:** DFHTPP, DFHTPR

### ABMF

**Explanation:** The value specified for the length option of the basic mapping support (BMS) send map is greater than the length of the ‘from’ area.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Redefine the value for the length option.

**Module:** DFHPBP

### ABMG

**Explanation:** The user has requested a basic mapping support (BMS) service that was not specified at system generation, or at initialization.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Correlate services requested against options specified in the system generation of BMS.

Follow this procedure:

1. Scan the trace table for the transaction ID that issued the abend. If this is CSPQR (page cleanup), module DFHTPQR abnormally terminated because a message purge delay of zero has been specified and CSPQR has been entered via a terminal. The message purge delay is specified in the PRGDLAY of the DFHSIT macro, and its value can be found in SITPRGD.

2. Scan the trace table for the last BMS request (code ‘FA’). Use the option bytes at the start of the failing module to see if the requested functions have been generated. For example, paging may have been requested, but standard or minimum BMS was specified in the SIT.

3. If the BMS request is compatible with the BMS options in the CICS system generation, some incompatible suffixing amongst BMS modules must have occurred. This can happen if the DFHSIT macro specified individual suffixes for the BMS modules.

The following modules differ between standard and full-function BMS:

DFHMCP DFHRLR DFHPBP DFHTPP

**Modules:** DFHMCP, DFHTPR
**ABMI**

**Explanation:** The map specified for a BMS input mapping request was not an input map.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Either define another input map or redefine the existing map.

**Modules:** DFHMC, DFHMCY, DFHMCY

**ABML**

**Explanation:** The terminal control locate routine received invalid data from DFHRDLR and returns an error return code. DFHRDLR is attempting to scan the TCT for a BMS ROUTE request with LIST=ALL or operator class or operator ID specified in the route list. The terminal control table may have been corrupted.

**Problem Determination:** Register 11 points to the current TCTTE in the search.

The TCT prefix (DFHTCST) can be located from CSATCTBA. The first terminal entry (TCTTE) in the TCT is addressed by TCTVTBA. TCTTETEL is the halfword offset from current TCTTE to the next.

**Analysis:** The current TCTTE address is either not on a full-word boundary or is not within the limits of the TCT, or the address of the next TCTTE, obtained by adding TCTTETEL to the current address, is invalid. This check is made by locate code (DFHZLOC) in DFHZCX.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

The terminal control table has probably been corrupted during execution. Attempt to scan through the TCT in a dump. (Because the system dump uses the same technique for printing all TCTTEs, the system dump fails at the same point.)

Determine which entry is incorrect. It may be that the TCTTE has been overwritten by user data that is recognizable in the dump.

Check the application program for references to the TCTTE pointer. Check for user data that may be addressed from the same pointer.

In an assembler program, there may be multiple equates for the TCTTE base register.

It may be that the TCT is being overwritten by some earlier transaction. If this is so, it is probably one associated with the terminal whose TCTTE is overwritten.

**Modules:** DFHRDLR for full-function BMS

**ABMM**

**Explanation:** An invalid map was specified.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Use the supplied dump to diagnose the problem. Register 6 contains the address of the BMS instruction being executed when the error was recognized.

**Module:** DFHPBP

**ABMO**

**Explanation:** The map specified for a BMS output mapping request was not an output map.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Either define another output map or redefine the existing map.

**Modules:** DFHMC, DFHMCY, DFHMCY

**ABMQ**

**Explanation:** The query transaction (CQRY) has been initiated and either the task is not terminal-oriented, or the associated terminal is not defined to CICS as a 3270 or SCSPRINT device. This abend will occur if CQRY is entered at a console, even when the console is a 3270 device, since the console has the appearance to CICS of a keyboard/printer device. The CQRY transaction does not have an operator interface, and under normal conditions there is no need for an operator to invoke CQRY or for a user transaction to START the CQRY transaction. CQRY can be run automatically by CICS when a 3270 or SCSPRINT device connects. In the transaction dump, register 8 contains the address of the TCTTE for the associated terminal. If register 8 contains zero, this indicates that the task is not terminal-oriented.

**System Action:** The task is abnormally terminated with a CICS dump.

**User Response:** Ensure that the terminal associated with CQRY is of the 3270 or SCSPRINT family of devices.

**Module:** DFHQR

**ABMR**

**Explanation:** The Page Retrieval transaction (CSPG) has been initiated but the task is not terminal-oriented.

**System Action:** The task is abnormally terminated with a CICS dump.

**User Response:** Ensure that a terminal is associated with the CSPG transaction.

**Module:** DFHTPR

**ABMU**

**Explanation:** The application program supplied an address that is not within region boundaries. The low-order 3 bytes of general register 1 in the transaction dump contain the erroneous address. The high-order byte of register 1 indicates the address type as follows:

- X'01': Title address (TCAMSTA)
- X'02': Alternate I/O area address (TCAMSOA)
- X'03': Map address (TCAMSM)
- X'04': Header address (TCAMSRD)
- X'05': Route list address (TCAMSLA)
- X'06': Trailer address (TCAMSTL)
- X'07': Map set address (TCAMS)
- X'08': TIOA address (TCTEDA)

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Correct the application program that is supplying the erroneous address.
ABMV

**Modules:** DFHMCP, DFHEMS

---

**ABMV**

**Explanation:** DFHRLR has detected an invalid route list entry.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Check that the route list is correctly built with a reserved field in the entry containing blank and a stopper of halfword X’FFFF’ to terminate the list.

**Module:** DFHRLR

---

**ABMX**

**Explanation:** A text string passed to BMS contained a set attribute order that was invalid for one of the following reasons:

1. The set attribute sequence was less than three characters.
2. The attribute type was invalid.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Correct the application program.

**Module:** DFHPBP

---

**ABMZ**

**Explanation:** The address of the terminal I/O area (TIOA) in TCTTEDA was found to be zero.

When using BMS fast path as a result of an EXEC CICS RECEIVE MAP, DFHEMS always initializes TCTTEDA with the address of the TIOA. If TCTTEDA is subsequently found to be zero by DFHMCP, an overwrite must have occurred.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why TCTTEDA is zero.

Scan the trace table for the last BMS request (code FA) for the failing task and try to determine which user programs have been given control since that BMS request.

**Modules:** DFHMCP, DFHCX, DFHCY

---

**ABM0**

**Explanation:** The map specified for a basic mapping support (BMS) request could not be located.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Check if the map has been defined. If it has, check that it has been specified correctly.

**Modules:** DFHMCP, DFHCX, DFHCY

---

**ABM1**

**Explanation:** A basic mapping support (BMS) service is requested by a task associated with a terminal that is not supported by BMS. The request is not a routing request.

**Problem Determination:** At the time of the abend, register 11 addresses the TCTTE, and TCTTETEA and register 6 address the TCTTE extension, TCTTET.

**Relevant fields are:**

- TCTTEDS the device dependent suffix.
- TCTEMSS the map set suffix.

**Analysis:** DFHRLR tests the device dependent suffix and the map set suffix in the TCTTE extension. If both of these are zero, the terminal is not supported by BMS and DFHRLR abends the task with the abend code ABM1.

**Register** | **Label** | **Description**
---|---|---
R4= | RLSFXCK | TCTTEDS=’x’00’ and TCTEMSS=’x’00’.
@TCTTETE | | The device dependent suffix and the map set suffix have loaded into the lower two bytes of register 3 by the subroutine RLRSFXS.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Do not use terminals not supported by BMS for applications using BMS services.

Check the terminal type and model number. Confirm that it is a terminal that is not supported by BMS. A list of terminals supported by BMS is given in the CICS Application Programming Guide. Check that the TCT macro for the terminal accurately describes the physical terminal.

**Module:** DFHRLR

---

**ABM2**

**Explanation:** No user data was supplied for this BMS request. That is, the address of a user data area was not found in either TCTTEDA or TCAMSIOA.

When a BMS macro level output request is issued, the user must have placed the address of the data to be passed to BMS in TCTTEDA or TCAMSIOA before issuing the macro. The choice is made on the following criteria:

- If the data is to be passed in a TIOA by a terminal-oriented task, the address of this TIOA may be placed either at TCTTEDA, or in TCAMSIOA together with the setting of binary zeros into TCTTEDA.
- If the data is being passed by a terminal-oriented task but not in a TIOA, the address of the TIOA-like area of this data must be placed in TCAMSIOA and binary zeros set into TCTTEDA.
- If the data is being passed by a non-terminal-oriented task, the address of the TIOA-like area of this data must be placed in TCAMSIOA. TCTTEDA cannot be referenced, because there is no TCTTE associated with this task.

If a task attempts to pass addresses from both TCTTEDA and TCAMSIOA, the address in TCTTEDA is the one selected.

**Problem Determination:** The output services work area (OSPWA) is addressed by register 9. The TCTTE is addressed by register 11. The TCA is addressed by register 12.

The relevant fields are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSPIND01</td>
<td>OSPWA indicator byte 1</td>
</tr>
<tr>
<td>OSPIOA</td>
<td>Alternate I/O area address</td>
</tr>
<tr>
<td>OSPSIOA</td>
<td>Address of address of data (TCTTEDA/TCAMSIOA)</td>
</tr>
<tr>
<td>OSPTIOA</td>
<td>Address of user data found by BMS</td>
</tr>
<tr>
<td>OSPTR1-8</td>
<td>BMS request data saved from the TCA</td>
</tr>
<tr>
<td>TCTTEDA</td>
<td>Terminal data area address</td>
</tr>
<tr>
<td>TCACFI</td>
<td>Facility control indicator</td>
</tr>
<tr>
<td>TCAMSIOA</td>
<td>Alternate I/O area address</td>
</tr>
</tbody>
</table>
Analysis: The ABM2 abend is invoked at one point in DFHMCP, at label MCPABEND. There are five regions in DFHMCP in which the user's data is sought:

Labels

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE=MAP</td>
<td>MCPMAP</td>
</tr>
<tr>
<td>TYPE=PAGEBLD,DATA=YES/ONLY</td>
<td>MCPPGBLD</td>
</tr>
<tr>
<td>TYPE=TEXTBLD,DATA=YES/ONLY</td>
<td>MCPGTIOA</td>
</tr>
<tr>
<td>Mapping but not PAGEBLD,DATA=YES/ONLY</td>
<td>MCPMAPNG</td>
</tr>
<tr>
<td>No (mapping,PAGEBLD,TEXTBLD,PAGEOUT)</td>
<td>MCPDFALT</td>
</tr>
</tbody>
</table>

"Mapping" refers to BMS requests that specify maps, that is OSPTR3 bits 5 or 6 or 7 or OSPTR4 bit 3 set on.

Each of these functional regions does a BAL to subroutine MCPFTIOA to search for a user data area. If a valid area (abend ABM2 if not) is found, its address is put into OSPTIOA and the address of the data address (of TCAMSIOA or TCTTEDA) is set into OSPSIOA. If a data area is not found, OSPTIOA is cleared and OSPSIOA is now loaded with the address of OSPTIOA as a null data area.

On the BAL return, OSPTIOA is tested for a nonzero value. If it is zero, a branch to MCPABEND is taken.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: The programmer must place the address of the data into TCTTEDA or TCAMSIOA, whichever is appropriate.

Firstly, check that the user has loaded TCTTEDA or TCAMSIOA with the address of the user data, by checking the application listing and the contents of TCTTEDA and/or TCAMSIOA.

Next, check that the BMS request has been correctly decoded by CICS by referring to the OSPWA request bytes (OSPTR1-8) or decoding the last BMS entry in the trace table. See OSPIND01 to check correct decoding of PAGEBLD or TEXTBLD, and TCAFCI bit 7 to identify whether the task is terminal-oriented or not.

At the abend point, register 1 contains the user data address last loaded, and register 4 the address of OSPTIOA as an address of null data.

If a CICS error is suspected, concentrate initially on subroutine MCPFTIOA, because this is a simple piece of code that shows the data-fetch logic. ABM2 condition is trapped early in the CICS decoding of the DFHBMS request and involves module DFHMCP only.

Case/Register Label Description

</tr>
</tbody>
</table>

Module: DFHMCP

ABM3

Explanation: A BMS input or output request has been issued from a task that is not terminal-oriented.

System Action: The task is abnormally terminated with a CICS dump.

User Response: The task issuing a BMS input or output request must be attached to a terminal.

Module: DFHMCP
ABM4

Explanation: An invalid request response has been received to a temporary storage PUT or PUTQ request issued by BMS. The data passed to the temporary storage program has an invalid length.

Problem Determination: Abend in DFHMCP (see Analysis)

The OSPWA (output services work area) is in user storage and is printed in a transaction dump. It is addressed by register 9 at the time of the abend. Relevant fields are:

- OSPTITLE
- OSPPLTI
- OSPTOTPG

The message control record (MCR) is an area of user storage obtained by BMS. It is addressed by register 8 at the time of the abend. The first 8 bytes contain storage accounting information. MCRLLBB contains the length of the MCR (halfword) abend in DFHTPP.

The page buffer is addressed by register 7 at the time of the abend. It contains storage accounting fields in the first 8 bytes and a halfword length at offset 8 (TSIOAVRL).

In both cases, the temporary storage use map (DFHTSMAP) is addressed from CSATSATA. TSMAPCOM contains the number of available bytes in a control interval on the temporary storage data set.

Analysis: If the temporary storage request preceding the abend is a DFHTS PUT, the abend occurred in DFHMCP. If the temporary storage request preceding the abend is a DFHTS PUTQ, the abend occurred in DFHTPP. If the abend occurred in DFHMCP, DFHMCP is attempting to put the message control record to temporary storage. Check the length of the MCR (MCRLLBB). It may be negative.

The length of the MCR is calculated by code following label MCPNODDS and is:

\[28 + 21 \times \text{OSPTTCNT} + (\text{length of title record}) + (\text{space for page/LDC table, if needed})\]

The address of the title record is at OSPTITLE and the length is contained in the first halfword. Space for the page/LDC table is required if OSPPLTI is nonzero, which should occur only for messages routed to LDC devices (3600, 3650, 3767, 3770, 3790). The number of entries is in OSPTOTPG. 2 bytes are required per entry.

If the abend occurred in DFHTPP, BMS is attempting to add a page to the temporary storage queue, and the page buffer will not fit in the control interval. TSIOAVRL contains the length of the page buffer.

For messages directed to 3270 devices, the page buffer consists of a 3270 data stream with a 4-byte page control area following it (a 3270 data stream may be larger than the number of characters available on the screen, particularly if extended 3270 attributes are used). For messages directed to other devices, the page buffer consists of a message formatted with NL characters, a 4-byte page control area following it. The length in TSIOAVRL should be less than the length in the preceding storage accounting area, otherwise an error has occurred in constructing the page, possibly in prior BMS requests.

In either of the above cases, if the length of the area being output appears valid, it is necessary to increase the control interval size for the temporary storage data set.

Register | Label | Description
---|---|---
DFHMCP | R8=OMCR | MCPMCRTS The MCR is too long or has invalid length ($4).
DFHTPP | R7=pgbuf | TPNOPL | TPNOPLS The page buffer is too large.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Determine from the trace table whether the abend occurred in DFHMCP or DFHTPP.

Check the length of the appropriate area.

If the MCR length is invalid, possible reasons are:

- The title record specified in the TITLE option on a BMS ROUTE request has an invalid format, that is, it does not begin with a halfword length field or is more than 64 characters.
- The message is being routed to more terminals than intended. OSPPTTCNT is very large, for example, if LIST=ALL is specified on a ROUTE request and there are a large number of terminals in the TCT.

If the page buffer length is too large, this may be because more data than intended is being built into the page. If the page buffer length is greater than the length of the storage area indicated in the preceding storage accounting area, an error has occurred in page or text building, and the page buffer extends beyond the area allocated to it (that is, storage violation).

Modules: DFHMCP, DFHTPP

ABM5

Explanation: A DFHTS TYPE=PURGE request has been issued with an invalid REQID. This incorrect request was issued by basic mapping support (BMS).

DFHTPR cannot find the terminal identifier for the current terminal in the terminal list in the message control record (MCR).

Problem Determination: The TS identifier is built in TCATSDI before the TS purge is issued, although this has probably been overwritten before the dump is taken. The trace table entry for the DFHTS TYPE=PURGE contains the TS identifier in the last 8 bytes.

The OSPWA is addressed by register 9.

OPSTSID temporary storage identifier (8 bytes).

Register 8 points to the MCR.
Register 5 points to the current entry.
Register 0 points to the end of table.
Register 9 points to the TCTTE.

The terminal list starts at MCRLDST and the terminal identifier is at the start of the terminal entry. Each terminal entry is X’15’ bytes long.

Analysis: DFHMCP uses the temporary storage identifier in OSPTSID.

Cannot find the terminal identifier for this terminal in the terminal list in the MCR.
<table>
<thead>
<tr>
<th>Register</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R9=0(OSPA)</td>
<td>MCPCKPGS</td>
<td>Code builds the temporary storage code in TCATSDI and issues DFHTS TYPE=PURGE macro, specifying IDERROR exit of MCPTSIDE, where the abend is raised.</td>
</tr>
<tr>
<td>R8=0(MCR)</td>
<td>TPRCKID</td>
<td>Code scans terminal list for a terminal entry that has the ID of the current terminal, and if it cannot be found, links to TPRSNH to raise the abend.</td>
</tr>
</tbody>
</table>

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Check the trace table and find the preceding PUT/PUTQ TS requests. Check whether the identifier for the PUT/PUTQ is the same as that for the PURGE. If it is not, find out how they differ. Check to see if the OSPWA has been corrupted.

This error is very unlikely, as the label indicates (TPRSNH - "Should Not Happen"). DFHTPS has scanned the MCR to identify the terminals to which this message is directed, and has created an AID to initiate CSPG (DFHTPR) at each of them. However, when DFHTPR retrieves the MCR, it cannot find the current terminal identifier in the list of terminals. Presumably the MCR has been corrupted between creation of the AID and dispatching of CSPG at the terminal. Check back through the trace table to find the instance of DFHTPS that built the AID for this terminal (transaction CSPS); it will have issued a TC LOCATE request to verify that the terminal identifier is valid, and this identifier can be seen in the trace entry.

**Modules:** DFHMCP, DFHTPR

---

**ABM8**

**Explanation:** A BMS text request specified a value for the JUSTIFY option which is zero or too large for the page being built.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Correct the application program that specified too large or zero value for the JUSTIFY option.

**Module:** DFHPBP

---

**ABM9**

**Explanation:** The text data overflow routines have been reentered while text overflow was in process. This condition occurs when the line requirements for the text header and/or trailer exceed the line capacity of the page for which data is being formatted.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Reduce the number of lines required for the header and/or trailer or increase the page size of the terminal.

**Module:** DFHPBP

---

**ABNA**

**Explanation:** No route list was supplied with a route request received from the remote system.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHTPS

---

**ABNB**

**Explanation:** Either the principal facility of the task is not a TCTTE of the correct type, or the task has no principal facility.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Ensure that DFHTPS has not been specified as the initial program of a transaction other than CSPS. Check that the operator did not enter CSPS from the terminal.

**Module:** DFHTPS

---

**ABNC**

**Explanation:** An attempt to access a temporary storage queue failed.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Ensure that temporary storage is correctly generated.

**Module:** DFHTPS
ABNE

Explanation: An error response was received from an invocation of a BMS TYPE=ROUTE or TYPE=STORE request.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Check that BMS was correctly generated.
Module: DFHTPS

ABNF

Explanation: The transaction was not in send mode when it sent data to the remote system.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHTPS

ABNG

Explanation: An attach request was received from the remote system without any data indicating the reason for the request.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHTPS

ABNH

Explanation: An attempt to ship data to the remote system failed.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHTPS

ABNI

Explanation: CICS could not find a profile for an LU6.2 transaction routing request.
System Action: CICS terminates the task abnormally.
User Response: Either you have specified an incorrect name in the PROFILE parameter of an EXEC CICS ALLOCATE command, or you have not installed the profile. Correct the error before resubmitting the transaction.
Module: DFHTPS

ABNJ

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition provides an exception trace.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Investigate the reason why the task was purged.
It was purged either by the master terminal operator or as a result of a deadlock timeout.
Module: DFHTPS
ABRG
Explanation: An invalid bridge facility token was specified.
System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.
User Response: This error was probably caused by the incorrect data being sent to the bridge exit from the client application.
Check the data set by tracing the data sent from the client application.
Ensure that the bridge facility token in the data transmitted by the application is correct.
Module: DFHBRXM

ABRH
Explanation: The bridge facility token specified is not known to CICS.
System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.
User Response: The most likely error is that the client application specified too small a keep time for the bridge facility. Before the client reused the bridge facility token, CICS had already discarded it. Check the bridge facility keep time in the outbound messages. CICS will use the keep time value specified in the last message used by a transaction. Alternatively use the trace or CEDX to look at the keep time in the BRXA passed back on the terminate call to the bridge exit.
Another possible error is that the client application passed a request to a CICS system other than that on which the original request was sent. Bridge facilities are only valid on a single CICS system.
Module: DFHBRXM

ABRI
Explanation: There are no free bridge facility tokens available. This is probably due to excessive keep time values being specified on the bridge exit termination call.
System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.
User Response: Review the keep time values used by the client applications. If some client applications are returning excessive values, modify the bridge exit to specify a limit to the values.
Module: DFHBRXM

ABRJ
Explanation: An invalid FACILITYLIKE value was specified.
The FACILITYLIKE value can be specified on the bridge exit initialization call. If the default value (blanks) is returned, the value in the user transaction profile definition is used. If no FACILITYLIKE value is specified in the profile definition, a value of CBRF is used.
The name must be that of an installed VTAM 3270 terminal.
System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.
User Response: Define the terminal specified by FACILITYLIKE, change the value on the profile definition, change the value supplied by the client application, or install a terminal definition for CBRF.
Module: DFHBRXM

ABRK
Explanation: The USERID check failed following the call to the bridge exit.
System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.
User Response: Enter the correct password. If the password is correct or was not supplied, review the RACF definitions.
Module: DFHBRXM

ABRN
Explanation: The bridge exit returned a value in BRXA_RESP that is not valid for the command for which it was invoked.
System Action: The task is backed out.
User Response: Change the bridge exit to only return valid response settings.
Modules: DFHBRIC, DFHBRMS, DFHRSP, DFHBRTC

ABRO
Explanation: The bridge exit issued an abend.
System Action: The transaction is backed out.
User Response: Identify why the bridge exit abended.
Modules: DFHBRMS, DFHBRTC

ABRR
Explanation: The user transaction's profile could not be found.
System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction is not started.
User Response: Check that the profile name in the user transaction definition is correct, and that this profile has been defined.
Module: DFHBRXM

ABRS
Explanation: CICS was unable to obtain storage to create the bridge facility.
System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction is not started.
User Response: Identify why CICS is running short on storage.
Module: DFHBRXM

ABRY
Explanation: CICS returned an unexpected error running the bridge exit. This is a CICS internal error.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Modules: DFHBRMS, DFHBRTC
Explanation: The bridge exit returned invalid data in the BRXA.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: If a user supplied bridge exit was used, review the format of the data returned by the exit.

If a CICS supplied exit was used, this is a CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Modules: DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC, DFHXMBR

Explanation: An unsupported BMS request was received by the bridge exit.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: The bridge only supports minimum function BMS and SEND TEXT. This transaction cannot be used in a bridge environment.

Module: DFHEMS

Explanation: A message passed to DFHBSMSG is too long. This is a CICS internal error.

System Action: CICS terminates the task abnormally with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHTBS

Explanation: A next BRMQ vector in the input message passed to the formatter is the wrong type of a RECEIVE vector. RECEIVE and RECEIVE MAP have separate vectors.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: This may just indicate that the transaction has gone down an error path which should result in a transaction backout. If not, the input message should have a BRMQ vector for this command. Change the client application, recompile and retry.

Module: DFH0CBRF

Explanation: An error occurred when a SYNCPOINT request was issued by the bridge exit.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check for other CICS messages and exception trace entries to investigate the cause of the SYNCPOINT ROLLBACK error.

Module: DFH0CBRE

Explanation: An error was detected by the bridge exit when it tried to input the next message.

System Action: An exception trace is made of any error information. The task is abnormally terminated with a CICS transaction dump.

User Response: Check for other CICS messages and exception trace entries to investigate the cause of the input error.

Module: DFH0CBAE,DFH0CBRE,DFH0CBAI

Explanation: An error was detected by the bridge exit when it tried to output the next message.

System Action: An exception trace is made of any error information. The task is abnormally terminated with a CICS transaction dump.

User Response: Check for other CICS messages and exception trace entries to investigate the cause of the output error.

Module: DFH0CBAE,DFH0CBRE

Explanation: An error occurred when a SYNCPONIT request was issued by the bridge exit.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check for other CICS messages and exception trace entries to investigate the cause of the SYNCPONIT error.

Module: DFH0CBRE

Explanation: The user transaction issued a request which requires more data (such as a RECEIVE request). No data was available in the message, and mqch-conversationaltask was set to mqct-no which specifies that the transaction is non conversational.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: This may be correct behaviour as defined by the client application. If it is not, the client application should either supply additional data, or be redesigned to allow the transaction to be conversational.

Module: DFH0CBRF
ABXI

Explanation: A message received by the bridge exit, exceeded the maximum message size.

System Action: An exception trace is made of the first 4K of data in error. The task is abnormally terminated with a CICS transaction dump.

User Response: Check that the client application is passing the correct data. If it is, it will be necessary to change the size of the buffer. This is in field block-length in the sample exit. Recompile and reload the exit and retry.

Module: DFH0CBAE,DFH0CBRE

ABXJ

Explanation: The bridge exit detected an error in the MQCIH header passed by the client application.

System Action: An exception trace is written containing the MQCIH header. The task is abnormally terminated with a CICS transaction dump.

User Response: The client application has either not set the MQCIH header, or is using a version of the header which is incompatible with the bridge exit. Correct the client application. Recompile, reload and retry.

Module: DFH0CBAE,DFH0CBRE

ABXK

Explanation: The bridge exit detected an error in the data passed on the BRDATA parameter of the START command.

System Action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the transaction which issued the START. Recompile, reload and retry.

Module: DFH0CBAE,DFH0CBRE

ABXM

Explanation: The bridge exit or formatter was called with a function or command which it doesn't support. This either indicates a storage overwrite, or that the bridge exit is not designed for this command.

System Action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

User Response: Check the BRXA data in the trace to see if there has been a storage overwrite, or whether the exit supports this command.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABXN

Explanation: The formatter detected that the input message was truncated.

System Action: An exception trace is made of the first 4K of the message. The task is abnormally terminated with a CICS transaction dump.

User Response: Check that the transport mechanism allows for messages of this length. If this is correct, it indicates that the client application is issuing an incorrect message. Trace the outbound message on the client application. Recompile, reload and retry.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABXO

Explanation: The formatter detected an error in a BRMQ vector passed by the client application.

System Action: The field MQCIH-ERROROFFSET is set to indicate the position of the error in the message An exception trace is made of the MQCIH and BRMQ vector. The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the client application. Recompile, reload and retry.

Module: DFH0CBRF

ABXP

Explanation: The formatter detected an error in a BRMQ vector header passed by the client application.

System Action: The field MQCIH-ERROROFFSET is set to indicate the position of the error in the message An exception trace is made of the MQCIH and BRMQ vector. The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the client application. Recompile, reload and retry.

Module: DFH0CBRF

ABXQ

Explanation: The formatter could not find an ADSD vector as part of the BRMQ-RM vector when MQCIH-ADSDESCRIPTOR specified MQCADSD-MSGFORMAT.

System Action: An exception trace is made of the request. The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the client application. Recompile, reload and retry.

Module: DFH0CBRF

ABXS

Explanation: An error was detected by the bridge exit when it tried to open the queue for the input or output message.

System Action: An exception trace is made of any error information. The task is abnormally terminated with a CICS transaction dump.

User Response: Check for other CICS messages and exception trace entries to investigate the cause of the open error.

Module: DFH0CBRE

ABX1

Explanation: The bridge exit or formatter was called with an invalid BRXA-HEADER. This indicates a storage overwrite.

System Action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump. As CICS also does a check of the BRXA on return from the call to the exit, there will probably be a subsequent ABRZ abend.

User Response: Investigate the cause of the storage error, and retry.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF
Explanation: The bridge exit or formatter was called with an invalid BRXA-TRANSACTION-AREA. This indicates a storage overwrite.

System Action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

As CICS also does a check of the BRXA on return from the call to the exit, there will probably be a subsequent ABRZ abend.

User Response: Investigate the cause of the storage error, and retry.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

Explanation: A next BMS BRMQ vector in the input message passed to the formatter does not contain the mapset requested to answer a RECEIVE MAP request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: This may just indicate that the transaction has gone down an error path which should result in a transaction backout. If not, the input message should have a BRMQ vector for this mapset. Change the client application, recompile and retry.

Module: DFH0CBRF

Explanation: This explanation applies to the two transaction abend codes, ACAA and ACAD. CICS cannot find a match for a function code in the language definition table because the parameterized resource definition contains an unrecognized resource type code. The abend code issued depends on the DFHCAP operation that was invoked before the error occurred:

Abend  DFHCAP operation  
ACAA  ANALYZE  
ACAD  DEFAULTS  

The cause of the abend is either:

- The language definition table, DFHEITCU, in the library is invalid for the release of CICS you are running, or
- A CICS logic error has occurred.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: Ensure that the DFHEITCU module is in the library and is valid for this release of CICS.

If a valid version of DFHEITCU is already in the library, a CICS logic error has occurred. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCAP

Explanation: See ACAA.

Module: DFHCAP
DFHFCDL

ACF

Explanation: A transaction has issued a request to a coupling facility data table which has been previously accessed using a previous instance of the coupling facility data table server (that is, the server for the pool in which this coupling facility data table resides has failed and been restarted one or more times since the last access). We therefore need to reopen the access between this CICS file and the coupling facility data table, but the attempt to reopen access has failed.

System Action: The requesting transaction abends with a transaction dump.

CICS continues normally.

User Response: Retry the failed transaction.

Module: DFHEIFC

ACFD

Explanation: During the loading of a Coupling Facility Data Table by the CFCL transaction, a call to the CICS Transaction Manager has returned a response (such as DISASTER) after which normal processing could not continue.

System Action: Message DFHFCDL is issued. Loading of the data table is terminated and CFCL abends.

User Response: Refer to the description of the message for further information and guidance.

Module: DFHFCDL

ACFE

Explanation: An attempt was made to attach a transaction specifying DFHFCDL as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCDL is for use by CICS system transaction CFCL. This loads a Coupling Facility Data Table.

System Action: The transaction is abnormally terminated. CICS processing continues.

User Response: Establish why an attempt was made to attach CFCL illegally, or why a transaction definition specified DFHFCDL as the program to be given control.

Module: DFHFCDL

ACFA

Explanation: During the loading of a Coupling Facility Data Table by the CFCL transaction, an abend was detected or a domain call returned a response (such as DISASTER) after which normal processing could not continue.

System Action: A message is issued (one of DFHFC7100, DFHFC7101, DFHFC7103 or DFHFC7104). Loading of the data table is terminated and CFCL abends.

User Response: If this abend is produced as a result of an abend during loading, message DFHFC7103 is issued. If it is a result of a domain call failure, depending on which domain the failure was returned by, one of the messages DFHFC7100, DFHFC7101 or DFHFC7104 is issued. Refer to the description of the message for further information and guidance.

Module: DFHFCDL

ACFC

Explanation: A transaction has issued a request to a coupling facility data table which holds an active lock, but after the lock was acquired, the coupling facility data table server for the pool in which this coupling facility data table resides failed and was restarted. This request is of a type which cannot continue against a new instance of the server, because it is reliant on the lock which was acquired before the server failed.

System Action: The requesting transaction abends with a transaction dump.

CICS continues normally.

User Response: Refer the failed transaction.

Module: DFHEIFC

ACJ

Explanation: An internal error has occurred when module DFHCAP was invoked while processing a CICS CREATE command. The preallocated dynamic storage area was too small.

System Action: The transaction executing the EXEC CICS CREATE command is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCAP

ACAJ

Explanation: An internal error has occurred when module DFHCAP was invoked while processing an EXEC CICS CREATE command. The preallocated dynamic storage area was too small.

System Action: The requesting transaction abends with a transaction dump.

CICS continues normally.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCAP

ACAM

Explanation: An internal error has occurred when module DFHECBAM was invoked while processing a CBAM transaction.

System Action: CBAM is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHECBAM

ACCx

Explanation: Abend codes with ‘ACC’ as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the C/370 User’s Guide.

ACFA

Explanation: During the loading of a Coupling Facility Data Table by the CFCL transaction, an abend was detected or a domain call returned a response (such as DISASTER) after which normal processing could not continue.

System Action: A message is issued (one of DFHFC7100, DFHFC7101, DFHFC7103 or DFHFC7104). Loading of the data table is terminated and CFCL abends.

User Response: If this abend is produced as a result of an abend during loading, message DFHFC7103 is issued. If it is a result of a domain call failure, depending on which domain the failure was returned by, one of the messages DFHFC7100, DFHFC7101 or DFHFC7104 is issued. Refer to the description of the message for further information and guidance.

Module: DFHFCDL
The trace is found in a queue whose name is ‘CEHS xxxx’, where ‘xxxx’ is the four-character terminal identifier. The queue can be browsed in text form or in hexadecimal form using CEBR. To find the terminal identifier, invoke CEBR on the terminal that has run CEHS, without giving a queue name. The queue name will default to ‘CEBRxxxx’, where ‘xxxx’ is the terminal identifier.

Note: CEBR requires the queue name to be in UPPER CASE.

For a description of the remote server and its trace entries and abend codes, see the CICS/VS Remote Server Diagnosis Manual (LC33-0438).

**System Action:** CICS terminates the remote server transaction abnormally with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCHS

---

The remote server did not receive the expected response type data frame from CICS/CMS.

**System Action:** CICS terminates the remote server abnormally with a dump.

**User Response:** Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the ‘Problem Determination’ section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCHS

---

The remote server attempted to send one of a series of data frames to CICS/CMS when, at this time, only a single frame is allowed. This indicates a logic error in the remote server.

**System Action:** CICS terminates the remote server abnormally with a dump.

**User Response:** Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the ‘Problem Determination’ section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCHS

---

The remote server attempted to send data to CICS/CMS. However, it was not set to the correct mode to do so. This indicates a logic error in the remote server.

**System Action:** CICS terminates the remote server abnormally with a dump.

**User Response:** Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the ‘Problem Determination’ section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCHS
ACHH

Explanation: A TIOA has not been created from the data received by the remote server from CICS/CMS.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the ‘Problem Determination’ section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCHS

ACHL

Explanation: CICS/CMS has supplied a buffer to the remote server which is not large enough to hold the reply that the remote server has to return.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the ‘Problem Determination’ section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCHS

ACHM

Explanation: The remote server has tried to receive a response from CICS/CMS which failed repeatedly until the retry limit was exceeded.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the ‘Problem Determination’ section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCHS

ACHN

Explanation: The remote server has tried to receive a request from CICS/CMS which failed repeatedly until the retry limit was exceeded.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the ‘Problem Determination’ section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCHS

ACHO

Explanation: The remote server has tried to receive a reply from CICS/CMS which failed repeatedly until the retry limit was exceeded.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the ‘Problem Determination’ section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCHS
**ACHP**

**Module:** DFHCHS

**ACHP**

**Explanation:** CICS/CMS has made a request to the remote server for which the reply would need more than the maximum storage allowed (32660 bytes). This indicates that a logic error has occurred.

**System Action:** CICS terminates the remote server with a dump.

**User Response:** For further information, see the ‘Problem Determination’ section for abend code ACHA.

**Module:** DFHCHS

---

**ACHR**

**Explanation:** The CICS/CMS remote server transaction (CEHS) has been initiated and either the task is not terminal-oriented, or the associated terminal is a console.

**System Action:** CICS abnormally terminates the remote server with a dump.

**User Response:** Ensure the transaction is initiated with an associated terminal and that the terminal is defined as a console. For further information, see the ‘Problem Determination’ section for abend code ACHA.

**Module:** DFHCHS

---

**ACHS**

**Explanation:** The CICS/OS2 remote server transaction (CEHP) has been initiated and either the task is not terminal-oriented, or the associated terminal is a console.

**System Action:** CICS abnormally terminates the remote server with a dump.

**User Response:** Ensure the transaction is initiated with an associated terminal and that the terminal is not defined as a console. For further information, see the ‘Problem Determination’ section for abend code ACHA.

**Module:** DFHCHS

---

**ACL0**

**Explanation:** The new operator failed to allocate storage whilst creating an object. This problem will occur if there is insufficient storage available to the CICS region to satisfy the request.

**System Action:** CICS abnormally terminates the transaction.

**User Response:** This abend may occur if you are in a loop creating objects and not deleting them. Alternatively CICS might be short on storage and you should try resubmitting the transaction.

**Module:** ICCGLIBC

---

**ACL1**

**Explanation:** The CICS Foundation Classes have thrown an exception which the application programmer failed to catch.

**System Action:** CICS abnormally terminates the transaction.

**User Response:** Check that you have coded your application to catch exceptions. Interrogate the message object contained within the exception object to establish the cause of the exception being thrown.

Another possible cause of this abend is that you are running a Foundation Classes program on a machine that does not have the C++ runtime installed. Check that your machine has the C++ runtime installed.

**Module:** ICCGLIBC

---

**ACL2**

**Explanation:** The CICS Foundation Classes invoked the default handleEvent method (defined in class IccResource) in order to handle a CICS condition because the application programmer did not implement his own handleEvent method.

**System Action:** CICS abnormally terminates the transaction.

**User Response:** Implement your own handleEvent method or customize your resource objects so they do not call the handleEvent method for any of the possible CICS conditions.

**Module:** ICCRESEC

---

**ACL3**

**Explanation:** The CICS Foundation Classes responded to an application programmer's request to abend a CICS task.

**System Action:** CICS abnormally terminates the transaction.

**User Response:** The application programmer requested that the CICS Foundation Classes abend the transaction using the appropriate return enumeration from the handleEvent method (see IccResource class).

**Module:** ICCRESEC

---

**ACL4**

**Explanation:** The CICS Foundation Classes detected an internal error.

**System Action:** CICS abnormally terminates the transaction.

**User Response:** This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

**Module:** ICCGLIBC

---

**ACL5**

**Explanation:** The CICS Foundation Classes received an error from a CICS storage request (GETMAIN). In response to a new operator request the CICS Foundation Classes issued a CICS GETMAIN request to allocate storage which CICS was unable to satisfy.

**System Action:** CICS abnormally terminates the transaction.

**User Response:** This abend may occur if you are in a loop creating objects and not deleting them. Alternatively CICS might be short on storage and you should try resubmitting the transaction.

**Module:** ICCBASEC

---

**ACL6**

**Explanation:** The CICS Foundation Classes detected an error while processing a storage release request.

**System Action:** CICS abnormally terminates the transaction.

**User Response:** This abend can occur if you try to delete an object that does not exist (that is, it has already been deleted). It may also indicate a CICS memory management problem, or a storage corruption problem. If the error persists, please contact your support organization.

**Module:** ICCBASEC
Explanation: The CICS Foundation Classes have thrown an exception which the application programmer failed to catch.

System Action: CICS abnormally terminates the transaction.

User Response: Check that you have coded your application to catch exceptions. Interrogate the message object contained within the exception object to establish the cause of the exception being thrown.

Another possible cause of this abend is that you are running a Foundation Classes program on a machine that does not have the C++ runtime installed. Check that your machine has the C++ runtime installed.

Module: ICCGLIBC

Explanation: The CICS Foundation Classes have thrown an exception which the application programmer failed to catch.

System Action: CICS abnormally terminates the transaction.

User Response: Check that you have coded your application to catch exceptions. Interrogate the message object contained within the exception object to establish the cause of the exception being thrown.

Another possible cause of this abend is that you are running a Foundation Classes program on a machine that does not have the C++ runtime installed. Check that your machine has the C++ runtime installed.

Module: ICCGLIBC

Explanation: The CICS Foundation Classes have responded to an application programmer's request to abend a CICS task.

System Action: CICS abnormally terminates the transaction.

User Response: A resource object was customized to cause a transaction abend if a particular CICS condition was raised, and this condition was subsequently raised by CICS.

Module: ICCRESIC

Explanation: The CICS Foundation Classes detected an internal error.

System Action: CICS abnormally terminates the transaction.

User Response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLIBC

Explanation: The CICS Foundation Classes detected an internal error.

System Action: CICS abnormally terminates the transaction.

User Response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLIBC

Explanation: The CICS Foundation Classes detected an internal error.

System Action: CICS abnormally terminates the transaction.

User Response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLIBC

Explanation: The CICS Foundation Classes detected an internal error.

System Action: CICS abnormally terminates the transaction.

User Response: This abend can occur if you try to delete an object that does not exist (that is, it has already been deleted). It may also indicate a CICS memory management problem, or a storage corruption problem. If the error persists, please contact your support organization.

Module: ICCBASEC
ACNA

Explanation: The table DFHCNV cannot be loaded. This is a general purpose abend code indicating that the LOAD request for the conversion table, DFHCNV, has failed.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Examine the transaction dump to determine the exact condition returned from LOAD request.

Module: DFHCCNV

ACNB

Explanation: The program DFHUCNV cannot be linked. This is a general purpose abend code indicating that the LINK request for the conversion program DFHUCNV, has failed.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Examine the transaction dump to determine the exact condition returned from LINK request.

Module: DFHCCNV

ACN1

Explanation: The table DFHCNV cannot be loaded. This is probably because a table has not been pregenerated. It could also occur if the table DFHCNV has been linked above 16MB but DFHCCNV has been linked below 16MB.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Check that the DFHCNV module is in the library and is valid for this release of CICS. Check the linkage of DFHCNV and relink it with the correct AMODE if necessary.

Module: DFHCCNV

ACN2

Explanation: The table DFHCNV has been loaded but the first record is in the wrong format. This is probably due to an error during assembly or linkedit, but could also be the result of a storage overwrite.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: The table should be reassembled and linked. Check the assemble and linkedit output. Check for any messages issued from CICS indicating that storage overwrites have occurred.

Module: DFHCCNV

ACN3

Explanation: The program DFHUCNV cannot be linked. A user conversion program must be available (even if it only returns).

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Check that the DFHUCNV module is in the library and is valid for this release of CICS. Check the linkage of DFHUCNV and relink it with the correct AMODE if necessary.

Module: DFHCCNV

ACN4

Explanation: An unrecognized format of a DFHCNV table has been encountered.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Re-assemble and re-link edit the DFHCNV macro.

Module: DFHCCNV

ACN5

Explanation: An override for the default client code page has been received; however the value is not recognized.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Check that the client system is using one of the client code pages supported by CICS/390.

Module: DFHCCNV

ACN6

Explanation: The conversion between client code page and server code page is not supported by CICS/390; for example conversion has been requested between Japanese code page 932 and Latin-1 code page 500.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Ensure that the Client codepage, both default and overrides are in the same group as the Server codepage. For example client code page 852 from Latin-2 group, is only supported to server code page 870.

Module: DFHCCNV

ACN7

Explanation: An override for the default binary format has been received; however the value is not recognized.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Data formats should be either S/370 or INTEL, anything else is unsupported by CICS/390.

Module: DFHCCNV

ACN8

Explanation: CICS data conversion is processing a FIELD defined as containing GRAPHIC characters (which are only DBCS): that is

DFHCNV TYPE=FIELD,DATATYP=GRAPHIC,...

However the client code page (defined in the CLINTCP operand), and the server code page (defined in the SRVERCP operand) imply that the FIELD contains only SBCS characters, for example

DFHCNV TYPE=ENTRY,CLINTCP=437,SRVERCP=037

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Correct the FIELD definition.

Module: DFHCCNV
ACN9

**Explanation:** The table DFHCNV cannot be loaded. This abend code is issued following a NOTAUTH condition being raised during loading of the DFHCNV table.

**System Action:** The transaction is abnormally terminated with a transaction dump.

**User Response:** Ensure the resource security definitions are correct.

**Module:** DFHCCNV

ACP1

**Explanation:** DFHIC TYPE=GET response code is other than the normal response during print key processing.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump. The keyboard of the terminal on which the print key was depressed remains locked to indicate the failure of the operation.

**User Response:** Analyze the dump. The response code is in the low order byte of register 0.

**Module:** DFHCPY

ACP2

**Explanation:** DFHIC TYPE=INITIATE response code is other than the normal response during print key processing.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump. The keyboard of the terminal on which the print key was depressed remains locked to indicate the failure of the operation.

**User Response:** Analyze the dump. The response code is in low-order byte of register 0.

**Module:** DFHCPY

ACQ

**Explanation:** The Connection Quiesce Protocol transaction has been initiated by user action, such as a START command or by typing the transaction identifier at a terminal. The transaction is not intended to be initiated in this way.

**System Action:**
1. If the transaction was not initiated by terminal input, message DFHZC4951 is written to destination CSNE.
2. An exception trace record is written to all active trace destinations.
3. The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Ensure what caused the transaction to be initiated. The exception trace record contains information which will help you.

**Module:** DFHAPRT

ACQB

**Explanation:** The Connection Quiesce Protocol transaction has encountered an error when communicating with another system on an APFC session.

**System Action:**
1. Message DFHZC4951 is written to destination CSNE.
2. An exception trace record is written to all active trace destinations.
3. The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Determine what caused the failure. A likely cause is a failure of the session with the partner system.

**Module:** DFHCLS5

ACQD

**Explanation:** The Connection Quiesce Protocol transaction has encountered an unexpected error.

**System Action:**
1. Message DFHZC4951 is written to destination CSNE.
2. An exception trace record is written to all active trace destinations.
3. The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCLS5

ACRA

**Explanation:** The relay program has been invoked without a terminal as its principal facility.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Ensure that DFHAPRT has not been specified as the initial program of a task that is not terminal-related.

**Module:** DFHAPRT

ACRB

**Explanation:** The relay program has been invoked by a transaction that is not defined as remote.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Check that the relay program is defined correctly. Determine why DFHAPRT was invoked if the transaction is not a remote transaction.

**Module:** DFHAPRT

ACRC

**Explanation:** The relay program received an invalid response from DFHZCX.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
ACRD

**Module:** DFHAPRT

**Explanation:** The system entry for the system to which routing is to be performed could not be found.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Check the installed transaction definition to confirm that the system was correctly specified. Check that the system entry is defined in the TCT.

**Module:** DFHAPRT

ACRE

**Explanation:** A transaction invoked from an APPC terminal and specified in the installed transaction definition as remote has abnormally terminated because the link is out of service.

**System Action:** The task is abnormally terminated.

**User Response:** Wait until the link is available. The CICS supplied transaction CEMT INQUIRE CONNECTION can be used to check the states of the links.

**Module:** DFHAPRT

ACRF

**Explanation:** The relay program received a nonzero return code from the dynamic router following its first invocation.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Use the dump to determine why the dynamic routing program has failed by checking the contents of the passed COMMAREA DFHDYE for correctness. The COMMAREA address can be found from field TCACOMM in the system TCA for the task. The COMMAREA fields are mapped via the DFHDYPDS DSECT.

**Module:** DFHAPRT

ACRG

**Explanation:** An error occurred when attempting to link to the dynamic routing program.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Refer to the message sent to the CSMT log. It identifies the cause of the link failure and provides further user guidance.

**Modules:** DFHAPRT, DFHEPC

ACRH

**Explanation:** The profile for the session that will carry intersystem flows during transaction routing could not be found.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Check the installed transaction definition to confirm that TRPROF is correctly specified.

**Module:** DFHAPRT

ACRI

**Explanation:** An abend has occurred in the dynamic routing program after a link has been executed from DFHAPRT or DFHEPC.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump. Message DFHRT4416 is written to the CSMT log.

**User Response:** Refer to message DFHRT4416. It identifies the abend in the dynamic routing program and provides further user guidance.

**Modules:** DFHAPRT, DFHEPC

ACRK

**Explanation:** The relay program has been invoked with no address for the principal facility.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHAPRT

ACRL

**Explanation:** The task does not own the facility.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHAPRT
ACRM

Explanation: In response to a request from the dynamic routing program, DFHAPRT has attempted an INITIAL_LINK to a program that is not the initial program of the transaction for which the dynamic router has been invoked. The attempt has failed.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Examine the following possibilities:
- The autoinstall user-replaceable module (URM) was called but is unable to do the autoinstall.
- The autoinstall URM was called but data supplied by the autoinstall URM is invalid.
- The autoinstall URM was called, but there is no processing program table (PPT) entry for the autoinstall model.
- There is a problem with the autoinstall URM.
- There is no PPT entry for the program, and either autoinstall is not active or the autoinstall URM indicated that the program should not be autoinstalled.
- The program is disabled.
- The program cannot be loaded.
- The program is defined as remote.

Module: DFHAPRT

ACSB

Explanation: An unexpected reply was received from a remote system in response to a request to schedule a task on that system.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCRS

ACSC

Explanation: An unexpected request was received from a remote system when expecting a request to schedule a task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCRS

ACSD

Explanation: An internal logic error has been detected.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCRS

ACSE

Explanation: Module DFHCRS has been attached in an unsupported manner.

System Action: CICS abnormally terminates the transaction with a transaction dump.

User Response: Module DFHCRS should be executed only by transaction CRSR, which executes with an MRO session, an LU6.1 session or an LU type 6.2 conversation as its principal facility. Ensure that the transaction is being attached by a CRSR transaction in the connected system, and not by a user transaction. If the transaction is being attached by a CRSR transaction, you will need assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCRS

ACSF

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detects the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of a deadlock timeout.

Module: DFHCRS
ACSG

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Please see the related error message produced by the domain that detected the original error.

Module: DFHCRS

ACSH

Explanation: The processing of APPC mapped data requires the generation of an LU6.2 attach FMH with default values. In particular, the sync level requested is defaulted to 2. However, the session that is to be used has been bound with a sync level of 1.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that:
- The entry in the TCT for the remote system has been defined with parallel sessions
- The remote system can support a sync level of 2
- The correct sync level has been requested.

Module: DFHCRS

ACSI

Explanation: An APPC conversation failure occurred when an attach between CICS systems was issued.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check the connection to the remote CICS system and try to reestablish it.

Module: DFHCRS

ACSJ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table). This failure is either the result of a task purge, or a CICS logic error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure.

In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCRS

ACSL

Explanation: CICS has been unable to attach a transaction to perform a mass flag (CFTS) or mass remote delete (CDTS) request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCRS

ACSM

Explanation: Transaction CFTS has abended. The mass flagging of terminals for deletion has failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCRS

ACSN

Explanation: Transaction CFTS has stalled. The mass flagging of terminals for deletion has exceeded the expected time and is therefore assumed to have failed.

System Action: The task is abnormally terminated with a CICS transaction dump. A flag is set in the remote work element (RWE) to indicate that the mainline transaction has assumed that CFTS has failed.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCRS

ACTA

Explanation: The relay program running in the terminal-owning region has received an unexpected request from the application owning region. The request received is in violation of CICS transaction routing protocols.

The request will be in the DFHLUCDS DSECT in DFHZTSP's LIFO – field LUCOPN0

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZTSP

ACTB

Explanation: The relay program running in the terminal-owning region issued a terminal control WRITE,LAST request to the application-owning system, and received a nonzero return code from terminal control.

This is the usual return code from terminal control in TCATPAPR.

System Action: The task is abnormally terminated with a CICS transaction dump.
**User Response:** Use the transaction dump to determine why terminal control was unable to process the request.

**Module:** DFHZTSP

---

**ACTC**

**Explanation:** The relay program running in the terminal-owning region issued a terminal control request to free its session to the application-owning system, and received a nonzero return code from terminal control.

This is the usual return code from terminal control in TCATPAPR.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Use the transaction dump to determine why terminal control was unable to process the request.

**Module:** DFHZTSP

---

**ACTG**

**Explanation:** The relay program running in the terminal-owning region issued a request to attach a transaction in the application-owning region, but the response received from that region was invalid.

The return code in the TCA (field TCATPAPR) will be nonzero, and either there will be no TIOA (field TCTTEDA in the TCTTE is zero) or there will be no FMH7 at the start of the TIOA.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Use the transaction dump to determine why terminal control was unable to process the request. The transaction on the application-owning region may have abnormally terminated or the session may have failed.

**Module:** DFHZTSP

---

**ACTH**

**Explanation:** A privileged allocate was issued against a remote LU 6.2 system.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCRT

---

**ACTI**

**Explanation:** The relay transaction has an ISC or MRO session as its principal facility. However the TCTTE for that session is not owned by the task.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCRT

---

**ACTJ**

**Explanation:** The principal facility of the relay transaction is not a TCTTE.

**System Action:** Task CXRT should only be started in a terminal-owning region by an ALLOCATE request issued in an application-owning region against a remote APPC device. The principal facility of the task should be an ISC or MRO link. Check that your CICS system is defined in such a way that this will always be the case. Also ensure that program DFHCRT is started only by task CXRT.

**Module:** DFHCRT
### ACTK

**Explanation:** The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate the reason why the task was purged. It was either purged by the master terminal operator or as a result of a deadlock timeout.

**Module:** DFHZISP

### ACTL

**Explanation:** An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related message produced by the domain that detected the original error.

**Module:** DFHZISP

### ACUA

**Explanation:** DFHZXRL was called with a request which is not supported for transaction routing.

The request is located in the DFHLUC parameter list which is printed in the exception trace. DFHZXRL is called from DFHZARL, which will put details of the request in its trace entry.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZXRXL

### ACUB

**Explanation:** The parameter list passed to DFHZXRL for an ALLOCATE request does not contain the TCTSE address of a remote APPC terminal.

The TCTSE address is located in the DFHLUC parameter list which is printed in the exception trace. DFHZXRL is called from DFHZARL, which will put details of the request in its trace entry.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZXRXL

### ACUG

**Explanation:** A request to allocate a session between the application-owning region and the terminal-owning region failed. The return code from the ALLOCATE request indicated that the profile could not be located as an installed transaction definition, although an earlier attempt to locate it was successful.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZXRXL
**ACUH**

**Explanation:** A request to allocate a session between the application-owning region and the terminal-owning region failed. The return code from the ALLOCATE request indicated that the requested session is already owned by the TCA.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZXRL

**ACUL**

Note: The description of this abend also applies to ACUX and ACUZ.

**Explanation:** The transaction routing program in the application-owning region issued a terminal control WRITE, WAIT, READ request to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

**Module:** DFHZXRL

**ACUI**

**Explanation:** An ISC session between the application-owning region and the terminal-owning region was not allocated because the MODENAME named in the profile could not be found. The profile DFHCICCSR as supplied by IBM does not specify a MODENAME. Therefore, this error will occur when a MODENAME has been added to the IBM-supplied profile, but that MODENAME is not defined in the SESSIONS definition for the terminal-owning region.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** Ensure that the MODENAME specified in profile DFHCICCSR was also specified when defining the SESSIONS to the terminal-owning region.

**Module:** DFHZXRL

**ACUM**

**Explanation:** A request to DFHZTSP to free a surrogate TCTTE was not satisfied.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZXRL

**ACUO**

Note: The description of this abend also applies to ACUQ, ACUS and ACU1.

**Explanation:** A terminal control READ request has failed. The transaction routing program in the application-owning region attempted to receive data from the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

**Module:** DFHZXRL

**ACUK**

**Explanation:** No TCT entry was found for the terminal-owning region specified in the TCTSE for the remote terminal.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** Ensure that the terminal-owning region defined in the remote system entry is also defined with a system entry in the TCT.

**Module:** DFHZXRL
ACUP

Note: The description of this abend also applies to ACUR.

Explanation: The transaction routing program in the application-owning region did not receive a rollback from the terminal-owning region. This violates CICS transaction routing protocols.

The trace from the terminal-owning region will show its response to the application-owning region.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZXRL

ACUQ

Explanation: Refer to the description of abend ACUO.

Module: DFHZXRL

ACUR

Explanation: Refer to the description of abend ACUP.

Module: DFHZXRL

ACUS

Explanation: Refer to the description of abend ACUO.

Module: DFHZXRL

ACUT

Explanation: The transaction routing program in the application-owning region did not receive either a syncpoint or a rollback from the terminal-owning region. This violates CICS transaction routing protocols.

The trace from the terminal-owning region will show its response to the application-owning region.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZXRL

ACUV

Explanation: The transaction routing program in the application-owning region issued a terminal control ISSUE ABEND request on an MRO link to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACUW

Explanation: The transaction routing program in the application-owning region issued a terminal control ISSUE ERROR request on an MRO link to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACUX

Explanation: Refer to the description of abend ACUL.

Module: DFHZXRL

ACUY

Explanation: The transaction routing program in the application-owning region issued a terminal control WRITE,WAIT request to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACUZ

Explanation: Refer to the description of abend ACUL.

Module: DFHZXRL
ACU0

**Explanation:** The transaction routing program in the application-owning region issued a terminal control WRITE,LAST, WAIT request to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:
- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

**Module:** DFHZXRL

ACU1

**Explanation:** Refer to the description of abend ACU0.

**Module:** DFHZXRL

ACU2

**Explanation:** The transaction routing program in the application-owning region received a response from the terminal-owning region which violates CICS transaction routing protocols.

The trace from the terminal-owning region will show its response to the application-owning region.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZXRL

ACU3

**Explanation:** The transaction routing program in the application-owning region attempted to set the conversation state machine to a state which violates CICS transaction routing protocols.

The register containing the state can be determined from the assembler listing.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZXRL

ACU4

**Explanation:** The transaction routing program in the application-owning region issued a SET request to the conversation state machine and received a nonzero return code. This violates CICS transaction routing protocols.

The trace entry on return from DFHZUSR will show the request type and current state.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZXRL

ACU5

**Explanation:** An program running in an application-owning region has issued an ALLOCATE against an APPC device attached to a terminal owning region, but the connection between the two systems is not installed.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** Install the connection between the two regions.

**Module:** DFHZXRL

ACU6

**Explanation:** A request to DFHRTSU to prepare the surrogate TCTTE for syncpoint gave an unexpected response and reason code. The response and reason code are included in DFHRTSU's parameter list which is printed in the exception trace.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZXRL

ACU7

**Explanation:** A request to allocate a session between the application-owning region and the terminal-owning region was issued, but the connection with the remote system is not an APPC or MRO connection.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Redefine the connection as APPC or MRO, or avoid using transaction routing on this connection.

**Module:** DFHZXRL

ACU8

**Explanation:** A request to DFHRTSU to get the recovery status of a surrogate TCTTE gave an unexpected response and reason code. The response and reason code are included in DFHRTSU's parameter list which is printed in the exception trace.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.
ACU9

Explanation: A request to recovery manager to set the recovery status of a link gave an unexpected response and reason code. The response and reason code are included in DFHRMLN’s parameter list which is printed in the exception trace.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZXRL

ACVA

Explanation: The transaction routing program in the terminal-owning region issued a terminal control WRITE, WAIT, READ request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

• The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.

• The session has failed.

Module: DFHZXRL

ACVB

Explanation: The transaction routing program in the terminal-owning region attempted to issue an ISSUE SIGNAL request on an MRO link to the application-owning region. This violates CICS transaction routing protocols.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZXRL

ACVC

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE SIGNAL request on an LU 6.2 link to the application-owning region, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

• The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.

• The session has failed.

Module: DFHZXRT

ACV

Explanation: The transaction routing program in the terminal-owning region issued a READ request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

• The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.

• The session has failed.

Module: DFHZXRT

ACVE

Explanation: The transaction routing program in the terminal-owning region issued a WRITE request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

• The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.

• The session has failed.

Module: DFHZXRT

ACVF

Explanation: The transaction routing program in the terminal-owning region issued a WRITE, LAST, WAIT request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

• The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.

• The session has failed.

Module: DFHZXRT
Chapter 3. Transaction abend codes

ACVG

**Explanation:** The transaction routing program in the terminal-owning region issued a FREE request to free the session with the LU 6.2 terminal, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed.

**Module:** DFHZXRT

ACVM

**Explanation:** The transaction routing program in the terminal-owning region issued an ISSUE ABEND request on an LU 6.2 link, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:
- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

**Module:** DFHZXRT

ACVN

**Explanation:** The transaction routing program in the terminal-owning region issued an ISSUE ABEND request on an LU 6.2 link, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:
- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

**Module:** DFHZXRT

ACVO

**Explanation:** The transaction routing program in the terminal-owning region issued an ISSUE PREPARE request and received either a nonzero return code or a response which violates CICS transaction routing protocols.

The return code is located in TCASPRC and the response is located in TCASPSN1.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** Use the transaction dump to determine whether the problem is caused by the return code or the response. If terminal control was unable to process the request, the abend may occur when:
- The program in the connected region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed. Otherwise the distributed application programs may have violated APPC conversation protocols.

**Module:** DFHZXRT

---

**ACVP**

**Explanation:** The transaction routing program in the terminal-owning region did not receive an FMH43 from the application-owning region. This violates CICS transaction routing protocols. The trace from the application-owning region will show its response to the terminal-owning region.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZXRT

---

**ACVQ**

**Explanation:** The transaction routing program in the terminal-owning region issued a request to the APPC terminal, and received a nonzero return code from terminal control. Both the request and the return code are located in the DFHLUC parameter list which is printed in the exception trace.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed or be in the wrong state, for example, as the result of both the terminal and application issuing SYNCPPOINT ROLLBACK at the same time.

**Module:** DFHZXRT

---

**ACVR**

**Explanation:** The transaction routing program in the terminal-owning region issued a SEND,LAST,WAIT request to the LU 6.2 terminal, and received a nonzero return code from terminal control. The return code is located in the DFHLUC parameter list which is printed in the exception trace.

**System Action:** The task is abnormally terminated with a transaction dump and an exception trace entry.

**User Response:** Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed.

**Module:** DFHZXRT

---

**ACWA**

**Explanation:** CICS CWTO transaction has failed because the task does not own a terminal (TCTTE) as its principal facility. This has probably happened because CWTO has been started as an EXEC CICS START transid without a terminal ID.

**System Action:** The transaction is abnormally terminated without a transaction dump.

**User Response:** Retry with a terminal ID value or enter CWTO from a terminal.

**Module:** DFHCWTO

---

**ACXA**

**Explanation:** The catch-up transaction, CXCU, has failed. CXCU runs either in response to a transaction request from an end-user, or is run automatically by an active CICS system in response to the appearance of an alternative CICS system. Its purpose is to inform the alternate system of the active system’s state regarding terminals and DBCTL connection.

**System Action:** The catch-up transaction, CXCU, is abnormally terminated with a CICS transaction dump. Both active and alternate CICS systems continue, but the alternate CICS system is less effective in the event of a takeover. For example, terminal back-up sessions may not be established. This abend is accompanied by DFHDX8313.

**User Response:** Retry by entering ‘CXCU’ from a terminal. If the error persists, diagnose the problem from the dump.

**Module:** DFHCXCU

---

**ADCA**

**Explanation:** This abend is issued if DBCTL returns a non-zero response code when a DL/I request has been issued from an application program.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Look up accompanying message DFHDB8109 that appears on the CDDBC transient data destination.

**Module:** DFHDLIDP

---

**ADCB**

**Explanation:** This abend occurs when DBCTL has notified CICS that a task has issued a DL/I request, but it did not have a PSB scheduled. If your application does have a PSB scheduled then a possible cause for this abend is that the DBCTL STOP THREAD command may have been used to terminate the DBCTL thread that corresponds to this task.

**System Action:** CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

**User Response:** Check if the DBCTL operator has issued a STOP THREAD command for the task that has abnormally terminated. Look up DBCTL response code 28 in the DBCTL return code section of the IMS Messages and Codes manual.

**Module:** DFHDLIDP
ADCC

Explanation: This abend occurs when DBCTL has notified CICS that a task has issued program specification block (PSB) request, but it has a PSB already scheduled. CICS prevents a task from issuing a PSB schedule request to DBCTL when it has already issued a PSB schedule request by returning a PSBSCH response in UIBDLTR. However, in this case it is DBCTL that has rejected the subsequent PSB schedule request. A possible cause for this abend is a storage over-write.

System Action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User Response: Check for any messages issued from your CICS system indicating that storage over-writes have taken place. Look up DBCTL response code 32 in the DBCTL return code section of the IMS Messages and Codes manual.

Module: DFHDLIDP

ADCD

Explanation: This abend occurs when a deadlock has been detected by IMS and this transaction has been selected for abnormal termination.

This abend can occur when a transaction is accessing IMS resources via DBCTL or via a remote DLI request to a remote CICS region. The remote CICS region can be accessing IMS via DBCTL, or if it is a pre CICS 4.2 region, accessing IMS via local DLI.

System Action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User Response: If ADCD abends occur infrequently in your system, no action is required although you may like to consider setting your system up in such a way that, after an ADCD abend is issued, the transaction is automatically restarted. See the CICS Recovery and Restart Guide for further information.

If ADCD abends are occurring frequently in your system, you may need to review the design of your applications. Some general techniques for deadlock avoidance are described in the CICS Recovery and Restart Guide.

Module: DFHDLIDP

ADCE

Explanation: This abend is issued when the module DFHDBAT returns a nonzero return code in reply to a DL/I request issued from an application program to DBCTL. DFHDBAT is a task related user exit and forms part of the CICS-DBCTL interface. This abend is accompanied by message DFHDB8110.

System Action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User Response: Look up the accompanying message DFHDB8110 that appears on the CDBC transient data destination.

Module: DFHDLIDP

ADCI

Explanation: This abend is issued when IMS returns a user abend 3303 response for a DL/I request issued from an application program.

System Action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User Response: Check the description in the IMS Messages and Codes manual for the meaning of IMS user abend 3303.

Module: DFHDLIDP

Module: DFHDLIDP

ADJ

Explanation: This abend is issued when an application has been using DBCTL, and while the application was still scheduled to DBCTL, the CICS-DBCTL interface was terminated.

System Action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User Response: Check the CDBC transient data destination for messages indicating the reason for termination of the CICS-DBCTL interface. If you do not know where the CDBC transient is, then please check with your system programmer. Check for messages issued from the DBCTL system.

Module: DFHDLIDP

ADCP

Explanation: When checking the DBCTL program specification block (PSB), the external security manager checked the usage of the PSB, and found that:

- The user was unauthorized to access the PSB, or
- The PSB was unknown to the external security manager, or
- The user was set to the capability of the default user.

The meaning of the term “user” in the above context depends on the way the transaction was invoked.

- If the transaction is being run from a local terminal, or has been routed from a remote terminal, the user is the terminal user. (For a routed transaction, if PSBCHK=NO is specified in the SIT, or RESSEC=NO is specified in the transaction definition (CEDA DEFINE TRANSACTION command), the security manager does not check the terminal user.)

- If the transaction is being run as a result of a request from another CICS MRO region, the user is the owner of the other CICS system (as defined to the external security manager in the JOB statement of the initializing JCL).

- If the transaction is being run as a result of a request from a connected ISC system, the user is defined in the SECURITYNAME operand of the installed CONNECTION definition that defines the link between the remote system and the local system. Ensure that the name in the SECURITYNAME operand is the same as that supplied by the connected CICS system. This will depend upon the type of CONNECTION between the two systems. For further information about this, refer to the CICS Intercommunication Guide.

Notes.

By the above definitions, a PSB used by a routed transaction has two users, the terminal user and the communicating region. Therefore, for routed transactions, the external security manager makes two checks, on the terminal user (as qualified in 1 above), and on the communicating region (2 or 3 above).

System Action: CICS abnormally terminates the task attempting to schedule the PSB. CICS processing continues.

User Response: Ensure that the PSB is defined to the external security manager, and that all users have the correct level of authorization. If the system setup is correct, note the security violation.

Module: DFHDLIDP
ADCQ

Explanation: This abend occurs when an application has issued an EXEC DLI SCHD request for a PSB that contains no DBPCBs, and the SYSSERVE keyword was not specified. This abend also occurs when an application has issued a PCB request for a PSB that contains no DBPCBs, and the IOPCB option was not specified.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Check that the application program has scheduled the appropriate PSB.

Module: DFHDLIDP

ADCR

Explanation: This abend occurs when an application has issued a DLI request other than a schedule request, and the DBCTL DRA return code of 40 indicates that there was no active communication with DBCTL.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Check the CDBC transient data destination for messages indicating the reason for termination of the CICS-DBCTL interface. If you do not know where the CDBC transient data destination is, check with your system programmer. Check for messages issued from the DBCTL system.

Module: DFHDLIDP

ADCS

Explanation: CICS issued a single-phase commit request to DBCTL and an unexpected response was returned from DBCTL.

System Action: CICS issues message DFHDB8119 to transient data queue CDBC, then terminates the task abnormally with a CICS transaction dump.

User Response: Message DFHDB8119 shows the unexpected response from DBCTL, along with the recovery token of the LUW involved. The explanation of message DFHDB8119 indicates how the outcome of the LUW can be determined.

Module: DFHDLIDP

ADCT

Explanation: A user has attempted to invoke the CICS-DBCTL control transaction from a terminal.

System Action: CICS rejects the request.

User Response: Do not try to invoke CICS internal transactions directly.

Module: DFHDBCT

ADDA

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the catalog (CC) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User Response: See related message from the domain that detected the original error.

Module: DFHDBME, DFHDLI, DFHDLIDP

ADDB

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the loader (LD) domain. The domain that detected the original error will have provided an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User Response: See related message from the domain that detected the original error.

Modules: DFHDBCON, DFHDBDSC

ADDC

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the catalog (CC) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User Response: See related message from the domain that detected the original error.

Modules: DFHDBCON, DFHDBDI

ADDI

Explanation: CICS has been notified of a DBCTL failure. However, it has been unable to complete the search for a DBCTL alternate. This is possibly due to an unexpected return code from an IEFSSREQ request.

System Action: A CICS transaction dump is produced. CICS continues as if no XRF DBCTL alternate has been found. This abend is accompanied by message DFHDX8323.

User Response: Refer to message DFHDX8323 for further information. It may be necessary to restart DBCTL manually.

Module: DFHDBCT

ADDJ

Explanation: CICS has failed to connect to DBCTL because program DFHDBAT could not be ENABLED.

System Action: A CICS transaction dump is produced. The state of the CICS/DBCTL interface remains not connected.

User Response: Refer to the transaction dump to determine why the ENABLE failed.

Module: DFHDBCON

ADEF

Explanation: A severe error has been encountered when executing transaction CLS3.

System Action: CLS3 is abnormally terminated with a transaction dump. CICS issues message DFHZC4948.

User Response: See message DFHZC4948 for further guidance.

Module: DFHCLS3
**ADIR**

**Explanation:** The abend code is issued for either of the following reasons:

- A DFHDI or DFHBMS request was issued when the DFHDIP program was generated as a dummy.
- A DFHDI TYPE=RECEIVE or TYPE=NOTE was attempted but the transaction identification did not specify either INBFMH=DIP or INBFMH=ALL.

**System Action:** A CICS transaction dump is provided to assist in problem determination.

**User Response:** Either CICS transaction dump is provided to assist in problem determination.

**Module:** DFHDLIRP

---

**ADLE**

**Explanation:** A DL/I request was made for a remote database, but the system named in the remote PDIR entry was unknown to CICS, that is, not specified in a DFHTCT TYPE=SYSTEM macro or CEDA DEFINE CONNECTION command.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Either correct the SYSIDNT parameter in the relevant DFHDLPSPB entry, or define the remote system to CICS with a DFHTCT TYPE=SYSTEM macro or a CEDA DEFINE CONNECTION command.

**Module:** DFHDLIRP

---

**ADLF**

**Explanation:** A DL/I request was made for a remote database, but the link to the system on which the database resides was down.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Notify the system programmer. Once the link to the remote system has been reestablished, resubmit the transaction.

**Module:** DFHDLIRP

---

**ADLG**

**Explanation:** A DL/I request was made for a remote database, but there were errors in the DL/I argument list that was provided by the user.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Ensure that any errors in the DL/I argument are corrected.

**Module:** DFHDLIRP

---

**ADLP**

**Explanation:** When checking the DL/I program specification block (PSB), the external security manager checked the usage of the PSB, and found that:

- The user was unauthorized to access the PSB, or
- The PSB was unknown to the external security manager, or
- The user was set to the capability of the default user.

The meaning of the term “user” in the above context depends on the way the transaction was invoked.

**System Action:**
- If the transaction is being run from a local terminal, or has been routed from a remote terminal, the user is the terminal user. (For a routed transaction, if PSBCHK=NO is specified in the SIT, or RESSEC=NO is specified in the transaction definition (CEDA DEFINE TRANSACTION command), the security manager does not check the terminal user.)
- If the transaction is being run as a result of a request from another CICS MRO region, the user is the owner of the other CICS system (as defined to the external security manager in the JOB statement of the initializing JCL).
- If the transaction is being run as a result of a request from a connected ISC system, the user is defined in the SECURITYNAME operand of the installed CONNECTION definition that defines the link between the remote system and the local system. Ensure that the name in the SECURITYNAME operand is the same as that supplied by the connected CICS system. This will depend upon the type of CONNECTION between the two systems. For further information about this, refer to the CICS Intercommunication Guide.

**Note:** By the above definitions, a PSB used by a routed transaction has two users, the terminal user and the communicating region. Therefore, for routed transactions, the external security manager makes two checks, on the terminal user (as qualified in 1 above), and on the communicating region (2 or 3 above).

**System Action:** The task attempting to schedule the PSB abnormally terminates.

**User Response:** Ensure that the PSB is defined to the external security manager, and that all users have the correct level of authorization. If the system setup is correct, note the security violation.

**Module:** DFHDLIRP

---

**ADMA**

**Explanation:** The alternate CICS task responsible for tracking the DBCTL connection status of the active CICS has received an error from the CICS Availability Manager (CAVM) message input service.

**System Action:** The tracking transaction terminates with a CICS transaction dump. No further action is taken in response to DBCTL status changes. The global exits, XXDFB and XXDTO, are never invoked and no attempt at a DBCTL restart is made in the event of a takeover. This abend is accompanied by DFHDX8331.

**User Response:** Check for any other messages relating the CAVM dataset problems. In the event of a takeover, it may be necessary to restart DBCTL manually.

**Module:** DFHDBCRR

---

**ADMB**

**Explanation:** The CICS/XRF DBCTL tracking task has received an unrecognizable message from the CICS/XRF message manager. This abend is preceded by message DFHDX8333.

**System Action:** The CICS/XRF DBCTL tracking task abends.

**User Response:** Refer to the instructions for message DFHDX8333.

**Module:** DFHDBCRR.
ADMD

**Explanation:** The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has been unable to complete its search for a DBCTL alternate, possibly due to an unexpected return code from an IEFSRREQ request.

**System Action:** A CICS transaction dump is produced. The tracking transaction continues as if no DBCTL alternate had been found. This abend is accompanied by message DFHDX8335.

**User Response:** Refer to message DFHDX8335 for further information. It may be necessary to restart DBCTL manually.

**Module:** DFHDDBC.

ADPL

**Explanation:** A server program has issued a command which is restricted in the distributed program link (DPL) environment. Certain API and CPI-RR requests, and the DL/I terminate request are not allowed in the DPL environment. See the CICS Application Programming Guide for a list of these restricted commands.

A server program is a program which has been remotely linked, or a program defined to run with the DPL subset.

**System Action:** CICS abends the transaction with a transaction dump.

**User Response:** Remove the restricted commands from the server program, or run the server program locally.

**Module:** DFHEIP, DFHCPIR, DFHDLI.

ADPM

**Explanation:** An application program has issued a CALL AIBTDLI request for a function type that is not supported by CICS. The CALL AIBTDLI interface can only be used to issue operator commands to DBCTL in CICS with function types of ICMD, RCMD and GMSG. For all other function types, the EXEC DLI, CALL ASMTDLI, CALL CBTLTDI or CALL PLITDLI interfaces must be used.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Correct the application program to use the correct application programming interface.

**Module:** DFHDLI.

ADXA

**Explanation:** The XRF DBCTL state catch-up transaction, DXCU, has failed.

**System Action:** DXCU is abnormally terminated with a CICS transaction dump. This abend is accompanied by DFHDX8319.

**User Response:** Diagnose the error from the CICS transaction dump. Refer to DFHDX8319 for further information.

**Module:** DFHDXC.

ADXB

**Explanation:** The XRF DBCTL state catch-up transaction, DXCU, has failed.

**System Action:** DXCU is abnormally terminated with a CICS transaction dump. This abend is accompanied by DFHDX8318.

**User Response:** Use the dump to help diagnose the problem. Refer to DFHDX8318 for further information. Check for any other messages relating to CICS availability manager (CAVM) data set problems.

**Module:** DFHDXC.

ADMD

**Explanation:** The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has been unable to complete its search for a DBCTL alternate, possibly due to an unexpected return code from an IEFSRREQ request.

**System Action:** A CICS transaction dump is produced. The tracking transaction continues as if no DBCTL alternate had been found. This abend is accompanied by message DFHDX8335.

**User Response:** Refer to message DFHDX8335 for further information. It may be necessary to restart DBCTL manually.

**Module:** DFHDDBC.

AD2A

**Explanation:** An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHDXE.
**AD2E**

**Explanation:** An unexpected EXCEPTION response has occurred on a locate call to directory manager (DD) domain to locate a DB2ENTRY control block. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHD2EX1

---

**AD2I**

**Explanation:** The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because it was not link edited AMODE 31.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the associated DFHDB2051 transient data message to determine the name of the dynamic plan exit program involved. Re-linked the dynamic plan exit program AMODE 31.

**Module:** DFHD2EX1

---

**AD2J**

**Explanation:** The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because it is disabled.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the associated DFHDB2053 transient data message to determine the name of the dynamic plan exit program involved. Enable the dynamic plan exit program.

**Module:** DFHD2EX1

---

**AD2K**

**Explanation:** The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because no program definition was found.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the associated DFHDB2057 transient data message to determine the name of the dynamic plan exit program involved. Ensure that the dynamic plan exit program has been correctly defined to CICS.

**Module:** DFHD2EX1

---

**AD2L**

**Explanation:** The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because the program could not be loaded.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the associated DFHDB2058 transient data message to determine the name of the dynamic plan exit program involved. Ensure that the dynamic plan exit program has been correctly defined and is in a load library accessible to CICS.

**Module:** DFHD2EX1

---

**AD2M**

**Explanation:** The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because the program is defined as remote.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the associated DFHDB2066 transient data message to determine the name of the dynamic plan exit program involved. Correct the program definition for the dynamic plan exit program so that it is defined as local.

**Module:** DFHD2EX1
AD2N

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the associated DFHDB2054 transient data message to determine the name of the dynamic plan exit program involved. Examine the transaction dump to determine why the link failed.

Module: DFHD2EX1

AD2O

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an WAIT_MVS call to the dispatcher (DS) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHD2EX1

AD2P

Explanation: The transaction was unable to obtain a DB2 thread from a DB2ENTRY or the pool. See the associated transient data message DFHD2011 to determine which DB2ENTRY was involved or whether it was the pool. The transaction was abended because the DB2ENTRY or the pool specified threadwait(no) meaning do not wait for a thread if all threads are currently in use. Note if message DFHD2011 indicates that the pool was being used, it means the transaction was using the pool directly rather than overflowing to the pool. (An abend AD3T is produced when a transaction overflows to the pool and no pool threads are available.)

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Determine whether more threads should be allocated to the DB2ENTRY or the pool, or whether the number of instances of this transaction should be limited using TRANCLASS.

Module: DFHD2EX1

AD2Q

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an getmain call to the storage manager (SM) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHD2EX1

AD2R

Explanation: The CICS-DB2 subtask processing the DB2 request for this transaction has abended. An exception trace is written containing the MVS abend code and reason code as well as the relevant CICS-DB2 control blocks used by the CICS task and the CICS-DB2 subtask.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Examine the trace in the CICS transaction dump to determine why the CICS-DB2 subtask abended.

Module: DFHD2EX1

AD2S

Explanation: The subtask servicing the DB2 request for the transaction issued a sign-on request to DB2 which failed. The installed DB2CONN specifies THREADERROR(N906D) or THREADERROR(ABEND).

System Action: If THREADERROR(N906D) is specified in the DB2CONN, processing continues. A -906 sqlcode is returned to the application, and a transaction dump is taken with abend code AD2S.

If THREADERROR(ABEND) is specified in the DB2CONN, the task is abnormally terminated with a CICS transaction dump.

User Response: Examine the AUTHID or AUTHTYPE parameter of the DB2ENTRY or pool used for the transaction. Ensure the id is authorised to access the plan in DB2.

Module: DFHD2EX1

AD2T

Explanation: An attempt to create a DB2 thread by the subtask servicing the DB2 request for the transaction failed with DB2 reason code 00F30040. The installed DB2CONN specifies THREADERROR(N906D) or THREADERROR(ABEND).

System Action: If THREADERROR(N906D) is specified in the DB2CONN, processing continues. A -906 sqlcode is returned to the application and a transaction dump is taken with abend code AD2T.

If THREADERROR(ABEND) is specified in the DB2CONN, the task is abnormally terminated with a CICS transaction dump.

User Response: Either the plan is unavailable or is not known to DB2.

Module: DFHD2EX1

AD2U

Explanation: An attempt to create a DB2 thread by the subtask servicing the DB2 request failed. The installed DB2CONN specifies THREADERROR(N906D) or THREADERROR(ABEND).

System Action: If THREADERROR(N906D) is specified in the DB2CONN, processing continues. A -906 sqlcode is returned to the application and a transaction dump is taken with abend code AD2U.

If THREADERROR(ABEND) is specified in the DB2CONN, the task is abnormally terminated with a CICS transaction dump.

User Response: Examine the dump to determine why the create thread failed.

Module: DFHD2EX1
AD2V

Explanation: The CICS-DB2 attachment facility issued a commit or end request to DB2 but received an 00F30805 reason code indicating that connection to DB2 has been lost. This is due to DB2 terminating abnormally or being in the process of terminating abnormally. The commit or end request may have been processed or DB2 may not have received the request and hence is still indoubt. The CICS-DB2 attachment facility instructs CICS to remember the outcome of the UOW pending resynchronisation which will happen when CICS and DB2 are reconnected.

System Action: The transaction completes normally but a transaction dump is taken with abend code AD2V. If DB2 is indoubt about the outcome of the UOW it will be resolved when CICS and DB2 are reconnected.

User Response: Contact your system programmer to restart the DB2 subsystem.

Module: DFHD2EX1

AD2W

Explanation: The CICS-DB2 attachment facility issued a single-phase commit call to DB2 but received an unexpected response. Transient data message DFHD2B055 details the DB2 reason code received. The commit request may have been processed or it may have been ended. There is no resynchronisation needed, as no CICS recoverable resources were updated.

System Action: The CICS-DB2 attachment facility abnormally terminates the transaction with abend code AD2W. The CICS recovery manager will supersede the AD2W abend code with abend code ASPR. A transaction dump is taken.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHD2EX1

AD2X

Explanation: The CICS-DB2 attachment facility detected that the CICS task and thread subtask were in an invalid state. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHD2EX1

AD2Y

Explanation: The transaction was unable to obtain a DB2 thread from a DB2ENTRY or the pool because there were no TCBs available on which to create the thread. The number of subtask TCBs currently running is at the TCBLIMIT defined in the DB2CONN. Message DFHD2B010 is output to transient data. The transaction was abended because either:

- The DB2ENTRY specifies threadwait(no), meaning do not wait for a thread, including having to wait to create a thread

because a TCB is not available - that is, do not wait for a TCB either.

- The DB2ENTRY specified threadwait(pool), but the pool definition within the DB2CONN specifies threadwait(no), and again there were no TCBs available.

- The transaction was using the pool directly, the pool specifies threadwait(no) and no TCB was available.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Determine whether TCBLIMIT should be increased or whether the number of transactions using DB2 at any one instance should be limited using transaction classes.

Module: DFHD2EX1

AD22

Explanation: DB2 detected a deadlock and the CICS-DB2 attachment facility attempted a syncpoint rollback command for the transaction as DROLLBACK(YES) was specified for the DB2ENTRY or POOL. The syncpoint rollback command failed. Message DFHD2B070 is output to transient data detailing the transid involved and the EIBRESP2 from the failed syncpoint rollback command.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Examine the eibresp2 value to determine why the syncpoint rollback request failed. One possible reason could be that the transaction running is a DPL server transaction which was DPl-ed to by a client transaction without specifying the SYNCONRETURN parameter. In this case syncpoints, or syncpoint rollbacks, cannot be taken by the server transaction, so DROLLBACK(YES) is invalid in this case.

Module: DFHD2EX1

AD21

Explanation: The CICS-DB2 attachment facility received a request for a resource manager with the incorrect name. Message DFHD2B045 is output to transient data detailing the invalid name.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHD2EX1

AD22

Explanation: The CICS-DB2 attachment facility EDF processor was unable to interpret the SQL request.

System Action: The command is not interpreted by EDF. A CICS transaction dump is taken with abend code AD22.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHD2EDF
AD23

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility service transaction CEX2. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The CICS-DB2 service task initiates a force shutdown of the CICS-DB2 interface.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHD2EX2

AD24

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility service transaction CEX2. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The CICS-DB2 Service task initiates a force shutdown of the CICS-DB2 interface.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHD2EX2

AD25

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility while processing a DSNC command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The DSNC command fails and the transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHD2CC

AD26

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility while processing a DSNC command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The DSNC command fails and the transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHD2CC

AD27

Explanation: The CICS-DB2 attachment facility attempted to attach a subtask on which a DB2 thread was to be created to service the SQL request from the application. The attach of the subtask failed due to lack of storage.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Increase the size of the CICS region or lower the TCBLIMIT value specified in the DB2CONN.

Module: DFHD2EX1

AD28

Explanation: The CICS-DB2 attachment facility attempted to attach a subtask on which a DB2 thread was to be created to service the SQL request from the application. The attach of the subtask failed.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHD2EX1

AD29

Explanation: The CICS-DB2 attachment facility was unable to link to its EDF processor DFHD2EDF.

System Action: The command is not interpreted by EDF. Message DFHDB2048 is output to transient data and a transaction dump is taken with abend code AD29.

User Response: Examine the trace in the CICS transaction dump to determine why the link to module DFHD2EDF failed.

Module: DFHD2EDF

AD3A

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility startup program. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHD2STR

AD3B

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain made by the CICS-DB2 Attachment facility startup program. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.
**AD3D**

**Explanation:** An unexpected response was received while attempting to delete a record from a temporary storage queue during processing of a DSNC STRT command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

**System Action:** The DSNC STRT command fails. The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHD2CM1

**AD3P**

**Explanation:** An unexpected error occurred during processing of a DSNC STOP command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

**System Action:** The DSNC STOP command fails. The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHD2CM1

**AD3Q**

**Explanation:** An unexpected response was received while attempting to read a record from a temporary storage queue during processing of a DSNC STRT command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

**System Action:** The DSNC STRT command fails. The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHD2CM1

**AD3R**

**Explanation:** An unexpected response was received while attempting to read a record from a temporary storage queue during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

**System Action:** Startup of the CICS-DB2 interface is terminated, the interface is closed. The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHD2CM1

**AD3S**

**Explanation:** An unexpected response was received from an EXEC CICS SET DB2CONN command issued during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

**System Action:** Startup of the CICS-DB2 interface is terminated, the interface is closed. The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHD2CM1
### AD3T

**Explanation:** The transaction was unable to obtain a DB2 thread from the pool. Message DFHDB2011 is output to transient data. The transaction was abended because the transaction tried using a DB2ENTRY but all threads were in use on the DB2ENTRY, and despite threadwait(pool) being specified, all threads in the pool were also in use. The pool definition within the DB2CONN specifies threadwait(no).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Determine whether more threads should be allocated to the DB2ENTRY or the pool, or whether the number of instances of this transaction should be limited using TRANCLASS.

**Module:** DFHD2EX1

### AD3U

**Explanation:** An error (INVALID or DISASTER response) has occurred on a locate call to transaction manager (XM) domain to locate a transaction definition. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHD2EX1

### AD3W

**Explanation:** An unexpected response was received while attempting to write a record to a temporary storage queue during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

**System Action:** Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHD2STR

### AD3X

**Explanation:** An unexpected response was received while attempting to write a record to a temporary storage queue during processing of a DSNC STRT command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

**System Action:** The DSNC STRT command fails. The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHD2CM1

### AD3Z

**Explanation:** The CICS-DB2 subtask processing the DB2 request for this transaction has abended because the DB2 adapter is being shutdown.

**System Action:** The task is abnormally terminated.

**User Response:** If this abend should occur at CICS or DB2 shutdown then it can be ignored, because the DB2 adapter is abending the task as part of shutdown processing, otherwise you will need assistance from IBM.

**Module:** DFHD2EX1

### AEC1

**Explanation:** An attempt has been made to use the Command Level Interpreter (CECI) or the Enhanced Master Terminal (CEMT) or an RDO (CEDA, CEDB, CEDC) transaction on a terminal that is not supported.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Use a terminal that is supported by the Command Level Interpreter, Enhanced Master Terminal, or RDO transaction.

**Modules:** DFHECIP, DFHECSP, DFHEMTP, DFHESTP, DFHEOTP, DFHEDAP

### AEC2

**Explanation:** An attempt has been made to use the Command Level Interpreter (CECI) or the Enhanced Master Terminal (CEMT) or an RDO (CEDA, CEDB, CEDC) transaction on a display terminal of size less than 24 X 80.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Use a display terminal that is supported by the Command Level Interpreter or Enhanced Master Terminal or RDO transaction.

**Modules:** DFHECIP, DFHECSP, DFHEMTP, DFHESTP, DFHEOTP, DFHEDAP

### AEC3

**Explanation:** An unsuccessful attempt has been made to call VS COBOL II to initialize a thread (for the first VS COBOL II program in a CICS transaction).

**System Action:** The transaction is abnormally terminated. The program is disabled.

**User Response:** Check your library setup to ensure that all of the VS COBOL II interface modules are present.

**Module:** DFHAPLI

### AEC4

**Explanation:** An unsuccessful attempt has been made to call VS COBOL II to initialize a run-unit (for any VS COBOL II program in a CICS transaction).

**System Action:** The transaction is abnormally terminated. The program is disabled.

**User Response:** Check your library setup to ensure that all of the VS COBOL II interface modules are present.

**Module:** DFHAPLI
AEC5

Explanation: An unexpected error has been encountered by C/370 during the THREAD INITIALIZATION phase while attempting to execute a C language program.

System Action: The return code received from C/370 is placed into the field EIBRESP2; then the transaction is abnormally terminated. The program is disabled.

User Response: Refer to the error message(s) provided by C/370 to determine the cause of the problem.

Module: DFHAPLI

AEC6

Explanation: An unexpected error has been encountered by C/370 during the RUNUNIT INITIALIZATION phase while attempting to execute a C language program.

System Action: The return code received from C/370 is placed into the field EIBRESP2; then the transaction is abnormally terminated. The program is disabled.

User Response: Refer to the error message(s) provided by C/370 to determine the cause of the problem.

Module: DFHAPLI

AEC7

Explanation: Language Environment/370 has encountered an unexpected error during the THREAD INITIALIZATION phase while attempting to execute a Language Environment/370 enabled program. The return code received from Language Environment/370 is placed into the field EIBRESP2.

System Action: Message DFHAP1200 is issued and the transaction is abnormally terminated. The program is disabled.

User Response: Refer to the error message or messages issued by Language Environment/370 to determine the cause of the problem.

Module: DFHAPLI

AEC8

Explanation: Language Environment/370 has encountered an unexpected error during the RUNUNIT INITIALIZATION phase while attempting to execute a Language Environment/370 enabled program.

System Action: The return code received from Language Environment/370 is placed into the field EIBRESP2. Message DFHAP1200 is issued and the transaction is abnormally terminated. The program is disabled.

User Response: Refer to the error message or messages issued by Language Environment/370 to determine the cause of the problem.

Module: DFHAPLI

AEC9

Explanation: Language Environment/370 has encountered an unexpected error during the RUNUNIT BEGIN INVOCATION phase while attempting to execute a Language Environment/370 enabled program.

System Action: The return code received from Language Environment/370 is placed into the field EIBRESP2. Message DFHAP1200 is issued and the transaction is abnormally terminated. The program is disabled.

User Response: Refer to the error message or messages issued by Language Environment/370 to determine the cause of the problem.

Module: DFHAPLI

AEDA

Explanation: The CEDF transaction has been started with an invalid start code. This could be the result of attempting to start the execution diagnostic facility (EDF) with EXEC CICS START(CEDF).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why the start has failed.

Module: DFHEDFX

AEDB

Explanation: DFHEDFP has been passed an invalid EDFXA. This is an internal CICS error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHEDFX

AEDC

Explanation: The program EDF has terminated because a GETMAIN request to the storage manager failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why the request has failed.

Module: DFHEDFX

AEDD

Explanation: CICS has attempted to attach the EDF task to display the user request but the attach has failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why the attach has failed.

Module: DFHEDFX

AEDE

Explanation: CICS has suspended the user task to allow the EDF task to complete but an error has occurred while performing the suspend.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why the suspend has failed.

Module: DFHEDFX
**AEDF**

**Explanation:** CICS has suspended the user task to allow the EDF task to complete. The user task has been purged while suspended, before control was returned from EDF.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** The task was probably purged by the master terminal operator. Investigate the reason why the task was purged. This may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

**Module:** DFHEDFX

---

**AEDG**

**Explanation:** CICS has suspended the user task to allow the EDF task to complete. The user task has gone away while suspended, before control was returned from EDF.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Use the transaction dump to determine the reason why the task finished before being resumed.

**Module:** DFHEDFX

---

**AEDH**

**Explanation:** An error occurred when CICS called the Program Manager in order to discover details of the user program that has invoked EDF.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Use the transaction dump to determine why the call has failed.

**Module:** DFHEDFX

---

**AED1**

**Explanation:** This abend is produced as a result of either:
- An attempt to use the execution diagnostic facility (EDF) on an unsupported terminal,
- Using the temporary storage browse transaction (CEBR) on an unsupported device, or
- An attempt to initiate the temporary storage browse transaction (CEBR) with a non-terminal principal facility.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Use a terminal that is supported as a display terminal by EDF. A CICS transaction dump of the task terminated with this abend code is available for review.

**Module:** DFHEDFX

---

**AED3**

**Explanation:** The program EDF has terminated a task and placed this abend code in the terminated task’s TCA. The termination occurs because execution of EDF is about to be abnormally terminated.

One possible cause of an abend in EDF is incorrect data being sent to the terminal by the user task.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** A CICS transaction dump of the terminated task and also a similar dump for EDF, when its termination was abnormally terminated, are available for review.

**Module:** DFHEDFX

---

**AED4**

**Explanation:** An internal logic error has been detected in EDF module DFHEDFP.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** This indicates a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHEDFP

---

**AED5**

**Explanation:** An internal logic error was detected in EDF. Insufficient dynamic storage was pre-allocated.

**System Action:** EDF is terminated abnormally with dumps having dump codes CXSP, RMIN, PAGE, LDIN. The user task continues.

**User Response:** The problem may be avoided by less complex user interactions with EDF. If the problem persists, you may need further assistance. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHEDFD

---

**AED6**

**Explanation:** An internal logic error was detected in EDF.

**System Action:** EDF is terminated abnormally with dumps having dump codes CXSP, RMIN, PAGE, LDIN. The user task continues.

**User Response:** The problem may be avoided by less complex user interactions with EDF. If the problem persists, you may need further assistance. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHEDFU

---
AED7

**Explanation:** The installed definition of the transaction CEDF has a TWA size which is too small.

**System Action:** CICS abnormally terminates the transaction with a CICS transaction dump.

**User Response:** If you have an updated copy of the CEDF transaction installed, ensure that you have a TWA size at least as big as the one defined by the IBM supplied definition. If you do not have an updated CEDF you may need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHEDFP

AED8

**Explanation:** A terminal control error has occurred in DFHEDFX.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHEDFX

AED9

**Explanation:** A temporary storage error has occurred in EDF. This could be caused by an input/output error on temporary storage or because temporary storage data is full.

**System Action:** EDF is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate the reason for the temporary storage request failure. Ensure that the definition of the temporary storage data set is correct.

See the *CICS Problem Determination Guide* for further guidance in dealing with temporary storage problems.

**Module:** DFHEDFD

AEIA

**Note:** The description of this abend also applies to AEID to AEI9, AEXC, AEXF, AEXG, AEXI to AEXL, AEXV to AEXX, AEX0 to AEX9, AEYA to AEYC, AEYE to AEY3, AEY7, and AEZE to AEZQ.

**Explanation:** The EXEC interface program issues an abend when an exceptional condition has occurred but the command does not have the RESP option (or NOHANDLE option), or the application program has not executed an EXEC CICS HANDLE CONDITION command for that condition. This will cause DFHEIP to take the system action for the condition in question. In most cases, the system action will be to abend the transaction.

Because of their similar characteristics, the above-named abend codes for the EXEC interface program are described as a group. The codes and their corresponding exceptional conditions are as follows:

<table>
<thead>

**Problem Determination:** The function code of the command that produced the exceptional response and the response code can be found in the EXEC interface block (EIB). The EIB is part of a larger control block, used by DFHEIP, known as the EXEC interface storage block (EIS). The EIS is addressed by the TCAEISA, which is the system part of the TCA + X’90’. The EIB is pointed to from the EIS + X’8’. The function code may be located at offset X’1B’ in the EIB while the response codes may be one of the following at the given offsets:

- EIBRCODE X’1D’
- EIBRESP X’4C’
- EIBRESP2 X’50’

The CICS Application Programming Reference gives translations of the encoded functions and their responses.

**Analysis:** Because these abend codes are directly related to exceptional conditions that can be specified in HANDLE CONDITION commands, the application programmer should decide whether the condition is one that should be handled by the application (for example ENDFILE), or one that requires modifications to the application or CICS tables.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Change the application program either to prevent the condition recurring, to check it by using the RESP option, or to handle the condition when it does occur (by using the EXEC CICS HANDLE CONDITION command). If necessary, use the contents of the EIBRESP2 field or the EIBRCODE in the EIB to assist in determining the cause of the exceptional condition.

**Module:** DFHEIP

---

**AELB**

**Explanation:** The executing function has been purged before control could be returned.

**System Action:** The transaction is marked to be abnormally terminated with abend code AELB.

**User Response:** Investigate the reason the task was purged. It was purged either by the master terminal operator, or as a result of a deadlock timeout.

If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased then the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

**Module:** DFHETL

---

**AEMA**

**Explanation:** An error (INVALID or DISASTER response) has occurred on a call to the application (AP) domain when a request for set user exit active could not be serviced.

**System Action:** The task is abnormally terminated. The domain that detected the original error issues a console message and might provide an exception trace, and depending on the options specified in the dump table, a system dump.

**User Response:** See the associated console message for further guidance.

**Module:** DFHUEM

---

**AEMB**

**Explanation:** An error (INVALID or DISASTER response) has occurred on a call to the loader (LD) domain. The domain that detected the original error will have provided an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

**User Response:** See the related message from the domain that detected the original error.

**Module:** DFHUEM

---

**AEMP**

**Explanation:** The task was purged before a set active request to the application (AP) domain was able to complete successfully. The domain that first detected the purged condition may provide an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting
for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

**Module:** DFHUEM

### AEMQ

**Explanation:** The task was purged before an IDENTIFY PROGRAM request to the loader (LD) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

**User Response:** Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

**Module:** DFHERM

### AETF

**Explanation:** The task was purged before a request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

**Module:** DFHERM

### AETG

**Explanation:** An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related message produced by the domain that detected the original error.

**Module:** DFHERM

### AETH

**Explanation:** The task was purged before a request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

**Module:** DFHERM
AETI

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHERM

AETJ

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an ADD_LINK call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHERM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHERM

AETK

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an SET_LINK call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHERM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHERM

AETL

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an SET_UOW call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHERM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHERM

AETM

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INQUIRE_TRANSACTION call to the transaction manager (XM) domain. For errors other than EXCEPTION, the XM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHRMSY

AETN

Explanation: An EXCEPTION response with an unexpected reason occurred on an INITITIATE_RECOVERY call to recovery manager (RM) domain. DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHRMSY

AETO

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INITIATE_RECOVERY call to the recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHRMSY also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHRMSY

846 CICS Messages and Codes
AETP

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an TERMINATE_RECOVERY call to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHRMSY

AETQ

Explanation: An EXCEPTION response with an unexpected reason occurred on an INQUIRE_UOW call to the recovery manager (RM) domain. DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHRMSY

AETR

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INQUIRY_UOW call to the recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHRMSY also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHRMSY

AETS

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INQUIRE_STARTUP call to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHRMSY

AEXU

Explanation: During execution of an EXEC CICS command, a NOTPOSS condition has been raised on encountering an invalid parameter. This is probably caused by a previous storage overlay.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Refer to abend AEIA for an explanation of how to determine the function code of the CICS command that caused the abend.

It is not possible to set an EXEC CICS HANDLE CONDITION for NOTPOSS.

The system programmer should investigate the cause of the storage overlay.

Modules: DFHEIDTI, DFHEIQDS, DFHEIQSA, DFHEIQSC, DFHEIQSM, DFHEIQSP, DFHEIQST, DFHEIQSX

AEXY

Explanation: The executing transaction has been purged before control could be returned.

This can arise when the transaction is purged while
- A CICS command was being processed
- The transaction was waiting to be dispatched

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Contact your system programmer to determine why the transaction has been purged.

Modules: DFHACP, DFHBEP, DFHBRX, DFHBRIC, DFHRMS, DFHRBSP, DFHBRTC, DFHBSTS, DFHBSTZO, DFHD2CC, DFHD2EX1, DFHD2EX2, DFHD2STR, DFHEDCP, DFHEDFP, DFHEDI, DFHEEI, DFHEGL, DFHEICRE, DFHEIIC, DFHEIIP, DFHEIPA, DFHEIPRT, DFHEIPSE, DFHEISP, DFHEIQDS, DFHEIQDN, DFHEIQDS, DFHEIQDQ, DFHEIQD2, DFHEIQIR, DFHHEIQMS, DFHHEIQMT, DFHHEIQPF, DFHHEIQPN, DFHHEIQRO, DFHHEIQSA, DFHHEIQSC, DFHHEIQSJ, DFHHEIQSK, DFHHEIQSL, DFHHEIQSM, DFHHEIQSP, DFHHEIQSQ, DFHHEIQST, DFHHEIQSX, DFHHEIQTM, DFHHEIQTR, DFHHEIQTS, DFHHEIQUE, DFHHEIQVT, DFHHEIOW, DFHEKC, WFHEMS, DFHEOP, DFHEPC, DFHERM, DFHESC, DFHESE, DFHESN, DFHETC, DFHETL, DFHETRX, DFHFPCC2, DFHTACP, DFHTFP, DFHTIEM, DFHUEM, DFHUBTC, DFHUMBR, DFHUTXP, DFHZATS, DFHZNCA, DFHZNCE, DFHZTS, DFHZXQO, DFHZXST

AEXZ

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System Action: The transaction is abnormally terminated with abend code AEXZ. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User Response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.
AEY6

Explanation: Internal logic error in DFHUEM. This arises when using EXITALL to DISABLE an exit program from all exit points for which it has been enabled. The entire user exit table has been scanned and all associations of the program have been found. But the activation count for the program in its exit program block indicates there should be more associations (for example, the activation count has not been reduced to zero). The user exit table and associated control blocks (EPBs and EPLs) are out of step and for which the prerequisite function has not been included in the current CICS start-up.

System Action: The transaction is abnormally terminated.

User Response: Ensure that the DFHEIENT, DFHEISTG, and DFHEIEND macro invocations are correctly positioned and retry. If the error persists, you will need further assistance. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Modules: DFHEIP, DFHEEI

AEZ6

Explanation: A transaction has been defined with a TASKDATALOC(ANY), but the programs within the transaction are running amode 31. The exec interface program is therefore unable to access the TCA for the application. Furthermore, any reference to the EIB would cause the transaction to fail with an O4 protection exception.

System Action: The task is abnormally terminated.

User Response: Either redefine and install a new definition for the transaction with TASKDATALOC(BELOW), or relink the programs as amode 31.

Module: DFHEIP
AEZB
Explanation: A transaction has been defined with a TASKDATALOC(ANY), and the application is attempting to call a task related user exit. However the task related user exit has been linkeded AMODE 24 and enabled with the LINKEDITMODE option, thereby directing CICS to invoke it in AMODE 24. An AMODE 24 task related user exit cannot run when the calling application is running with TASKDATALOC(ANY), as this would cause a protection exception, or a storage overwrite.
System Action: The transaction is abnormally terminated.
User Response: Either redefine and install a new definition for the transaction with TASKDATALOC(BELOW), or modify the task related user exit so that it is invoked in AMODE 31.
Module: DFHERM

AEZC
Explanation: A transaction has been defined with a TASKDATALOC(ANY), but a program within the transaction is defined to run AMODE 24. CICS cannot invoke the AMODE 24 program when the transaction is running with TASKDATALOC(ANY), as this would cause a protection exception, or a storage overwrite.
System Action: The transaction is abnormally terminated.
User Response: Either redefine and install a new definition for the transaction with TASKDATALOC(BELOW), or relink the program as AMODE 31.
Module: DFHAPLI

AEZD
Explanation: An attempt has been made to run a program defined as EXECKEY(USER) as part of a transaction defined as TASKDATAKEY(CICS). These attributes are incompatible and the transaction is abended. This incompatibility could occur as a result of the program definition being autoinstalled. See the CICS Customization Guide and the CICS Resource Definition Guide for more information about program autoinstall.
System Action: The transaction is abnormally terminated.
User Response: Redefine and install a new definition either for the transaction with TASKDATAKEY(USER), or for the program with EXECKEY(CICS).
If this abend occurs when running a CICS transaction, a possible cause is that you are not using the CICS-supplied definition for the program. If you are using your own copies of CICS-supplied program definitions, they must be defined as EXECKEY(CICS).
Module: DFHAPLI

AEZE
Explanation: CHANGED condition not handled.
This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.
See the description of abend AEIA for further details.
Module: DFHEIP

AEZF
Explanation: PROCESSBUSY condition not handled.

| This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group. |
| See the description of abend AEIA for further details. |
| Module: | DFHEIP |

AFCB

| Explanation: | Module DFHEIFC issued a resource level security check (RSLC) request to module DFHXSRC and received a response other than OK or EXCEPTION. |
| System Action: | The transaction is abnormally terminated with a transaction dump. |
| User Response: | Examine the trace to find the exception trace entry created by DFHXSRC at the time of the error. Use this trace entry to determine the cause of the return code from DFHXSRC. |
| Module: | DFHEIFC |

AFCC

| Explanation: | An internal logic error was detected when calling the file control request processing module DFHFCFR. Either DFHFCFR returned an INVALID response to its caller indicating an error in the caller's parameter list, or DFHFCFR passed back a return code that was not recognized by its caller. |
| System Action: | The transaction is abnormally terminated with a transaction dump. |
| User Response: | You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. |
| Modules: | DFHEIFC, DFHDMPCA |

AFCD

| Explanation: | During an attempt to locate an AFCT entry, the table manager program DFHTMP has returned a ‘disastrous error’ response that could not be handled by its caller. |
| System Action: | The transaction is abnormally terminated with a transaction dump. |
| User Response: | You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. |
| Module: | DFHEIFC |

AFCF

| Explanation: | A deadlock has been detected between two or more tasks issuing file control requests. |
| System Action: | The task that would have entered deadlock is abended with a CICS transaction dump. |
| User Response: | Examine this transaction and other transactions in the system that update the same files to find the cause of the deadlock, then correct the error. |
| When transactions update several files within the same unit of work, all transactions should update these files in the same order. A transaction that abends AFCF may be retried by specifying RESTART(YES) in the transaction definition and by coding a suitable DFHREST program. |
| Module: | DFHEIFC |
**Chapter 3. Transaction abend codes**

### AFCG

**Explanation:** A transaction has issued a sequence of file control requests that would cause the file to deadlock itself. This response arises for different reasons depending upon the file type.

If the file is being accessed in non-RLS mode, the response is caused by the transaction making conflicting requests against the same CI. For example, if the file is being accessed using LSR, a self deadlock will arise when an attempt is made to read a record that is in the same CI as a record that is the subject of a READ UPDATE or WRITE MASSINSERT request issued by the same transaction.

If the file is accessed in RLS mode there is no CI locking, but self deadlock responses can still arise. They are caused by sequences of requests that are either logically meaningless or which cannot be performed by VSAM RLS.

With VSAM RLS the most likely causes of this abend are as follows:

- Two successive READ UPDATE requests against the same record by the same transaction without an intervening REWRITE, DELETE or UNLOCK command.
  
  This is an incorrect use of file control requests.

- A transaction has created a record by WRITE MASSINSERT and then, without terminating the WRITE MASSINSERT sequence by issuing an UNLOCK request, the same transaction has attempted to modify the same record by issuing a READ UPDATE or DELETE request.

  This sequence of requests fails if VSAM has not written the record out to disk. The only way to guarantee that the record has been written to disk is to issue the UNLOCK request.

- A transaction has updated or deleted a record using a browse for update sequence and then, without terminating the browse for update sequence by issuing an ENDBR request, the same transaction has attempted to modify the same record by issuing a separate READ UPDATE or DELETE or WRITE request.

  This sequence of requests fails if VSAM has not written the record out to disk. The only way to guarantee that the record has been written to disk is to issue the ENDBR request.

If the file is used to access a coupling facility data table, then self deadlock responses are caused by sequences of requests that are either logically meaningless or which cannot be performed by coupling facility data tables support.

For coupling facility data tables, the most likely cause of this abend is as follows:

- Two successive READ UPDATE requests have been issued against the same record by the same transaction without an intervening REWRITE, DELETE or UNLOCK command.

  This is an incorrect use of file control requests.

**System Action:** The task that would have entered deadlock is abended with a CICS transaction dump.

**User Response:** Examine the previous requests made by this transaction against this file to identify the cause of the deadlock, then correct the error. In some cases (particularly when the file is being accessed in RLS mode or is using a coupling facility data table) this abend may indicate a programming error in the program that issued the file control requests.

### AFCH

**Explanation:** The transaction has issued a request for a remote shared data table for which it has an active browse, but in the meantime the table has been disabled or closed by the owning CICS system, or the owning CICS system has failed.

**System Action:** The requesting transaction abends with a transaction dump.

CICS continues normally.

**User Response:** In the application owning region, take whatever action normally follows the issue of a FORCE request in, or the failure of, the file owning CICS system.

See the CICS Shared Data Tables Guide for further guidance.

**Module:** DFHEIFC

### AFCK

**Explanation:** DFHFCU issued a call to DFHFCFS to open a file. A purged error was returned from DFHFCFS because the task has been waiting for a resource longer than the DTIMEOUT interval specified for the CSFU transaction.

**System Action:** The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

**User Response:** Examine the dump to determine the cause of the error. A system dump can be produced by adding the appropriate dump table entry using the CEMT SET TRDUMPCODE command.

**Module:** DFHFCU

### AFCL

**Explanation:** During the loading of a Shared Data Table by the CFSL transaction, a call to the CICS Transaction Manager has returned a response (such as DISASTER) after which normal processing could not continue.

**System Action:** Message DFHFC0949 is issued. Loading of the data table is terminated and CFSL abends.

**User Response:** Refer to the description of the message for further information and guidance.

**Module:** DFHDTLX
AFCM

**Explanation:** During the loading of a data table by the CFSL transaction, an abend was detected, or a domain call returned a response (such as DISASTER) after which normal processing could not continue.

**System Action:** A message is issued (one of DFHFC0945, DFHFC0946, or DFHFC0947). Loading of the data table is terminated and CFSL abends.

**User Response:** If this abend is produced as a result of an abend during loading, message DFHFC0945 is issued. If it is a result of a domain call failure, depending on which domain the failure was returned by, one of the messages DFHFC0946 or DFHFC0947 is issued. Refer to the description of the message for further information and guidance.

**Module:** DFHDTLX

---

AFCN

**Explanation:** The transaction issued a file request that caused file control to attempt to create a journal record but the record was too large for the journal buffer to accommodate. This indicates that a journal referenced in the file definition is using an MVS logstream, which in turn, is using a coupling facility structure which has been defined with a MAXBUFSIZE parameter less than the recommended 64000.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Redefine the coupling facility structure that the logstream is using with a MAXBUFSIZE parameter of 64000. The journal in error can be the forward recovery log or the journal used for auto-archiving.

If the module that detected the error is DFHDMPCA, the error is associated with a journal referenced in the definition of the CSD (DFHCSD).

**Modules:** DFHDMPCA, DFHEIFC

---

AFCO

**Explanation:** An attempt was made to attach a transaction specifying DFHDTLX as the program to be given control, but the transaction was not internally attached by CICS.

**System Action:** The transaction is abnormally terminated. CICS processing continues.

**User Response:** Establish why an attempt was made to attach CFSL illegally, or why a transaction definition specified DFHDTLX as the program to be given control.

**Module:** DFHDTLX

---

AFCT

**Explanation:** The program has made a file control request against a file opened in RLS mode. The SMSVSAM server has been recycled since an earlier RLS request from the same unit of work. The same unit of work cannot issue requests against two different instances of the SMSVSAM server. Note that this abend will occur even if the earlier request was not successful.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Resubmit the transaction.

**Modules:** DFHEIFC, DFHDMPCA
AFCU

Explanation: A program made a file control request against a file that is being accessed in VSAM RLS mode. The underlying data set is in lost lock state. File control requests are not allowed against a data set that is in lost locks state.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Recovery from lost locks is normally automatic. See the CICS Recovery and Restart Guide for a full explanation of lost locks recovery. You will not be able to issue any file control requests against this data set until all systems that owned locks at the time of the lock structure failure have completed their lost locks recovery.

See the CICS Recovery and Restart Guide for guidance on how to determine which CICS systems still have lost locks recovery pending, for information on commands that allow you to find the work that these systems have outstanding, and on commands that allow you to force a system to immediately complete lost locks recovery. The commands that force immediate completion of lost locks recovery should only be used as a last resort as they may cause loss of data integrity. It is better to allow the automatic recovery procedures to complete normally.

Modules: DFHEIFC, DFHDMPCA

AFCV

Explanation: A request made against a file opened in RLS mode was unable to acquire a record lock. It waited for the lock, but the wait time exceeded the maximum wait time applicable to that request.

System Action: The task is abnormally terminated with a CICS transaction dump.

CICS prints message DFHFC0164 and message DFHFC0165 which identify the transaction or transactions that were immediately in front of this transaction in the queue for the lock. Normally this transaction or these transactions are the owners of the lock, although this is not the case if a chain of requests for the record has built up.

User Response: Retry the transaction.

If the problem recurs, see messages DFHFC0164 and DFHFC0165 to determine the transaction that is holding the lock. In most cases the problem lies with the lock owner rather than the transaction that has failed.

Examples of causes of timeouts are as follows:

- The transaction that holds the lock has a design error. For example:
  - A conversational transaction updates a recoverable record and then issues a terminal control read. It does not issue syncpoint (and therefore does not release the lock) until the end user has responded to the terminal control read. It may therefore hold the lock for a considerable period.
  - A transaction updates very many records in recoverable files before issuing syncpoint. You are recommended to keep the number of updates made within a unit of work small and to issue frequent syncpoints to ensure that locks are released regularly.
- The system in which the lock holder is running is experiencing severe performance degradation. Investigate the reason for the performance degradation.
- There is a deadlock between RLS and another resource manager. For example one transaction may be holding an RLS lock and waiting for a lock on a transient data queue. The transaction that times out may hold the lock on the transient data queue and be waiting for the RLS lock. RLS can detect deadlocks only when all the locks involved in the deadlock are RLS locks. A deadlock such as this can appear to RLS to be a long wait for a lock and is reported as a time out. Examine the design of the transactions to determine whether resource manager deadlocks can occur.
- It may be possible for RLS deadlocks to be reported as RLS timeouts if VSAM does not perform deadlock detection until after the time out value for the request occurred. For example, assume that DEADLOCK_TIMEOUT in specified as (15,4) in SYS1.PARMLIB. This means that VSAM does not attempt to detect cross-MVS deadlocks until 4 periods of 15 (that is, 60) seconds have elapsed. If DTIMOUT was not active for the transaction and the SIT specified FTIMEOUT=30, the RLS request times out after 30 seconds, before VSAM has attempted to detect cross-MVS deadlocks. Adjust FTIMEOUT, DTIMOUT, and DEADLOCK_DETECTION to avoid such effects.

Modules: DFHEIFC, DFHDMPCA

AFCW

Explanation: The program issued a file control request against a file opened in RLS mode. VSAM RLS detected that this request would cause a deadlock. This transaction is abended in order to break the deadlock chain.

System Action: The task is abnormally terminated with a CICS transaction dump.

CICS prints message DFHFC0166 and message DFHFC0167 which identify the other transactions in the deadlock chain.

User Response: Retry the transaction.

Examine the logic of all the programs involved in the deadlock chain to determine whether they could be improved to avoid possible sources of deadlock. See the CICS Application Programming Guide for guidance on how to write programs that avoid deadlocks.

Modules: DFHEIFC, DFHDMPCA

AFCY

Explanation: The transaction issued a file request resulting in a call to the main file control program (DFHFCFR). During the processing of the request the transaction was purged (that is, was the subject of an explicit PURGE or FORCEPURGE request, was timed out, or was selected by CICS for termination in an attempt to alleviate an SOS condition). A “purged” response was returned from DFHFCFR to its caller.

System Action: The task is abnormally terminated with a CICS transaction dump.

Exception trace entries are made between the point at which the purge occurred and the issuing of the abend.

User Response: In some instances, for example if the transaction was explicitly purged, no further action is necessary. Otherwise examine the exception trace and the transaction dump to identify the point at which the purge occurred.

Modules: DFHDMPCA, DFHEIFC
**Explanation:** The transaction issued a file request resulting in a call to the main file control program (DFHFCFR). A “disastrous error” response was returned from DFHFCFR to its caller.

**System Action:** At the time the error is detected, CICS writes a message to the console, records an exception trace entry, and takes a system dump. The trace and dump identify the point of error.

Subsequently, the task is abnormally terminated with a CICS transaction dump.

**User Response:** The system programmer should use the trace and dumps to determine what the error is, and why it has occurred.

**Modules:** DFHDMPCA, DFHEIFC

---

**Explanation:** An attempt has been made to update a file after file control restart failed.

**System Action:** The transaction is abnormally terminated with a transaction dump.

**User Response:** Determine the cause of the failure in file control restart. Restart CICS.

**Modules:** DFHEIFC, DFHDMPCA

---

**Explanation:** DFHFCU issued a call to DFHFCFS to open a file. A disastrous error was returned from DFHFCFS. This file is for use by CICS system transactions CFQS and CFQR. These provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss BWO and non-BWO backups, and certain other data set related operations.

**System Action:** The task is abnormally terminated with a CICS transaction dump. CICS processing continues but it is probable that VSAM RLS data set quiesce support has been lost.

**User Response:** Restart CICS. If the problem reoccurs, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHFCQT

---

**Explanation:** An attempt was made by CICS to internally attach a transaction specifying DFHFCQT as the program to be given control, and the transaction id was other than CFQS or CFQR. DFHFCQT is for use by CICS system transactions CFQS and CFQR. These provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss BWO and non-BWO backups, and certain other data set related operations.

**System Action:** The transaction is abnormally terminated. CICS processing continues.

**User Response:** Establish why an attempt was made to illegally attach CFQS or CFQR, or why a transaction definition specified DFHFCQT as the program to be given control.

**Module:** DFHFCQT

---

**Explanation:** An attempt was made by CICS to internally attach a transaction specifying DFHFCQT as the program to be given control, but the transaction was not internally attached by CICS. DFHFCQT is for use by CICS system transactions CFQS and CFQR. These provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss BWO and non-BWO backups, and certain other data set related operations.

**System Action:** The transaction is abnormally terminated. CICS processing continues.

**User Response:** Determine why an attempt was made to illegally attach CFQS or CFQR, or why a transaction definition specified DFHFCQT as the program to be given control.

**Module:** DFHFCQT

---

**Explanation:** An attempt was made to attach a transaction specifying DFHFCQT as the program to be given control, but the transaction was not internally attached by CICS.

**System Action:** The transaction is abnormally terminated. CICS processing continues.

**User Response:** Establish why an attempt was made to illegally attach CFQS or CFQR, or why a transaction definition specified DFHFCQT as the program to be given control.

**Module:** DFHFCQT

---

**Explanation:** CICS system transaction CFQS has failed due to a serious error. An attempt will be made to reattach the transaction. CICS messages should indicate the cause of the error.

**System Action:** CFQS is abnormally terminated with a CICS transaction dump. CFQS is reattached and CICS processing continues.

**User Response:** Check Transient Data Queue CSFL for message DFHFC6028, indicating that the reattach of CFQS was successful. If the reattach fails, VSAM RLS data set quiesce initiation support is lost. If this support is required, CICS must be restarted.

**Module:** DFHFCQT

---

**Explanation:** CICS system transaction CFQS has failed due to a serious error. An attempt will be made to reattach the transaction. CICS messages should indicate the cause of the error.

**System Action:** CFQS is abnormally terminated with a CICS transaction dump. CFQS is reattached and CICS processing continues.

**User Response:** Check Transient Data Queue CSFL for message DFHFC6028, indicating that the reattach of CFQS was successful. If the reattach fails, VSAM RLS data set quiesce initiation support is lost. If this support is required, CICS must be restarted.

**Module:** DFHFCQT
AFDD

**Explanation:** CICS system transaction CFOR has failed due to a serious error. An attempt will be made to reattach the transaction. CICS messages should indicate the cause of the error.

CFOR provides support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss BWO and non-BWO backups, and certain other data set related operations.

**System Action:** CFOR is abnormally terminated with a CICS transaction dump. CFOR is reattached and CICS processing continues.

**User Response:** Check Transient Data Queue CSFL for message DFHFC6028, indicating that the reattachment of CFOR was successful. If the reattachment fails, VSAM RLS data set quiesce support is lost. If this happens, CICS must be restarted.

If it is not possible to restore VSAM RLS quiesce support, a more serious error is indicated. In this case, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHFCOR

AFDE

**Explanation:** An attempt was made to attach a transaction specifying DFHFCRD as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCRD is for use by CICS system transaction CSFR. This provides support for error recovery after a failure of the SMSVSAM server.

**System Action:** The transaction is abnormally terminated. CICS processing continues.

**User Response:** Establish why an attempt was made to illegally attach CSFR, or why a transaction definition specified DFHFCRD as the program to be given control.

**Module:** DFHFCRD

AFDF

**Explanation:** An attempt was made to attach a transaction specifying DFHFCOR as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCOR is for use by CICS system transaction CFOR. This provides part of the RLS offsite recovery support.

**System Action:** The transaction is abnormally terminated. CICS processing continues.

**User Response:** Establish why an attempt was made to illegally attach CFOR, or why a transaction definition specified DFHFCOR as the program to be given control.

**Module:** DFHFCOR

AFDG

**Explanation:** CICS system transaction CFOR has failed due to a serious error. CICS messages should indicate the cause of the error.

DFHFCOR provides part of the RLS offsite recovery support.

This abend indicates that this CICS system has completed its RLS offsite recovery, but an error occurred either in attempting to issue message DFHFC0575D which reports this fact, or in attempting to process the reply to message DFHFC0575D.

**System Action:** CFOR is abnormally terminated with a CICS transaction dump. CICS processing continues.

**User Response:** If you are using an automated procedure to check for and reply to message DFHFC0575D, then you should shut this CICS down and restart it specifying OFFSITE=YES again. If you are using manual procedures to check for completion of all RLS offsite recovery and to reply to message DFHFC0575D then you can "tick" this CICS off the list of systems which have completed their recovery, but you must ensure that it is not restarted with OFFSITE=NO until all other CICS systems have completed their RLS offsite recovery. Also note that until the system is restarted, RLS access will not be allowed by this system.

**Module:** DFHFCOR

AFDH

**Explanation:** VSAM has returned a response indicating that the RLS lock structure in the coupling facility is full. VSAM RLS is unable to create any new locks.

This abend code is usually issued from various CICS systems residing within the same sysplex.

**System Action:** The transaction which issued the VSAM RLS request is abnormally terminated with a CICS transaction dump. CICS processing continues.

**User Response:** Allocate a larger VSAM RLS lock structure and rebuild the RLS structure into the new larger structure. See OS/390 MVS Setting up a Sysplex, (GC28-1779) and DFSMS/MVS DFSMSdfp Storage Administration Reference, (SC26-4920) for further details on creating RLS lock structures and rebuilding lock structures.

**Modules:** DFHEIFC, DFHDMPCA

AGMA

**Explanation:** An attempt to initiate the good morning message transaction was made without specifying a termid for it to be displayed.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Use the dump to determine how the attempt to start the transaction was made. Ensure that no EXEC CICS STARTs are made for the good morning message transaction where no termid is specified.

**Module:** DFHGMM

AICA

**Explanation:** A task has been executing for longer than the runaway time interval (defined by the ICVR operand on the system initialization table macro, DFHSIT) without giving up control. The runaway task condition indicates a possible loop in the application.

**System Action:** The task is terminated with an AICA transaction dump.

**User Response:** See the CICS Problem Determination Guide for guidance on dealing with loops.

**Module:** DFHSRP
AICB

Explanation: A RETRIEVE WAIT request has been reissued in system shutdown.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: None

Module: DFHICP

AICC

Explanation: An incorrect response was returned from a timer (TI) domain request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Modules: DFHTAJP, DFHICP

AICD

Explanation: An incorrect response was returned from a kernel (KE) domain request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHICP

AICE

Explanation: An incorrect response was returned from a dispatcher (DS) domain request (other than AICG).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHICP

AICF

Explanation: An incorrect response was returned from a transaction manager (TM) domain request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHICP

AICG

Explanation: A PURGED response was returned from a dispatcher domain (DS) request, with a reason code of TASK_CANCEL. TASK_CANCEL was returned as the transaction had been explicitly canceled.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Notify your system programmer to determine why the task has been purged.

Module: DFHICP

AICH

Explanation: The task was purged before a request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHICP, DFHEIIC

AICJ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHICP

AICK

Explanation: Module DFHEIIC has issued a resource level security check (RSLC) request to module DFHXSRC and received a response other than OK or EXCEPTION.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Examine the trace to find the exception trace entry created by DFHXSRC at the time of the error. Use this trace entry to determine the cause of the return code from DFHXSRC.
Module: DFHEIIC

AICL

Explanation: DFHEIIC detected an invalid function code in the command level parameter list. This is caused either by a storage overwrite or a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 trace of the IC and EI components would aid problem determination. Look in the program storage section of the transaction dump and compare argument 0, the exec interface descriptor (EID), for the command being processed with the argument 0 produced by the translator for the same command. Any differences mean that an overwrite of the application program may have occurred. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHEIIC

AICN

Explanation: An incorrect response has been returned from a user domain (US) request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHICP

AICO

Explanation: An unexpected EXCEPTION response was received from a call to the user (US) domain.

The call was issued during initialization of a transaction that was started without a terminal. The call was made as part of processing to associate the transaction with its intended user. The attempt to associate the intended user with the transaction has failed.

The userid for the intended user of the transaction may not be correctly defined.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Determine why the intended user of the transaction is not correctly defined.

Examine messages produced for the CICS job by the external security manager (ESM). This may require the assistance of a security administrator.

It may be necessary to examine the transaction dump to determine why the external security manager has informed CICS that the user is not correctly defined.

When the user has been correctly defined, consider rerunning the transaction.

Module: DFHDFST

AICT

Explanation: Module DFHDFST has encountered an error during Retrieve processing.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use level 1 trace entries to determine the cause of the failure.

Module: DFHDFST

AICR

Explanation: A DFHTC write request has failed for IRC. The return codes within TCATPAPR and TCTEIRET should be examined to determine the cause of failure.

System Action: The CSNC transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHDFST

AINA

Explanation: An application program has issued an EXEC CICS LINK command to the indoubt testing tool program DFHINDT but has failed to pass a commarea containing the request to be executed. Valid requests are: ON, OFF, RESYNC COMMIT or RESYNC BACKOUT

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the application program so that it passes a commarea to DFHINDT containing a valid request for DFHINDT.

Module: DFHDFST
AINB

**Explanation:** An application program has issued an EXEC CICS LINK command to the indoubt testing tool program DFHINDT passing a commarea that did not contain a valid request to be executed. Valid requests are: ON, OFF, RESYNC COMMIT or RESYNC BACKOUT.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Correct the application program so that it passes a commarea to DFHINDT containing a valid request for DFHINDT.

**Module:** DFHINDT

AIND

**Explanation:** The indoubt testing tool issued a EXEC CICS INQUIRE EXITPROGRAM command to inquire on the status of the indoubt testing tool task related user exit program DFHINTRU, and the command failed with a NOTAUTH response.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** The indoubt testing tool can be run under transaction CIND, under a user transaction where the program EXEC CICS LINKs to DFHINDT, or under a transaction where the program EXEC CICS LINKs to DFHINDAP. If command security checking is active for the transaction (CMDSEC=YES), check that the user has read access to resource EXITPROGRAM. If resource security checking is active for the transaction (RESSEC=YES), check that the user has read access to resource DFHINTRU.

**Modules:** DFHINDT, DFHINDAP

AINE

**Explanation:** An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an GET_NEXT_LINK call issued by the indoubt testing tool to recovery manager (RM) domain. DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHINDT

AINF

**Explanation:** An EXCEPTION response with an unexpected reason occurred on an GET_NEXT_LINK call issued by the indoubt testing tool to recovery manager (RM) domain. DFHINDT also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHINDT

AINH

**Explanation:** An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an END_LINK_BROWSE command issued by the indoubt tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHINDT

AINI

**Explanation:** An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an INQUIRE_UOW command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHINDT
**AINJ**

**Explanation:** An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an ADD_LINK command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

**AINM**

**Explanation:** An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an INITIATE_RECOVERY command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

**AINN**

**Explanation:** An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an ADD_LINK command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINTRU provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINTRU

**AINO**

**Explanation:** The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TRANSACTION command to inquire whether the current transaction was in the indoubt transaction class DFHTCIND. The command failed with a NOTAUTH response.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: When the indoubt testing tool is active, the task related user exit DFHINTRU is invoked whenever a CICS transaction is started. For all transactions for which command security checking is active, ensure that the user has read access to resource TRANSACTION. If started transaction resource security checking is specified, for all transactions for which resource security checking is active, ensure that the user has read access to the transaction name in the specified RACF resource class.

For more information on command security and resource security see the *CICS RACF Security Guide*.

Module: DFHINTRU
AINP

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TRANSACTION command to inquire whether the current transaction was in the indoubt transaction class DFHTCIND. The command failed with an unexpected response.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHINTRU

AIOA

Explanation: The main method within CICSMain has been invoked with a null COMMAREA.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFJIIOP

AIOB

Explanation: The checkBytes method within CICSCommareaMapping has detected an error while trying to map the COMMAREA passed from DFHIIOPA. The COMMAREA length or commareaLength field is invalid.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFJIIOP

AIOC

Explanation: The setBytes method within CICSCommareaMapping has detected an error while trying to map the COMMAREA passed from DFHIIOPA. Either the hostnameLength or the commareaLength field is invalid.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFJIIOP

AIOD

Explanation: The setIIOPDataFromTSQ method within CICSCommareaMapping has detected an error reading input data from a Temporary Storage queue. The number of items expected, set by DFHIIOPA, does not match the numItems returned by the TSQ readNextItem method.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFJIIOP

AIOE

Explanation: The setIIOPDataFromTSQ method within CICSCommareaMapping has detected an error reading input data from a Temporary Storage queue. An unexpected CICS condition was thrown by the TSQ readNextItem method.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFJIIOP
**Explanation:** The `setIIOPDataFromTSQ` method within CICSCommareaMapping has detected an error creating its IIOP data buffer from a Temporary Storage queue. This is probably due to a mismatch between the length of data expected, set by DFHIIOPA, and the length of data read from the Temporary Storage queue.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFJIIOP

---

**Explanation:** The main method within CICSMmain has failed to initialize the ORB. This may be due to invalid data in the COMMAREA passed from DFHIIOPA.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFJIIOP

---

**Explanation:** The `setBytes` method within CICSCommareaMapping has detected an error while trying to map the COMMAREA passed from DFHIIOPA. An UnsupportedEncodingException has been caught during conversion of the hostname to a String using codepage 8859_1.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFJIIOP

---

**Explanation:** When the IIOP/CORBA call was processed it resulted in an abend; probably in the CORBA object or DFJIIOP.

**System Action:** An IIOP SYSTEM_EXCEPTION reply is sent to the client and the task is abnormally terminated with a CICS transaction dump.

**User Response:** Check the system log to determine the reason for the original abend. Resolve the problem and resubmit the request.

**Modules:** DFHIOP DFHIIOPA

---

**Explanation:** A call to the Socket domain has failed when the IIOP code was attempting to send or receive data.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Modules:** DFHIOP DFHIIOPA
AIO2

**Explanation:** The IIOP/CORBA data stream contained an invalid header or data structure.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Modules:** DFHIIOP DFHIIOPA

AIO3

**Explanation:** The WRITEQ/READQ TS call detected that the queue has been modified by another process.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Modules:** DFHIIOP DFHIIOPA

AIO4

**Explanation:** The IIOP transaction CIOF etc. has been started incorrectly, e.g. by CECI START TR(CIOF)

**System Action:** The task is terminated.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Modules:** DFHIIOP DFHIIOPA

AISA

**Explanation:** The mirror transaction (CSMI) has been attached from some facility other than a terminal. This is not permitted.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Using the dump, check the field TCAFCAAA to identify the invalid attach.

**Module:** DFHMIIRS

AISB

**Explanation:** The mirror transaction (CSMI) has detected errors in the data passed to it from the attaching transaction.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** The invalid input will be visible in the transaction dump. This error is likely to be caused by some mismatch between the two systems. A typical example might be a DL/I request received on a system generated without DL/I.

**Module:** DFHMIIRS

AISC

**Explanation:** The mirror transaction (CSMI) has not received a TIOA from the terminal.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Use the trace in the dump and the dumped TCTTE to analyze the problem further.

**Module:** DFHMIIRS

AISD

**Explanation:** The mirror program executed the request and received a nonzero return code as a result. The data flow control state of the intersystem link being used was such that this information could not be returned normally.

**System Action:** The mirror task is abnormally terminated with a CICS transaction dump.

**User Response:** The transaction dump provided will provide information required to analyze the source of the nonzero return code at its point of origin.

**Module:** DFHMIIRS

AISF

**Explanation:** The CICS mirror program DFHMIIRS has been attached in an unsupported manner. The principal facility for the mirror transaction is defined as APPC, however the conversation is unmapped.

**System Action:** CICS abnormally terminates the transaction with a transaction dump.

**User Response:** There is a problem with the system that caused the mirror transaction to be attached. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHMIIRS

AISG

**Explanation:** The mirror program executed the request and produced the reply. This would not be sent because the data flow control state of the intersystem link was such that this could not be done.

**System Action:** The task (CSMI) is abnormally terminated with a CICS transaction dump.

**User Response:** Use the transaction dump provided to analyze the problem.

**Module:** DFHMIIRS

AISH

**Explanation:** The new connection task, CSNC, has been invoked in an incorrect manner (for example, from a terminal or via an EXEC CICS START request).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** None.

**Module:** DFHCRNP
AISI
Explanation: A function shipping request was passed by DFHEIP to DFHISP. This was found to be invalid by the transformer, DFHXFP.
System Action: The transaction issuing the function shipping request is abnormally terminated with a CICS transaction dump.
User Response: The transaction dump will provide information to further analyze the problem.
Module: DFHISP

AISJ
Explanation: The IRC control task CSNC has abended because the attempt to LINK to DFHCRR failed.
System Action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated. All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abnormally terminated.
User Response: Ensure that program DFHCRR is available.
Module: DFHCRR

AISK
Explanation: The user transaction has been abnormally terminated during the execution of a function shipping request on an APPC session. This has happened because the mirror transaction on the remote system has abnormally terminated, and caused a request for syncpoint rollback to be sent across the session. CICS abends the user transaction in these circumstances so that function shipping remains transparent to the transaction.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Check the log on the mirror system to determine the reason for the original abend of the mirror task.
Module: DFHISP

AISL
Explanation: The LU services manager transaction has been started directly from a user terminal. This is not permitted.
System Action: The task is abnormally terminated with a transaction dump.
User Response: None. The LU services manager transaction must be started internally by CICS.
Modules: DFHLUP, DFHCLS3, DFHCLS4, DFHZLS1

AISN
Explanation: Task CSNC attempted to acquire a SUSPEND TOKEN to enable it to suspend itself until further work arrives. The attempt failed.
System Action: CSNC is abnormally terminated with a dump. The IRC facility is disabled.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCRR

AISO
Explanation: Task CSNC attempted to suspend itself, awaiting further work. The attempt failed.
System Action: CSNC is abnormally terminated with a dump. The IRC facility is disabled.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCRR

AISP
Explanation: A mirror transaction (transaction identifiers CSHR, CSM1, CSM2, CSM3, CSM5, or CSMI) has been invoked with an invalid principal facility. The mirror transaction executes with an MRO session, an LU6.1 session or an APPC session as its principal facility.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: Do not attempt to invoke the mirror transaction by entering the transaction identifier at a terminal.
Module: DFHCRR

AISQ
Explanation: An EXEC CICS command has been issued against a CPI Communications session. A CPI Communications session is one that has a CPI-Communications Control Block (CPC) associated with it.
System Action: The mirror task is abnormally terminated with a CICS transaction dump.
User Response: Do not mix EXEC commands with CPI Communications calls on the same end of a conversation.
Module: DFHCRR

AISR
Explanation: The CICS Inter-Region Session Recovery Program (DFHCRR) has been invoked in an incorrect manner, for example, from a terminal.
System Action: The program DFHCRR is abnormally terminated with a CICS transaction dump.
User Response: None.
Module: DFHCRR

AISS
Explanation: A security violation has occurred while CICS was attempting to start a conversation with a remote APPC system. The security access level of the requestor was insufficient to access the transaction on the connected APPC system. Depending on the nature of the request and the way security has been set up, the requestor with an insufficient access level can be the local CICS system, the requesting transaction, or the terminal user.
Note: DTP programs do not abend with code AISS after a security failure in the remote region.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: First, verify that the access was correctly denied. Then, if required, change the access level.
AIST

Module: DFHZARM

Explanation: An unexpected return code has been returned after a DFHTC TYPE=LOCATE command.

System Action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated. All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User Response: The trace in the system dump should be used to analyze the problem further.

Module: DFHCRNP

AISU

Explanation: An INVALID, DISASTER, or EXCEPTION condition has occurred on a call to the storage manager domain (SM) to FREEMAIN a FCENT control block.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System Action: The task is abnormally terminated with a transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHMIRS

AVIS

Explanation: A PURGED condition has occurred on a call to the storage manager domain (SM) to FREEMAIN a FCENT control block.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System Action: The task is abnormally terminated with a transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHCRSP

AISY

Explanation: The LU services manager transaction has been started, but invalid parameters have been detected.

System Action: The task is abnormally terminated with a transaction dump.

User Response: See message DFHZC4921 for further guidance.

Module: DFHLUP

AIZ

Explanation: DFHMXP has received an unexpected reply when committing START PROTECT NOCHECK requests sent on a LUTYPE6.2 synlevel 1 conversation.

System Action: The task is abnormally terminated.

User Response: Determine what happened to transaction CVMI in the partner system. If the START PROTECT NOCHECK requests had been committed, no further action is necessary. If they had not been committed, user-defined action is required to recover from the error.

Module: DFHMXP
AIS1
Explanation: An unexpected return code has been returned after a DFHMROOM FUNC=ENQ command was issued.
This command was issued when enqueueing work for the IRC control task (CSNC) during IRC initialization.
System Action: If IRC is being initialized during CICS initialization (as a result of IRCSTRT being specified in the DFHSIT or override parameters), then CICS is abnormally terminated.
If IRC is being initialized during the execution of a CEMT SET IRC OPEN command, then the CEMT transaction is abnormally terminated.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCRSP

AIS2
Explanation: An unexpected return code has been returned after a DFHMROOM FUNC=WAIT_Q command was issued.
This command was issued when waiting for more IRC work to process.
System Action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated.
All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCRNP

AIS3
Explanation: An attempt to issue a STCK (Store Clock) instruction failed.
System Action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated.
All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.
User Response: Repair or enable the system clock.
Module: DFHCRNP

AIS4
Explanation: An unexpected return code has been returned after a DFHMROOM FUNC=ENQUEUE command. This command was issued when enqueueing work to the IRC 'delayed work' queue.
System Action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated.
All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCRNP

AIS5
Explanation: An unexpected return code has been returned after a DFHMROOM FUNC=ENQUEUE command was issued.
This command was issued when enqueueing work to the IRC 'immediate work' queue.
System Action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated.
All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCRNP

AIS6
Explanation: An INVALID, DISASTER or EXCEPTION condition has occurred on a call to the storage manager domain (SM) to GETMAIN or FREEMAIN a file control read set buffer.
The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.
System Action: The task is abnormally terminated with a transaction dump.
User Response: See the related message from the domain that detected the original error.
Module: DFHMIRS

AIS7
Explanation: A PURGED condition has occurred on a call to the storage manager domain (SM) to FREEMAIN a file control read set buffer.
The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.
System Action: The task is abnormally terminated with a transaction dump.
User Response: Investigate the reason why the task was purged. It was purged either by the master terminal operator, or as a result of a deadlock timeout.
Module: DFHMIRS

AIS8
Explanation: An internal logic error has been detected in module DFHMIRS.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHMIRS

Chapter 3. Transaction abend codes  865
AIS9

Explanation: The mirror program has detected that a DPL server program has returned in an invalid state following the completion of the LINK command. The server program or a program it linked to has initiated a synclevel 2 conversation with another program which in turn has issued a syncpoint. The server program has not responded to the syncpoint request which is still outstanding when control returns to the mirror program.

The mirror program only issues this abend code if the LINK request did not specify SYNCONRETURN.

System Action: The task is abnormally terminated with a transaction dump.

User Response: Correct the design of the DTP application or applications initiated by the server program. If the SYNCONRETURN option is not specified on the LINK request, only the client program should initiate the syncpoint. If it is necessary to issue syncpoint requests from the DTP applications, consider using the SYNCONRETURN option on the LINK request. See the CICS Intercommunication Guide for further details of the LINK command and its options.

Module: DFHMIRS

AITA

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain to initialize the recovery status of an IRC session. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This failure is either the result of a task purge, or a CICS logic error.

System Action: The CSNC task is abnormally terminated with a CICS transaction dump.

User Response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure. In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCRNP

AITE

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This failure is either the result of a task purge, or a CICS logic error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the design of the DTP application or applications initiated by the server program. If the SYNCONRETURN option is not specified on the LINK request, only the client program should initiate the syncpoint. If it is necessary to issue syncpoint requests from the DTP applications, consider using the SYNCONRETURN option on the LINK request. See the CICS Intercommunication Guide for further details of the LINK command and its options.

Module: DFHISP

AITC

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This failure is either the result of a task purge, or a CICS logic error.

System Action: The mirror task is abnormally terminated with a CICS transaction dump.

User Response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure. In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHMIRS

AITD

Explanation: The mirror program has received an unexpected response from the RX domain.

There are several reasons why this error may occur:
- A request received from an EXCI client is inconsistent with an earlier request in the same Unit of Work.
- CICS has received an unexpected response from the Recoverable Resource Management Services component of MVS.
- There has been an internal error in the RX domain.

System Action: The mirror task is abnormally terminated with a CICS transaction dump.

User Response: Use the exception trace provided by the RX domain to determine the reason for the failure. If the error is caused by an inconsistent request from an EXCI client, there may be an error in the client program.

In the other cases, you might need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHMIRS

AITE

Explanation: A transaction has executed a transactional EXCI request from a batch region, and has been waiting for one of the following events for longer than the interval specified in the RTIMOUT value for the transaction.
- A further transactional EXCI request from the batch region
- A syncpoint initiated by Resource Recovery Management Services (RRMS).

System Action: The mirror task is abnormally terminated with a CICS transaction dump.

User Response: Determine why the expected event has not occurred:
- If a further transactional EXCI request is expected
- The batch program may be suspended
- If a syncpoint is expected
- The batch program may be suspended before reaching syncpoint
- RRMS may have started syncpoint processing but is waiting for another Resource Manager to respond to the syncpoint request.
AJCA

Explanation: The transaction has executed a transactional EXCI request from a batch region, and the transactional EXCI request from the batch region has been purged while waiting for one of the following events:

- A further transactional EXCI request from the batch region
- A syncpoint initiated by Resource Recovery Management Services (RRMS).

System Action: The mirror task is abnormally terminated with a CICS transaction dump.

User Response: Determine why both events have occurred. This situation may arise when an EXCI client times out on a DPL request that CICS is not ready to receive and then proceeds to take a syncpoint. If this is not the case, you may need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHJCP

AJCD

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHJCP

AJCE

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHJCP

AJCS

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the log manager (LM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHJCP

AJCT

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHJCP
Explanation: A purge response has been received from either the log manager or the recovery manager. The domain that detected the original purge condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHJCP

Explanation: The main method of the java environment setup class, Wrapper, has been invoked without an argument. Wrapper main expects the class name of the user's main to be passed as the first argument.

The callUserClass method of Wrapper detects this, sets return code INVALID_ARGUMENTS and invokes native method SetAbend to abend the task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFJCICS

Explanation: A CICS AbendError has been caught by the java environment setup class, Wrapper.

The callUserClass method of Wrapper detects this, sets return code ABEND_RECEIVED and invokes native method SetAbend to abend the task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See related messages to determine the reason for the original abend.

Module: DFJCICS

Explanation: A CicsConditionException has been caught by the java environment setup class, Wrapper.

The callUserClass method of Wrapper detects this, sets return code CONDITION_RECEIVED and invokes native method SetAbendForCondition to abend the task. The appropriate default abend code for the condition should be issued but, if for some reason this is not possible, an AJ03 abend may be issued.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See related messages to determine the reason for the original CicsConditionException.

Module: DFJCICS

Explanation: An unexpected error has been caught by the java environment setup class, Wrapper, attempting to invoke the user class.

The callUserClass method of Wrapper detects this, sets return code UNEXPECTED_EXCEPTION and invokes native method SetAbend to abend the task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFJCICS

Explanation: An unhandled exception has been caught by the java environment setup class, Wrapper, as an InvocationTargetException from the user class.

The callUserClass method of Wrapper detects this, sets return code INVOCATION_TARGET_EXCEPTION and invokes native method SetAbend to abend the task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFJCICS

Explanation: The java environment setup class, Wrapper, has been unable to invoke the user's main method. The class whose name was passed as an input parameter to its CallUserClass method was not found.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: If your java program has been bound using ET/390, check that the -main option correctly specifies, or defaults to, the name of the class containing your main method.

Module: DFJCICS

Explanation: The java environment setup class, Wrapper, has been unable to invoke the user's main method. A public static method, taking either a CommAreaHolder or a String array as input, was not found in the class whose name was passed as an input parameter to the CallUserClass method of Wrapper.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that you have provided a main method, with an appropriate method signature, in the specified class. If your java program has been bound using ET/390, check that the
Explanation: The CICS JVM interface invoked the JVM to build an Java argument string needed to pass to the CICS Wrapper class. The build argument string request failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Examine the value set for CLASSPATH in the DFJVM member of the SDFHENV dataset. The pathname for the CICS supplied dfjwrap.jar must be present in CLASSPATH.

Module: DFHCJVM

AJM4
Explanation: The CICS JVM interface invoked the JVM to locate the CICS Wrapper class used to set up the operating environment before executing the user Java class. The JVM failed to find the CICS Wrapper class on the HFS.

Message DFHAP1218 output to destination CSMT contains the CICS Wrapper class name. DFHCJVM provides an exception trace containing the name of the CICS Wrapper class and the current setting of CLASSPATH.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT & STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by language environment/370 and the Java Native Interface (JNI). You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCJVM
STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by language environment/370 and the Java Native Interface (JNI). You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCJVM

**AJM5**

**Explanation:** The CICS Wrapper class threw an exception.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Examine the HFS file used for stderr (as named by the environment STDERR, whose default name is dfhjvmerr) to determine the exception thrown by the Wrapper.

Module: DFHCJVM

**AJM6**

**Explanation:** The CICS JVM interface issued a call to setup CICS Recovery facilities prior to issuing a call to CICS, for example prior to invoking CICS trace domain. The call to setup CICS Recovery facilities failed.

DFHCJVM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCJVM

**AJM7**

**Explanation:** The CICS JVM interface issued a call to delete CICS Recovery facilities after issuing a call to CICS, for example after invoking CICS trace domain. The call to delete CICS Recovery facilities failed.

DFHCJVM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCJVM

**AJM8**

**Explanation:** The CICS JVM interface invoked the JVM to execute the CICS Wrapper class and then the user Java class. A severe error occurred whilst the JVM was executing causing the JVM to abend, the language environment/370 ESTAE to be run, and control to return abnormally to DFHAPLJ.

DFHAPLJ provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT & STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by language environment/370 and the Java Native Interface (JNI). You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHAPLJ

**AKC7**

**Explanation:** The CICS JVM interface issued a call to delete CICS Recovery facilities after issuing a call to CICS, for example after invoking CICS trace domain. The call to delete CICS Recovery facilities failed.

DFHCJVM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCJVM

**AKC8**

**Explanation:** The CICS JVM interface invoked the JVM to execute the CICS Wrapper class and then the user Java class. A severe error occurred whilst the JVM was executing causing the JVM to abend, the language environment/370 ESTAE to be run, and control to return abnormally to DFHAPLJ.

DFHAPLJ provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT & STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by language environment/370 and the Java Native Interface (JNI). You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHAPLJ

**AKC9**

**Explanation:** The CICS JVM interface issued a call to setup CICS Recovery facilities prior to issuing a call to CICS, for example prior to invoking CICS trace domain. The call to setup CICS Recovery facilities failed.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHCJVM

**AKCC**

**Explanation:** The CICS transaction manager reject task could not complete because a necessary step failed. The task has done some essential recovery operations and abnormally terminated itself with code AKCB.

**System Action:** CICS writes a transaction dump for the transaction manager reject task.

CICS sends three messages to the console, one to identify the error detected by the transaction manager reject task, one to say that the task has failed, and one that gives you the option of canceling CICS or letting it continue. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

**User Response:** Use the messages and dumps to find out the cause of the failure.

Module: DFHKCRP

**AKCC**

**Explanation:** The CICS transaction manager has abended the transaction because the purge threshold of its TRANCLASS has been reached. This is specified by the PURGETHRESH parameter on CEDA DEFINE TRANCLASS. See the CICS Resource Definition Guide manual for more details of this parameter.

**System Action:** The transaction is abended and messages DFHAC2004 and DFHAC2236 are issued. The transaction dump is suppressed for this abend code.

**User Response:** Resubmit the transaction. The cause of the abend may be a temporary stress condition in the system.

If the problem persists, determine why the TRANCLASS purge threshold has been reached. Ensure that PURGETHRESH has been specified correctly. Also, ensure that the MAXACTIVE value of the TRANCLASS has not been set too low. Transactions attached after the MAXACTIVE limit has been reached are immediately queued subject to the PURGETHRESH limit.

If PURGETHRESH and MAXACTIVE are set correctly, look for a more general problem which has caused a decrease in the capacity of the system to execute transactions in the TRANCLASS. The
decrease might, for example, be caused by a connected CICS region which processes requests for transactions in the TRANCLASS, if this connected region has slowed down.

Examine all resources (files, links, storage, and so on) used by the transactions in the TRANCLASS which is reaching the purge threshold and determine why the capacity of the system is reduced.

**AKCS**

**Explanation:** While CICS transaction manager was recording changes to a transaction or profile definition, a write to the system log failed.

**System Action:** CICS terminates the transaction with a transaction dump.

**User Response:** Use the dumps to find out why the write to the log failed.

**Module:** DFHXMAT, DFHXMCL

---

**AKCE**

**Explanation:** While CICS transaction manager was recording changes to a profile definition, a write to the catalog failed.

**System Action:** CICS terminates the transaction with a transaction dump.

**User Response:** Use the dumps to find out why the write to the catalog failed.

**Module:** DFHKCQ

---

**AKCF**

**Explanation:** Transaction manager has received an invalid request code. The last AP F000 trace entry before the program control program (PCP) ABEND TRACE entry (TRACE ID 'F2', request code X'6000') will contain the invalid transaction manager request code in the fifth byte of the first section of the trace.

**System Action:** The transaction is abnormally terminated. A transaction dump is provided.

**User Response:** Determine the cause of the invalid request code and correct the problem.

**Module:** DFHXCP

---

**AKCR**

**Explanation:** Transaction manager has received an invalid request code. The last AP F000 trace entry before the program control program (PCP) ABEND TRACE entry (TRACE ID 'F2', request code X'6000') will contain the invalid transaction manager request code in the fifth byte of the first section of the trace.

**System Action:** The transaction is abnormally terminated. A transaction dump is provided.

**User Response:** Determine the cause of the invalid request code and correct the problem.

**Module:** DFHXCP

---

**AKCS**

**Explanation:** A deadlock timeout condition has been detected. This condition may occur within a transaction that specifies DTIMOUT to be nonzero on its installed transaction definition. Deadlock timeout occurs when a transaction has been waiting or has been suspended for longer than the time specified in DTIMOUT.

The abend may be driven by a variety of internal CICS events, for example:

- A short on storage condition
- A temporary storage shortage
- ENQUEUE
- An ALLOCATE request
- A RETRIEVE WAIT request.

The abend can also occur if CICS stops running for a time, for example while an sdump is taken. This is because deadlock timeout is based on total elapsed time, and not just the time CICS is executing.

**Analysis:** The transaction receiving the AKCS abend must have been suspended or must be waiting for a reason such as a short on storage, enqueued on a lock, a short on temporary storage, a suspend after RETRIEVE WAIT, a suspend after ALLOCATE, or an implicit ALLOCATE within function shipping or terminal sharing support. If none of these apply, the trace might reveal some event that has caused CICS to stop running for a time.

**System Action:** The transaction is abnormally terminated. A dump is not provided (even if a dump table entry has been set up) unless install/delete processing causes this abend, in which case a transaction dump is taken.

**User Response:** The transaction should be reexecuted, and the situation causing the SUSPEND to occur may clear itself.

The AKCS abend is to be expected occasionally, unless DTIMOUT is set to zero. No special action is necessary.

**Module:** DFHXCP

---

**AKCT**

**Explanation:** A terminal read-time-out condition has been detected. The transaction has been waiting for a terminal input message for an interval longer than specified in the RTIMOUT value for that transaction.

If an EXEC CICS HANDLE ABEND has been issued for this task, the read that was timed-out is still outstanding. To cancel this read you should issue an EXEC CICS ABEND at the end of the user exit routine so that CICS can clean up the terminal's TCTTE.

**System Action:** The transaction is abnormally terminated. A transaction dump is not provided.

**User Response:** This task is a normal one. Coding RTIMOUT in the PROFILE entry asks for the task to be abnormally terminated if the terminal does not send input within the specified time.

**Module:** DFHXCP

---

**AKCV**

**Explanation:** A bad return code was passed as a result of the resume of a task suspended by ICP.

**System Action:** The transaction is terminated with a dump.

**User Response:** Check the response from the resume in the trace to determine the cause of the error.

**Module:** DFHALP

---

**AKC0**

**Explanation:** An attempt has been made to run the CICS internal task CSSY as a user transaction.

**System Action:** CICS terminates the task with a transaction dump.

**User Response:** Investigate why the attempt was made to run CSSY as a user transaction.

**Module:** DFHAPATT

---

**AKC1**

**Explanation:** A DFHKC WAIT request was issued when the ECB was already marked as waiting.

**System Action:** There is a probable user error. The transaction is abnormally terminated.

**User Response:** Correct the program that issued the request.

**Module:** DFHXCP
AKC2

**Explanation:** A bad response has been received from a dispatcher (DS) domain call.

**System Action:** The transaction is abnormally terminated with a transaction dump and a trace entry.

**User Response:** Examine the trace entry for further information.

**Module:** DFHXCP

---

**Explanation:** The task has been purged, probably due to operator action such as a CEMT TASK PURGE command. The task might also have been purged as a result of CICS issuing a purge request.

**System Action:** The transaction is abnormally terminated with a transaction dump.

**User Response:** Use the transaction dump to determine why the task was purged. In particular, if the purge was operator initiated, the dump should be useful in determining why this task needed to be explicitly purged.

**Modules:** DFHXCP, DFHXMAT, DFHXMCL, DFHXMIQ, DFHXMTA

---

**Explanation:** DFHKC RESUME should always be preceded by DFHKC SUSPEND. If this protocol is violated then the transaction is abnormally terminated with abend code AKC6.

**System Action:** Transaction is abnormally terminated with abend code AKC6.

**User Response:** Examine the trace entry for further information.

**Module:** DFHXCP

---

**Explanation:** A bad response has been received from a call to the kernel (KE) domain during the processing of a task purge request.

**System Action:** The transaction is abnormally terminated with a transaction dump.

**User Response:** Examine the dump and any exception trace entries for further information.

**Module:** DFHXCP

---

**Explanation:** An incorrect response has been received from a call to the enqueue (NQ) domain during the processing of a DFHKC TYPE=ENQ or a DFHKC TYPE=DEQ request.

**System Action:** The transaction is abnormally terminated with a transaction dump.

**User Response:** Examine the dump and any exception trace entries for further information. Since the DFHKC service is only used for internal enqueues, this abend indicates an error in CICS. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHXCP

---

**Explanation:** An operating system abend has been detected by the kernel (KE) domain.

**System Action:** If an application is in control, the ASRB abend is presented to the application. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

**User Response:** Check the console for any MVS messages that may have caused this abend. Look at the kernel domain section of the system dump to determine where the abend has occurred.

**Module:** DFHKESTX

---

**Explanation:** The kernel (KE) domain has detected runaway.

**System Action:** If an application is in control, the AICA abend is presented to the application. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

**User Response:** Look at the kernel domain section of the system dump to determine where the runaway has occurred.

**Modules:** DFHKESTX, DFHKERRU

---

**Explanation:** The kernel (KE) domain has been requested to initiate abend processing as a result of a deferred abend request.

**System Action:** Abend processing starts for the task that is subject to the deferred abend request.

**User Response:** The task is not abended with AKED but by an abend code specified by the requestor of the deferred abend. See the description of this abend for further guidance.

**Module:** DFHKEEDA

---

**Explanation:** The kernel (KE) domain has detected an error while processing a domain call. The error may have been caused by a domain gate that was not yet active during initialization.

**System Action:** If an application is in control, the transaction terminates with a system dump. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

**Module:** DFHXCP
**User Response:** See any related messages from the kernel domain. Look at the kernel domain section of the system dump to determine where the error has occurred. Check that a call has not been made to a domain gate that has not yet been made active. Check that the caller has NOT specified KERNERROR(YES).

**Module:** DFHKERKE

---

**AKEG**

**Explanation:** The kernel (KE) domain issued an MVS GETMAIN for kernel stack storage, but the GETMAIN request failed.

**System Action:** If an application is in control, the transaction terminates with a system dump. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

**User Response:** Look at the kernel domain section of the system dump to determine why sufficient storage was not available.

Check that the REGION parameter for the CICS job is large enough. For information about how to do this, refer to the OS/390 MVS JCL Reference.

**Module:** DFHKESGM

---

**AKEH**

**Explanation:** The transaction was purged while running outside the control of CICS.

**System Action:** CICS terminates the transaction abnormally. The EXEC CICS HANDLE ABEND command can not handle this abend.

**User Response:** Investigate the reason the transaction was purged.

**Module:** DFHKESTX

---

**AKEI**

**Explanation:** The kernel (KE) domain has detected runaway while the transaction is running outside the control of CICS.

**System Action:** If an application is in control, the AICA abend is presented to the application. Otherwise, the functional recovery routine of the CICS module which was last in control at the time of runaway detection is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

The EXEC CICS HANDLE ABEND command can not handle this abend.

**User Response:** See the CICS Problem Determination Guide for guidance on dealing with loops.

**Module:** DFHKESTX

---

**AKEZ**

**Explanation:** A user attach has failed because there are insufficient kernel tasks available. This indicates an internal logic error.

**System Action:** Message DFHEK0001 is issued and a system dump is taken. The attach of the user transaction fails.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHKETA

---

**ALGA**

**Explanation:** An error has occurred obtaining a lock within the log manager domain.

**System Action:** The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

**User Response:** See the description of message DFHLG0002 for further guidance.

**Modules:** DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

---

**ALGB**

**Explanation:** An error has occurred releasing a lock within the log manager domain.

**System Action:** The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

**User Response:** See the description of message DFHLG0002 for further guidance.

**Modules:** DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

---

**ALGC**

**Explanation:** A disaster response has been detected when processing the building block code used by the log manager.

**System Action:** The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

**User Response:** See the description of message DFHLG0002 for further guidance.

**Modules:** DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

---

**ALGD**

**Explanation:** A disaster response has been detected when processing the building block storage interface code used by the log manager.

**System Action:** The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

**User Response:** See the description of message DFHLG0002 for further guidance.

**Modules:** DFHLGCM, DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

---

Chapter 3. Transaction abend codes 873
ALGE

Explanation: An unexpected error has occurred while the log manager was attempting to find a journal model definition.

System Action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User Response: See the description of message DFHLG0002 for further guidance.

Module: DFHLGJN

ALGF

Explanation: An unexpected error occurred when the log manager was attempting an enqueue or dequeue operation.

System Action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User Response: See the description of message DFHLG0002 for further guidance.

Modules: DFHLGGL, DFHLGJN, DFHLGST

ALGG

Explanation: Transaction CSQC has been issued from a terminal. This is not permitted. The transaction can only be started internally by CICS.

System Action: The transaction is abnormally terminated.

User Response: Do not try to invoke CSQC from a terminal.

Module: DFHLGQC

ALIA

Explanation: CICS has issued a GETMAIN request during the initialization phase for an OS/VS COBOL application program in order to get run time storage for the task global table and working storage areas. However insufficient storage was available to satisfy the request.

System Action: CICS abnormally terminates the task. CICS processing continues.

User Response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALIB

Explanation: CICS has issued a GETMAIN request during the initialization phase for a C/370 application program in order to obtain run time execution storage above the 31-bit line. However insufficient storage was available to satisfy the request.

System Action: CICS abnormally terminates the task. CICS processing continues.

User Response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALIC

Explanation: CICS has issued a GETMAIN request during the initialization phase for an LE/370 application program in order to obtain run time execution storage above the 31-bit line. However insufficient storage was available to satisfy the request.

System Action: CICS abnormally terminates the task. CICS processing continues.

User Response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALID

Explanation: CICS has issued a GETMAIN request during the initialization phase for an LE/370 application program in order to obtain run time execution storage below the 31-bit line. However insufficient storage was available to satisfy the request.

System Action: CICS abnormally terminates the task. CICS processing continues.

User Response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALIE

Explanation: CICS has issued a GETMAIN request during the initialization phase for a C/370 application program in order to obtain thread storage. However insufficient storage was available to satisfy the request.

System Action: CICS abnormally terminates the task. CICS processing continues.

User Response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALIF

Explanation: CICS has issued a GETMAIN request during the initialization phase for an LE/370 application program in order to obtain thread storage. However insufficient storage was available to satisfy the request.

System Action: CICS abnormally terminates the task. CICS processing continues.

User Response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALIG

Explanation: CICS has been unable to determine the language of the user application program about to be executed. Either the program was compiled against an old level of compiler that is no longer supported by CICS, or the language of the program is not supported by CICS.

System Action: CICS abnormally terminates the task and disables the program. CICS processing continues.

User Response: Ensure that the program to be run is written in one of the languages and compiled against a level of compiler supported by CICS. See the CICS Application Programming Guide for details of the languages and compilers currently supported.

Module: DFHAPLI
**AMI1**

**Explanation:** When the mirror task is resumed, a bad response other than a time out or a cancellation was given by the dispatcher.

**System Action:** The mirror transaction is abnormally terminated with a transaction dump.

**User Response:** Use the dump and the trace to determine the cause of the error.

**Module:** DFHMIRS

---

**AMNA**

**Explanation:** An exception response has been received from the monitoring (MN) domain while processing a user event monitoring point (EMP) request. The exception response is produced when the 4-byte DATA1 field in the user parameter contains an invalid address.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Use the transaction dump to determine why the DATA1 value passed to the monitoring (MN) domain was invalid.

**Module:** DFHCMP

---

**AMNB**

**Explanation:** An exception response has been received from the monitoring (MN) domain while processing a user event monitoring point (EMP) request. The exception response is produced when the 4-byte DATA2 field in the user parameter contains invalid data.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Use the transaction dump to determine why the DATA2 value passed to the monitoring (MN) domain was invalid.

**Module:** DFHCMP

---

**AMNZ**

**Explanation:** An unexpected error response has been received from the monitoring (MN) domain while processing a user event monitoring point (EMP) request. The exception response is produced when the 4-byte DATA1 field in the user parameter contains invalid address.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** This indicates a possible error in CICS code. An earlier CICS message is issued from the monitoring domain. Follow the user response for that message.

**Module:** DFHCMP

---

**AMS A**

**Explanation:** An input data stream received from a 3270 begins with a set buffer address (SBA) order but is not followed by two 1-byte address fields. This is probably due to a hardware error.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** It may be possible to bypass the problem by entering two spaces before the data to be entered.

If the problem persists, you need further assistance. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHMSP

---

**AMSB**

**Explanation:** An internal logic error has been detected in module DFHMSP.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Retry the CMSG transaction, specifying operands in a different order. If this fails, keep the dump and contact your IBM Support Center.

**Module:** DFHMSP

---

**AMSC**

**Explanation:** The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

**Module:** DFHMSP

---

**AMSD**

**Explanation:** An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related error message produced by the domain that detected the original error.

**Module:** DFHMSP

---

**ANQA**

**Explanation:** An error has occurred obtaining a lock within the enqueue domain.

**System Action:** The recovery routine of the module in control is invoked which issues message DFHNQ0002 with a system dump. DFHNQ0002 reports the module in control at the time of the error.

**User Response:** See the description of message DFHNQ0002 for further guidance.

**Modules:** DFHNQED, DFHNQIB, DFHNQNQ, DFHNQST
ANQB

Explanation: An error has occurred releasing a lock within the enqueue domain.

System Action: The recovery routine of the module in control is invoked. This routine issues message DFHNQ0002 with a system dump. DFHNQ0002 reports the module in control at the time of the error.

User Response: See the description of message DFHNQ0002 for further guidance.

Modules: DFHNQED, DFHNQIB, DFHNQNQ, DFHNQST

ANQC

Explanation: An error has occurred obtaining a sysplex enqueue. The limit for the number of concurrent sysplex resource ENQ requests has been reached.

System Action: Module DFHNQED issues message DFHNQ0103 and the task issuing the EXEC ENQ request is abended.

User Response: See the description of message DFHNQ0103 for further guidance.

Module: DFHNQED

ANQD

Explanation: An error has occurred obtaining a sysplex enqueue. An unexpected environmental error has been detected.

System Action: Module DFHNQED issues message DFHNQ0104 and the task issuing the EXEC ENQ request is abended.

User Response: See the description of message DFHNQ0104 for further guidance.

Module: DFHNQED

ANQE

Explanation: An EXEC ENQ has been issued on a resource for which the enqmodel is either disabled or in the waiting state.

System Action: Module DFHNQRN issues message DFHNQ0105 and the task issuing the EXEC ENQ request is abended.

User Response: See the description of message DFHNQ0105 for further guidance.

Module: DFHNQRN

APCF

Explanation: A CICS task has invoked a program which was defined as PL/I, but the program was not compiled with a supported PL/I compiler.

System Action: CICS terminates the task, and disables the program.

User Response: Check that the program is PL/I. If the program is PL/I, recompile it with the PL/I optimizing compiler; you may need to change the source program. If the program is not PL/I, redefine it correctly.

Module: DFHAPLI

APCG

Explanation: The transaction was purged either by master terminal actions or due to deadlock timeout actions as part of a request to the loader for a usable program copy. Deadlock timeout could be caused by a program whose size exceeds the available space in the DSAs or EDSAs.

System Action: CICS terminates the task with a transaction dump.

User Response: Use the dump to investigate why the transaction was purged. This may be due to waiting for loader resources or for program storage. Check the program size. It may be necessary to increase the overall size limits of the DSAs or EDSAs.

Modules: DFHACP, DFHCRNP, DFHCRSP, DFHDBCST, DFHDBDSC, DFHEDFP, DFHEIP, DFHEIPSH, DFHEIQIR, DFHEIQSJ, DFHFCSR, DFHFEP, DFHCIP, DFHCKQ, DFHMCP, DFHMCEP, DFHCME, DFHMSP, DFHPCPG, DFHPHP, DFHPISIP, DFHPUP, DFHRDCAL, DFHRGC, DFHSII, DFHSJU, DFHSPP, DFHTSP, DFHTACP, DFHTBSG, DFHTCRP, DFHTD, DFHTFP, DFHTSPA, DFHTSRP, DFHUSBP, DFHXRC, DFHXRE, DFHXZAT, DFHZNCA, DFHZNCP, DFHZXC

APCH

Explanation: A request for a VS COBOL II program could not be executed because a problem has occurred during system initialization for VS COBOL II. This is probably due to the absence of VS COBOL II or Language Environment support.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Redefine the program or ensure that the correct Language Environment or VS COBOL II support is present.

Module: DFHAPLI

APCI

Explanation: A request for a PL/I program could not be executed because execution of PL/I programs has been disabled.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Ensure that the PL/I libraries are included in DFHRPL.

Module: DFHAPLI

APCJ

Explanation: A request for a C program could not be executed either because C/370 was unable to recognize the program as having been compiled under the C/370 Compiler, or because the program was not link-edited with the attribute AMODE(31).

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Ensure that the program is correctly defined to CICS; or, if necessary, recompile the program using the current level of the C/370 Compiler.

Module: DFHAPLI
APCK

Explanation: A request for a C program could not be honored; execution of C programs has been disabled either because CICS was unable to load the required C/370 support module EDCCICS, or because C/370 initialization failed. This abend may be accompanied by message DFHFC0410.

System Action: The transaction is terminated abnormally and the program is disabled.

User Response: Refer to the explanation for message DFHFC0410 and, in particular, check that C/370 has been installed correctly.

Module: DFHAPLI

APCL

Explanation: An attempt to run the program failed because Language Environment/370 was unable to determine its language.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Ensure that the program is correctly defined to CICS.

Module: DFHAPLI

APCN

Explanation: An attempt to release an internal CICS program, a mapset, or a partitionset because the program, mapset or partitionset has not been loaded or has already been deleted. This is probably an internal CICS error.

System Action: The transaction is abnormally terminated with a CICS transaction dump. The name of the program for which the RELEASE was attempted can be found in the abend dump at TCAPCPI.

User Response: This is either an internal CICS error or is due to the overwriting of CICS internal control blocks. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHAMPEN, DFHFEP, DFHMCP, DFHMCP, DFHMCP, DFHCP, DFHTBSSP, DFHZCPLN

APCO

Explanation: A GETMAIN of storage for LEVEL 2 trace failed during transaction initialization.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHAPXM

APCS

Explanation: An attempt to run the program failed because CICS was unable to make a successful connection with Language Environment/370 to determine the run-time characteristics of the program. This abend is accompanied by message DFHAP1200 which gives the reason code set by Language Environment/370 indicating the nature of the error.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Refer to the Language Environment/370 Debugging Guide and Runtime Messages manual for the meaning of the reason code, and take whatever action is necessary to correct the error.

Module: DFHAPLI

APCT

Explanation: One of the following has occurred:

1. The program name in the EXEC CICS HANDLE ABEND program is not usable at the time an abend occurs because:
   - The program is not on the relocatable program library (RPL).
   - The program is disabled.
   - The program cannot be loaded.

2. An attempt to load a mapset or partitionset failed because although the program is defined to CICS
   - It is not available on the RPL, or
   - It is disabled, or
   - It cannot be autoinstalled.

3. An attempt to link to, load, or release an internal CICS program failed because:
   - The program is not on the RPL.
   - The program is disabled.
   - The program cannot be loaded.

Problem Determination: The trace preceding the abend indicates the program, mapset, or partitionset that could not be loaded, linked to, or released. The name is also in TCAPCEPI.

System Action: The transaction requiring the program is abnormally terminated with a CICS transaction dump.

User Response: In cases 1 and 2, define the program, mapset partitionset to CICS using CEDA and ensure it is enabled.

In case 3, the definition of a CICS-provided module is incorrect. Check for associated messages issued during CICS start up.

Modules: DFHACP, DFHAMPER, DFHCMP, DFHEDFP, DFHEIP, DFHEIPSH, DFHEIQSJ, DFHFEP, DFHCP, DFHMCP, DFHMCP, DFHMCP, DFHMCP, DFHMCP, DFHMCP, DFHMELDE, DFHPCPG, DFHPHP, DFHPUP, DFHRDCAL, DFHSI1I, DFHTBSSG, DFHTFP, DFHTSRP, DFHZCPLN, DFHZQ00, DFHZXCU

APCW

Explanation: The program language is defined as COBOL but the level of the compiler under which it was originally compiled cannot be determined. Most probably, the program was compiled under an OS/VS COBOL II compiler but the required level of support for that compiler is not present in the system.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Check that OS/VS, COBOL II or Language Environment/370 support is present in the system and that the required interface modules (IGZECIC or CEECCICS) have been correctly loaded during system startup.

Module: DFHAPLI

Chapter 3. Transaction abend codes 877
APCY

Explanation: In an MVS/ESA environment, a CICS macro request has been issued from a PL/I or COBOL application. Alternatively, it is possible that the application program has been link edited without the EXEC interface module (for example, DFHECI or DFHELII) which is used by the CICS high-level language programming interface. See the CICS System Definition Guide for details of what has to be done to include this module.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Remove the macro request from the application program.

Module: DFHAPLI

APCZ

Explanation: An attempt has been made to run either an 'old-style' application program (that is, a program with a pre-release 1.6 or a DFHE program stub) or an OS/VS COBOL program, either having been link-edited with the RENT or REFR attributes. These types of programs are not reentrant and therefore cannot be loaded into read-only storage.

System Action: The transaction is abnormally terminated.

User Response: Relink the program without the RENT and REFR attributes.

Module: DFHAPLI

APC0

Explanation: A serious error occurred in a call to the program manager domain when trying to link a system program.

System Action: CICS terminates the task with a transaction dump.

User Response: Use the dump to investigate why the error occurred. Look at the trace records prior to the error for abnormal conditions in processing the PGLK domain call. This may be due to a problem with directory manager, loader, or storage manager. Check the program size. It may be necessary to increase the overall size limits of the DSAs or EDSAs.

Modules: DFHPCP, DFHMCY

APC1

Explanation: A request for a TGT exceeding 64KB has been detected.

System Action: CICS abnormally terminates the transaction and disables the installed program definition.

User Response: Change the application program to reduce the working storage requirement. Perform CEMT NEWCOPY and ENABLE for the program when it has been corrected.

Module: DFHAPLI

APC2

Explanation: An illegal branch has been attempted by a Language Environment/370 user program following an abend condition with an active handle label abend. Usually an Out-Of-Block GOTO will have resulted, implying that the program tried to branch to, for example, an inactive block. This abend is accompanied by message DFHAP1200 which gives the reason code set by Language Environment/370 indicating the nature of the error.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Refer to the Language Environment/370 Debugging Guide and Runtime Messages manual for the meaning of the reason code, and amend the program to avoid the GOTO in error.

Module: DFHAPLI

APC3

Explanation: An attempt to run the program failed because the program appeared to be defined to CICS as Language Environment/370 but no Language Environment/370 support was present in the system and no other language environment was able to run the program.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Redefine the program to CICS in a language other than Language Environment/370.

Module: DFHAPLI

APC4

Explanation: A call to the loader domain to define program ILBOCOM failed.

System Action: The transaction is abnormally terminated.

User Response: Check that the library containing the OS/VS COBOL runtime library modules is named in the DFHRPL DD concatenation.

Module: DFHPCPC2

APC5

Explanation: A call to the loader domain to load program ILBOCOM failed.

System Action: The transaction is abnormally terminated.

User Response: Check that the library containing the OS/VS COBOL runtime library modules is included in the DFHRPL concatenation. If it is, obtain and check a trace of the failure. If no reasonable explanation is found (such as lack of storage), you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHPCPC2
An internal error has occurred.  
**System Action:** The transaction is abnormally terminated.  
**User Response:** See the associated X'F230' Exception trace entry for further diagnostic information. For an ACQUIRE error ensure the associated module is in a library in the CICS DFHRPL concatenation. For an IDENTIFY error make sure that the associated module has not been MVS LOADed for example by the inadvertent link-editing of a VS COBOL II program with a COBOL subprogram.  
**Module:** DFHPCPC2

An MVS IDENTIFY call has given a non zero return code. The IDENTIFY call was being used to make the entry point ILBOCOM0 known to MVS.  
**System Action:** The transaction is abnormally terminated.  
**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.  
**Module:** DFHPCPC2

An MVS LOAD of ILBOCOM0 has given a non zero return code.  
**System Action:** The transaction is abnormally terminated.  
**User Response:** Ensure the library containing the OS/VS COBOL runtime modules is available to STEPLIB.  
**Module:** DFHPCPC2

An MVS LOAD of ILBOCOM has given a non zero return code.  
**System Action:** The transaction is abnormally terminated.  
**User Response:** Ensure the library containing the OS/VS COBOL runtime modules is available to STEPLIB.  
**Module:** DFHPCPC2

Abend codes with ‘PL’ as the middle two characters are issued by PL/I, and are described in further detail in the OS PL/I Optimizing Compiler: Programmer’s Guide.  
**Module:** DFHP3270

Explanation: The length of data that has been passed to DFHP3270 via temporary storage is less than or equal to 5.  
**Problem Determination:** Register 6 points to the data retrieved from temporary storage via a DFHIC TYPE=GET macro invocation. The layout of this data is:  
- Terminal data area length (2 bytes)  
- Write control indicator (1 byte)  
- Write control or carriage control character (1 byte)  
- Data (variable length)  
**Analysis:** DFHP3270 has been called to handle a print request from a 3270 Information Display System terminal. It obtains from temporary storage the data to be printed, via a DFHIC TYPE=GET invocation. It ensures that some data to be printed is present. The area returned from temporary storage contains the data to be printed preceded by 4 bytes as described above. DFHP3270 has found that, because the length of data passed to it is less than or equal to 5, there is no data to be printed.  
**System Action:** The transaction is abnormally terminated with a CICS transaction dump.  
**User Response:** Check the user DFHTEP. If it is not at fault, submit an APAR. If this abend has occurred, the data that DFHP3270 obtained from temporary storage was probably put there with an incorrect length. The user may have requested indirectly that this data be placed in temporary storage either by an application request for printing (for example ISSUE PRINT) or by pressing the Print Request key. However, CICS should control the data length for this request. Under normal circumstances, the only way the user could have requested directly that data is to be placed in temporary storage is in the user’s TEP. The user should check any invocations of DFHIC TYPE=PUT in handling print requests, particularly when dealing with the “printer unavailable or busy” condition, and ensure that the length field is set correctly.  
**Module:** DFHP3270

Explanation: An attempt to request data has been sent to a nonprinter or unsupported device type by either:  
- A terminal operator entering CSPP as a transaction code, or  
- A transaction issuing a DFHTEP request.  
**System Action:** The transaction is abnormally terminated. A CICS transaction dump is not provided.  
**User Response:**  
1. Ensure that the terminal operator ceases to use CSPP as a transaction code, or  
2. Correct the user DFHTEP program.  
**Module:** DFHP3270

Explanation: An abnormal DFHIC TYPE=PUT response code was received during print key processing.  
**System Action:** The transaction is abnormally terminated with a CICS transaction dump. The keyboard of the terminal on which the print key was depressed remains locked to indicate the failure of the operation.  
**User Response:** Analyze the dump. The response code is in low-order byte of register 0.  
**Module:** DFHPRK
APSJ

Explanation: The abending transaction invoked the system spooler initialization program (DFHPSIP) illegally, that is from a program other than the CICS module, DFHSIJ1.

System Action: CICS terminates the transaction abnormally. The EXEC CICS HANDLE ABEND command can not handle this abend.

User Response: Remove any calls or links to DFHPSIP from your application programs. If you can find no invocation of DFHPSIP in your application, you need further assistance to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHPSIP

APST

Explanation: A task issued a SPOOL command without the mandatory NOHANDLE operand.

System Action: CICS terminates the task abnormally with a dump.

User Response: Correct the syntax of the command, specifying NOHANDLE.

Module: DFHEPS

APSU

Explanation: The CICS SVC passed an invalid JES interface return code to the CICS system spooler (an MVS subtask).

System Action: CICS terminates the task abnormally.

User Response: This is an internal error – check any JES failures that occurred at the same time.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHPSPST

APSV

Explanation: A storage area for VSAM macro return codes contained an invalid value.

System Action: CICS terminates the task abnormally with a dump.

User Response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

Module: DFHPSPST

APSW

Explanation: An abend occurred within a CICS system spooler subtask.

System Action: CICS terminates the task abnormally with a dump.

User Response: This is an internal CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHPSPST

APSX

Explanation: A CICS storage area used for notification of invalid parameters contained an invalid value.

System Action: CICS terminates the task abnormally with a dump.

User Response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

Module: DFHPSPST

APSY

Explanation: A CICS storage area for MVS macro return codes contained an invalid value.

System Action: CICS terminates the task abnormally with a dump.

User Response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

Module: DFHPSPST

APSZ

Explanation: A CICS area, used to store a JES interface return code, contained an invalid value.

System Action: CICS terminates the task abnormally with a dump.

User Response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

This is an internal CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHPSPST

APTI

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHPSPST
Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHPSPST

---

Explanation: An internal error was detected when module DFHPUP was invoked. The GETSTG parameter is missing on a call to DFHPUP (PUPF).

System Action:
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHPUP

---

Explanation: The RDO language definition table (DFHEITSP) could not be located in the library.

System Action:
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: Ensure that module DFHEITSP is in the library and is valid for this release of CICS.

Module: DFHPUP

---

Explanation: Either the RDO language definition table is invalid or it is missing from the library.

System Action:
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: Allocate more storage and resubmit the offline COPY or APPEND command(s) that failed.

Modules: DFHPUP (Batch environment)

---

Explanation: An internal error was detected in module DFHPUP. Storage could not be obtained for the CSD record buffer.

System Action:
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHPUP

---

Explanation: An internal error was detected in module DFHPUP. Storage could not be obtained for the argument list.

System Action:
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHPUP

APUI

Explanation: An internal error was detected in module DFHPUP. Storage cannot be freed for the argument list.

System Action:
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHPUP

APUJ

Explanation: An internal error was detected in module DFHPUP. Storage cannot be freed for the CSD record buffer.

System Action:
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHPUP

APUK

Explanation:
- In a CICS environment, storage could not be acquired for a buffer to contain logged RDO commands in the CEDA transaction.
- In a batch environment, storage could not be acquired for a buffer to contain back-translated resource definitions from the CSD.

System Action:
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHPUP

APUL

Note: The description of this abend also applies to APUM, APUN and APUO.

Explanation: CICS cannot find a match for a function code in the language definition table, because the parameterized resource definition contains an unrecognized resource type code.

The abend code issued depends on the DFHPUP operation that was invoked before the error occurred:

<table>
<thead>
<tr>
<th>Abend</th>
<th>DFHPUP operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>APUL</td>
<td>FLATTEN</td>
</tr>
<tr>
<td>APUM</td>
<td>TRANCASE</td>
</tr>
<tr>
<td>APUN</td>
<td>COMPARE</td>
</tr>
<tr>
<td>APUO</td>
<td>BACKTRANS</td>
</tr>
</tbody>
</table>

The cause of the abend is either:
1. A language definition table (DFHEITSP or DFHEITCU) in the library is invalid for the CICS release you are running, or
2. A CICS logic error has occurred.

System Action:
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: Your response depends on which of the two possible reasons apply:
1. Ensure that the DFHEITSP and DFHEITCU modules in the library are valid for this release of CICS.
2. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHPUP

APUM

Explanation: Refer to the description of abend APUL.

Module: DFHPUP

APUN

Explanation: Refer to the description of abend APUL.

Module: DFHPUP

APUO

Explanation: Refer to the description of abend APUL.

Module: DFHPUP

APUP

Explanation: An internal error occurred in DFHPUP processing of the language definition table for RDO. There was a stack error building a keyword list for the syntax tree.

System Action:
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHPUP
**APUQ**

**Explanation:** An internal error occurred in DFHPUP processing of the language definition table for RDO. Too many keywords found in syntax expansion.

**System Action:**
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHPUP

---

**APUR**

**Explanation:** An internal error occurred in DFHPUP processing of an argument list or a CSD record buffer. The data type for a keyword field conflicts with the data type specified in the language definition table.

**System Action:**
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

**User Response:** Ensure that the module DFHEITSP is in the library and is valid for this release of CICS.

**Module:** DFHPUP

---

**APUS**

**Explanation:** An internal error occurred in DFHPUP processing of a CSD record buffer. The integer data length for a keyword field is invalid.

**System Action:**
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

**User Response:** Ensure that the module DFHEITSP is in the library and is valid for this release of CICS.

**Module:** DFHPUP

---

**APUT**

**Explanation:** An internal error occurred in DFHPUP processing of an argument list or a CSD record buffer. The keyword existence bit number, which is the KEP(1) value in language definition table DFHEITSP, is not valid.

**System Action:**
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

**User Response:** Ensure that the module DFHEITSP is in the library and is valid for this release of CICS.

**Module:** DFHPUP

---

**APUZ**

**Explanation:** CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This abend can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMV) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

**System Action:**
- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump
- In a batch environment, processing is abnormally terminated with an operating system dump.

**User Response:** Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Avoid operations on groups containing definition-types that are unsupported by the CICS release you are running.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHPUP

---

**APX**

**Explanation:** The user transaction's profile could not be found.

**System Action:** The task is abnormally terminated with a CICS transaction dump. The user transaction is not started.

**User Response:** Check that the profile name in the user transaction definition is correct, and that this profile has been defined.

**Module:** DFHAPXM

---

**ARCB**

**Explanation:** CICS has attempted to enable a task-related user exit, or a global user exit during initialization, but failed because the exit program could not be found.

On all types of start, CICS attempts to enable DFHEDP, the EXEC DLI task-related user exit. On an emergency restart, CICS enables transaction backout exit programs as specified by the first two TBEXITS system initialization parameters.

On all types of start, CICS attempts to enable file control backout programs as specified by the third, fourth, fifth and sixth TBEXITS system initialization parameters.

**System Action:** CICS issues a message to the console indicating which exit program is involved. CICS initialization then terminates abnormally with a system dump.

**User Response:** If the associated message indicates that program DFHEDP could not be found, check that IBM-supplied group DFHEDP is included in the group list used at CICS cold or initial start time.
For transaction backout exit programs, including the file control backout programs, ensure the program has been defined and is in a library available to CICS.

If necessary, use the dump to find out why the exit program could not be enabled.

**Module:** DFHRCEX

**Explanation:** The SAA resource recovery interface has been invoked with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** A level 2 trace for ‘CP’ of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCPIR

**Explanation:** The SAA resource recovery interface has detected an unexpected return code from the syncpoint program. This is a CICS internal logic error.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** A level 2 trace for ‘CP’ of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCPIR

**Explanation:** An attempt was made to attach CSKP incorrectly, or why a transaction definition specified DFHRMXN3 as the program to be given control.

**Module:** DFHRMXN3

**Explanation:** An unexpected response from DFHSUSN has occurred when trying to sign off a user of the CRTE transaction in the target system when processing a CANCEL request.

This abend can be caused by incorrect use of the VTAM VARY INACT command. Otherwise it indicates that there may be an error in CICS.

**System Action:** The CSSF transaction (CRTE cancel processor transaction) is terminated with an ARPA abend.

**User Response:** Ensure that the VTAM VARY inact command is used correctly. If this is not the cause of the abend, you need further assistance from IBM to correct this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHRTC

**Explanation:** The alias could not be initialized.

**System Action:** One of the following messages is issued: DFHP0103, DFHP0104, DFHP0106, DFHP0108, DFHP0109.

**User Response:** See the user response for the message.

**Module:** DFHPAS

**Explanation:** The alias was not able to link to the CICS program or the Encode function of the converter one of the following reasons:

- The userid supplied for the alias was not valid.
- The CICS program is not defined as a resource to the external security manager.
- The CICS program name is not valid.
- The CICS program was on a different system from CICS ONC RPC, and the specified system name was not valid.
- The converter program name was not valid.
- The converter program is defined as remote.
- The alias is not authorized to use the converter

**System Action:** One of the following messages is issued: DFHP0121, DFHP0131, DFHP0138, DFHP0139, DFHP0141, DFHP0156, DFHP0157, DFHP0159.

**User Response:** See the user response for the message.

**Module:** DFHPAS

**Explanation:** The alias detected a global work area error.

**System Action:** The following message is issued: DFHP0118.

**User Response:** See the user response for the message.

**Module:** DFHRASWAS

**Explanation:** The alias was not able to link to the CICS program or the Encode function of the converter one of the following reasons:

- The userid supplied for the alias was not valid.
- The CICS program is not defined as a resource to the external security manager.
- The CICS program name is not valid.
- The CICS program was on a different system from CICS ONC RPC, and the specified system name was not valid.
- The converter program name was not valid.
- The converter program is defined as remote.
- The alias is not authorized to use the converter

**System Action:** One of the following messages is issued: DFHP0121, DFHP0131, DFHP0138, DFHP0139, DFHP0141, DFHP0156, DFHP0157, DFHP0159.

**User Response:** See the user response for the message.

**Module:** DFHPAS

**Explanation:** The alias detected a global work area error.

**System Action:** The following message is issued: DFHP0118.

**User Response:** See the user response for the message.

**Module:** DFHRASWAS
**ARPI**

**Explanation:** The alias detected a logic error.

**System Action:** One of the following messages is issued: DFHRP0107, DFHRP0133, DFHRP0135, DFHRP0137, DFHRP0143, DFHRP0144, DFHRP0148, DFHRP0149, DFHRP0155, DFHRP0164, DFHRP0168, DFHRP0170.

**User Response:** See the user response for the message.

**Module:** DFHRPAS

**ARPJ**

**Explanation:** The alias ends for one of the following reasons:

- An unexpected response was received from CICS during transaction initialization.
- The external security manager is no longer available.
- The remote CICS region in which the CICS program was running abended.
- The CICS program, which was running in a remote CICS region, abended.
- The reply could not be sent to the client.

**System Action:** One of the following messages is issued: DFHRP0105, DFHRP0132, DFHRP0136, DFHRP0140, DFHRP0145, DFHRP0146, DFHRP0147, DFHRP0150, DFHRP0165, DFHRP0166, DFHRP0167.

**User Response:** See the user response for the message.

**Module:** DFHRPAS

**ARPK**

**Explanation:** The alias detected a CICS logic error.

**System Action:** One of the following messages is issued: DFHRP0102, DFHRP0122, DFHRP0142, DFHRP0160.

**User Response:** See the user response for the message.

**Module:** DFHRPAS

**ARPL**

**Explanation:** The alias detected an authorization error.

**System Action:** One of the following messages is issued: DFHRP0119, DFHRP0120, DFHRP0132, DFHRP0134.

**User Response:** See the user response for the message.

**Module:** DFHRPAS

**ARPM**

**Explanation:** The alias detected an error in user code.

**System Action:** One of the following messages is issued: DFHRP0161, DFHRP0162, DFHRP0163, DFHRP0169.

**User Response:** See the user response for the message.

**Module:** DFHRPAS

**ARPN**

**Explanation:** The alias detected an error while trying to switch TCBs.

**System Action:** The following message is issued: DFHRP0151.

**User Response:** See the user response for the message.

**Module:** DFHRPAS

**ARPO**

**Explanation:** The alias program detected an abend.

**System Action:** One of the following messages is issued: DFHRP0181, DFHRP0182, DFHRP0183.

**User Response:** See the user response for the message.

**Module:** DFHRPAS

**ARPU**

**Explanation:** The connection manager could not access the CICS ONC RPC data set, and received an error response when it tried to send message DFHRP1512.

**System Action:** None.

**User Response:** You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHRPC01

**ARPV**

**Explanation:** The connection manager received an unexpected response from CICS following an EXEC CICS command.

**System Action:** One of the following messages is issued: DFHRP1540, DFHRP1651, DFHRP1954.

**User Response:** See the user response for the message.

**Module:** DFHRPC0E

**ARPW**

**Explanation:** The connection manager received an unexpected response from CICS following an EXEC CICS command.

**System Action:** The following message is issued: DFHRP1969.

**User Response:** See the user response for the message.

**Module:** DFHRPC0E

**ARPX**

**Explanation:** The connection manager was started against an invalid terminal.

**System Action:** The following message is issued: DFHRP1522.

**User Response:** See the user response for the message.

**Module:** DFHRPC01

**ARPZ**

**Explanation:** The connection manager has insufficient authority.

**System Action:** The following message is issued: DFHRP1902.

**User Response:** See the user response for the message.

**Module:** DFHRPC0B

**ARP2**

**Explanation:** The server controller detected an internal error during CICS ONC RPC enable processing.

**System Action:** One of the following messages is issued: DFHRP0508, DFHRP0509, DFHRP0528, DFHRP0529, DFHRP0590, DFHRP0591.

**User Response:** See the user response for the message.

**Module:** DFHRPMS
ARP4

**Explanation:** The server controller has performed an exception disable because of an internal error.

**System Action:** One of the following messages is issued: DFHRP0503, DFHRP0559, DFHRP0697, DFHRP0726, DFHRP0728, DFHRP0730, DFHRP0741.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHRPMS

ARP5

**Explanation:** An invalid attempt was made to start the server controller.

**System Action:** The following message is issued: DFHRP0640.

**User Response:** See the user response for the message.

**Module:** DFHRPC01

ARP9

**Explanation:** There was not enough storage for the connection manager.

**System Action:** None.

**User Response:** You need further assistance from IBM to resolve this problem. See the CICS External Interfaces Guide and Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHRPMS

ARTA

**Explanation:** The task does not own a terminal as its principal facility.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Ensure that DFHRTE has not been specified as the program for a task other than CRTE. Ensure that CRTE has not been initiated by means other than terminal input.

**Module:** DFHRTE

ARTB

**Explanation:** There is no input TIOA or the data length is zero.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Ensure that DFHRTE has not been specified as the program for a task other than CRTE. Ensure that CRTE has not been initiated by means other than terminal input.

**Module:** DFHRTE

ARTC

**Explanation:** The link to the required system is not usable for an unknown reason.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHRTE

ARTD

**Explanation:** An internal logic error has been detected.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHRTE

ARTE

**Explanation:** An error was encountered when attempting to read from or write to temporary storage.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Determine the cause of the temporary storage problem and correct it.

**Module:** DFHRTE

ARTF

**Explanation:** An attempt has been made to use the routing transaction (CRTE) from a terminal that has a permanent transaction code set.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Inform the system programmer.

**Module:** DFHRTE

ARTG

**Explanation:** CICS could not find the profile specified for a transaction being routed.

**System Action:** CICS terminates the task abnormally with a dump.

**User Response:** Check your transaction and profile definitions.

**Module:** DFHRTE

ARTH

**Explanation:** An error (INVALID, DISASTER or EXCEPTION response) has occurred on a call to schedule a remote terminal delete by DFHRTE during sign-off for a surrogate terminal session running CRTE. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

**System Action:** CICS terminates the task abnormally with a dump.

**User Response:** See the related message produced by the domain that detected the original error.

**Module:** DFHRTE
ARUA

**Explanation:** An exception condition was returned on the ADD_LINK during the BIND phase of ATTACH for the transaction invoked by the RUN command.

**System Action:** CICS terminates the invoked transaction abnormally with a dump. The RUN SYNCHRONOUS command that was issued by the application returns with an error response of INVREQ (RESP2 28).

**User Response:** More details can be found in the trace.

**Module:** DFHXMRU

ARUB

**Explanation:** A RUN SYNCHRONOUS command caused an attempt to attach a transaction defined as remote. Only transactions defined as local may be run synchronously.

**System Action:** CICS terminates the invoked transaction abnormally with a dump. The RUN SYNCHRONOUS command that was issued by the application returns with an error response of ACTIVITYERR or PROCESSERR (RESP2 27).

**User Response:** More details can be found in the trace.

**Module:** DFHXMMX

ARUC

**Explanation:** A RUN SYNCHRONOUS command caused an attempt to attach a transaction with an invalid USERID.

**System Action:** CICS terminates the invoked transaction abnormally with a dump. The RUN SYNCHRONOUS command that was issued by the application returns with a resp2 value of 27.

**User Response:** More details can be found in the trace.

**Module:** DFHXMRU

ARXA

**Explanation:** A transactional EXCI request has been received from a batch region. CICS has encountered an error when attempting to express interest in an RM Unit of Recovery. DFHRXUW provides an exception trace, console message DFHRX0002, and possibly a system dump (depending on the options in the dump table).

**System Action:** The transaction is terminated with a CICS transaction dump.

**User Response:** Resource Recovery Services (RRS) may have been shut down after the request was received by CICS. If this is the case, retry the EXCI request once RRS has been restarted. If this is not the case, use the exception trace provided by the RX domain to determine the reason for the failure. You might need further assistance from IBM in this situation. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHRXUW

ARXB

**Explanation:** An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an ADD_LINK call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRXUW provides an exception trace, console message DFHRX0002, and possibly a system dump (depending on the options in the dump table).

**System Action:** The transaction is terminated with a CICS transaction dump.

**User Response:** See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHRXUW

ARXC

**Explanation:** A transactional EXCI request has been received from a batch region when either:

- CICS did not register as a resource manager with Recoverable Resource Management Services (RRMS) because system initialization parameter RRMS=NO was specified.
- the RX domain did not successfully complete its initialization.

**System Action:** The transaction is terminated with a CICS transaction dump.

**User Response:** If CICS was started with system initialization parameter RRMS=NO, restart CICS specifying RRMS=YES (or route transactional EXCI requests to another CICS system).

Otherwise, investigate why the RX domain did not initialize successfully. A failure during initialization of the domain is accompanied by a console message and a system dump. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHRXUW

ASCA

**Explanation:** A DFHSC TYPE=GETMAIN request has resulted in a call to the storage manager (SM) domain which has returned an INVALID or DISASTER response.

**System Action:** The transaction is terminated with a CICS transaction dump.

**User Response:** There has been an earlier failure which led to the response from the storage manager domain. Investigate the earlier failure (which is accompanied by a console message and a system dump).

**Module:** DFHSMSCP

ASCB

**Explanation:** A DFHSC TYPE=FREEMAIN request has resulted in a call to the storage manager (SM) domain which has returned an INVALID or DISASTER response.

**System Action:** The transaction is terminated with a CICS transaction dump.

**User Response:** There has been an earlier failure which led to the response from the storage manager domain. Investigate the earlier failure (which is accompanied by a console message and a system dump).

**Module:** DFHSMSCP
ASCP

Explanation: A task which has issued an unconditional DFHSC TYPE=GETMAIN request has been purged while waiting for sufficient contiguous main storage to become free.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. This will either have been as a result of a purge from the master terminal operator via the CEMP transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the task was purged by the master terminal operator then this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded then this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased then the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

Module: DFHSMSCP

ASCR

Explanation: A DFHSC macro request has been issued with an invalid request type.

System Action: The transaction is terminated with a CICS transaction dump.

Detection of the invalid request by DFHSMSCP causes a console message and a system dump to be produced.

User Response: Use the associated console message and system dump to investigate the problem.

Module: DFHSMSCP

ASDA

Explanation: The default shutdown transaction (CESD) has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: None.

Module: DFHCESD

ASFA

Explanation: An internal logic error occurred in DFHSFP because of an unexpected response from EXEC CICS. This abend code is usually accompanied by message DFHCE3598 which contains the associated return codes.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHSFP

ASFB

Explanation: An attempt was made to execute the CICS signoff program without an associated terminal.

System Action: CICS terminates the transaction with a dump. This abend code is usually accompanied by message DFHCE3598.

User Response: Only use the signoff program when there is a related terminal.

Module: DFHSFP

ASFC

Explanation: An attempt was made to execute the CICS signoff program against an APPC session.

System Action: CICS terminates the transaction with a dump. This abend code is usually accompanied by message DFHCE3598.

User Response: Only use the signoff program when there is a related terminal.

Module: DFHSFP

ASHA

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System Action: The transaction is abnormally terminated with abend code ASHA. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User Response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHDM

ASHB

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System Action: The transaction is abnormally terminated with abend code ASHB. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User Response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHDM

ASHR

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System Action: The transaction is abnormally terminated with abend code ASHR. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User Response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHRSP
ASHU

**Explanation:** In the process of transferring the request from one region to another an abend occurred due to a routing failure. The Request cannot be routed to a suitable region. The request is unserviceable.

**System Action:** The transaction is abnormally terminated with abend code ASHU. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

**User Response:** Check the links between regions are available. Check the Distributed Routing Program name is correct and the program is usable. Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

**Module:** DFHSHRSP

ASH2

**Explanation:** An attempt to service a Scheduler Services request failed due to required resources being unobtainable. This may result in a request being unserviceable or an Activity being marked abended depending on the nature of the failure.

**System Action:** The transaction is abnormally terminated with abend code ASH2. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

**User Response:** Check that any required links between regions are available. Check the Distributed Routing Program name is correct and the program is usable. Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

**Module:** DFHSHRSP

ASH3

**Explanation:** A transaction bound to a Scheduler Services request has backed out. No other abend code has been set. The SH abend request uses this abend code by default.

**System Action:** The transaction continues backing out. A subsequent task will process the SH abend request.

**User Response:** None.

**Module:** DFHSHRM

ASH4

**Explanation:** A Scheduler Services request attempted to attach a transaction that is currently disabled.

**System Action:** The transaction is abnormally terminated with abend code ASH4. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

**User Response:** Check the status of the transaction. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

**Module:** DFHSHRM

ASHA

**Explanation:** An error has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump. CICS then terminates abnormally.

**User Response:** See the related message from the domain that detected the original error.

**Module:** DFHSHRM

ASIA

**Explanation:** An attempt has been made to run the CICS internal task CPLT as a user transaction.

**System Action:** CICS terminates the task with a transaction dump.

**User Response:** Investigate why the attempt was made to run CPLT as a user transaction.

**Module:** DFHSHRM

ASIB

**Explanation:** An attempt has been made to run the CICS internal task CPLT as a user transaction.

**System Action:** CICS terminates the task with a transaction dump.

**User Response:** Investigate why the attempt was made to run CPLT as a user transaction.

**Module:** DFHSHRM

ASIN

**Explanation:** An attempt was made execute the CICS sign on program without an associated terminal. This abend code is usually accompanied by message DFHCE3548.

**System Action:** CICS terminates the transaction with a dump.

**User Response:** Only use the sign on program when there is a related terminal.

**Module:** DFHSHRM

ASNC

**Explanation:** The signon program attempted to send a request to the user but failed to do so.

**System Action:** CICS terminates the transaction with a dump. This abend code is usually accompanied by message DFHCE3548.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHSHRM
ASND

**Explanation:** A request from DFHSNTU to ENQ on the address of the SNEX has failed during signoff terminal user.

**System Action:** A transaction dump is taken and the task which issued the signoff is abended.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHSNTU

ASOA

**Explanation:** The TCP/IP listener task CSOL has been incorrectly started from a terminal. It can only be enabled by the Sockets Domain at CICS system initialization or by using CEMT SET TCPIP OPEN or the equivalent SPI function.

**System Action:** The transaction is abnormally terminated with a transaction dump.

**User Response:** None.

**Module:** DFHSOL

ASPC

**Explanation:** An error (INVALID or DISASTER) has occurred on a call to the bridge syncpoint routine (DFHBRSP). The domain that detected the original error will have provided an exception trace, and, possibly, a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related message from the domain that detected the original error.

**Module:** DFHSSP

ASPF

**Explanation:** CICS issued an internal syncpoint request resulting in a syncpoint with an intersystem session which has returned ROLLEDBACK to recovery manager (RM) domain. As a result, the transaction is abnormally terminated because the unit of work which was being syncpointed has been backed out. This could result from shutting down IRC or from the failure of a connected CICS region.

**System Action:** The transaction is abnormally terminated. Recoverable resources updated by the unit of work are backed out and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2215 is sent to the terminal end user if possible, and message DFHAC2245 is sent to transient data destination CSMT.

**User Response:** Determine why the remote intersystem session returned a ROLLEDBACK response to the syncpoint request. Once this has been corrected retry the transaction.

To avoid ASF abends in future, ensure that no in-flight units of work exist before shutting down IRC.

**Module:** DFHAPAC

ASPI

**Explanation:** During CICS synchronization level 1 (synclevel 1) commit, an unexpected FMH or no data has been received from the partner system. Local resources and synclevel 2 partners have been committed, but synclevel 1 function-shipped resource updates may have been backed out.

**System Action:** The transaction does not abend. CICS synclevel 1 commit processing continues, with the aim of committing as many synclevel 1 resources as possible.

**User Response:** Examine the transaction dump to determine why the FMH was invalid or missing. It is likely that the error is in the remote system.

See the CICS Family: Communicating from CICS on System/390 for more information about syncpointing.

**Module:** DFHCR2U

ASPD

**Explanation:** A request from DFHSNTU to ENQ on the address of the SNEX has failed during signoff terminal user.

**System Action:** A transaction dump is taken and the task which issued the signoff is abended.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHSNTU

ASPB

**Explanation:** An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump. If processing is at a point where data integrity might not be maintained, CICS is abnormally terminated.

**User Response:** See the related message from the domain that detected the original error. If CICS was abnormally terminated, it should be emergency restarted to ensure that data integrity is maintained.

**Module:** DFHAPAC
Chapter 3. Transaction abend codes

ASPO

Explanation: During CICS synchronization level 1 (synclevel 1) commit, unexpected syncpoint message data has been received from the partner system. Local resources and synclevel 2 partners have been committed, but synclevel 1 function-shipped resource updates may have been backed out.

System Action: The transaction does not abend. CICS synclevel 1 commit processing continues, with the aim of committing as many synclevel 1 resources as possible.

User Response: Examine the transaction dump to determine why the message data was invalid. It is likely that the error is in the remote system.

See the CICS Family: Communicating from CICS on System/390 for more information about syncpointing.

Module: DFHCR2U

ASPN

Explanation: A transaction has issued an EXEC CICS RETURN in backout required program state. The backout required program state is set when an application receives or issues an abend, or receives a backout request on a protected conversation.

System Action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are backed out and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

User Response: To avoid the transaction abend, the application should code an EXEC CICS SYNCPOINT command before the EXEC CICS RETURN. A syncpoint issued in 'backout required' program state results in a backout being performed, and the ROLLEDBACK condition returned on the EXEC CICS SYNCPOINT command. If this condition is then handled, a subsequent EXEC CICS RETURN will complete successfully.

Module: DFHAPAC

ASPO

Explanation: An intersystem session failed while a syncpoint was being taken. The intersystem session that failed was the link to the coordinator system. The failure occurred during the indoubt period of syncpoint processing. As a result this CICS system is in doubt as to the outcome of the unit of work for the transaction.

The unit of work is not shunted to await the return of the coordinator system, but is instead unilaterally committed. The unit of work is not shunted for one of the following reasons:

- The unit of work involves the installation of CICS resource definitions from the CSD (CICS system definition) file.
- The unit of work is committed, rather than backed out, because the transaction definition specifies ACTION(COMMIT).
- The fact that the unit of work is committed is remembered by the recovery manager (RM) domain until the unit of work is resynchronized with the coordinator system. At this time, according to whether the coordinator system committed or backed out, the recovery manager domain issues resynchronization messages reporting whether or not the resolution of the unit of work in the subordinate system was consistent with the coordinator system.

System Action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are committed and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2202 is sent to the terminal end user if possible, and message DFHAC2232 is sent to transient data destination CSMT.

User Response: Any updates performed by the unit of work are committed. There is a danger that recoverable resources will be inconsistent with the coordinator system if the coordinator system has backed out. If the reason for the failure is the first of those listed above and if you wish CICS to ensure that data integrity is maintained, change the indoubt transaction definition to specify WAIT(YES) so that CICS automatically handles indoubt failures and resynchronizes the unit of work when the link to the coordinator system is reestablished.

Module: DFHAPAC

ASPP

Explanation: An intersystem session failed while a syncpoint was being taken. The intersystem session that failed was the link to the coordinator system, and the failure occurred during the critical indoubt period of syncpoint processing. As a result this CICS system is in doubt as to the outcome of the unit of work for the transaction.

The unit of work is not shunted to await the return of the coordinator system. Instead it is unilaterally backed out. The unit of work is not shunted for one of the following reasons:

- The transaction definition specifies WAIT(NO).
- The unit of work includes an MRO session to a back-level CICS system which does not support the WAIT=YES option, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work involves a task related user exit which is not enabled with the INDOUBTWAIT option.
- The unit of work has updated a recoverable transient data destination, which is defined with WAIT(NO),
reporting whether or not the resolution of the unit of work in the subordinate system was consistent with the coordinator system.

**System Action:** The transaction is abnormally terminated. Recoverable resources updated by the unit of work are backed out and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2203 is sent to the terminal end user if possible, and message DFHAC2223 is sent to transient data destination CSMT.

**User Response:** Any updates performed by the unit of work are backed out. There is a danger that recoverable resources will be inconsistent with the coordinator system if the coordinator system has committed. If the reason for the failure is the first of those listed above and if you wish CICS to ensure that data integrity is maintained, change the indoubt transaction definition to specify WAIT(YES) so that CICS automatically handles indoubt failures and resynchronizes the unit of work when the link to the coordinator system is reestablished.

**Module:** DFHAPAC

### ASPQ

**Explanation:** During phase 2 of the two phase syncpoint protocol an error occurred while communicating with a remote system. The error occurred after the recoverable resources were committed or backed out, so data integrity is not in danger.

**System Action:** The transaction is abnormally terminated. Recoverable resources updated by the unit of work will have backed out or committed depending on the decision taken by the recovery manager (RM) domain, which was not influenced by this later problem. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2221 is sent to the terminal end user if possible, and message DFHAC2251 is sent to transient data destination CSMT.

**User Response:** Refer to earlier messages issued by the communication or remote resource management components of CICS to determine the cause of the intersystem communication problem.

**Module:** DFHAPAC

### ASPR

**Explanation:** Intersystem communication failed while a syncpoint was being taken. Communication with the coordinator system has been interrupted, and the failure occurred during the critical indoubt period of syncpoint processing. As a result this CICS system is in doubt about the outcome of the unit of work for the transaction. Alternatively, a transaction may have timed out while waiting for Recoverable Resource Management Services (RRMS) to provide the outcome of the unit of work, or RRMS may have failed during the critical indoubt period.

The transaction definition specifies WAIT(YES) as an indoubt attribute. Therefore the unit of work is not completed but is shunted and allowed to wait for resynchronization with the coordinator system. If the WAITTIME attribute is specified on the transaction definition, the unit of work waits for the specified time. If after that time the coordinator system has not resynchronized, a unilateral decision is made about the unit of work as specified by the ACTION keyword on the transaction definition. A WAITTIME of zero, the default, means an indefinite wait. The unit of work can also be forced to take a unilateral decision by means of a CEMT SET UOW command.

**System Action:** The transaction is abnormally terminated. The EXEC CICS HANDLE ABEND command cannot handle this abend.

The associated unit of work is shunted awaiting the return of the coordinator system. Recoverable resources updated by the unit of work remain locked. The locks are released when the unit of work is backed out or committed at resynchronization time, or when a unilateral decision is made by this system.

Message DFHAC2201 is sent to the terminal end user if possible, and message DFHAC2231 is sent to transient data destination CSMT.

**User Response:** None. Any updates performed by the unit of work are resolved automatically when resynchronization with the coordinator system takes place. Alternatively, the user can force resolution of the updates independently of the coordinator system by making a CEMT request to commit or back out the unit of work.

**Module:** DFHAPAC

### ASP2

**Explanation:** A syncpoint has been attempted when an intersystem conversation is in a state in which the EXEC CICS SYNCPOINT command is not allowed.

**System Action:** The task is abnormally terminated with a CICS transaction dump which includes terminal control information. In particular, the dump contains state information for the links used by this transaction. The EXEC CICS HANDLE ABEND command cannot handle this abend.

**User Response:** Ensure that the application issues an EXEC CICS SYNCPOINT command only when its sync level 2 conversations are in the correct state. The EXEC CICS
Chapter 3. Transaction abend codes

SYNCPONT command may be issued only when each conversation is in one of the following states:

- SEND
- PEND-RECEIVE (Not for MRO)
- PEND-FREE
- SYNC-RECEIVE
- SYNC-SEND (Not for MRO)
- SYNC-FREE

Module: DFHAPAC

ASP3

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPONT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote. During the syncpoint protocol the remote coordinator has decided that the unit of work cannot be committed and must be backed out.

This error can occur with external resource managers connected to CICS via the resource manager interface (RMI) as well as CICS systems connected via LU 6.2, and MRO. If an external resource manager such as DB2 is the only recoverable resource updated in the transaction, the recovery manager (RM) domain can optimize the syncpoint protocol. In this instance, the external resource manager becomes the syncpoint coordinator. In this instance if the external resource manager returns with a backed out response, an ASP3 abend results.

System Action: The transaction is abnormally terminated and recoverable resources updated by the unit of work are backed out. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2220 is sent to the terminal end user if possible, and message DFHAC2250 is sent to transient data destination CSMT.

User Response: Refer to the remote coordinator system to determine why the unit of work was backed out.

Module: DFHAPAC

ASP7

Explanation: A resource manager involved in syncpoint protocols has replied ‘No’ to a request to ‘Prepare’. The resource manager may be local to this CICS system, or may be a remote resource manager on another CICS system, or an external resource manager communicating through the resource manager interface (RMI).

System Action: CICS terminates the transaction abnormally. Recoverable resources updated by the unit of work are backed out. The EXEC CICS HANDLE ABEND command cannot handle this abend.

If it is a local resource manager that has voted no, message DFHAC2218 is sent to the terminal end user if possible, and message DFHAC2247 is sent to transient data destination CSMT.

If it is a remote resource manager that has voted no, message DFHAC2219 is sent to the terminal end user if possible, and message DFHAC2249 is sent to transient data destination CSMT.

User Response: This abend is caused by a prior problem. For example, the resource manager cannot flush its buffers because of an I/O error, or it cannot communicate with CICS because of a TP failure. Correct the earlier problem.

Module: DFHAPAC

ASP8

Explanation: The transaction requested syncpoint rollback, but was using a type of processing for which syncpoint rollback is not supported.

System Action: CICS terminates the transaction abnormally. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2217 is sent to the terminal end user if possible, and message DFHAC2247 is sent to transient data destination CSMT.

User Response: This error may be an application error or a configuration error. Some communication sessions, (for example, LU6.1) do not support syncpoint rollback, and if CICS detects such a session during rollback processing, the task is abended. This restriction is described in the CICS Intercommunication Guide. To resolve the problem, either:

- Change the application so that it does not issue syncpoint rollback commands while the non-supporting sessions are allocated, or
- Change the configuration so that either APPC or MRO sessions are used for communication. These are the only two session types which support syncpoint rollback.

Alternatively, following a session failure during a previous syncpoint, CICS may have decided to rollback this unit-of-work in order to preserve data integrity. Since the unit-of-work contains a session which does not support syncpoint rollback, this abend ensues. In this case, no action is required in response to this abend, although action may be required to deal with the original failure.

Module: DFHAPAC

ASP9

Explanation: The transaction requested syncpoint via EXEC CICS SYNCPONT, but this is not allowed in a transaction that is acting on behalf of an Activity.

System Action: CICS terminates the transaction abnormally. The EXEC CICS HANDLE ABEND command cannot handle this abend.

User Response: The error indicates an invalid attempt to syncpoint the transaction.

Module: DFHEISP

ASQA

Explanation: The CLS2 transaction was processing resynchronization work but the communications session which it was using has failed.

System Action: The work is reexecuted on a new session. If reexecution has already been attempted, the transaction terminates.

User Response: The error may be caused by the failure of several sessions between communicating systems during the resynchronization process. To confirm this, examine the CSMT transient data queue for the relevant period.

Another cause could be logic errors within the resynchronization program, either on this system or on the partner system, which caused the session to be terminated. In this case, CSMT transient data messages indicate the nature of the error.

Module: DFHCRRSY
**ASQB**

**Explanation:** The CLS2 transaction was executing exchange log names or resynchronization with a remote system when a logic error occurred.

**System Action:** The transaction is abnormally terminated with a transaction dump.

Message DFHRS2158 may also be issued.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCRRS¥

---

**ASQC**

**Explanation:** The CLS2 transaction was attached with an unexpected start code. The transaction can be attached due to terminal input (on a communications session), or via a system attach. Neither of these methods was used.

**System Action:** The transaction is abnormally terminated.

**User Response:** The error indicates an invalid attempt to start the transaction.

**Module:** DFHCRRS¥

---

**ASQD**

**Explanation:** The CLS2 transaction was attached but could not use the transaction manager interface to obtain input parameters.

**System Action:** The transaction is abnormally terminated.

**User Response:** The error indicates a failure in the transaction manager. See the exception trace entries produced by the transaction managed to determine the reason for the error.

**Module:** DFHCRRS¥

---

**ASQG**

**Explanation:** The CLS2 transaction was executing resynchronization work and has failed during the receipt of data from remote system via an MRO session. The data was longer than expected.

**System Action:** The transaction is abnormally terminated with a transaction dump.

**User Response:** The abend indicates a CICS logic error, possibly in the remote system. The transaction storage in the dump shows the data received. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCRRS¥

---

**ASQH**

**Explanation:** The CLS2 transaction was executing resynchronization work and has failed during the receipt of data from remote system via an MRO session. The data was shorter than the minimum length expected.

**System Action:** The transaction is abnormally terminated with a transaction dump.

**User Response:** This indicates a CICS logic error, possibly in the remote system. The transaction storage in the dump shows the data received. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCRRS¥
Chapter 3. Transaction abend codes

ASQM
Explanation: A CICS internal logic error has occurred in the management of dynamic storage for the resynchronization program.
System Action: The transaction is abnormally terminated with a transaction dump.
User Response: This indicates that the resynchronization program has exhausted the available space for recording storage areas. The symptoms may indicate that the program was looping without executing the error recovery process. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHCRRSY

ASRA
Explanation: The task has terminated abnormally because of a program check.
System Action: The task is abnormally terminated and CICS issues either message DFHAP0001 or DFHSR0001. Message DFHSR0622 may also be issued.
User Response: Refer to the description of the associated message or messages to determine and correct the cause of the program check.
Module: DFHSRP

ASRB
Explanation: An operating system abend has occurred and CICS has been able to abend the current transaction.
System Action: The task is abnormally terminated and CICS issues either message DFHAP0001 or DFHSR0001.
User Response: Refer to the description of the associated message to determine the cause of the original operating system abend, and take the necessary corrective action.
Module: DFHSRP

ASRD
Explanation: The task has been abnormally terminated for one of these reasons:
- A program contains an assembler macro call which is no longer supported by CICS.
- An invalid attempt has been made to access the CSA or TCA. This abend could be caused by an attempt to address the CSA through OS/VS COBOL BLL cells. For example:
  - When an OS/VS COBOL program is invoked by CICS for MVS, CICS inserts the address of the fetch-protected dummy CSA into the first of the application-managed BLL cells. If an attempt is made to access this storage before the application has reinitialized the BLL cell, abend ASRD will occur.
  - A non-assembler program has been wrongly defined to CICS as an assembler program.
This error appears as a program check.
System Action: The task is abnormally terminated and CICS issues message DFHSR0618, followed by either DFHAP0001 or DFHSR0001.
User Response: Refer to the description of the associated messages to determine and correct the error.

ATCA
Explanation: It is likely that either R12 which usually addresses the TCA or R13 which usually addresses the CSA is pointing to an area of storage that you are not allowed to access.
For more information about OS/VS COBOL BLL cells and associated problems, see the CICS Problem Determination Guide
Module: DFHSRP

ATCB
Explanation: The CICS application program issued two consecutive DFHTC writes or two consecutive DFHTC reads, but in either case did not issue an intervening wait.
Problem Determination: A transaction dump is provided with this abend. In the dump, register 12 addresses the current TCA, and register 10 and the field TCAFCAA address the TCTTE associated with this task. In TCATPOS2, bit TCATPOWR (X’01’) indicates that a write is requested by the DFHTC macro, and bit
**ATCC**

TCATPORR (X'10') indicates that a read is requested. In TCTTEOS, bit TCCTEOWR (X'01') indicates that a write is in progress, and bit TCCTEORR (X'10') indicates that a read is in progress.

**Analysis:**

<table>
<thead>
<tr>
<th>Register</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R10=8TCTTE</td>
<td>TCZARQ05</td>
<td>Bit TCAPORR is on in byte TCATPOS2.</td>
</tr>
<tr>
<td>R12=0TCA</td>
<td>TCZARQ1W</td>
<td>Bit TCAPORR is on in byte TCTTEOS.</td>
</tr>
</tbody>
</table>

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Take corrective action within the program being executed.

This is almost certainly an application program error. Determine the flow of control through the application and determine why an intervening wait is not issued. The trace table may be useful to discover where the application is issuing the read and write requests. If necessary, start trace or auxiliary trace using the master terminal command and rerun the transaction to obtain a trace. The output of the auxiliary trace can be printed using the trace utility program, DFHTUS20.

**Module:** DFHZARQ

---

**ATCC**

**Explanation:** An application program, using a pipeline session, has either issued more than one write request or issued a read request.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Correct the application program so that it will not issue more than one consecutive WRITE to a pipeline session terminal.

**Module:** DFHZARQ

---

**ATCD**

**Explanation:** This abend code is used whenever a CTYPE request or a QUEUE request is issued and VTAM or a ZCP function has not been included in the system.

It is also used to abend a task that issues an APPC command when the CICS system is not at a level to support APPC.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Correct the transaction so that it does not issue a CTYPE macro instruction if VTAM is not generated into the system, or include the ZCP function for which the CTYPE or QUEUE request was issued.

**Modules:** DFHZDSP, DFHZERH

---

**ATCE**

**Explanation:** A CICS application program has issued a DFHTC request without specifying the address of a TIOA, but the request is not an ERASE ALL UNPROTECTED or a READBUF request for a 3270 data stream terminal.

**Problem Determination:** A transaction dump is provided with this abend. In the dump, register 12 addresses the current TCA, and register 10 and the field TCACFCAA addresses the TCTTE associated with this task. Register 8 and TCTTEDA should contain the address of the TIOA to be used in the I/O request, but actually they contain zero. For a 3270 data stream terminal, byte TCTTEDST has bit TCTETTSI (X'01') set. An erase-all-unprotected request is indicated by the setting of bit TCTTEEUI (X'40') in byte TCTTEEUB, and a read buffer request is indicated by the setting of bit TCTTERBI (X'80') in byte TCTTERBB. **Analysis:**

<table>
<thead>
<tr>
<th>Register</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R10=8TCTTE</td>
<td>TCZARQ41</td>
<td>NIOABAR (register 8) contains zero.</td>
</tr>
<tr>
<td>R8=0</td>
<td></td>
<td>Register 8 has been loaded field TCTTEDA of the TCTTE associated with this task.</td>
</tr>
</tbody>
</table>

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Correct the error in the user program by ensuring that a terminal input/output area (TIOA) is provided at write time.

This is almost certainly an application program error. Determine the flow of control through the application and determine why a TIOA has not been specified.

**Module:** DFHZARQ

---

**ATCF**

**Explanation:** A DFHTC CTYPe macro was issued to a non-VTAM terminal control table terminal entry (TCTTE), or a DFHTC CTYPe=COMMAND or RESPONSE macro was issued to a VTAM 3270 TCTTE.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Ensure that the program issues CTYpe macros to VTAM terminals only, and does not issue CTYPe=COMMAND or RESPONSE to a VTAM 3270.

**Module:** DFHZCRO

---

**ATCG**

**Explanation:** A CICS application program has issued a DFHTC request for a terminal that it does not own. The problem of ownership may be because the task previously issued a WRITE, LAST request (which would have detached the terminal from that task) or because the task incorrectly specified the terminal to which the request is directed.

**Problem Determination:** Register 12 addresses the current TCA and register 10 contains the address of the TCTTE. The address of the TCTTE was obtained either from TCACFCAA in the case of a non-ISC transaction, or from TCATPPTA if bit TCATPPTTA (X'40') is on in byte TCATPOC3 (this indicates that TERM=YES was specified on the DFHTC request and that this is an ISC transaction). In the TCTTE thus located, the field TCTTETA does not contain the address of the TCA, indicating that this TCA is not owned by this task.

**Modules:** DFHZDSP, DFHZERH
**Analysis:** A DFHTC request has been issued specifying a TCTTE in which the field TCTTECA does not contain the address of the TCA.

**Register Label Description**

R10=TCTTE TCZARQ5 TCTTECA is not equal to register 12.

**System Action:** The transaction is abnormally terminated with an ABEND code.

**User Response:** This most probably an application error (unless storage has been completely overwritten). Determine the flow from the trace table and when a request to the DFHZCP detach routine, DFHZDZET, or a DFHTC WRITE.LAST was issued.

**Module:** DFHZARQ

---

**ANNCH**

**Explanation:** The task was purged before a domain call was able to complete successfully. The task that first detected the purged condition provides an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction, or by CICS issuing a purge request.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

When CICS purges a task, it does so to allow an operation to complete which would be held up by the presence of active tasks, or to ensure data integrity. For example, CICS will purge a task which has made recoverable updates to a coupling facility data table if it determines that the coupling facility data table server for the pool in which that table resides has recycled, to ensure that all updates in the unit of work will be backed out.

**Modules:** DFHBSM62 DFHBSS DFHBSSZ DFHBSTZ DFHBSTZV DFHBSTZ1 DFHBSTZ2 DFHTBSB DFHTBSBP DFHTBSD DFHTBSDP DFHTBSLP DFHTBSQ DFHTBSRP DFHTBSSP DFHTCRP DFHTOASE DFHTOATM DFHTOCLR DFHTOLUI DFHTRZCP DFHTRZIZP DFHTRZPPP DFHTRZXP DFHTRZZP DFHZCQCH DFHZCQDL DFHZCQIQ DFHZCQIS DFHZCQRS DFHZCQ00 DFHRMRXM DFH62XM

---

**ATCI**

**Explanation:** An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to module DFHRTS. The module that detected the original error provides an exception trace, a console message and, possibly a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related message produced by the module that detected the original error.

**Modules:** DFHZSUP DFHMRXM DFH62XM

---

**ATCJ**

**Explanation:** This abend is issued by DFHZATA in the following circumstances:

- Transaction CATA is issued from a terminal
- The address of the AWE (TCAFCAA) is 0
- The AWE is invalid (TCTWETYP should be TCTTEAWE)
- An abend is issued early in DFHZATA.

This abend is issued by DFHZATD in the following circumstances:

- Transaction CATD is issued from a terminal
- The address of the AWE (TCAFCAA) is 0
- TCAFCAA is an AWE and not a terminal
- An abend is issued early in DFHZATD.

This abend is issued by DFHZATR in the following circumstances:

- Transaction CATR is issued from a terminal
- An abend is issued early in DFHZATD.

**System Action:** CICS rejects the request.

**User Response:** Determine the issuing program and the reason for the abend and take the appropriate action as follows:

Do not try to invoke CATA, CATD or CATR from a terminal.

If the address in TCAFCAA is incorrect, the calling mechanism has failed. This is a CICS logic error.

If an abend has been issued, use the transaction dump to determine where the abend occurred. This is a CICS logic error.

**Modules:** DFHZATA DFHZATD DFHZATR

---

**ATCK**

**Explanation:** An application program has issued a WRITE to a VTAM terminal specifying CCOMPL=NO without being authorized to do so.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Specify CHAINCONTROL in the transaction profile.

**Module:** DFHZARQ

---

**ATCL**

**Explanation:** An error has occurred either during automatic journaling or automatic logging of terminal messages to or from this transaction. The message being logged will be one associated with an explicit READ or WRITE in the application program.

**Problem Determination:** Register 12 addresses the current TCA and field TCAJCAAD and register 4 address the JCA. The log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are:

- X'8001' - WRITE
- X'8003' - PUT

Possible response codes are:
ATCN

Explanation: An error has occurred during the automatic journaling or automatic logging of the initial input message of this transaction. This input message is the message that actually caused the transaction to be invoked.

Problem Determination: Register 12 addresses the current TCA and field TCATCRAAD and register 4 address the JCA. The log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are:
X'01' - IDERROR - Journal identification error
X'02' - INVREQ - Invalid request
X'03' - STATERR - Status error
X'05' - NOTOPEN - Journal not open
X'06' - LERROR - Journal record length error
X'07' - IOERROR - I/O error.

Analysis:

Register Label Description
R4=0JCA TCZACP JCAJCRC is nonzero.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the dump to ascertain why the log record could not be written correctly. If a journal record length error is indicated, TIOATDL may have been corrupted.

Modules: DFHETL, DFHTCPCM, DFHZARQ

ATCO

Explanation: An application program has attempted to perform a function not supported by a terminal or system.

Possible errors are:
1. SIGNAL not supported.
   A DFHTC TYPE=SIGNAL request with the WAIT=YES option was issued to a VTAM logical unit that CICS does not support for the receipt of the SIGNAL indicator.

2. WRITE STRUCTURED FIELD not supported.
   This write may have been attempted as a result of a SEND command with the STRFIELD keyword to a device that does not support this function.

3. APPC mapped conversation not supported.
   The application has attempted to perform a normal terminal control command on a session that is in use for an APPC unmapped conversation. (Only EXEC CICS GDS commands are permitted.)

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Correct the application program.

Module: DFHZARQ

ATCQ

Explanation: The application program issued a write operation to a terminal that was in send status. In order to allow this write to proceed, a signal command was sent, and DFHZCP started to read data from the terminal waiting for the change direction indication. As each data record is received, it is placed on temporary storage and, for one of these operations, a temporary storage error has occurred.

Problem Determination: Register 12 addresses the current TCA.

TCACCSV1 contains a saved copy of TCATSTR containing the temporary storage response code. The temporary storage response code may be one of:
X'01' - IDERROR - Journal identification error
X'02' - INVREQ - Invalid request
X'03' - STATERR - Status error
X'05' - NOTOPEN - Journal not open
X'06' - LERROR - Journal record length error
X'07' - IOERROR - I/O error.

Analysis:

Register Label Description
R4=0JCA TCZACP JCAJCRC is nonzero.

TCZSUPIZ Journal error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the dump to ascertain why the log record could not be written correctly. For a guide to analyzing the dump, see abend code ATCM.

If a journal record length error is indicated, TIOATDL (X'08') may have been corrupted.

Modules: DFHZSUP DFH62XM DFHTFNM
**Module**: DFHZRAQ

**ATCR**

**Explanation**: An application program has issued a read operation, after a previous write operation has caused DFHZCP to read-ahead data from the terminal in order to avoid a lock-out. DFHZCP has now issued a DFHTS GETQ to retrieve the saved data from temporary storage, and an error has occurred.

**Problem Determination**: Register 12 addresses the current TCA. TCACCSV1 contains a saved copy of TCATSTR that contains the temporary storage response code. The temporary storage response code may be one of:

- X'01' - ENERROR - Entry error
- X'02' - IDERROR - Identification error
- X'04' - IOERROR - I/O error
- X'20' - INVREQ - Invalid request

The temporary storage identification is constructed by concatenating the character string “DFHQ” with the terminal identification from TCTTETI. The temporary storage identification is placed in TCATSDI.

**Analysis**: After the DFHTS TYPE=GETQ, the temporary storage response code was not zero.

**Register Label Description**

- R12=0TCA ZRAR90 TCATSTR is not zero.

**System Action**: The transaction is abnormally terminated with a CICS transaction dump.

**User Response**: Determine the cause of the temporary storage error and correct it.

If a temporary storage identification error is indicated, examine TCTTETI for a valid terminal identification.

**Module**: DFHZRAR

**ATCS**

**Explanation**: An application program attempted to send data to a logical unit, but was in receive mode (EIBRECV is set), and read-ahead queuing was not specified in installed profile definition (RAQ=NO).

**System Action**: The transaction is abnormally terminated with a CICS transaction dump.

**User Response**: Either change the application program to issue receives until EIBRECV is not set, or specify RAQ=YES in the installed profile definition (if RAQ=YES is specified, ensure that all input messages are read before the transaction is terminated.)

**Module**: DFHZARQ

**ATCV**

**Explanation**: An application attempted an operation on a logical unit, but was not in the correct mode for one of the following reasons:

1. When issued by DFHZARQ, CICS cannot perform the current request because another request is outstanding (EIBSYNC is set). This holds for APPC or non-APPC systems.
2. When issued by DFHETL, the application is communicating with an APPC system, and is not in the correct state to perform the attempted operation. This holds for APPC systems only.
3. When issued by DFHZISP, a TCTTE free was requested, and there is an outstanding sync point request. This holds for non-APPC systems only.
4. When issued by DFHZISP, a TCTTE free was requested, the TCTTE is in receive mode, and RAQ=NO was specified in the installed profile definition. This holds for non-APPC systems only.

**Problem Determination**: Register 12 addresses the current TCA. Register 10 and field TCACFFAAA address TCTTE. The terminal byte TCTECRE has bit TCTEUCOM (X'04') set if Free Session is required, and TCTEUFFT (X'04') set if Free Session is required; TCTEUSMD has TCTEUSMD (X'02') set if the application is in SEND mode. TCTERCVI has TCTEUCRV (X'01') set if the application is in RECEIVE mode. Bit TCTEIRAQ in byte TCTEIRAQ indicates that read-ahead queuing is coded on the installed profile definition for this transaction.

The type-of-request bits in the TCA are set as follows:

- TCATPOS1 TCATPS (X'01') Signal requested.
- TCATPOS2 TCATPFRE (X'03') Free TCTTE.
- TCATPOS2 TCATPorr (X'10') Receive requested.
- TCATPOS2 TCATPOWR (X'01') Send requested.

**Analysis**

<table>
<thead>
<tr>

**Module**: DFHZARQ

**ATCU**

**Explanation**: An application program attempted to send data to a logical unit, but was in receive mode (EIBRECV is set), and read-ahead queuing was not specified in installed profile definition (RAQ=NO).

**System Action**: The transaction is abnormally terminated with a CICS transaction dump.

**User Response**: Either change the application program to issue receives until EIBRECV is not set, or specify RAQ=YES in the installed profile definition (if RAQ=YES is specified, ensure that all input messages are read before the transaction is terminated.)

**Module**: DFHZARQ

**ATCT**

**Explanation**: An attempt to build a surrogate TCTTE to represent a remotely-owned terminal failed.

**System Action**: The task is abnormally terminated with a CICS transaction dump.

**User Response**: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Modules**: DFHZSUP DFHMRXM DFH62XM
### ATCW

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** The response depends on the reason for the error as follows:

1. Issue a sync point and then issue the request.
2. Issue the free request and reallocating the session.
3. Either change the application to issue releases until EIBRECV is not set, or specify RAQ=YES in the installed profile definition. (If you specify RAQ=YES in the installed profile definition, ensure that all input messages are read before the transaction is terminated.)
4. See the CICS Distributed Transaction Programming Guide where rules for the correct use of commands are given. Then correct the application.

The application program has attempted an operation on a logical unit that is invalid, because the program’s current status on the session with that logical unit does not permit it. An investigation of the TCTTE (that is, Session), status bytes, and TCA type of request bytes will reveal which of the above problems are relevant.

When the cause of the problem has been ascertained, the application program should be changed to ensure that the session-oriented information is acted upon before any further requests are sent across that session. The session status information is made available to the application program in the exec interface block (EIB) immediately following the execution of RECEIVE, CONVERSE, or RETRIEVE requests across the session. The relevant bytes must be tested, strictly in the order shown, and acted upon, before any further operations are attempted on the session. In addition, the status information bytes themselves are necessarily volatile in that they are reset before the execution of every EXEC CICS... statement. Thus it is good programming practice to save them into application user storage after a RECEIVE, CONVERSE, or RETRIEVE for later testing. The states are:

1. **EIBSYNC**  
   - the application must take a syncpoint
2. **EIBFREE**  
   - the application must free the session (or terminate when the session will be freed automatically)
3. **EIBRECV**  
   - the application must continue receiving data by issuing further RECEIVE commands; by definition, data cannot be sent while in this state.

Some of these status tests can sometimes be omitted (for example, testing of the EIBSYNC status is not essential if it is known that the application program on the remote system never issues sync point requests itself). However, the tests should always be carried out, particularly if the remote application might be amended at a future date, in which event the session handling logic may well be altered. Also, it may be that the remote transaction itself causes an unsuspected flow on the session. For example, if the remote program issues EXEC CICS SEND...... LAST across the session, followed by RETURN, a syncpoint request (RQD2) will be added onto the transmitted data. (The application programmer is referred to the CICS Distributed Transaction Programming Guide for a discussion of this topic). As a result of this addition, an unsuspected syncpoint request is received by the local application, which abandons if the session is freed without the sync point request being honored.

**Note:** An ATCW abend is also raised by module DHETEL if a state error occurs during processing of an APPC mapped application (that is, the program attempts to perform an operation while in the wrong state). The handling of APPC mapped applications is described in the CICS Diagnosis Reference. Some commands are processed by DHZARQ, as above, and others by various other modules invoked by DHETEL. Rules for using commands for APPC are given in the CICS Distributed Transaction Programming Guide. Reference to this guide should reveal the programming error.

**Modules:** DFHETL, DFZARQ, DFHZISP

---

### ATCW

**Explanation:** The system has been generated without an installed profile definition for an LU6.1 or APPC session.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Notify the system programmer of the error.

**Modules:** DFHZSUP, DFHMRXM, DFH62XM

---

### ATCX

**Explanation:** An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

An application program that issues terminal control requests after an ATCX abend may cause further problems.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related message produced by the domain that detected the original error.

**Modules:** DFHBSMIR, DFHBSMPP, DFHBSM62, DFHBSS, DFHBSTB, DFHBSTB3, DFHBSTC, DFHBSTZ, DFHBSTZB, DFHBSTZO, DFHBSTZS, DFHBSTZV, DFHBSTZ1, DFHBSTZ2, DFHBSTZZS, DFHAPRT, DFHCRP, DFHQRY, DFHZARL, DFHZARQ, DFHZERH, DFHZGET, DFHZFRE, DFHZNAC, DFHZRVS, DFHZSUP, DFHMRXM, DFH62XM, DFHZTSP, DFHZXST

---

### ATCY

**Explanation:** An error has occurred during the processing of an inbound function management header (FMH). Either a length error has been detected, for example, incomplete FMH received, or an invalid field has been detected within the FMH.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Notify the system programmer of the error. The problem is probably in the remote system that has sent the invalid FMH.

If the inbound FMH is from a system with an earlier release of CICS then you may need to set USEDFLTUSER. See ‘Attach Time Security and the USEDFLTUSER option’ in chapter 12 of the CICS RACF Security Guide.

**Modules:** DFHZARQ, DFHZSUP, DFHMRXM, DFH62XM
ATC1
Explanation:  The CICS terminal control restart task could not complete because a necessary step failed. The task has done some recovery operations and abnormally terminated itself with code ATC1.

System Action:  CICS writes a transaction dump for the terminal control restart task.

CICS sends two messages to the console, one to identify the error detected by the terminal control restart task, and DFHTC1001 to report that the task has failed. A third message follows either to say that CICS has terminated abnormally with a dump, or to ask you to reply GO or CANCEL. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

User Response:  First, if CICS has requested a response, you must reply. If you reply ‘GO’, CICS continues processing, but without terminal control. If you reply ‘CANCEL’, CICS terminates abnormally with a dump.

Use the messages and dumps to find out the cause of the failure.
Module:  DFHTCRP

ATC2
Explanation:  A CICS SET VTAM OPEN command has failed due to VTAM rejecting a CICS request.

System Action:  Message DFHZC2302, DFHZC2304 or DFHZC2307 is sent to the console, and CICS terminates the transaction abnormally with a transaction dump.

User Response:  The RPL with the VTAM request code and return code can be found in the RA pool addressed from TCTVRVRA. Use the VTAM Programming manual, to determine the cause of the error and the actions necessary to correct it. After correcting the error, either retry the request or terminate CICS and restart the network in your own time.

Module:  DFHZSLS

ATC3
Explanation:  A write to a TLX device was issued with a data length of 0 causing TIOATDL to be 0.

System Action:  The transaction is abnormally terminated with a CICS transaction dump.

User Response:  Correct the error in the user program by ensuring that a data length for data to be placed in the Terminal Input/Output area (TIOA) is provided at write time.
Module:  DFHZSLS

ATC4
Explanation:  A serious CAVM error has occurred. The XRF TCB has abended.

System Action:  CICS abnormally terminates with a system dump.

User Response:  Use the dump and the guidance in any messages issued by other system components to diagnose and correct the original error.

See the CICS Problem Determination Guide for further guidance on using system dumps.
Module:  DFHTCRP

ATC5
Explanation:  An internal logic error has been detected during APPC mapped processing. The conversation state maintained by DFHZARL does not match the state which is jointly maintained by DFHETL and DFHZARM.

This problem could also arise when CICS is receiving application data. CICS may receive and end of chain notification before receiving all the data expected.

System Action:  The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User Response:  You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module:  DFHETL

ATC6
Explanation:  DFHETL has a SEND DATA request with a data length greater than 65528 bytes which is the maximum that it can process.

System Action:  The transaction is abnormally terminated with a CICS transaction dump.

User Response:  This is a CICS internal logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module:  DFHETL

ATC7
Explanation:  DFHZSUP has detected a bad response from an INITIAL-CALL request to DFHZARL. This response is returned to DFHZSUP in the DFHLUC parameter list.

System Action:  The transaction is abnormally terminated with a CICS transaction dump.

User Response:  Examine field LUCCDRCD in the DFHLUC parameter list. This appears in the ENTR/EXIT trace points for DFHZARL. If trace is switched off, then it can be found in DFHZSUP’s LIFO entry in the transaction dump.

- LUCCDRCD = ’A0000100’ - session failure
- LUCCDRCD = ’A00100100’ - read timeout
- LUCCDRCD = ’A00100000’ - deadlock timeout.

(The offset for LUCCDRCD can be found in CICS Data Areas).

If LUCCDRCD is X’00000000’, the error is the result of a connection failure. In this case examine the CSMT log for further diagnostic information.
Module:  DFHZSUP

Module:  DFHZARQ

Chapter 3. Transaction abend codes
**ATC8**

**Explanation:** An error has occurred during the processing of an inbound function management header (FMH). Either a length error has been detected, for example, incomplete FMH received, or an invalid field has been detected within the FMH.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Notify the system programmer of the error. The problem is probably in the remote system that has sent the invalid FMH.

**Module:** DFHETL

---

**ATC9**

**Explanation:** A DFHKC RESUME macro call has been issued for a task without first issuing DFHKC SUSPEND. DFHKC RESUME must be preceded by DFHKC SUSPEND.

**System Action:** The transaction is abnormally terminated with a transaction dump.

**User Response:** Examine the trace entry to locate the error.

**Module:** DFHZNCE

---

**ATDC**

**Explanation:** A transaction has issued an EXEC CICS READQ, WRITEQ or DELETEQ command against a logically recoverable transient data queue. The task was enqueued because another task currently owns the enqueue. While waiting to obtain the enqueue, the task was purged.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why the transaction was purged. It may have been purged via CEMT or automatically, by DTIMOUT for example.

**Module:** DFHETD

---

**ATDY**

**Explanation:** Transient data initialization has failed. A console message, DFH12xx, gives the reason for the failure.

**System Action:** Transient data initialization terminates abnormally. This abend is always followed by an ATDZ abend for the failing function, and by message DFHS11521 (if CICS abends unconditionally), or message DFHS11522, which prompts you to reply GO or CANCEL.

**User Response:** See the associated console message for information regarding the cause of the failure. Then respond to message DFHS11522, if it has been issued.

**Module:** DFHTDRP

---

**ATDZ**

**Explanation:** A CICS function invoked by transient data initialization has failed. If the failing function is a transient data routine, this abend is preceded by a console message and an ATDY abend.

**System Action:** Transient data initialization terminates abnormally. This abend is always followed by message DFHS11521 (if CICS abends unconditionally), or message DFHS11522, which asks you to reply GO or CANCEL.

**User Response:** Refer to the associated console message for further information regarding the cause of the failure. Then respond to message DFHS11522, if it has been issued.

**Module:** DFHTDRP

---

**ATFE**

**Explanation:** A FREEMAIN request to the storage manager has failed while CICS was executing a CEDA CHECK or CEDA INSTALL command.

**System Action:** CICS abnormally terminates the task with a transaction dump.

**User Response:** Use the dump and any associated messages issued by the storage manager to investigate the FREEMAIN failure.

**Module:** DFHTOUT1

---

**ATGE**

**Explanation:** A GETMAIN request to the storage manager has failed while CICS was executing a CEDA CHECK or CEDA INSTALL command.

**System Action:** CICS abnormally terminates the task with a transaction dump.

**User Response:** Use the dump and any associated messages issued by the storage manager to investigate the GETMAIN failure.

**Module:** DFHTOUT1

---

**ATMA**

**Explanation:** The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction, or by CICS issuing a purge request. If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

When CICS purges a task, it does so to allow an operation to complete which would be held up by the presence of active tasks.

**Module:** DFHTMP

---

**AT92**

**Explanation:** Refer to the associated console message for further information regarding the cause of the failure. Then respond to message DFHS11522, if it has been issued.

**Module:** DFHTDRP
ATMB

**Explanation:** An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related message from the domain that detected the original error.

**Module:** DFHTMP

---

ATNA

**Explanation:** A terminal operator entered the transaction identification for NACP.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Do not reenter the NACP transaction identification (CSNE).

**Module:** DFHZNAC

---

ATND

**Explanation:** The node error program (NEP) or NACP decides that a task should abnormally terminate, but the task is at a critical point of processing and immediate termination would put the integrity of the system at risk.

**System Action:** The task is abnormally terminated with a CICS transaction dump when the task next requests any action against the terminal, or issues a sync point request involving the terminal.

**User Response:** Check destination CSMT for possible further information. Use the dump to determine why the task was abnormally terminated by NEP.

**Modules:** DFHZARL, DFHZARL, DFHZSUP

---

ATNI

**Explanation:** There are two forms of this abend:

**VTAM form**

The node error program (NEP) or NACP decides the task should be abnormally terminated. DFHZNAC informs the request module to abend the transaction after the TC unit has completed.

**Non-VTAM form**

The terminal error program (TEP) or terminal abnormal condition program (TACP) decides the task should be abnormally terminated. DFHTACP informs DFHZARQ to abend the transaction after the TC unit has completed.

**System Action:**

- The task is abnormally terminated with a CICS transaction dump.
- This usually occurs when, due to a hardware failure, a network device rejects the data stream sent to it. The device itself may indicate an error code that will give a specific reason for the rejection. Check the CSMT log for further information.

**User Response:**

- Abend ATNI can occur if a user application does not correctly handle an error return code from an external resource manager, such as DB2.
- For the NEP (VTAM) form, run a VTAM trace type=BUF for the logical unit and repeat the error.
- For the TEP (non-VTAM) form, run a link trace for the line or local channel address for the device.
- Examine the data stream and error response to determine the cause of the error.
- This type of error occurs if the definitions in the TCT do not match the attributes of the actual device.

**Modules:** DFHZARQ, DFHZARL, DFHZARQ, DFHZARQ, DFHZSUP

---

ATOA

**Explanation:** You have attempted to invoke the CESC transaction with a terminal as principal facility. This is not allowed.

**System Action:** CICS terminates the CESC transaction. No dump is produced.

**User Response:** Ensure that the CESC transaction is not run against a terminal.

**Module:** DFHCESC

---

ATOB

**Explanation:** CICS has received an abnormal response from an EXEC CICS START TRANSACTION(CESC) request. This is caused by an internal error.

**System Action:** CICS terminates the CESC transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCESC

---

ATOC

**Explanation:** CICS has received an abnormal response from an EXEC CICS CANCEL TRANSACTION(CESC) request.

**System Action:** CICS terminates the CESC transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCESC

---

ATOD

**Explanation:** CICS has received an abnormal response from an EXEC CICS CANCEL TRANSACTION(CESC) request.

**System Action:** CICS terminates the CESC transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCESC
ATOE

**Explanation:** CICS cannot determine the time at which an XRF takeover began.

**System Action:** CICS terminates the CESC transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCESC

ATOF

**Explanation:** CICS has received an abnormal response from an EXEC CICS DELAY TRANSACTION(CESC) request. This is caused by an internal error.

**System Action:** CICS terminates the CESC transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCESC

ATOG

**Explanation:** CICS has received an abnormal response from an EXEC CICS START TRANSACTION(CEGN) request. The CEGN transaction should only be invoked by CICS. Valid codes are TERM_TIMEOUT, XRF_TIMEOUT, and ENABLE_TIMEOUT. The most likely cause of this error is an invalid attempt by a user to invoke CESC.

**System Action:** CICS terminates the CESC transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCESC

ATOH

**Explanation:** An attempt has been made to invoke the CESC transaction with an invalid function code. The CESC transaction should only be invoked by CICS. Valid codes are TERM_TIMEOUT, XRF_TIMEOUT, and ENABLE_TIMEOUT. The most likely cause of this error is an invalid attempt by a user to invoke CESC.

**System Action:** CICS terminates the CESC transaction with a transaction dump.

**User Response:** Determine how CESC was invoked. If it was invoked by CICS, you will need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCESC

ATOT

**Explanation:** An error has occurred when trying to retrieve a CICS message from the message domain.

**System Action:** CICS terminates the transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHTPR

ATOU

**Explanation:** The CEGN transaction has attempted to issue an EXEC CICS RETURN but the command has failed.

**System Action:** CICS terminates the transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCESC

ATOV

**Explanation:** The CEGN transaction has attempted to issue an EXEC CICS GETMAIN, ASSIGN, or SEND but the command has failed.

**System Action:** CICS terminates the transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCESC

ATPA

**Explanation:** An error occurred when trying to estimate the length of a CICS message owned by the message domain.

**System Action:** CICS terminates the transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHTPR

ATPB

**Explanation:** An error occurred when trying to retrieve a CICS message from the message domain.

**System Action:** CICS terminates the transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHTPR

ATPC

**Explanation:** An error occurred when trying to estimate the length of a CICS message owned by the message domain.

**System Action:** CICS terminates the transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHTPR

ATPC

**Explanation:** An error occurred when trying to estimate the length of a CICS message owned by the message domain.

**System Action:** CICS terminates the transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHTPR
ATPD

**Explanation:** An error occurred when trying to retrieve a CICS message from the message domain.

**System Action:** CICS terminates the transaction with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHTPD.

---

ATPE

**Explanation:** The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction, or by CICS issuing a purge request.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

When CICS purges a task, it does so to allow an operation to complete which would be held up by the presence of active tasks.

**Modules:** DFHTPD, DFHTPR.

---

ATPF

**Explanation:** An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related message produced by the domain that detected the original error.

**Modules:** DFHTPD, DFHTPR.

---

ATRA

**Explanation:** The field engineering global trap exit program, DFHTRAP, requested task abnormal termination. However, the currently active task was not a system task (for example, task dispatcher) and it was not about to abend.

**System Action:** CICS disables the trap exit so that it will not be reentered, and terminates the currently active task abnormally.

**User Response:** This is a user-requested task abend.

If you want to use the trap again, you must reactivate it as follows:

```
CSFE DEBUG,TRAP=ON
```

You should use the global trap exit only in consultation with an IBM support representative.

**Module:** DFHTRP

---

ATSA

**Explanation:** The transaction CTSD was attached other than by an internal request from the TS domain.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why the CTSD transaction was started. This transaction is intended for CICS internal use only and should not be started by a user or from a terminal.

**Module:** DFHTSDQ

---

ATSB

**Explanation:** The transaction CTSD was attached with invalid parameters.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHTSDQ

---

ATSC

**Explanation:** The task was canceled during execution of a temporary storage command.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate the reason the task was canceled. The task has been canceled by the master terminal operator or automatically by either the deadlock timeout (DTIMEOUT) mechanism or the read timeout (RTIMOUT) mechanism.

**Modules:** DFHEITS, DFHICP, DFHTSP

---

ATSD

**Explanation:** An INVALID or DISASTER response was received from a request to the Temporary Storage (TS) Domain.

**System Action:** The transaction is terminated with a CICS transaction dump.

**User Response:** There has been an earlier failure which lead to the response from TS. Investigate the earlier failure (which is accompanied by a console message and a system dump).

**Modules:** DFHEITS, DFHICP, DFHTSP

---

ATSP

**Explanation:** A task has attempted to issue a WRITEQ TS or a DELETEQ TS request for a recoverable TS queue that has already been deleted in the same unit of work.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Correct the application to avoid issuing a WRITEQ TS or a DELETEQ TS to a recoverable queue in a unit of work in which the queue has already been deleted.
ATSQ

**Modules:** DFHEITS, DFHTSP

**ATSQ**

**Explanation:** A move of data to or from temporary storage has failed. The probable reason is that the size of the area being passed to CICS is inconsistent with the data length being used.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** Identify the failing temporary storage request in the application and verify whether the length supplied on the request agrees with the data area size. Correct the application as appropriate.

**Note:** If the error occurs in DFHTSP and not in DFHETS, there is probably an internal logic error in temporary storage. In this case you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHEITS

ATUF

**Explanation:** Insufficient space exists to build the parameter list for the DYNALLOC SVC.

**System Action:** The task is abnormally terminated and a dump is taken.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFH99KO

AUEA

**Explanation:** An unexpected error occurred when one of the Transaction Affinities Utility Detector exit programs called Detector program CAUTABM. Transaction CAFB issues this abend on behalf of the exit program.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU4100.

**Module:** CAUCAF1

AUXB

**Explanation:** The Transaction Affinities Utility Detector dataspace has filled up. If the situation was detected by a Detector exit program, transaction CAFB issues this abend on its behalf.

**System Action:** The Detector is stopped.

**User Response:** message DFHAU4200.

**Modules:** CAUCAF3, CAUCAF6, CAUCAF1

AUYA

**Explanation:** The Transaction Affinities Utility Detector transaction CAFB received an unrecognizable request from another Detector component (CAFF or a Detector exit program).

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU3302.

**Module:** CAUCAF1

AUYC

**Explanation:** The Transaction Affinities Utility Detector transaction CAFB received a request from another Detector component (CAFF or an exit program) to abend because of an unexpected error.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU3304.

**Module:** CAUCAF1

AUYE

**Explanation:** A Transaction Affinities Utility Detector program found an invalid affinity file number in an internal array in the Detector global work area (GWA).

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU3310.

**Modules:** CAUCAF2, CAUCAF3

AUYF

**Explanation:** The Transaction Affinities Utility Detector transaction CAFB was not started by transaction CAFF.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU3311.

**Module:** CAUCAF1
**AUYG**

**Explanation:** The Transaction Affinities Utility Detector transaction CAFB was still running at CICS termination.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU3312.

**Module:** CAUCAFB1

**AUZH**

**Explanation:** One of the Transaction Affinities Utility files contains a CICS APPLID that does not match the APPLID of the CICS system.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2205.

**Modules:** CAUCAFF1, CAUCAFF2

**AUZI**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB issued a VSAM file control EXEC CICS command.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2211.

**Modules:** CAUCAFF3, CAUCAFF6

**AUZJ**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to add an element to an affinity table in the dataspace.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2212.

**Module:** CAUCAFF3

**AUYG**

**Explanation:** The Transaction Affinities Utility Detector transaction CAFB was still running at CICS termination.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU3312.

**Module:** CAUCAFB1

**AUZC**

**Explanation:** The internal field holding the Transaction Affinities Utility Detector state has an invalid value.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2203.

**Modules:** CAUCAFF1, CAUCAFF2

**AUZH**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to create an affinity table in the dataspace.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2211.

**Modules:** CAUCAFF3, CAUCAFF6

**AUZI**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB issued an EXEC CICS command.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2201.

**Modules:** CAUCAFF1, CAUCAFF2, CAUCAFF3, CAUCAFF4, CAUCAFF5, CAUCAFF6, CAUCAFF7, CAUCAFB1, CAUCAFB2, CAUCAFB4, CAUCAFB5, CAUCAFB6, CAUCAFB7

**AUZC**

**Explanation:** The internal field holding the Transaction Affinities Utility Detector state has an invalid value.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2203.

**Modules:** CAUCAFF1, CAUCAFF2

**AUZJ**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to add an element to an affinity table in the dataspace.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2212.

**Module:** CAUCAFF3

**AUZH**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to create the MVS dataspace to hold the affinity data.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2210.

**Module:** CAUCAFF2

**AUZI**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to add an element to an affinity table in the dataspace.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2212.

**Module:** CAUCAFF3

**AUYH**

**Explanation:** A Transaction Affinities Utility Detector program has found that the address held in the Detector global work area (GWA) for one of the Detector internal modules is invalid.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU3313.

**Modules:** CAUCAFF4, CAUCAFF5, CAUCAFB1

**AUZC**

**Explanation:** The internal field holding the Transaction Affinities Utility Detector state has an invalid value.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2203.

**Modules:** CAUCAFF1, CAUCAFF2

**AUZJ**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to add an element to an affinity table in the dataspace.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2212.

**Module:** CAUCAFF3

**AUYI**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB called Detector program CAUTABM to access affinity table data in the dataspace.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU3314.

**Modules:** CAUCAFB2, CAUCAFF6

**AUZD**

**Explanation:** One of the Transaction Affinities Utility files contains a CICS APPLID that does not match the APPLID of the CICS system.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2205.

**Modules:** CAUCAFF1, CAUCAFF2

**AUZJ**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to add an element to an affinity table in the dataspace.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2212.

**Module:** CAUCAFF3

**AUZI**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB issued a Detector user exit related EXEC CICS command. The command is either ENABLE, DISABLE or EXTRACT EXIT.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2206.

**Modules:** CAUCAFF1, CAUCAFF2, CAUCAFF3, CAUCAFF4, CAUCAFF5, CAUCAFF6, CAUCAFB1

**AUZH**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to create an affinity table in the dataspace.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2211.

**Modules:** CAUCAFF3, CAUCAFF6

**AUZI**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB issued an EXEC CICS command.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2201.

**Modules:** CAUCAFF1, CAUCAFF2, CAUCAFF3, CAUCAFF4, CAUCAFF5, CAUCAFF6, CAUCAFF7, CAUCAFB1, CAUCAFB2, CAUCAFB4

**AUZI**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB issued an EXEC CICS command.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2201.

**Modules:** CAUCAFF1, CAUCAFF2, CAUCAFF3, CAUCAFF4, CAUCAFF5, CAUCAFF6, CAUCAFB1, CAUCAFB2

**AUZH**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to create an affinity table in the dataspace.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2211.

**Modules:** CAUCAFF3, CAUCAFF6

**AUZI**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB issued a Detector user exit related EXEC CICS command. The command is either ENABLE, DISABLE or EXTRACT EXIT.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2206.

**Modules:** CAUCAFF1, CAUCAFF2, CAUCAFF3, CAUCAFF4, CAUCAFF5, CAUCAFF6, CAUCAFB1

**AUZJ**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to add an element to an affinity table in the dataspace.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2212.

**Module:** CAUCAFB3, CAUCAFF6

**AUZB**

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB issued a VSAM file control EXEC CICS command.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2202.

**Modules:** CAUCAFF1, CAUCAFF2, CAUCAFF3, CAUCAFF4, CAUCAFF5, CAUCAFF6, CAUCAFB1, CAUCAFB2, CAUCAFB4
AUZK

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF was attempting to initialize the internal trace table.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2234.

**Module:** CAUCAFF3

AUZL

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF was attempting to release the internal trace table.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2235.

**Module:** CAUCAFF4

AUZN

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to destroy the dataspace.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2216.

**Module:** CAUCAFF4

AUZO

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to destroy a table in the dataspace.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2217.

**Module:** CAUCAFF6

AUZQ

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUCAFP to create its MVS CPOOL storage.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2220.

**Module:** CAUCAFF3

AUZR

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB called Detector program CAUCAFP to access its MVS CPOOL storage.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2221.

**Modules:** CAUCAFF4, CAUCAFF5, CAUCAFB1

AUZS

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUCAFP to destroy its MVS CPOOL storage.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2222.

**Module:** CAUCAFF4

AUZU

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF calculated what percentage of the dataspace is occupied by affinity data.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2224.

**Module:** CAUCAFF1

AUZV

**Explanation:** The method of initiating Transaction Affinities Utility Detector transaction CAFF is incorrect.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2225.

**Module:** CAUCAFF1

AUZY

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB called Detector program CAUTABM to replace a table element in the dataspace.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2228.

**Modules:** CAUCAFF3, CAUCAFB2

AUZZ

**Explanation:** An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called a Detector subroutine to update the termid table (TT) or userid table (UT).

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2229.

**Modules:** CAUCAFF3, CAUCAFF6

AUZ1

**Explanation:** When the Transaction Affinities Utility Detector was being started by transaction CAFF, the header record could not be found on one of the VSAM affinity data files.

**System Action:** The Detector is stopped.

**User Response:** Refer to message DFHAU2230.

**Module:** CAUCAFF3
AWBA

Explanation: The CICS Web Receive process has received an exception response from the Web Send Receive function, DFHWBSR, which could be one of the following errors:
- An error in the Analyzer program
- No Analyzer program specified
- Unable to link to Analyzer program
- An Analyzer data length error
- An Analyzer header length error
- A codepage conversion error
- A storage error occurred
- An error that the connection has been closed
- A sockets receive error

System Action: An error message is sent to the client and the CWBO transient data queue.

User Response: Refer to any error messages accompanying this abend to determine why the abend has occurred.
Module: DFHWBXL

AWBB

Explanation: The incoming parameter list to the CICS Web Business Logic Interface program is not in the expected format. At present, the structure is assumed to be fixed and only a single version level is recognized.

System Action: The CICS Web Business Logic Interface program is not executed.

User Response: Ensure that the program receives a parameter list in the correct format.
Module: DFHWBXN

AWBC

Explanation: No commarea was passed to a CICS Web Interface utility program. One of the utility programs supplied with the CICS Web Interface was executed, but the commarea that was passed was absent or was too short to contain valid information.

System Action: The CICS Web Interface utility is not executed.

User Response: Ensure that the program passes a commarea that is long enough to contain the expected parameters for the utility you are invoking.
Modules: DFHWBENV, DFHWBTL

AWBE

Explanation: The CICS Web Interface detected that a Converter program attempted to change the address of the response buffer when it was not allowed to do so.

System Action: The data in the new response buffer is not returned to the Web browser. A CICS transaction dump is taken.

User Response: The Converter program is only allowed to replace the response buffer if the converter_volatile flag in the Converter parameter list is set to '1'. Check that your Converter program is not trying to return a new response buffer when this flag is set to '0'.
Module: DFHWBLI

AWBF

Explanation: The CICS Web Interface alias detected an error in its initialization. The alias was not started by EXEC CICS START, or there was an error in the EXEC CICS RETRIEVE command for the start data.

System Action: If there is an error in EXEC CICS RETRIEVE, message DFHWB0103 is written to the CWBO destination. A CICS transaction dump is taken.

User Response: If the alias was not started by EXEC CICS START, check if it is being started from a terminal. This is not allowed. Otherwise, see the associated message for guidance.
Module: DFHWBA

AWBH

Explanation: The CICS Web Interface alias detected a logic error.

System Action: An exception trace entry 454F is written. Message DFHWB0106 is written to the CWBO destination. A CICS transaction dump is taken.

User Response: Use related diagnostics to determine the user response.
Module: DFHWBA

AWBI

Explanation: The CICS Web Interface alias received an unexpected response from EXEC CICS ASSIGN STARTCODE

System Action: An exception trace entry 4544 is written. Message DFHWB0102 is written to the CWBO destination.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHWBA

AWBJ

Explanation: The CICS Web Interface alias received an unexpected response when it switched to the RP TCB.

System Action: An exception trace entry 454E is written. Message DFHWB0105 is written to the CWBO destination. A transaction dump is taken.

User Response: See the associated message for guidance.
Module: DFHWBA

AWBK

Explanation: The CICS Web Interface alias detected an abend in the converter or the CICS program servicing the request.

System Action: An exception trace entry 4550 is written. Message DFHWB0108 is written to the CWBO destination.

User Response: Use related diagnostics to determine the user response.
Module: DFHWBA

Chapter 3. Transaction abend codes  909
AWBL

**Explanation:** The CICS Web Interface alias detected an error in an EXEC CICS LINK command for program DFHWBBLI.

**System Action:** An exception trace entry 4543 is written. Message DFHWB0100 is written to the CWBO destination. A transaction dump is taken.

**User Response:** See the associated message for guidance.

**Module:** DFHWBA

AWBM

**Explanation:** The CICS Web Interface alias detected error response from the Business Logic Interface program DFHWBBLI.

**System Action:** Message DFHWB0101 is written to the CWBO destination. A transaction dump is taken.

**User Response:** See the associated message for guidance.

**Module:** DFHWBA

AWBO

**Explanation:** The CICS Web Business Logic Interface program detected an error in its parameter list.

**System Action:** If the abend was issued from the Business Logic Interface program, DFHWBBLI, an exception trace entry '4581' is made and message DFHWB0119 is written to the CWBO transient data destination. If the abend was issued from the Web Interface program, DFHWBA1, an exception trace entry '4560' is written and message DFHWB0124 is sent to the CWBO destination. A transaction dump is taken.

**User Response:** See the associated message for guidance.

**Modules:** DFHWBA1, DFHWBBLI

AWBR

**Explanation:** The CICS Web Business Logic Interface program detected a logic error.

**System Action:** If the abend was issued from the Business Logic Interface program, DFHWBBLI, an exception trace entry '4583' is made and message DFHWB0118 is written to the CWBO transient data destination. If the abend was issued from the Web Interface program, DFHWBA1, an exception trace entry '4558' is written and message DFHWB0123 is sent to the CWBO destination.

**User Response:** Use related diagnostics to determine the user response.

**Modules:** DFHWBA1, DFHWBBLI

AWBU

**Explanation:** The CICS Web Interface connection manager could not get storage to send a message to the terminal.

**System Action:** Processing continues.

**User Response:** Use related diagnostics to determine the user response.

**Module:** DFHWBC01

AWBV

**Explanation:** The CICS Web Interface connection manager detected an error response on EXEC CICS DEQ.

**System Action:** An exception trace entry 4345 is written. Message DFHWB1651 is written to the CWBO destination.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHWBC04

AWBX

**Explanation:** The CICS Web Interface connection manager was started against an invalid terminal type.

**System Action:** An exception trace entry 4308 is written. Message DFHWB1522 is written to the CWBO destination.

**User Response:** See the associated message for guidance.

**Module:** DFHWBC01

AWBZ

**Explanation:** The CICS Web Interface connection manager detected a NOTAUTH response to EXEC CICS EXTRACT EXIT.

**System Action:** Message DFHWB1902 is written to the CWBO destination.

**User Response:** See the associated message for guidance.

**Module:** DFHWBC0B

AWB2

**Explanation:** The CICS Web Interface has encountered an error while performing a transaction attach call for the alias task.

**System Action:** Message DFHWB0727 describing the error is written to the CWBO transient data destination and a trace entry is made.

**User Response:** See the associated message for guidance.

**Module:** DFHWBXN

AWB3

**Explanation:** CICS Web transaction, CWXN, has been illegally started either with data, or by a user at a terminal, with the wrong start code.

**System Action:** The CICS Web Interface is not started.

**User Response:** CICS Web Transaction Execution should only ever be started by Sockets Domain using DFHXMAT ATTACH, not by a user at a terminal or with data.

**Module:** DFHWBXN

AWB4

**Explanation:** The CICS Web Transaction Execution has received a bad response from an INQUIRE_TRANSACTION call to determine the start code for the CWXN transaction.

**System Action:** The CICS Web Interface is not started.

**User Response:** CICS Web Transaction Execution should only ever be started by Sockets Domain using DFHXMAT ATTACH, not by a user at a terminal or with data.

**Module:** DFHWBXN
AWB5

**Explanation:** The CICS Web Interface Server Controller could not continue with enable processing because the requested port is not available.

**System Action:** An exception trace entry 4106 is written, and message DFHWB0131 is issued.

**User Response:** Terminate the TCP/IP application which is using the requested port, and use CBWB to enable the feature again, or use CWBC to enable the CICS web Interface using a different port number.

**Module:** DFHWBM

AWB7

**Explanation:** The CICS Web Interface environment variables program was invoked, but the invoking transaction does not appear to be executing in a valid Web environment.

**System Action:** The program writes an exception trace point 4623.

**User Response:** Determine how the environment variables program was invoked. It is only meaningful to execute the program from a transaction that has been initiated from the Web, either through the CICS Web Interface or through the Business Logic Interface.

**Module:** DFHWBENV

AWB8

**Explanation:** The CICS Web Interface environment garbage collection task CWBG has been started directly from a terminal. This is not permitted.

**System Action:** The transaction is abnormally terminated with a transaction dump.

**User Response:** None.

**Module:** DFHWBGB

AWB9

**Explanation:** The CICS Web Interface connection manager failed due to lack of storage.

**System Action:** A transaction dump is taken.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHWBC01

AWC1

**Explanation:** The CICS Web Interface 3270 bridge exit DFHWBLT could not establish a partnership with the Web terminal translation task which started the abended transaction.

**System Action:** An exception trace entry 4106 is written, and message DFHWB0131 is issued.

**User Response:** Use related diagnostics to determine the user response.

**Module:** DFHWBLT

AWC2

**Explanation:** The CICS Web Interface 3270 bridge exit DFHWBLT was passed an invalid state token by attach processing.

**System Action:** An exception trace entry 410C is written, and message DFHWB0130 is issued.

**User Response:** Use related diagnostics to determine the user response. On a busy CICS region, the most likely cause is that the bridged transaction started after the state data had been discarded by Web 3270 garbage collection process.

**Module:** DFHWBLT

AWC3

**Explanation:** An application using the CICS Web 3270 function issued an unsupported combination of BMS and Terminal Control commands.

**System Action:** An exception trace entry is written.

**User Response:** Use related diagnostics to determine the user response.

**Module:** DFHWBLT

AWC4

**Explanation:** The CICS Web Interface 3270 bridge exit DFHWBLT has been reinvoked after returning an earlier error.

**System Action:** An exception trace entry is written.

**User Response:** Use related diagnostics to determine the user response.

**Module:** DFHWBLT

AWC5

**Explanation:** The CICS Web Interface 3270 bridge exit DFHWBLT abended during attach processing because it could not getmain a brxa user area.

**System Action:** Message DFHWB0132 is issued, and an exception trace entry 410D is written.

**User Response:** Use related diagnostics to determine the user response. The most likely cause of this abend is that CICS is having storage problems.

**Module:** DFHWBLT

AWC6

**Explanation:** The CICS Web Interface 3270 bridge exit DFHWBLT has detected an inconsistency in its request parameters or state data.

**System Action:** Message DFHWB0133 is issued, and an exception trace entry is written.

**User Response:** Use related diagnostics to determine the user response. The most likely cause of this abend is a storage overwrite.

**Module:** DFHWBLT
AWKY

Explanation: A request to PURGE or WRITE a record using the global catalog during warm keypointing has failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check for problems with the global or local catalog. See any DFHCCnnnn messages issued by the CICS catalog domain for further guidance.

Module: DFHWKP

AXFA

Explanation: The key length for a file control request that is to be sent to a remote system has to be obtained from the file control table, and has proved to be zero.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Ensure that the key length has been defined either in the remote file definition that is being used, or as a length option from the application program that is using it.

Module: DFHXFP

AXFB

Explanation: An unacceptable function management header (FMH) type has been found. It must be type 05, type 06, or type 43.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHXFP

AXFC

Explanation: The request passed to the data transformation program is unknown to CICS. This abend can also occur in an MRO/IRC system as a result of an invalid EXEC CICS START request issued from the user’s node error program (DFHZNEP).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the CICS Customization Guide for restrictions on the use of EXEC CICS commands from within an NEP. If this is not the cause of the abend, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHXFP

AXFD

Explanation: The request that is passed to the data transformation program cannot be sent to a remote system; for example, a storage control request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHXFP
AXFJ

Explanation: The error code held in UIBFCTR and UIBDLTR cannot be converted to an equivalent SNA error code.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHXFP

AXFL

Explanation: Transformers 2 and 4 expect to receive a function management header (FMH), possibly followed by user data. A null chain of data has been received.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHXFP

AXFM

Explanation: The ISCINVREQ condition has been raised. This can happen when the resource proves to be on yet another remote system, that is, when daisy-chaining is active.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that daisy-chaining of requests is intended and that all relevant intersystem links are in service.

Module: DFHXFP

AXFO

Explanation: The check on the DS and DBA parameters in an attach function management header (FMH) has failed. This abend represents a user error resulting from a mismatch in the system definitions for both ends of an intersystem link.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer.

Module: DFHXFP

AXFP

Explanation: CICS requires a second function management header (FMH) to follow an attach FMH. No second FMH was received.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer.

Module: DFHXFP

AXFQ

Explanation: Either the function management header (FMH) just received is too short or too long to be a valid FMH, or an expected FMH is not present.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that the transaction profile parameter, INBFMH, is set to ALL. If communicating across a distributed program link, ensure that the requested function is supported on the partner system.

Module: DFHXFP

AXFR

Explanation: The CICS command level interface imposes a maximum length of 32,767 for data. The length of the data just received exceeds this limit.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer.

Module: DFHXFP

AXFS

Explanation: A PSB has been scheduled successfully. However, the maximum possible length of an I/O area exceeded 65,535. This abend is likely to occur if path calls are used to retrieve large segments, and/or if FLS causes excessive expansion of segments.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer.

Module: DFHXFP

AXFT

Explanation: An estimate of the size of the output I/O area has been made, and it exceeds the maximum possible size of 65,535.

Note: While the estimated size may exceed the actual size, the difference will only be a few bytes.

This abend is likely to occur if a database calls, inserts, or replaces multiple segments, and many qualified segment search arguments are specified.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer.

Module: DFHXFP

AXFU

Explanation: A two-level cursor is present in a function management header (FMH) relating to a linear (temporary storage) queue. However, these cursors are valid only for hierarchical queues that are not supported by CICS.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHXFP
**AXFW**

**Explanation:** An invalid length specification has been given in a CICS command-level request corresponding to one of the data variables.

The CICS-architected FMH is followed by zero or more self-describing data variables for each parameter specified.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Check for an invalid or zero length specified in a CICS command-level request, or for data truncation in a user-written node error program (NEP).

**Module:** DFHXFP

---

**AXFX**

**Explanation:** A function shipping request by an APPC link failed because

- the remote system does not support full syncpoint protocols, or
- the exchange log name sequence could have failed, resulting in a mismatch, or
- the request has not completed within the allocated time (10 seconds).

**System Action:** CICS terminates the task abnormally.

**User Response:** Check that the request was directed to the correct remote system, and that the remote system is set up to support full syncpoint protocols (synclevel 2).

**Module:** DFHXFP

---

**AXFY**

**Explanation:** An APPC conversation failure has occurred when an attach between CICS systems was issued.

**System Action:** The task is abnormally terminated with a transaction dump.

**User Response:** Check the connection to the remote CICS system and try to reestablish it.

**Module:** DFHXFP

---

**AXF0**

**Explanation:** A task has been purged due to lack of storage in a dynamic storage area (DSA).

**System Action:** The task is abnormally terminated with a transaction dump.

**User Response:** Try the transaction again later.

If the short-on-storage condition persists, consider increasing the size of the dynamic storage area using the DFHSIT DSA parameter.

**Module:** DFHXFP

---

**AXF1**

**Explanation:** The storage manager module, DFHSMGF, has returned a condition not expected by DFHXFP.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related message from the domain that detected the original error.

**Module:** DFHXFX

---

**AXF2**

**Explanation:** A task has been purged due to lack of storage in the DSA.

**System Action:** The task is abnormally terminated with a transaction dump.

**User Response:** Try the transaction again later.

If the short-on-storage condition persists, increase the size of the dynamic storage area using the DFHSIT DSA parameter.

**Module:** DFHXFP

---

**AXF3**

**Explanation:** The storage manager module DFHSMDC has returned a condition not expected by DFHXFP.

**System Action:** The task is abnormally terminated with a transaction dump.

**User Response:** Look for any related CICS messages and abends to determine if there has been a prior failure in CICS storage.

**Module:** DFHXFP

---

**AXF4**

**Explanation:** The task was purged before a GET_BUFFER request to the EXEC interface service routines module (DFHEISR), was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

**Module:** DFHXFX

---

**AXF5**

**Explanation:** An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the EXEC interface service routines module (DFHEISR). The domain that detected the original error provides an exception trace, a console message, and possibly, a system dump (depending on the options specified the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related message from the domain that detected the original error.

**Module:** DFHXFX
AXF8

Explanation: A keyword such as TOKEN, CONSISTENT, REPEATABLE, UNCOMMITTED, or NOSUSPEND has been specified on a file control command for shipping to a system which does not support these functions.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Ensure that CICS in the file-owning region is at the correct level.

Module: DFHFXF

AXMA

Explanation: An error has occurred obtaining a lock within the transaction manager domain.

System Action: The recovery routine of the module in control is invoked which issues message DFHXM0002 with a system dump. DFHXM0002 reports the module in control at the time of the error.

User Response: See the description of message DFHXM0002 for further guidance.

Modules: DFHXMAT, DFHXMBD, DFHXMC, DFHXMD, DFHXMF, DFHXMDL, DFHXMQ, DFHXMT, DFHXMTA, DFHXMXD, DFHXMXE

AXMB

Explanation: An error has occurred releasing a lock within the transaction manager domain.

System Action: The recovery routine of the module in control is invoked. This routine issues message DFHXM0002 with a system dump. DFHXM0002 reports the module in control at the time of the error.

User Response: See the description of message DFHXM0002 for further guidance.

Modules: DFHXMAT, DFHXMBD, DFHXMC, DFHXMD, DFHXMF, DFHXMDL, DFHXMQ, DFHXMT, DFHXMTA, DFHXMXD, DFHXMXE

AXMC

Explanation: An severe error has occurred allocating a unique transaction number to a new transaction.

System Action: The recovery routine of the module in control is invoked. This routine issues message DFHXM0002 with a system dump. DFHXM0002 reports the module in control at the time of the error.

User Response: See the description of message DFHXM0002 for further guidance.

Modules: DFHXMAT, DFHXMXE

AXMD

Explanation: An attempt has been made to run the CICS internal task CSXM as a user transaction.

System Action: CICS terminates the task with a transaction dump.

User Response: Investigate why the attempt was made to run CSXM as a user transaction.

Module: DFHXMB

AXMY

Explanation: During transaction attach an unexpected error occurred obtaining transaction class membership.

System Action: The transaction is no longer considered for class membership. It is then abnormally terminated with a CICS transaction dump.

User Response: Use the dump to determine why the transaction failed to obtain membership of its transaction class.

Module: DFHXMAT

AXMZ

Explanation: A serious failure in another component has been detected by the transaction manager domain.

System Action: The task in control is abnormally terminated with a transaction dump. Further diagnostics should have been taken by the failing component.

User Response: Look for earlier messages identifying the source of the problem. Refer to the descriptions of these messages for further guidance.

Module: DFHXMTA

AXSA

Explanation: The CICS security control task could not complete because a necessary step failed. The task has done some essential recovery operations and abnormally terminated itself with code AXSA.

System Action: CICS writes a transaction dump for the security control restart task.

CICS sends messages to the console, one to identify the error detected by the security control task, and, if the error occurred during initialization, one to say that security initialization or CEMT PERFORM SECURITY REBUILD has failed. A third message follows either to say that CICS has terminated abnormally with a dump, or to ask you to reply GO or CANCEL. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

User Response: First, if CICS has requested a response, you must reply. If you reply 'GO', CICS continues processing, but without support for the external security manager. CICS security still operates. If you reply 'CANCEL', CICS terminates abnormally with a dump. Use the messages and dumps to find out the cause of the failure.

Module: DFHXSMN

AXSC

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.
If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. Another possibility is to increase the value of the DTIMOUT option for the transaction.

**Module:** DFHXSMN

**AXSD**

**Explanation:** An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the related message produced by the domain that detected the original error.

**Module:** DFHTCRP

**AXTA**

**Explanation:** The calculation of the length of data to be shipped has failed.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHXTP

**AXTB**

**Explanation:** An attempt to obtain a TIOA to ship data has failed.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHXTP

**AXTC**

**Explanation:** An attempt to transform data ready for shipment has failed.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHXTP

**AXTH**

**Explanation:** An attempt to locate terminal identifier failed.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHXTP

**AXTD**

**Explanation:** No TIOA received message was received from a remote system.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHXTP

**AXTE**

**Explanation:** Incorrect data was received from a remote system. The data was not long enough.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHXTP

**AXTF**

**Explanation:** No relay process function management header (FMH) was received from the remote system.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHXTP

**AXTG**

**Explanation:** Transformation of data received from remote system failed.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Check that the reason for failure of the transformation process was not incorrect definition of the remote terminal. In particular check that the user area length specified for the terminal is the same in both local and remote systems. If the terminal definitions are correct, you need further assistance to resolve this problem. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHXTP
Chapter 3. Transaction abend codes

### AXTI

**Explanation**: The major request byte LUCOPN0 of the DFHLUC parameter list specified to the transaction-routing transformer is invalid, or corresponds to a request that is not shipped to a remote system. The parameter list will be found in the dynamic storage of XTP's caller and may be located using the output from auxiliary trace.

**System Action**: The task is abnormally terminated with a transaction dump.

**User Response**: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module**: DFHXTP

### AXTJ

**Explanation**: An unexpected combination of bit settings in the fields XTSSTAT and XTSTCOPC in the parameter list of the transaction-routing transformer was made.

**System Action**: The task is abnormally terminated with a transaction dump.

**User Response**: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module**: DFHXTP

### AXTK

**Explanation**: An APPC conversation failure occurred when an attach between CICS systems was issued.

**System Action**: The task is abnormally terminated with a CICS transaction dump.

**User Response**: Check the connection to the remote CICS system and try to reestablish it.

**Module**: DFHXTP

### AXTL

**Explanation**: The processing of APPC mapped data requires the generation of an APPC attach FMH with default values. In particular, the sync level requested is defaulted to 2. However, the session that is to be used has been bound with a sync level of 1.

**System Action**: The task is abnormally terminated with a CICS transaction dump.

**User Response**: Check that:
- The entry in the TCT for the remote system has been defined with parallel sessions
- The remote system is capable of supporting a sync level of 2
- Exchange lognames has completed for the connection. You can use the command CEMT INQUIRE CONNECTION to do this. See the CICS Intercommunication Guide for more details of the exchange lognames process.
- The correct sync level has been requested.

**Module**: DFHXTP

### AXTM

**Explanation**: An attempt has been made to route a message-protected transaction over an APPC link bound at sync level 1. The attempt has failed because such transactions can be routed only over an APPC link that has been bound at sync level 2.

**System Action**: The task is abnormally terminated with a CICS transaction dump.

**User Response**: If the transaction is to be routed to CICS OS/2 (which is bound at synclevel 1), remove the message protection option. If the transaction is to be routed to another host system and message protection is required, the link must be redefined so that it can be bound at synclevel 2.

**Module**: DFHXTP

### AXTN

**Explanation**: Module DFHXTP detected that the application buffer chained off a TCTTE at offset TCTERCSA has a corrupted header. This is caused either by a CICS logic error or by a storage overwrite.

**System Action**: The transaction is abnormally terminated with a CICS transaction dump.

**User Response**: This is a CICS internal logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module**: DFHETL

### AXTO

**Explanation**: An exception response has been returned to the DFHXTP module from the CICS security manager. Prior to the call to the CICS security manager, the DFHXTP module detected that a shipped terminal definition had preset security. DFHXTP then invoked the CICS security manager in order to perform a preset security signon for the userid sent with the shipped terminal information. It is this preset security signon attempt which failed.

**System Action**: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSNx xxx message to the transient data queue, CSCS.

**User Response**: The most likely cause of this abend is that the terminal being shipped to the application owning region (AOR) has preset security with a userid which is not valid in the AOR. To confirm this, check the associated DFHSNx xxx message on the CSCS transient data queue in the AOR which gives the precise reason for the failure of the preset security signon request. This could be the result of an unauthorized transaction routing request.

**Module**: DFHXTP

### AXTP

**Explanation**: An exception response has been returned to the DFHXTP module from DFHCONV FUNCTION(CONVERT_DS3270_FOR_SBCS). The module was called for a CICS client virtual terminal which requested conversion from ASCII to EBCDIC for data coming from the client. However, the conversion failed.

**System Action**: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security
manager issues a DFHSNnnn message to the transient data queue, CSCS.

**User Response:** Examine the response and reason returned in the DFHCCNV commarea DFHC32. The client and server codepages will have already been validated so this may be a CICS error. You may need to contact IBM for further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHXTP

---

**AXTQ**

**Explanation:** An exception response has been returned to the DFHXTP module from DFHCCNV FUNCTION(CONVERT_DS3270_FOR_SBCS). The module was called for a CICS client virtual terminal which requested conversion from EBCDIC to ASCII for data to be sent to the client. However the conversion failed.

**System Action:** The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSNnnn message to the transient data queue, CSCS.

**User Response:** Examine the response and reason returned in the DFHCCNV commarea DFHC32. The client and server codepages will have already been validated so this may be a CICS error. You may need to contact IBM for further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHXTP

---

**AXTR**

**Explanation:** An exception response has been returned to the DFHXTP module from DFHPGLE FUNCTION(LOAD_EXEC) whilst trying to load EXEC program DFHCCNV.

**System Action:** The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSNnnn message to the transient data queue, CSCS.

**User Response:** Examine the response and reason returned from DFHPGLE to determine why CICS was unable to call DFHCCNV.

**Module:** DFHXTP

---

**AZAB**

**Explanation:** DFHZARM has a SEND DATA request with a data length greater than 65528 bytes which is the maximum that it can process.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** This is a CICS internal logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZARM

---

**AZAD**

**Explanation:** DFHZC1N1 has been started from an unexpected system. The CCIN transaction can only be issued by a client.

**System Action:** The transaction is abnormally terminated. Exception trace point AP3008 is written. Data1 holds the XMIQ start type.

**User Response:** Issue the CCIN transaction only from a client.

**Module:** DFHZC1N1

---

**AZAE**

**Explanation:** DFHZC1N1 was started from a terminal facility, but not an LU6.2 session. The CCIN transaction may only be issued by a client.

**System Action:** The transaction is abnormally terminated.

**User Response:** Issue the CCIN transaction only from a client.

**Module:** DFHZC1N1

---

**AZAF**

**Explanation:** DFHZC1N1 was started from a terminal facility. However either the environment is wrong or the client architecture has been violated. This abend is always issued in conjunction with a DFHZC32nn message which explains the problem in more detail.

**System Action:** Exception trace point AP30xx is written. The transaction is abnormally terminated.

**User Response:** Look for a DFHZC32nn message on the console or CSNE and look for exception trace points AP30xx. Use these to diagnose the problem.

**Module:** DFHZC1N1

---

**AZAG**

**Explanation:** DFHZCT1 has been started from an unexpected system. The CTIN transaction can only be issued by a client.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump. Exception trace point AP302A is written. Data1 holds the XMIQ start type.

**User Response:** Issue the CTIN transaction only from a client.

**Module:** DFHZCT1

---

**AZAH**

**Explanation:** DFHZCT1 was started from a terminal facility, but not an LU62 session. The CTIN transaction can only be issued by a client.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump. Exception trace point AP302A is written. Data1 holds the principal facility address.

**User Response:** Issue the CTIN transaction only from a client.

**Module:** DFHZCT1

---

**AZAI**

**Explanation:** DFHZCT1 was started from a terminal facility. However either the environment is wrong or the client architecture has been violated. This abend is always issued in conjunction with a DFHZC32nn message which explains the problem in more detail.

**System Action:** Exception trace point AP30xx is written. The transaction is abnormally terminated.

**User Response:** Look for a DFHZC32nn message on the console
or CSNE and look for exception trace points AP30xx. Use these to diagnose the problem.

**Module:** DFHZCT1

---

**AZAJ**

**Explanation:** DFHZCN1 was started for transaction CCIN. However, the CCIN transaction is being started on a surrogate, which means that it has been defined as a remote transaction. CCIN must be a local transaction and be run on a CICS region which is directly connected to a client.

**System Action:** Exception trace point AP3041 is written. The transaction is abnormally terminated.

**User Response:** Either use the default definitions for CCIN or ensure that it is defined as a local transaction.

**Module:** DFHZCN1

---

**AZAK**

**Explanation:** DFHZCT1 was started for transaction CTIN. However, the CTIN transaction is being started on a surrogate, which means that it has been defined as a remote transaction. CTIN must be a local transaction and be run on a CICS region which is directly connected to a client.

**System Action:** Exception trace point AP3039 is written. The transaction is abnormally terminated.

**User Response:** Either use the default definitions for CTIN or ensure that it is defined as a local transaction.

**Module:** DFHZCN1

---

**AZCA**

**Explanation:** An internal logic error has been detected during APPC mapped processing. The length of application data received is expected.

**System Action:** The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZARM

---

**AZCD**

**Explanation:** A possible intersystem logic error has been detected during APPC mapped processing. The length of application data that is to be received (as determined from the LL fields and concatenation flags) does not match the length actually received. CICS determines the length of application data that is to be received from the LL fields and concatenation flags. However, CICS has not received all of the data that is expected.

This abend can be caused by a loss of data following the failure of a persistent sessions restart in a partner system. In this case, no logic error has occurred because any updates are backed out.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** If this abend is not caused by the failure of a persistent sessions restart in a partner system, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Modules:** DFHETL, DFHZARM

---

**AZCE**

**Explanation:** An intersystem error has been detected during APPC mapped processing. The length of application data that is to be received (as determined from the LL fields and concatenation flags) exceeds the CICS implementation limit of 32767, for receive and converse commands, or 65000 for CICS transaction routing or function shipping requests.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Reduce the amount of data that the transaction in the remote system is transmitting to CICS.

**Modules:** DFHETL, DFHZARM

---
AZCF

Explanation: An internal logic error has been detected during APPC mapped processing. An invalid request has been passed to DFHZARL.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARM

AZCG

Explanation: An internal logic error has been detected during APPC mapped processing. DFHZARM expects the TCTTE passed to have been defined as APPC, TCTEILUC (TCTELUC) set on, and TCTECVT set to TCTEMAPD (to indicate a mapped conversation).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARM

AZCH

Explanation: Sense code X'0889xxxx' has been received unexpectedly during the processing of APPC mapped data. This represents a violation of the APPC architecture by the remote system.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Modules: DFHETL, DFHZARM

AZCI

Explanation: The processing of APPC mapped data requires generation of an APPC attach function management header (FMH) with default values. In particular, the sync level requested is defaulted to 2. However, the session that is to be used has been bound with a sync level of 1.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that:
- The entry in the TCT for the remote system has been defined with parallel sessions.
- The remote system is capable of supporting a sync level of 2.
- Exchange lognames has completed for the connection. You can use the CEMT INQUIRE CONNECTION to do this. See the CICS Intercommunication Guide for details of the exchange lognames process.

Modules: DFHETL, DFHZARM, DFHZARQ

AZCJ

Explanation: An APPC structured field with GDS ID X'12F1' (null data) has been sent to a remote system that does not support the receipt of these fields. The remote system has responded negatively and has terminated the conversation.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: The problem is in the remote system. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARM

AZCK

Explanation: An internal logic error has been detected during error recovery for APPC mapped processing. The conversation was being switched to RECEIVE state by an internal CICS SEND INVITE, but the conversation had already been FREEd by the partner.

System Action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARM

AZCL

Explanation: CICS has received sense code X'088901xx' during APPC mapped processing. The generalized data stream (GDS) should contain a valid GDS identity in the error data but CICS does not recognize the value. The values recognized by CICS are:
- X'12F1' null data
- X'12F2' function management data
- X'12FF' application data.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check for session failure and for an abend by the transaction in the other system.

Module: DFHZARM

AZCM

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHZARM
AZCN

**Explanation:** The task has been purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition provides an exception trace.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

**Module:** DFHZARM

AZCO

**Explanation:** The VTAM persistent sessions initialization transaction CGRP has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** None.

**Module:** DFHZCGRP

AZCP

**Explanation:** A logic error has been detected in ZCP. An allocation request for a starting task cannot be satisfied.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Modules:** DFHZSUP DFH62XM

AZCQ

**Explanation:** An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain to change the recovery status of an intercommunication session. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** This failure is either the result of a task purge, or it represents a CICS logic error and you will need assistance from IBM.

See the related diagnostic material produced by the recovery manager domain.

**Modules:** DFHZSUP DFHMRXM DFH62XM

AZCR

**Explanation:** A logic or protocol error has been detected during processing of an APPC SYNCPOINT ROLLBACK request. An attempt has been made to restore the conversation state to what it was after completion of the last successful unit of work. This saved state does not match flows received from the partner.

The problem arises during rollback in one of the following situations:

- The saved state is receive, and the partner sent change direction on the last flow, indicating that the partner expects CICS to be in send state
- The saved state is send, and the partner did not send the change-direction indicator on the last flow, indicating that the partner expects CICS to be in receive state.

**System Action:** The task is abnormally terminated with a CICS transaction dump. Other processing continues.

**User Response:** The problem can arise because of a failure in CICS, or a failure in the partner. To determine which is failing, analyze the flows at the last successful syncpoint. Try to determine the states the two LUs were in at this point. Look at the last syncpoint flow into CICS from the partner, before the andembr. From this flow, calculate whether the change-direction indicator on the SPCMOD modifier byte is on. (See the SNA Formats manual for further information on the SPCMOD modifier byte.) The indicator must only be set when the saved CICS conversation state is send. If the last CICS state was send, and the indicator is on, CICS is at fault. Similarly, if the last CICS state was receive, and the indicator is off, CICS is at fault.

If the last CICS state was send and the indicator is off, or the last CICS state was receive, and the indicator is on, CICS has received a change-direction indicator when it was not expecting one. In this case, examine the partner for a logic error.

**Module:** DFHZARL

AZCT

**Explanation:** A terminal read-time-out condition has been detected. The transaction has been waiting for a terminal input message for an interval longer than specified in the RTIMOUT value for that transaction.

Coding RTIMOUT in the PROFILE entry causes the task to be abnormally terminated if the terminal does not send input within the specified time.

**System Action:** The transaction is abnormally terminated. A dump is not provided unless the dump table entry for transaction dump code AZCT indicates that one should be taken.

**User Response:** If a DFHPC TYPE=SETEXIT macro has been issued for this task, the read that was timed-out is still outstanding. In order to cancel this read, issue a DFHPC TYPE=ABEND at the end of the user exit routine so that CICS can clean up the terminal’s TCTTE.

**Module:** DFHZARQ
AZCU
Explanation: The COVR transaction has been started directly from a terminal, or by a START command. This is not permitted. This transaction can only be started internally by CICS.
System Action: The transaction is abnormally terminated. No transaction dump is taken.
User Response: None.
Module: DFHZCOVR

AZCV
Explanation: A logic error has been detected in the COVR transaction while trying to connect to VTAM.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZCOVR

AZCW
Explanation: An attempt has been made to run the CICS internal task CSTP as a user transaction.
System Action: CICS terminates the task with a transaction dump.
User Response: Investigate why the attempt was made to run CSTP as a user transaction.
Module: DFHZCSTP

AZIA
Explanation: The transaction attempted to acquire or free storage during MRO processing. The response from the CICS storage manager (SM) domain indicated that the request was invalid.
System Action: The task is abnormally terminated with a dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZIS2

AZIB
Explanation: The transaction was purged whilst waiting for storage to receive MRO data from a connected subsystem. The purge may have been the result of operator action, such as CEMT SET TASK PURGE, or as the result of the waiting time exceeding the DTIMOUT value for the transaction.
System Action: The task is abnormally terminated with a dump.
User Response: If the condition is caused by time-out, examine the DTIMOUT value for the failing transaction and increase it if it is too low.
Module: DFHZIS2

AZIC
Explanation: An INVALID, DISASTER, or EXCEPTION condition has occurred on a call to the storage manager domain (DFHSMGFM) to FREEMAIN a CRB control block.
The domain that detected the original error provides an exception trace, a console message, and possibly a system dump.
System Action: The task is abnormally terminated with a transaction dump.
User Response: Please see the related message from the domain that detected the original error.
Module: DFHZIS2

AZID
Explanation: A PURGED condition has occurred on a call to the storage manager domain (DFHSMGFM) to FREEMAIN a CRB control block.
The domain that detected the original error provides an exception trace.
System Action: The task is abnormally terminated with a transaction dump.
User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.
If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.
If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.
Module: DFHZIS2

AZIE
Explanation: An interregion communication (IRC) ISSUE-ERROR or ISSUE-ABEND flow has been received in violation of IRC protocols. This can be caused by:
• A CICS logic error. IRC protocols are not available to MRO distributed transaction processing applications. They are for CICS internal use only.
• A transaction abend on a connected system. This results in an FMH 7 flow over an LU6.2 connection and causes this abend to be issued.
System Action: The task is abnormally terminated with a transaction dump.
User Response: Check whether a mixture of mapped and unmapped conversations are being used as this can cause this abend. Check for any other reasons for transactions to be abending on the attached system.
If a CICS logic error is involved, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZARQ
**AZIF**

**Explanation:** An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain to change the recovery status of an intercommunication session. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This is either the result of a task purge, a CICS logic error, or of the inappropriate use of the indoubt test transaction, CIND. CIND should be activated only on the CICS system where the syncpoint processing was initiated. In particular, CIND should not be used on any of the CICS mirror transactions.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Determine whether CIND has been activated for a transaction that did not initiate the syncpoint processing. If CIND is not being used see the related diagnostic material produced by the recovery manager domain and determine the reason for the failure.

In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZARQ

---

**AZI1**

**Explanation:** An IRC data transmission request has been issued, but cannot be completed because the transmission protocol has been violated.

If the session is not used for distributed transaction processing, that is if it is used for function shipping or transaction routing, then the problem is caused by a CICS logic error.

If the session is used for distributed transaction processing, then the following are possible causes of the abend:

- An invalid terminal control command, such as ISSUE SIGNAL, was issued
- A send request was issued but the session was not in send state, or a read request was issued but the session was not in receive state.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Determine the cause of the abend and if appropriate, correct the application. For further guidance, refer to the section on the EXEC Interface block (EIB) in the CICS Intercommunication Guide. The EIB describes the state of the session after a request has been issued.

**Module:** DFHZARQ

---

**AZI2**

**Explanation:** An IRC data transmission request has been issued but cannot be completed. Possible causes of the problem include:

- The transaction running in the connected system has been purged, or
- The transaction running in the connected system has been timed out, or
- The abending transaction has attempted to SEND while in RECEIVE state, or
- The abending transaction has attempted to RECEIVE while in SEND state.

If the abend was caused by DFHIRP rejecting the transmission request, the dump will contain DFHIRP’s return code in the field TCTEIRET for the TCTTE representing the failed IRC session. The address of this TCTTE is in field B of the trace entry representing the DFHTC data transmission request.

The meanings of the DFHIRP return codes are given in the copybook, DFHIRSDS.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** If the cause of the error was a purge or a time-out, no further action is required.

If the error was caused by a condition such as an attempted SEND while in RECEIVE state or vice versa, analyze the dump and correct the protocol violation.

**Module:** DFHZARQ

---

**AZI3**

**Explanation:** A terminal control request issued by an application to a remotely-owned terminal failed because the conversation with the other system failed.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZARQ

---

**AZI4**

**Explanation:** An IRC data transmission request has been issued, but cannot be completed because the other system has become unavailable for interregion communication.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Rerun the transaction when IRC is available.

**Module:** DFHZARQ

---

**AZI5**

**Explanation:** An IRC data transmission request has been issued, but the data sent by the connected system in response to the request violated IRC protocols.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZARQ

---

**AZI6**

**Explanation:** The transaction was connected to another transaction in another CICS system via an IRC link. This other transaction has abnormally terminated.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Correct the cause of the abend in the connected transaction.

**Module:** DFHZARQ
AZ17

**Explanation:** The transaction was processing an MRO request which involved waiting for a response from a connected subsystem. The 'wait' request was rejected by the CICS dispatcher.

**System Action:** The transaction is abnormally terminated with a dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZIS2

AZ18

**Explanation:** The error log data received with an ISSUE-ABEND flow on an IRC connection was not in the correct format.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZIS1

AZ19

**Explanation:** The transaction was processing an MRO request which involved waiting for a response from a connected subsystem. During the wait, the failing transaction was purged. The purge can only have been the result of operator action, such as a CEMT SET TASK PURGE.

**System Action:** The task is abnormally terminated with a dump.

**User Response:** Investigate the reason the transaction was purged.

**Module:** DFHZIS2

AZRA

**Explanation:** DFHZARRC detected that the address of an FMH in the APPC was not in the receive buffer. The cause could either be a storage overwrite or a CICS internal logic error.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

**Module:** DFHZARRC

AZRB

**Explanation:** Module DFHZARR0 was called with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS logic error.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZARR

AZRF

**Explanation:** The DFHZUSR state machine has returned an invalid state error at a point where it should not be possible. This is a CICS internal logic error.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZARRF

AZRG

**Explanation:** The DFHZUSR state machine has returned an invalid state error at a point where it should not be possible. This is a CICS internal logic error.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZARR
AZRH

Explanation: The DFHZARR state variable RECEIVE_TYPE, used to control receive processing, has been set to an invalid value. The only other module that has access to this variable is DFHZARRF. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARR

AZRI

Explanation: One of the parameters passed to DFHZARR1 was invalid. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARR1

AZRJ

Explanation: The length of a record that DFHZARR0 has been requested to remove from the APPC receive buffer, is longer than the buffer itself. This problem could be caused either by a storage overwrite or by a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Module: DFHZARR0

AZRK

Explanation: The DFHLUC parameter list passed back from DFHZERH to DFHZARRF contained an invalid combination of LUCCIERR, LUCCIFRE, and LUCCIRBK fields. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARRF

AZRJ

Explanation: Module DFHZARR was called one of its own internal routines at the wrong time. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARR

AZRJ

Explanation: The DFHLUC parameter list passed back from DFHZERH to DFHZARRF did not have LUCCIERR set on. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARRF

AZRJ

Explanation: Module DFHZARER was called with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARER
**AZRP**

**Explanation:** Module DFHZARER detected an invalid response from DFHZNAC. This is a CICS internal logic error.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZARER

**AZRQ**

**Explanation:** Module DFHZARRA was called with an invalid parameter. This is a CICS internal logic error.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZARRA

**AZRR**

**Explanation:** Module DFHZARRA detected that the application buffer chained off of a TCTTE at offset TCTERCSA had a corrupted header. This is caused either by a CICS logic error or by a storage overwrite. The exception trace point that accompanies this abend code gives the TCTTE address.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

**Module:** DFHZARRA

**AZRS**

**Explanation:** Module DFHZARRA is unable to acquire main memory for a new application buffer into which it is supposed to copy some data. This is because the DFHLUC receive request is SUBTYPE=LLID, SET=YES and DFHZARRA does not know the length to acquire on the GETMAIN. DFHZARRA requires the length of the record currently being received, but it has been set to 0 in error. This is a CICS logic error. The exception trace point that accompanies this abend code gives the TCTTE address.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZARRA

**AZRT**

**Explanation:** Module DFHZARRA has detected that the application buffer, into which it is supposed to copy some data, is invalid. This is either because the address of the buffer is zero or because its length is less than that of the data to be copied into it. This is a CICS logic error. The exception trace point that accompanies this abend code gives the buffer address and length plus the data address and length.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZARRA

**AZRU**

**Explanation:** Module DFHZARRF detected an unexpected response from DFHZARR0. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZARRF

**AZRV**

**Explanation:** Module DFHZARR1 detected an unexpected response from DFHZARR0. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** One of the parameters passed to DFHZARR1

**AZRW**

**Explanation:** Module DFHZARRA detected a negative record length in the TCTTE (field TCTECLLC). This is caused either by a CICS logic error or by a storage overwrite. The exception trace point that accompanies this abend code gives the TCTTE address and the value of TCTECLLC.

**System Action:** The transaction is abnormally terminated with a CICS transaction dump.

**User Response:** If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

**Module:** DFHZARRA
AZRY

Explanation: Module DFHZARR detected an unexpected response from DFHZARRC. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARR

AZRZ

Explanation: Module DFHZARR detected an unexpected response from an internal subroutine. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARR

AZR2

Explanation: Module DFHZARRA is unable to acquire main memory for a new application buffer because the storage manager GETMAIN failed.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the trace to identify the failing return from the storage manager and analyze the reason for failure.

Module: DFHZARRA

AZR3

Explanation: During a GETMAIN request, the storage domain detected that the task has been purged.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the trace to investigate why the task was purged. Check if the master terminal operator was responsible.

Module: DFHZARRA

AZR4

Explanation: An unexpected response has been received from a dispatcher domain call.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZizzie

AZR5

Explanation: An unexpected response has been received from a dispatcher domain call.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARR1

AZR6

Explanation: An exception condition was raised as the result of a request from the APPC communications routine DFHZARL to the CICS recovery manager domain. This is either caused by a CICS logic error or by the inappropriate use of the indoubt test transaction, CIND. CIND should be activated only on the CICS system where the syncpoint processing was initiated. In particular, CIND should not be used on any of the CICS mirror transactions.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Determine whether CIND has been activated for a transaction that did not initiate the syncpoint processing. If CIND is not being used, you will need further assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZARRER

AZS0

Explanation: An invalid request was passed via the DFHZSTAM macro to the processing DFHZSTAP program. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZSTAP

AZS1

Explanation: No TCTTE pointer was passed via the DFHZSTAM macro to the processing DFHZ program. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZSTAP

AZS2

Explanation: The TCTTE passed via the DFHZSTAM macro to the processing DFHZSTAP program does not relate to an MRO or an APPC Conversation. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
AZS3
Module: DFHZSTAP
Explanation: The TCTTE passed via the DFHZSTAM macro to the processing DFHZSTAP program for an APPC Conversation, but the LUC Extension Control Block was not located. This is a CICS internal logic error.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZSTAP

AZS4
Explanation: While processing a DFHZSTAM request in DFHZSTAP, the DFHZUSRM LUC State Machine was found to have an invalid setting. This is a CICS internal logic error.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZSTAP

AZS5
Explanation: Whilst processing a DFHZSTAM request in DFHZSTAP, the Internal State number was found to have an invalid setting. This is a CICS internal logic error.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZSTAP

AZS6
Explanation: Whilst processing a DFHZSTAM request in DFHZSTAP, the Internal State number was found to have an invalid setting. This is a CICS internal logic error.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZSTAP

AZT
Explanation: The task does not own a terminal as its principal facility.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZTSP

AZTB
Explanation: An attempt to install or delete a remote terminal in this CICS system has failed. This abend can also occur if the CITS/CDTS/CMTS/CFTS transactions are not available (that is, if the transactions have not been installed).
System Action: DFHZTSP is abnormally terminated with a CICS transaction dump.
User Response: Verify that the listed transactions exist and have been installed. If they have, you need further assistance to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZTSP

AZTC
Explanation: An attempt to install or delete a remote terminal in this system has failed. This is because a short-on-storage (SOS) condition has caused the failure of a GETMAIN for the attach of CITS, CDTS, or CFTS.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: Investigate the reason for the SOS condition. See the CICS Problem Determination Guide for guidance on dealing with the SOS condition.
Retry the transaction later.
Module: DFHZTSP

AZTF
Explanation: DFHZTSP tried to GETMAIN or FREEMAIN a TCTTE whose length (TCTTETEL) is longer than the largest TCTTE SUBPOOL and is therefore invalid. This implies a storage violation or a CICS internal logic error.
System Action: The transaction is abnormally terminated with a CICS transaction dump.
User Response: Use the transaction dump to identify the TCTTE in error. First, check whether this is a storage overwrite. If so, check in your statistics to see if you are getting a number of storage violations caused by the same transaction. If this is the case, then a user-supplied application is probably causing the problem.
If it is not a storage violation problem, or if there is a random storage violation, there might be an error in CICS. In this case, you need further assistance to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZTSP

AZTG
Explanation: An attempt has been made to attach a task on a remotely-owned terminal without an intersystem TCTTE as its principal facility.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZTSP
AZTH

Explanation: An error response was received from the remote terminal control macro.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZTSP

AZTH

Explanation: An attempt has been made to attach a task on a remotely-owned terminal, but the terminal is not defined in this system as a remotely-owned terminal.
Alternatively, another task holds a lock on this terminal.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Check the terminal control table definitions in the systems involved. If the definitions are correct, check that no other tasks have locks held on the terminal (CECI, for example).
Module: DFHZTSP

AZTL

Explanation: An attempt has been made to attach a task to a remotely-owned terminal that cannot be used to run this transaction.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Inform the system programmer. Check the terminal control table definitions in the systems involved.
Module: DFHZTSP

AZTM

Explanation: The data received from the remote system does not contain an FMH (function management header).
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZTSP

AZTN

Explanation: Conversation with a remote system has been unexpectedly terminated.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZTSP

AZTO

Explanation: The TCTTE ownership chain is in error.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZTSP

AZTP

Explanation: A BMS TYPE=STORE request issued on behalf of a remote transaction failed.
System Action: The task abnormally terminates with a CICS transaction dump.
User Response: Inform the system programmer. Check that the required BMS support has been generated.
Module: DFHZTSP

AZTQ

Explanation: Invalid BMS data received from remote system.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Module: DFHZTSP

AZTR

Explanation: A BMS TYPE=PAGEOUT request issued on behalf of a remote system failed.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Ensure that the required BMS support has been generated.
Module: DFHZTSP

AZTS

Explanation: An attempt to ship data to a remote system failed.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Investigate why the conversations with the remote system failed. The transaction on the remote system has probably been abnormally terminated or the session has failed.
Module: DFHZTSP

AZTT

Explanation: An attempt was made to attach a task on a remote system, but the connection with the remote system is not an APPC or MRO connection.
System Action: The task is abnormally terminated with a CICS transaction dump.
User Response: Redefine the connection as APPC or MRO, or avoid using transaction routing on this connection.
Module: DFHZTSP
AZTU

**Explanation:** The task does not own the link TCTTE after a sync point has been taken.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZTSP

AZTV

**Explanation:** An invalid function management header (FMH) has been received from the remote system.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZTSP

AZTW

**Explanation:** An attempt was made to attach a task on a remotely-owned terminal that was already running a task.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Check the terminal control table definitions in the systems involved.

**Module:** DFHZTSP

AZTY

**Explanation:** A session TCT entry for a remotely owned APPC terminal or connection could not be created because to do so would exceed the maximum number of APPC sessions permitted.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Inform the system programmer. Either wait for the system to become less busy, or delete some APPC sessions.

**Module:** DFHZTSP

AZTZ

**Explanation:** The CICS relay program DFHCRT has been attached in an unsupported manner.

**System Action:** CICS abnormally terminates the transaction with a transaction dump.

**User Response:** The conversation with the routing system should be an MRO session or an LU type 6.2 conversation. Ensure that the transaction is being attached by the CICS relay program in the connected system and not by a user program.

If the transaction is being attached by the CICS relay program in the connected system, you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZTSP

AZT1

**Explanation:** The task has been attached improperly in the application-owning region when transaction routing.

**System Action:** CICS abnormally terminates the transaction with a transaction dump.

**User Response:** The conversation with the routing system should be an MRO session or an LU type 6.2 conversation. Ensure that the transaction is being attached by the CICS relay program in the connected system and not by a user program.

If the transaction is being attached by the CICS relay program in the connected system, you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZTSP

AZT3

**Explanation:** The task is being routed back to the region from where it came.

**System Action:** CICS abnormally terminates the transaction with a transaction dump.

**User Response:** Correct the transaction definition.

**Module:** DFHZTSP

AZT6

**Explanation:** The task in the application-owning region has received a ROLLBACK request from the terminal-owning region, but the conversation is continuing. The terminal-owning region has violated the transaction routing protocol.

**System Action:** CICS abnormally terminates the transaction with a transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZTSP

AZT7

**Explanation:** A session terminal control table (TCT) entry for a remotely owned APPC terminal or connection could not be added to the TCT.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZTSP

AZT8

**Explanation:** A session terminal control table (TCT) entry for a remotely owned APPC terminal or connection could not be deleted from the TCT.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZTSP
AZT9

**Explanation:** A session terminal control table (TCT) entry for a remotely owned APPC terminal or connection could not be deleted from the TCT because it is locked by another task.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** The other task may be transitory in nature, and if so, another attempt will succeed.

**Module:** DFHZTSP

AZVA

**Explanation:** DFHZTSP has timed out waiting for service transaction CITS to complete during the creation of a remote terminal while attaching a task in the application-owning region.

The probable cause of this is that the application-owning region is very busy, so the CITS transaction has been waiting to be dispatched for longer than the timeout value allowed by DFHZTSP. Lack of storage on the target system is one possible reason why CITS has not been dispatched, or has been dispatched but has not completed.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Retry the transaction when the system becomes less busy. For more information on improving transaction throughput on the target system, see the *CICS Performance Guide*.

**Module:** DFHZATS

AZVB

**Explanation:** DFHZCQ has failed to create the remote terminal definition. A previous message or messages should indicate the reason for the failure.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** See the previous message or messages for further guidance.

**Module:** DFHZATS

AZVC

**Explanation:** An unexpected error has occurred in DFHZATS. This is probably caused by DFHZATS being unable to address the CSA, EIB or the TCA. It can also occur if DFHZATS is called with an EXEC CICS START command for transactions CITS, CFTS, CMTS or CDTS. These are internal CICS transactions and should not be called in this way.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZATS

AZVD

**Explanation:** An unexpected error has occurred in the install procedure of DFHZATS.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** This is a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZATS

AZVE

**Explanation:** DFHZATS is trying to install a remote terminal with the same terminal id as an existing TCT entry.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Change the terminal names to ensure that a duplicate does not occur in the same system.

**Module:** DFHZATS

AZVF

**Explanation:** One of the remote install or delete transactions of DFHZATS (CITS, CFTS, CMTS or CDTS) has been started directly from a terminal. This is not permitted. These transactions can only be started internally by CICS.

**System Action:** The transaction is abnormally terminated with a transaction dump.

**User Response:** None.

**Module:** DFHZATS

AZVG

**Explanation:** An error has occurred in the remote delete routines.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZATS

AZVH

**Explanation:** An error has occurred in the remote delete routine during the mass deletion of remote terminals.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHZATS
### AZVI

**Explanation:** An error has occurred in the remote delete routine while an attempt was being made to delete a single remote terminal.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Check the CADL transient data queue for any associated messages indicating the reason for the error. If you cannot resolve the problem, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZATS

### AZVJ

**Explanation:** An error has occurred during the mass deletion of remote terminals. This is caused by a CICS logic error.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZATS

### AZVK

**Explanation:** An unexpected return code has been received from the remote delete routine during the deletion of a single remote terminal.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Look for an accompanying DFHZC6911 message indicating the reason for the delete failure, and take appropriate action.

**Module:** DFHZATS

### AZVL

**Explanation:** An error has occurred during the mass flagging of remote terminals for deletion.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZATS

### AZVM

**Explanation:** An error has occurred in DFHZATMF. This is probably caused by DFHZATMF being unable to address the CSA, EIB, or the TCA.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZATMF

### AZVN

**Explanation:** The remote delete flag transaction of DFHZATMF (CRMF) has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

**System Action:** The transaction is abnormally terminated with a transaction dump.

**User Response:** None.

**Module:** DFHZATMF

### AZVO

**Explanation:** The remote delete transaction of DFHZATMD (CRMD) has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

**System Action:** The transaction is abnormally terminated with a transaction dump.

**User Response:** None.

**Module:** DFHZATMD

### AZVP

**Explanation:** An error has occurred in DFHZATMD. This is probably caused by DFHZATMD being unable to address the CSA, EIB, or the TCA.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHZATMD

### AZVQ

**Explanation:** A request to install a shipped terminal definition has been rejected by the autoinstall user program.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Retry the transaction when the system is less busy.

**Module:** DFHZATS

### AZVR

**Explanation:** An attempt to install a shipped terminal definition has failed because the autoinstall user program has issued an unexpected return code.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Examine the autoinstall user program to determine why this return code was issued.

**Module:** DFHZATS

### AZVS

**Explanation:** An attempt to install a shipped terminal definition has failed because an error has occurred in the autoinstall user program.

**System Action:** The task is abnormally terminated with a CICS transaction dump.

**User Response:** Examine the autoinstall user program to determine the reason for the failure.
Module: DFHZATS

Explanation: DFHZATS was attempting to autoinstall a shipped terminal, a virtual terminal or a shipped connection and the autoinstall URM was called. However the autoinstall failed for one of the following reasons:

- The name returned by the URM in SELECTED_SHIPPED_TERMID started with one of these characters:
  
  `<`
  
  `>`
  
  `-`

- The value in the SIT VTPREFIX parameter contained imbedded blanks or a character that is not allowed for terminal names.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: DFHZATS

AZXA

Explanation: An unexpected error, with reason code 5, has been detected in the catchup program, DFHZXCU. See the description of message DFHXG6492 for further details.

System Action: Console message DFHXG6492 is issued, and CICS continues after abending the transaction.

User Response: Refer to message DFHXG6492.

Module: DFHZXCU

AZXB

Explanation: An unexpected error, with reason code 4, has been detected in the catchup program, DFHZXCU. See the description of message DFHXG6492 for further details.

System Action: Console message DFHXG6492 is issued, and CICS continues after abending the transaction.

User Response: Refer to message DFHXG6492.

Module: DFHZXCU

System dump codes

Whenever a CICS system dump is requested, CICS references a system dump code that corresponds to the event that caused the dump request to be made. This is done in order to see what further action should be taken. More information about this can be found in the CICS Problem Determination Guide.

In most cases, system dump codes correspond to a DFH message with the DFH tag stripped off. For example, system dump code DM0001 corresponds to message DFHD0M0001 with the DFH tag removed. For further information, look up the relevant message where appropriate.

However, there are some exceptions to this format, as shown in the following list.

### System dump code | Corresponding message or exception condition
---|---
ABNDU603 | This system dump code refers to a USER abend code and is associated with message DFHSR6003.
ABNDU605 | This system dump code refers to a USER abend code and is associated with message DFHSR6005.
APTRAPPC | This system dump code is associated with message DFHTR1001.
APTRAPUS | This system dump code is associated with message DFHTR1000.
APUSER | This system dump code is issued through the use of the CEBT transaction when performing a PERFORM SNAP command.
APXRFTO | This system dump code has no DFH message associated with it. An error in the currently active CICS system has occurred. An alternate CICS system is now taking control and is requesting that the active CICS system produces a dump of itself.
MT0001 | This system dump code has no DFH message associated with it. It indicates that a dump was requested by a user of CEMT, issuing either a PERFORM SNAP or a PERFORM DUMP.

DHxx (IMS/ESA) abend codes

If the IMS high-level programming interface (HLPI) has found a condition caused by a programming error, or if DL/I has returned a status code to HLPI which indicates an error, IMS/ESA returns a status code xx to CICS Transaction Server for OS/390. These codes are described in the IMS/ESA Application Programming: EXEC DLI Commands manual.

DHTA

Explanation: A task has issued a program specification block (PSB) schedule request but the PSB could not be found. See the description of the DL/I status code TA in the IMS/ESA Application Programming: EXEC DLI Commands manual for guidance.

DHTC

Explanation: A task has issued a program specification block (PSB) schedule request but the PSB has already been scheduled. See the description of the DL/I status code TC in the IMS/ESA Application Programming: EXEC DLI Commands manual for guidance.

DHTE

Explanation: A task has issued a program specification block (PSB) schedule request but a PSB initialization error occurred. See the description of the DL/I status code TE in the IMS/ESA Application Programming: EXEC DLI Commands manual for guidance.
**Explanation:** A task has issued a terminate request but the request failed because the program specification block (PSB) is not scheduled.

See the description of the DL/I status code TG in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

**DHTH**

**Explanation:** A task has issued a DL/I request but the request failed because the program specification block (PSB) is not scheduled.

See the description of the DL/I status code TH in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

**DHTJ**

**Explanation:** A task has issued a program specification block (PSB) schedule request but the request failed because CICS is not connected to DBCTL.

See the description of the DL/I status code TJ in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

**DHTQ**

**Explanation:** A task has issued a program specification block (PSB) schedule request but the request failed.

See the description of the DL/I status code TQ in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

---

**01xx (translator) abend codes**

**0100**  **LISTING FILE CANNOT BE OPENED**

**Explanation:** The listing data set has not opened successfully.

**System Action:** The CICS command level translator terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

**User Response:** Ensure correct JCL or determine what is causing the open error.

**Modules:** DFHEAP (for assembler language), DFHECP (for COBOL), DFHEDP (for C), DFHEPP (for PL/I)

**0101**  **UNRECOVERABLE TRANSLATOR ERROR**

**Explanation:** The translator encountered a program check from which it could not recover.

**System Action:** The CICS command-level translator terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHEAP (for assembler language), DFHECP (for COBOL), DFHEDP (for C), DFHEPP (for PL/I)

**02xx (DFHPD520) abend codes**

**0211**  **RECURSIVE PROGRAM CHECK**

**Explanation:** A program check has occurred while the system dump formatting program was handling an earlier program check.

**System Action:** The system dump formatting program terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

**User Response:** The program check preceding the abend is accompanied by message DFHPD0123. See the description of this message for more guidance.

**Module:** DFHPD520

**0212**  **TOO MANY PROGRAM CHECKS**

**Explanation:** A sixth program check has occurred during execution of the system dump formatting program.

**System Action:** The system dump formatting program terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

**User Response:** This abend is preceded by five DFHPD0123 messages, one for each of the five earlier program checks. See the description of this message for more guidance.

**Module:** DFHPD520

**03xx (DFHCSDUP) abend codes**
**0300**

**Explanation:** The SYSIN data set has not opened successfully.

**System Action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

**User Response:** Ensure that the JCL is correct and that the SYSIN data set exists in sequential form. If necessary, examine the SYSIN DD statement to determine the cause of the error.

**Module:** DFHCSDUP

---

**0301**

**Explanation:** The RECFM parameter specified in the SYSIN data set is invalid.

**System Action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

**User Response:** Ensure that the RECFM parameter in the SYSIN data set is either F or V.

**Module:** DFHCSDUP

---

**0302**

**Explanation:** The record length specified in the SYSIN data set is invalid.

**System Action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

**User Response:** Ensure that the record length specified in the SYSIN data set is no greater than 80.

**Module:** DFHCSDUP

---

**0303**

**Explanation:** The SYSPRINT data set did not open successfully.

**System Action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

**User Response:** Ensure that the SYSPRINT data set exists. If necessary, examine the SYSPRINT DD statement to determine the cause of the error.

**Module:** DFHCSDUP

---

**0304**

**Explanation:** DFHCSDUP has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

**System Action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

**User Response:** Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies. Take action corresponding to the reason you have established as follows:

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCSDUP

---

**0305**

**Explanation:** An unexpected return code was received either while trying to close the alternate SYSIN and SYSPRINT DCBs (CLOSEDCB) or while trying to free the task local storage (FREETLS).

**System Action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCSDUP

---

**0307**

**Explanation:** An attempt to print the input command failed. Since messages cannot be issued, the utility must terminate.

**System Action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCSDUP

---

**0308**

**Explanation:** During the migration of a TCT table, a bad command sequence was found. This can occur for one of the following reasons:

- TYPETERM was not preceded by TERMINAL
- TERMINAL was not followed by TYPETERM

**System Action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

**User Response:** Correct the TCT table to be migrated and rerun the job.

**Module:** DFHCSDUP

---
**Explanation:** DFHCSDUP has found an unrecognized function code in a command. This is a CICS internal logic error.

**System Action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCSDUP

---

**Explanation:** An internal error has occurred in module DFHCSDUP when invoked by a CSD utility command.

**System Action:** Message DFH5100 is issued and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCSDUP

---

**Explanation:** While processing a MIGRATE command, the specified table to be migrated could not be loaded.

**System Action:** Message DFH5601 is issued and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCSDUP

---

**Explanation:** While processing a command, VSAM detected an error.

**System Action:** Message DFH5179 is issued preceded by either DFH5177 or DFH5178 depending on the error and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

**User Response:** See the description of the issued messages to determine the cause of the error.

**Module:** DFHCSDUP

---

**Explanation:** When the LIST command invoked DFHDMP to scan the objects on the CSD file, an error occurred during execution of the DFHDMP function.

**System Action:** Message DFH5180 is issued and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Module:** DFHCSDUP
Chapter 3. Transaction abend codes

**0331**

**Explanation:** DFHCSDUP was invoked to perform an EXTRACT command using a Language Environment-conforming HLL user exit, but the utility failed to initialize the CEE environment successfully.

**System Action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP statement is provided, a system dump is produced. Register 15 contains the initialization return code.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCSDUP

**0332**

**Explanation:** DFHCSDUP was invoked to perform an EXTRACT command using a Language Environment-conforming HLL user exit, but during execution the utility received a bad return code from the Language Environment.

**System Action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP statement is provided, a system dump is produced. Register 15 contains the Language Environment return code.

**User Response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Module:** DFHCSDUP

**0401**

**Explanation:** An external CICS interface (EXCI) request was issued using the CALL API or the EXEC API, and the EXCI stub DFHXCSTB link-edited with the application detected that it was running in AMODE 24. The external CICS interface only supports calls made in AMODE 31.

**System Action:** The application terminates abnormally.

**User Response:** Change the application so that EXCI calls are made in AMODE 31, or relink-edit the application AMODE 31.

**Module:** DFHXCSTB.

**0402**

**Explanation:** The external CICS interface module DFHXCPRH issued an MVS ESTAE macro to establish a recovery environment, but a nonzero return code was returned from MVS.

**System Action:** The application terminates abnormally with a dump.

**User Response:** Examine the dump and any associated MVS messages produced to determine why the MVS ESTAE request failed.

If the error occurred while processing an INITIALIZE_USER request on behalf of the application, an attempt to format the dump using the CICS IPCS dump formatter does not produce any formatted output. This is because the error occurred too early in EXCI initialization for there to be any control blocks.

**Module:** DFHXCPRH

**0403**

**Explanation:** The external CICS interface module DFHXCPRH issued an MVS GETMAIN request to obtain storage for its XCGLOBAL block, but a nonzero return code was returned from MVS.

**System Action:** Module DFHXCPRH issues an MVS abend with abend code 0403 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(XCGLOBAL_GETMAIN_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(602).

**User Response:** Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

**Module:** DFHXCPRH

**0404**

**Explanation:** The external CICS interface module DFHXCPRH needed to take an MVS SDUMP for an earlier reported problem. However, the error has occurred too early in EXCI initialization for EXCI dump services to be available.

**System Action:** Module DFHXCPRH issues an MVS abend with abend code 0404 which invokes its ESTAE routine from which a SYSMDUMP is taken instead of an SDUMP to capture the earlier reported problem.

**User Response:** Examine the SYSMDUMP to determine the cause of the earlier reported problem.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

**Module:** DFHXCPRH

**0405**

**Explanation:** The external CICS interface module DFHXCPRH issued an IEFSSREQ SSI verify request to MVS to determine the number of the CICS SVC type 3 SVC to use. The SSI VERIFY request failed.

**System Action:** Module DFHXCPRH issues an MVS abend with abend code 0405 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(SSI_VERIFY_FAILED) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the SSI verify failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(606).

**User Response:** Use the MVS R15 return code obtained from the application or from the dump to determine why the SSI VERIFY request failed.
An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

**Module:** DFHXCPRH

0406

**Explanation:** The external CICS interface module DFHXCPRH called the CICS SVC to initialize the EXCI environment. The CICS SVC call failed.

**System Action:** Module DFHXCPRH issues an MVS abend with abend code 0406 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(CICS_SVC_CALL_FAILURE) in its return area. The subreason1 field of the return area contains the R15 return code from the CICS SVC indicating why it failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(607).

**User Response:** Use the MVS R15 return code obtained from the application or from the dump to determine why the CICS SVC call failed.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

**Module:** DFHXCPRH

0407

**Explanation:** The external CICS interface module DFHXCPRH issued a call to the CICS SVC to check whether the SVC in use is at the correct level to be used with the external CICS interface. The check failed indicating that the CICS SVC is not at the correct level.

**System Action:** Message DFHEX0100 is output, and module DFHXCPRH issues an MVS abend with abend code 0407 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(INCORRECT_SVC_LEVEL) in its return area. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(627).

**User Response:** See the explanation of message DFHEX0100 for guidance.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

**Module:** DFHXCPRH

0408

**Explanation:** The external CICS interface module DFHXCPRH issued an MVS GETMAIN request for its working storage but a nonzero return code was returned from MVS.

**System Action:** Module DFHXCPRH issues an MVS abend with abend code 0408 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR)

**User Response:** Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application. An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

**Module:** DFHXCPRH

0409

**Explanation:** The external CICS interface module DFHXCPRH issued an MVS GETMAIN request for storage required for its SSI VERIFY request, but a nonzero return code was returned from MVS.

**System Action:** Module DFHXCPRH issues an MVS abend with abend code 0409 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(VERIFY_BLOCK_GM_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(605).

**User Response:** Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application. An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

**Module:** DFHXCPRH

0410

**Explanation:** The external CICS interface module DFHXCPRH issued an MVS GETMAIN request for an XCUSER block but a nonzero return code was returned from MVS.

**System Action:** Module DFHXCPRH issues an MVS abend with abend code 0410 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(XCUSER_GETMAIN_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(603).

**User Response:** Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application.

**Module:** DFHXCPRH
Chapter 3. Transaction abend codes

0411
Explanation: The external CICS interface dump module DFHXCDMP was attempting to call the CICS SVC in order for an MVS SDUMP to be taken to capture an earlier problem. DFHXCDMP was unable to call the SVC as no SVC number was available. DFHXCDMP issued an 0411 abend in order that the callers ESTAE routine is invoked which takes a SYSMDUMP instead.

System Action: A SYSMDUMP is taken instead of an SDUMP for an earlier reported problem.

User Response: Use the SYSMDUMP produced to diagnose the earlier reported problem.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCDMP

0412
Explanation: The external CICS interface dump module DFHXCEIP was processing an EXCI EXEC API request and detected that the EXEC parameter list passed to it contained a function that is not supported by the external CICS interface.

System Action: The application is abnormally terminated with a dump.

User Response: This error indicates the parameter list being passed to the EXCI has not been generated by the CICS translator. The translator should always be used. Correct the application to specify the correct EXCI EXEC API command.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job if this was the first EXCI request for this TCB.

Module: DFHXCEIP

0413
Explanation: The external CICS interface dump module DFHXCEIP was processing an EXCI EXEC API request and detected that the EXEC parameter list passed to it did not require the mandatory RETCODE parameter in which return codes are returned to the application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job if this was the first EXCI request for this TCB.

System Action: The application is abnormally terminated with a dump.

User Response: This error indicates the parameter list being passed to the EXCI has not been generated by the CICS translator. The translator should always be used. Correct the application to specify RETCODE.

Module: DFHXCEIP

0414
Explanation: The external CICS interface module DFHXCEIP issued an MVS ESTAE macro to establish a recovery environment but a nonzero return code was returned from MVS.

System Action: The application terminates abnormally with a dump.

User Response: Examine the dump and any associated MVS messages to determine why the MVS ESTAE request failed.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job if this was the first EXCI request for this TCB.

Module: DFHXCEIP

0415
Explanation: The external CICS interface module DFHXCEIP detected an error early in EXCI initialization before EXCI dump services were available. DFHXCEIP issues abend 0415 so that its ESTAE routine is invoked from where an SYSMDUMP is taken instead to capture the error.

System Action: The application terminates abnormally with a dump.

User Response: Examine the SYSMDUMP to determine the cause of the earlier reported error.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCEIP

05xx CICS JVM Interface abend codes

0501
Explanation: A JCICS Java Class method was invoked from a Java application running under control of a JVM and executing on a thread other than the initial process thread (IPT). JCICS requests can only be issued when executing under the initial process thread.

System Action: The thread is abended with a MVS 0501 user abend code causing the initial process thread to be abnormally terminated. Language environment recovery processing is driven causing a 4xxx abend to be issued under the J8 TCB on which the JVM is running. CICS recovery processing terminates the JVM and abnormally terminates the transaction with an ASRB abend code.

User Response: Change the application so that JCICS requests are issued when running under the initial process thread.

Modules: DFHCALLA, DFHMSGIF, DFHTRCIF

0555
Explanation: A program check occurred, or an operating system or CICS abend was issued within the CICS JVM interface. CICS recovery processing issues an MVS 555 user abend in order to drive the language environment ESTAE routine, which is still active, as part of its cleanup and termination of the CICS task.

System Action: The 555 abend code drives language environment recovery processing. The JVM is terminated and the CICS task is abnormally terminated with the abend code that first initiated CICS recovery processing.

User Response: None. The 555 abend is an internal mechanism to ensure that CICS and Language environment recovery facilities correctly terminate the CICS task and the JVM environment.

Module: DFHAPLJ
1xxx - 9xxx (COBOL II) abend codes

Abend codes with 1 through 9 as the first character are issued by COBOL II applications running on CICS. The last three digits of the abend code, xxx, correspond to the digits xxx in the associated COBOL II run-time message, IGZxxxI. For example, if you receive an abend code of 1001, the associated run-time message is IGZ001I.

COBOL II run-time messages are described in VS COBOL II Application Programming Debugging.

4xxx LE/370 abend codes

Abend codes in the range 4000 to 4095 are issued by LE/370 runtime library modules for LE enabled applications running on CICS.

When LE/370 detects an unrecoverable error, LE/370 terminates the transaction with an EXEC CICS abend with an abend code numbered from 4000-4095. A write-to-operator (WTO) is performed to write a CEE1000S message to the system console. This message contains the abend code and the reason code associated with the abend.

Some of these abends can occur when the system is under stress and LE/370 is unable to acquire the resources required to report a previous abend or failure. In this case there will usually be other symptoms that the system is under stress (for example short on storage messages or other transactions being purged with AEXY or AKC3 abends), and inspection of the transaction dump should allow identification of the original abend.

LE/370 abend codes and run-time messages are described in IBM Language Environment for MVS and VM Debugging Guide and Run-Time Messages.
Chapter 4. Transaction Dump Codes

A transaction dump is normally taken as a result of one of two events:

- When an application abends, or issues an EXEC CICS ABEND request.
  
  In this case, the dump code is the same as the transaction abend code.

- When either CICS or an application issues an EXEC CICS DUMP TRANSACTION request.
  
  In this case, the dump code is the value specified in the DUMPCODE operand of the request.

CICS-requested Transaction Dump Codes

AUTO

Explanation: The IBM-supplied sample PL/I terminal autoinstall program DFHZPTDX issues an EXEC CICS DUMP TRANSACTION request with this dump code if the autoinstall program is called with an unexpected request.

System Action: DFHZPTDX is ended.

User Response: Check and correct the request made to the sample autoinstall program.

Module: DFHZPTDX

CSXP

Explanation: The CEDF transaction has abended.

System Action: CEDF captures diagnostic information which may be used by IBM.

User Response: Check for a previous message which will indicate which abend caused CEDF to end abnormally. Investigate this abend.

See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Module: CEDF

ERRS

Explanation: A CICS sample program has encountered an error and issued an EXEC CICS DUMP TRANSACTION request.

System Action: The sample program terminates abnormally.

User Response: Check and correct the source of the sample program which issued the DUMP TRANSACTION request.

Module: DFH$AAL, DFH$ABRW, DFH$ACOM, DFH$AREN, DFH$DALL, DFH$DBRW, DFH$DCOM, DFH$DREN, DFH$PALL, DFH$PBRW, DFH$PCOM, DFH$PREN, DFH0CALL, DFH0CBRW, DFH0CCOM, DFH0CREN

LDIN

Explanation: See dump code CSXP.

PAGE

Explanation: See dump code CSXP.

RMIN

Explanation: See dump code CSXP.
Appendix. Summary of changes

This appendix lists messages and abends changed between CICS Transaction Server for OS/390 Release 3 and CICS Transaction Server for OS/390 Release 2.

New abends

The following abends have been added:

Sending your comments to IBM

CICS® Transaction Server for OS/390®

CICS Messages and Codes

GC33-1694-02

If you want to send to IBM any comments you have about this book, please use one of the methods listed below. Feel free to comment on anything you regard as a specific error or omission in the subject matter, and on the clarity, organization or completeness of the book itself.

To request additional publications, or to ask questions or make comments about the functions of IBM products or systems, you should talk to your IBM representative or to your IBM authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate, without incurring any obligation to you.

You can send your comments to IBM in any of the following ways:

- **By mail:**
  - IBM UK Laboratories
  - Information Development
  - Mail Point 095
  - Hursley Park
  - Winchester, SO21 2JN
  - England

- **By fax:**
  - From outside the U.K., after your international access code use 44 1962 870229
  - From within the U.K., use 01962 870229

- **Electronically, use the appropriate network ID:**
  - IBM Mail Exchange: GBIBM2Q9 at IBMMAIL
  - IBMLink: HURSLEY(IDRCF)
  - Email: idrcf@hursley.ibm.com

Whichever method you use, ensure that you include:

- The publication number and title
- The page number or topic to which your comment applies
- Your name and address/telephone number/fax number/network ID.
