Messages and Codes
Messages and Codes
Before using this information and the product it supports, be sure to read the general information under "Notices" on page 1391.

First Edition (March 2004)

This edition applies to Version 8 of IBM DB2 Universal Database for z/OS (DB2 UDB for z/OS), product number 5625-DB2, and to any subsequent releases until otherwise indicated in new editions. Make sure you are using the correct edition for the level of the product.

Specific changes are indicated by a vertical bar to the left of a change. A vertical bar to the left of a figure caption indicates that the figure has changed. Editorial changes that have no technical significance are not noted.

Chapter 1. Introduction to this book and the DB2 library

This chapter contains specific information about this book and a general overview of the DB2 library.

Throughout this book, “DB2” means the program product DB2 Universal Database for z/OS (DB2 UDB for z/OS). Other DB2 products are given their complete names or abbreviations.

**Important**
In this version of DB2 UDB for z/OS, the DB2 Utilities Suite is available as an optional product. You must separately order and purchase a license to such utilities, and discussion of those utility functions in this publication is not intended to otherwise imply that you have a license to them. See Part 1 of DB2 Utility Guide and Reference for packaging details.

Who should read this book

This book, DB2 Universal Database for z/OS Messages and Codes, lists messages and codes issued by DB2, with explanations and suggested responses. This book is intended for users and system programmers who might encounter DB2 messages and codes.

How to use this book

This book consists of the following six sections and five appendixes:

- **Part 1, “Introduction,” on page 1** explains the different types of messages and codes that DB2 generates.
- **Part 2, “SQL return codes,” on page 11** lists the SQL return codes.
- **Part 3, “DB2 messages,” on page 155** lists the various DB2 messages.
- **Part 4, “Section 4. DB2 Codes,” on page 771** lists the various DB2 codes.
- **Part 5, “IRLM messages and codes,” on page 1303** lists the various IRLM messages and codes.
- **Part 6, “SNA codes,” on page 1337** lists the SNA codes.
- **Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347** explains the CICS transaction abend/dump code (DSNC).
- **Appendix B, “Problem determination,” on page 1349** lists the diagnostic items and resource types you can use to resolve problems.
- **Appendix C, “SQLSTATE Values—Common Error Codes,” on page 1359** lists the error code SQLSTATE values. These values provide common return codes for common error conditions.
- **Appendix D, “New, Changed, and Deleted Messages and Codes,” on page 1379** lists the new, changed, and deleted messages and codes.
- **“Notices” on page 1391** lists contact information and legal notices about this product.

The introduction provides general information about DB2 messages and codes. You will be referred to it from appropriate places in the manual. However, it is recommended that you become familiar with this material ahead of time.
The SQL return codes are listed by numeric sequence. The DB2 messages are listed in order of their subcomponent identifier and further by their numeric identifier. The codes are listed by their hexadecimal ID and further by their numeric identifier. The IRLM messages and codes are listed by numeric sequence.

Message identifiers and CSECT names are used to identify messages. Unless the message is issued by a subcomponent operating outside the DB2 environment (such as the precompiler or attachment facilities), messages are preceded by a subsystem recognition character that is defined during system installation. The subsystem recognition character is not shown in the message texts in this book.

All DB2 message identifiers are eight to ten characters long. The first three characters are always DSN: it is the DB2 component prefix name. The fourth character is the subcomponent identifier: it identifies the subcomponent of DB2 that issued the message. Each subcomponent has an associated hexadecimal identifier (hex ID): it is the hexadecimal representation of the subcomponent identifier. The numeric identifier is three to five characters long and begins at the fifth character in the message. The numeric identifier is unique within the subcomponent. The last character of the message identifier is the message type code. For DB2 messages in general, the I type code is used. However, some older messages use other type codes. The type code does not necessarily reflect the action that you should take to remedy the situation. See the Response sections for a message to determine the required actions associated with that message. An optional field that can be found after the message number is the subsystem identifier or subsystem recognition character. An additional optional field follows the subsystem identifier: it is the CSECT name. Message identifiers and CSECT names have the following format:

```
DSNB209I ! DSNB1CHK
```

where:

- **DSN** is the DB2 subsystem prefix name.
- **B** is the subcomponent identifier; in this example B identifies the DB2 buffer manager and the hexadecimal ID for this subcomponent is X'C2'.
- **209** is the numeric identifier.
- **I** indicates that this message is for information only.
- **!** is the subsystem recognition character; it is an optional field.
- **DSNB1CHK** is the csect name; it is an optional field.

The DB2 reason codes and subsystem termination reason codes are 4 bytes long. The first byte is always 00: it is the high-order byte. The second byte is the hexadecimal identifier (hex ID): it identifies the DB2 subcomponent. The last 2 bytes are the numeric identifier: it is unique within the subcomponent. The codes have the following format:

```
00E50041
```

where:

- **00** is the high-order byte.
- **E5** is the hexadecimal identifier; it identifies the DB2 agent services manager.
- **0041** is the numeric identifier.

Accompanying each message and code is the following information, when applicable:
**Explanation:** This section tells what the message or code means, why it occurred, and what caused it. To assist in diagnosing problems, the CSECTs that issued the message are also included. However, if the issuing CSECT is placed in the message text at run time, it is not included in the explanation.

**System Action:** This part tells what is happening as a result of the condition causing the message or code. If this information is not shown, no system action is taken.

**User Response:** If a response by the user is necessary, this section tells what the pertinent responses are and their effect. If this information is not shown, no user response is required.

**Operator Response:** If an operator response is necessary, this section tells what the pertinent responses are and their effect. If this information is not shown, no operator response is required.

**System Programmer Response:** If a response by the system programmer is needed, this part tells what the pertinent responses are and their effect. If this information is not shown, no system programmer response is required.

**Programmer Response:** If a programmer response is necessary, this part tells what the pertinent responses are and their effect. If this information is not shown, no programmer response is required.

**Problem Determination:** This section lists the actions that can be performed to obtain adequate data for support personnel to diagnose the problem. If this information is not shown, no problem determination is required.

**Message type codes**

The last character of a message identifier is the type code. Four type codes are used, as shown in the following list:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Immediate action</td>
</tr>
<tr>
<td>D</td>
<td>Immediate decision</td>
</tr>
<tr>
<td>E</td>
<td>Eventual action</td>
</tr>
<tr>
<td>I</td>
<td>Information only</td>
</tr>
</tbody>
</table>

**DB2 message severity codes**

Messages issued by the precompiler subcomponent of DB2, as well as some messages issued by the service controller and utility subcomponents of DB2, provide severity codes. The specific meanings of the severity codes differ slightly for each of the subcomponents. In general, the higher the severity level, the more significant the situation.

Severity codes for these subcomponents are described at the beginning of the individual subcomponent sections in Part 3, “DB2 messages,” on page 155. They are also included in the individual messages, where appropriate.

**DB2 abend completion codes (X'04E' and X'04F)**

DB2 uses two system abend completion codes: X'04E' and X'04F'.

- X'04E' and X'04F' identify:
  - Internal errors encountered during DB2 operation
  - Diagnostic information for problem determination
• Subsystem actions initiated by the DB2 subcomponent involved in the error

**X'04E'**

An X'04E' abend completion code indicates that DB2 detected an internal error and abended a DB2 internal task (TCB) or a user-connected task. Errors associated with an X'04E' abend completion code might be preceded by an MVS system code or by internal errors.

The diagnostic material generated by the X'04E' abend must be examined to determine the source of the error that actually resulted in a subsequent task or subsystem termination.

**X'04F'**

An X'04F' abend completion code indicates that DB2 detected a severe error and abended the entire DB2 subsystem. When an X'04F' is issued, DB2 determined that continued operation could result in the loss of data integrity. Errors associated with an X'04F' abend completion code might be preceded by an MVS system error or by one or more DB2 X'04E' abend completion codes.

| Table 1 summarizes the diagnostic information and subsystem actions available to DB2 when these abend completion codes are issued. Some pieces of this information are not relevant to some error situations and will not help in problem diagnosis. In these cases, DB2 does not produce any diagnostic information that is unnecessary. The information that DB2 produces for a given error depends upon the specific problem. The MVS services that provide diagnostic information are discussed in “DB2 diagnostic information” on page 7 |

DB2 diagnostic information

DB2's functional recovery routines use MVS services to provide diagnostic information for assistance in problem determination.

The following MVS services provide diagnostic information:

- SVC dumps
  The DB2 abend completion code X'04E' uses the MVS SDUMP service to create SVC dumps. The content and storage areas associated with these dumps vary depending on the specific error and the state of the DB2 subsystem at the time the error.
- SYS1.LOGREC entries
  Entries are requested in the SYS1.LOGREC data set at the time of the error using the MVS SETRP service. The following are also recorded in SYS1.LOGREC:
  - Subsystem abnormal terminations
  - Secondary abends occurring in a recovery routine
  - Recording requests from recovery routines percolated to by the recovery termination manager.
- Variable recording area (VRA) data
  Data entries are added to the VRA of the SDWA by using an MVS VRA defined key. VRA data includes a series of diagnostic data entries common to both DB2 abend completion codes. Additional information is provided by the invoking subcomponent recovery routine during initial error processing or recovery termination manager percolation.

MVS abends resulting from DB2 operation

During DB2 operation, an abend can occur with an MVS system completion code. If you receive an MVS abend during DB2 operation, refer to the appropriate MVS publication.

Using LookAt to obtain message explanations

LookAt is an online facility that displays explanations for most messages that you encounter, and for some system abends and codes.

You can use LookAt:

- From the Internet at:
  www.ibm.com/eserver/zseries/zos/bkserv/lookat/
- From anywhere in z/OS where you can access a TSO/E command line (for example, a TSO/E prompt, ISPF, or z/OS UNIX System Services running OMVS). To use LookAt as a TSO/E command, LookAt must be installed on your host system. Obtain the LookAt code for TSO/E from a disk on your z/OS Collection (SK3T-4269) or from the LookAt ftp site:
  ftp.software.ibm.com/ps/products/ibmreader/tools/lookat/ZOS/
- From your Palm VIIx personal data assistant (PDA). To use LookAt from your Palm VIIx PDA, LookAt must be installed on the PDA. Obtain the LookAt code from a disk on your z/OS Collection (SK3T-4269) or from the LookAt ftp site:
Terminology and citations

In this information, DB2 Universal Database™ for z/OS™ is referred to as "DB2 UDB for z/OS." In cases where the context makes the meaning clear, DB2 UDB for z/OS is referred to as "DB2®." When this information refers to titles of books in this library, a short title is used. (For example, "See DB2 SQL Reference" is a citation to IBM® DB2 Universal Database for z/OS SQL Reference.)

When referring to a DB2 product other than DB2 UDB for z/OS, this information uses the product’s full name to avoid ambiguity.

The following terms are used as indicated:

**DB2**
 Represents either the DB2 licensed program or a particular DB2 subsystem.

**DB2 PM**
 Refers to the DB2 Performance Monitor tool, which can be used on its own or as part of the DB2 Performance Expert for z/OS product.

**C, C++, and C language**
 Represent the C or C++ programming language.

**CICS®**
 Represents CICS Transaction Server for z/OS or CICS Transaction Server for OS/390®.

**IMS™**
 Represents the IMS Database Manager or IMS Transaction Manager.

**MVS™**
 Represents the MVS element of the z/OS operating system, which is equivalent to the Base Control Program (BCP) component of the z/OS operating system.

**RACF®**
 Represents the functions that are provided by the RACF component of the z/OS Security Server.

Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products. The major accessibility features in z/OS products, including DB2 UDB for z/OS, enable users to:

- Use assistive technologies such as screen reader and screen magnifier software
- Operate specific or equivalent features by using only a keyboard
- Customize display attributes such as color, contrast, and font size

Assistive technology products, such as screen readers, function with the DB2 UDB for z/OS user interfaces. Consult the documentation for the assistive technology products for specific information when you use assistive technology to access these interfaces.

Online documentation for Version 8 of DB2 UDB for z/OS is available in the DB2 Information Center, which is an accessible format when used with assistive technologies such as screen reader or screen magnifier software. The DB2 Information Center for z/OS solutions is available at the following Web site: http://publib.boulder.ibm.com/infocenter/db2zhelp.
How to send your comments

Your feedback helps IBM to provide quality information. Please send any comments that you have about this book or other DB2 UDB for z/OS documentation. You can use the following methods to provide comments:

- Send your comments by e-mail to db2pubs@vnet.ibm.com and include the name of the product, the version number of the product, and the number of the book. If you are commenting on specific text, please list the location of the text (for example, a chapter and section title, page number, or a help topic title).
- You can also send comments from the Web. Visit the library Web site at:

  www.ibm.com/software/db2zos/library.html

  This Web site has a feedback page that you can use to send comments.
- Print and fill out the reader comment form located at the back of this book. You can give the completed form to your local IBM branch office or IBM representative, or you can send it to the address printed on the reader comment form.

Summary of changes to this book

This edition adds and modifies messages and codes to support DB2 Version 8. It also incorporates technical corrections and changes made to previously published information. For specific information about new, changed and deleted messages and codes for Version 8, see Appendix D, “New, Changed, and Deleted Messages and Codes,” on page 1379.
Part 2. SQL return codes
Chapter 2. SQL return codes

The information in this chapter is General-use Programming Interface and Associated Guidance Information, as defined in "Notices" on page 1391.

Introduction

Structured Query Language (SQL) return codes, and the tokens referred to in the explanations, are returned in the SQL communication area (SQLCA).

The SQLCA is an area in the application program (defined by the application program) for the use of DB2. It is described in Appendix C of DB2 SQL Reference.

The SQL return code is returned in the SQLCODE field of the SQLCA. The tokens are returned in the SQLERRM field. If there are several tokens, they appear sequentially in SQLERRM in the order in which they appear in the message text. The tokens are separated by the character X'FF'.

A token appears in the message text in lowercase letters. When an SQL return code is returned through SPUFI, the tokens have been substituted into the message text and the text is displayed. The substitution of tokens into message text is performed by a DB2 module named DSNTIAR. This module can also be used by application programs. Refer to Part 2 of DB2 Application Programming and SQL Guide for more information about DSNTIAR.

Checking the execution of SQL statements

An application program containing executable SQL statements must either provide a structure named SQLCA or a stand-alone integer variable named SQLCODE (SQLCOD in FORTRAN). An SQLCA may be provided by using the INCLUDE SQLCA statement. INCLUDE SQLCA must not be used if a stand-alone SQLCODE is provided.

The SQLCA includes an integer variable named SQLCODE. The option of providing a stand-alone SQLCODE instead of an SQLCA allows for conformance with the ISO/ANSI SQL standard. The use of this option must be indicated to the precompiler.

SQLCODE

Regardless of whether the application program provides an SQLCA or a stand-alone variable, SQLCODE is set by DB2 after each SQL statement is executed. DB2 conforms to the ISO/ANSI SQL standard as follows:

- If SQLCODE = 0, execution was successful.
- If SQLCODE > 0, execution was successful with a warning.
- If SQLCODE < 0, execution was not successful.
- SQLCODE = 100, "no data" was found. For example, a FETCH statement returned no data because the cursor was positioned after the last row of the result table.
SQLSTATE

SQLSTATE is also set by DB2 after the execution of each SQL statement. Thus, application programs can check the execution of SQL statements by testing SQLSTATE instead of SQLCODE. SQLSTATE (SQLSTT in FORTRAN) is a 5-byte character string variable in the SQLCA.

SQLSTATE provides application programs with common codes for common error conditions (the values of SQLSTATE are product-specific only if the error or warning is product-specific). Furthermore, SQLSTATE is designed so that application programs can test for specific errors or classes of errors. The coding scheme is the same for all IBM relational database products. See Appendix C, “SQLSTATE Values—Common Error Codes,” on page 1359 for more information and a complete list of the possible values of SQLSTATE.

Successful execution SQL code

<table>
<thead>
<tr>
<th>Code</th>
<th>Explanation</th>
<th>Destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>SUCCESSFUL EXECUTION</td>
<td>000000 for unqualified successful execution</td>
</tr>
<tr>
<td>012</td>
<td>THE UNQUALIFIED COLUMN NAME column-name WAS INTERPRETED AS A CORRELATED REFERENCE</td>
<td>01ddd for successful execution with warning ‘ddd’</td>
</tr>
<tr>
<td>098</td>
<td>A DYNAMIC SQL STATEMENT ENDS WITH A SEMICOLON.</td>
<td></td>
</tr>
<tr>
<td>100</td>
<td>ROW NOT FOUND FOR FETCH, UPDATE OR DELETE, OR THE RESULT OF A QUERY IS AN EMPTY TABLE</td>
<td>02000</td>
</tr>
<tr>
<td>110</td>
<td>SQL UPDATE TO A DATA CAPTURE TABLE NOT SIGNALLED TO ORIGINATING SUBSYSTEM</td>
<td></td>
</tr>
</tbody>
</table>

Explanation:

| +098 | A DYNAMIC SQL STATEMENT ENDS WITH A SEMICOLON. |
| Explanation: | The statement string of a PREPARE or EXECUTE IMMEDIATE statement is a valid dynamic SQL statement, but it ends with a semicolon. |
| System Action: | The semicolon and any subsequent text are ignored. |
| Programmer Response: | Check that the semicolon is being used as a statement terminator. |
| Destination: | 01568 |

| +100 | ROW NOT FOUND FOR FETCH, UPDATE OR DELETE, OR THE RESULT OF A QUERY IS AN EMPTY TABLE |
| Explanation: | One of the following conditions occurred: |
| • | No row met the search conditions specified in an UPDATE or DELETE statement. |
| • | The result of a SELECT INTO statement was an empty table. |
| • | A FETCH statement was executed when the cursor was positioned after the last row of the result table. |
| • | The result of the subselect of an INSERT statement is empty. |
| When a SELECT statement is executed using SPUFI, this SQLCODE indicates normal completion. |
| System Action: | No data was retrieved, updated, or deleted. |
| Destination: | 02000 |

| +110 | SQL UPDATE TO A DATA CAPTURE TABLE NOT SIGNALLED TO ORIGINATING SUBSYSTEM |
| Explanation: | DataPropagator (DPropNR) exit routine issued an SQL INSERT, UPDATE, or DELETE |
statement to a table defined with DATA CAPTURE CHANGES. Since data capture is already in progress, notification is not sent back to the originating IMS subsystem.

System Action: DB2 changes the data and records the change in the log. DB2 does not notify DPropNR’s exit routine of the change, because doing so might cause the same change to be made again.

Destination: 01561

THE SUBPAGES OPTION IS NOT SUPPORTED FOR TYPE 2 INDEXES

Explanation: You cannot use the SUBPAGES option for type 2 indexes.

System Action: The option is ignored and processing continues.

Programmer Response: Remove the SUBPAGES option to get rid of the warning.

Destination: 01590

THE NUMBER OF INSERT VALUES IS NOT THE SAME AS THE NUMBER OF OBJECT COLUMNS

Explanation: The number of insert values in the value list of the INSERT statement is not the same as the number of object columns specified.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, specify one and only one value for each of the specified object columns.

Destination: 01525

TABLESPACE database-name.tablespace-name HAS BEEN PLACED IN CHECK PENDING

Explanation: The indicated table space is in check pending status because the ALTER TABLE statement was used to specify a referential constraint or a check constraint (while special register CURRENT RULES = 'DB2') on a populated table. The table space is not generally available until the check pending status is removed from the table space.

System Action: The table space was placed in check pending status.

Programmer Response: Run the CHECK DATA utility. The enforcement of the referential constraint or the check constraint is deferred until the CHECK DATA utility is run.

Destination: 01514

THE QUALIFIED COLUMN NAME column-name WAS RESOLVED USING A NON-UNIQUE OR UNEXPOSED NAME

Explanation: The table designator selected to resolve a qualified column name is one of the following:
- An unexposed name
- An exposed name that has an exposed duplicate in the same FROM clause
- An exposed name that has an unexposed duplicate which appears before the selected name in the ordered list of names to which the qualifier is compared

Therefore, the statement does not conform to the guidelines for using only unique exposed names as qualifiers or it is possible that the column reference was not resolved to the intended instance of the table or view.

System Action: DB2 uses the selected name to resolve the reference.

Programmer Response: If DB2’s resolution of the qualifier was not what you intended, rewrite the SQL statement and submit it again. The rules used to resolve column name qualifiers are given in Chapter 2 of DB2 SQL Reference.

Destination: 01552

name IS AN UNDEFINED NAME

Explanation: The object identified by ‘name’ is not defined in the DB2 subsystem. This return code can be generated for any type of DB2 object.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, determine that the object name was correctly specified in the SQL statement (including any required qualifiers). If so, ensure that the object exists in the system before resubmitting the statement.

Destination: 01532

column-name IS NOT A COLUMN OF AN INSERTED TABLE, UPDATED TABLE, OR ANY TABLE IDENTIFIED IN A FROM CLAUSE

Explanation: This return code is used to report one of these errors:
- In the case of an INSERT or UPDATE statement, the specified column is not a column of the table or view that was specified as the object of the insert or update.
• In the case a SELECT or DELETE statement, the specified column is not a column of any of the tables or views identified in a FROM clause in the statement.
• There is a correlated reference in GROUP BY.
• There is an unresolved qualified reference in HAVING.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, verify that the column and table names are specified correctly in the SQL statement. In the case of a SELECT statement, check to be sure that all of the required tables were named in the FROM clause.

Destination: 01533

+218 THE SQL STATEMENT REFERRING TO A REMOTE OBJECT CANNOT BE EXPLAINED

Explanation: The user has used EXPLAIN(YES) on the bind subcommand to bind an application which has SQL statement referencing a remote object or the user has a static EXPLAIN SQL statement which references a remote object in the application program. EXPLAIN on a remote object is not supported by DB2.

It is issued at BIND time, and only with VALIDATE(RUN).

System Action: The plan or package will be bound successfully, but no information will be filled in the user's PLAN-TABLE for the SQL statement referencing a remote object. An SQLCODE -512 will be issued at run time if the EXPLAIN statement is found to explain a remote object.

Destination: 01537

+219 THE REQUIRED EXPLANATION TABLE table-name DOES NOT EXIST

Explanation: The EXPLAIN statement assumes the existence of the explanation table and it is not defined in the DB2 subsystem as a base table. Refer to Chapter 5 of [DB2 SQL Reference] for more information.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, determine whether the required explanation table does exist. If not, create the required table.

Destination: 01532

+220 THE COLUMN column-name IN EXPLANATION TABLE table-name IS NOT DEFINED PROPERLY

Explanation: An error occurred during the insertion of a row into the explanation table. The table is improperly defined for the following reasons:
• A column is missing.
• Columns are defined in the wrong order.
• The table contains an extra column.
• A column description is invalid because of its name, data type, length, or null attributes.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, correct the definition of the required explanation table. Refer to Chapter 5 of [DB2 SQL Reference] for information about defining an explanation table.

Destination: 01546

+222 HOLE DETECTED USING CURSOR cursor-name

Explanation: A delete hole or an update hole has been detected while processing a FETCH for cursor cursor-name. With a SENSITIVE STATIC cursor, a delete hole occurs when DB2 tries to refetch a row from the database for a cursor and finds that the corresponding row of the underlying table has been deleted. An update hole occurs when DB2 tries to refetch a row from the database for a cursor and finds that the corresponding row of the underlying table no longer satisfies the search condition.

cursor-name
Name of the cursor used for the FETCH statement.

System Action: The statement cannot be processed, and no data is fetched. The cursor is repositioned on the hole.

Programmer Response: Correct the application program to handle this situation, or change isolation levels so the base row cannot be deleted during the cursor operation.

Destination: 02502

+231 CURRENT POSITION OF CURSOR cursor-name IS NOT VALID FOR FETCH OF THE CURRENT ROW

Explanation: The cursor was not positioned on a row, and either FETCH CURRENT or FETCH RELATIVE 0 was specified. No data was fetched.
cursor-name

Name of the cursor used for the FETCH statement.

System Action: The statement cannot be processed. The cursor position is unchanged.

Programmer Response: Correct the application program to establish position before issuing this FETCH statement.

Destination: 02000

+236 SQLDA INCLUDES integer1 SQLVAR ENTRIES, BUT integer2 ARE REQUIRED FOR integer3 COLUMNS

Explanation: The value of the SQLN field of the SQLDA should be at least as large as the number of columns being described. integer3 is the number of columns being described.

In the case that USING BOTH has been specified, twice as many SQLVAR entries are needed as the number of columns being described.

The number of SQLVAR entries that are needed to return all of the information about the columns is integer2.

Note: in the case of DESCRIBE INPUT, each reference to column would actually be parameter.

System Action: The SQLDAID 7th byte flag "on" with a value of 2 indicating that 2 SQLVAR entries are needed for each column. DB2 has not set any SQLVAR entries.

Programmer Response: Increase the value of the SQLN field in the SQLDA to the value indicated in the message (making sure the SQLDA is large enough to support that amount) and resubmit the statement.

Destination: 01594

+238 SQLDA INCLUDES integer1 SQLVAR ENTRIES, BUT integer2 SQLVAR ENTRIES ARE NEEDED FOR integer3 COLUMNS BECAUSE AT LEAST ONE OF THE COLUMNS BEING DESCRIBED IS A LOB

Explanation: Given that at least one of the columns being described is a LOB, space must be provided for the extended SQLVAR entries in addition to the base SQLVAR entries. The value of SQLN, integer1, indicates that there are not enough SQLVAR entries for the base and extended SQLVAR entries. One or more of the columns being described may be a distinct type.

The total number of SQLVAR entries that are required depends on whether USING BOTH was specified or not (n is the number of columns being described):

- With USING BOTH, space should be allocated for 3n SQLVAR entries.
- Otherwise, space should be allocated for 2n SQLVAR entries.

The number of SQLVAR entries that are needed to return all of the information about the columns is integer2.

Note: in the case of DESCRIBE INPUT, each reference to column would actually be parameter.

System Action: DB2 has set the SQLDAID 7th byte flag "on" because sufficient space was not provided for the extended SQLVAR entries. The value of the 7th byte flag indicates how many SQLVAR entries are needed for each column. Additionally, because there were enough SQLVAR entries for the base SQLVARs, DB2 has set the fields of the base SQLVAR entries. However, DB2 has not set any extended SQLVAR entries.

Programmer Response: If there is no need for the additional information about the distinct type(s), then no action is required unless USING BOTH was specified (in which case additional SQLVAR entries must be provided for the labels).

If the distinct type information is needed, the value of the SQLN field in the SQLDA should be increased to integer2 (after making sure that the SQLDA is large enough to support that amount) and the statement should be resubmitted.

Destination: 01594

+237 SQLDA INCLUDES integer1 SQLVAR ENTRIES, BUT integer2 ARE REQUIRED BECAUSE AT LEAST ONE OF THE COLUMNS BEING DESCRIBED IS A DISTINCT TYPE

Explanation: Given that at least one of the columns being described is a distinct type, space should be provided for the extended SQLVAR entries in addition to the base SQLVAR entries. The value of SQLN, integer1, indicates that there are not enough SQLVAR entries for the base and extended SQLVAR entries. One or more of the columns being described may be a distinct type.

The total number of SQLVAR entries that are required depends on whether USING BOTH was specified or not (n is the number of columns being described):

- With USING BOTH, space should be allocated for 3n SQLVAR entries.
- Otherwise, space should be allocated for 2n SQLVAR entries.

The number of SQLVAR entries that are needed to return all of the information about the columns is integer2.
Note: in the case of DESCRIBE INPUT, each reference to column would actually be parameter.

System Action: DB2 has set the SQLDAID 7th byte flag "on" because sufficient space was not provided for the extended SQLVAR entries. The value of the 7th byte flag indicates how many SQLVAR entries are needed for each column. DB2 has not set any SQLVAR entries.

Programmer Response: Increase the value of the SQLN field in the SQLDA to integer2 (after making sure that the SQLDA is large enough to support that amount) and resubmit the statement.

Destination: 01005

+239 SQLDA INCLUDES integer1 SQLVAR ENTRIES, BUT integer2 ARE REQUIRED FOR integer3 COLUMNS BECAUSE AT LEAST ONE OF THE COLUMNS BEING DESCRIBED IS A DISTINCT TYPE

Explanation: Given that at least one of the columns being described is a distinct type, space should be provided for the extended SQLVAR entries in addition to the base SQLVAR entries. The value of SQLN, integer1, indicates that there are not enough SQLVAR entries for the base and extended SQLVAR entries.

The total number of SQLVAR entries that are required depends on whether USING BOTH was specified or not (n is the number of columns being described which is integer3),

• With USING BOTH, space should be allocated for 3n SQLVAR entries.
• Otherwise, space should be allocated for 2n SQLVAR entries.

The number of SQLVAR entries that are needed to return all of the information about the columns is integer2.

Note: in the case of DESCRIBE INPUT, each reference to column would actually be parameter.

System Action: DB2 has set the SQLDAID 7th byte flag "on" because sufficient space was not provided for the extended SQLVAR entries. The value of the 7th byte flag indicates how many SQLVAR entries are needed for each column. DB2 has not set any SQLVAR entries.

Programmer Response: If the distinct type information is needed, the value of the SQLN field in the SQLDA should be increased to integer2 (after making sure the SQLDA is large enough to support that amount) and the statement should be resubmitted.

If there is no need for the additional information about the distinct type(s) in the result set, then it is possible to resubmit the statement only providing enough SQLVAR entries to accommodate the number of columns being described (i.e. provide the necessary number of base SQL entries).

Destination: 01005

+252 A NON-ATOMIC statement STATEMENT SUCCESSFULLY PROCESSED ALL REQUESTED ROWS, WITH ONE OR MORE WARNING CONDITIONS

Explanation: A non-atomic statement statement successfully processed multiple rows of data. However, one or more warning conditions occurred. Use GET DIAGNOSTICS to obtain information about the warning conditions that occurred.

System Action: The statement was processed.

Programmer Response: Analyze the warning conditions to determine whether the statement should be rolled back or not.

Destination: 01659

+304 A VALUE WITH DATA TYPE data-type1 CANNOT BE ASSIGNED TO A HOST VARIABLE BECAUSE THE VALUE IS NOT WITHIN THE RANGE OF THE HOST VARIABLE IN POSITION position-number WITH DATA TYPE data-type2

Explanation: A FETCH or SELECT into a host variable list or structure, position number position-number failed because the host variable having data type data-type2 was not large enough to hold the retrieved value having data type data-type1.

System Action: The FETCH or SELECT could not return the data for the indicated SELECT item, the indicator variable is set to negative two (-2) to indicate a null value returned. Processing continues.

Programmer Response: Verify that table definitions are current, and that the host variable has the proper data type. See the explanation for SQLCODE -405 for ranges of SQL data types.

Destination: 01515

+331 THE NULL VALUE HAS BEEN ASSIGNED TO A HOST VARIABLE BECAUSE THE STRING CANNOT BE TRANSLATED. REASON reason-code, CHARACTER code-point, HOST VARIABLE position-number

Explanation: A string assigned to a host variable had to be translated from its coded character set to the coded character set of the host variable and an error occurred during the translation. The position-number is the ordinality of the host variable in the SQLDA. See the description of SQLCODE -331 for further information.
including the meaning of the reason-code and code-point.

System Action: The host variable is unchanged and its indicator variable is set to -2 to indicate that a null value is returned. Execution of the statement continues as if the translation error had not occurred.

Destination: 01520

+335  DB2 CONVERTED A HOST VARIABLE, PARAMETER, OR COLUMN NUMBER
       var-name var-name-or-num TO COLUMN
       NAME, HOST VARIABLE, OR
       col-name-or-num FROM from-ccsid TO
to-ccsid, AND RESULTING IN
       SUBSTITUTION CHARACTERS

Explanation: A translation error occurred during the conversion of a string to a different coded character set. One or more substitution characters have been placed in the string during the conversion process.

System Action: DB2 processes the statement successfully.

Programmer Response: DB2 processes the SQL statement, but used substitution characters instead of one or more characters as a result of character conversion from from-ccsid to to-ccsid. If substitution is acceptable, then no action is necessary. If substitution is not acceptable, then issue a ROLLBACK. Ensure that data being provided to DB2 is convertible from from-ccsid to to-ccsid without data loss.

Destination: 01517

+347  THE RECURSIVE COMMON TABLE
       EXPRESSION name MAY CONTAIN AN
       INFINITE LOOP

Explanation: The recursive common table expression called name may not complete. This warning is based on not finding specific syntax as part of the iterative portion of the recursive common table expression. The expected syntax includes:

- incrementing an INTEGER column in the iterative select list by 1.
- a predicate in the where clause of the iterative portion of the form "counter_col < constant" or 
  "counter_col < :hostvar".

The absence of this syntax in the recursive common table expression may result in an infinite loop. The data or some other characteristic of the recursive common table expression may allow the successful completion of the statement anyway.

System Action: The statement cannot be executed.

Programmer Response: To prevent an infinite loop, include the expected syntax as described.

Destination: 01605

+394  USER SPECIFIED OPTIMIZATION
       HINTS USED DURING ACCESS PATH
       SELECTION

Explanation: Normal access path selection was bypassed in favor of an access path specified in the PLAN_TABLE.

System Action: Processing continues normally.

Programmer Response: Ensure that the access path is correct and produces the correct results.

Destination: 01629

+395  USER SPECIFIED OPTIMIZATION
       HINTS ARE INVALID (REASON CODE =
       reason-code). THE OPTIMIZATION
       HINTS ARE IGNORED.

Explanation: The optimization hints specified for this query are invalid. The reason-code in the following table can help identify why the hints were invalid:

<table>
<thead>
<tr>
<th>reason-code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>TABNO is invalid.</td>
</tr>
<tr>
<td>3</td>
<td>TNAME is not specified.</td>
</tr>
<tr>
<td>4</td>
<td>TNAME is ambiguous.</td>
</tr>
<tr>
<td>5</td>
<td>TABNO doesn't agree with TNAME.</td>
</tr>
<tr>
<td>6</td>
<td>OBLOCKNO doesn't agree with TNAME.</td>
</tr>
<tr>
<td>7</td>
<td>PAGE_RANGE is invalid.</td>
</tr>
<tr>
<td>8</td>
<td>PREFETCH is invalid.</td>
</tr>
<tr>
<td>9</td>
<td>METHOD is invalid.</td>
</tr>
<tr>
<td>10</td>
<td>SORTN_JOIN is invalid.</td>
</tr>
<tr>
<td>11</td>
<td>SORTC_JOIN is invalid.</td>
</tr>
<tr>
<td>12</td>
<td>ACCESSSTYPE is invalid.</td>
</tr>
<tr>
<td>13</td>
<td>ACCESSCREATOR or ACCESSNAME is invalid.</td>
</tr>
<tr>
<td>14</td>
<td>TYPE 1 index can't be used with isolation level 'UR'.</td>
</tr>
<tr>
<td>15</td>
<td>Specified index can't be used as requested.</td>
</tr>
<tr>
<td>16</td>
<td>Multi-index access can't be done.</td>
</tr>
<tr>
<td>17</td>
<td>Invalid ACCESSSTYPE combination.</td>
</tr>
<tr>
<td>18</td>
<td>METHOD specified for first table accessed.</td>
</tr>
<tr>
<td>19</td>
<td>Nested-loop join can't be done as requested.</td>
</tr>
<tr>
<td>20</td>
<td>Merge join can't be done as requested.</td>
</tr>
<tr>
<td>21</td>
<td>Hybrid join can't be done as requested.</td>
</tr>
</tbody>
</table>
+402  LOCATION location IS UNKNOWN

Explanation: A remote object is referenced and either the table SYSIBM.Locations is not defined or the referenced 'location' matches no entry in the SYSIBM.Locations.location column.

System Action: The value has been truncated.

Programmer Response: Ensure that the output is as expected and that the truncation has not caused any unexpected consequences.

Destination: 01004

+403  THE LOCAL OBJECT REFERENCED BY THE CREATE ALIAS STATEMENT DOES NOT EXIST

Explanation: The local object referenced by the CREATE ALIAS statement does not exist when creating the alias.

System Action: The alias is created.

Destination: 01522

+404  PARALLELISM_MODE requested can't be done.

+405  PARALLELISM_MODE is invalid.

+406  ACCESS_DEGREE is invalid.

+407  JOIN_DEGREE is invalid.

+408  A table is missing.

+409  A table is redundant.

+410  PRIMARY_ACCESSSTYPE is invalid.

+411  ACCESS_PGROUP_ID is not specified.

+412  JOIN_PGROUP_ID is not specified.

+413  PARALLELISM_MODE is not specified.

+414  CREATOR or TNAME is invalid.

+415  Join sequence is incorrect.

+416  Full outer join requires merge join method.

+417  WHEN_OPTIMIZE is invalid or inconsistent.

+418  Unexpected error.

System Action: The user-specified optimization hints are ignored. The access path is determined without the use of hints and processing continues normally.

Programmer Response: Correct the problem with the optimization hints, or disable their use for this query.

Destination: 01628

+434  OPTION keyword IS A DEPRECATED FEATURE

Explanation: keyword is a deprecated feature that will not be supported in releases following DB2 Version 8. It is accepted, but continued use of this keyword is not recommended.

For indexes, use type 2 indexes rather than type 1 indexes to avoid any incompatibilities.

System Action: Processing continues normally.

Programmer Response: No change is required for the current release. However, you should change your SQL statement and remove this feature to prepare for future releases when this feature is not supported.

Destination: 01608

+445  VALUE value HAS BEEN TRUNCATED

Explanation: The value value was truncated by a cast function, which was called to transform the value in some way. This is a warning situation. The cast function was a result of

- a CAST specification
- a built-in function such as CHAR, VARCHAR, etc.
- a CAST FROM specification on the CREATE FUNCTION statement that created the function
- a user-defined function that is sourced on another function and the result needed to be transformed.

If 'value' has the 'for bit data' subtype, then the 'value' is printed as a hexadecimal string in quotes followed by an X.

System Action: The value has been truncated.

Programmer Response: Ensure that the output is as expected and that the truncation has not caused any unexpected consequences.

Destination: 01004

+462  EXTERNAL FUNCTION OR PROCEDURE name (SPECIFIC NAME specific-name) HAS RETURNED A WARNING SQLSTATE, WITH DIAGNOSTIC TEXT text

Explanation: An SQLSTATE of the form 01Hxx was returned to DB2 by user-defined function or procedure name, along with message text text.

System Action: Processing continues.

Programmer Response: See your database administrator, or the author of the function or procedure to find out the meaning of the warning. The significance of the bad SQLSTATE to the invoking application can be learned from the author of the function or procedure.

Destination: 01Hxx
### 464

**Explanation**: The stored procedure named by `proc` completed normally. However, the stored procedure exceeded the defined limit on the number of query result sets the procedure can return.

- `num` identifies the number of query result sets returned by the stored procedure.
- `integer` identifies the defined limit on the number of query result sets for the stored procedure.

Only the first `integer` query result sets are returned to the SQL program that issued the SQL CALL statement.

The possible causes are as follows:

- The stored procedure is unable to return `num` result sets due to the limit defined for the procedure.
- The stored procedure is unable to return `num` result sets due to the DRDA limitations imposed by the client. The DRDA client establishes this limit with the MAXRSLCNT DDM code point.

**System Action**: The SQL statement is successful. The SQLWARN9 field is set to ’Z’.

**Destination**: 0100E

### 466

**Explanation**: The stored procedure named by `proc` completed normally. The procedure returned the number of SQL query result sets specified in `num`.

**System Action**: The SQL statement is successful. The SQLWARN9 field is set to ‘Z’.

**Destination**: 0100C

### 494

**Explanation**: The number of result set locators specified on the ASSOCIATE LOCATORS statement is less than the number of result sets returned by the stored procedure. The first “n” result set locator variables are returned, where “n” is the number of result set locator variables specified on the SQL statement.

**System Action**: The SQL statement is successful. The SQLWARN3 field is set to ‘Z’.

**Programmer Response**: Increase the number of result set locator variables specified on the SQL statement.

**Destination**: 01614

### 495

**Explanation**: The prepare of a dynamic INSERT, UPDATE, DELETE, or SELECT SQL statement resulted in a cost estimate that exceeded the warning threshold value specified in the resource limit specification table (RLST). This warning is also issued if DB2’s cost category value was “B”, and the default action specified in the RLF_CATEGORY_B column in the RLST is to issue a warning.

- `estimate_amount1` The cost estimate (in processor seconds) if the prepared INSERT, UPDATE, DELETE or SELECT statement were to be executed.
- `estimate_amount2` The cost estimate (in service units) if the prepared INSERT, UPDATE, DELETE or SELECT statement were to be executed.
- `cost-category` DB2’s cost-category for this SQL statement. The possible values are A or B.
- `limit-amount` The warning threshold (in service units) specified in the RLFASUWARN column of the RLST.

**System Action**: The prepare of the dynamic INSERT, UPDATE, DELETE, or SELECT statement was successful. An SQLCODE -905 might be issued if the execution of the prepared statement exceeds the ASUTIME value specified in the RLST.

**Programmer Response**: Ensure that there is application logic to handle the warning to either allow the statement to execute or to stop the statement from being executed. If this SQLCODE was returned because the cost category value is “B”, it might be that the statement is using parameter markers or that some statistics are not available for the referenced tables and columns. Make sure the administrator has run the utility RUNSTATS on the referenced tables. It might also be that UDFs will be invoked when the statement is executed, or for INSERT, UPDATE, or DELETE statements that triggers are defined on the changed table. Check the DSN_STATEMNT_TABLE or the IFCID 22 record for this statement to find the reasons this SQL statement has been put in cost category “B”.

**User Response**: If the warning is caused by an SQL statement that is consuming too much processor resource, attempt to rewrite the statement to perform more efficiently. Another option is to ask the administrator to increase the warning threshold value in the RLST.
**Destination:** 01616  

**Explanation:** A positioned update of a primary key or a delete from a table with a self-referencing constraint was requested.

**System Action:** DB2 executes the UPDATE or DELETE statement and the contents of the table are changed.

**Programmer Response:** For better performance, rebind the plan or package after correcting the statement. To correct the statement, ensure that auth-id has been granted the authority to perform the desired operation, that object-name exists, and that auth-id is not trying to create a table with a different authorization ID.

**Destination:** 01548

**Explanation:** Authorization ID 'auth-id' has attempted to perform the specified 'operation' without having been granted the authority to do so.

**System Action:** A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

**Programmer Response:** For better performance, rebind the plan or package after correcting the statement. To correct the statement, ensure that the authorization-ID has been granted the authority necessary to perform the desired operation.

**Destination:** 01542

**Explanation:** The GRANT statement contained one of the following situations:

- PUBLIC was within the list of 'grantee' authorization IDs.
- BINDAGENT privilege was being granted.
- ANY package privilege on collection-id.* was being granted.

The WITH GRANT option may not be used in the above situations.

**System Action:** The offending privilege(s) in the authorization specification are granted without the GRANT option. If the grantee is PUBLIC, all the privileges in the authorization specification are granted without the GRANT option.

**Destination:** 01516

**Explanation:** You specified a GRANT statement with either an ALL or ALL PRIVILEGES keyword. ALL and ALL PRIVILEGES imply the granting of ALTER, INDEX, REFERENCES, AND TRIGGER privileges that cannot be granted to a remote user.

**System Action:** DB2 executes the GRANT statement.
However, it does not grant the ALTER, INDEX, REFERENCES, or TRIGGER privileges to PUBLIC*. 

**Destination:** 01523

**+562** A GRANT OF A PRIVILEGE WAS IGNORED BECAUSE THE GRANTEE ALREADY HAS THE PRIVILEGE FROM THE GRANTOR

**Explanation:** At least one of the privileges in the GRANT statement was ignored because the privilege was already granted to the grantee by the grantor.

**System Action:** The privileges previously granted are ignored; all others are granted.

**Destination:** 01560

**+585** THE COLLECTION **collection-id** APPEARS MORE THAN ONCE WHEN SETTING THE **special-register** SPECIAL REGISTER

**Explanation:** The SET statement for special register **special-register** includes **collection-id** more than once.

**System Action:** Duplicates are removed from the list, and the first occurrence of **collection-id** is used. The statement is executed.

**Programmer Response:** Verify the list that contains the duplicate. If the error is only in entering a **collection-id** incorrectly that happens to duplicate another entry, enter the **collection-id** correctly and reissue the statement. If the entry is intended to be a duplicate, no action is required.

**Destination:** 01625

**+599** COMPARISON FUNCTIONS ARE NOT CREATED FOR A DISTINCT TYPE BASED ON A LONG STRING DATA TYPE

**Explanation:** Comparison functions are not created for a distinct type based on a long string data type (BLOB, CLOB, DBCLOB) since the corresponding function are not available for these built-in data types.

**System Action:** The statement is processed successfully.

**Programmer Response:** No action is required.

**Destination:** 01596

**+610** A CREATE/ALTER ON OBJECT **object-name** HAS PLACED OBJECT IN utility PENDING

**Explanation:** The identified object is in one of the following states:
- REBUILD pending for an index

The index is in REBUILD PENDING status because CREATE INDEX with DEFER was specified on a populated table. The index is not generally available until the index is removed from the REBUILD pending state.

- REORG pending for a table space partition
  The table space is in REORG pending because ALTER INDEX was used to change the limit key values. The table space partition is not generally available until the REORG pending status is removed.

- REORG pending for a table space
  The table space is in REORG pending because ALTER TABLE was used to add an identity column to a populated table. The table space is not generally available until the REORG pending status is removed.

**System Action:** The object was placed in the indicated pending status.

**Programmer Response:** The following actions may be taken:
- For REBUILD pending on an index, use the REBUILD INDEX utility to rebuild the index and remove the REBUILD pending status.
- For REORG pending on a table space partition, perform the following steps:
  1. Issue a DISPLAY DATABASE command for the table space to identify which partitions are in REORG pending.
  2. Run the REORG utility on the partitions that are in REORG pending.
- For REORG pending on a table space, run the REORG utility on the table space.

**Destination:** 01566

**+645** WHERE NOT NULL IS IGNORED BECAUSE THE INDEX KEY CANNOT CONTAIN NULL VALUES

**Explanation:** The WHERE NOT NULL clause is ignored on the CREATE INDEX statement because the index key is defined on columns that cannot contain null values.

**System Action:** The option is ignored; processing continues.

**Programmer Response:** Remove the WHERE NOT NULL clause to get rid of the warning.

**Destination:** 01528

**+650** THE TABLE BEING CREATED OR ALTERED CANNOT BECOME A DEPENDENT TABLE

**Explanation:** This table is defined with the maximum number of columns. It cannot be altered to be a dependent table later.
System Action: The table is created. Check to see if the table will become a dependent table at a later time. If yes, drop and recreate the table with fewer than 750 columns.

Destination: 01538

+653 TABLE table-name IN PARTITIONED TABLESPACE tspace-name IS NOT AVAILABLE BECAUSE ITS PARTITIONED INDEX HAS NOT BEEN CREATED

Explanation: An attempt has been made to insert or manipulate data in or create a view on a partitioned table (that is, a table residing in a partitioned table space) before the partitioned index for that table has been created.

A table residing in a partitioned table space cannot be referenced in any SQL manipulative statement or a CREATE VIEW statement before the partitioned index for that table has been created.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, verify that the correct table was specified in the statement. If so, ensure that the partitioned index for the table has been created successfully before attempting to execute any SQL manipulative statements that reference that table.

Destination: 01551

+655 STOGROUP stogroup_name HAS BOTH SPECIFIC AND NON-SPECIFIC VOLUME IDS. IT WILL NOT BE ALLOWED IN FUTURE RELEASES

Explanation: The CREATE/ALTER STOGROUP statement has caused the STOGROUP with 'stogroup_name' to have both specific and non-specific ('*') volume ids. This warning code is used to specify that the mixing of different types of volume ids will not be allowed in future releases.

System Action: DB2 continues processing.

Programmer Response: Plan to use either specific or non-specific volume ids to avoid future release migration impact. ALTER STOGROUP may be used to drop all specific volume ids or all non-specific volume ids.

Destination: 01597

+658 THE SUBPAGES VALUE IS IGNORED FOR THE CATALOG INDEX index-name

Explanation: Only SUBPAGES 1 is allowed for this catalog index.

System Action: The index was altered successfully using SUBPAGES 1. If you are also altering the TYPE option to a new value, the index is placed in recovery pending status.

Destination: 01600

+738 DEFINITION CHANGE OF object object_name MAY REQUIRE SIMILAR CHANGE ON READ-ONLY SYSTEMS

Explanation: A change was made to the definition of the specified object that may also require a similar change to any read-only shared systems.

System Action: The statement is successfully executed.

Programmer Response: Check the read-only shared systems that have the specified object defined, and determine if a change must be made to the object on those systems.

Destination: 01530

+799 A SET STATEMENT REFERENCES A SPECIAL REGISTER THAT DOES NOT EXIST AT THE SERVER SITE

Explanation: A DB2 server received a SET statement that it does not understand.

System Action: The SET SPECIAL REGISTER request is ignored.

Programmer Response: This SQLCODE can be returned to an application for any SQL statement. This SQLCODE may be masked by other negative SQLCODEs that the SQL statement receives. Processing continues at the server.

Destination: 01527

+802 EXCEPTION ERROR exception-type HAS OCCURRED DURING operation-type OPERATION ON data-type DATA, POSITION position-number

Explanation: The exception error exception-type occurred while doing an ADDITION, SUBTRACTION, MULTIPLICATION, DIVISION, NEGATION, or BUILT-IN FUNCTION operation on a field whose data-type is DECIMAL, FLOAT, SMALLINT, or INTEGER. The error occurred while processing an arithmetic expression in the SELECT list of an outer SELECT statement, and the position in the select list is denoted by position-number. The possible exception types are FIXED POINT OVERFLOW, DECIMAL OVERFLOW, DIVIDE EXCEPTION, EXPONENT OVERFLOW, ZERO DIVIDE, or OUT OF RANGE. The data type displayed in the message may indicate the data type of the temporary internal copy of the data, which may differ from the actual column or literal data type due to conversions by DB2.
A fixed point overflow can occur during any arithmetic operation on either INTEGER or SMALLINT fields.

A decimal overflow exception can occur when one or more nonzero digits are lost because the destination field in any decimal operation is too short to contain the result.

A divide exception can occur on a decimal division operation when the quotient exceeds the specified data-field size. A zero divide exception occurs on any division by zero.

An exponent overflow can occur when the result characteristic of any floating-point operation exceeds 127 and the result fraction is not zero, i.e. the magnitude of the result exceeds approximately 7.2E+75.

Any of the exceptions/overflows can occur during the processing of a built-in function. If the operation-type is FUNCTION then the error occurred while processing either an input, intermediate, or final value. The cause could be that the value of a parameter is out of range.

**Note:** Parts of exception-type, data-type, operation-type, and position-number may or may not be returned in SQLCA, depending upon when the error was detected.

**System Action:** For each expression in error the indicator variable is set to negative two (-2) to indicate a null value returned. The data variable is unchanged. Execution of the statement continues with all nonerror columns and expressions of the outer SELECT list being returned. If the statement is cursor controlled then the CURSOR will remain open.

**Programmer Response:** Examine the expression for which the warning occurred to see if the cause (or the likely cause) of the problem can be determined. The problem may be data-dependent, in which case it will be necessary to examine the data that was being processed at the time the error occurred.

See the explanation of SQLCODE -405 for allowed ranges of numeric data types.

**Destination:** 01519

**+806**

**BIND ISOLATION LEVEL RR CONFLICTS WITH TABLESPACE LOCKSIZE PAGE OR LOCKSIZE ROW AND LOCKMAX 0**

**Explanation:** The specification of isolation level RR is incompatible with the LOCKSIZE PAGE or LOCKSIZE ROW and LOCKMAX 0 specification for a table space accessed by the application. Table space locking is used to protect the integrity of the application.

**System Action:** A valid package/plan is created if no errors are detected. Table space locking is used. RR isolation level is preserved.

**Programmer Response:** If you do not want table space locking, use isolation level UR, CS, or RS.

**Destination:** 01553

**+807**

**THE RESULT OF DECIMAL MULTIPLICATION MAY CAUSE OVERFLOW**

**Explanation:** An arithmetic expression contains a decimal multiplication that may cause an overflow condition when the statement is executed. The problem may be corrected by restructuring the arithmetic expression so that decimal multiplication precedes decimal division or by changing the precision and scale of the operands in the arithmetic expression. Refer to Chapter 2 of *DB2 SQL Reference* for the precision and scale of the decimal multiplication and division results.

**System Action:** A valid package will be created if no errors are detected.

**Destination:** 01554

**+863**

**THE CONNECTION WAS SUCCESSFUL BUT ONLY SBCS WILL BE SUPPORTED**

**Explanation:** The target AS supports only the DB2 SBCS CCSID. The DB2 Mixed CCSID or GRAPHIC CCSID or both are not supported by the target AS. DB2 character data sent to the target AS must be restricted to SBCS.

**System Action:** The CONNECT statement is successful. The release level of the target AS has been placed into the SQLERRP field of the SQLCA (see *DB2 SQL Reference* for the CONNECT statement).

**Programmer Response:** Do not execute any SQL statements which pass either mixed data or graphic data as input host variables.

**Destination:** 01539

**+883**

**ROLLBACK TO SAVEPOINT OCCURED WHEN THERE WERE OPERATIONS THAT CANNOT BE UNDONE, OR AN OPERATION THAT CANNOT BE UNDONE OCCURRED WHEN THERE WAS A SAVEPOINT OUTSTANDING**

**Explanation:** The operations that are referred to are updates (inserts into or deletes from) a created global temporary table. If this SQL warning code is received as the result of a ROLLBACK TO SAVEPOINT statement, the rollback is performed; however, the changes that were made to the temporary table are not undone. If this SQL warning code is received as the result of an operation to a created global temporary table, the operation is performed; however, be advised that a savepoint is outstanding, and the update will not be backed out if a rollback to the savepoint is performed.

**System Action:** The SQL statement is processed.
Programmer Response: Verify that this is what you meant. 

**Destination:** 01640

---

**+20002**

THE GBPCACHE SPECIFICATION IS IGNORED, bpname DOES NOT ALLOW CACHING

**Explanation:** This message is issued in response to a CREATE or ALTER of a table space or index which is a buffer pool is named that corresponds to a group buffer pool that is defined with GBPCACHE NO. The corresponding group buffer pool is used only for cross-invalidation. It contains no data entries. All reads and writes are from and to DASD.

**System Action:** The statement is processed.

**User Response:** If you want to use one of the GBPCACHE options other than NONE, you must alter the table space or index to use a group buffer pool that is defined with GBPCACHE YES.

**Destination:** 01624

---

**+20007**

USE OF OPTIMIZATION HINTS IS DISALLOWED BY A DB2 SUBSYSTEM PARAMETER. THE SPECIAL REGISTER 'OPTIMIZATION HINT' IS SET TO THE DEFAULT VALUE OF BLANKS.

**Explanation:** DB2 is not enabled to use optimization hints. The special register OPTIMIZATION HINT is set to the default value of BLANKS.

**System Action:** Processing continues normally using the default OPTIMIZATION HINT value. The user-specified optimization hints are ignored. The access path is determined without the use of hints and processing continues normally.

**Programmer Response:** Enable the use of OPTIMIZATION HINT by changing the value of OPTIMIZATION HINTS on the DB2 Installation panel DSNTP4.

If, after further consideration, you do not want to use an OPTIMIZATION HINT, change or remove the SET CURRENT OPTIMIZATION HINT statement.

**Destination:** 01602

---

**+20141**

TRUNCATION OF VALUE WITH LENGTH length OCCURRED FOR hv-or-parm-number

**Explanation:** A value that was assigned to a host variable or parameter was truncated. However, the length of the value that was truncated is too large to be returned in the indicator variable. This situation can occur when truncation occurs on assignment of:

- a value to a parameter of a remote stored procedure if the value being truncated is greater than 127 bytes. In this case, the indicator variable will contain a value of 127.
- a LOB value to a host variable if the value being truncated is greater than 32K bytes. In this case, the indicator variable will contain a value of 32K.

In these cases, the actual length of the truncated value cannot be returned to the application that uses the indicator variable. The actual length of the value is returned as message token length.

**System Action:** The assignment was made, but the data was truncated.

**Programmer Response:** Change the declaratioin of hv-or-parm-number to avoid truncation.

**Destination:** 01004
NOT PADDED CLAUSE IS IGNORED FOR INDEXES CREATED ON AUXILIARY TABLES

Explanation: The NOT PADDED clause is ignored on the CREATE INDEX statement because auxiliary indexes are always PADDED.

System Action: The option is ignored; processing continues.

Programmer Response: Remove the NOT PADDED clause to avoid this warning.

Destination: 01663

OPTION NOT SPECIFIED FOLLOWING ALTER PARTITION CLAUSE

Explanation: An ALTER INDEX statement, which included the ALTER PARTITION clause, did not contain an option following the ALTER PARITION keywords.

System Action: The SQL statement is processed.

Programmer Response: Specify a partition option after the ALTER PARTITION keywords to avoid this warning in the future. For an ALTER INDEX statement, if partition-element is specified, specify either the ENDING clause of:

- partition-element
- using-block
- free-block
- gbcaches-block

Destination: 01664

THE LAST PARTITION’S LIMIT KEY VALUE OF old-limit-key-value IS SET TO THE HIGHEST OR LOWEST POSSIBLE VALUE

Explanation: After one of the following statements was completed, the last partition’s limit key value old-limit-key-value was set to the highest possible value for ascending index key columns, or lowest possible value for descending index key columns. These are the statements:

- CREATE PARTITIONED INDEX
- DROP INDEX for a partitioning index
- ALTER INDEX with the CLUSTER NO clause

The external limit key value in SYSTABLEPART.LIMITKEY has been changed to its highest or lowest possible value.

System Action: The statement is successfully executed.

Destination: 01666

OPERATION COMPLETED SUCCESSFULLY BUT A DISTRIBUTION PROTOCOL VIOLATION HAS BEEN DETECTED. ORIGINAL SQLCODE=original-sqlcode AND ORIGINAL SQLSTATE=original-sqlstate

Explanation: The application requested operation (either COMMIT or ROLLBACK) has completed successfully but the response from the remote server and the SQLCODE that was returned from the remote server are inconsistent. For example, the reply message from the remote server indicates that a COMMIT operation completed successfully but the SQLCODE returned from the AS was negative.

System Action: An alert was generated. A DSNL031I message may have been written to the console. Refer to the description of this message for further information.

The SQLCODE returned by the remote server is replaced with +30100 and the SQLSTATE returned by the remote server is replaced with 01558.

The SQLCODE and SQLSTATE values that were returned from the AS are stored in the SQLERRM field in a string of the following format:

'original-sqlcode 'FF'X original-sqlstate'

Programmer Response: Notify the System Programmer for assistance in analyzing the trace data that was generated.

Destination: 01558
Error SQL codes

-007  STATEMENT CONTAINS THE ILLEGAL CHARACTER character

Explanation: The specified 'character' is not a valid character in SQL statements.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax and resubmit the statement. Refer to Chapter 2 of DB2 SQL Reference for information about the valid SQL character set.

Destination: 42601

-010  THE STRING CONSTANT BEGINNING string IS NOT TERMINATED

Explanation: The statement contains a string constant, beginning with 'string', that is not terminated properly.

System Action: The statement cannot be executed.

Programmer Response: Examine the statement for missing quotation marks or apostrophes in the indicated string constant.

Destination: 42603

-029  INTO CLAUSE REQUIRED

Explanation: SELECT statements embedded in an application program must have an INTO clause to denote where the results of the SELECT are to be placed. Dynamic SELECT statements do not permit the INTO clause.

System Action: The statement cannot be executed.

Programmer Response: Add the INTO clause to the SELECT statement and precompile the application program again.

Destination: 42601

-060  INVALID type SPECIFICATION : spec

Explanation: 'type' is either LENGTH or SCALE. 'spec' is the specified length or scale. Length or scale must be specified by an unsigned integer constant and the value must be in the range allowed by the data type.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement. Refer to Chapter 2 of DB2 SQL Reference for rules for length and scale.

Destination: 42815

-079  QUALIFIER FOR DECLARED GLOBAL TEMPORARY TABLE table-name MUST BE SESSION, NOT qualifier

Explanation: The qualifier for a declared temporary table must be SESSION. The DECLARE GLOBAL TEMPORARY TABLE statement defines a new temporary table named table-name with an explicit qualifier of qualifier. Specifying a qualifier other than SESSION is not allowed.

System Action: The statement was not executed.

Programmer Response: Change the statement in one of the following ways:
- Change the qualifier to SESSION.
- Remove the qualifier, and let DB2 default it to SESSION.

Destination: 428EK

-084  UNACCEPTABLE SQL STATEMENT

Explanation: This SQL statement is unacceptable to DB2. One of the following has occurred:
- An attempt has been made to PREPARE or EXECUTE IMMEDIATE an SQL statement that cannot be prepared; refer to the proper SQL statement in DB2 SQL Reference.
- The embedded SQL statement is not an SQL statement supported by DB2.
- The statement referenced an undeclared cursor.
- An attempt was made to prepare an ALLOCATE CURSOR statement but the statement identifier is already associated with a declared cursor.

System Action: The statement cannot be executed.

Programmer Response: If the situation involves an SQL statement that cannot be prepared, the problem is in the source of the SQL statement, not the application program. Thus, no action is necessary unless the source of the SQL statement is the application program itself.

If the situation involves an SQL statement that is not supported by DB2, remove it from the application program and precompile again.

If the situation involves an invalid PREPARE of an ALLOCATE CURSOR statement, change the application program to use a statement identifier that is not associated with a declared cursor.

Destination: 42612
-096  VARIABLE variable-name DOES NOT EXIST OR IS NOT SUPPORTED BY THE SERVER AND A DEFAULT VALUE WAS NOT PROVIDED

Explanation: The GETVARIABLE function was invoked for variable variable-name. However, a value does not exist for a variable with that name, and a default value was not provided.

- If the qualifier is SESSION, a user-defined variable with name variable-name has not been set.
- If the qualifier is SYSIBM, the server does not support a built-in session variable with name variable-name.

System Action: The statement cannot be executed.

Programmer Response: Change the invocation of the function to specify a default variable for variable-name, or change the name of a variable that does exist.

Destination: 42704

-097  THE USE OF LONG VARCHAR OR VARGRAPHIC IS NOT ALLOWED IN THIS CONTEXT

Explanation: The statement attempted to use the LONG VARCHAR or VARGRAPHIC syntax. This syntax cannot be used for the following statements:
- CAST specification syntax
- CREATE DISTINCT TYPE
- CREATE FUNCTION
- CREATE PROCEDURE
- ALTER FUNCTION
- COMMENT ON FUNCTION
- GRANT EXECUTE ON FUNCTION
- REVOKE EXECUTE ON FUNCTION
- DROP

Use the VARCHAR or VARGRAPHIC syntax specifying an explicit length as required.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement.

Destination: 42601

-101  THE STATEMENT IS TOO LONG OR TOO COMPLEX

Explanation: DB2 cannot process the statement because it exceeds the system limits for length or complexity. Enabling parallelism will increase the complexity of the statement.

System Action: DB2 cannot process the statement.

Programmer Response: Divide the statement into shorter or less complex SQL statements.

If the statement enables parallelism, try disabling parallelism. You may do this by using the DEGREE(1) bind option for static SQL, or by setting the CURRENT DEGREE special register to '1' for dynamic SQL.

Destination: 54001

-102  LITERAL STRING IS TOO LONG. STRING BEGINS string

Explanation: The string constant beginning with string has a length greater than the maximum allowed length. Most strings have these limits:
- For a hexadecimal constant (X, GX, or UX), the number of hexadecimal digits must not exceed 32704.
- Any other character string constant must be short enough so that its UTF-8 representation requires no more than 32704 bytes.
- Any other graphic string constant must be short enough so that its UTF-8 representation requires no more than 32698 bytes.

In some contexts, however, the limit is smaller; see the DB2 SQL Reference for the specific cases.

For special registers, the allowable length depends on the particular special register. A string that exceeds the limit can be specified only through assignment from a host variable. If this release of DB2 increases the maximum allowed length of a string constant, then an attempt to exploit the new length before using the New Function Mode produces this SQL return code.

Two consecutive string delimiters are used to represent one string delimiter within the character string, but these count as 2 bytes when calculating the lengths of character string constants.

System Action: The statement cannot be executed.

Programmer Response: The requested function is not available interactively. If the error occurred in the context of an SQL statement embedded in an application program, the desired result can be achieved by assigning the long string to a host variable, and substituting that variable for the string literal in the SQL statement.

Destination: 54002

-103  literal IS AN INVALID NUMERIC LITERAL

Explanation: The indicated 'literal' begins with a digit, but is not a valid integer, decimal, or float literal.

System Action: The statement cannot be executed.

Programmer Response: Correct the invalid literal.

Destination: 42604
-104 ILLEGAL SYMBOL "token". SOME SYMBOLS THAT MIGHT BE LEGAL ARE: token-list

Explanation: A syntax error was detected where the symbol "token" occurs in the SQL statement. The list of symbols that might be legal shows some alternate symbols that could possibly be correct at that point, if the preceding part of the statement is entirely correct.

However, the preceding part of the statement might be incorrect. For example, if an important keyword is omitted, DB2 detects the error later, and not always immediately after the point where the keyword should appear. The list of alternate symbols are only suggestions. Some of those symbols might not even be legal for statements to be executed by DB2. Those symbols are possibly correct for statements sent to other database management systems.

This SQL code will also be issued if the RELEASE TO SAVEPOINT statement is specified without a savepoint name.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement and execute it again.

Destination: 42601

-105 INVALID STRING

Explanation: The statement contains an invalid string. It is neither a character string nor a graphic string.

System Action: The statement cannot be executed.

Programmer Response: Specify the correct format of the string. Check for a graphic string, paired delimiters, the character G or N, and an even number of bytes within the string.

Destination: 42604

-107 THE NAME name IS TOO LONG. MAXIMUM ALLOWABLE SIZE IS size

Explanation: The name is too long. The maximum permissible length for names of that type is indicated by size. For each type of name, the DB2 SQL Reference lists the maximum allowed length. If this release of DB2 increases the maximum allowed length of a name, then an attempt to exploit the new length before using the New Function Mode produces this SQL return code.

System Action: The statement cannot be processed.

Programmer Response: Choose a shorter name for the object.

Destination: 42622

-108 THE NAME name IS QUALIFIED INCORRECTLY

Explanation: The name name is improperly qualified.

A target name on the RENAME statement may not have a qualifier.

System Action: The statement cannot be executed.

Programmer Response: Remove the qualifier and reissue the statement.

Destination: 42601

-109 clause CLAUSE IS NOT PERMITTED

Explanation: The indicated clause is not permitted in the context in which it appears in this SQL statement for the following reasons:

- A subselect cannot have an INTO clause.
- A CREATE VIEW statement cannot have INTO, ORDER BY, or FOR UPDATE clauses.
- An embedded SELECT statement cannot have ORDER BY or FOR UPDATE clauses
- SELECT statements used in cursor declarations cannot have an INTO clause.
- A RAISE_ERROR function can only be used as a select list item if it is cast to some data type using the CAST specification.
- DESCRIBE INPUT statement can not have USING clause.
- QUERYNO cannot be specified as part of an EXPLAIN statement when the EXPLAIN statement contains an 'explainable-sql-statement'.
- The table being updated in a POSITIONED UPDATE statement cannot be assigned a correlation name.
- INPUT SEQUENCE cannot be specified if the table-spec is not included in a select-statement that contains an INSERT statement.
- A SET DATA TYPE clause cannot be specified on ALTER TABLE for an identity column.

If the clause is part of a CREATE INDEX, CREATE TABLE, CREATE TABLESPACE or ALTER TABLESPACE statement, see the appropriate section of the SQL Reference for a description of the valid use of clauses for the statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement.

Destination: 42601

-110 INVALID HEXADECIMAL LITERAL BEGINNING string

Explanation: The string constant that begins with the specified string is invalid because it has at least one of the following errors:
-111  AN AGGREGATE FUNCTION DOES NOT INCLUDE A COLUMN NAME

Explanation: The specification of an aggregate function (for example: AVG, MAX, MIN, or SUM) was invalid because such functions must include a column name in the operand. In a trigger definition, a transition variable specification does not qualify as a column name for this purpose.

This message is still issued with Version 8 prior to New Function Mode.

System Action: The statement cannot be executed.

Programmer Response: Correct the invalid string constant.

Destination: 42606

-112  THE OPERAND OF A AGGREGATE FUNCTION INCLUDES AN AGGREGATE FUNCTION OR A SCALAR FULLSELECT

Explanation: The operand of an aggregate function can be either an expression or DISTINCT followed by an expression. The operand cannot be another aggregate function or a scalar fullselect.

System Action: The statement cannot be executed.

Programmer Response: Correct the function specification. Refer to Chapter 3 of DB2 SQL Reference for information about the proper usage of aggregate functions.

Destination: 42607

-113  INVALID CHARACTER FOUND IN: string, REASON CODE nnn

Explanation: The string contains an invalid character. It can be an SQL ordinary identifier name, a host variable name, or a DBCS comment.

For SBCS SQL ordinary identifiers, names of buffer pools, databases, plans, and storage groups must contain only uppercase alphabetic or national characters and numerics when CHARSET is KATAKANA; the first character must be alphabetic or national.

In some cases, the name of an SQL procedure can contain an underscore character. Please see the DB2 SQL Reference for more information.

The following reason codes apply to SBCS identifiers:

000 An invalid character was found in the SBCS identifier (including the case in which a DBCS identifier was used where only an SBCS identifier is allowed.)

The following reason codes apply to DBCS identifiers or comments:

101 An odd number of bytes exists between the shift-out and the shift-in character.
102 Either a shift-in or shift-out character is missing.
103 DBCS blanks X’4040’ are not allowed.
104 There are no characters between the shift-out and the shift-in characters.
105 Shift-out cannot be the first byte of the DBCS character between the shift-out and the shift-in characters.

System Action: Processing is terminated.

User Response: Correct the name.

Destination: 42602

-114  THE LOCATION NAME location DOES NOT MATCH THE CURRENT SERVER

Explanation: A 3-part SQL procedure name was provided for one of the following SQL statements:

ASSOCIATE LOCATORS
CALL DESCRIBE PROCEDURE

The first part of the SQL procedure name, which specifies the location where the stored procedure resides, did not match the value of the SQL CURRENT SERVER special register.

System Action: The statement cannot be executed.

Programmer Response: Take one of these actions to resolve the mismatch:

- Change the location qualifier to match the CURRENT SERVER special register.
- Issue an SQL CONNECT to the location where the stored procedure resides before issuing the SQL statement. Ensure that the SQL CALL statement is issued before the ASSOCIATE LOCATORS or DESCRIBE PROCEDURE.
- Bind the package containing the 3-part SQL procedure name with the BIND option.
DBPROTOCOL (DRDA). With this option, DB2 implicitly uses the DRDA protocol for remote access to the stored procedure.

- Correct the statements so that the exact syntax used to specify the procedure name on the CALL statement be the same as that on the ASSOCIATE LOCATOR and/or DESCRIBE PROCEDURE. If an unqualified name is used to CALL the procedure, the 1-part name must also be used on the other statements. If the CALL statement is made with a 3-part name, and the current server is the same as the location in the 3-part name, the ASSOCIATE LOCATOR or DESCRIBE procedure can omit the location.

**System Action:** The statement cannot be executed.

**Programmer Response:** No data was updated or deleted.

**Explanation:** The implied function is not supported by DB2. Refer to Chapter 4 of the DB2 SQL Reference for information about the syntax of SQL statements.

**Destination:** 42902

---

### -115

A PREDICATE IS INVALID BECAUSE THE COMPARISON OPERATOR IS FOLLOWED BY A PARENTHESES LIST OR BY ANY OR ALL WITHOUT A SUBQUERY

**Explanation:** A simple comparison like ‘>=’ must not be followed by a list of items. ANY and ALL comparisons must be followed by a subselect, rather than an expression or a list of items.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the SQL statement. Refer to Chapter 5 of the DB2 SQL Reference for information about the syntax of SQL statements.

**Destination:** 42601

---

### -117

THE NUMBER OF VALUES ASSIGNED IS NOT THE SAME AS THE NUMBER OF SPECIFIED OR IMPLIED COLUMNS

**Explanation:** The number of insert values in the value list of the INSERT statement is not the same as the number of object columns specified. Alternatively, the number of values on the right side of an assignment in a SET assignment statement or the SET clause of an UPDATE statement does not match the number of columns on the left side.

**System Action:** The statement cannot be executed. No data was inserted into the object table.

**Programmer Response:** Correct the statement to specify one and only one value for each of the specified object columns.

**Destination:** 42802

---

### -118

THE OBJECT TABLE OR VIEW OF THE DELETE OR UPDATE STATEMENT IS ALSO IDENTIFIED IN A FROM CLAUSE

**Explanation:** The table or view specified as the object of a DELETE or UPDATE statement also appears in the FROM clause of a subselect within the statement.

**System Action:** The statement cannot be executed.

**Programmer Response:** No data was updated or deleted.

**Explanation:** The implied function is not supported by DB2. Refer to Chapter 4 of the DB2 SQL Reference for information about restrictions on operands that can be specified within a WHERE clause, SET clause, VALUES clause, SET host-variable statement, SET transition-variable statement, assignment

**Destination:** 42803
statement, or as the expression of a RETURN
statement.

**Destination:** 42903

---

**-121**  
**THE COLUMN name IS IDENTIFIED MORE THAN ONCE IN THE INSERT OR UPDATE OR SET TRANSITION VARIABLE STATEMENT**

**Explanation:** The same column 'name' is specified more than once, either in the list of object columns of an INSERT statement, in the SET clause of an UPDATE statement, or in a SET transition variable statement.

**System Action:** The statement cannot be executed. No data was inserted or updated in the object table.

**Programmer Response:** Correct the syntax of the statement so that each column name is specified only once.

**Destination:** 42701

---

**-122**  
**A SELECT STATEMENT WITH NO GROUP BY CLAUSE CONTAINS A COLUMN NAME AND AN AGGREGATE FUNCTION IN THE SELECT CLAUSE OR A COLUMN NAME IS CONTAINED IN THE SELECT CLAUSE BUT NOT IN THE GROUP BY CLAUSE**

**Explanation:** The SELECT statement contains one of these errors:

- The statement contains a column name and a aggregate function in the SELECT clause, but no GROUP BY clause.
- A column name is contained in the SELECT clause (possibly within a scalar function) but not in the GROUP BY clause. Grouping expressions can be used in a SELECT list. A grouping expression specifies only one value for each group. A grouping expression that is specified in this context must exactly match a grouping expression that is specified in the GROUP BY clause, except that blanks are not significant.

**Note:** A HAVING clause specified without a GROUP BY clause implies a GROUP BY with no columns. Thus, no column names are allowed in the SELECT clause.

- A sort-key-expression was specified in the ORDER BY clause, the result table contains grouped data, but the select-clause and ORDER BY clause contain a mixture of grouped data and non-grouped data. Grouping expressions can be used in a sort-key-expression of an ORDER BY clause. A grouping expression specifies only one value for each group. A grouping expression that is specified in this context must exactly match a grouping expression that is specified in the GROUP BY clause, except that blanks are not significant.

**System Action:** The statement cannot be executed.

**Programmer Response:** You can correct the statement by:
- including the columns in the GROUP BY clause that are in the SELECT clause, or
- removing the columns from the SELECT clause.

Refer to Chapter 4 of [DB2 SQL Reference](#) for information about the use of GROUP BY clauses in SQL statements.

**Destination:** 42803

---

**-123**  
**THE PARAMETER IN POSITION n IN THE FUNCTION name MUST BE A CONSTANT OR KEYWORD**

**Explanation:** The parameter in position n in the function name is not a constant when it is required to be a constant or a keyword when it is required to be a keyword.

**System Action:** The statement could not be processed.

**Programmer Response:** Action: Ensure that each argument of the function conforms to the definition of the corresponding parameter.

**Destination:** 42601

---

**-125**  
**AN INTEGER IN THE ORDER BY CLAUSE DOES NOT IDENTIFY A COLUMN OF THE RESULT**

**Explanation:** The ORDER BY clause in the statement contains a column number that is either less than one, or greater than the number of columns of the result table (the number of items in the SELECT clause).

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the syntax of the ORDER BY clause such that each column identifier properly denotes a column of the result table.

**Destination:** 42805

---

**-126**  
**THE SELECT STATEMENT CONTAINS BOTH AN UPDATE CLAUSE AND AN ORDER BY CLAUSE**

**Explanation:** The SELECT statement in the declaration for a cursor contains both an UPDATE clause and an ORDER BY clause. Unless you use a scrollable cursor, an ORDER BY clause cannot be specified in the declaration for a cursor that is to be used for UPDATE.

**System Action:** The statement cannot be processed. The cursor remains undefined in the application program.

**Programmer Response:** The implied function is not
supported by DB2. A cursor that is to be used for update cannot be defined to fetch the rows of the object table in a specific order.

Refer to Chapter 4 of [DB2 SQL Reference] for information about restrictions on the declarations for cursors to be used for update.

**Destination:** 42829

---

**-127**

**DISTINCT IS SPECIFIED MORE THAN ONCE IN A SUBSELECT**

**Explanation:** The DISTINCT qualifier can be used only once in a SELECT statement or a subselect.

**Note:** This message is still issued with Version 8 prior to New Function Mode.

**System Action:** The statement cannot be executed.

**Programmer Response:** The implied function is not supported by DB2. Refer to Chapter 4 of [DB2 SQL Reference] for information about restriction on the use of the DISTINCT qualifier.

**Destination:** 42905

---

**-128**

**INVALID USE OF NULL IN A PREDICATE**

**Explanation:** The use of NULL in the search condition does not conform to the rules of SQL syntax.

**System Action:** The statement cannot be executed.

**Programmer Response:** The implied function is not supported by DB2. Refer to Chapter 2 of [DB2 SQL Reference] for information about the proper use of the NULL operand.

**Destination:** 42601

---

**-129**

**THE STATEMENT CONTAINS TOO MANY TABLE NAMES**

**Explanation:** A subselect (including all subqueries) can have a maximum of 225 references to table names.

**System Action:** The statement cannot be executed.

**Programmer Response:** Break the SQL statement into two or more simpler statements with less than 225 table references in each. The count will include the number of base table occurrences from each table or view on the FROM list. Refer to Chapter 4 of [DB2 SQL Reference] for the definition of a subselect.

**Destination:** 54004

---

**-130**

**THE ESCAPE CLAUSE CONSISTS OF MORE THAN ONE CHARACTER, OR THE STRING PATTERN CONTAINS AN INVALID OCCURRENCE OF THE ESCAPE CHARACTER**

**Explanation:** The ESCAPE character must be a single character, either SBCS or DBCS as appropriate. For 'column-name LIKE pattern', the ESCAPE character can only appear in the character string if it is followed by itself, %, or _ (underscore). The Escape Clause cannot be specified if the column name at the left of the LIKE or NOT LIKE has the MIXED subtype.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the string pattern, or choose a different ESCAPE character and change the pattern accordingly, or eliminate the use of the Escape Clause on the LIKE or NOT LIKE predicate where the column name to the left has the MIXED subtype.

**Destination:** 22019 if other than invalid ESCAPE pattern. 22025 if invalid ESCAPE pattern.

---

**-131**

**STATEMENT WITH LIKE PREDICATE HAS INCOMPATIBLE DATA TYPES**

**Explanation:** If the column name at the left of LIKE or NOT LIKE is of type character, the expression at the right and the ESCAPE character must be of type character. If the column name is of type graphic, the expression at the right and the ESCAPE character must be of type graphic.

**System Action:** The statement cannot be executed.

**Programmer Response:** Check the data type of every operand.

**Destination:** 42818

---

**-132**

**AN OPERAND OF value IS NOT VALID**

**Explanation:** The operation value can be the LIKE predicate, the ESCAPE clause, the LOCATE scalar function, or the POSSTR scalar function. The operand or argument of value was not valid for one of the following reasons:

- The match-expression operand of a LIKE or NOT LIKE predicate must be a string expression.
- The pattern-expression operand of the LIKE or NOT LIKE predicate, or search-string argument of the LOCATE or POSSTR function must be a string expression that can be specified by any one of the following:
  - A constant
  - A special register
  - A host variable (including a LOB locator variable)
  - A scalar function whose arguments are any of the above (though nested function invocations cannot be used)
-133  AN AGGREGATE FUNCTION IN A SUBQUERY OF A HAVING CLAUSE IS INVALID BECAUSE ALL COLUMN REFERENCES IN ITS ARGUMENT ARE NOT CORRELATED TO THE GROUP BY RESULT THAT THE HAVING CLAUSE IS APPLIED TO

Explanation: If an aggregate function has a correlated column reference, it must be correlated from within a HAVING clause to the GROUP BY result that the HAVING clause is applied to. All column references in the argument must satisfy this condition.

System Action: The statement cannot be executed.

Destination: 54005

-137  THE LENGTH RESULTING FROM operation IS GREATER THAN maximum-length

Explanation: The length of the result of concatenation or a function exceeds the defined maximum. The operation that resulted in the error is operation.
-138 • -144

-138  
THE SECOND OR THIRD ARGUMENT OF THE SUBSTR FUNCTION IS OUT OF RANGE

Explanation: One of the following conditions exists:
- The second argument of the SUBSTR function is less than 1 or greater than M.
- The third argument of the SUBSTR function is an integer constant 0 or an expression whose value is less than 0 or greater than M−N+1.

M is the length of the first argument, if it is of fixed-length, or M is the maximum length of the first argument, if it is of varying-length. N is the value of the second argument.

System Action: The statement cannot be executed.
Programmer Response: Ensure that the second and third arguments of the SUBSTR function have legal values according to the above rules.
Destination: 22011

-142  
THE SQL STATEMENT IS NOT SUPPORTED

Explanation: An SQL statement was detected that is not supported by the database. The statement might be valid for other IBM relational database products or it might be valid in another context. For example, statements such as VALUES and SIGNAL SQLSTATE can appear only inside a trigger. The SQLCODE is also issued if a DB2 private protocol application uses SQL statements that were added after Version 7. DB2 limits the SQL statements that a DB2 private protocol application can use to Version 7 or earlier SQL statements. See Part 4 of [DB2 Application Programming and SQL Guide](https://www.ibm.com/support/docview.ws/docid/57408) for more information.

Additionally, this SQL code will also be issued if a distributed private protocol application uses SQL statements that were implemented after Version 7. DB2 limits the SQL statements that a distributed private protocol application can use to Version 7 or lower SQL statements. Please see "MOVING FROM DB2 PRIVATE PROTOCOL ACCESS TO DRDA ACCESS" in [DB2 Application Programming and SQL Guide](https://www.ibm.com/support/docview.ws/docid/57408) for more information.

System Action: The statement cannot be executed.

Programmer Response: Change the syntax of the SQL statement or remove the statement from the program.
Destination: 42612

-144  
INVALID SECTION NUMBER number

Explanation: One of the following:
1. The user attempted to execute an invalid section.
2. This release of DB2 does not support the SQL statement.
3. The section number in the call parameter list is one of these:
   - Negative
   - An invalid duplicate
   - Greater than the maximum section number of the DBRM or package.

System Action: The statement is not executed.
Programmer Response: For case 1: If you are executing a package that was bound with SQLERROR(CONTINUE), determine whether the statement in question was bound as a valid section. You can use the following statements to query the DB2 catalog:

```sql
SELECT SQLERROR FROM SYSIBM.SYSPACK
WHERE COLLID = collection-id AND
NAME = package-id AND
VERSION = version-name;
```

If that query returns 'C', the package was bound with SQLERROR(CONTINUE).

```sql
SELECT STMTNO, TEXT
FROM SYSIBM.SYSPACKSTMT
WHERE COLLID = collection-id AND
NAME = package-id AND
VERSION = version-name AND
SECTNO = number AND
BINDERROR = 'Y';
```

If that query returns any rows, the section is invalid. Refer to the error messages issued during the bind to determine the cause. Correct any errors and bind the package again, using the REPLACE option.

For case 2: If the DB2 system has fallen back to a previous release, determine whether there are any SQL statements with a section number of zero that are not supported by that release. You can use the following statements to query the DB2 catalog:

```sql
SELECT * FROM SYSIBM.SYSTMT
WHERE SECTNO = 0
ORDER BY NAME, PLNAME, STMTNO, SEQNO;
```

When executing from a DBRM, use:

```sql
SELECT *
FROM SYSIBM.SYSTMT
WHERE SECTNO = 0
ORDER BY NAME, PLNAME, STMTNO, SEQNO;
```

When executing from a package, use:
For case 3: Examine the application to determine whether the call parameter list was changed in some way. In general, you should not attempt to change the output of the precompiler.

Destination: 58003

-147 ALTER FUNCTION function-name FAILED BECAUSE SOURCE FUNCTIONS CANNOT BE ALTERED

Explanation: The function cannot be altered because it is a source function. Only external scalar functions, or external table functions can be altered.

To change an existing source function, you must DROP the function and recreate it.

System Action: The statement cannot be executed.

Programmer Response: Change the statement to refer to a function that can be altered, or recreate the function by dropping it and then creating a new version of it.

Destination: 42809

-148 THE SOURCE TABLE source-name CANNOT BE RENAMED OR ALTERED

Explanation: Possible cases:

1. The RENAME statement cannot be used to rename a view, an active RLST table, or a table for which a synonym is defined.

2. The ALTER statement cannot be used to alter the length of the column because the column is referenced in a referential integrity relation, a user exit (field procedure, edit procedure, valid procedure, stored procedure or user defined function), a global temporary table, or a table defined with data capture changes. If the table name specified in the alter is a view or if there exists a row in SYSVIEWDEP that has source-name as a base table name, then this ALTER statement will fail.

System Action: The statement cannot be executed.

Programmer Response: For case:

1. Drop all views, inactivate the RLST table, or drop the synonym.

2. Avoid referential integrity relations, user exits, or global temporary tables.

3. Run REORG INDEX, REORG TABLESPACE, or REBUILD INDEX. If the index is partitioned, then run the utility on all the partitions. Reissue the statement.

Destination: 42809

-150 THE OBJECT OF THE INSERT, DELETE, OR UPDATE STATEMENT IS A VIEW, SYSTEM-MAINTAINED MATERIALIZED QUERY TABLE, OR TRANSITION TABLE FOR WHICH THE REQUESTED OPERATION IS NOT PERMITTED

Explanation: One of the following occurred:

- A transition table was named in an INSERT, UPDATE, or DELETE statement in a triggered action. Transition tables are read-only.

- The view named in the INSERT, UPDATE, or DELETE statement is defined in such a way that the requested insert, update, or delete operation cannot be performed upon it.

Inserts into a view are prohibited if:

- The view definition contains a join, a GROUP BY, or a HAVING clause.

- The SELECT clause in the view definition contains the DISTINCT qualifier, an arithmetic expression, a string expression, a built-in function, or a constant.

- Two or more columns of the view are derived from the same column.

- A base table of the view contains a column that does not have a default value and is not included in the view.

Updates to a view are prohibited if:

- The view definition contains a join, a GROUP BY, or a HAVING clause.

- The SELECT clause in the view definition contains the DISTINCT qualifier or a function.

Also, a given column in a view cannot be updated (that is, the values in that column cannot be updated) if the column is derived from an arithmetic expression, a constant, a column that is part of the key of a partitioned index, or a column of a catalog table that cannot be updated.

Deletes against a view are prohibited if:

- The view definition contains a join, a GROUP BY, or a HAVING clause.

- The SELECT clause in the view definition contains the DISTINCT qualifier or a built-in function.

- A system-maintained materialized query table was named in an INSERT, UPDATE, or DELETE statement. System-maintained materialized query tables are refreshed using the REFRESH TABLE statement.

System Action: The statement cannot be executed. No data was inserted, updated, or deleted.
Programmer Response: The requested function cannot be performed on the view. Refer to Chapter 5 of [DB2 SQL Reference] for further information regarding inserting, deleting, and updating views.

If the error occurred on a CREATE TRIGGER statement, remove the INSERT, UPDATE, or DELETE reference to the transition table.

If the table is a system-maintained materialized query table, the requested function cannot be performed on that table. Refer to the description of the REFRESH TABLE statement in Chapter 5 of [DB2 SQL Reference].

Destination: 42807

-151 THE UPDATE STATEMENT IS INVALID BECAUSE THE CATALOG DESCRIPTION OF COLUMN column-name INDICATES THAT IT CANNOT BE UPDATED

Explanation: The specified column cannot be updated for one of the following reasons:

• The values for columns occurring in the partitioning key of a partitioned table cannot be updated.
• The object table is a view and the specified column is defined (in the definition of the view) in such a way that it cannot be updated.
• The object table is a catalog table with no columns that can be updated.
• The object column is a ROWID column.
• The object column is defined with the AS IDENTITY and GENERATED ALWAYS attributes.
• The specified column of catalog tables cannot be updated because the column itself is not updatable.

Individual columns in a view cannot be updated for one of the following reasons:

• The column is derived from an SQL function, an arithmetic expression, or a constant.
• The column is defined for a column of an underlying view that cannot be updated.
• The column is defined for a read-only view.
• The column is defined for a column that is in the partitioning key of a partitioned table.

System Action: The statement cannot be executed. No data was updated in the object table or view.

Programmer Response: The requested function is not supported by DB2. Refer to the description of the UPDATE statement in Chapter 5 of [DB2 SQL Reference] for information about restrictions on the ability to update ROWID columns, identity columns, and columns in partitioned tables and views.

Destination: 42808

-152 THE DROP clause CLAUSE IN THE ALTER STATEMENT IS INVALID BECAUSE constraint-name IS A constraint-type

Explanation: The DROP clause of an ALTER TABLE statement tried to drop a constraint that does not match the constraint-type in the DROP clause. clause must identify an appropriate constraint-type as follows:

REFERENTIAL CONSTRAINT The identified constraint must be a referential constraint.

CHECK CONSTRAINT The identified constraint must be a check constraint.

PRIMARY KEY CONSTRAINT The identified constraint must be a primary key constraint.

UNIQUE KEY CONSTRAINT The identified constraint must be a unique key constraint.

System Action: The ALTER TABLE DROP statement cannot be executed. No object was dropped.

Programmer Response: Drop the existing object with the correct DROP clause of the ALTER TABLE statement.

Destination: 42809

-153 THE STATEMENT IS INVALID BECAUSE THE VIEW OR TABLE DEFINITION DOES NOT INCLUDE A UNIQUE NAME FOR EACH COLUMN

Explanation: You must specify a list of column names if the result table of the fullselect that is specified in the CREATE VIEW, CREATE TABLE, or DECLARE GLOBAL TEMPORARY TABLE statement has duplicate column names or an unnamed column (a column from a constant, function, or expression).

System Action: The statement cannot be executed. The specified view or table was not created, or the declared temporary table was not declared.

Programmer Response: Correct the statement by providing a list of names for the columns of the view or table. Refer to Chapter 5 of [DB2 SQL Reference] for information about the syntax of the CREATE VIEW statement, the CREATE TABLE statement, or the DECLARE GLOBAL TEMPORARY TABLE statement.

Destination: 42908
-154  THE STATEMENT FAILED BECAUSE VIEW OR TABLE DEFINITION IS NOT VALID

Explanation:  The view defined in the CREATE VIEW statement, the table defined in the CREATE TABLE statement, or the table declared in the DECLARE GLOBAL TEMPORARY TABLE statement is not valid because the view or table definition references a remote object.

System Action:  The statement cannot be executed. The specified object is not defined.

Programmer Response:  Refer to Chapter 5 of [DB2 SQL Reference] for information about restrictions on the definitions for views, materialized query tables, or declared temporary tables.

Destination:  42909

-156  THE STATEMENT DOES NOT IDENTIFY A TABLE

Explanation:  The statements ALTER TABLE, DROP TABLE, LOCK TABLE, CREATE INDEX, and CREATE TRIGGER apply only to tables. Indexes and triggers can be defined only on tables.

System Action:  The statement cannot be executed. The specified view or remote object was not altered, dropped, or locked, or the index or trigger was not created.

Programmer Response:  Verify that the proper name was specified in the statement.

Destination:  42809

-157  ONLY A TABLE NAME CAN BE SPECIFIED IN A FOREIGN KEY CLAUSE. object-name IS NOT THE NAME OF A TABLE.

Explanation:  The indicated object was identified in a FOREIGN KEY clause of a CREATE or ALTER TABLE statement. A FOREIGN KEY clause must identify a table.

System Action:  The statement cannot be executed.

Programmer Response:  Correct the statement to specify a table name in the foreign key clause.

Destination:  42810

-158  THE NUMBER OF COLUMNS SPECIFIED FOR THE VIEW OR TABLE IS NOT THE SAME AS THE NUMBER OF COLUMNS SPECIFIED BY THE FULLSELECT, OR THE NUMBER OF COLUMNS SPECIFIED IN THE CORRELATION CLAUSE IN A FROM CLAUSE IS NOT THE SAME AS THE NUMBER OF COLUMNS IN THE CORRESPONDING TABLE, VIEW, TABLE EXPRESSION, OR TABLE FUNCTION

Explanation:  There are three potential reasons for this SQL code:

- The number of column names that are specified for a view in a CREATE VIEW statement must equal the number of elements that are specified in the SELECT clauses of the following fullselect. These elements may be column names, SQL functions, and expressions, for example.

- The number of column names that are specified for a table in a CREATE TABLE statement must equal the number of columns in the result table of the following fullselect.

- The number of column names that are specified in a correlation clause must equal the number of columns in the corresponding table, view, table expression or table function.

System Action:  The statement cannot be executed.

Programmer Response:  Correct the syntax of the statement to specify a column name for each column in the corresponding object (table, view, etc.). Refer to Chapter 5 of [DB2 SQL Reference] for information about the syntax of the statement.

Destination:  42811

-159  THE STATEMENT REFERENCES object-name WHICH IDENTIFIES AN object-type RATHER THAN AN expected-object-type

Explanation:  The object object-name was specified as part of a statement, and refers to an object of type object-type instead of the expected type expected-object-type. The type of the object that is provided with the statement must match the type that is identified by expected-object-type. For example, if the statement is DROP ALIAS TED.T1, then TED.T1 must be an alias name.

If object-type or expected-object-type is TABLE, and object-type or expected-object-type is a particular type of table, then the type of table was not valid for the statement that was specified.

System Action:  The statement cannot be executed.

Programmer Response:  Change the statement to match the type of object that is identified by
of the object view (and underlying base table) remain unchanged.

**Programmer Response:** Examine the view definition to determine why the requested INSERT or UPDATE was rejected. Note that this may be a data-dependent condition.

**Destination:** 44000

---

**-160**

**THE WITH CHECK OPTION CANNOT BE USED FOR THE SPECIFIED VIEW**

**Explanation:** The WITH CHECK OPTION does not apply to a view definition under either of the following circumstances:

- The view is read-only (for example, the view definition includes DISTINCT GROUP BY, or JOIN).
- The view definition includes a subquery.

**System Action:** The statement cannot be executed. The specified view was not created.

**Programmer Response:** Refer to Chapter 5 of *DB2 SQL Reference* for rules regarding use of the WITH CHECK OPTION in view definitions.

**Destination:** 42813

---

**-170**

**THE NUMBER OF ARGUMENTS SPECIFIED FOR function-name IS INVALID**

**Explanation:** An SQL statement includes the scalar function ‘function-name’ with either too many or too few arguments.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the statement. Refer to Chapter 3 of *DB2 SQL Reference* for information about the number of arguments required by the scalar function ‘function-name’.

**Destination:** 42605

---

**-171**

**THE DATA TYPE, LENGTH, OR VALUE OF ARGUMENT nn OF function-name IS INVALID**

**Explanation:** Either the data type, the length or the value of argument nn of scalar function function-name is incorrect.

If the encoding scheme is EBCDIC or ASCII, a possible reason for this error is that a character argument was specified for a built-in function that expects a graphic argument, or a graphic argument was specified for a built-in function that expects a character argument. The UNICODE encoding scheme does support the mixing of character and graphic arguments.
System Action: The statement cannot be executed.

Programmer Response: Correct the statement. Refer to Chapter 3 of [DB2 SQL Reference] for rules for each argument of the scalar function function-name.

Destination: 42815

-181 THE STRING REPRESENTATION OF A DATETIME VALUE IS NOT A VALID DATETIME VALUE

Explanation: The string representation of a datetime is not in the acceptable range or is not in the correct format. The proper ranges for datetime values are as follows:

<table>
<thead>
<tr>
<th>Datetime</th>
<th>Numeric Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Years</td>
<td>0001 to 9999</td>
</tr>
<tr>
<td>Months</td>
<td>0 to 12</td>
</tr>
<tr>
<td>Days</td>
<td>0 to 31</td>
</tr>
<tr>
<td>Hours</td>
<td>0 to 24</td>
</tr>
<tr>
<td>Minutes</td>
<td>0 to 59</td>
</tr>
<tr>
<td>Seconds</td>
<td>0 to 59</td>
</tr>
<tr>
<td>Microseconds</td>
<td>0 to 999999</td>
</tr>
</tbody>
</table>

System Action: The statement cannot be executed.

Programmer Response: Check whether the value is within the valid range and is in the proper format. Refer to Chapter 2 of [DB2 SQL Reference] for information on string data formats.

Destination: 22007

-182 AN ARITHMETIC EXPRESSION WITH A DATETIME VALUE IS INVALID

Explanation: The specified arithmetic expression contains an improperly used datetime value or labeled duration.

Programmer Response: Correct the indicated arithmetic expression.

Destination: 42816

-183 AN ARITHMETIC OPERATION ON A DATE OR TIMESTAMP HAS A RESULT THAT IS NOT WITHIN THE VALID RANGE OF DATES

Explanation: The result of an arithmetic operation is a date or timestamp that is not within the valid range of dates which are between 0001-01-01 and 9999-12-31.
System Action: The statement cannot be executed.

Programmer Response: Examine the SQL statement to see if the cause of the problem can be determined. The problem may be data-dependent, in which case it will be necessary to examine the data that was processed at the time the error occurred.

Destination: 22008

---

**-184**

**AN ARITHMETIC EXPRESSION WITH A DATETIME VALUE CONTAINS A PARAMETER MARKER**

Explanation: The specified arithmetic expression contains a parameter marker improperly used with a datetime value.

System Action: The statement cannot be executed.

Programmer Response: Correct the indicated arithmetic expression.

Destination: 42610

---

**-185**

**THE LOCAL FORMAT OPTION HAS BEEN USED WITH A DATE OR TIME AND NO LOCAL EXIT HAS BEEN INSTALLED**

Explanation: The local format option has been used with a datetime value and no datetime exit has been installed. This may occur if the LOCAL DATE LENGTH or LOCAL TIME LENGTH on the Installation Application Programming Defaults Panel indicated that an exit for datetime was supplied, but in fact the exit supplied by DB2 was not replaced. This may also occur if the datetime exit was replaced and the corresponding LOCAL DATE LENGTH or LOCAL TIME LENGTH on the Installation Application Programming Defaults Panel was not set to a nonzero value.

System Action: The statement cannot be executed.

Programmer Response: Contact the system programmer about installation of the date or time exit.

Destination: 57008

---

**-186**

**THE LOCAL DATE LENGTH OR LOCAL TIME LENGTH HAS BEEN INCREASED AND EXECUTING PROGRAM RELIES ON THE OLD LENGTH**

Explanation: The local format option has been used with a datetime value and DB2 has discovered that the datetime exit routine has been changed to produce a longer local format.

System Action: The statement cannot be executed.

Programmer Response: If the statement receiving this error is embedded in the application program, then a REBIND must be issued for the application plan. If the statement was dynamic SQL, then the statement can be reentered.

Destination: 22505

---

**-187**

**A REFERENCE TO A CURRENT DATETIME SPECIAL REGISTER IS INVALID BECAUSE THE MVS TOD CLOCK IS BAD OR THE MVS PARMTZ IS OUT OF RANGE**

Explanation: DB2 has encountered an invalid time-of-day (TOD) clock. The user referenced one of the special registers: CURRENT DATE, CURRENT TIME, CURRENT TIMESTAMP, or CURRENT TIMEZONE. If the user referenced CURRENT TIMEZONE, the MVS parameter PARMTZ was out of range.

System Action: The statement cannot be executed.

Programmer Response: For CURRENT TIMEZONE, check that the MVS parameter PARMTZ is between –24 and +24 hours. For the other CURRENT special registers, check that the MVS TOD clock has been set correctly.

Destination: 22506

---

**-188**

**THE STRING REPRESENTATION OF A NAME IS INVALID**

Explanation: The host variable referenced in the DESCRIBE statement does not contain a valid string representation of a name. One of the following error conditions has occurred.

- The first byte of the variable is a period or a blank.
- The number of identifiers is greater than 3.
- An identifier is too long.
- A period not contained in a delimited identifier is followed by a period or a blank.
- A delimited identifier is followed by a character other than a period or a blank.
- A delimited identifier is not terminated by a quotation mark.

System Action: The statement cannot be executed.

Programmer Response: Correct the value of the host variable so that it is a valid string representation of a name.

Destination: 22503

---

**-189**

**CCSID ccsid IS INVALID**

Explanation: To determine the subtype of an input host variable or result column, the SYSSTRINGS catalog table was accessed with the specified CCSID and:

- The CCSID is not a value of either INCCSID or OUTCCSID, or
- The TRANSTYPE column classifies the CCSID as GRAPHIC rather than CHARACTER, or

...
-190  THE ATTRIBUTES SPECIFIED FOR THE COLUMN column-name ARE NOT COMPATIBLE WITH THE EXISTING COLUMN DEFINITION

Explanation: The attributes that were specified in the ALTER COLUMN clause for the column column-name of the table table-name in an ALTER TABLE statement are not compatible with the attributes of the existing column. The error was returned for one of the following reasons:

• If a SET DATA TYPE clause is specified, the existing column is not compatible with the new data type that was specified, or is of a data type that cannot be changed. The ALTER TABLE ALTER COLUMN SET DATA TYPE statement only allows changing columns of data type character or numeric.

• If a RESTART, SET GENERATED, SET INCREMENT BY, SET MINVALUE, SET NO MINVALUE, SET MAXVALUE, SET NO MAXVALUE, SET CYCLE, SET NO CYCLE, SET CACHE, SET NO CACHE, SET ORDER, or SET NO ORDER clause is specified, the existing column is not defined as an identity column. These clauses can only be specified for a column that is defined as an identity column.

System Action: The statement cannot be executed.

Programmer Response: Make the attributes that are specified in the statement compatible with the existing column definition, remove the attribute specification, or specify a different column name.

Destination: 42877

-191  A STRING CANNOT BE USED BECAUSE IT IS INVALID MIXED DATA

Explanation: The operation required the translation of a mixed data character string to a different coded character set. The string could not be translated because it does not conform to the rules for well-formed mixed data. For example, the string contains EBCDIC shift codes that are not properly paired.

System Action: The statement cannot be executed.

Programmer Response: If the string contains the intended information, the description of the column or host variable should be changed from MIXED DATA to BIT or SBCS DATA. If the description of the column or host variable is correct, the string is the problem and it must be changed to conform to the rules for well-formed mixed data. For more information about well-formed MIXED DATA refer to Chapter 2 of DB2 SQL Reference.

Destination: 22504

-197  QUALIFIED COLUMN NAMES IN ORDER BY CLAUSE NOT PERMITTED WHEN UNION OR UNION ALL SPECIFIED

Explanation: A SELECT statement that specifies both the union of two or more tables and the ORDER BY clause cannot use qualified column names in the ORDER BY clause.

Programmer Response: Change the statement so that qualified names are not necessary in the ORDER BY clause.

System Action: The statement is not executed.

Destination: 42877

<tr>
<td>-206</td>
<td>column-name IS NOT A COLUMN OF AN INSERTED TABLE, UPDATED TABLE, OR ANY TABLE IDENTIFIED IN A FROM CLAUSE, OR IS NOT A COLUMN OF THE TRIGGERING TABLE OF A TRIGGER</td>
<td>This return code is used to report one of the following errors: • In the case of an INSERT or UPDATE statement, the specified column is not a column of the table or view that was specified as the object of the insert or update.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
• In the case of an INSERT with VALUES clause, there is a column referenced and columns are not allowed in the VALUES clause.
• In the case of a SELECT or DELETE statement, the specified column is not a column of any of the tables or views identified in a FROM clause in the statement.
• There is a correlated reference in the GROUP BY clause in the select list of a subselect, or a correlated reference is not used in a search condition.
• There is an unresolved qualified reference in HAVING.
• For a CREATE TRIGGER statement:
  – A reference is made to a column using an OLD or NEW correlation name. The column name is not defined in the triggering table.
  – The left side of an assignment in the SET transition-variable statement in the triggered action specifies an old transition variable where only a new transition variable is supported or trigger was not created.

System Action: The statement cannot be executed. No data was retrieved, inserted, or updated or the trigger was not created.

Programmer Response: Verify that the column and table names are specified correctly in the SQL statement. In the case of a SELECT statement, check to be sure that all of the required SELECT tables were named in the FROM clause.

In the case of a CREATE TRIGGER statement, ensure that only new transition variables are specified on the left side of assignments in the SET transition-variable statement and that any reference to columns of the triggering table are qualified with a transition variable correlation name.

Destination: 42703

-208 THE ORDER BY CLAUSE IS INVALID BECAUSE COLUMN name IS NOT PART OF THE RESULT TABLE

Explanation: The statement is invalid because a column ('name') specified in the ORDER BY list does not appear in the result table (that is, it is not specified in the SELECT-list). Only columns in the result table can be used to order that result when the fullselect of the select-statement is not a subselect.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the statement, either by adding the specified column to the result table, or deleting it from the ORDER BY clause. Refer to Chapter 4 of [DB2 SQL Reference] for information about restrictions on the use of the ORDER BY clause to order the result of an SQL SELECT.

Destination: 42707

-212 name IS SPECIFIED MORE THAN ONCE IN THE REFERENCING CLAUSE OF A TRIGGER DEFINITION

Explanation: The REFERENCING clause of a CREATE TRIGGER statement specified the same name for more than one of the OLD or NEW correlation names or the OLD_TABLE or NEW_TABLE identifiers. name is the name that was specified multiple times.

System Action: The statement cannot be executed. The trigger was not created.

Programmer Response: Change the statement to specify unique names for all transition variables and tables in the REFERENCING clause and resubmit the CREATE TRIGGER request.

Destination: 42712

-214 AN EXPRESSION IN THE FOLLOWING POSITION, OR STARTING WITH position-or-expression-start IN THE clause-type CLAUSE IS NOT VALID. REASON CODE = reason-code

Explanation: The expression identified by the first part of the expression expression-start in the clause-type clause is not valid for the reason specified by the reason-code as follows:

1. The fullselect of the select-statement is not a subselect. Expressions are not allowed in the ORDER BY clause for this type of select-statement. This reason code occurs only when clause-type is ORDER BY.

2. DISTINCT is specified in the select clause, and either a column name in the ORDER BY clause cannot be matched exactly with a column name in the SELECT list, or a sort-key-expression is specified in the ORDER BY clause. This reason code occurs only when clause-type is ORDER BY.

3. The select list includes an aggregate function or the subselect includes a GROUP BY clause and the expression is not an aggregate function or does not match exactly with an expression in the select list.

4. Grouping is caused by the presence of an aggregate function in the ORDER BY clause. This reason code occurs only when clause-type is ORDER BY.

5. Expression in a GROUP BY clause cannot contain a scalar-fullselect. This reason code occurs only when clause-type is GROUP BY.

6. Invalid use of scalar-fullselect. This reason code can be issued when the RETURN statement of an SQL function contains a scalar-fullselect, or a scalar-fullselect is passed as an argument on a CALL statement for a parameter that is defined as an input parameter (IN).

System Action: The statement cannot be executed.

Programmer Response: Modify the select-statement
based on the reason specified by the reason-code as follows:

1. Remove the expression from the ORDER BY clause. If attempting to reference a column of the result, change the sort key to the simple-integer or simple-column-name form. See the ORDER BY syntax diagram in the DB2 SQL Reference for more information.
2. Remove DISTINCT from the select clause.
3. Remove DISTINCT from the SELECT clause.
4. Change the expression in the ORDER BY or GROUP BY clause to an aggregate function or change the clause to use a numeric column identifier or a column name.
5. Add a GROUP BY clause or remove the aggregate function from the ORDER BY clause.
6. Remove the scalar fullselect from the GROUP BY clause.
7. Remove the scalar fullselect from the statement.

**Destination:** 42822

---

**-216**

**THE NUMBER OF ELEMENTS ON EACH SIDE OF A PREDICATE OPERATOR DOES NOT MATCH**

**Explanation:** The number of expressions specified on the left-hand side of OPERATOR operator is unequal to either the number of values returned by the fullselect or to the number of expressions specified on the right-hand side of the operator. The number of expressions and the number of values/expressions on either side of the operator must be equal.

**System Action:** The statement was not executed.

**Programmer Response:** Change the number of expressions to match the number of values returned by the fullselect or vice versa.

**Destination:** 428C4

---

**-219**

**THE REQUIRED EXPLANATION TABLE table-name DOES NOT EXIST**

**Explanation:** The EXPLAIN statement assumes the existence of the explanation table and it is not defined in the DB2 subsystem as a base table. Refer to Chapter 5 of [DB2 SQL Reference] for more information.

**System Action:** The statement cannot be executed.

**Programmer Response:** Determine whether the required explanation table does exist. If not, create the required table.

**Destination:** 42704

---

**-220**

**THE COLUMN column-name IN EXPLANATION TABLE table-name IS NOT DEFINED PROPERLY**

**Explanation:** An error occurred during the insertion of a row into the explanation table. The table is improperly defined for the following reasons:

- A column is missing.
- Columns are defined in the wrong order.
- The table contains an extra column.
- A column description is invalid because of its name, data type, length, or null attributes.

**System Action:** The statement cannot be executed. The explanation information is not generated.

**Programmer Response:** Correct the definition of the required explanation table. Refer to Chapter 5 of [DB2 SQL Reference] for information on defining an explanation table.

**Destination:** 55002

---

**-221**

**"SET OF OPTIONAL COLUMNS" IN EXPLANATION TABLE table-name IS INCOMPLETE. OPTIONAL COLUMN column-name IS MISSING**

**Explanation:** The EXPLAIN statement assumes the required explanation table is defined properly. The optional column indicated is not defined in the indicated explanation table. PLAN_TABLEs must have one of several specific formats. The format chosen must be complete, and each column in the PLAN_TABLE definition must be correct for the chosen format. The allowed formats for the PLAN_TABLE are described in Chapter 6 of [DB2 SQL Reference].

**System Action:** The explanation information is not generated.

**Programmer Response:** Correct the definition of the required explanation table to include all of the optional columns in the chosen format, just the Version 2 Release 2 optional columns, or no optional columns. Refer to Chapter 5 of [DB2 SQL Reference] for information on defining an explanation table.

**Destination:** 55002

---

**-222**

**AN UPDATE OR DELETE OPERATION WAS ATTEMPTED AGAINST A HOLE USING CURSOR cursor-name**

**Explanation:** DB2 could not process a positioned update or delete with cursor cursor-name that is defined as SENSITIVE STATIC. The selected row is either a delete hole or an update hole. DB2 detects these holes when DB2 tries to delete or update the current row of the result table for cursor cursor-name, and cannot locate the corresponding row of the underlying table.

A delete hole occurs when the corresponding row of the
underlying table has been deleted.

An update hole occurs when the corresponding row of the underlying table has been updated, and the updated row no longer satisfies the search condition that is specified in the SELECT statement of the cursor.

**System Action:** The statement cannot be processed. The cursor is positioned on the hole.

**Programmer Response:** Issue a FETCH statement to position the cursor on a row.

**Destination:** 24510

---

**-224**

**THE RESULT TABLE DOES NOT AGREE WITH THE BASE TABLE USING cursor-name**

**Explanation:** DB2 attempted a positioned UPDATE or DELETE was attempted on a row that no longer matches its previous condition. The column values in the result table row do not match the current values in the base table row because the row was updated between the time it was inserted into the result table and the positioned update or delete was executed.

**cursor-name**

Name of the cursor used for the positioned update or delete.

**System Action:** The statement cannot be processed. The cursor is positioned on the same row.

**Programmer Response:** Correct the application program to handle this error condition or change isolation levels so the base row cannot be updated during the cursor operation.

**Destination:** 24512

---

**-225**

**FETCH STATEMENT FOR cursor-name IS NOT VALID BECAUSE THE CURSOR IS NOT DEFINED AS SCROLL**

**Explanation:** DB2 could not process a FETCH statement for cursor cursor-name because it contained a disallowed keyword. You may only specify the keyword NEXT for non-scrollable cursors. The keywords PRIOR, FIRST, LAST, ABSOLUTE, RELATIVE, CURRENT, BEFORE, and AFTER are disallowed for a cursor that was not declared with the SCROLL attribute.

**cursor-name**

Name of the cursor used for the FETCH statement.

**System Action:** The statement cannot be processed.

**Programmer Response:** Correct the FETCH statement to exclude the disallowed keyword, or correct the DECLARE CURSOR statement to include the appropriate SCROLL option.

**Destination:** 42872

---

**-227**

**FETCH fetch-orientation IS NOT ALLOWED, BECAUSE CURSOR cursor-name HAS AN UNKNOWN POSITION (sqlcode,sqlstate)**

**Explanation:** The cursor position for cursor-name is unknown. The previous multiple-row FETCH for cursor cursor-name resulted in an error (SQLCODE sqlcode, SQLSTATE sqlstate) in the middle of processing multiple rows that were retrieved from DB2. One or more of the requested rows could not be returned to the program following the error, leaving the position of the cursor unknown.

If an indicator structure had been provided on the previous multiple-row FETCH, a positive SQLCODE would have been returned and all of the rows that were retrieved from DB2 could have been returned to the application program.

**System Action:** The statement cannot be processed. The cursor position is not changed.

**Programmer Response:** Close and reopen the cursor to reset the position. For scrollable cursors, you can change the FETCH statement to specify one of the other fetch orientations (such as FIRST, LAST, BEFORE, AFTER, or ABSOLUTE) to establish a valid cursor position and fetch a row of data.

**Destination:** 24513

---

**-228**

**FOR UPDATE CLAUSE SPECIFIED FOR READ-ONLY CURSOR cursor-name**

**Explanation:** A cursor was declared read-only with the INSENSITIVE SCROLL option, but the SELECT statement contained a FOR UPDATE clause.

**cursor-name**

Name of the cursor used for the FETCH.

**System Action:** The statement cannot be processed.

**Programmer Response:** To define a scrollable cursor that is read-only, specify INSENSITIVE SCROLL, but do not specify FOR UPDATE clause. To define a scrollable cursor that can be updated, specify SENSITIVE SCROLL. Correct the application program to DECLARE CURSOR appropriately.

**Destination:** 42620

---

**-229**

**THE LOCALE locale SPECIFIED IN A SET LOCALE OR OTHER STATEMENT THAT IS LOCALE SENSITIVE WAS NOT FOUND**

**Explanation:** The statement attempted to reference a Locale that is not known or not available to DB2. locale is the locale that was either specified on the SET CURRENT LOCALE statement or the locale that was in effect at the time the Locale access was attempted.

**System Action:** The statement cannot be executed.
Programmer Response: If the statement was a SET LOCALE statement, re-specify a locale that is correct (known and available to DB2). Refer to Chapter 3 of SQL Reference for more information on Locales. If the statement was something other than SET LOCALE, then the statement contained a locale sensitive interface (the UPPER function is an example of a locale sensitive interface). Issue "SELECT CURRENT LOCALE FROM SYSPIM.SYSDUMMY1" to determine the value of the LOCALE in use by your program. Possible reasons for this message include an incorrect LOCALE bind option, or an incorrect LOCALE default value specified at installation time (the value of a Locale is not validated until it is needed in a Locale sensitive interface). Because Locales are dynamic in nature, they can be added, created, or deleted at anytime, they are not validated until they are used. Therefore, it is possible to specify a locale that is not valid at installation or bind time.

Destination: 42708

-240 THE PART CLAUSE OF A LOCK TABLE STATEMENT IS INVALID

Explanation: The LOCK TABLE statement is invalid for one of the following reasons:

- It is partitioned, specify a PART clause that identifies the partition you want to lock.

System Action: The LOCK TABLE statement cannot be executed.

Programmer Response: Determine whether the specified table resides in a partitioned table space defined with LOCKPART YES.

- If it is partitioned and defined with LOCKPART YES, specify a PART clause that identifies the partition you want to lock.

- If it is partitioned but does not have the LOCKPART YES attribute and you want to lock a single partition, use ALTER TABLESPACE to change the LOCKPART attribute to YES.

- If it is not partitioned, do not specify the PART clause.

Destination: 428B4

-242 THE OBJECT NAMED object-name OF TYPE object-type WAS SPECIFIED MORE THAN ONCE IN THE LIST OF OBJECTS

Explanation: In a list of object names of type object-type, the object named object-name was specified more than once.

System Action: The statement cannot be processed.

Programmer Response: Correct the error by removing from the list all duplicate occurrences of the object.

Destination: 42713

-243 SENSITIVE CURSOR cursor-name CANNOT BE DEFINED FOR THE SPECIFIED SELECT STATEMENT

Explanation: The cursor cursor-name is defined as SENSITIVE, but the content of the SELECT statement requires DB2 to build a temporary table with the result table of the cursor, and DB2 cannot guarantee that changes made outside the cursor will be visible. This situation occurs when the content of the query making the result table read-only. In this case the cursor must be defined INSENSITIVE or ASENSITIVE.

System Action: The statement cannot be processed.

Programmer Response: Either change the content of the query to result in a result table that is not read-only, or change the type of cursor to be INSENSITIVE or ASENSITIVE.

Destination: 36001

-244 SENSITIVITY sensitivity SPECIFIED ON THE FETCH IS NOT VALID FOR CURSOR cursor-name

Explanation: The sensitivity option specified on FETCH conflicts with the sensitivity option in effect for cursor cursor-name. If a cursor is declared INSENSITIVE, the FETCH statement can only specify INSENSITIVE or nothing. If a cursor is declared SENSITIVE, the FETCH statement can specify INSENSITIVE, SENSITIVE, or nothing.

The keyword INSENSITIVE is not allowed with the FETCH statements if the associated cursor is either:

- Declared as SENSITIVE DYNAMIC SCROLL, or
- The cursor is declared ASENSITIVE, and DB2 selected the maximum allowable sensitivity of SENSITIVE DYNAMIC SCROLL for the associated SELECT statement.

In the case of a non-scrollable cursor, the sensitivity option cannot be specified.

sensitivity
Specified sensitivity for the FETCH statement.

cursor-name
Name of the cursor used for the FETCH statement.

System Action: The statement cannot be processed.

Programmer Response: Change or remove the sensitivity option that is specified on the FETCH.

Destination: 428F4

-245 THE INVOCATION OF FUNCTION routine-name IS AMBIGUOUS

Explanation: DB2 issues this error when an invocation of a function is ambiguous. This occurs when an untyped parameter marker is passed to a function and
there are two or more possible candidate functions to resolve to during function resolution.

**System Action:** The statement cannot be processed.

**Programmer Response:** Fix the problem and retry. This could involve a change to the SQL statement, changing the definition of a function, or a change to the user’s current path. See the [DB2 Application Programming and SQL Guide](#) for details on function resolution.

**Destination:** 428F5

| -246 | **STATEMENT USING CURSOR**
| cursor-name | **SPECIFIED NUMBER OF ROWS num-rows WHICH IS NOT VALID WITH dimension** |

**Explanation:** A multiple-row FETCH or multiple-row INSERT statement is not valid in this context. The number of rows that were specified is not greater than 0 and not less than or equal to 32767, or is greater than the dimension of the host variable array. The number of rows that were specified is num-rows. and the dimension of the array is dimension. If this is a FETCH statement, the cursor name is cursor-name. Otherwise, the cursor name is not applicable.

**System Action:** The statement cannot be processed. The cursor position is unchanged.

**Programmer Response:** Change the application to either declare, or allocate a host-variable-array that is large enough to contain the number of rows specified in the statement, or update the value of num-rows to a value within the valid range.

**Destination:** 42873

| -247 | **A HOLE WAS DETECTED ON A MULTIPLE ROW FETCH STATEMENT USING CURSOR cursor-name, BUT INDICATOR VARIABLES WERE NOT PROVIDED TO DETECT THE CONDITION** |

**Explanation:** A hole was detected on a FETCH statement for multiple rows of data, but no indicator variables were provided to reflect the situation to the application.

**System Action:** The statement cannot be processed.

**Programmer Response:** Change the FETCH statement to provide at least one indicator variable, and resubmit the statement.

**Destination:** 24519

| -248 | **A POSITIONED DELETE OR UPDATE STATEMENT FOR CURSOR cursor-name SPECIFIED ROW n OF A ROWSET, BUT THE ROW IS NOT CONTAINED WITHIN THE CURRENT ROWSET** |

**Explanation:** The FOR row n OF ROWSET clause was specified on a positioned DELETE or UPDATE statement, but row n is not contained within the bound of the rowset. This situation can also occur when row n is within the bounds of the rowset that was requested, but the current rowset contains less than the requested number of rows. In this case, a partial rowset is returned. A partial rowset can occur for various reasons, including an end of data condition or an error that did not result in the closure of the cursor.

**System Action:** The statement cannot be processed.

**Programmer Response:** Reissue the positioned UPDATE or DELETE with a value that corresponds to a row of the current rowset. If the row that is specified is outside of the current rowset, then do the following:

- Use the FOR n ROWS clause on a FETCH CURRENT ROWSET statement to specify that the rowset contains a larger number of rows
- Reissue the positioned UPDATE or DELETE statement.

If this message is issued because a partial rowset was returned,

- Update the application logic to detect that the actual rowset size was less than the rowset size that was requested
- Ensure that a positioned UPDATE or DELETE statement only refers to rows of the current rowset.

**Destination:** 24521

| -249 | **DEFINITION OF ROWSET ACCESS FOR CURSOR cursor-name IS INCONSISTENT WITH THE FETCH ORIENTATION CLAUSE clause SPECIFIED** |

**Explanation:** The clause that was specified as the fetch-orientation for a FETCH statement is inconsistent with the definition of the cursor. What can be specified for fetch-orientation depends on whether the cursor was defined for rowset access:

- A cursor defined WITH ROWSET POSITIONING can only use rowset positioned fetch orientation clauses: NEXT ROWSET, PRIOR ROWSET, FIRST ROWSET, LAST ROWSET, CURRENT ROWSET, or ROWSET STARTING AT.
- A cursor defined WITHOUT ROWSET POSITIONING can only use row positioned fetch orientation keywords: NEXT, PRIOR, FIRST, LAST, BEFORE, AFTER, CURRENT, or ABSOLUTE, RELATIVE.

**System Action:** The statement cannot be processed.
Programmer Response: Correct the fetch orientation, or redefine the cursor.

Destination: 24523

THE LOCAL LOCATION NAME IS NOT DEFINED WHEN PROCESSING A THREE-PART OBJECT NAME

Explanation: A three-part object name (table, view, or alias) cannot be used until the local location name is defined.

System Action: Install or reinstall the DB2 distributed data facility (DDF) with a registered location name for local DB2.

Programmer Response: Define the local location name and then retry the function.

Destination: 42718

TOKEN name IS NOT VALID

Explanation: A location name cannot contain alphabetic extenders. (The standard alphabetic extenders in the United States are #, @, $.)

System Action: The statement cannot be executed

Programmer Response: Correct the name and reissue the statement.

Destination: 42602

A NON-ATOMIC statement STATEMENT SUCCESSFULLY COMPLETED FOR SOME OF THE REQUESTED ROWS, POSSIBLY WITH WARNINGS, AND ONE OR MORE ERRORS

Explanation: A non-atomic statement statement successfully processed some of the rows of data that were requested. However, one or more error conditions occurred, and some warnings may have also occurred. Use GET DIAGNOSTICS to obtain information about the error and warning conditions that occurred.

System Action: One or more rows were successfully processed, but one or more errors or warnings also occurred.

Programmer Response: Analyse the error and warning conditions to determine if the statement should be rolled back.

Destination: 22529

A NON-ATOMIC statement STATEMENT ATTEMPTED TO PROCESS MULTIPLE ROWS OF DATA, BUT ERRORS OCCURRED.

Explanation: A non-atomic statement statement specified that multiple rows of data were to be processed, but errors occurred during the processing of those rows of data. Use GET DIAGNOSTICS to obtain information about the error and warning conditions that occurred.

System Action: One or more rows were successfully processed, but one or more errors or warnings also occurred.

Programmer Response: Analyse the error and warning conditions to determine the appropriate corrective actions.

Destination: 22530

FUNCTION NOT SUPPORTED

Explanation: The statement cannot be processed because it violates one or more of the following restrictions:

- For an ALTER TABLE statement that names a materialized query table, the alterations are limited to either:
  - Changing materialized query table attributes, or turning the materialized query table to a base table, or
  - Using AUDIT, DATA CAPTURE, and ADD OR DROP RESTRICT ON DROP clauses, (but not both in the same statement).
- The length of the column for a base table cannot be altered if that base table is referenced by a materialized query table definition.
- A materialized query table cannot be renamed.
- The XML data type can only be used as a transient data type, and cannot be stored in the database nor returned to an application.

System Action: The statement cannot be processed.

Programmer Response: Alter the materialized query table into a base table before performing the alteration, or drop and recreate the materialized query table.

If this error is caused by an XML data type, input the XML data to one of the functions that accept XML input. Store the output of the function in the database, or return it to the application.

Destination: 42997

THE STRING CONTAINED IN HOST VARIABLE OR PARAMETER position-number IS NOT NUL-TERMINATED

Explanation: A host variable or parameter is invalid. Its entry in the SQLDA is indicated by position-number. The host variable or parameter is a C string variable that is one of the following:

- Used as an input parameter to a stored procedure or function.
• Returned as an output parameter from a stored procedure or function.
• Referenced as an input variable in an embedded SQL statement.
• Used to provide a value for a parameter marker of a dynamic SQL statement.

If the data type of the variable is character string, it is invalid because it does not include 'X’00'. If the data type of the variable is graphic string, it is invalid because it does not include 'X’0000'.

**System Action:** The statement cannot be executed.

**Programmer Response:** Append a NUL-terminator to the end of the string.

**Destination:** 22024

---

**-301 THE VALUE OF INPUT HOST VARIABLE OR PARAMETER NUMBER position-number CANNOT BE USED AS SPECIFIED BECAUSE OF ITS DATA TYPE**

**Explanation:** DB2 received data that could not be used as specified in the statement because its data type is incompatible with the requested operation.

The *position-number* identifies either the host variable number (if the message is issued as a result of an INSERT, UPDATE, DELETE, SELECT, VALUE INTO, or SET assignment statement), or the parameter number (if the message is issued as the result of a CALL statement, or the invocation of a function).

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the application program, function or stored procedure. Ensure that the data type of the indicated input host variable or parameter in the statement is compatible with the way it is used.

**Destination:** 42895

---

**-302 THE VALUE OF INPUT VARIABLE OR PARAMETER NUMBER position-number IS INVALID OR TOO LARGE FOR THE TARGET COLUMN OR THE TARGET VALUE**

**Explanation:** DB2 received data that was invalid or too large to fit in the corresponding column of the table or the corresponding target value. The *position-number* identifies either the host variable number (if the message is issued as a result of an INSERT, UPDATE, DELETE, SELECT, VALUES INTO, or SET assignment statement), or the parameter number (if the message is issued as the result of a CALL statement or the invocation of a function).

One of the following occurred:

• The column is defined as a string and the host variable or parameter contains a string that is too long for the column.
• The column is defined as numeric and the host variable or parameter contains a numeric value too large for the definition of the column.
• The host variable is defined as decimal, but contains invalid decimal data.
• The target value is a string constant and the host variable or parameter contains a string that is too long for the target value.
• The target value is a numeric constant and the host variable or parameter contains a numeric value that is too large for the target value.

**System Action:** The statement cannot be executed.

**Programmer Response:** Verify that table definitions are current and that the host variable has the correct data type.

**Destination:** 42806

---

**-303 A VALUE CANNOT BE ASSIGNED TO OUTPUT HOST VARIABLE NUMBER position-number BECAUSE THE DATA TYPES ARE NOT COMPARABLE**

**Explanation:** A CALL, FETCH, SELECT, VALUES INTO, or SET host-variable statement with an output host variable, whose entry in the output SQLDA is indicated by *position-number*, could not be performed. The data type of the variable was not compatible with the data type of the corresponding SELECT, VALUES INTO, or SET host-variable statement list element. The values of the output host variable and the corresponding list element must be in one of the following categories:

• Both must be numbers.
• Both must be character strings if not using Unicode.
• Both must be graphic strings if not using Unicode.
• Both must be row IDs.

In addition, for datet ime, timestamp values, the host variable must be a character string variable with a correct length.

**System Action:** The CALL, FETCH, SELECT, VALUES INTO, or SET host-variable statement cannot be executed. No data was retrieved.

**Programmer Response:** Verify that table definitions are current and that the host variable has the correct data type.

**Destination:** 42806
-304  A VALUE WITH DATA TYPE data-type1 CANNOT BE ASSIGNED TO A HOST VARIABLE BECAUSE THE VALUE IS NOT WITHIN THE RANGE OF THE HOST VARIABLE IN POSITION position-number WITH DATA TYPE data-type2

Explanation: A CALL, FETCH, SELECT, VALUES INTO, or SET assignment statement with a host variable list or structure in position number position-number failed because the host variable with data type data-type2 was not large enough to hold the retrieved value with data type data-type1.

System Action: The statement cannot be executed. No data was retrieved. If the statement was a FETCH, the cursor remains open.

Programmer Response: Verify that table definitions are current, and that the host variable has the correct data type. See the explanation for SQLCODE -405 for ranges of SQL data types.

Destination: 22003

-305  THE NULL VALUE CANNOT BE ASSIGNED TO OUTPUT HOST VARIABLE position-number BECAUSE NO INDICATOR VARIABLE IS SPECIFIED

Explanation: A FETCH, SELECT, VALUES INTO, or SET assignment statement resulted in the retrieval of a null value to be inserted into the host output variable, designated by entry number 'position-number' of the output SQLDA, for which no indicator variable was provided. An indicator variable must be supplied if a column returns a null value.

System Action: The statement cannot be executed. No data was retrieved.

Programmer Response: Examine the definition of the table that is the object of the statement and correct the application program to provide indicator variables for all host variables into which null values can be retrieved. This includes host variables for columns which can contain null values and host variables which receive the results of aggregate functions whose result table could be empty.

Destination: 22002

-309  A PREDICATE IS INVALID BECAUSE A REFERENCED HOST VARIABLE HAS THE NULL VALUE

Explanation: The statement could not be processed because a host variable appearing in a predicate such as

\[ \text{column-name} = \text{host-variable} \]

had the NULL value. Such a predicate is not permitted when the host variable contains the NULL value even though the object column might contain nulls.

System Action: The statement cannot be executed.

Programmer Response: Rebind the plan or package containing the statement. The condition described is not an error in DB2 Version 2 Release 3 and later releases.

Destination: 22512

-310  DECIMAL HOST VARIABLE OR PARAMETER number CONTAINS NON-DECIMAL DATA

Explanation: DB2 received nondecimal data from either an application (in the form of a host variable), function or a stored procedure (in the form of a parameter that was passed to or from function or a stored procedure).

number Identifies either the host variable number (if the message is issued as a result of a FETCH, INSERT, UPDATE, DELETE, SELECT, VALUES INTO, or SET assignment statement statement), or the parameter number (if the message is issued as the result of the invocation of a function, or a CALL statement).

System Action: The statement cannot be processed.

Programmer Response: Correct the application program or stored procedure. Ensure that all decimal variables or parameters contain valid System/370 packed decimal numbers.

Destination: 22023

-311  THE LENGTH OF INPUT HOST VARIABLE position-number IS NEGATIVE OR GREATER THAN THE MAXIMUM

Explanation: When evaluated, the length specification for input host string variable, whose entry in the SQLDA is indicated by position-number, was negative or greater than the maximum.

System Action: The statement cannot be executed.

Programmer Response: Correct the program to ensure that the lengths of all host string variables are not negative or that they are not greater than the maximum allowed length.

Destination: 22501

-312  variable-name IS AN UNDEFINED OR UNUSABLE HOST VARIABLE OR IS USED IN A DYNAMIC SQL STATEMENT OR A TRIGGER DEFINITION

Explanation: The host variable variable-name appears in the SQL statement, but:
- The SQL statement is a prepared statement, or
- The attributes of the variable are inconsistent with its usage in the SQL statement, or
- The variable is not declared in the application program or
- The variable appeared in one of the triggered SQL statements in a CREATE TRIGGER statement.

**System Action:** The statement cannot be executed.

**Programmer Response:** Verify that
- The variable name is spelled properly in the SQL statement.
- The variable is allowed in the SQL statement.
- The application program contains a declaration for that variable.
- The attributes of the variable are compatible with its use in the statement.

**Destination:** 42618

---

**-313**

**THE NUMBER OF HOST VARIABLES SPECIFIED IS NOT EQUAL TO THE NUMBER OF PARAMETER MARKERS**

**Explanation:** The number of host variables specified in the EXECUTE or OPEN statement is not the same as the number of parameter markers (question marks) appearing in the prepared SQL statement.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the application program so that the number of host variables specified in the EXECUTE or OPEN statement is the same as the number of parameter markers appearing in the prepared SQL statement. The DESCRIBE INPUT SQL statement can be used to determine the expected number of input parameter markers.

**Destination:** 07001

---

**-314**

**THE STATEMENT CONTAINS AN AMBIGUOUS HOST VARIABLE REFERENCE**

**Explanation:** A host variable used in the statement has been defined more than once in this application program causing confusion as to which host variable defined should be used.

**System Action:** The statement cannot be executed.

**Programmer Response:** Make the host variable unique or use qualifications to indicate which host variable definition is to be used.

**Destination:** 42714

---

**-327**

**THE ROW CANNOT BE INSERTED BECAUSE IT IS OUTSIDE THE BOUND OF THE PARTITION RANGE FOR THE LAST PARTITION**

**Explanation:** When a row is inserted, the calculated partition key value for the new row must be within the bounds of a partition (as specified in the VALUES clause of the CREATE INDEX statement).

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the statement to specify a value for the partition key that is within the bounds of the last partition of the partitioned table space.

**Destination:** 22525

---

**-330**

**A STRING CANNOT BE USED BECAUSE IT CANNOT BE CONVERTED. REASON reason-code, CHARACTER code-point, HOST VARIABLE position-number**

**Explanation:** A translation error occurred during the translation of a string to a different coded character set. The type of error is indicated by the `reason-code`:

- 8 Length exception (for example, expansion required for PC MIXED data exceeds the maximum length of the string).
- 12 Invalid code point (for example, use of the ERRORBYTE option of SYSSTRINGS).
- 16 Form exception (for example, invalid MIXED data).
- 20 Conversion procedure error (for example, an exit set the length control field of the string to an invalid value).
- 24 SBCS character found in string contained in a wchar_t host variable.

If the `reason-code` is 12, `code-point` is the invalid code point. Otherwise, `code-point` is either blank or an additional `reason-code` returned by an exit. If the string is the value of an input host variable, the `position-number` is the ordinality of the variable in the SQLDA. If the string is not the value of a host variable, the `position-number` is blank.

**System Action:** The statement cannot be executed.

**Programmer Response:** Take one of the following actions based on the `reason-code`

- If the `reason-code` is 8, extend the maximum length of the host variable to allow for the expansion that occurs when the string is converted.
- If the `reason-code` is 12, either change the convert table to accept the `code-point` or the data to eliminate the `code-point`. 

---

Chapter 2. SQL return codes 53
• If the reason-code is 16 and the string is described as MIXED data, either change its description or the string to conform to the rules for well-formed mixed data.

• If the reason-code is 20, correct the conversion procedure.

• If the reason-code is 24, delete the SBCS character from the graphic string.

Destination: 22021

-331 A STRING CANNOT BE ASSIGNED TO A HOST VARIABLE BECAUSE IT CANNOT BE CONVERTED. REASON reason-code, CHARACTER code-point, POSITION position-number

Explanation: The operation required the conversion of a string to the coded character set of the host variable and a conversion error occurred. The type of error is indicated by the reason-code:

• 8 for length exception (e.g., expansion required for PC MIXED data exceeds the maximum length of the string).

• 12 for invalid code-point (e.g., use of the ERRORBYTE option of SYSSTRINGS).

• 16 for form exception (e.g., invalid MIXED data).

• 20 for conversion procedure error (e.g., an exit set the length control field of the string to an invalid value).

If the reason-code is 12, code-point is the invalid code-point. Otherwise, code-point is blank. The position-number is the ordinality of the output variable in the SQLDA.

System Action: The statement cannot be executed.

Programmer Response: Take one of the following actions based on the reason-code:

• If the reason-code is 8, the maximum length of the result column must be extended to allow for the expansion that occurs when the string is converted.

• If the reason-code is 12, either the conversion table must be changed to accept the code-point or the data must be changed to eliminate the code-point.

• If the reason-code is 16, and the string is described as MIXED data, either its description must be changed or the string must be changed to conform to the rules for well-formed MIXED data.

• If the reason-code is 20, the conversion procedure must be corrected.

An alternative to these corrective actions is to provide an indicator variable so that a null value and a warning can be returned rather than an error. Refer to Chapter 2 of [DB2 SQL Reference] for more information on coded character set.

Destination: 22021

-332 CHARACTER CONVERSION BETWEEN CCSID from-ccsid TO to-ccsid REQUESTED BY reason-code IS NOT SUPPORTED

Explanation: The operation required a conversion between two different CCSIDs, but no conversion support was found.

This error may occur if one CCSID is 65535 (BIT data) and the other CCSID is a graphic CCSID. Conversion is not defined between 65535 and a graphic CCSID.

from-ccsid identifies the coded character set of the string to be converted.

to-ccsid identifies the coded character set to which it must be converted.

reason code describes the reason codes returned from DB2. Reason codes returned from DB2 begin with 'DSN' and identify the context in which the conversion was requested. Values other than those that start with 'DSN' are returned from other DB2 platforms and are described in the documentation for the platform.

System Action: The statement cannot be processed.

Programmer Response: If the conversion request is correct, refer to Appendix B of DB2 Installation Guide for information on how to add conversion support.

Destination: 57017

-333 THE SUBTYPE OF A STRING VARIABLE IS NOT THE SAME AS THE SUBTYPE KNOWN AT BIND TIME AND THE DIFFERENCE CANNOT BE RESOLVED BY CONVERSION CHARACTER

Explanation: The CCSID in the run time SQLDA is inconsistent with the bind time subtype of the host variable or parameter marker. Either the run time description is BIT and the bind time description was not BIT, or the run time description is not BIT and the bind time description was BIT.

System Action: The statement cannot be executed.

Programmer Response: Change the CCSID in the SQLDA so that the subtype of the host variable is consistent with the bind time subtype of the host variable or parameter marker. If the input data in error is a parameter marker, you can use the DESCRIBE INPUT SQL statement to determine the expected SQLTYPE, SQLLEN and CCSID expected. Refer to Chapter 2 of [DB2 SQL Reference] for more information on coded character set.

Destination: 56010
-336 THE SCALE OF THE DECIMAL NUMBER MUST BE ZERO

Explanation: The decimal number is used in a context where the scale must be zero. This can occur when a decimal number is specified in a CREATE or ALTER SEQUENCE statement for START WITH, INCREMENT BY, MINVALUE, MAXVALUE, or RESTART WITH.

Programmer Response: Change the decimal number so that there are no non-zero digits to the right of the decimal point.

Destination: 428FA

-338 AN ON CLAUSE IS INVALID

Explanation: This return code reports a violation of one of the following:
- One expression of the predicate must only reference columns of one of the operand tables of the associated join operator, full join, and the other expression of the predicate must only reference columns of the other operand table.
- A VALUE or COALESCE function is allowed in the ON clause only when the join operator is a FULL OUTER JOIN or FULL JOIN.
- An operator other than '=' is not allowed in a FULL OUTER JOIN or FULL JOIN.
- A subquery is not allowed in the ON clause.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax so that it doesn't violate any of the above items within the ON clause.

Destination: 42972

-340 THE COMMON TABLE EXPRESSION name HAS THE SAME IDENTIFIER AS ANOTHER OCCURRENCE OF A COMMON TABLE EXPRESSION DEFINITION WITHIN THE SAME STATEMENT

Explanation: The common table expression name used is used in the definition of more than one common table expressions in the statement. The name used to describe a common table expression must be unique within the same statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the error by changing the name of one of the common table expressions.

Destination: 42726

-341 A CYCLIC REFERENCE EXISTS BETWEEN THE COMMON TABLE EXPRESSIONS name1 AND name2

Explanation: The common table expression name1 refers to name2 in a FROM clause within its fullselect and name2 refers to name1 in a FROM clause within its fullselects. Such forms of cyclic references are not allowed.

System Action: The statement cannot be executed.

Programmer Response: Remove the cyclic reference from one of the common table expressions.

Destination: 42835

-342 THE COMMON TABLE EXPRESSION name MUST NOT USE SELECT DISTINCT AND MUST USE UNION ALL BECAUSE IT IS RECURSIVE

Explanation: There are two possible explanations:
- A fullselect within the common table expression name cannot start with SELECT DISTINCT because the common table expression is recursive.
- A fullselect within the common table expression name specified UNION instead of UNION ALL as required for recursive common table expressions.

System Action: The statement cannot be executed.

Programmer Response: Remove the keyword DISTINCT from the common table expression, add the keyword ALL following UNION, or remove the recursive reference within the common table expression.

Destination: 42925

-343 THE COLUMN NAMES ARE REQUIRED FOR THE RECURSIVE COMMON TABLE EXPRESSION name

Explanation: The recursive common table expression name must include the specification of the column names following the identifier of the common table expression.

System Action: The statement cannot be executed.

Programmer Response: Add column names following the identifier of the common table expressions.

Destination: 42908

-344 THE RECURSIVE COMMON TABLE EXPRESSION name HAS MISMATCHED DATA TYPES OR LENGTHS FOR COLUMN column-name

Explanation: The recursive common table expression name has a column column-name that is referred to in the iterative fullselect of the common table expression. The data type and length are set based on
the initialization fullselect for this column. The result of
the expression for the column column-name in the
iterative fullselect has a different data type or length that
may result in failure to assign the value for the column.

System Action: The statement cannot be executed.

Programmer Response: Correct the column used in
the fullselects of the recursive common table expression
so that the initialization column matches the iterative
columns.

Destination: 42825

-345

THE FULLSELECT OF THE
RECURSIVE COMMON TABLE
EXPRESSION name MUST BE THE
UNION OF TWO OR MORE
FULLSELECTS AND MUST NOT
INCLUDE COLUMN FUNCTIONS,
GROUP BY CLAUSE, HAVING CLAUSE,
OR AN EXPLICIT JOIN INCLUDING AN
ON CLAUSE

Explanation: The common table expression name
includes a reference to itself and therefore:
• must be the union of two or more fullselects.
• cannot include a GROUP BY clause.
• cannot have column functions.
• cannot include a HAVING clause.
• and cannot include an explicit join with an ON
clause.

System Action: The statement cannot be executed.

Programmer Response: Change the common table
expression by:
• making it a union of two or more fullselects.
• removing any column functions, GROUP BY clause,
HAVING clause, or explicit JOIN including an ON
clause.

Destination: 42836

-346

AN INVALID REFERENCE TO COMMON
TABLE EXPRESSION name OCCURS IN
THE FIRST FULLSELECT, AS A
SECOND OCCURRENCE IN THE SAME
FROM CLAUSE, OR IN THE FROM
CLAUSE OF A SUBQUERY

Explanation: The common table expression name
includes an invalid reference to itself as described by
one of the following:
• A recursive reference in the first fullselect before the
UNION ALL set operator. The first fullselect must be
an initialization and cannot include a recursive
reference.

• More than one reference to the same common table
expression in the same FROM clause. Such
references are not permitted in recursive common
table expression.

• A recursive reference in the FROM clause of a
subquery. A recursion cycle cannot be defined using
a subquery.

System Action: The statement cannot be executed.

Programmer Response: Change one of the following:
• the fullselect prior to the union operator so that it
does not include a recursive reference.
• the FROM clause containing more than one
reference to the same common table expression to
just one reference.
• the FROM clause of the subquery so that it does not
reference the common table expression.

Destination: 42836

-348

sequence-expression CANNOT BE
SPECIFIED IN THIS CONTEXT

Explanation: The statement contains a NEXT VALUE
expression or PREVIOUS VALUE expression in an
invalid context.

The NEXT VALUE expression or PREVIOUS VALUE
expression cannot be specified in the following contexts:
• Join condition of a full outer join
• DEFAULT value for a column in a CREATE TABLE or
ALTER TABLE statement
• Column definition that is generated in a CREATE
TABLE or ALTER TABLE statement
• Materialized query table definition in a CREATE
TABLE or ALTER TABLE statement
• Condition of a CHECK constraint
• Input value-specification for LOAD
• CREATE VIEW statement

NEXT VALUE expressions cannot be specified in the
following contexts:
• CASE expression
• Parameter list of an aggregate function
• Subquery in a context in which it is not otherwise
allowed
• SELECT statement for which the outer SELECT
contains a DISTINCT operator or a GROUP BY
clause
• SELECT statement for which the outer SELECT is
combined with another SELECT statement using the
UNION set operator
• Join condition of a join
• Nested table expression
• Parameter list of a table function
• SELECT clause of the fullselect of an expression in
the SET clause of an UPDATE statement
-350  INVALID SPECIFICATION OF A LARGE OBJECT COLUMN

Explanation: The ALTER TABLE, CREATE TABLE, or CREATE INDEX statement is invalid for one of the following reasons:

- A LOB column cannot be added to a temporary table.
- A LOB column cannot be added to a table defined with an EDITPROC.
- The PRIMARY KEY clause cannot specify a LOB column as a column of the primary key.
- The UNIQUE clause cannot specify a LOB column as a column of the unique key.
- The referential-constraint clause cannot specify a LOB column as a column of a foreign key.
- A LOB column cannot be specified in a references clause.
- The CREATE INDEX statement cannot name a LOB column as a column of the index key.
- When specifying PARTITIONING KEY, LOB columns cannot be specified when defining the partitioning key.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax and resubmit the statement.

Destination: 42962

-351  AN UNSUPPORTED SQLTYPE WAS ENCOUNTERED IN POSITION position-number OF THE SELECT-LIST

Explanation: position-number is the position of the first element in the SQLDA with an unsupported data type. Either the application requestor or the application server does not have support for this type. This error can only occur in a client/server environment.

System Action: The statement cannot be executed.

Programmer Response: Change the statement to exclude the unsupported data type. For a select statement, remove the names of any columns in the select-list with the unsupported data types.

Destination: 56084

-352  AN UNSUPPORTED SQLTYPE WAS ENCOUNTERED IN POSITION position-number OF THE INPUT-LIST

Explanation: The input SQLDA for an OPEN, EXECUTE, FETCH, or CALL statement contains an unsupported SQLTYPE for the parameter in position position-number. position-number is the position of the first element in the SQLDA with an unsupported data type. Either the application requestor or the application server does not have support for this data type. This error can only occur in a client/server environment.

System Action: The statement cannot be executed.

Programmer Response: Change the SQLDA to exclude the unsupported data type.

Destination: 56084

-353  FETCH IS NOT ALLOWED, BECAUSE CURSOR cursor-name HAS AN UNKNOWN POSITION

Explanation: The cursor position for cursor-name is unknown. The previous multiple-row-fetch for cursor cursor-name resulted in an error in the middle of processing multiple rows that were retrieved from DB2. One or more of the requested rows could not be returned to the program following the error, leaving the position of the cursor unknown. The error may have been detected at the requestor. For example a row with a null value was returned to an application, but no indicator variable was provided. A subsequent FETCH statement would result in SQLCODE -353. If an indicator had been provided, a positive SQLCODE would have been returned and all of the rows retrieved from DB2 could have been returned to the application program.

System Action: The statement cannot be processed. The cursor position is not changed.

Programmer Response: Close and reopen the cursor to reset the cursor position. For scrollable cursors, you can change the FETCH statement to specify one of the other fetch orientations such as FIRST, LAST, BEFORE, AFTER, ABSOLUTE, FIRST ROWSET, LAST ROWSET, or ROWSET STARTING AT ABSOLUTE to establish a valid rowset cursor position, and fetch data. Alternately, change the application to correct the error that originally occurred. For example, if the error was issued because an indicator was not provided, change the application to provide an indicator.

Destination: 24513

-355  A LOB COLUMN IS TOO LARGE TO BE LOGGED

Explanation: One of the following has occurred:

- a CREATE TABLE statement for an auxiliary table stores a BLOB, CLOB or DBCLOB column whose
-359  •  -390

length exceeds 1 gigabyte but whose associated
LOB table space was defined with the LOG YES
attribute
• an ALTER TABLESPACE statement of a LOB table
space specifies the LOG YES clause but the auxiliary
table in the LOB table space stores a BLOB or CLOB
column whose length exceeds 1 gigabyte or a
DBCLOB column whose length exceeds 500
megabyte characters
System Action:  The statement cannot be executed.
Programmer Response:  Either change the attribute of
the LOB table space to LOG NO or drop the base table,
and recreate it with columns of an acceptable length for
logging.
Destination:  42993

-359  THE RANGE OF VALUES FOR THE
IDENTITY COLUMN OR SEQUENCE IS
EXHAUSTED

Explanation:  DB2 attempted to generate a value for
an identity column or a sequence object. However, all
allowable values have already been assigned.
System Action:  The statement cannot be processed.
Programmer Response:  Take one of the following
actions:
• For an identity column, redefine the table with a
larger range of values for the identity column. If a
MAXVALUE or MINVALUE specification has been
made that limits the range of values to be less than
the range for the data type of the column, then the
column can be altered to expand the range of valid
values. Otherwise, the identity column must be
recreated, which requires that the table be recreated.
First, drop the existing table; then, recreate the table
with a different data type for the identity column,
specifying a data type that has a larger range of
values than the current data type for the identity
column.
• For a sequence object, redefine the sequence with a
larger range of values. If a MAXVALUE or
MINVALUE specification has been made that limits
the range of values to be less than the range for the
data type, then the sequence can be altered to
expand the range of valid values. Otherwise, the
sequence must be recreated using DROP
SEQUENCE and CREATE SEQUENCE to cover a
larger range of values.
Destination:  23522

-373  DEFAULT CANNOT BE SPECIFIED FOR
IDENTITY COLUMN OR SECURITY
LABEL columnname-seclabel

Explanation:  A DEFAULT clause may not be specified
for a column that has been identified as an IDENTITY
column or a security label column
System Action:  The statement cannot be executed.
Programmer Response:  Remove the DEFAULT
clause and resubmit the statement.
Destination:  42623

-390  THE FUNCTION function-name,
SPECIFIC NAME specific-name, IS NOT
VALID IN THE CONTEXT IN WHICH IT
OCCURS

Explanation:  A function resolved to a specific function
that is not valid in the context where it is used. If
specific-name is an empty string, then the function
resolved to the built-in function identified by
function-name. Some of the possible situations include:
• A scalar or aggregate function is referenced where
only a table function is allowed (such as in the FROM
clause of a query).
• A table function is referenced where only a scalar or
aggregate function is allowed (such as in an
expression, or in a SOURCE clause of a CREATE
FUNCTION statement).
System Action:  The statement cannot be executed.
Programmer Response:  Ensure that the correct
function name and arguments are specified and that the
SQL path includes the schema where the correct
function is defined. You may need to change the
function name, arguments, SQL path (using SET
CURRENT PATH or the PATH bind option), or change
the context in which the function is used. Refer to Chapter 5 of [DB2 SQL Reference] for information on the use of functions.

**Destination:** 42887

--392

**SQLDA PROVIDED FOR CURSOR**

**cursor HAS BEEN CHANGED FROM THE PREVIOUS FETCH**

**Explanation:** The application is running with DB2 rules, and has requested that LOB data be returned as a LOB in one FETCH statement, and as a locator in another FETCH statement. This is not permitted.

**System Action:** The statement is not executed and the connection is terminated.

**Programmer Response:** Either do not use DB2 rules, or change to application to not change the data type code from LOB to locator (or the reverse) in the SQLDA between successive fetches.

**Destination:** 42855

--393

**THE CONDITION OR CONNECTION NUMBER IS INVALID**

**Explanation:** The value of the CONDITION or CONNECTION number that was specified in the GET DIAGNOSTICS statement is either less than zero, or greater than the number of available diagnostics.

**System Action:** The statement cannot be processed.

**Programmer Response:** Correct the value of the CONDITION or CONNECTION number, while ensuring that the number is between 1 and the value of the NUMBER statement-information item or GET DIAGNOSTICS. Resubmit the GET DIAGNOSTICS CONDITION or GET DIAGNOSTICS CONNECTION statement.

**Destination:** 35000

--396

**object-type object-name ATTEMPTED TO EXECUTE AN SQL STATEMENT DURING FINAL CALL PROCESSING**

**Explanation:** A user-defined function named object-name was invoked and attempted to execute an SQL statement (other than CLOSE CURSOR) during final call processing, but the statement is not allowed.

**System Action:** The SQL statement cannot be executed.

**Programmer Response:** Change the definition of the function to not issue SQL statements during final call processing.

**Destination:** 38505

--397

**GENERATED IS SPECIFIED WITH A COLUMN THAT IS NOT A ROW ID, A DISTINCT TYPE BASED ON A ROW ID, OR AN IDENTITY COLUMN**

**Explanation:** GENERATED was specified in a CREATE or ALTER TABLE statement for a column with a data type that is not a row ID, a distinct type that is based on a row ID, or an identity column. GENERATED can only be specified for a column with a data type of row ID, a distinct type that is based on a row ID, or an identity column.

**System Action:** The statement cannot be processed.

**Programmer Response:** Correct the statement. Either eliminate the GENERATED clause or change the data type of the column to ensure that the data type of the object is row ID, or that the column is an identity column.

**Destination:** 428D3

--398

**A LOCATOR WAS REQUESTED FOR HOST VARIABLE NUMBER position-number BUT THE VARIABLE IS NOT A LOB**

**Explanation:** The application requested that a locator be returned from host variable number position-number. A locator can only be used with LOB data, and the requested data is not a LOB.

**System Action:** The statement cannot be executed.

**Programmer Response:** Change the statement to either return LOB data, or change the target host variable to not be a locator.

**Destination:** 428D2

--399

**ATTEMPTED TO INSERT AN INVALID VALUE INTO A ROWID COLUMN**

**Explanation:** When inserting into a table, a value specified for a ROWID column was invalid. Only row ID values previously generated by DB2 are valid.

**System Action:** The INSERT is not performed.

**Programmer Response:** Do not attempt to generate any value for insertion into a ROWID column. Insertion into ROWID columns is supported for purposes of Data Propagation, where DB2 has previously generated the row ID values. Only row ID values previously generated by DB2 can be used as values for insertion into a row ID column. Alternatively, insert the row specifying DEFAULT for the ROWID column or remove the ROWID column from the insert column-list.

You may also use the OVERRIDING clause as a possible solution for this situation. See INSERT in DB2 SQL Reference for more information about the OVERRIDING USER VALUE clause.

**Destination:** 22511
-400  THE CATALOG HAS THE MAXIMUM NUMBER OF USER DEFINED INDEXES

Explanation: Only one hundred user-defined indexes can be created in the catalog database.
System Action: The statement cannot be executed.
Programmer Response: If this index must be created, another user-defined index on the catalog must be dropped. After that index is dropped, this statement can be executed.
Destination: 54027

-401  THE OPERANDS OF AN ARITHMETIC OR COMPARISON OPERATION ARE NOT COMPARABLE

Explanation: An arithmetic operation appearing within the SQL statement contains a mixture of numeric and non-numeric operands, or the operands of a comparison operation are not compatible.
One reason for this error is that the comparison involves both character and graphic operands. This combination of operands is not allowed for EBCDIC and ASCII data. For Unicode data, this combination of operands is not allowed if a field procedure exists on one of the columns.
System Action: The statement cannot be executed.
Programmer Response: Check the data types of all operands to ensure that their data types are comparable and compatible with their usage in the statement.
If all the operands of the SQL statement are correct, then, if a view is being accessed, check the data types of all the operands in the view definition.
Destination: 42818

-402  AN ARITHMETIC FUNCTION OR OPERATOR arith-op is APPLIED TO CHARACTER OR DATETIME DATA

Explanation: A nonnumeric operand has been specified for the arithmetic function or operator arith-op.
System Action: The statement cannot be executed.
Programmer Response: Examine and correct the syntax of the SQL statement such that all operands of the specified function or operator are numeric.
Destination: 42819

-404  THE SQL STATEMENT SPECIFIES A STRING THAT IS TOO LONG

Explanation: An INSERT, UPDATE, CALL, VALUES INTO, SET, parameter, host variable, or transition variable statement specifies a value that is longer than the maximum length string that can be stored in the target column.
System Action: The statement cannot be executed.
Programmer Response: Check the length of the target column, parameter, host variable or transition variable and correct the program or SQL statement so that the length of the string does not exceed that maximum. For example, you could use the SUBSTR function to shorten the string.
Destination: 22001

-405  THE NUMERIC LITERAL literal CANNOT BE USED AS SPECIFIED BECAUSE IT IS OUT OF RANGE

Explanation: The numeric literal is not in the proper range.
The proper ranges for SQL values are as follows:
- 5.4E−79 to 7.2E+75 for FLOAT values
- -(10^{31} -1) to +(10^{31} -1) for DECIMAL values
- −2147483648 to 2147483647 for INTEGER values
- −32768 to +32767 for small integer (SMALLINT) values.
System Action: The statement cannot be executed.
Programmer Response: The value of literal should be reduced to the appropriate size for this data type.
Destination: 42820

-406  A CALCULATED OR DERIVED NUMERIC VALUE IS NOT WITHIN THE RANGE OF ITS OBJECT COLUMN

Explanation: A value derived or calculated during processing of the SQL statement was outside the range of the data type of its object column. This problem might have arisen because either the values occurring in the object column were out of range, or the SQL operation performed was not appropriate for the values in the object column.
System Action: The statement cannot be executed.
Programmer Response: See the explanation of SQLCODE -405 for allowed ranges for numeric data types.
Destination: 22003

-407  AN UPDATE, INSERT, OR SET VALUE IS NULL, BUT THE OBJECT COLUMN column-name CANNOT CONTAIN NULL VALUES

Explanation: One of the following conditions occurred:
- A null insert or update value was specified for a column defined as NOT NULL.
- No insert value was provided for a column that does not have a default value.
- A SET transition variable statement specified a NULL value for column defined as NOT NULL.
• The insert value was DEFAULT, but the object column was declared as NOT NULL without WITH DEFAULT in the table definition. Consequently, a default value of NULL cannot be inserted into that column.
• A null insert value was specified for a ROWID column.

**System Action:** The statement cannot be executed. The 'column-name' might be returned in the SQLCA, depending on the syntax of the SQL statement in which the error was detected.

**Programmer Response:** Examine the definition of the object table to determine which columns of the table have the NOT NULL attribute or have a type of ROWID, and correct the SQL statement accordingly.

**Destination:** 23502

---

**-408**

THE VALUE IS NOT COMPATIBLE WITH THE DATA TYPE OF ITS TARGET. TARGET NAME IS name

**Explanation:** The data type of the value to be assigned to the column, parameter, host variable or transition variable by the SQL statement is incompatible with the declared data type of the assignment target. Both must be:
- Numeric
- Character
- Graphic
- Dates or character
- Times or character
- Timestamps or character
- Row IDs
- The same distinct types

However, dates, times, or timestamps cannot be assigned to a character column that has a field procedure. Also note that character and graphic data types are compatible when using Unicode.

This SQLCODE is issued for any statement that fails required assignment rule checking.

**System Action:** The statement cannot be executed.

**Programmer Response:** Examine the current definition for the object table, procedure, user-defined function, or host variable and ensure that the host variable or literal value that is assigned to the object has the proper data type. In some cases, you can convert the value to the proper data type by using a function such as CHAR or DECIMAL.

**Destination:** 42821

---

**-409**

INVALID OPERAND OF A COUNT FUNCTION

**Explanation:** The operand of the COUNT or COUNT_BIG function in the statement violates SQL syntax. A common error is a column name or other expression without DISTINCT.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the syntax and resubmit the statement. Refer to Chapter 3 of **DB2 SQL Reference** for information about the proper form for the operands of a COUNT or COUNT_BIG function.

**Destination:** 42607

---

**-410**

THE FLOATING POINT LITERAL literal CONTAINS MORE THAN 30 CHARACTERS

**Explanation:** The specified floating-point literal is more than 30 characters in length. A floating-point literal has a maximum length of 30 characters.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the indicated literal.

**Destination:** 42820

---

**-411**

CURRENT SQLID CANNOT BE USED IN A STATEMENT THAT REFERENCES REMOTE OBJECTS

**Explanation:** A reference to the CURRENT SQLID special register is invalid in a statement that contains the three-part name or alias of an object that is remote to the remote server.

**System Action:** The statement cannot be executed.

**Programmer Response:** Either remove the reference to CURRENT SQLID or the reference to the remote object.

**Destination:** 56040

---

**-412**

THE SELECT CLAUSE OF A SUBQUERY SPECIFIES MULTIPLE COLUMNS

**Explanation:** In the context in which it was used in the SQL statement, the subquery can have only one column specified in its SELECT clause.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the syntax of the SQL statement. Refer to Chapter 4 of **DB2 SQL Reference** for information about restrictions on the syntax for subqueries.

**Destination:** 42823
**-413 OVERFLOW OCCURRED DURING NUMERIC DATA TYPE CONVERSION**

**Explanation:** During processing of the SQL statement, an overflow condition arose when converting from one numeric type to another. Numeric conversion is performed according to the standard rules of SQL.

**System Action:** The statement cannot be processed. No data was retrieved, updated, or deleted.

**Programmer Response:** Examine the syntax of the SQL statement to determine the cause of the error. If the problem is data-dependent, it might be necessary to examine the data processed at the time of the error.

**Destination:** 22003

**-416 AN OPERAND OF A UNION CONTAINS A LONG STRING COLUMN**

**Explanation:** The UNION specified in the SQL statement could not be performed because one of the tables participating in the union contains a long string column. The operands of a UNION cannot contain long string columns.

**System Action:** The statement cannot be executed.

**Programmer Response:** The implied function is not supported by DB2. Refer to Chapter 2 of [DB2 SQL Reference](https://www.ibm.com/support/knowledgecenter/SSEKSS_12.1.0/com.ibm.db2.luw.sql.ref.doc/doc/r00001655.html) for information about restrictions on the manipulation of long string columns.

**Destination:** 42907

**-414 A LIKE PREDICATE IS INVALID BECAUSE THE FIRST OPERAND IS NOT A STRING**

**Explanation:** The data type of the first operand of the LIKE predicate must be a character string or graphic string.

**System Action:** The statement cannot be executed.

**Programmer Response:** Respecify the predicate so that the data type of each operand is a character string or a graphic string.

**Destination:** 42824

**-417 A STATEMENT STRING TO BE PREPARED INCLUDES PARAMETER MARKERS AS THE OPERANDS OF THE SAME OPERATOR**

**Explanation:** The statement string specified as the object of a PREPARE contains a predicate or expression where parameter markers have been used as operands of the same operator—for example:

```
? > ?
```

This syntax is not permitted.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the logic of the application program so that this syntax error does not occur. Refer to Chapter 5 of [DB2 SQL Reference](https://www.ibm.com/support/knowledgecenter/SSEKSS_12.1.0/com.ibm.db2.luw.sql.ref.doc/doc/r00001655.html) for information about the proper usage of parameter markers within SQL statements to be prepared.

**Destination:** 42609

**-415 THE CORRESPONDING COLUMNS, column-number, OF THE OPERANDS OF A UNION OR A UNION ALL DO NOT HAVE COMPARABLE COLUMN DESCRIPTIONS**

**Explanation:** The column descriptions of corresponding columns of the operands of a UNION or UNION ALL must be comparable. The columns of ordinality ‘column-number’ of the operands in this UNION or UNION ALL do not satisfy this requirement. For columns to be comparable, they must both be either numeric, character, graphic, date, time, or timestamp. They cannot be a mixture of these groups. If corresponding columns have field procedures, they must both have the same field procedure.

**System Action:** The statement cannot be executed.

**Programmer Response:** Check the data types of the specified columns and correct the UNION or UNION ALL statement so that all corresponding columns have comparable column descriptions.

**Destination:** 42825

**-418 A STATEMENT STRING TO BE PREPARED CONTAINS AN INVALID USE OF PARAMETER MARKERS**

**Explanation:** Parameter markers cannot be used in the SELECT list, as the sole argument of a scalar function, or in a concatenation operation. Parameter markers cannot be used in the string expression of an EXECUTE IMMEDIATE SQL statement.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the logic of the application program so that this error does not occur. Refer to Chapter 5 of [DB2 SQL Reference](https://www.ibm.com/support/knowledgecenter/SSEKSS_12.1.0/com.ibm.db2.luw.sql.ref.doc/doc/r00001655.html) for information about the proper usage of parameter markers within SQL statements and for EXECUTE IMMEDIATE SQL statement restrictions.

**Destination:** 42610
-419  THE DECIMAL DIVIDE OPERATION IS INVALID BECAUSE THE RESULT WOULD HAVE A NEGATIVE SCALE

Explanation: The decimal division is invalid because it will result in a negative scale.

The formula used internally to calculate the scale of the result for decimal division is explained in Chapter 2 of DB2 SQL Reference.

System Action: The statement cannot be executed. No data was retrieved, updated, or deleted.

Programmer Response: Examine the precision and scale of all columns that may have participated in a decimal division. Note that an integer or small integer value may have been converted to decimal for this calculation.

Destination: 42911

-420  THE VALUE OF A STRING ARGUMENT WAS NOT ACCEPTABLE TO THE function-name FUNCTION

Explanation: A string argument did not conform to the requirements of the function. For example, a character string passed to the DECIMAL function did not conform to the rules for forming an SQL integer or decimal constant.

System Action: The statement cannot be processed.

Programmer Response: Change the argument value so that it conforms to the requirements of the function as specified in DB2 SQL Reference.

Destination: 22018

-421  THE OPERANDS OF A UNION OR UNION ALL DO NOT HAVE THE SAME NUMBER OF COLUMNS

Explanation: The operands of a UNION or UNION ALL must have the same number of columns.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement so that there are exactly the same number of columns in each operand.

Destination: 42826

-423  INVALID VALUE FOR LOCATOR IN POSITION position-#

Explanation: The value specified in a result set locator host variable, a LOB locator host variable, or a table locator that is specified at position position-# in the locator variable list of the SQL statement does not identify a valid result set locator, LOB locator variable, or table locator, respectively.

System Action: The statement cannot be executed.

Programmer Response: For a result set locator there are two common causes for the error:

- The host variable used as a result set locator was never assigned a valid result set locator value. Result set locator values are returned by the DESCRIBE PROCEDURE and ASSOCIATE LOCATORS statements. Make sure the value in your host variable is obtained from one of these statements.
- Result set locator values are only valid as long as the underlying SQL cursor is open. If a commit or rollback operation closes an SQL cursor, the result set locator associated with the cursor is no longer valid.

For a LOB locator, some common causes for the error are:

- The host variable used as a LOB locator was never assigned a valid LOB value.
- A commit or rollback operation or an SQL FREE LOCATOR statement freed the locator.

For a table locator, the error commonly occurs when the host variable that was used as a table locator was never assigned a valid table locator value.

Destination: 0F001

-426  DYNAMIC COMMIT NOT VALID AT AN APPLICATION SERVER WHERE UPDATES ARE NOT ALLOWED

Explanation: An application executing using DRDA protocols has attempted to issue a dynamic COMMIT statement, or a stored procedure has attempted to issue a COMMIT_ON_RETURN, while connected to a location at which updates are not allowed. A dynamic COMMIT or COMMIT_ON_RETURN can be issued only while connected to a location at which updates are allowed.

System Action: The statement cannot be executed. No COMMIT is performed.

Programmer Response: The IMS or CICS protocols should be used to commit work in these environments.

Destination: 2D528

-427  DYNAMIC ROLLBACK NOT VALID AT AN APPLICATION SERVER WHERE UPDATES ARE NOT ALLOWED

Explanation: An application executing using DRDA protocols has attempted to issue a dynamic ROLLBACK statement while connected to a location at which updates are not allowed. A dynamic ROLLBACK may be issued only while connected to a location at which updates are allowed.

System Action: The statement cannot be executed. No ROLLBACK is performed.

Programmer Response: The IMS or CICS protocols
should be used to rollback work in these environments.

**Destination:** 2D529

---

**-430**  
```
routine-type routine-name (SPECIFIC NAME specific-name) HAS ABNORMALLY TERMINATED
```

**Explanation:** An abnormal termination has occurred while the routine `routine-name` (stored procedure or function) was in control.

**System Action:** The statement cannot be executed.

**Programmer Response:** The stored procedure or function needs to be fixed. Contact the author of the routine or your database administrator. Until it is fixed, the routine should not be used.

**Destination:** 38503

---

**-433**  
```
VALUE value IS TOO LONG
```

**Explanation:** The value `value` required truncation by a system (built-in) cast or adjustment function, which was called to transform the value in some way. The truncation is not allowed where this value is used. The value being transformed is one of the following:

- an argument to a user defined function (UDF)
- an input to the SET clause of an UPDATE statement
- a value being INSERTed into a table
- an input to a cast or adjustment function in some other context.

If `value` has the ‘for bit data’ subtype, then the `value` is printed as a hexadecimal string in quotes followed by an 

**System Action:** The statement cannot be executed.

**Programmer Response:** If `value` is a literal string in the SQL statement, it is too long for its intended use. If `value` is not a literal string, examine the SQL statement to determine where the transformation is taking place. Either the input to the transformation is too long, or the target is too short. Correct the problem and rerun the statement.

**Destination:** 22001

---

**-435**  
```
AN INVALID SQLSTATE sqlstate IS SPECIFIED IN THE FUNCTION RAISE_ERROR OR IN A SIGNAL SQLSTATE STATEMENT
```

**Explanation:** The SQLSTATE specified in the RAISE_ERROR function or specified in a SIGNAL SQLSTATE statement of a trigger definition does not conform to the rules for an application defined SQLSTATE.

**System Action:** The statement cannot be processed.

**Programmer Response:** Correct the SQLSTATE

---

**-438**  
```
APPLICATION RAISED ERROR WITH DIAGNOSTIC TEXT: text
```

**Explanation:** This error occurred as a result of execution of the RAISE_ERROR function or as a result of the SIGNAL SQLSTATE statement.

**text** Diagnostic text provided by the invocation of the RAISE_ERROR function or the SIGNAL SQLSTATE statement.

**System Action:** The statement cannot be processed.

**Programmer Response:** Use application-provided diagnostic text, if provided, to determine the cause of the error.

**Destination:** application-defined

---

**-440**  
```
NO routine-type BY THE NAME routine-name HAVING COMPATIBLE ARGUMENTS WAS FOUND
```

**Explanation:** This occurs in a reference to routine (stored procedure or function) `routine-name`, when DB2 cannot find a function or stored procedure it can use to implement the reference. There are several reasons why this could occur.

- `routine-name` was either incorrectly specified or does not exist in the database.
- A qualified reference was made, and the qualifier was incorrectly spelled.
- A user’s current path does not contain the schema to which the desired function belongs, and an unqualified reference was used.
- The wrong number of arguments were included.
- For functions, the data types of one or more of the arguments is incorrect.
• The routine invoker is not authorized to execute the routine.

**System Action:** The statement cannot be executed.

**Programmer Response:** Fix the problem and retry. This could involve a change to the SQL statement, the addition of new routines or a change to the user’s current path.

**Destination:** 42884

---

### -441 INVALID USE OF 'DISTINCT' OR 'ALL' WITH SCALAR FUNCTION

**function-name**

**Explanation:** The keyword 'DISTINCT' or 'ALL' was detected within parentheses in a reference to function **function-name** and the function has been resolved as a scalar function. Use of the keyword 'DISTINCT' or 'ALL' with a scalar function is invalid.

**System Action:** The statement cannot be executed.

**Programmer Response:** If a scalar function is being used, then remove the keyword 'DISTINCT' or 'ALL'. If an aggregate function is being used, then there is a problem with function resolution. Check your current path to see if the desired function is in one of the schemas, and also check the SYSIBM.SYSROUTINES catalog for the spelling of the function name and the number and types of parameters.

**Destination:** 42601

---

### -443 ROUTINE routine-name (SPECIFIC NAME specific-name) HAS RETURNED AN ERROR SQLSTATE WITH DIAGNOSTIC TEXT msg-text

**Explanation:** An SQLSTATE of the form 38xxx was returned by routine **routine-name**, along with message text **msg-text**.

If the third character is not 5 (for example, '385xx') then the last 3 characters of the SQLSTATE value were chosen by the function to indicate the reason of the failure. SQLSTATEs values of the form 385xx are issued by IBM with a different SQLCODE.

**System Action:** The actions in the external function should be rolled back.

**Programmer Response:** Contact the author of the function or your database administrator. Until the problem is resolved, the function should not be used.

**Destination:** 38xxx (the SQLSTATE that was returned by the routine).

---

### -444 USER PROGRAM name COULD NOT BE FOUND

**Explanation:** DB2 received an SQL CALL statement for a stored procedure or an SQL statement containing an invocation of a user-defined function, and found the row in the SYSIBM.SYSROUTINES catalog table associated with the requested procedure name. However, the MVS load module identified in the EXTERNAL_NAME column of the SYSIBM.SYSROUTINES row could not be found.

**name** The name of the MVS load module that could not be found

**System Action:** The statement cannot be executed.

**Programmer Response:** If the EXTERNAL_NAME column value in the SYSIBM.SYSROUTINES table is incorrect, use the ALTER FUNCTION or ALTER PROCEDURE statement to correct the value.

If the EXTERNAL_NAME column value is correct, use the MVS linkage editor to create the required MVS load module in one of the MVS load libraries used by your installation for stored procedures.

This error can also occur if you are invoking a WLM-managed stored procedure that is not APF authorized, and the DB2 load libraries are not in the STEPLIB concatenation because they are being loaded from LINKLIST. In this case, if you want the stored procedure program to run APF-authorized, link-edit it with AC=1 into an MVS APF authorized library. If you do not want the stored procedure program to run APF-authorized, add the DB2 load library to the STEPLIB concatenation of the JCL used to start the WLM-managed address space.

**Destination:** 42724

---

### -449 CREATE OR ALTER STATEMENT FOR FUNCTION OR PROCEDURE

**routine-name** CONTAINS AN INVALID FORMAT OF THE EXTERNAL NAME-clause OR IS MISSING THE EXTERNAL NAME clause

**Explanation:** An error was found in the EXTERNAL_NAME clause of the CREATE FUNCTION, CREATE PROCEDURE, ALTER FUNCTION, or ALTER PROCEDURE statement for **routine-name**, or the clause is needed but was not specified.

• For a LANGUAGE JAVA or COMPJAVA stored procedure, or LANGUAGE JAVA user-defined function, the name must be specified and it must contain a valid external-java-routine-name of the following form:

```
jar-name:package-id...class-id.method-id(method-signature)
```

– No blanks are permitted within the single quotes.

– For LANGUAGE COMPJAVA, do not specify a **jar-name**.

---

Chapter 2. SQL return codes 65
- The method-name consists of the list of package-ids, class-id, and method-id, and must not be longer than 254 bytes.

- For LANGUAGE JAVA, zero or more package-ids may be specified, preceding the class-id. For LANGUAGE COMPJAVA, at least one package-id must be specified, preceding the class-id.

- The method-signature is optional, and is a list of Java data types that are separated by commas. If specified, the method-signature must not be longer than 1024 bytes.

- If multiple strings are specified, the total length of all the strings concatenated together for the external-java-routine-name must not be greater than 1305.

- For external routines with a language other than JAVA or COMPJAVA, the external name must be a short identifier with letters or digits. The first character must be a letter. (This is the MVS naming convention for load modules). A possible cause for this error is the inclusion of a blank in the name.

If the clause is omitted, the external name defaults to function-name. However, for CREATE FUNCTION or CREATE PROCEDURE if the function or procedure name is longer than eight characters then the EXTERNAL NAME clause must be explicitly specified to specify a valid short identifier as the external name.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the SQL statement. Refer to the DB2 SQL Reference for information on the EXTERNAL NAME clause.

User Response: When LANGUAGE is JAVA or COMPJAVA, possible causes include:

- Omitting the EXTERNAL NAME clause.
- Including a blank.
- Having the " " at the beginning or end of the name.
- Specifying an invalid external-java-routine-name.

Destination: 42878

-451 THE data-item DEFINITION, IN THE CREATE FUNCTION FOR function-name CONTAINS DATA TYPE type WHICH IS NOT APPROPRIATE FOR AN EXTERNAL FUNCTION WRITTEN IN THE GIVEN LANGUAGE

Explanation: An error was made in the data-item part of the CREATE FUNCTION statement for function-name. The CREATE FUNCTION statement contained an invalid type, or it contained a distinct type which is based on the invalid type.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement.

Destination: 42815

-453 THERE IS A PROBLEM WITH THE RETURNS CLAUSE IN THE CREATE FUNCTION STATEMENT FOR function-name

Explanation: A problem casting the result of user-defined function function-name has been identified. The CAST FROM data type is not castable to the RETURNS data type, and it must be. See the SQL Reference for details on casting between data types.

System Action: The statement cannot be executed.

Programmer Response: Change the RETURNS or CAST FROM clause so that the CAST FROM data type is castable to the RETURNS data type.

Destination: 42880

-454 THE SIGNATURE PROVIDED IN THE CREATE FUNCTION STATEMENT FOR function-name MATCHES THE SIGNATURE OF SOME OTHER FUNCTION ALREADY EXISTING IN THE SCHEMA

Explanation: The signature consists of the function name (function-name), the number of parameters defined for the function, and an ordered list of the types of the parameters (without regard to any parameters of the types). In this case there is a function already in the schema and the existing function has the same signature as the function being created. See the SQL Reference for the details on the uniqueness of a function.

System Action: The statement cannot be executed.

Programmer Response: Determine if the existing function already provides the functionality desired. If not, then the new function’s signature will have to be changed (e.g. change the function name).

Destination: 42723
IN CREATE FUNCTION FOR
function-name, THE SCHEMA NAME
schema-name1 PROVIDED FOR THE
SPECIFIC NAME DOES NOT MATCH
THE SCHEMA NAME schema-name2 OF
THE FUNCTION

Explanation: If the SPECIFIC name is specified as a
two part name, the schema-name1 portion must be the
same as the schema-name2 portion of
function-name. Note that the schema-name2 portion of
function-name may have been specified directly or it
may have defaulted to the authorization ID of the
statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement.

Destination: 42882

IN CREATE FUNCTION FOR
function-name, THE SPECIFIC NAME
specific-name ALREADY EXISTS IN THE
SCHEMA

Explanation: A SPECIFIC name has been explicitly
specified as specific-name in the CREATE FUNCTION
statement for function-name, but this name already
exists as the SPECIFIC name for another function
within the schema.

System Action: The statement cannot be executed.

Programmer Response: Choose a new SPECIFIC
name.

Destination: 42710

A FUNCTION OR DISTINCT TYPE
CANNOT BE CALLED name SINCE IT
IS RESERVED FOR SYSTEM USE

Explanation: The user-defined function or distinct type
cannot be created or referenced because the name
selected is reserved for use by the system.

A number of names used as keywords are reserved for
system use. These names may not be used as
user-defined functions or distinct-type-names, even if
they are delimited identifiers. These names are:

=  <  >  >=  <=
~=  `>  `>

ALL  AND  ANY  BETWEEN  DISTINCT
EXCEPT  EXISTS  FALSE  FOR  FROM
IN IS LIKE MATCH NOT
NULL ONLY OR OVERLAPS SIMILAR
SOME TABLE TRUE TYPE UNIQUE
UNKNOWN

The names of built-in data types cannot be used as the
name of a distinct type (for example, CHAR).

System Action: The statement is not executed.

Programmer Response: Select a name for the
function or distinct type that is not reserved for system
use.

Destination: 42939

IN A REFERENCE TO FUNCTION
function-name BY SIGNATURE, A
MATCHING FUNCTION COULD NOT BE
FOUND

Explanation: In a reference to function function-name
by signature, no matching function could be found. The
problem could be with the data type or some other
attributes of a parameter. For some data types there are
attributes in addition to data type:

- Length, precision, or scale

While it is not necessary to specify a length,
precision, or scale attribute for a data type, if one is
specified then there must be an exact match on the
corresponding specification of the parameter for the
existing function as defined in SYSPARMS.

A type of FLOAT(n) does not need to match the
declared value for n since 1<=n<=21 means REAL
and 22<=n<=53 means DOUBLE. Matching occurs
based on whether the type is REAL or DOUBLE.

However, a match on data type is sufficient.
To indicate this, an empty set of parentheses must be
specified for the data types that allow a specification
of length, precision, or scale. For example, assuming
a function exists for which a parameter was defined
as CHAR(12) on the CREATE FUNCTION statement,
a reference to that function by a signature could
specify this parameter as either CHAR(12), or
CHAR(). The CHAR() syntax provides a way to say
“don’t care about length, precision and scale
attributes in finding a matching function”.

FLOAT() cannot be used since the parameter value
indicates different data types (REAL or DOUBLE).

If, however, neither length, precision, scale, or empty
parentheses were specified, then normal default rules
apply. For example, a specification of CHAR would
result in CHAR(1) as on the CREATE TABLE
statement. Furthermore, this implicit specification of
length, precision, or scale must exactly match the
corresponding specification of the parameter for the
existing function as defined in SYSPARMS.

- Subtype, or encoding scheme

You do not need to specify the subtype or encoding
scheme (CCSID clause) to identify an existing
function in the database. However, if a subtype or
encoding scheme is specified then the specification
must be an exact match on the corresponding
specification of the parameter for the existing function as defined in
SYSPARMS.

Unqualified function names:

- For ALTER FUNCTION, DROP FUNCTION,
  COMMENT ON FUNCTION, GRANT and REVOKE
statements for EXECUTE on functions, an unqualified function name is implicitly qualified with the statement authorization ID, and this is the schema where the function with the problem can be found.

- In the SOURCE clause of a CREATE FUNCTION statement, the qualification comes from the SQL path. In this case, the is no matching function in the entire path.

Note: A function cannot be sourced on the COALESCE, NULLIF, RAISE_ERROR, or VALUE built-in functions. Additionally, there are restrictions on the way that you can source on the COUNT, COUNT_BIG, CHAR, and STRIP built-in functions because of some of the keywords that they accept.

System Action: The statement cannot be executed.

Programmer Response: Possible responses include:
- Changing the SQL path to include the correct schema.
- Changing the attributes of the parameters.
- Using a SPECIFIC name to refer to the function instead of a signature.

Destination: 42883

---

-461 A VALUE WITH DATA TYPE source-data-type CANNOT BE CAST TO TYPE target-data-type

Explanation: The statement contains a CAST with the first operand having a data type of source-data-type to be cast to the data type target-data-type. This is not supported.

Change the data type of either the source or target so that the cast is supported. For predefined (built-in) data types or a cast involving a user-defined distinct type, see the SQL Reference.

System Action: The statement could not be processed.

Programmer Response: Correct the CAST specification to specify a supported combination of source and target types.

Destination: 42846

---

-469 SQL CALL STATEMENT MUST SPECIFY AN OUTPUT HOST VARIABLE FOR PARAMETER number

Explanation: DB2 received an SQL CALL statement for a stored procedure. DB2 found the row in the SYSIBM.SYSPRINTES catalog table associated with the requested procedure name. However, parameter number was identified in the SYSIBM.SYSPARMS table as an OUT or INOUT parameter. A host variable must be supplied on the SQL CALL statement for parameters defined as OUT or INOUT.

number The parameter number from the ORDINAL field in SYSIBM.SYSPARMS.

System Action: The statement cannot be executed.

Programmer Response: If the SQL CALL statement is coded incorrectly, modify the SQL application to provide an output host variable on the SQL CALL statement.

If the SYSIBM.SYSPARMS table contains incorrect information, the DROP PROCEDURE and CREATE PROCEDURE statements must be used to replace the catalog definition for the stored procedure.

Destination: 42886

---

-470 SQL CALL STATEMENT SPECIFIED A NULL VALUE FOR INPUT PARAMETER number, BUT THE STORED PROCEDURE DOES NOT SUPPORT NULL VALUES.

Explanation: DB2 received an SQL CALL statement for a stored procedure and found a null value in the incoming parameter list. The stored procedure was defined in the SYSIBM.SYSPRINTES catalog table with PARAMETER_STYLE of GENERAL, which specifies that the routine does not accept null values.

A call to a stored procedure with a LANGUAGE value of JAVA or COMPJAVA receives this SQLCODE if an input parameter in the compiled Java stored procedure has a Java base type that cannot be set to a null value.

number The parameter number from the ORDINAL field in SYSIBM.SYSPARMS.

System Action: The statement cannot be executed.

Programmer Response: If the stored procedure should not accept null values, change the calling application to provide a nonnull value.

If the stored procedure should accept null values, use the ALTER PROCEDURE statement to change the PARAMETER STYLE of the stored procedure to be DB2SQL or GENERAL WITH NULLS.

Destination: 39004

---

-471 INVOCATION OF FUNCTION OR PROCEDURE name FAILED DUE TO REASON rc

Explanation: A routine was invoked. The routine invocation was not accepted because of DB2 reason code rc.

name The name of the routine that was invoked.

rc The DB2 reason code describing the cause of the failure.

System Action: The statement cannot be executed.
DSNX9xx message describing the error might be displayed on the MVS system console.

**Programmer Response:** Correct the condition described by the DB2 reason code.

**Destination:** 55023

---

**-472**

| CURSOR cursor-name WAS LEFT OPEN BY EXTERNAL FUNCTION function-name (SPECIFIC NAME specific-name) |

**Explanation:** The function program did not close the specified cursor. Modify the function program so that it closes the cursor.

**System Action:** The statement cannot be executed.

**Programmer Response:** Reissue the statement when desired.

**Destination:** 24517

---

**-473**

| A USER DEFINED DATA TYPE CANNOT BE CALLED THE SAME NAME AS A SYSTEM PREDEFINED TYPE (BUILT-IN TYPE) |

**Explanation:** The name of a data type to be created has an unqualified name that is the same as a system-predefined data type or is BOOLEAN. This is not allowed. Adding delimiters does not make the name valid. The following names are restricted:

<table>
<thead>
<tr>
<th>BLOB</th>
<th>CHAR</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHARACTER</td>
<td>CLOB</td>
</tr>
<tr>
<td>DEC</td>
<td>DATE</td>
</tr>
<tr>
<td>INT</td>
<td>DECIMAL</td>
</tr>
<tr>
<td>_ROWID</td>
<td>SMALLINT</td>
</tr>
<tr>
<td>VARCHAR</td>
<td>VARGRAPHIC</td>
</tr>
</tbody>
</table>

**System Action:** The statement could not be processed.

**Programmer Response:** Correct the statement to use another identifier for the name of the new user-defined type.

**Destination:** 42918

---

**-475**

| THE RESULT TYPE type-1 OF THE SOURCE FUNCTION CANNOT BE CAST TO THE RETURNS TYPE type-2 OF THE USER-DEFINED FUNCTION function-name |

**Explanation:** In order for the CREATE FUNCTION for a sourced user-defined function to be valid, the result type (type-1) of the source function must be castable to the RETURNS type (type-2) of the function being created. There is no supported cast between these data types. See the [DB2 SQL Reference](#) for details on casting between data types.

**System Action:** The statement cannot be executed.

---

**Programmer Response:** Change the RETURNS data type or the SOURCE function identified so that the result type of the SOURCE function is castable to the RETURNS data type.

**Destination:** 42866

---

**-476**

| REFERENCE TO FUNCTION function-name WAS NAMED WITHOUT A SIGNATURE, BUT THE FUNCTION IS NOT UNIQUE WITHIN ITS SCHEMA |

**Explanation:** References to a function without a signature are permitted, but the named function function-name must be unique in its schema and it is not.

Note also that in the ALTER FUNCTION, DROP FUNCTION, COMMENT ON FUNCTION, GRANT and REVOKE statements for EXECUTE on functions, an unqualified reference is qualified with the statement authorization ID, and this is the schema where the problem can be found. In the SOURCE clause of a CREATE FUNCTION statement, the qualification comes from the CURRENT PATH. In this case, the first schema in the path containing a function with this name had other functions by the same name.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the reference by one of the following:

- completing the signature
- using the SPECIFIC name of the desired function
- changing the CURRENT PATH

**Destination:** 42725

---

**-478**

| DROP OR REVOKE ON OBJECT TYPE type1 CANNOT BE PROCESSED BECAUSE OBJECT name OF TYPE type2 IS DEPENDENT ON IT |

**Explanation:** The requested action cannot be processed because a dependency exists on this type1. type2 is the type of object that has the dependency on the type1 object involved in the DROP or REVOKE. type2 can be one of the following:

- FUNCTION
- PROCEDURE
- TABLE
- VIEW
- TRIGGER (for the trigger package)
- CHECK CONSTRAINT (object_name contains the table name)
- DEFAULT (object_name contains the table name)

**DROP** If type1 is FUNCTION, the dependencies for DROP might be:

- Another function is sourced on this function.
- A view uses this function.
• A trigger package uses this function.
• A table uses this function in a check constraint or user-defined default.
• A materialized query table definition uses this function.

The dependency might be on one of the generated cast functions for a distinct type. If type1 is DISTINCT TYPE, the dependencies for DROP might be:
• A parameter of a function is defined as this distinct type.
• A column of a table is defined as this distinct type.
• A parameter of a stored procedure is defined as this distinct type.

If type1 is PROCEDURE, the dependencies for DROP might be:
• A trigger definition contains a CALL statement with the name of this stored procedure.

REVOKE

If type1 is FUNCTION, the dependencies for REVOKE might be:
• A function owned by the revokee is sourced on this function.
• A view owned by the revokee uses this function.
• A trigger package owned by the revokee uses this function.
• A table owned by the revokee uses this function in a check constraint or user-defined default.
• A materialized query table owned by the revokee uses this function in the definition.

If type1 is DISTINCT TYPE, the dependencies for REVOKE might be:
• A parameter of a function owned by the revokee is defined as this distinct type.
• A column of a table owned by the revokee is defined as this distinct type.
• A parameter of a stored procedure owned by the revokee is defined as this distinct type.

If type1 is PROCEDURE, the dependencies for REVOKE might be:
• A trigger definition owned by the revokee contains a CALL statement with the name of this stored procedure.

This SQLCODE may also be issued when SYSADM is being revoked. When SYSADM is revoked the cascading of the REVOKE statement may encounter dependencies that prevent the REVOKE from being successfully processed.

System Action: The statement cannot be executed.
Programmer Response: Remove the dependencies on this object and then reissue the request.
Destination: 42893

-480 THE PROCEDURE procedure-name HAS NOT YET BEEN CALLED

Explanation: The procedure identified in a DESCRIBE PROCEDURE or an ASSOCIATE LOCATORS statement has not yet been called within the application process or the procedure has been called, but an explicit or implicit commit occurred before the statement.
System Action: The statement cannot be executed.
Programmer Response: Correct the statements so that the exact syntax used to specify the procedure name on the CALL statement be the same as that on the ASSOCIATE LOCATOR and/or DESCRIBE PROCEDURE. If an unqualified name is used to CALL the procedure, the 1-part name must also be used on the other statements. If the CALL statement is made with a 3-part name, and the current server is the same as the location in the 3-part name, the ASSOCIATE LOCATOR or DESCRIBE procedure can omit the location. Rerun the statements.
Destination: 51030

-482 THE PROCEDURE procedure-name RETURNED NO LOCATORS

Explanation: The procedure identified in an ASSOCIATE LOCATORS statement returned no result set locators.
System Action: The statement cannot be executed.
Programmer Response: Determine if result set locators are returned from the identified procedure by using the DESCRIBE PROCEDURE statement.
Destination: 51030

-483 IN CREATE FUNCTION FOR function-name STATEMENT, THE NUMBER OF PARAMETERS DOES NOT MATCH THE NUMBER OF PARAMETERS OF THE SOURCE FUNCTION

Explanation: An attempt is being made to CREATE a user-defined function function-name which is sourced on another function. One of the following situations has been identified:
• The SOURCE clause uses a function-name (input parameter list) to identify the source function, and the number of types in the list is different from the number of parameters of the function being created.
• The SOURCE clause uses different syntax to identify the source function, and the number of types of that function is different from the number of parameters of the function being created.

System Action:  The statement cannot be executed.

Programmer Response:  The number of parameters for the SOURCE function and for the function being created must be the same. The identification of the SOURCE function needs to be changed to:
• fix the input parameter list
• correct the function name or function specific name to identify the proper function.

It is also possible that the current path needs to be corrected in order for correct function resolution to occur.

Destination:  42885

-487  object-type object-name ATTEMPTED TO EXECUTE AN SQL STATEMENT WHEN THE DEFINITION OF THE FUNCTION OR PROCEDURE DID NOT SPECIFY THIS ACTION

Explanation:  A user-defined function or stored procedure object-name was invoked and attempted to execute SQL statements, but the function or procedure was created with the NO SQL option.

In an environment of nested functions and procedures, the SQL option in effect is the most restrictive one that has been specified in the nested hierarchy of functions and procedures. The SQL data access option in effect does not allow for modifying data.

System Action:  The SQL statement cannot be executed.

Programmer Response:  Either use an ALTER statement to change the definition of the function or procedure to allow SQL statements, or remove the failing SQL statement from the external function or procedure.

Destination:  38001

-490  NUMBER number DIRECTLY SPECIFIED IN AN SQL STATEMENT IS OUTSIDE THE RANGE OF ALLOWABLE VALUES IN THIS CONTEXT (minval, maxval)

Explanation:  A number (number) was specified that is not valid in the context in which it was specified. The minimum allowed value in this context is minval. The maximum allowed value in this context is maxval. n must be within the range specified by minval and maxval (minval <= n <= maxval).

System Action:  The statement was not executed.

Programmer Response:  Change the value n to a valid value in the statement.

Destination:  42879

-491  CREATE STATEMENT FOR USER-DEFINED FUNCTION function-name MUST HAVE A RETURNS CLAUSE AND: THE EXTERNAL CLAUSE WITH OTHER REQUIRED KEYWORDS; THE RETURN STATEMENT AND PARAMETER NAMES; OR THE SOURCE CLAUSE

Explanation:  A required clause is missing in the CREATE for function function-name.
• For an EXTERNAL function, specify EXTERNAL and one of the following:
  – LANGUAGE
  – PARAMETER STYLE
• For an SQL FUNCTION, specify a RETURN statement, and a parameter name for each parameter.
• For a user-defined SOURCE FUNCTION, specify the SOURCE class.

System Action:  The statement cannot be processed.

Programmer Response:  Add the missing clauses or statement, and reissue the failing statement.

Destination:  42601

-492  THE CREATE FUNCTION FOR function-name HAS A PROBLEM WITH PARAMETER NUMBER number, IT MAY INVOLVE A MISMATCH WITH A SOURCE FUNCTION

Explanation:  The parameter in position number of function function-name is in error. The parameter in position number of the source function is not castable to the corresponding parameter of the function being created.

If the parameter of the function being created is a table parameter then the corresponding parameter of the source function must also be a table parameter. Furthermore, the column numbers for both of the table parameters must be the same.

If the parameter of the function being created is not a table parameter then the corresponding parameter of the source function must also not be a table parameter.

System Action:  The statement cannot be executed.

Programmer Response:  Possible corrections include:
• Identify a different source function.
• Change the data type of the parameter of the function being created so that the data type of the source function can be cast to this data type.

Destination:  42879
ESTIMATED PROCESSOR COST OF 
estimate-amount1 PROGRAMMER 
SECONDS (estimate-amount2 SERVICE 
UNITS) IN COST CATEGORY 
cost-category EXCEEDS A RESOURCE 
LIMIT ERROR THRESHOLD OF limit- 
amount SERVICE UNITS

Explanation: The prepare of a dynamic INSERT, 
UPDATE, DELETE, or SELECT SQL statement resulted 
in a cost estimate that exceeded the error threshold 
value specified in the resource limit specification table 
(RLST). This error is also issued if DB2’s cost category 
value was “B”, and the default action specified in the 
RLF_CATEGORY_B column in the RLST is to issue an 
error.

estimate_amount1 
The cost estimate (in processor seconds) if the 
preserved INSERT, UPDATE, DELETE or 
SELECT statement were to be executed.

estimate_amount2 
The cost estimate (in service units) if the 
preserved INSERT, UPDATE, DELETE or 
SELECT statement were to be executed.

cost-category 
DB2’s cost-category for this SQL statement. 
The possible values are A or B.

limit-amount 
The error threshold (in service units) specified 
in the RLFASUERR column of the RLST.

System Action: The prepare of the dynamic INSERT, 
UPDATE, DELETE, or SELECT statement was 
unsuccessful.

Programmer Response: If this SQLCODE was 
returned because the cost category value is “B”, it might 
be that the statement is using parameter markers or 
that some statistics are not available for the referenced 
tables and columns. Make sure the administrator has 
rung the utility RUNSTATS on the referenced tables. It 
might also be that UDFs will be invoked when the 
statement is executed, or for INSERT, UPDATE, or 
DELETE statements that triggers are defined on the 
changed table. Check the DSN_STATEMNT_TABLE or 
the IFCID 22 record for this statement to find the 
reasons this SQL statement has been put in cost 
category “B”. If the program cannot be changed, or if 
statistics cannot be obtained, ask the administrator to 
change the value in the RLF_CATEGORY_B column in the 
RLST to “Y” which allows the statement to execute 
or “W” which returns a warning instead of an error.

User Response: If the warning is caused by an SQL 
statement that is consuming too much processor 
resource, attempt to rewrite the statement to perform 
more efficiently. Another option is to ask the 
administrator to increase the error threshold value in the 
RLST.

Destination: 57051

THE SQL STATEMENT CANNOT BE 
EXECUTED BECAUSE IT 
REFERENCES A RESULT SET THAT 
WAS NOT CREATED BY THE 
CURRENT SERVER

Explanation: The SQL statement cannot be executed 
because the current server is different from the server 
that called a stored procedure. The SQL statement can 
be any of the following:
• ALLOCATE CURSOR
• DESCRIBE CURSOR
• FETCH (using an allocated cursor)
• CLOSE (using an allocated cursor)

System Action: The statement cannot be executed.

Programmer Response: Connect to the server that 
called the stored procedure which created the result set 
before running the SQL statement that failed.

Destination: 51033

THE MAXIMUM LIMIT OF INTERNAL 
IDENTIFIERS HAS BEEN EXCEEDED 
FOR DATABASE database-name

Explanation: The SQL statement cannot be executed 
because an internal identifier limit has been exceeded 
for the database. The cause of this error is due to one 
of the following:
1. On a CREATE DATABASE statement, the limit of 
65279 DBIDs has been exceeded.
2. For all other statements, the limit of 32767 OBIDs 
has been exceeded for that database.

System Action: The SQL statement cannot be 
executed.

Programmer Response: Take the appropriate action 
as described in the following cases:
1. In the case of a DBID limit being exceeded, DROP 
all unused databases and issue a COMMIT.
2. In the case of an OBID limit being exceeded, DROP 
all unused objects in the database and issue a 
COMMIT, specify a different database or run the 
MODIFY utility to reclaim unused OBIDs.

Destination: 54041

CURSOR cursor-name HAS ALREADY 
BEEN ASSIGNED TO THIS OR 
ANOTHER RESULT SET FROM 
PROCEDURE procedure-name.

Explanation: An attempt was made to assign a cursor 
to a result set using the SQL statement ALLOCATE 
CURSOR and one of the following applies:
• The result set locator variable specified in the 
ALLOCATE CURSOR statement has been previously 
assigned to cursor cursor-name.
• Cursor `cursor-name` specified in the `ALLOCATE CURSOR` statement has been previously assigned to a result set from stored procedure `procedure-name`.

**System Action:** The statement cannot be executed.

**Programmer Response:** Determine if the target result set named in the `ALLOCATE CURSOR` statement has been previously assigned to a cursor.

If the result set has been previously assigned to cursor `cursor-name`, then either choose another target result set or call stored procedure `procedure-name` again and reissue the `ASSOCIATE LOCATOR` and `ALLOCATE CURSOR` statements.

If the result set has not been previously assigned to a cursor, the cursor `cursor-name` specified in the `ALLOCATE CURSOR` statement has been previously assigned to some result set from stored procedure `procedure-name`. You can not assign cursor `cursor-name` to another result set, so you must specify a different cursor name in the `ALLOCATE CURSOR` statement.

Correct the statements so that the exact syntax used to specify the procedure name on the CALL statement be the same as that on the `ASSOCIATE LOCATOR` and/or `DESCRIBE PROCEDURE`. If an unqualified name is used to CALL the procedure, the 1-part name must also be used on the other statements. If the CALL statement is made with a 3-part name, and the current server is the same as the location in the 3-part name, the `ASSOCIATE LOCATOR` or `DESCRIBE` procedure can omit the location.

**Destination:** 24516

---

**-500 THE IDENTIFIED CURSOR WAS CLOSED WHEN THE CONNECTION WAS DESTROYED**

**Explanation:** The `FETCH`, `UPDATE`, `DELETE`, or `CLOSE` statement identifies a closed cursor that was defined with the `WITH HOLD` option. The cursor was closed when the connection on which it was dependent was destroyed during a commit operation. The connection was destroyed because the application process placed it in the released state, or the application plan was bound with the `DISCONNECT(AUTOMATIC)` option.

**System Action:** The statement cannot be executed.

**Programmer Response:** The correction depends on the desired state of both the cursor and the connection, as follows:

- If you want the cursor closed, change the application program so that the cursor is not referenced in the closed state.
- If you want the cursor open and the connection was placed in the released state by the application program, change the program so that the connection is not placed in the released state until the cursor is explicitly closed.
- If you want the cursor open and the connection was placed in the released state as a result of the `DISCONNECT(AUTOMATIC)` option, rebind the plan using `DISCONNECT(CONDITIONAL)`.

Correct the error in the application, rebind the plan, and resubmit the job.

**Destination:** 24501

---

**-502 THE CURSOR IDENTIFIED IN AN OPEN STATEMENT IS ALREADY OPEN**

**Explanation:** The application program attempted to execute an `OPEN` statement for a cursor that was already open.

**System Action:** The statement cannot be executed. The cursor was unchanged (that is, it was not ‘reopened’).

**Programmer Response:** Correct the logic of the application program to ensure that it does not attempt to execute an `OPEN` statement for a cursor that is already open.

**Destination:** 24502
**-503**  
A COLUMN CANNOT BE UPDATED BECAUSE IT IS NOT IDENTIFIED IN THE UPDATE CLAUSE OF THE SELECT STATEMENT OF THE CURSOR

**Explanation:** The application program attempted to update (using a cursor) a value in a column of the object table that was not identified in the FOR UPDATE clause in the cursor declaration.

Any column that is to be updated must be identified in the FOR UPDATE clause of the cursor declaration.

**System Action:** The statement cannot be executed. No data was updated in the object table.

**Programmer Response:** Correct the application program. If the column is to be updated, its name must be added to the FOR UPDATE clause of the cursor declaration.

**Destination:** 42912

---

**-504**  
THE CURSOR NAME cursor-name IS NOT DEFINED

**Explanation:** Cursor cursor-name was referenced in an SQL statement, and one of the following is true:

- Cursor cursor-name was not declared (using the DECLARE CURSOR statement) or allocated (using the ALLOCATE CURSOR statement) in the application program before it was referenced.
- Cursor cursor-name was referenced in a positioned UPDATE or DELETE statement which is not a supported operation for an allocated cursor.
- Cursor cursor-name was allocated, but a CLOSE cursor statement naming cursor-name was issued and deallocated the cursor before this cursor reference.
- Cursor cursor-name was allocated, but a ROLLBACK operation occurred and deallocated the cursor before this cursor reference.
- Cursor cursor-name was allocated, but its associated cursor declared in a stored procedure was not declared WITH HOLD, and a COMMIT operation occurred and deallocated the cursor before this cursor reference. The COMMIT operation can be either explicit (the COMMIT statement) or implicit (that is, a stored procedure defined as COMMIT_ON_RETURN = 'Y' was called before this cursor reference).
- Cursor cursor-name was allocated, but its associated stored procedure was called again since the cursor was allocated, new result sets were returned, and cursor cursor-name was deallocated.

**System Action:** The statement cannot be executed.

**Programmer Response:** Check the application program for completeness and for a possible spelling error in the cursor declaration or allocation. The declaration for or allocation of a cursor must appear in an application program before SQL statements that reference the cursor.

If the cursor-name was <UNKNOWN>, then the cursor was not successfully declared or allocated. This can occur if SQL(DB2) was used, and a warning message was issued during precompilation. Check the precompile output for warning messages on the DECLARE CURSOR or ALLOCATE CURSOR statement, and correct the statement.

For an allocated cursor, if an implicit or explicit COMMIT, ROLLBACK, or CLOSE occurred since the cursor was successfully allocated, modify the application program logic to do one of the following:

- After the COMMIT, ROLLBACK, or CLOSE operation, call the associated stored procedure again, and reissue the ASSOCIATE LOCATORS and ALLOCATE CURSOR statements.
- For COMMIT, declare the associated cursor in the stored procedure WITH HOLD so the COMMIT operation will not deallocate the cursor.

For an allocated cursor, if the associated stored procedure was called again and new result sets were returned since the cursor was allocated, reissue the ASSOCIATE LOCATORS and ALLOCATE CURSOR statements.

**Destination:** 34000

---

**-507**  
THE CURSOR IDENTIFIED IN THE UPDATE OR DELETE STATEMENT IS NOT OPEN

**Explanation:** The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement at a time when the specified cursor was not open.

**System Action:** The statement cannot be executed. No update or delete was performed.

**Programmer Response:** Check for a previous SQL return code that might have closed the cursor. SQLCODES -404, -652, -679, -802, -901, -904, -909, -910, -911, -913, and -952 may force the cursor to close. After the cursor is closed, any fetches or close cursor statements receive SQLCODE -501. Any updates or deletes receive this SQLCODE -507. Correct the logic of the application program to ensure that the specified cursor is open at the time the UPDATE or DELETE statement is executed.

**Destination:** 24501
-508  THE CURSOR IDENTIFIED IN THE UPDATE OR DELETE STATEMENT IS NOT POSITIONED ON A ROW OR ROWSET THAT CAN BE UPDATED OR DELETED

Explanation: The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement at a time when the specified cursor was not positioned on a row of the object table. The cursor must be positioned on the row that is to be updated or deleted.

This can occur if the cursor is no longer positioned on the row because another cursor in the same application program delete the row or updates an index column. This includes deletes and index column updates that are performed as a result of rolling back to a savepoint.

This can also occur with a sensitive dynamic cursor when the FOR ROW n OF ROWSET clause is specified and the specified row of the current rowset has been updated or deleted.

System Action: The statement cannot be executed. No data was updated or deleted.

Programmer Response: Correct the logic of the application program to ensure that the cursor is correctly positioned on the intended row of the object table before the UPDATE or DELETE statement is executed. Note that the cursor is not positioned on a row if FETCH returned an SQLCODE = 100.

Destination: 24504

-509  THE TABLE IDENTIFIED IN THE UPDATE OR DELETE STATEMENT IS NOT THE SAME TABLE DESIGNATED BY THE CURSOR

Explanation: The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement where the table named in that statement did not match the name of the table specified in the declaration for that cursor.

System Action: The statement cannot be executed. The update or delete was not performed.

Programmer Response: Correct the application program to ensure that the table identified in the UPDATE or DELETE statement is the same table identified in the declaration for the cursor.

Destination: 42827

-510  THE TABLE DESIGNATED BY THE CURSOR OF THE UPDATE OR DELETE STATEMENT CANNOT BE MODIFIED

Explanation: The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement against a table or view that cannot be updated or deleted. This can occur for a delete from a read-only view or for an update in which the cursor was not defined with the FOR UPDATE clause.

This error code is also returned when the table exists at a remote location and DB2 has employed block fetching because you explicitly declared the cursor FOR FETCH ONLY, or because the application is bound CURRENTDATA(NO) and the cursor is ambiguous.

This error code is also returned if DB2 has employed parallelism to execute the SELECT statement associated with the cursor named in a DELETE WHERE CURRENT OF cursor statement, or if a DELETE WHERE CURRENT OF is issued against a row which DB2 cannot guarantee to have not been modified by another application since the time the cursor was positioned upon it (in accordance with ISO(82) semantics for an ambiguous cursor in an application bound CURRENTDATA(NO)).

System Action: The statement cannot be processed. No data was updated or deleted in the object table.

Programmer Response: The requested UPDATE or DELETE cannot be performed. Refer to Chapter 5 of DB2 SQL Reference for information about restrictions on using UPDATE and DELETE operations against views.

For a remote table, modify the DECLARE CURSOR and then rebind the PLAN.

For a cursor that uses parallelism, disable parallelism for the query by using the DEGREE(1) BIND option for static SQL or by setting the CURRENT DEGREE special register to '1' for dynamic SQL.

For an ambiguous cursor in an application bound CURRENTDATA(NO), either make the cursor unambiguous (declare it FOR UPDATE OF), or rebind the application CURRENTDATA:YES).

Destination: 42827

-511  THE FOR UPDATE CLAUSE CANNOT BE SPECIFIED BECAUSE THE TABLE DESIGNATED BY THE CURSOR CANNOT BE MODIFIED

Explanation: The result table of the SELECT statement cannot be updated. This can occur if the SELECT specifies more than one table or view in the FROM clause, if the SELECT list contains a built-in function or DISTINCT, or if the statement contains an ORDER BY or GROUP BY or HAVING clause. This can also occur if a view is specified in the FROM clause and the view cannot be updated.

System Action: The statement cannot be executed. The specified cursor remains undefined in the application program.

Programmer Response: Updates cannot be performed on the result table as it is specified. Refer to Chapter 5 of DB2 SQL Reference for information about restrictions on the updating of views.
-512  STATEMENT REFERENCE TO REMOTE OBJECT IS INVALID

Explanation: One of the following conditions exists:
- The statement refers to multiple locations.
- A statement with a remote reference is being EXPLAINED either by a dynamic EXPLAIN statement or the EXPLAIN(YES) option.
- An alias is used incorrectly.
- A three-part name is implicitly or explicitly used in a statement that is not supported by the DB2 private protocols.
- A three-part name is implicitly or explicitly used in a triggered statement.
- A PREPARE statement contains an ATTRIBUTES clause. This is not supported by the DB2 private protocols.

System Action: The statement cannot be executed.

Programmer Response: If the object cannot be meaningfully eliminated from the statement, see your Database Administrator for other ways to obtain the data required. Refer to Chapter 3 of DB2 SQL Reference for more information about using remote objects.

If the remote object reference is in a triggered SQL statement, you can instead invoke a user-defined function or a stored procedure from the trigger and access the remote object from the function or stored procedure.

Destination: 56023

-513  THE ALIAS alias-name MUST NOT BE DEFINED ON ANOTHER LOCAL OR REMOTE ALIAS

Explanation: The object indicated by ‘alias-name’ is a local or remote alias. An alias is not allowed to be defined on a local alias, and it should not be defined on a remote alias.

System Action: The statement cannot be executed.

Programmer Response: Modify the SQL statement to ensure that all object references are to base tables or views.

Destination: 42924

-514  THE CURSOR cursor-name IS NOT IN A PREPARED STATE

Explanation: The application program has tried to use a cursor, ‘cursor-name’, that is not in a prepared state. The cursor is associated with a statement that either (1) has never been prepared, or (2) has been invalidated by a commit or rollback operation.

System Action: The statement cannot be executed.

Programmer Response: Verify that the statement-name is specified correctly in the PREPARE statement and the DECLARE CURSOR statement for cursor ‘cursor-name’. Alternatively, correct the application program logic to ensure that only prepared SELECT statements are used in association with cursor declarations.

Destination: 07005
-518  THE EXECUTE STATEMENT DOES NOT IDENTIFY A VALID PREPARED STATEMENT

Explanation:  One of the following conditions exists:

  • The statement named in the EXECUTE statement has not been prepared.
  • The statement named in the EXECUTE statement identifies a SELECT, VALUE INTO, or statement.
  • The statement named in the EXECUTE IMMEDIATE statement identifies a SELECT, VALUE INTO, or statement.

System Action:  The statement cannot be executed.

Programmer Response:  Ensure that you prepare the statement prior to EXECUTE. Also, ensure that the statement you prepare is not a SELECT or VALUES INTO statement.

Destination:  07003

-519  THE PREPARE STATEMENT IDENTIFIES THE SELECT STATEMENT OF THE OPENED CURSOR cursor-name

Explanation:  The application program has attempted to PREPARE (actually, re-PREPARE) the SELECT statement for the specified cursor at a time when that cursor was already open.

System Action:  The statement cannot be executed. The cursor was not affected.

Programmer Response:  Correct the logic of the application program so that it does not attempt to re-PREPARE the SELECT statement for a cursor when that cursor is open.

Destination:  24506

-525  THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE IT WAS IN ERROR AT BIND TIME FOR SECTION sectno

Explanation:  One of the following:

  • The statement was in error when the package was bound, but the error was ignored then because the option SQLERROR (CONTINUE) was used. Since the statement contains an error, it cannot be executed.
  • The statement might not be an executable statement at this location, or might only be executable by a DB2 application requester (for example, DECLARE TABLE in an application running on OS/2 causes this message).

The variables are:

sectno  Section number

pkgname  locid.collid.pkgid

contoken  Consistency token in hexadecimal

System Action:  The statement cannot be executed.

Programmer Response:  If the SQL statement is not supposed to execute at the indicated location, then correct the program so that the statement in error does not execute at that location. Precompile, compile, and bind replace the package. If the SQL statement is supposed to execute at the indicated location, correct the problem found when it was bound and bind the package over using BIND with ACTION(REPLACE). If multiple versions of the package have been bound, issue the following SELECT statement to determine which version has the error: SELECT VERSION FROM locid.SYSIBM.SYSPACKAGE WHERE LOCATION = ' ' AND COLLID = 'collid' AND NAME = 'pkgid' AND HEX(CONTOKEN) = 'contoken'

Where:

locid  Location name

collid  Collection id

pkgid  Program name

Destination:  51015

-526  THE REQUESTED OPERATION OR USAGE DOES NOT APPLY TO table type TEMPORARY TABLE table name

Explanation:  DB2 assumes that the SQL statement being executed refers to a created or declared temporary table named table name, and the requested operation or usage in the statement is not allowed on the temporary table.

The variables are:

table type  CREATED or DECLARED

CREATED is for a temporary table defined by the CREATE GLOBAL TEMPORARY TABLE statement.

DECLARED is for a temporary table defined by the DECLARE GLOBAL TEMPORARY TABLE statement.

table name  Qualified name of the temporary table.

System Action:  The statement cannot be processed.

Programmer Response:  Modify the SQL statement to ensure that the object references are not to the indicated type of temporary table, or if table type is DECLARED and you intended table name to refer to an existing persistent base table, you must perform one of the following actions:

  • Recreate the persistent base table table name with a different qualifier

Chapter 2. SQL return codes  77
• In the same application process, issue a DROP TABLE for *table name* followed by a COMMIT to drop the declared temporary table and afterwards be able to reference the persistent base table with the same *table name* in the same application process.

• Remove the DECLARE GLOBAL TEMPORARY TABLE statement from the application process to use the persistent base table with the same *table name*.

**Destination: 42995**

---

**-530**

**THE INSERT OR UPDATE VALUE OF FOREIGN KEY constraint-name IS INVALID**

**Explanation:** An UPDATE or INSERT operation attempted to place a value in a foreign key of the object table; however, this value was not equal to some value of the parent key of the parent table.

When a row is inserted into a dependent table, the insert value of a foreign key must be equal to the value of the parent key of some row of the parent table in the associated relationship.

When the value of the foreign key is updated, the update value of a foreign key must be equal to the value of the parent key of some row of the parent table of the associated relationship.

**System Action:** The UPDATE or INSERT statement cannot be executed. The object table is unchanged.

**Programmer Response:** Examine the insert or update value of the foreign key first, and then compare it with each of the parent key values of the parent table to determine the cause of the problem.

**Destination: 23503**

---

**-531**

**PARENT KEY IN A PARENT ROW CANNOT BE UPDATED BECAUSE IT HAS ONE OR MORE DEPENDENT ROWS IN RELATIONSHIP constraint-name**

**Explanation:** For plans and packages bound beginning with Version 5 or dynamic SQL, a multi-row update of a parent key attempted to remove a parent key value on which a foreign key was dependent.

For plans and packages bound prior to Version 5 an UPDATE operation attempted to update a primary key in the specified row of the object table; however, the primary key in the specified row had dependent rows associated with it. The value of a primary key in a parent row cannot be updated if the parent row has any dependent rows.

**System Action:** The UPDATE statement cannot be executed. The object table is unchanged.

**Programmer Response:** Examine the parent key of the object table and the foreign key of the dependent table to determine if the value of the specified row of the parent key should be changed. If this does not expose the problem, examine the contents of the object table and the dependent table to determine the cause of the problem.

**Destination: 23504**

---

**-532**

**THE RELATIONSHIP constraint-name Restricts the Deletion of Row With RID X’rid-number’**

**Explanation:** A DELETE operation attempted to delete a specified parent row in the object table and all related descendent rows in the descendent tables. However, a delete rule of RESTRICT or NO ACTION was specified for one or more descendent tables.

A row of the table cannot be deleted because it has a dependent in a relationship with a delete rule of RESTRICT or NO ACTION or the deletion cascades to a row which is a dependent in a relationship with a delete rule of RESTRICT or NO ACTION.

If the statement that failed is an ALTER TABLE with ALTER PART ROTATE FIRST TO LAST, then there is a referential constraint that is defined with DELETE RESTRICT on the table, and the data in the partition that is to be reused cannot be deleted because of the referential constraint.

**System Action:** The DELETE statement cannot be executed. The contents of the object table are unchanged.

**Programmer Response:** Examine the delete rule for all descendent tables to determine the cause of the problem. The specific tables involved can be determined from the relationship 'constraint-name'. The specific descendent row is known by RID X’rid-number’.

**Destination: 23504**

---

**-533**

**INVALID MULTIPLE-ROW INSERT**

**Explanation:** An INSERT operation with a subselect attempted to insert multiple rows into a self-referencing table.

The subselect of the INSERT operation should return no more than one row of data.

**System Action:** The INSERT statement cannot be executed. The contents of the object table are unchanged.

**Programmer Response:** Examine the search condition of the subselect to make sure that no more than one row of data is selected.

**Destination: 21501**
-534  THE PRIMARY KEY CANNOT BE UPDATED BECAUSE OF MULTIPLE-ROW UPDATE

Explanation: An UPDATE operation attempted to update a primary key on multiple rows of the object table.

An UPDATE statement updating the primary key cannot be used to update more than one row of the object table.

Note: This SQLCODE will only be issued for plans and packages bound prior to Version 5. SQLCODE -534 will not be issued for dynamic SQL or plans and packages bound with Version 5 or later releases.

System Action: The UPDATE statement cannot be executed. The contents of the object table are unchanged.

Programmer Response: Examine the search condition of the UPDATE statement to make sure that no more than one row of the object table is selected to be updated.

Destination: 21502

-536  THE DELETE STATEMENT IS INVALID BECAUSE TABLE table-name CAN BE AFFECTED BY THE OPERATION

Explanation: A DELETE operation with the indicated table referenced in a subquery was attempted.

If ‘T’ is the object table of the DELETE, the indicated table is one of the following:
• A dependent of ‘T’ in a relationship with a delete rule of CASCADE or SET NULL
• A dependent of another table in a relationship with a delete rule of CASCADE or SET NULL in which deletions from ‘T’ can cascade to that table.

System Action: The DELETE statement cannot be processed. The contents of the object table are unchanged.

Programmer Response: Do not attempt to reference a table in a subquery of a DELETE statement when the table can be affected by the DELETE statement.

Destination: 42914

-537  THE PRIMARY KEY, FOREIGN KEY, UNIQUE, OR PARTITIONING CLAUSE IDENTIFIES COLUMN column-name MORE THAN ONCE

Explanation: The primary key clause, foreign key clause, uniqueness clause and partitioning clause each contain a list of one or more column names. The statement violates the rule that no column name can appear more than once in any such list.

Programmer Response: Correct the statement to specify unique names for each column.

Destination: 42709

-538  FOREIGN KEY name DOES NOT CONFORM TO THE DESCRIPTION OF A PARENT KEY OF TABLE table-name

Explanation: The definition of the indicated foreign key does not conform to the description of parent key of the indicated table due to one of the following reasons:
• The referenced parent kkey has not been defined as a primary key or a unique key.
• The keys do not have the same number of columns.
• The description of the keys are not identical. The requirement for identical descriptions includes data type, length attribute, and field procedure.

name is the constraint-name specified in the foreign key clause or, if a constraint-name was not specified, the first column-name specified in the clause.

System Action: The statement cannot be processed.

Programmer Response: Correct the statement so that the description of the foreign key references a primary key or unique key, or so that the description of the foreign key conforms to that of a parent key of the indicated table.

Destination: 42830

-539  TABLE table-name DOES NOT HAVE A PRIMARY KEY

Explanation: DB2 cannot perform the CREATE or ALTER TABLE statement because the indicated table does not have a primary key. Thus, the primary key cannot be dropped, or the table cannot be defined as a parent in a referential constraint.

System Action: The statement cannot be processed.

Programmer Response: Correct the statement to reference a table with a primary key, or define a primary key with ALTER TABLE ADD PRIMARY KEY before referencing the table in a FOREIGN KEY clause.

Destination: 42888

-540  THE DEFINITION OF TABLE table-name IS INCOMPLETE BECAUSE IT LACKS A PRIMARY INDEX OR A REQUIRED UNIQUE INDEX

Explanation: The table named was defined with a PRIMARY KEY clause, a UNIQUE clause, or with a ROWID column with the GENERATED BY DEFAULT attribute. Its definition is incomplete, and it cannot be used until a unique index is defined for
• the primary key (the primary index)
• a ROWID column
-542 • -546

-542  

\textit{column-name CANNOT BE A COLUMN OF A PRIMARY KEY, A UNIQUE CONSTRAINT, OR A PARENT KEY BECAUSE IT CAN CONTAIN NULL VALUES}

\textbf{Explanation:} The code is used to report that a column identified in a PRIMARY KEY, a UNIQUE constraint clause, or a parent key (via a REFERENCES clause) is defined to allow null values.

\textbf{System Action:} The statement cannot be executed.

\textbf{Programmer Response:} In the case of a column identified in a PRIMARY KEY or a UNIQUE constraint clause, correct the statement and rerun it.

In the case of a column identified in a REFERENCES clause, drop the parent table then recreate it with referenced columns defined as NOT NULL. Afterwards, rerun the statement.

\textbf{Destination:} 57001

-544  

\textbf{THE CHECK CONSTRAINT SPECIFIED IN THE ALTER TABLE STATEMENT CANNOT BE ADDED BECAUSE AN EXISTING ROW VIOLATES THE CHECK CONSTRAINT}

\textbf{Explanation:} An existing row violates the check constraint specified in the ALTER TABLE statement.

\textbf{System Action:} The statement cannot be executed. The check constraint definition is not added to the table. The table definition is unchanged.

\textbf{Programmer Response:} Examine the check constraint definition that was specified in the ALTER TABLE statement and the data in the table to determine why the ALTER TABLE statement was rejected.

You can determine which rows violated the check constraint by using the SELECT statement, negating the check constraint in the WHERE clause. For example:

\begin{verbatim}
SELECT * FROM table WHERE (NOT (check-condition));
\end{verbatim}

\textbf{Destination:} 23512

-545  

\textbf{THE REQUESTED OPERATION IS NOT ALLOWED BECAUSE A ROW DOES NOT SATISFY THE CHECK CONSTRAINT check-constraint}

\textbf{Explanation:} Table check constraint violations occurred on an INSERT or UPDATE statement. The resulting row violated the check constraint definition on the table.

\textbf{System Action:} The INSERT or UPDATE statement cannot be executed. The contents of the table are unchanged.

\textbf{Programmer Response:} Examine the data and the check constraint definition in the SYSIBM.SYSCHECKS catalog table to determine why the INSERT or UPDATE statement was rejected. The data must be changed to satisfy the check constraint.

\textbf{Destination:} 23513

-546  

\textbf{THE CHECK CONSTRAINT constraint-name IS INVALID}

\textbf{Explanation:} A check constraint in the CREATE TABLE or ALTER TABLE statement is invalid for one or more of the following reasons:

\begin{itemize}
  \item The constraint definition refers to a column that has a field procedure.
  \item The constraint definition refers to a column with a data type that is lower in the hierarchy of numeric data types than the data type of any other operand. The hierarchy is as follows:
  \begin{verbatim}
  small integer < large integer < decimal
  < single precision float < double precision float
  \end{verbatim}
\end{itemize}

\textbf{System Action:} The statement cannot be executed. The contents of the table are unchanged.

\textbf{Programmer Response:} Examine the foreign key and its delete rule in the dependent table and the conflicting check constraint. Change either the delete rule or the check constraint so that they do not conflict.

\textbf{Destination:} 23511
- The constraint definition refers to a column with a numeric data type that is not the same numeric data type as that of the other column operands.
- The constraint definition refers to a column with a length that is shorter than the other operands when the column and other operands are not character string data types.
- The constraint definition refers to a built-in or user-defined function.
- The constraint definition uses a cast function that requires conversion of the data. The only functions that are allowed in a check constraint are cast functions that do not require conversion of the data.

System Action:  The statement is not executed.

For ALTER TABLE, the check constraint is not added to the object table. The definition of the table is unchanged.

For CREATE TABLE, the table is not created.

Programmer Response:  Correct the check constraint definition and execute the statement again.

Destination:  42621

---

A CHECK CONSTRAINT THAT IS DEFINED WITH column-name IS INVALID

Explanation:  A check constraint in the CREATE TABLE or ALTER TABLE statement is invalid for one or more of the following reasons:
- The constraint definition refers to a column that has a field procedure.
- The constraint definition refers to a column with a data type that is lower in the hierarchy of numeric data types than the data type of any other operand. The hierarchy is as follows:
  - small integer < large integer < decimal
  - single precision float < double precision float
- The constraint definition refers to a column with a numeric data type that is not the same numeric data type as that of the other column operands.
- The constraint definition refers to a column with a length that is shorter than the other operands when the column and other operands are not character string data types.
- The constraint definition refers to a ROWID column.
- The constraint definition refers to a LOB column.

System Action:  The statement is not executed.

For ALTER TABLE, the check constraint is not added to the object table. The definition of the table is unchanged.

For CREATE TABLE, the table is not created.

Programmer Response:  Correct the check constraint definition and execute the statement again.
• If appropriate, use the SQL statement with a package or plan that is bound with DYNAMICRULES(RUN).

• Issue the REBIND command with the DYNAMICRULES(RUN) option for the plan or package to which the SQL statement is bound.

Refer to the BIND PACKAGE(DSN), BIND PLAN(DSN), REBIND PACKAGE(DSN), or REBIND PLAN(DSN) statement in DB2 Command Reference for the description of the DYNAMICRULES option and the expected results. Determine if either the SQL statement should be removed from the program or the plan or package should be rebound with the DYNAMICRULES(RUN) option.

Destination: 42509

-551  

auth-id DOES NOT HAVE THE PRIVILEGE TO PERFORM OPERATION operation ON OBJECT object-name

Explanation: Authorization ID auth-id attempted to perform operation on object object-name without having been granted the proper authority to do so. This error might also occur if the object is a read-only view (for INSERT, DELETE, or UPDATE), or if auth-id is trying to create a table or view with an authorization ID other than its own.

You can create a table from an auth-id other than your own only if your authorization ID is SYSADM, DBADM, or DBCTRL. You can create a view from an auth-id other than your own only if your authorization ID is SYSADM.

When operation is 'GRANT **', the keyword ALL was used in the GRANT statement, but the grantor auth-id did not possess any privilege to grant.

If this error occurs while DB2 is creating or altering a table involving referential constraints, this code reports that the user does not have the necessary ALTER privilege to perform a FOREIGN KEY, DROP FOREIGN KEY, DROP PRIMARY KEY, or DROP UNIQUE operation. The object-name identifies the object table of the CREATE ALTER TABLE statement, not the table for which the user lacks the ALTER privilege.

If this error occurs for a distributed SQL request, then:
1. If authorization ID translation is in effect for either the requesting DB2 site or the serving (responding) DB2 site, then auth-id is the translated authorization ID. Refer to Part 3 (Volume 1) of DB2 Administration Guide for information on authorization ID translation.
2. If an alias name was used in the SQL statement, then object-name is the resolved remote table or view name.

If the operation is a DROP PACKAGE, the object name consists of the collection ID, the package name and the consistency token. The consistency token uniquely identifies which version of the package the user does not have authorization to drop.

-552  

auth-id DOES NOT HAVE THE PRIVILEGE TO PERFORM OPERATION operation

Explanation: Authorization ID 'auth-id' has attempted to perform the specified 'operation' without having been granted the authority to do so.

System Action: The statement cannot be executed.

Installation Action: Check for an attempted authorization violation.

Programmer Response: Ensure that auth-id was granted the authority to perform the desired operation, the object-name exists, and auth-id is not trying to create a table with a different authorization ID.

Destination: 42502

-553  

auth-id SPECIFIED IS NOT ONE OF THE VALID AUTHORIZATION IDS

Explanation: The authorization ID specified as the value of the 'authorization-id' or host variable in the SQL SET CURRENT S Q L ID statement is neither the user's primary authorization ID nor one of the associated secondary authorization IDs.

System Action: The SET CURRENT SQL ID statement cannot be executed. The current SQL ID is not changed.

Programmer Response: Correct the error in the statement or contact the security administrator to have the authorization ID defined for your use.

Destination: 42503
AN AUTHORIZATION ID CANNOT GRANT A PRIVILEGE TO ITSELF

Explanation: An authorization ID attempted to execute a GRANT statement in which that ID itself appears as one of the entries in the list of ‘grantee’ authorization IDs.

An authorization ID cannot GRANT a privilege to itself. However, if SQLRULES(STD) is in effect or CURRENT RULES contains STD, GRANT to self is allowed.

System Action: The statement cannot be executed. No privileges were granted.

Programmer Response: Refer to Chapter 4 of DB2 SQL Reference for information about restrictions on the use of the GRANT statement.

Destination: 42502

AN AUTHORIZATION ID CANNOT REVOKE A PRIVILEGE FROM ITSELF

Explanation: An authorization ID attempted to execute a REVOKE statement in which that ID itself appears as one of the entries in the list of authorization IDs to be revoked.

An authorization ID cannot REVOKE its own privilege. However, if SQLRULES(STD) is in effect or CURRENT RULES contains STD, REVOKE to self is allowed.

System Action: The statement cannot be executed. No privileges were revoked.

Programmer Response: Refer to Chapter 5 of DB2 SQL Reference for information about restrictions on the use of the REVOKE statement.

Destination: 42502

authid2 CANNOT HAVE THE privilege PRIVILEGE on_object REVOKE BY authid1 BECAUSE THE REVOKEE DOES NOT POSSESS THE PRIVILEGE OR THE REVOKEE DID NOT MAKE THE GRANT

Explanation: The REVOKE statement was not successful for one of the following reasons:

• authid2 does not possess the privilege.
• The revoker, authid1, did not explicitly grant the privilege to authid2.
• authid2 is the owner of the specified object.
• When privilege is ‘*’* the keyword ALL was used in the REVOKE statement, but authid2 did not possess any privilege to revoke.
• When authid1 is ALL, the BY ALL clause was used in the REVOKE statement, but authid2 did not possess any privilege to revoke.

An authorization ID can revoke only the privileges that it has explicitly granted to other authorization IDs, unless the authorization ID has SYSADM or SYSCtrl authority and specifies the BY clause. No authorization ID, not even SYSADM, can revoke ‘privileges’ on an object from the object owner.

System Action: The statement cannot be executed. No privileges were revoked from any authorization ID.

Programmer Response: Check the appropriate authorization catalog tables to verify that authid2 possesses the privilege to be revoked. Queries can be made with GRANTEE = authid2 and the privilege column not = blanks. Correct and reissue the REVOKE statement.

If a user holding SYSADM or SYSCtrl authority receives this SQLCODE, the BY clause might have been omitted from the REVOKE statement.

Destination: 42504

INCONSISTENT GRANT/REVOKE KEYWORD keyword. PERMITTED KEYWORDS ARE keyword-list

Explanation: The GRANT or REVOKE statement contains a syntax or spelling error at or before the specified ‘keyword’. As an aid to the programmer, ‘keyword-list’ provides a list of the keywords that would be permitted in this context.

Alternatively:

• The mixture of privileges specified on the GRANT or REVOKE statement is not permitted. The privileges must all be of one type, and consistent with the form of the GRANT or REVOKE statement.
• REVOKE UPDATE (column-list) is not permitted; only REVOKE UPDATE is valid.
• The keywords DELETE, INSERT, SELECT, TRIGGER, UPDATE, REFERENCES and ALTER cannot be specified for an auxiliary table.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the GRANT or REVOKE statement.

Destination: 42852

INVALID CLAUSE OR COMBINATION OF CLAUSES ON A GRANT OR REVOKE

Explanation: The location qualifier specified for a GRANT or REVOKE statement is invalid.

System Action: The statement cannot be executed.

Programmer Response: Refer to Chapter 5 of DB2 SQL Reference for valid keywords for the GRANT statement.

Destination: 56025
**-559**  
**ALL AUTHORIZATION FUNCTIONS HAVE BEEN DISABLED**

Explanation: The authorization mechanism has been disabled in the DB2 subsystem. Consequently, GRANT and REVOKE statements are ignored.

System Action: The statement cannot be executed. No privileges were granted or revoked.

Programmer Response: Do not attempt to execute GRANT or REVOKE statements unless and until the authorization mechanism is enabled in the DB2 subsystem.

Destination: 57002

---

**-567**  
**bind-type AUTHORIZATION ERROR USING auth-id AUTHORITY PACKAGE = package-name PRIVILEGE = privilege**

Explanation: The authorization ID given does not have the privilege indicated, and cannot invoke the indicated subcommand against the indicated package.

bind-type  
Type of bind subcommand (BIND | REBIND | FREE).

auth-id  
Authorization ID of the package owner.

package-name  
Name of the package (location.collection.package.version)

privilege  
Name of the privilege not held:
- BINDADD—The authority to create a new package using BIND with the ADD option.
- BIND—The authority to BIND (REPLACE) or REBIND a package.
- COPY—The authority to COPY from the indicated package
- CREATE IN—The authority to create a package in the indicated collection.

System Action: The indicated package is not bound, rebound, or freed.

System Programmer Response: The indicated privilege must be granted to the authorization ID that will become the package owner.

Destination: 25000

---

**-571**  
**THE STATEMENT WOULD RESULT IN A MULTIPLE SITE UPDATE**

Explanation:

This SQLCODE is issued in the following situations:
- When an application program has explicit SQL statements within a commit scope that would result in updates at multiple sites where one of the sites at which data is being updated does not support multi-site update.

This SQLCODE can be issued when an application program explicitly modifies data at a single location within a commit scope. This can occur in the following situations:
- A package or plan associated with the application program was invalidated.
- A package or plan was bound at one release of DB2 and fallback occurs to a prior release.

In the situations described above, an implicit autobind is done on behalf of the user. An autobind results in the DB2 catalog being updated. The conditions that must exist for this SQLCODE to be issued when an autobind occurs are:
- One site where data has been modified does not support multi-site update.
- The autobind occurs at a separate and distinct site from where an application program explicitly modifies data.
- At the time of the autobind, locks are being held to process an SQL statement within the application program.

System Action: The statement cannot be executed.

Programmer Response:
- Ensure that all requests for modifications to the data are confined to a single location within any given commit scope for any application that references a location that does not support multi-site update.
- For programs operating in an IMS or CICS environment where the remote database systems do not support multi-site update, all SQL statements must be read-only access.
- If an autobind is causing this SQLCODE to be issued, REBIND the plan or package.

Destination: 42890

---

**-573**  
**TABLE table-name DOES NOT HAVE A UNIQUE KEY WITH THE SPECIFIED COLUMN NAMES**

Explanation: A referential constraint cannot be defined with the specified table as the parent because a unique index with the specified column names does not exist for the identified parent table.

System Action: The statement cannot be processed.

Programmer Response: Create a unique index with the specified columns for the parent table.

Destination: 42890
THE SPECIFIED DEFAULT VALUE OR IDENTITY ATTRIBUTE VALUE CONFLICTS WITH THE DEFINITION OF COLUMN column-name

Explanation: The DEFAULT value specified for column-name is not valid for one of the following reasons:

- The value is not assignable to the column because the constant does not conform to the format for a constant of that data type, or the value has the incorrect length or precision.
- A floating-point constant is specified and the column is not a floating point data type.
- A decimal constant is specified and non-zero digits would be truncated when assigned to the column.
- The value is more than 255 bytes, including quotes for strings, introducer characters such as the X for a hex constant, fully qualified function names, and parentheses.
- Either the USER or CURRENT SQLID special register is specified and the length attribute of the character string data type is less than 8.
- A system-generated cast function was specified and the column is not defined with a user-defined distinct type.
- A function was specified that is not supported. A function may only be specified when the data type is a distinct type, and in this case the specified function must be one of the system-generated cast functions associated with this distinct type.
- WITH DEFAULT is specified with a value other than NULL for a LOB column.
- A value with non-zero scale was specified for the START WITH or INCREMENT BY option of an identity column with the DECIMAL data type.

System Action: The SQL statement cannot be executed.

Programmer Response: Specify a default value that is valid for the definition of the column.

Destination: 42894

- VIEW view-name CANNOT BE REFERENCED

Explanation: An alteration was made to a table underlying view-name which caused the view definition to become invalid. The view must be successfully regenerated with an ALTER VIEW statement before it can be referenced in a statement other than ALTER VIEW, GRANT, REVOKE, DROP, COMMENT, or LABEL.

System Action: The statement cannot be processed.

Programmer Response: Issue an ALTER VIEW statement to regenerate the view.

Destination: 51024

- object-type object-name ATTEMPTED TO MODIFY DATA WHEN THE DEFINITION OF THE FUNCTION OR PROCEDURE DID NOT SPECIFY THIS ACTION

Explanation: The current environment does not allow SQL statements that modify data. One of the following situations has occurred:

- A user-defined function or stored procedure object-name was invoked and attempted to modify data, but the function or procedure was defined without the MODIFIES SQL option.
- A user-defined function or stored procedure object-name was invoked and attempted to execute a data definition statement, but the function or procedure was defined without the MODIFIES SQL option.
- A function or procedure defined with READS SQL DATA, CONTAINS SQL, or NO SQL has attempted to invoke another function or procedure defined with MODIFIES SQL DATA.
- A user-defined function or stored procedure object-name was invoked and attempted to use a NEXTVAL expression. However, the function or procedure was defined without the MODIFIES SQL DATA option.

In an environment of nested functions and procedures, the SQL option in effect is the most restrictive one that has been specified in the nested hierarchy of functions and procedures. The SQL data access option in effect does not allow for modifying the data.

System Action: The SQL statement failed.

Programmer Response: Either use an ALTER statement to change the definition of the function or procedure to allow statements that modify data, or remove the failing SQL statement from the external function or procedure.

Destination: 38002

- object-type object-name ATTEMPTED TO READ DATA WHEN THE DEFINITION OF THE FUNCTION OR PROCEDURE DID NOT SPECIFY THIS ACTION

Explanation: The current environment does not allow SQL statements that read data. One of the following situations had occurred:

- A user-defined function or stored procedure object-name was invoked and attempted to read data, but the function or procedure was defined without the READS SQL DATA or MODIFIES SQL DATA option.
- A function or procedure defined with CONTAINS SQL or NO SQL has attempted to invoke another function or procedure defined with READS SQL DATA.
In an environment of nested functions and procedures, the SQL option in effect is the most restrictive one that has been specified in the nested hierarchy of functions and procedures. The SQL data access option in effect does not allow for reading data.

**System Action:** The SQL statement failed.

**Programmer Response:** Either use an ALTER statement to change the definition of the function or procedure to allow statements that read data, or remove the failing SQL statement from the external function or procedure.

**Destination:** 38004

---

**-580 THE RESULT-EXPRESSIONS OF A CASE EXPRESSION CANNOT ALL BE NULL**

**Explanation:** There is a CASE expression in the statement that has all the result-expressions (expressions following the THEN and ELSE keywords) coded with the keyword NULL.

**System Action:** The statement cannot be processed.

**Programmer Response:** Change the CASE expression to include at least one result-expression with a keyword other than NULL.

**Destination:** 42625

---

**-581 THE DATA TYPES OF THE RESULT-EXPRESSIONS OF A CASE EXPRESSION ARE NOT COMPATIBLE**

**Explanation:** There is a CASE expression in the statement that has result-expressions (expressions following THEN and ELSE keywords) that are not compatible. The data type of the result-expressions might be incompatible because the CASE condition result data types are not all:

- character
- graphic
- numeric
- date
- time
- timestamp

If encoded in Unicode, character and graphic data types are compatible, however. Refer to DB2 SQL Reference for more information about Unicode.

**System Action:** The statement cannot be processed.

**Programmer Response:** Correct the result-expressions so that they are compatible.

**Destination:** 42804

---

**-582 THE SEARCH-CONDITION IN A SEARCHED-WHEN-CLAUSE CANNOT BE A QUANTIFIED PREDICATE, IN PREDICATE, OR AN EXISTS PREDICATE.**

**Explanation:** The search-condition in a searched-when-clause specifies a quantified predicate, an IN predicate, or an EXISTS predicate, but is not allowed.

**System Action:** The statement cannot be processed.

**Programmer Response:** Correct the search-condition.

**Destination:** 42625

---

**-583 THE USE OF FUNCTION function-name IS INVALID BECAUSE IT IS NOT DETERMINISTIC OR HAS AN EXTERNAL ACTION**

**Explanation:** The function function-name is defined as a not deterministic function or a function with an external action. This type of function is not supported in the context in which it is used. The contexts in which these are not valid are:

- in the expression prior to the first WHEN keyword in a simple-case-expression.
- in the WHERE clause of the subselect in a CREATE VIEW statement if the WITH CHECK OPTION is specified.
- in an expression of an ORDER BY clause

**System Action:** The statement cannot be executed.

**Programmer Response:** If the use of a not deterministic or external action function was not intended, substitute a function without these characteristics. If the behavior associated with the not deterministic or external action function is intentional, use the alternate form of the statements that make that intent explicit.

- Instead of a simple-when-clause, use the corresponding searched-when-clause where the function would get specified in each search-condition.
- Remove the WITH CHECK OPTION from the CREATE VIEW statement.
- Remove the function from the ORDER BY clause. If the column is part of the result set of the query, change the expression in the ORDER BY clause to the simple-integer or simple-column-name form of the sort key. See the ORDER BY syntax diagram in the DB2 SQL Reference for more information.

**Destination:** 42845
-585  THE COLLECTION ID collection-id APPEARS MORE THAN ONCE IN THE SET special-register STATEMENT

Explanation:  The SET statement for special register special-register includes collection-id more than once.

System Action:  The statement cannot be executed.

Programmer Response:  Remove duplicate occurrences of collection-id from the SET statement for the special register.

Destination:  42732

-586  THE TOTAL LENGTH OF THE CURRENT PATH SPECIAL REGISTER CANNOT EXCEED 2048 CHARACTERS

Explanation:  The CURRENT PATH special register is defined as a VARCHAR(2048). The content of the string includes each schema name delimited with double quotes and separated from the next schema name by a comma. The total length of the string of all schema names in the CURRENT PATH cannot exceed 2048 characters. A SET PATH statement causing this message would exceed this limit.

System Action:  The statement is not executed.

Programmer Response:  Remove schema names to reduce the total length to fit the 2048 character maximum length. If all the schema names are required, it may be necessary to consolidate some user-defined functions so that fewer schema names are required for the CURRENT PATH.

Destination:  42907

-589  A POSITIONED DELETE OR UPDATE STATEMENT FOR CURSOR cursor-name SPECIFIED A ROW OF A ROWSET, BUT THE CURSOR IS NOT POSITIONED ON A ROWSET

Explanation:  The FOR ROW n OF ROWSET clause was specified on a positioned DELETE or UPDATE statement, but the cursor is not currently positioned on a rowset.

System Action:  The statement cannot be processed.

Programmer Response:  Issue a FETCH statement to position the cursor on the desired rowset, and then reissue the positioned DELETE or UPDATE statement. If the cursor is not defined for rowset access, redefine the cursor first.

Destination:  24520

-590  PARAMETER NAME parameter-name IS NOT UNIQUE IN THE CREATE FOR ROUTINE routine-name

Explanation:  The parameter name parameter-name specified on a CREATE FUNCTION or CREATE PROCEDURE statement for routine-name is not unique.

System Action:  The statement cannot be executed.

Programmer Response:  Change the name of the parameter to make all of the parameter names unique within the CREATE statement.

Destination:  42734

-592  NOT AUTHORIZED TO CREATE FUNCTIONS OR PROCEDURES IN WLM ENVIRONMENT env-name

Explanation:  This message is issued when:

- The value of the env-name token is 'NO WLM ENVIRONMENT' and the check for authorization to the DB2-managed stored procedures address space failed because the NO WLM ENVIRONMENT clause was specified on the CREATE PROCEDURE or ALTER PROCEDURE statement.
- There is no DB2-managed stored procedures address space.

System Action:  The statement cannot be executed.

Programmer Response:  To correct the error, perform one of the following actions:

- If the value of the env-name token is 'NO WLM ENVIRONMENT', choose a different value for the WLM ENVIRONMENT keyword or request authorization to create objects in the specified WLM ENVIRONMENT from the system administrator.
- If there is no DB2-managed stored procedures address space, request that one be created. Also request that a RACF PERMIT be completed to allow access to this resource.

After doing one of the above, reissue the SQL statement.

Destination:  42510

-593  NOT NULL MUST BE SPECIFIED FOR ROWID OR DISTINCT TYPE COLUMN column-name

Explanation:  ROWID columns and distinct type columns for which the source type is a ROWID do not support null values. When a ROWID column (or distinct type for which the source type is a ROWID) is defined on a CREATE TABLE, ALTER TABLE, or DECLARE TABLE statement, the NOT NULL clause must be specified for the column.

System Action:  The statement cannot be executed.
-594 • -603

Programmer Response: Change the statement to specify NOT NULL for ROWID column column-name.

Destination: 42831

-594 ATTEMPT TO CREATE A NULLABLE ROWID OR DISTINCT TYPE COLUMN column-name

Explanation: A CREATE VIEW statement attempted to create a new view with a nullable ROWID column. ROWID columns (or distinct type columns for which the source type is a ROWID) do not support null values. One of the following situations has occurred:

- The subselect of a CREATE VIEW statement involves an outer join for which a column of the result table is a ROWID column that needs to allow for null values.

System Action: The statement cannot be executed.

Programmer Response: Change the content of the statement so that it does not try to create a ROWID column which must allow for null values.

Destination: 42831

-601 THE NAME OF THE OBJECT TO BE CREATED OR THE TARGET OF A RENAME STATEMENT IS IDENTICAL TO THE EXISTING NAME name OF THE OBJECT TYPE obj-type

Explanation: One of the following situations has been detected:

- A CREATE statement tried to create an object name of type obj-type, but an object of that type with the same name is already defined in the DB2 subsystem.
  - If obj-type is CONSTRAINT, the name was specified in the FOREIGN KEY clause, CHECK clause, PRIMARY KEY clause, or UNIQUE clause of either a CREATE or ALTER TABLE statement. All referential integrity, check constraint, primary key, and unique key constraint names defined on a table must be unique.
  - If obj-type is TABLE or VIEW, and a CREATE ALIAS statement failed, then the alias-name specified in the CREATE ALIAS statement is identical to the table name or view name specified. The TABLE or VIEW might not exist in the DB2 subsystem.
  - If obj-type is DISTINCT TYPE, and a CREATE DISTINCT TYPE statement failed, then there is already a user-defined type existing with the same name as the distinct type name specified in the CREATE DISTINCT TYPE statement.
  - If obj-type is FUNCTION or PROCEDURE, and a CREATE FUNCTION or CREATE PROCEDURE statement failed, then there is already a routine existing with the same name as the name specified in the CREATE FUNCTION or CREATE PROCEDURE statement.

System Action: The CREATE, ALTER or RENAME statement cannot be executed. No new object was created, no existing object was altered, and no existing object was renamed.

Programmer Response: Either drop the existing object or choose another name. If obj-type is data set, do an IDCAMS DELETE of the data set before retrying the CREATE. Refer to Chapter 2 of DB2 SQL [Reference] for information about the scope of object names in DB2.

Destination: 42710

-602 TOO MANY COLUMNS SPECIFIED IN A CREATE INDEX OR ALTER INDEX STATEMENT

Explanation: The number of columns specified in the CREATE INDEX or ALTER INDEX statement exceeds 64, which is the maximum that is permitted by DB2.

System Action: The statement cannot be executed. The specified index was not created.

Programmer Response: The index definition must be modified to conform to the system-imposed column limit of 64.

Destination: 54008

-603 A UNIQUE INDEX CANNOT BE CREATED BECAUSE THE TABLE CONTAINS ROWS WHICH ARE DUPLICATES WITH RESPECT TO THE VALUES OF THE IDENTIFIED COLUMNS

Explanation: The index defined in the CREATE INDEX statement could not be created as unique because the specified table already contains rows that
are duplicates with respect to the values of the identified columns.

**System Action:** The statement cannot be executed.

**Programmer Response:** Examine the data to ascertain whether or not the duplicate data is valid. Alternatively, consider creating a nonunique index.

**Destination:** 23515

---

-**604**

**A DATA TYPE DEFINITION SPECIFIES AN INVALID LENGTH, PRECISION, OR SCALE ATTRIBUTE**

**Explanation:** A data type definition in a CREATE or ALTER statement contains an invalid length, precision, or scale attribute specification. In addition, the specification of data type might be incorrect or invalid. Or, the column definition in a view referenced in a CREATE TABLE LIKE view has an invalid length.

**System Action:** The statement cannot be executed. The specified object was not created or altered.

**Programmer Response:** Correct the syntax, and resubmit the statement. Refer to Chapter 2 of [DB2 SQL Reference](http://example.com) for information about valid length, precision, and scale attributes for the data type of an object.

**Destination:** 42611

---

-**607**

**OPERATION OR OPTION operation IS NOT DEFINED FOR THIS OBJECT**

**Explanation:** The operation or option cannot be performed on the object specified in the SQL statement.

**System Action:** The statement cannot be executed.

**Programmer Response:** If an option of the SQL statement is not allowed for this object, modify the SQL statement and resubmit the statement. If an operation is not defined for the object, the statement cannot be executed.

**Destination:** 42832

---

-**611**

**ONLY LOCKMAX 0 CAN BE SPECIFIED WHEN THE LOCK SIZE OF THE TABLESPACE IS TABLESPACE OR TABLE**

**Explanation:** This message is issued when:

- The LOCKSIZE of the table space is TABLESPACE or TABLE, and LOCKMAX is being altered to or created as a nonzero value.
- The LOCKSIZE of the table space is being altered to TABLESPACE or TABLE, and LOCKMAX is being altered to or created as a nonzero value.

If LOCKSIZE is TABLESPACE or TABLE, LOCKMAX must be 0 because lock escalation is not supported from these levels.

**System Action:** The statement cannot be executed.

**Programmer Response:** Do one of the following:

- Reissue the statement with LOCKMAX 0.
- Alter the LOCKSIZE of the table space to a value other than TABLESPACE or TABLE.

**Destination:** 53088

---

-**612**

**column-name IS A DUPLICATE COLUMN NAME**

**Explanation:** The CREATE INDEX, CREATE TABLE, CREATE VIEW or ALTER TABLE statement specifies the same column-name for two (or more) columns of the index, table, view, or the UPDATE OF clause of a trigger definition specifies the same column name more than once. Column names must be unique within an index, a table, a view, or in the UPDATE OF clause of a trigger definition. A column cannot be specified in more than one ALTER TABLE clause except if it is specified in an ALTER COLUMN clause and ADD CHECK CONSTRAINT clause. For ALTER TABLE ALTER COLUMN, the column name that is specified cannot be a column that is added in the same ALTER TABLE statement.

**System Action:** The statement cannot be executed. The specified index, table, view, or trigger was not created.

**Programmer Response:** Correct the CREATE statement to specify unique names for each of the columns of the index, table, view, or the columns in the UPDATE OF clause of a trigger definition. Correct the ALTER statement to specify unique names for each of the ALTER COLUMN clauses.

This error can also occur on CREATE TABLE when a column list of a PRIMARY KEY, FOREIGN KEY, or UNIQUE clause contains two or more occurrences of the same column name.

**Destination:** 42711

---

-**613**

**THE PRIMARY KEY OR A UNIQUE CONSTRAINT IS TOO LONG OR HAS TOO MANY COLUMNS**

**Explanation:** This error code results from a problem with the columns that are defined for a PRIMARY KEY or UNIQUE constraint. The number of columns is greater than 64, or the sum of the column length attributes is greater than the number allowed for the type of index.

If the failing statement was an ALTER TABLE statement that included the SET DATA TYPE clause to alter the definition of an existing column, a column being changed is part of a unique or primary constraint. The new sum of the lengths of the columns of the keys exceeds 255-n, where n is the number of columns allowing nulls. This sum currently exceeds the maximum number that is allowed.
If the failing statement was an ALTER TABLE statement with a PARTITIONING KEY specification, only 64 columns can be specified, and the combined lengths of all columns specified in the PARTITIONING KEY clause exceeds the maximum length of 255-n, where n is the number of columns that can contain null values.

**System Action:** The CREATE or ALTER statement cannot be executed. The specified table cannot be created or altered.

**Programmer Response:** Change the table definition to keep within the prescribed limits.

**Destination:** 54008

---

**-614**

**Explanation:** The index cannot be created or altered, or the length of a column cannot be changed because the sum of the internal lengths of the key columns would exceed the allowable maximum. The maximum permitted key length is as follows:

- For PADDED indexes, the sum of the length attributes of the columns must not be greater than 2000-n, where n is the number of columns that contain null values.
- For NOT PADDED indexes, the sum of the length attributes of the columns must not be greater than 2000-n-2m, where n is the number of nullable columns and m is the number of varying length columns.

**System Action:** The statement cannot be executed. The specified index was not created or the length of the column was not changed.

**Programmer Response:** The definition for the index must be modified (possibly by eliminating one or more key columns) to reduce the length of the key to the permitted maximum. Refer to Chapter 5 of [DB2 SQL Reference](#) if you require a complete explanation of other possible maximum key lengths and how they are computed.

**Destination:** 54008

---

**-615**

**Explanation:** The operation 'operation-type' cannot be performed because the package is in use by the same application process.

**operation-type**

Type of bind operation (BIND, REBIND or DROP).

**System Action:** The BIND, REBIND, or DROP operation on the package is not performed.

**Programmer Response:** Change the application to invoke the BIND, REBIND or DROP operation when the package is not use by the same application process.

**Destination:** 55006

---

**-616**

**Explanation:** Some types of objects cannot be dropped if there are other objects which are dependent upon them. For example, a storage group cannot be dropped if there are one or more existing table spaces that use that storage group.

Execution of the specified DROP statement would drop object obj-name1 of type obj-type1 on which object obj-name2 of type obj-type2 is dependent.

**System Action:** The statement cannot be processed. The specified object was not dropped.

**Programmer Response:** Verify that the object specified in the DROP statement was, indeed, the object to be dropped. If so, all the existing objects that have a dependency on that object must first be dropped.

A LOB table space cannot be dropped when an association exists between it and another table space. The associated base table must be dropped first.

A populated auxiliary table and its index can only be dropped by dropping the associated base table.

A trigger package cannot be explicitly dropped. It can only be dropped by dropping the associated trigger with a DROP TRIGGER statement or by dropping the triggering table.

**Destination:** 42893

---

**-618**

**Explanation:** System databases cannot be the object of certain types of operations. The attempted 'operation' cannot be performed on system databases. One possible reason for this error is that CCSID ASCII was specified when a system database was being created.

**System Action:** The statement cannot be executed. No changes were made to the specified system database.

**Programmer Response:** Do not attempt to perform the requested operation on system databases.

**Destination:** 42832
-619  OPERATION DISALLOWED BECAUSE THE DATABASE IS NOT STOPPED

Explanation: The statements CREATE, ALTER or DROP for a table space, table, or index in the database cannot be processed unless the database is stopped (using the STOP command).

System Action: The statement cannot be processed.

Programmer Response: Issue the -DISPLAY DATABASE command to verify that the work file database is stopped before resubmitting the statement.

Destination: 55011

-620  KEYWORD keyword IN stmt type
STATEMENT stmt type IS NOT PERMITTED FOR A space type SPACE IN THE database type database.

Explanation: The specified keyword in the SQL statement stmt type indicates an attribute that is not allowed for a space type space in the database type.

keyword

Specifies the keyword that is not allowed.

stmt type

CREATE or ALTER
CREATE is for CREATE TABLESPACE or CREATE INDEX.
ALTER is for ALTER TABLESPACE or ALTER INDEX.

space type

TABLE or INDEX
TABLE is for table space, and INDEX is for index space.

database type

WORK FILE or TEMP

System Action: The statement cannot be executed.

Programmer Response: Refer to DB2 SQL Reference for information about attributes that are allowed or not allowed for a space type space in a database type database. Correct and resubmit the stmt type statement.

Destination: 53001

-621  DUPLICATE DBID dbid WAS DETECTED AND PREVIOUSLY ASSIGNED TO database-name

Explanation: The current database being created was assigned a DBID of 'dbid', which is identical to the DBID assigned to database 'database-name'. An inconsistency exists between the DB2 catalog and directory.

System Action: The statement cannot be executed. No new object was created, and the existing object was not altered or modified.

Programmer Response: Notify the system programmer. The inconsistency must be corrected before CREATE DATABASE will be successful.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Destination: 58001

-622  FOR MIXED DATA IS INVALID BECAUSE THE MIXED DATA INSTALL OPTION IS NO

Explanation: FOR MIXED DATA is specified in a column description of a CREATE or ALTER TABLE, a CREATE FUNCTION, or a CREATE PROCEDURE statement, but the MIXED DATA install option is set to NO. FOR MIXED DATA is valid only when the MIXED DATA install option is set to YES.

System Action: The statement is not executed.

Programmer Response: Either change the install option or the FOR clause. If the install option is correctly set to NO, the allowable FOR clause options are BIT and SBCS.

Destination: 56031

-623  A CLUSTERING INDEX ALREADY EXISTS ON TABLE table-name

Explanation: A given table can have only one cluster index. This error can occur for the following reasons:

- A CREATE INDEX statement would create a second cluster index on the specified table.
- An ALTER INDEX statement specified the CLUSTER clause, but there is already a clustering index defined for the table.

System Action: The statement cannot be executed.

Programmer Response: Check to determine the identity and validity of the existing cluster index on the object table. Alternatively, consider creating the index without the CLUSTER attribute.

Destination: 55012

-624  TABLE table-name ALREADY HAS A PRIMARY KEY OR UNIQUE KEY CONSTRAINT WITH SPECIFIED COLUMNS

Explanation: The code is used to report that a primary key or unique key cannot be defined in an ALTER TABLE statement because the table either:

- Already has a primary key, or
-625 • -628

Has an existing unique constraint with the same definition (same set of columns specified) as the new key.

**System Action:** The statement cannot be run.

**Programmer Response:** Do not attempt to define a table with more than one primary key, or a unique constraint that duplicates the definition of an existing unique constraint.

**Destination:** 42889

---

**-625**

**TABLE table-name DOES NOT HAVE AN INDEX TO ENFORCE THE UNIQUENESS OF THE PRIMARY OR UNIQUE KEY**

**Explanation:** The ALTER TABLE statement is invalid for one of the following reasons:

- The table does not have a unique index with a key that is identical to the nominated primary or unique key.
- A unique index exists, but the index is already being used to enforce referential constraints. In this case, DB2 does not choose the index to enforce the primary or unique key.

**System Action:** The statement cannot be executed.

**Programmer Response:** Make sure the key list specified on the ALTER TABLE statement identifies an existing unique index of the table that is not already enforcing referential constraints.

**Destination:** 55014

---

**-626**

**THE ALTER STATEMENT IS NOT EXECUTABLE BECAUSE THE PAGE SET IS NOT STOPPED**

**Explanation:** An ALTER statement specifies an ADD PART, BUFFERPOOL, USING, PRIQTY, SECTOR, ERASE, or GBPCACHE clause, but the page set is not stopped.

**System Action:** The SQL statement cannot be executed.

**Programmer Response:** Stop the page set before resubmitting the statement.

**Destination:** 55015

---

**-627**

**THE ALTER STATEMENT IS INVALID BECAUSE THE PAGESET HAS USER-MANAGED DATA SETS**

**Explanation:** This code is used if a PRIQTY, SECTOR, or ERASE clause is specified, USING STOGROUP is not specified, and the page set has user-managed data sets.

**System Action:** The SQL statement cannot be executed.

**Programmer Response:** Verify that the correct table or partition is specified. The primary and secondary space allocation of a user-managed data set cannot be altered by means of an ALTER statement.

**Destination:** 55016

---

**-628** THE CLAUSES ARE MUTUALLY EXCLUSIVE

**Explanation:** Mutually exclusive clauses were specified in one or more of the following ways:

- A CREATE TABLESPACE statement contains both the SEGSIZE and NUMPARTS clauses.
- A CREATE TABLESPACE statement contains both the SEGSIZE and LARGE clauses.
- A CREATE TABLESPACE statement contains both the SEGSIZE and MEMBER CLUSTER clauses.
- A CREATE or ALTER TABLESPACE contains both the LOCKPART YES and LOCKSIZE TABLESPACE clause.
- A 'column-definition' contains both NOT NULL and DEFAULT NULL clauses.
- A 'column-definition' contains both FIELDPROC and DEFAULT clauses.
- A select-statement contains both the update-clause and the FOR FETCH ONLY clause.
- An ALTER TABLE statement contains both a DROP CONSTRAINT clause and either a DROP FOREIGN KEY, DROP CHECK, DROP PRIMARY KEY, or DROP UNIQUE clause.
- A CREATE or ALTER TABLESPACE statement contains both LOCKPART YES and LOCKSIZE TABLESPACE.
- A CREATE TRIGGER statement specifies more than one correlation name for OLD, NEW, OLD_TABLE, or NEW_TABLE. Each of these correlation specifications can appear no more than once in the CREATE TRIGGER statement.
- A CREATE FUNCTION statement contains both a CAST FROM clause and a SOURCE clause.
- A CREATE FUNCTION statement contains both a SOURCE clause and a RETURNS TABLE clause.
- A CREATE FUNCTION statement contains both a SOURCE clause and a clause used to define an external function (For example, EXTERNAL, LANGUAGE, NO SQL).
- A CREATE or ALTER FUNCTION statement specified SCRATCHPAD. SCRATCHPAD must not be specified when LANGUAGE JAVA or PARAMETER STYLE JAVA is also specified for a function.
- A CREATE or ALTER FUNCTION statement specified FINAL CALL. FINAL CALL must not be specified when LANGUAGE JAVA or PARAMETER STYLE JAVA is also specified for a function.
- A CREATE or ALTER FUNCTION or PROCEDURE statement specified LANGUAGE JAVA, LANGUAGE
COMPJAVA, or PARAMETER STYLE JAVA, with DBINFO. DBINFO must not be specified in these cases.

- A CREATE or ALTER FUNCTION or PROCEDURE statement specified LANGUAGE JAVA, LANGUAGE COMPJAVA, or PARAMETER STYLE JAVA, with RUN OPTIONS. RUN OPTIONS must not be specified in these cases.
- A CREATE or ALTER PROCEDURE statement specified PARAMETER STYLE JAVA, but LANGUAGE COMPJAVA or LANGUAGE JAVA was not specified.
- A CREATE or ALTER PROCEDURE statement specified LANGUAGE JAVA, but did not specify PARAMETER STYLE JAVA.
- A CREATE or ALTER FUNCTION statement specified PARAMETER STYLE JAVA, but LANGUAGE JAVA was not specified.
- A CREATE or ALTER FUNCTION statement specified LANGUAGE JAVA, but did not specify PARAMETER STYLE JAVA.
- A CREATE or ALTER PROCEDURE statement specified LANGUAGE JAVA with NO WLM ENVIRONMENT. NO WLM ENVIRONMENT must not be specified when LANGUAGE JAVA or LANGUAGE COMPJAVA is also specified for a procedure.
- A CREATE or ALTER PROCEDURE statement attempts to use the NO WLM ENVIRONMENT and PROGRAM TYPE SUB options. When NO WLM ENVIRONMENT is used, then SECURITY must also be used.
- A CREATE or ALTER PROCEDURE statement attempts to use both NO WLM ENVIRONMENT and either USER or DEFINER for SECURITY. When NO WLM ENVIRONMENT is used, then SECURITY DB2 must also be used.
- A CREATE or ALTER PROCEDURE statement contains both a LANGUAGE REXX clause, and a PARAMETER STYLE DB2SQL or PARAMETER STYLE JAVA clause.
- An ALTER TABLE statement contains both an ALTER COLUMN clause and a VALIDPROC clause.
- An ALTER TABLE statement contains both an ALTER COLUMN clause and a clause other than the check constraint clause.
- An ALTER TABLE statement contains either an ADD MATERIALIZED QUERY or DROP MATERIALIZED QUERY clause, and some other clauses.
- The AS (subselect) clause of a DECLARE GLOBAL TEMPORARY TABLE statement contains both an INCLUDING COLUMN DEFAULTS clause and a USING TYPE DEFAULTS clause.
- A CREATE DATABASE statement contains both the AS WORKFILE clause and the AS TEMP clause.
- If INSENSITIVE or SENSITIVE is specified, then SCROLL must also be specified, either on DECLARE CURSOR or with the ATTRIBUTES clause of the PREPARE statement.
- If SCROLL is specified, then either INSENSITIVE or SENSITIVE STATIC must also be specified, either on DECLARE CURSOR or with the ATTRIBUTES clause of the PREPARE statement.
- The attribute-string specified in the ATTRIBUTES clause of the PREPARE statement cannot specify conflicting options.
- LANGUAGE JAVA is not allowed for table functions.
- UNIQUE and UNIQUE WHERE NOT NULL cannot be specified with PARTITIONED on CREATE INDEX.
- EXTERNAL NAME is not allowed on ALTER TABLE for an SQL procedure. You may attempt the same action by issuing a DROP for the procedure, and rebuilding it with CREATE PROCEDURE.

Programmer Response: Change the options specified in the statement, and reissue the statement.

Destination: 42613

-629 SET NULL CANNOT BE SPECIFIED BECAUSE FOREIGN KEY name CANNOT CONTAIN NULL VALUES

Explanation: The code SET NULL option of the indicated FOREIGN KEY clause is invalid because no column of the key allows null values. The name is the constraint-name specified in the FOREIGN KEY clause or, if a constraint-name was not specified, the first column-name specified in the clause.

System Action: The statement cannot be processed.

Programmer Response: Change a column of the key to allow null values or change the delete rule.

Destination: 42834

-631 FOREIGN KEY name IS TOO LONG OR HAS TOO MANY COLUMNS

Explanation: This code is used to report that the sum of the length attributes of the columns identified in the indicated FOREIGN KEY clause is greater than 255 bytes or the number of columns identified is greater than 64. The 'name' is the constraint-name specified in the FOREIGN KEY clause or, if a constraint-name was not specified, the first column-name specified in the clause.

System Action: The statement cannot be executed.

Programmer Response: The table definition must be modified to conform to the system-imposed limit of the sum of the length attributes of the columns identified in the PRIMARY KEY clause.

Destination: 54008
THE TABLE CANNOT BE DEFINED AS A DEPENDENT OF table-name BECAUSE OF DELETE RULE RESTRICTIONS

Explanation: This code is used to report that the object of an ALTER TABLE statement cannot be defined as a dependent of the indicated table because either:

- The relationship would form a cycle that would cause the table to be delete-connected to itself.
- The relationship would cause the table to be delete-connected to the indicated table through multiple paths and the delete rule of the existing relationship is SET NULL.

The error is due to the delete rules of existing relationships, not the delete rule specified in the FOREIGN KEY clause of the ALTER TABLE statement.

System Action: The statement cannot be executed.

Programmer Response: Eliminate the particular FOREIGN KEY clause from the ALTER or CREATE TABLE statement.

Destination: 42915

THE DELETE RULE MUST BE delete-rule

Explanation: The code is used to report that the 'delete-rule' specified in a FOREIGN KEY clause of the ALTER TABLE statement is invalid. The indicated 'delete-rule' is required because:

- A self-referencing constraint must have a 'delete-rule' of CASCADE or NO ACTION.
- The relationship would cause the table to be delete-connected to the same table through multiple paths and such relationships must have the same 'delete-rule'.

System Action: The statement cannot be executed.

Programmer Response: Change the 'delete rule' in the FOREIGN KEY clause.

Destination: 42915

THE DELETE RULE MUST NOT BE CASCADE

Explanation: The code is used to report that the CASCADE delete rule specified in the FOREIGN KEY clause of an ALTER TABLE statement is invalid because:

- The relationship would form a cycle that would cause a table to be delete-connected to itself.
- The relationship would cause another table to be delete-connected to the same table through multiple paths with different delete rules or with a delete rule equal to SET NULL.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement by removing duplicate clauses.

Destination: 42614

THE DELETE RULES CANNOT BE DIFFERENT OR CANNOT BE SET NULL

Explanation: The code is used to report that the delete rules specified in two FOREIGN KEY clauses of the CREATE TABLE statement are invalid because the table would be delete-connected to the same table through multiple paths involving relationships with different delete rules or with delete rules of SET NULL.

System Action: The statement cannot be executed.

Programmer Response: Change the delete rule.

Destination: 42915

THE PARTITIONING KEYS FOR PARTITION part-num ARE NOT SPECIFIED IN ASCENDING OR DESCENDING ORDER

Explanation: In the CREATE INDEX or ALTER INDEX statement for the CLUSTER index for a partitioned table (that is, a table residing in a partitioned table space), the partitioning key values specified in the limit key value specifications were not in either ascending or descending order.

System Action: The statement cannot be executed. The specified cluster index was not created.

Programmer Response: Correct the limit key value specifications in the CREATE INDEX or ALTER INDEX statement for the identified partitions so that the limit key values for successive partitions are in strictly ascending or descending order.

Destination: 56016

DUPLICATE keyword KEYWORD

Explanation: The SQL statement contains a duplicate specification for the keyword keyword. For example:

- DEFAULT, UNIQUE, and PRIMARY can only be specified once in a column definition.
- UNIQUE and PRIMARY cannot both be specified for the same column definition.
- PRIMARY can only be specified once in a CREATE TABLE statement.
- The attribute-string specified in the ATTRIBUTES clause of the PREPARE statement cannot specify an option more than once.

System Action: The statement cannot be processed.

Programmer Response: Correct the statement by removing duplicate clauses.

<td>Verify that the correct table space was specified in the CREATE statement. Do not attempt to create more than one table in a partitioned, implicitly defined, or LOB table space.</td>
<td>55017</td>
</tr>
</tbody>
</table>
**-647** BUFFERPOOL bp-name CANNOT BE SPECIFIED BECAUSE IT HAS NOT BEEN ACTIVATED

**Explanation:** The buffer pool specified in a CREATE or ALTER statement for a table space or index (index space) is not activated.

Table spaces and indexes (index spaces) can only be assigned or reassigned to buffer pools that are currently activated.

**System Action:** The statement cannot be executed. The specified table space or index space was not created or altered.

**Programmer Response:** Verify that the proper buffer pool was specified in the CREATE or ALTER statement. Use the -DISPLAY BUFFERPOOL command to display the attributes of the buffer pool and determine if the buffer pool is activated. If the buffer pool is not activated, use the -ALTER BUFFERPOOL command to change the VPSIZE from 0 to the desired size.

**Destination:** 50703

---

**-650** THE ALTER STATEMENT CANNOT BE EXECUTED, REASON reason

**Explanation:** The ALTER statement cannot be executed for one of the following reasons:

1. Alter to type 1 index is not allowed for the index whose associated table space has a LOCKSIZE specification of ROW.
2. Alter to type 1 index is not allowed for the index defined with UNIQUE WHERE NOT NULL.
3. Alter to type 1 index is not allowed for the index whose associated table space has been defined as a LARGE table space.
4. Alter to type 1 index is not allowed for an index on an ASCII table.
5. Alter PIECESIZE is not allowed for a partitioning index.
6. Alter PIECESIZE 4G is not allowed for non-partitioned indexes on a non-LARGE table.
7. ALTER INDEX is not allowed when there is a pending SQL STATEMENT.
8. ALTER TABLE is not allowed when there is a pending SQL STATEMENT.
9. ALTER INDEX VALUES is not allowed when using table-controlled partitioning.
10. Using ALTER to change the attributes of a partition values is not allowed for an index on a partitioned basetable with LOB columns, or the table itself.

**System Action:** The ALTER statement is not executed.

**Programmer Response:** Correct the error according to the given reason and reissue the statement.

**Destination:** 56090

---

**-651** TABLE DESCRIPTION EXCEEDS MAXIMUM SIZE OF OBJECT DESCRIPTOR.

**Explanation:** The CREATE TABLE or ALTER TABLE statement causes the table descriptor (record OBD) to exceed the object descriptor size limit of 32KB.

**Programmer Response:** Change the statement by reducing either the number or length (or a combination of both) of the user-defined default string constants or check constraints and execute the statement again.

**System Action:** The statement is not executed. For an ALTER TABLE statement, the definition of the table is unchanged. For a CREATE TABLE statement, the table is not created.

**Destination:** 54025

---

**-652** VIOLATION OF INSTALLATION DEFINED EDIT OR VALIDATION PROCEDURE proc-name

**Explanation:** The result of the SQL statement has been rejected by the installation defined edit or validation procedure ‘proc-name’ for the object table.

**System Action:** The statement cannot be executed. The contents of the object table were not modified.

**Programmer Response:** Determine the requirements imposed by the edit or validation procedure for inserts and updates of the object table.

**Destination:** 23506

---

**-653** TABLE table-name IN PARTITIONED TABLE SPACE tspace-name IS NOT AVAILABLE BECAUSE ITS PARTITIONED INDEX HAS NOT BEEN CREATED

**Explanation:** An attempt has been made to insert or manipulate data in or create a view on a partitioned table (that is, a table residing in a partitioned table space) before the partitioned index for that table has been created.

A table residing in a partitioned table space cannot be referenced in any SQL manipulative statement or a CREATE VIEW statement before the partitioned index for that table has been created.
System Action: The statement cannot be executed.

Programmer Response: Verify that the correct table was specified in the statement. If so, ensure that the partitioned index for the table has been created successfully before attempting to execute any SQL manipulative statements that reference that table.

Destination: 57004

-655 THE CREATE OR ALTER STOGROUP IS INVALID BECAUSE THE STORAGE GROUP WOULD HAVE BOTH SPECIFIC AND NON-SPECIFIC VOLUME IDS

Explanation: One of the following error conditions occurred:

• Both a specific and a non-specific (""") volume ID are specified in the VOLUMES clause of a CREATE STOGROUP statement.
• Both a specific and a non-specific (""") volume ID are specified in an ADD VOLUMES clause of an ALTER STOGROUP statement.
• A specific volume ID is specified in an ADD VOLUMES clause of an ALTER of a storage group that has non-specific volume IDs or mixed volume IDs.
• A non-specific volume ID (""") is specified in an ADD VOLUMES clause of an ALTER of a storage group that has specific volume IDs or mixed volume IDs.

System Action: The statement is not executed.

Programmer Response: Specify either specific or non-specific volume IDs in the VOLUMES clause of CREATE STOGROUP statement and the ADD VOLUMES clause of the ALTER STOGROUP statement. To add specific volume IDs to a storage group with non-specific volume IDs, use the REMOVE VOLUMES clause to remove the non-specific volume IDs. To add non-specific volume IDs to a storage group with specific volume IDs, use the REMOVE VOLUMES clause to remove the specific volume IDs.

Destination: 56036

-661 INDEX index-name CANNOT BE CREATED OR ALTERED ON PARTITIONED TABLE SPACE tspace-name BECAUSE THE NUMBER OF PART SPECIFICATIONS IS NOT EQUAL TO THE NUMBER OF PARTITIONS OF THE TABLE SPACE

Explanation: The CREATE INDEX statement for the cluster index on a partitioned table (that is, a table residing in a partitioned table space) does not contain the same number of PART specifications as there are partitions in the table space. The definition for the cluster index for a partitioned table must contain exactly as many PART specifications as there are partitions in the table space in which that table resides. Also, the part numbers must be valid and unique.

System Action: The statement cannot be executed. The specified cluster index was not created.

Programmer Response: Examine the definition of the partitioned table space to determine how many partitions have been specified, and then correct the syntax of the CREATE INDEX statement to provide the proper number of PART specifications. Refer to Chapter 5 of DB2 SQL Reference for information about the
-662 A PARTITIONED INDEX CANNOT BE CREATED ON A NON-PARTITIONED TABLE SPACE tspace-name

Explanation: The CREATE INDEX statement contains PART specifications, but the specified object table is not partitioned (that is, does not reside in a partitioned table space).

System Action: The statement cannot be executed.

Programmer Response: Verify that the proper object table was specified in the statement. Refer to Chapter 5 of [DB2 SQL Reference] for information about the proper usage of PART specifications in CREATE INDEX statements.

Destination: 53036

-663 THE NUMBER OF KEY LIMIT VALUES IS EITHER ZERO, OR GREATER THAN THE NUMBER OF COLUMNS IN THE KEY OF INDEX index-name

Explanation: The number of limit key value specifications provided in at least one of the PART specifications of the CREATE INDEX or ALTER INDEX statement is either zero or greater than the number of columns in the index key.

System Action: The statement cannot be executed. The specified index was not created.

Programmer Response: Correct the statement so that each PART specification contains exactly the same number of limit key value specifications as there are columns in the index key.

Destination: 53037

-665 THE PART CLAUSE OF AN ALTER STATEMENT IS OMITTED OR INVALID

Explanation: The ALTER statement is invalid for one of the following reasons:

- The table space or index is not partitioned and the PART clause is specified.
- The table space or index is partitioned, a partition attribute (FREEPAGE or PCTFREE) is specified, and the PART clause is not specified.
- The integer specified in the PART clause does not identify a partition of the table space or index.
- A USING, PRIQTY, SECQTY, or ERASE clause is used to alter storage attributes, but the partition is not specified.
- A GBPCACHE clause is used to alter the group buffer pool caching attributes, but the partition is not specified.

System Action: The VALUES clause is specified without the PART clause. You must specify PART to change VALUES.

- Using ALTER to change the attributes of a partition values is not allowed for an index on a partitioned base table with LOB columns, or the table itself.

System Action: The SQL statement cannot be executed.

Programmer Response: Determine whether the table space or index you want to alter is partitioned. If it is partitioned, specify a PART clause that identifies the partition you want to alter. If it is not partitioned, do not specify the PART clause.

Destination: 53039

-666 stmt-verb object CANNOT BE EXECUTED BECAUSE function is IN PROGRESS

Explanation: The SQL statement could not be executed because the named function was executing at the time.

stmt-verb The type of data definition language (DDL) statement
object The DB2 object type
function A utility, the governor, or the distributed data facility (DDF)

If the object is part of the communications database, it cannot be dropped while the DDF is active.

System Action: The statement was not executed.

Programmer Response: If the function is a utility, wait for the function to complete or stop. Then resubmit the statement for execution.

If the function is the governor, the statement cannot be executed until the resource limit facility is stopped or switched to a different resource limit specification table (RLST). In a DB2 data sharing environment, the resource limit facility must be stopped on all members of the DB2 data sharing group or all members must switch to an RLST that is not associated with the object.

If the function is the DDF, the facility must be stopped before the object can be dropped. In a DB2 data sharing environment, the facility must be stopped on all members of the DB2 data sharing group.

Destination: 57005

-667 THE CLUSTERING INDEX FOR A PARTITIONED TABLE SPACE CANNOT BE EXPPLICITLY DROPPED

Explanation: The DROP INDEX statement attempted to drop the cluster index for a table residing in a partitioned table space. The cluster index for such a
table cannot be dropped explicitly with the DROP INDEX statement.

**System Action:** The statement cannot be executed. The specified index was not dropped.

**Programmer Response:** The cluster index for a table in a partitioned table space can only be dropped implicitly when the associated partitioned table space is dropped.

**Destination:** 42917

---

**-668**

**THE COLUMN CANNOT BE ADDED TO THE TABLE BECAUSE THE TABLE HAS AN EDIT PROCEDURE**

**Explanation:** The ALTER TABLE statement attempted to add a column to a table that has an edit procedure. If a table has an edit procedure, no columns can be added to it.

**System Action:** The statement cannot be executed. The specified table was not altered.

**Programmer Response:** Verify that the correct table was specified in the ALTER statement. Do not attempt to ALTER the definition of a table that has an installation-written edit procedure associated with it.

**Destination:** 56018

---

**-669**

**THE OBJECT CANNOT BE EXPLICITLY DROPPED, REASON reason-code**

**Explanation:** The DROP statement failed for the reason indicated by the *reason-code* as follows:

- **0001** The DROP TABLE statement attempted to drop a table that resides in a partitioned table space.
- **0002** The DROP INDEX statement attempted to drop an index required to enforce the primary key, unique key, or referential constraint of the table.

**System Action:** The statement cannot be processed. The object is not dropped.

**Programmer Response:** If the statement is a DROP TABLE statement, the table of a partitioned table space can only be dropped implicitly when the table space itself is dropped.

If the statement is a DROP INDEX statement and you do not want to keep the primary key, unique key, or referential constraint, use the DROP CONSTRAINT clause of the ALTER TABLE statement to remove the constraint, then drop the index.

**Destination:** 42917

---

**-670**

**THE RECORD LENGTH OF THE TABLE EXCEEDS THE PAGE SIZE LIMIT**

**Explanation:** The row length for a table cannot exceed the page size of the table space in which that table resides (or is to reside). The page size of the table space is determined by the buffer pool used by that table space.

One of following conditions may occur:

- As defined in a CREATE TABLE statement, the row length for the table would exceed the page size of the specified (or default) table space.
- In the case of an ALTER TABLE statement, addition of the specified column would cause the row length of the table to exceed the page size of the table space.
- In the case of an ALTER TABLE statement used to alter the length of an existing variable length column, the new length of the altered column would cause the row length of the table to exceed the page size of the table space.
- The row length in the result of a join exceeds the page size of a work file table space.
- The row length of a large sort record exceeds the page size of a work file table space. The sort record includes columns that are being sorted and columns that the user selects. The length of the columns that are being sorted is the sort key length. The length of the columns that the user selects is the sort data length.

**System Action:** The statement cannot be executed. The object table was not created or altered.

**Programmer Response:** In the case of CREATE TABLE, either (1) the row length of the table must be reduced (by eliminating or reducing the lengths of one or more of the columns), or (2) the table must be assigned to a table space that uses a larger buffer pool (assuming that the row length of the table does not exceed that page size limit).

In the case of ALTER TABLE, either (1) the length of the column to be added to the table must be reduced or, (2) if the row length of the table is already at the maximum, the table cannot be altered to add any additional columns.

In the case of a row length that exceeds the page size of a work file table space, eliminate columns from the result of the join.

In the case of a large sort record in which the row length exceeds the page size of a work file table space, eliminate columns from the `SELECT` list or reduce the number of columns that are being sorted.

**Destination:** 54010
-671  THE BUFFERPOOL ATTRIBUTE OF THE TABLE SPACE CANNOT BE ALTERED AS SPECIFIED BECAUSE IT WOULD CHANGE THE PAGE SIZE OF THE TABLE SPACE

Explanation: For example, the change to the buffer pool attribute for the table space specified in the ALTER TABLESPACE statement would change the page size of the table space—either from 4KB to 32KB, 8KB to 16KB, or vice versa.

Use of the ALTER TABLESPACE statement to change the page size of a table space is not permitted.

System Action: The statement cannot be executed. The table space definition was not altered.

Programmer Response: For example, if the table space uses one of the 4KB buffer pools (for example, BP0, BP1, or BP2), it can be reassigned to one of the other 4KB buffer pools (but not buffer pool BP32K). If, however, it is assigned to buffer pool BP32K, the buffer pool assignment cannot be subsequently altered.

Destination: 53040

-672  OPERATION DROP NOT ALLOWED ON TABLE table_name

Explanation: The DROP operation failed for one of the following reasons:
- The table being dropped has the RESTRICT ON DROP attribute.
- The table space or database being dropped contains the specified table, which has the RESTRICT ON DROP attribute.

System Action: The DROP statement cannot be executed.

Programmer Response: Before dropping the table, alter the table, specifying DROP RESTRICT ON DROP.

For DROP TABLESPACE or DROP DATABASE, make sure that there are no other tables within the table space or database with the RESTRICT ON DROP attribute. The following SELECT statement can identify the tables:

```
SELECT CREATOR, NAME FROM SYSTBL.SYSTABLES WHERE TYPE = 'T' AND CLUSTERTYPE = 'Y' AND DBNAME = 'database_name' AND TSPACE = 'tablespace_name';
```

Destination: 55035

-676  ONLY A 4K PAGE BUFFERPOOL CAN BE USED FOR AN INDEX

Explanation: A buffer pool having a page size other than 4KB was specified in the CREATE INDEX statement. Only 4KB buffer pools (that is, BP0, BP1, and BP2) can be specified for indexes.

System Action: The statement cannot be executed. The specified index was not created.

Programmer Response: Correct the statement to specify a 4KB buffer pool. Refer to Chapter 5 of DB2 SQL Reference for information about the syntax of SQL statements.

Destination: 53041

-677  INSUFFICIENT VIRTUAL STORAGE FOR BUFFERPOOL EXPANSION

Explanation: An attempt to either open (create) or expand a buffer pool has failed because insufficient virtual storage was available.

This error may occur under either of two circumstances:
- An attempt to create a buffer pool while opening a table space or index space, or
- An attempt to expand a buffer pool from its current size to its maximum size.

System Action: The statement cannot be executed.

Programmer Response: If this error should occur during interactive execution of an SQL statement or execution of an application program, installation administration should be notified.

Installation Action: It may be necessary to reexamine the buffer pool storage strategy.

One of the following messages has also been sent to the MVS console: DSNB601I, DSNB603I, or DSNB605I. Refer to Part 3, "DB2 messages," on page 155 for explanations of these messages.

Destination: 57011

-678  THE LITERAL literal SPECIFIED FOR THE INDEX LIMIT KEY MUST CONFORM TO THE DATA TYPE data-type OF THE CORRESPONDING COLUMN column-name

Explanation: The index limit key value literal has been specified incorrectly in the CREATE INDEX or ALTER INDEX statement.

Limit key value specifications must conform to the data type of the corresponding index key column. In this case, literal must be of data type data-type to conform to the data type of column &column-name.

System Action: The statement cannot be executed. The index was not created.

Programmer Response: Correct the statement so that each limit key value literal is of precisely the same data type as that of the corresponding index key column.

Destination: 53045
9. **THE OBJECT name CANNOT BE CREATED BECAUSE A DROP IS PENDING ON THE OBJECT**

**Explanation:** The application program has executed a DROP for the specified object, and then tried to re-create an object with the same name (and of the same type) before the DROP was completed.

**System Action:** The statement cannot be executed. The specified object was not created.

**Programmer Response:** The logic of the application program must be modified to issue a COMMIT (or the IMS or CICS equivalent) between the DROP and CREATE statements.

**Destination:** 57006

---

10. **TOO MANY COLUMNS SPECIFIED FOR A TABLE, VIEW OR TABLE FUNCTION**

**Explanation:** The maximum number of columns permitted per table, view, or table function is 750. The statement attempted to perform one of the following actions:

- CREATE or ALTER a table to contain more than 750 columns
- CREATE a view with more than 750 columns
- CREATE a table function with more than 750 columns in the RETURNS TABLE clause

**System Action:** The statement cannot be executed.

**Programmer Response:** Change the CREATE statement to not include more than 750 columns, or do not try to alter an existing table to contain more than 750 columns.

**Destination:** 54011

---

11. **COLUMN column-name IN VIOLATION OF INSTALLATION DEFINED FIELD PROCEDURE. RT: return-code, RS: reason-code, MSG: message-token**

**Explanation:** An installation field procedure returned an error for 'column-name'. The 'reason-code' and 'message-token' are defined by the field procedure. They may give additional information to help determine the cause of the problem.

**Return code**

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>Invalid value on encode or decode or invalid column description on define</td>
</tr>
<tr>
<td>8</td>
<td>Invalid parameter value</td>
</tr>
<tr>
<td>12</td>
<td>Field procedure error on any function</td>
</tr>
</tbody>
</table>

Use 'reason-code' and 'message-token' for additional information.

**System Action:** The statement cannot be executed.

**Destination:** 42842

---

12. **FIELD PROCEDURE procedure-name COULD NOT BE LOADED**

**Explanation:** The field procedure 'procedure-name' cannot be loaded.

**System Action:** The statement cannot be executed.

**Programmer Response:** The application should either commit or roll back to previous COMMIT. Then, in general, the application should terminate.

**Destination:** 57010

---

13. **THE SPECIFICATION FOR COLUMN, DISTINCT TYPE, FUNCTION, OR PROCEDURE data-item CONTAINS INCOMPATIBLE CLAUSES**

**Explanation:** There is an error in the data item specification in a CREATE or ALTER statement. Incompatible specifications are present such as "INTEGER and FOR BIT DATA". The location of the error is given by data-item as follows:

- For a CREATE or ALTER TABLE statement, data-item gives the name of the column containing the error. The error could be an invalid specification of FOR BIT DATA, FOR SBCS DATA, FOR MIXED DATA, or FIELDPROC for column data-item.
- For a CREATE FUNCTION or CREATE PROCEDURE statement, data-item is a token that identifies the area of the problem in the statement. For example, "PARAMETER 3" or "RETURNS" or "CAST FROM".
- For a CREATE DISTINCT TYPE statement, data-item gives the name of the type being defined.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the SQL statement by removing the incompatible specification.

**Destination:** 42842

---

14. **THE LENGTH OF LITERAL LIST BEGINNING string IS TOO LONG**

**Explanation:** The length of the literal list beginning with 'string', excluding insignificant blanks and delimiting parentheses is greater than 255.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the SQL statement.
-685  Destination: 54012

-685  INVALID FIELD TYPE, column-name

Explanation: The field description returned by the field procedure is invalid. The data type code denotes a long string or has an invalid value.

System Action: The statement cannot be executed.

Programmer Response: Correct the field procedure so that it returns a valid data type code.

Destination: 58002

-686  COLUMN DEFINED WITH A FIELD PROCEDURE CAN NOT COMPARE WITH ANOTHER COLUMN WITH DIFFERENT FIELD PROCEDURE

Explanation: The columns specified are not compatible. Different field procedures are specified, or only one field procedure is specified.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement to conform to the column limit for a dependent table.

Destination: 53043

-687  FIELD TYPES INCOMPARABLE

Explanation: One column cannot be compared with another column that has incompatible field types.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement. Refer to Chapter 2 of [DB2 SQL Reference] for comparison restrictions between columns defined with a field procedure.

Destination: 53044

-688  INCORRECT DATA RETURNED FROM FIELD PROCEDURE, column-name, msgno

Explanation: Unexpected data returned from field procedure for column 'column-name'. For more information see 'msgno'.

System Action: The statement cannot be executed.

Programmer Response: Correct the field procedure so that it returns values that are consistent with their descriptions.

Destination: 58002

-689  TOO MANY COLUMNS DEFINED FOR A DEPENDENT TABLE

Explanation: The maximum number of columns allowed for a dependent table is 749. The code is used to report that the statement is invalid because of one of the following:

- A CREATE TABLE statement is creating a dependent table with 750 columns.
- An ALTER TABLE statement is altering a dependent table with 749 columns to add a column, or altering a table with 750 columns to become a dependent table.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement to conform to the column limit for a dependent table.

Destination: 54011

-690  THE STATEMENT IS REJECTED BY DATA DEFINITION CONTROL SUPPORT. REASON reason-code

Explanation: The code is issued by the data definition control support to report that the statement is rejected for the reason indicated by 'reason-code' after consulting the application registration table and object registration table.

The explanation of the given reason code:

- 0001
  Data definition control support is running under the controlling by application name mode. The statement is rejected because the current application is not registered in application registration table with DEFAULTAPPL on.

- 0002
  Data definition control support is running under the controlling by application name with exceptions mode. The statement is rejected because the object is not registered in object registration table and the current application is not registered in application registration table with DEFAULTAPPL on.

- 0003
  Data definition control support is running under the controlling by application name with exceptions mode. The statement is rejected because the object is registered in object registration table but the current application does not match.

- 0004
  Data definition control support is running under the controlling by object name with exceptions mode. The statement is rejected because the object is registered in object registration table but the current application does not match.

- 0005
  Data definition control support is running under the controlling by object name mode. The statement is
rejected because the object is registered in object registration table but the current application does not match.

- 0006

Data definition control support is running under the controlling by object name mode. The statement is rejected because the object is not registered in object registration table.

**System Action:** The statement cannot be executed.

**Programmer Response:** None if valid rejection. Otherwise, check to see if data definition control support is running under the desired mode. Check one or both registration table(s) to determine if the entries of the registration table(s) are correct. If they are not, then update the registration table(s).

**Destination:** 23508

---

**-691**

**THE REQUIRED REGISTRATION TABLE table-name DOES NOT EXIST**

**Explanation:** The data definition control support assumes the existence of the application registration table and object registration table. But either one or both tables is not defined.

**System Action:** The statement cannot be executed.

**Programmer Response:** Determine whether the required registration tables do exist. If not, create the required tables.

**Destination:** 57018

---

**-692**

**THE REQUIRED UNIQUE INDEX index-name FOR DDL REGISTRATION TABLE table-name DOES NOT EXIST**

**Explanation:** A unique index must be defined for each registration table. The code is issued when either the required index does not exist or the index defined is not a unique index.

**System Action:** The statement cannot be executed.

**Programmer Response:** Determine whether the required unique index does exist. If not, create the required index. If the index does exist, but is not unique, drop it and recreate it as a unique index.

**Destination:** 57023

---

**-693**

**THE COLUMN column-name IN DDL REGISTRATION TABLE OR INDEX table-name (index-name) IS NOT DEFINED PROPERLY**

**Explanation:** An error occurred during verification of the application or object registration table.

The table is improperly defined for the following reasons:
  - A required column is missing.
  - A column description is invalid because its name, column number, data type, length, or null attribute is incorrect.

or

The index is improperly defined for the following reasons:
  - A required key column is missing.
  - A key column description is invalid because of its key sequence or because its ordering is incorrect.
  - A defined key column should not be part of the unique key.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct or alter the definition of the required registration table or index.

**Destination:** 55003

---

**-694**

**THE DDL STATEMENT CANNOT BE EXECUTED BECAUSE A DROP IS PENDING ON THE DDL REGISTRATION TABLE table-name**

**Explanation:** An error occurred while accessing the application registration table or object registration table. The application registration table or object registration table was dropped, but the DROP statement was not committed.

**System Action:** The statement cannot be executed.

**Programmer Response:** Resubmit the job. If the same error happens, check for the application that issued the DROP statement for the application registration table or the object registration table. Either commit the DROP statement which dropped the table and create a new application registration table or object registration table, or issue a ROLLBACK for the DROP statement to put the tables back.

**Destination:** 57023

---

**-695**

**INVALID VALUE seclabel SPECIFIED FOR SECURITY LABEL COLUMN OF TABLE table-name**

**Explanation:** For an INSERT or an UPDATE to table table-name, the value that was specified for the security label was invalid.

**System Action:** The INSERT or UPDATE cannot be performed.

**Programmer Response:** Ensure that the value that is specified for the security label column is a valid security label. Alternatively, insert the row that specifies DEFAULT for the security label column, or remove the security label column from the insert column list.

**Destination:** 23523
-696  THE DEFINITION OF TRIGGER  

trigger-name INCLUDES AN INVALID USE OF CORRELATION NAME OR TRANSITION TABLE NAME. 

name. 

REASON CODE=reason-code

Explanation: The trigger definition included an invalid use of name.

trigger-name
The trigger that encountered the error.

name
The transition variable correlation name or transition table name.

reason-code
A reason-code indicating the specific problem as follows:
1. NEW correlation name and NEW_TABLE name are not allowed in a DELETE trigger.
2. OLD correlation name and OLD_TABLE name are not allowed in an INSERT trigger.
3. OLD_TABLE name and NEW_TABLE name are not allowed in a BEFORE trigger.

System Action: The statement cannot be executed. The trigger was not created.

Programmer Response: Remove the invalid correlation name or transition table name along with the preceding keyword.

Destination: 42898

-697  OLD OR NEW CORRELATION NAMES ARE NOT ALLOWED IN A TRIGGER DEFINED WITH THE FOR EACH STATEMENT CLAUSE. OLD_TABLE OR NEW_TABLE NAMES ARE NOT ALLOWED IN A TRIGGER WITH THE BEFORE CLAUSE.

Explanation: The trigger, as defined, includes a REFERENCING clause with one of the following invalid combinations:
• OLD or NEW correlation names specified (or both) and the FOR EACH STATEMENT clause.
• NEW_TABLE or OLD_TABLE correlation names specified (or both) and the BEFORE clause.

System Action: The statement cannot be executed. The trigger was not defined.

Programmer Response: Remove invalid correlation names or change the trigger granularity to FOR EACH ROW.

Destination: 42899

-713  THE REPLACEMENT VALUE value FOR special-register IS INVALID

Explanation: The value specified in the SET special-register statement is not a valid value of the indicated special register.

System Action: The statement cannot be executed.

Programmer Response: Correct the replacement value. See [DB2 SQL Reference] for an explanation of the valid values of each special register.

Destination: 42815

-715  PROGRAM program-name WITH MARK release-dependency-mark FAILED BECAUSE IT DEPENDS ON FUNCTIONS OF THE RELEASE FROM WHICH FALLBACK HAS OCCURRED

Explanation: Program 'program-name' depends on a function of DB2 that is not supported by the current active release.

program-name
Name of the application program.

release-dependency-mark
A 1-character mark showing the oldest DB2 release supporting this program.

System Action: The BIND operation for this plan or package is not performed.

User Response: The program cannot be used until the DB2 subsystem is remigrated to the newer release.

Operator Response: Notify the system programmer.

System Programmer Response: Warn users not to use plans or packages containing this program until the DB2 subsystem has been remigrated to the newer release.

Destination: 56064

-716  PROGRAM program-name PRECOMPILED WITH INCORRECT LEVEL FOR THIS RELEASE

Explanation: Program 'program-name' was precompiled under a release not supported by the current level of DB2, or the contents of the DBRM have been modified after the precompilation phase.

User Response: Precompile the named program again using the current precompiler. Reissue the BIND subcommand.

Problem Determination: If the program was precompiled at an appropriate release, and the problem persists, collect the following:
• A hexadecimal print of the first record of the failing DBRM
- The listing from the precompile job that generated the DBRM
- Output from the BIND attempt.

**Destination:** 56065

---

**-717**

<table>
<thead>
<tr>
<th>bind-type FOR object-type object-name</th>
<th>WITH MARK release-dependency-mark FAILED BECAUSE object-type DEPENDS ON FUNCTIONS OF THE RELEASE FROM WHICH FALLBACK HAS OCCURRED</th>
</tr>
</thead>
</table>

**Explanation:** The plan or package indicated depends on a function of DB2 which is not supported by the currently active release.

**bind-type**
- REBIND

**object-type**
- PLAN | PACKAGE

**object-name**
- Name of the application plan, or the package

**release-dependency-mark**
- A one-character mark showing the oldest release of DB2 can support this plan or package. The release dependency mark for the plan is kept in the IBMREQD columns in the DB2 catalog in SYSIBM.SYSPLAN (plans), SYSIBM.SYSPACKAGE(packages).

**System Action:** The REBIND operation for this plan or package is not performed.

**User Response:** The plan or package cannot be used until the DB2 subsystem is remigrated to the newer release.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Warn users not to use the plan or package until the DB2 subsystem has been remigrated to the newer release.

**Destination:** 56066

---

**-718**

<table>
<thead>
<tr>
<th>REBIND OF PACKAGE package-name FAILED BECAUSE IBMREQD OF ibmreqd IS INVALID</th>
</tr>
</thead>
</table>

**Explanation:** The IBMREQD column of the SYSIBM.SYSPACKAGE catalog table for the named package contains an unrecognizable character.

**package-name**
- Name of the package
  - (location.collection.package.version)

**System Action:** The REBIND failed.

**User Response:** You must do a BIND ACTION(REPLACE) for this package.

**Destination:** 56067

---

**-719**

| BIND ADD ERROR USING auth-id AUTHORITY PACKAGE package-name ALREADY EXISTS |

**Explanation:** An attempt is made to add a package that already exists. The combination of 'location.collection.package.version' must be unique in the SYSIBM.SYSPACKAGE table. In addition, the combination of 'location.collection.package.consistency-token' must be unique.

**auth-id**
- Authorization ID of the invoker of the BIND subcommand.

**package-name**
- Name of the package
  - (location.collection.package.version).

**System Action:** No package is created.

**System Programmer Response:** Check the SYSIBM.SYSPACKAGE catalog table for names of existing application packages. Re invoke the BIND subcommand with a 'location.collection.package.version' that is not in use.

**Destination:** 42710

---

**-720**

| BIND ERROR, ATTEMPTING TO REPLACE PACKAGE = package_name WITH VERSION = version2 BUT THIS VERSION ALREADY EXISTS |

**Explanation:** An attempt is made to create a version of a package that already exists. The version specified in the REPLVER keyword is different from the version specified for the precompile. The version specified for the precompile already exists in the catalog. The combination of 'location.collection.package.version' must be unique in the SYSIBM.SYSPACKAGE catalog table. A common mistake is that the user may believe that the version he is creating is the one specified in the REPLVER keyword. This is not the case. The version specified in the REPLVER keyword is the name of the version being replaced. The version that will be created is the version that was given to the program when it was precompiled.

**package_name**
- Fully qualified package name

**version2**
- Version-id of package that is to be created

**System Action:** The bind will fail.

**System Programmer Response:** There are two approaches to solve this problem. The first is to precompile the program again with a new version name and reissue the original BIND subcommand. The other approach is not to do the precompile but reissue the BIND subcommand with REPLVER(SAME).

**Destination:** 42710
-721  BIND ERROR FOR PACKAGE = pkg-id
       CONTOKEN = contoken'X IS NOT UNIQUE SO IT CANNOT BE CREATED

Explanation:  An attempt is made to add or replace a package with a consistency token that is not unique for that package. In other words, the combination of location.collection.package.consistency-token already exists.

pkg-id    Fully qualified name of the package.
contoken  Consistency token in hexadecimal.

System Action:  The BIND will fail.

System Programmer Response:  Check the SYSIBM.SYSPACKAGE catalog table for names of existing application packages with the indicated consistency token. Reissue the BIND subcommand such that the location.collection.package.consistency-token is unique within the catalog. The following SQL statement can be used to query the catalog:

       SELECT COLLID,NAME
       FROM loc-id.SYSIBM.SYSPACKAGE
       WHERE HEX(CONTOKEN) = contoken

Destination:  42710

-722  bind-type ERROR USING auth-id
       AUTHORITY PACKAGE package-name
       DOES NOT EXIST

Explanation:  The indicated subcommand was issued against a package that does not exist. The individual variable fields contain:

bind-type   Type of bind subcommand (BIND | REBIND | FREE).
auth-id    Authorization ID of the invoker of the BIND subcommand.
package-name  Name of the package
               (location.collection.package.version)

System Action:  Package not rebound or freed.

System Programmer Response:  Check the SYSPACKAGE catalog table for the correct 'location.collection.package.version' to use.

Destination:  42704

-723  AN ERROR OCCURRED IN A TRIGGERED SQL STATEMENT IN
       trigger-name. INFORMATION RETURNED: SQLCODE: sqlerror,
       SQLSTATE: sqlstate, MESSAGE TOKENS token-list, SECTION NUMBER
       section-number

Explanation:  During execution of an UPDATE, INSERT, or DELETE statement, a trigger was activated. One of the triggered SQL statements received an SQL error condition.

trigger-name  The trigger that was activated when the error occurred.
section-number  The section number associated with the failing triggered SQL statement. For triggers that contain a WHEN clause, the WHEN clause is section number one. The triggered SQL statements are numbered sequentially, beginning with section number two. This is true for triggers with or without a WHEN clause.
sqlcode   The SQLCODE received by the activated trigger.
sqlstate   The corresponding SQLSTATE for the SQLCODE received by the activated trigger.
token-list  The list of tokens from the original SQL error. This list might be truncated.

System Action:  The trigger and the original INSERT, UPDATE, or DELETE statement cannot be processed. The triggering table is unchanged.

Programmer Response:  Contact your Database Administrator to determine why the trigger named in the message received the error.

System Programmer Response:  Use the trigger name and section number to determine the failing SQL statement. If the trigger definition is available, use the section number to determine the failing statement. Alternatively, the failing statement can be retrieved from the SYSIBM.SYSPACKSTMT catalog table: SELECT TEXT, SEQNO FROM SYSIBM.SYSPACKSTMT
               WHERE COLLID = 'schema-name' AND NAME = 'trigger-name' AND SECTNO = section-number ORDER BY SEQNO Refer to the explanation of the reported SQLCODE. Follow the action suggested by that SQLCODE.

Destination:  09000
THE ACTIVATION OF THE **object-type**
**OBJECT** **object-name** **WOULD EXCEED**
THE MAXIMUM LEVEL OF INDIRECT SQL CASCADING

**Explanation:** Cascading of indirect SQL occurs when a trigger, user-defined function or stored procedure invokes another trigger, user-defined function or stored procedure which in turn invokes another. The activation of some of the triggers in this chain might be due to the enforcement of referential constraint delete rules. The depth of this cascading is limited to 16.

Note that recursive situations where a trigger includes a triggered SQL statement that directly or indirectly causes the same trigger to be activated are very likely to cause this error. The trigger should contain logic to check for a terminating condition to prevent this error.

**object-type** Names the type of object being called. Object type is TRIGGER, FUNCTION, or PROCEDURE.

**object-name** Specifies the name of the trigger, user-defined function or stored procedure that would have been activated at the seventeenth level of cascading.

**System Action:** The original statement could not be executed. All SQL statements executed by all triggers, user-defined functions, and stored procedures in the cascade chain are rolled back. External actions performed by the indirect SQL, such as sending a network message might have already occurred.

**Programmer Response:** Start with the indirect SQL that is activated by the original SQL operation. Check for recursive patterns in any invoked user-defined functions or in any triggers defined on the subject of an update operation. If the chain is not recursive, the cascade chain must be simplified by altering the triggers, user-defined functions, or stored procedures involved.

**Destination:** 54038

---

THE SPECIAL REGISTER **register** AT LOCATION **location** WAS SUPPLIED AN INVALID VALUE

**Explanation:** DB2 received a SET statement with an invalid value. Valid SETs might be allowed or retained. Further processing stops at the named site until the SET statement is corrected.

**System Action:** All SQL statements at the named remote site are rejected until the SET statement that was in error is corrected.

**Programmer Response:** The SET statement should be reissued with a valid value. This situation can be corrected with a local SET statement or with a DRDA SET statement executed at the remote site. Once the special register has been supplied a valid value, the application can resume execution.

**Destination:** 42721

---

BIND ERROR ATTEMPTING TO REPLACE PACKAGE = **package-name**. THERE ARE ENABLE OR DISABLE ENTRIES CURRENTLY ASSOCIATED WITH THE PACKAGE

**Explanation:** The BIND subcommand was issued to replace a package that has ENABLE or DISABLE entries currently associated with the package.

**System Action:** Package not bound.

**System Programmer Response:** FREE the package first and then BIND the package.

**Destination:** 55030

---

DATA TYPE **data-type** IS NOT ALLOWED IN DB2 PRIVATE PROTOCOL PROCESSING

**Explanation:** An SQL statement uses a data type that cannot be used with DB2 private protocol. Data types such as LOBs (large objects), row IDs and user defined types cannot be accessed using DB2 private protocol.

**System Action:** The statement cannot be executed.

**Programmer Response:** If this is an invalid data type, correct the statement. If this is a valid (but disallowed) data type, you can:

- Remove access to the data type listed, and re-execute the statement.
- Change the application program so that DRDA is used to access the data.
- BIND the package containing the statement to the remote site with bind option DBPROTOCOL(DRDA) and rerun the program.

Refer to the [DB2 SQL Reference](#) for more information.

**Destination:** 56080

---

A STORED PROCEDURE SPECIFYING COMMIT ON RETURN CANNOT BE THE TARGET OF A NESTED CALL STATEMENT

**Explanation:** A stored procedure defined with the COMMIT ON RETURN attribute was called from a stored procedure, user-defined function, or trigger. Stored procedures defined with COMMIT ON RETURN cannot be nested in this way.

**System Action:** The SQL statement is not executed. If the CALL statement references a remote server, the unit of work is placed in a must rollback state.

**Programmer Response:** Remove the CALL to the
stored procedure that was defined with the COMMIT ON RETURN attribute.

Destination:  429B1

-730  THE PARENT OF A TABLE IN A READ-ONLY SHARED DATABASE MUST ALSO BE A TABLE IN A READ-ONLY SHARED DATABASE

Explanation:  An attempt was made to define a relationship between a table in a read-only shared database and a table that is not.

System Action:  The statement cannot be executed.

Programmer Response:  Insure that the correct tables are being used for the relationship being defined.

Destination:  56053

-731  USER-DEFINED DATASET dsname MUST BE DEFINED WITH SHAREOPTIONS(1,3)

Explanation:  The VSAM SHAREOPTIONS must be (1,3) for all of the indexes and table spaces in the database. The user-defined data set identified did not meet this requirement.

System Action:  The statement cannot be executed.

Programmer Response:  Insure that the data sets used in the shared database are defined with the proper SHAREOPTIONS.

Destination:  56054

-732  THE DATABASE IS DEFINED ON THIS SUBSYSTEM WITH THE ROSHARE READ ATTRIBUTE BUT THE TABLE SPACE OR INDEX SPACE HAS NOT BEEN DEFINED ON THE OWNING SUBSYSTEM

Explanation:  Prior to creating a table space or index in a database with the ROSHARE READ attribute, that object must first be defined on the owning subsystem.

System Action:  The statement cannot be executed.

Programmer Response:  Verify that the table space or index has been defined on the owning system in a ROSHARE OWNER database.

Destination:  56055

-733  THE DESCRIPTION OF A TABLE SPACE, INDEX SPACE, OR TABLE IN A ROSHARE READ DATABASE MUST BE CONSISTENT WITH ITS DESCRIPTION IN THE OWNER SYSTEM

Explanation:  This code is issued while creating a table space, index, or table in the ROSHARE READ database. These objects must be consistent with their descriptions in the ROSHARE OWNER database as follows:

- For a table space, the following attributes must be the same:
  - Page size
  - Segment size
  - Number of partitions
- For an index, the following attributes must be the same:
  - Number of partitions
  - Number of subpages
  - Table OBID
  - Total key length
  - Index type (Type 1 or Type 2 Index)
  - Number of key columns
- For a table, the following attributes must be the same:
  - Table OBID
  - Maximum record length
  - Number of columns
  - Whether an edit procedure exists

System Action:  The statement cannot be executed.

Programmer Response:  Ensure that the definition of the table space, index, or table is consistent with that in the ROSHARE OWNER database.

Destination:  56056

-734  THE ROSHARE ATTRIBUTE OF A DATABASE CANNOT BE ALTERED FROM ROSHARE READ

Explanation:  An attempt was made to ALTER a database from ROSHARE READ to either ROSHARE OWNER or ROSHARE NONE.

System Action:  The statement cannot be executed.

Programmer Response:  Verify that the correct database was specified on the ALTER DATABASE statement. The ROSHARE attribute of a read-only shared database cannot be altered. To change this, DROP and recreate the database.

Destination:  56057

-735  DATABASE dbid CANNOT BE ACCESSED BECAUSE IT IS NO LONGER A SHARED DATABASE

Explanation:  An attempt was made to access an object in the database identified by dbid, that is known to the system as having the ROSHARE READ attribute. The database, however, is no longer defined as ROSHARE OWNER on the owning subsystem.

System Action:  The statement cannot be processed.

Programmer Response:  Verify that the correct object is specified on the statement.
**-736** INVALID OBID *obid* SPECIFIED

**Explanation:** An invalid OBID value was given on the CREATE statement. The OBID is invalid for one of the following reasons:

- The specified OBID does not fall within the acceptable range for OBIDs, which is 1 to 32767.
- The specified OBID is already in use for the given database.

**System Action:** The statement cannot be executed.

**Programmer Response:** Verify that the given OBID is a valid value for an OBID. If so, ensure that the OBID is correct for the object to be created, then query the catalog to find the object that is already defined as having the same OBID in the database. If an invalid OBID was given for the object to be created, correct the statement and execute it again. If the existing object is in error, then DROP and CREATE that object using the correct OBID value.

It is possible that the OBID “in use” is the OBID for an object that had been previously dropped. If that is the case, and the CREATE was issued for a table in a non-ROSHARE READ database, then select a different OBID for use in the OBID clause. If the object had been previously dropped and the CREATE was issued for a table in a ROSHARE READ database, COMMIT and re-submit the CREATE TABLE request.

**Destination:** 55004

---

**-737** IMPLICIT TABLE SPACE NOT ALLOWED

**Explanation:** A CREATE TABLE statement was issued using an implicit table space. An implicit table space may not be used in a database that has been defined as a read-only shared database.

**System Action:** The statement cannot be executed.

**Programmer Response:** CREATE a table space for the table, using the same name as is given on the owning system. Then resubmit the CREATE TABLE statement.

**Destination:** 56056

---

**-739** CREATE OR ALTER FUNCTION

function-name FAILED BECAUSE FUNCTIONS CANNOT MODIFY DATA WHEN THEY ARE PROCESSED IN PARALLEL.

**Explanation:** The function cannot be created or altered because ALLOW PARALLEL and MODIFIES SQL DATA were both specified explicitly or implicitly. A function cannot be parallelized if it modifies data.

**System Action:** The statement cannot be processed.

**Destination:** 55020

---

**-740** FUNCTION *name* IS DEFINED WITH THE OPTION MODIFIES SQL DATA WHICH IS NOT VALID IN THE CONTEXT IN WHICH IT WAS INVOKED

**Explanation:** A user-defined function defined with MODIFIES SQL DATA is only allowed in:

- VALUES clause of an INSERT statement
- SET clause of an UPDATE statement
- VALUES statement in a trigger
- SET Assignment statement
- CALL procedure statement

**System Action:** The SQL statement failed.

**Programmer Response:** Remove the user-defined function from the failing statement, or remove the MODIFIES SQL DATA option from the definition of the function.

**Destination:** 51034

---

**-741** A *database-type* DATABASE IS ALREADY DEFINED FOR MEMBER

member-name

**Explanation:** A CREATE DATABASE statement was issued for a WORK FILE or TEMP database, but the database can not be created because one is already defined for the named DB2 subsystem or data sharing group member.

**database-type**

WORK FILE or TEMP

**member-name**

Name of the DB2 subsystem or data sharing group member that already has a *database-type* database.

**System Action:** The statement cannot be executed.

**Programmer Response:** Verify the identity and validity of the existing *database-type* database for the named DB2 subsystem or data sharing member. The existing database can be altered or dropped if necessary. If the existing database is dropped, resubmit the CREATE DATABASE statement.

**Destination:** 55020

---

**-742** DSNDDB07 IS THE IMPLICIT WORK FILE DATABASE

**Explanation:** The WORKFILE clause cannot be used on a CREATE DATABASE statement to create a work file database for a DB2 subsystem that is not a member of a DB2 data sharing group. The system database,
DSNDB07, is the implicit work file database.

**System Action:** The statement cannot be executed.

**Programmer Response:** To create the work file database for a DB2 subsystem that is not a member of a DB2 data sharing group, create database DSNDB07 without the WORKFILE clause.

**Destination:** 53004

---

-746  THE SQL STATEMENT IN AN EXTERNAL FUNCTION, TRIGGER, OR IN STORED PROCEDURE name VIOLATES THE NESTING SQL RESTRICTION

**Explanation:** If a table is being modified (by INSERT, DELETE or UPDATE), the table cannot be accessed by the lower level nesting SQL statement.

If any table is being accessed by a SELECT statement, no table can be modified (by INSERT, DELETE or UPDATE) in any lower level nesting SQL statement.

**System Action:** The SELECT, INSERT, DELETE or UPDATE SQL statement failed.

**Programmer Response:** Remove the failing statement from the named external function, trigger or the stored procedure.

**Destination:** 57053

---

-747  TABLE table-name IS NOT AVAILABLE UNTIL THE AUXILIARY TABLES AND INDEXES FOR ITS EXTERNALLY STORED COLUMNS HAVE BEEN CREATED

**Explanation:** An attempt was made to access or reference a table with one or more LOB columns, however either

- an auxiliary table for storing one of the LOB columns has not been created, or
- an index has not been created for an auxiliary table, or
- there is not an auxiliary table for each partition of the table space.

**System Action:** The statement was not executed.

**Programmer Response:**
1. Use CREATE TABLESPACE to create a LOB table space.
2. Use CREATE TABLE to create the auxiliary table for storing the column.
3. Use CREATE INDEX to create an index on the auxiliary table.
4. Resubmit the statement that failed.

**Destination:** 57054

---

-748  AN INDEX ALREADY EXISTS ON AUXILIARY TABLE table-name

**Explanation:** The CREATE INDEX statement would create a second index on the specified auxiliary table. An auxiliary table can have only one index.

**System Action:** The statement cannot be executed.

**Programmer Response:** An index already exists. Another index cannot be created.

**Destination:** 54042

---

-750  THE SOURCE TABLE source-name CANNOT BE RENAMED BECAUSE IT IS REFERENCED IN EXISTING VIEW, MATERIALIZED QUERY TABLE, OR TRIGGER DEFINITIONS

**Explanation:** The source table in a RENAME statement cannot be renamed because it is referenced in one or more existing triggers:

- It is referenced in one or more materialized query table definitions
- It is referenced as the triggering table in one or more existing triggers.

**System Action:** The statement cannot be executed.

**Programmer Response:** Change the source name to the name of an object that can be renamed and reissue the statement. Drop any triggers defined on the table before issuing the RENAME statement. These can be found by querying the system catalog: SELECT " FROM SYSIBM.SYSTRIGGERS WHERE TBNAME = 'source-name'"

**Destination:** 42986

---

-751  object-type object-name (SPECIFIC NAME specific name) ATTEMPTED TO EXECUTE AN SQL STATEMENT statement THAT IS NOT ALLOWED

**Explanation:** A stored procedure or user-defined function attempted to execute an SQL statement that is not allowed.

**Stored procedure**

A stored procedure issued an SQL statement that forced the DB2 thread to roll back the unit of work. The SQL statement that caused the thread to be placed in the MUST_ROLLBACK state is one of the following:

```
COMMIT
ROLLBACK
```

All further SQL statements are rejected until the SQL application that issued the SQL CALL statement rolls back the unit of work. When control returns to the SQL application that issued the SQL CALL statement, the SQL application must roll back the unit of work. This
can be done by issuing an SQL ROLLBACK statement or the equivalent IMS or CICS operation.

User-defined function
External function object-name issued one of the following SQL statements:
• COMMIT
• ROLLBACK

System Action: The statement cannot be executed.

Programmer Response: Remove the unsupported statement from your stored procedure or user-defined function.

Remotely called stored procedures cannot execute embedded SQL Commit and/or Rollback statements unless:
• The connection with the requester system uses one phase commit protocols
• The requester system indicates that commits are allowed (via sending a DRDA RDBCMTOK=TRUE indication) when the stored procedure is called.

Note: For DB2 Connect requester systems, this requires that the client application must use Connect Type 1, or Remote Unit of Work connections. Connect Type 2 or Distributed Unit of Work connections will cause DB2 Connect to indicate that commits are not allowed, thus embedded SQL Commit and/or Rollback statements in a stored procedure will fail.

Any Commit or Rollback statements in the stored procedure must be removed, or the client application should be modified to establish an environment that allows the stored procedure to execute SQL Commit and/or Rollback statements.

Destination: 38003

-752 THE CONNECT STATEMENT IS INVALID BECAUSE THE PROCESS IS NOT IN THE CONNECTABLE STATE

Explanation: The application process attempted to execute a CONNECT statement while in the unconnectable state. See the description of the CONNECT statement in the DB2 SQL Reference for an explanation of connection states.

System Action: The statement cannot be executed. The connection state of the application process is unchanged.

Programmer Response: Modify the application program to execute a commit or rollback operation prior to executing the CONNECT statement.

Destination: 0A001

-763 INVALID TABLE SPACE NAME

```
table-space-name
```

Explanation: The named table space is invalid for one of the following reasons:
• It is a LOB table space and therefore cannot reside in a work file database.
• It is a LOB table space and therefore cannot contain a non- auxiliary table.
• It is not a LOB table space and therefore cannot contain an auxiliary table.

System Action: The statement cannot be executed.

Programmer Response: Either
• Create the LOB table space in a non-workfile database.
• Create the table in a non-LOB table space.
• Create the auxiliary table in a LOB table space.

Destination: 560A1

-764 A LOB TABLE SPACE AND ITS ASSOCIATED BASE TABLE SPACE MUST BE IN THE SAME DATABASE

Explanation: An attempt was made to create an auxiliary table in a LOB table space that is not in the same database as the associated base table space.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement to specify a LOB table space in the same database as the associated base table space.

Destination: 560A2

-765 TABLE IS NOT COMPATIBLE WITH DATABASE

Explanation: A CREATE TABLE or ALTER TABLE statement defines a LOB column in a table whose database attribute is ROSHARE OWNER or ROSHARE READ. This is not permitted.

System Action: The statement is not executed.

Programmer Response: If CREATE TABLE, either assign the table to an ROSHARE NONE database or create the table without a LOB column. If ALTER TABLE, redefine the column as a non-LOB column or move the table to an ROSHARE NONE database.

Destination: 560A3

-766 THE OBJECT OF A STATEMENT IS AN AUXILIARY TABLE FOR WHICH THE REQUESTED OPERATION IS NOT PERMITTED

Explanation: An auxiliary table was named in one of the following statements:
• ALTER TABLE
• CREATE ALIAS
-767 • -770

-767

MISSING OR INVALID COLUMN SPECIFICATION FOR INDEX

index-name

Explanation: The CREATE INDEX statement failed for one of the following reasons:
- An index on a non-auxiliary table must specify the columns on which the index is defined.
- An index on an auxiliary table must not have a column specification.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the CREATE INDEX statement.
- To create an index on a non-auxiliary table, specify the columns on which the index is defined.
- To create an index on an auxiliary table, do not specify the name of any column.

Destination: 42626

-768

AN AUXILIARY TABLE ALREADY EXISTS FOR THE SPECIFIED COLUMN OR PARTITION

Explanation: An attempt was made to create an auxiliary table, but an auxiliary table for the specified column or partition already exists. When the base table belongs to a non-partitioned table space, there can be only one auxiliary table per LOB column of the table. When the base table belongs to a partitioned table space, for any given LOB column, all values of the LOB column for a given partition are stored in their own auxiliary table. There must be one auxiliary table per partition of the base table space.

System Action: The statement is not executed.

Programmer Response: Check that the correct table name, column name, and if applicable, partition number have been specified. If a different name is desired for the existing auxiliary table, the RENAME TABLE statement can be used to rename the auxiliary table.

Destination: 560A5

-769

SPECIFICATION OF CREATE AUX TABLE DOES NOT MATCH THE CHARACTERISTICS OF THE BASE TABLE

Explanation: Either an attempt was made to create an auxiliary table
- using the PART clause and the specified base table is not partitioned or
- without using the PART clause and the specified base table is partitioned

If the base table is not partitioned, then the PART keyword is not allowed on the CREATE AUXILIARY TABLE statement. If the base table is partitioned, then the PART keyword must be specified.

System Action: The auxiliary table was not created.

Programmer Response: Check whether the name of the base table specified in the CREATE AUXILIARY TABLE statement is correct. If it is correct and the table is not partitioned, remove the PART clause from the statement. If it is correct and the table is partitioned, add the PART clause to the statement. If the table name is not correct, correct the name and also check that the correct column name is specified.

Destination: 53096

-770

TABLE table-name CANNOT HAVE A LOB COLUMN UNLESS IT ALSO HAS A ROWID COLUMN

Explanation: An attempt was made to create a table with a LOB column or to add a LOB column to a table, but the table does not have a ROWID column. A table with a LOB column must also have a ROWID column.

System Action: The statement was not executed.

Programmer Response: If creating a table with a LOB column, define a column with type ROWID in the same table. If using ALTER to add a LOB column to a table, first use ALTER to add a column with type ROWID to the table.
-771 INVALID SPECIFICATION OF A ROWID COLUMN

Explanation: For an ALTER or CREATE TABLE statement, the specification of a ROWID column might be invalid for one of the following reasons:

- A ROWID column cannot be added to a temporary table.
- The referential-constraint clause cannot specify a ROWID column as a column of a foreign key.
- A ROWID column cannot be a column of a primary key or unique key.
- A ROWID column cannot be a column in a table with an EDITPROC.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax and resubmit the statement.

Destination: 428C7

-797 ATTEMPT to CREATE TRIGGER trigger-name WITH AN UNSUPPORTED TRIGGERED SQL STATEMENT

Explanation: The trigger definition includes an unsupported triggered SQL statement. The SQL statements allowed as a triggered SQL statement depend on the type of trigger:

- A BEFORE trigger can include the following triggered SQL statements:
  - a fullselect or VALUES statement
  - a SET transition-variable statement (not allowed in a BEFORE DELETE trigger)
  - a SIGNAL SQLSTATE statement
  - a CALL statement

- An AFTER trigger can include the following triggered SQL statements:
  - a fullselect or VALUES statement
  - an INSERT statement
  - a searched UPDATE statement
  - a searched DELETE statement
  - a SIGNAL SQLSTATE statement
  - a CALL statement

System Action: The CREATE TRIGGER statement cannot be executed, and the trigger is not created.

Programmer Response: Check the triggered SQL statements in the trigger for any statement that is not listed above and remove it.

Destination: 42987

-798 YOU CANNOT INSERT A VALUE INTO A COLUMN THAT IS DEFINED WITH THE OPTION GENERATED ALWAYS COLUMN column-name

Explanation: When inserting into a table, a value was specified for column column-name with the GENERATE ALWAYS attribute. GENERATED ALWAYS columns should not be specified in the column-list for an insertion unless the corresponding entry in the VALUES list is DEFAULT.

System Action: The INSERT is not performed.

Programmer Response: Remove the column from the column-list or specify DEFAULT for the GENERATED ALWAYS column in the VALUES clause.

You may also use the OVERRIDING clause as a possible solution for this situation. See INSERT in DB2 SQL Reference for more information about the OVERRIDING USER VALUE clause.

Destination: 428C9

-802 EXCEPTION ERROR exception-type HAS OCCURRED DURING operation-type OPERATION ON data-type DATA, POSITION position-number

Explanation: An exception error has occurred in the processing of an SQL arithmetic function or arithmetic expression. This error may be indicated by exception-type. Possible values for exception-type are FIXED POINT OVERFLOW, DECIMAL OVERFLOW, ZERO DIVIDE, DIVIDE EXCEPTION, EXPONENT OVERFLOW, or OUT OF RANGE. The exception error occurred in one of the following areas:

- In the SELECT list of an SQL SELECT statement.
- In the search condition of a SELECT, UPDATE, or DELETE statement.
- In the SET clause of the UPDATE statement.
- Found during the evaluation of an aggregate function.

Data-type may indicate the data types of the items being manipulated. Possible values for data-type are INTEGER, SMALLINT, DECIMAL, and FLOAT. The data type displayed in the message may indicate the data type of the temporary internal copy of the data, which may differ from the actual column or literal data type due to conversions by DB2.

Operation-type may indicate the arithmetic operation that was being performed at the time of the error. The possible operation-types are ADDITION, SUBTRACTION, MULTIPLICATION, DIVISION, NEGATION, BUILT-IN FUNCTION, AGGREGATE FUNCTION, and JAVA CONVERSION.
-803  AN INSERTED OR UPDATED VALUE IS INVALID BECAUSE THE INDEX IN INDEX SPACE indexspace-name
CONSTAINS COLUMNS OF THE TABLE SO NO TWO ROWS CAN CONTAIN DUPLICATE VALUES IN THOSE COLUMNS. RID OF EXISTING ROW IS Xrid

Explanation: The table that is the object of the INSERT or UPDATE operation is constrained (by UNIQUE INDEX in the INDEX SPACE indexspace-name to have unique values in certain columns. Completion of the requested INSERT or UPDATE would result in duplicate values occurring in row rid.

If a view is the object of the INSERT or UPDATE statement, the table that defines the view is constrained. The update might also be caused by a DELETE operation of a parent row that cascades to a dependent row with a delete rule of SET NULL.

System Action: The INSERT, UPDATE, or DELETE statement cannot be executed. The object table is unchanged.

Programmer Response: Examine the definitions for UNIQUE INDEX in the INDEX SPACE indexspace-name to determine the uniqueness constraint imposed. Please refer to SYSIBM.SYSINDEXES for the indexspace-name and the associated index-name.

For an UPDATE statement, verify that the specified operation is consistent with the uniqueness constraint. If this does not indicate the error, examine the object table to determine the cause of the problem.

For an INSERT statement, examine the object table to determine which values violate the uniqueness constraint. If the INSERT statement contains a subquery, match the contents of the table addressed by the subquery and the contents of the object table to determine the cause of the problem.

For a DELETE statement, examine the index key columns in the table that defines the index. These columns contain a foreign key, which when set NULL on a cascade delete from the object table, causes the duplicate values.

Destination: 23505
-804 AN ERROR WAS FOUND IN THE APPLICATION PROGRAM INPUT PARAMETERS FOR THE SQL STATEMENT, REASON reason

Explanation: The call parameter list or the SQLDA is invalid.
- The call parameter list, which is created by the precompiler, might be invalid if the application programmer has modified the output of the precompiler, used a variable name beginning with 'SQL' in the application program, or overwritten the call parameter list in some other way.
- The SQLDA, which is created by the application program, has an invalid data type or data length.
- The value of SQLDABC is not consistent with the value of SQLD.

The following is the list of reason codes:
01 Open issued for non-cursor.
02 Close issued for non-cursor.
03 Prepare of EXECUTE IMMEDIATE.
04 Statement is not recognized.
05 No statement string present.
06 Bad SQLDA format in parameter list.
07 SQLDA length is invalid.
08 Unrecognized input data type.
09 Invalid length for input variable.
10 Invalid data length for output variable.
11 The value of SQLDABC is not consistent with the value of SQLD.
12 Invalid input data pointer.
13 Invalid output data pointer.
14 SQLN has too many items for SQLDABC.
15 Input RDI pointer is invalid.
16 Unrecognized output data type.
17 The value of the 7th byte of SQLDAID is not consistent with the data types contained in the SQLDA. The SQLDA contains a LOB type host variable, but the 7th byte of SQLDAID is not set to '2' or greater to indicate that the extended SQLVARs have been allocated.

System Action: The statement cannot be executed.

System Programmer Response: Examine the application program for any of the errors noted under the explanation above. In general, the application programmer should not attempt to modify the output of the precompiler.

Destination: 07002

-805 DBRM OR PACKAGE NAME location-name.collection-id.dbrm-name.consistency-token NOT FOUND IN PLAN plan-name. REASON reason

Explanation: An application program attempted to use a DBRM or package 'location-name.collection-id.dbrm-name.consistency-token' that was not found.

Collection id is blank (location-name..dbrm-name.consistency-token') if the CURRENT PACKAGESET special register was blank for the local program execution.

The REASON token is blank if the length of 'location-name' is 16, the length of 'collection-id' is 18, and the length of 'dbrm-name' is 8 due to the length of SQLERRMT.

The DBRM or package name was not found for one or more of the following reasons:
- 01
  - The DBRM name was not found in the member list of the plan and there is no package list for the plan. Refer to the first SQL statement under problem determination for assistance in determining the problem.
  - The package name was not found because there is no package list for the plan. Refer to the second SQL statement under Problem Determination for assistance in determining the problem.
- 02
  - The DBRM name 'dbrm-name' did not match an entry in the member list or the package list. Any of the following conditions could be the problem:
    - Bind conditions:
      - The 'collection-id' in the package list was not correct when the application plan 'plan-name' was bound. Refer to the second SQL statement under Problem Determination for assistance in determining the problem.
      - The 'location-name' in the package list was not correct when the application 'plan-name' was bound. Refer to the second SQL statement under Problem Determination for assistance in determining the problem.
      - The 'location-name' in the CURRENTSERVER option for the bind subcommand was not correct when the application plan 'plan-name' was bound. Refer to the third SQL statement under Problem Determination for assistance in determining the problem.
  - The application was not connected to the proper location.
- 03

Chapter 2. SQL return codes 115
The DBRM name 'dbrm-name' matched one or more entries in the package list and the search of those entries did not find the package. The conditions listed under reason 02 or the following conditions might be the problem.

- The DBRM of the version of the application program being executed was not bound (A package with the same consistency token as that of the application program was not found.) Refer to the fourth and fifth SQL statements under the Problem Determination section.
- The incorrect version of the application program is being executed.

• 04

The package, 'collection-id.dbrm-name.consistency-token', does not exist at the remote site, 'location-name'. Refer to the fifth SQL statement under the Problem Determination section.

System Action: The statement cannot be executed.

System Programmer or Programmer response: Based on the above reasons, the programmer can perform one or more of the following operations for each reason to correct the error.

• 01
  - Add the DBRM name 'dbrm-name' to the MEMBER list of the BIND subcommand and bind the application plan 'plan-name', or
  - Add the PKLIST option with the appropriate package list entry to the REBIND subcommand and rebind the application plan 'plan-name'.

• 02
  - Correct the dbrm-name of the entry in the PKLIST option and use the REBIND subcommand to rebind the application plan 'plan-name', or
  - Correct the location-name of the entry in the PKLIST option and use the REBIND subcommand to rebind the application plan 'plan-name', or
  - Correct the location-name in the CURRENTSERVER option and use the REBIND subcommand to rebind the application plan 'plan-name', or
  - Set the CURRENT PACKAGESET special register correctly, or
  - Connect to the correct location name.

• 03

All the operations under reason 02 above might fix the problem, plus the following operations.
  - Correct the collection-id of the entry in the PKLIST option and use the REBIND subcommand to rebind the application plan 'plan-name', or
  - Bind the DBRM of the version of the application program to be executed into the collection 'collection-id', or
  - Execute the correct version of the application program. The consistency token of the application program is the same as the package that was bound.

• 04

All the operations under reason 02 and 03 might fix the problem.

Problem Determination: The following queries aid in determining the problem. Run these queries at the local location.

1. This query displays the DBRMs in the member list for the plan. If no rows are returned, then the plan was bound without a member list.
   ```sql
   SELECT PLCREATOR, PLNAME, NAME, VERSION FROM SYSIBM.SYSDBRM
   WHERE PLNAME = 'plan-name';
   ```

2. This query displays the entries in the package list for the plan. If no rows are returned, then the plan was bound without a package list.
   ```sql
   SELECT LOCATION, COLLID, NAME FROM SYSIBM.SYSPACKLIST
   WHERE PLANNAME = 'plan-name';
   ```

3. This query displays the CURRENTSERVER value specified on the BIND subcommand for the plan.
   ```sql
   SELECT NAME, CURRENTSERVER FROM SYSIBM.SYSPACK
   WHERE NAME = 'plan-name';
   ```

4. This query displays if there is a matching package in SYSpackage. If the package is remote, put the location name in the FROM clause. If no rows are returned, the correct version of the package was not bound.
   ```sql
   SELECT COLLID, NAME, HEX(CONTOKEN), VERSION FROM <location-name>..SYSIBM.SYSpackage
   WHERE NAME = 'dbrm-name'
   AND HEX(CONTOKEN) = 'consistency-token';
   ```

5. This query displays if there is a matching package in SYSpackage. If the package is remote, put the location name in the FROM clause. Use this query when collection-id is not blank. If no rows are returned, the correct version of the package was not bound.
   ```sql
   SELECT COLLID, NAME, HEX(CONTOKEN), VERSION FROM <location-name>..SYSIBM.SYSpackage
   WHERE NAME = 'dbrm-name'
   AND HEX(CONTOKEN) = 'consistency-token'
   AND COLLID = 'collection-id';
   ```

Destination: 51002

-807 ACCESS DENIED: PACKAGE package-name IS NOT ENABLED FOR ACCESS FROM connection-type connection-name

Explanation: Access is denied for one of the following reasons:
• It is disabled, either from the 'connection-type' or from the 'connection-type' with the specific connection-name'.
• The attach library that you are using is from a previous release of DB2 that does not support the ENABLE and DISABLE options of the bind operation.

The variables are:

- **package-name**
  The package name (collection.package-id).

- **connection-type**
  One of the following: BATCH, DB2CALL, REMOTE, IMSBMP, IMSMPP, CICS, DLIBATCH, or UNKNOWN.

- **connection-name**
  Name of the connection that is restricted. If all connection names from a specific connection-type are restricted, this value is not specified.

**System Action:** The statement is not executed and the package is not allocated.

**System Programmer Response:** One of the following:

• Rebind the package to enable it to execute with the required connection type and name.
• Check the SYSPLSYSTEM or SYSPKSYSTEM catalog table to find a connection from which the package can be executed.
• Correct the attach library.

**Destination:** 23509

---

**-808**

**THE CONNECT STATEMENT IS NOT CONSISTENT WITH THE FIRST CONNECT STATEMENT**

**Explanation:** The CONNECT semantics that apply to an application process are determined by the first CONNECT statement executed (successfully or unsuccessfully) by the application process. One of the following rules was violated:

• A type 2 CONNECT statement cannot be executed after a type 1 CONNECT statement was executed.
• A type 1 CONNECT statement cannot be executed after a type 2 CONNECT statement was executed.

**System Action:** The statement cannot be executed.

**Programmer Response:** The probable cause of this error is that different programs in the application process were precompiled with different CONNECT options.

Ensure that the application process uses either type 1 or type 2 CONNECT statements and then resubmit the job. The type of CONNECT to be used is a precompiler option. The default is type 2 CONNECT.

**Destination:** 08001

---

**-811**

**THE RESULT OF AN EMBEDDED SELECT STATEMENT OR A SUBSELECT IN THE SET CLAUSE OF AN UPDATE STATEMENT IS A TABLE OF MORE THAN ONE ROW, OR THE RESULT OF A SUBQUERY OF A BASIC PREDICATE IS MORE THAN ONE VALUE**

**Explanation:** Execution of an embedded SELECT statement or a subselect in the SET clause of an UPDATE statement has resulted in a result table that contains more than one row. Alternatively, a subquery contained in a basic predicate has produced more than one value.

**System Action:** The statement cannot be executed.

**Programmer Response:** Examine the syntax of the statement to ensure that it contains the proper condition specifications. If the statement syntax is correct, there might be a problem with the data that is causing more than one row or value to be returned when you do not expect it.

**Destination:** 21000

---

**-812**

**THE SQL STATEMENT CANNOT BE PROCESSED BECAUSE A BLANK COLLECTION-ID WAS FOUND IN THE CURRENT PACKAGESET SPECIAL REGISTER WHILE TRYING TO FORM A QUALIFIED PACKAGE NAME FOR PROGRAM program-name.consistency-token USING PLAN plan-name**

**Explanation:** A last or only entry in the package list for the plan contained a blank 'collection-id' which requires the 'CURRENT PACKAGESET' special register to be set to a nonblank 'collection-id' in order to form a qualified package name.

**System Action:** The statement cannot be executed.

**Programmer Response:** Set the 'CURRENT PACKAGESET' special register to the desired 'collection-id' or have your system administrator check the plan’s package list for correctness.

**Destination:** 22508

---

**-815**

**A GROUP BY OR HAVING CLAUSE IS IMPLICITLY OR EXPLICITLY SPECIFIED IN A SUBSELECT OF A BASIC PREDICATE OR THE SET CLAUSE OF AN UPDATE STATEMENT**

**Explanation:** A subselect of a basic predicate or a SET clause of an UPDATE statement either:

• directly contains a GROUP BY or HAVING clause
• specifies as its object a view having a definition that includes a GROUP BY or HAVING clause

Neither construct is permitted.
**-817 • -820**

**System Action:**  The statement cannot be executed. No data was retrieved.

**Programmer Response:**  The implied function is not supported by DB2.

No coding workaround exists for the subselect. A GROUP BY or HAVING clause cannot be used within the subselect of a basic predicate because the subselect is allowed to return only a single value. For more information on basic predicates, refer to [DB2 SQL](#).

**Reference**

**Destination:**  42920

---

**-817**

**THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE THE STATEMENT WILL RESULT IN A PROHIBITED UPDATE OPERATION.**

**Explanation:**  The application attempted to execute an SQL statement that would result in updates to user data or to the subsystem catalog. This is prohibited for one of the following reasons:

- The application is running as an IMS inquiry-only transaction.
- The application is an IMS or CICS application that is attempting to update data at a remote DBMS that does not support two-phase commit.
- The application is attempting to update data at multiple locations and one of the locations does not support two-phase commit.
- A trigger defined with activation time BEFORE was activated and its triggered action caused updates to the database.

These SQL statements include INSERT, UPDATE, DELETE, CREATE, ALTER, DROP, GRANT, and REVOKE.

**System Action:**  The statement cannot be executed.

**Programmer Response:**  If the application is running as an IMS inquiry-only transaction, see your IMS system programmer about changing the inquiry-only status of the transaction under which your application is running.

If the IMS or CICS application is attempting a remote update, either the application must be changed to run as a local application on the server DBMS, or the server DBMS must be upgraded to support two-phase commit.

If the application is attempting to update data at multiple locations, either the application must be changed, or all DBMSs involved must be upgraded to support two-phase commit.

If the error is due to an invalid statement during a trigger activation, contact your system administrator to correct the trigger definition.

**Destination:**  25000

---

**-818**

**THE PRECOMPILER-GENERATED TIMESTAMP \(y\) IN THE LOAD MODULE IS DIFFERENT FROM THE BIND TIMESTAMP \(z\) BUILT FROM THE DBRM.**

**Explanation:**  The SQL precompiler places timestamp \(y\) in the DBRM, and time stamp \(x\) in the parameter list in the application program for each SQL statement. At BIND time, DB2 stores the DBRM timestamp for run-time use. At run-time, timestamp \(x\), for the SQL statement being processed, is compared with timestamp \(y\) derived from the DBRM \(z\) at BIND time. If the two timestamps do not match, the DBRM and the application program were not the result of the same precompile.

This problem can occur if you:

- Precompile, compile, and link, without doing a BIND of the application,
- Precompile and BIND, without doing the compile and link for the application program, or
- BIND the application using a DBRM that resulted from a different precompile of the application program than that which produced the object module that is linked into the application module.

The timestamps \(x\) and \(y\) are DB2 internal timestamps. They do not have an external interpretation.

**System Action:**  The statement cannot be executed.

**Programmer Response:**  BIND the application again, using the DBRM for the application program that matches the object module.

**Destination:**  51003

---

**-819**

**THE VIEW CANNOT BE PROCESSED BECAUSE THE LENGTH OF ITS PARSE TREE IN THE CATALOG IS ZERO.**

**Explanation:**  SYSIBM.SYSVTREE.VTREE is a varying-length string column that contains the parse trees of views. In processing a view, the length control field of its parse tree was found to be zero.

**System Action:**  The statement cannot be executed.

**Programmer Response:**  This is a system error. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Destination:**  58004

---

**-820**

**THE SQL STATEMENT CANNOT BE PROCESSED BECAUSE catalog-table CONTAINS A VALUE THAT IS NOT VALID IN THIS RELEASE.**

**Explanation:**  A column of the indicated catalog table contains a value that prevents further processing of an SQL statement. The meaning of the value is unknown to
the release of DB2. If a fall back has occurred, the value is probably the result of the use of new function prior to the fall back.

**System Action:** The statement cannot be executed.

**Programmer Response:** Verify that the statement refers to the intended tables or views and that the problem is the result of a fall back. If this is the case, the statement cannot be corrected because it depends on a function that is not supported in the current release. If the problem is not the result of a fall back, -820 is a system error. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Destination:** 58004

---

**-822** THE SQLDA CONTAINS AN INVALID DATA ADDRESS OR INDICATOR VARIABLE ADDRESS

**Explanation:** The application program has placed an invalid address in the SQLDA.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the application program such that valid addresses are placed in SQLDA.

**Destination:** 51004

---

**-840** TOO MANY ITEMS RETURNED IN A SELECT OR INSERT LIST

**Explanation:** The number of items returned in the select list or presented in an insert list exceeds the allowable maximum of 750.

**System Action:** The statement cannot be executed.

**Programmer Response:** Determine whether all the information is actually needed. (Note that the number of items returned by the select list * in the SQL statement SELECT * FROM A, B, C is the sum of the number of columns in all three tables.) If not, rewrite the SQL statement so that only the necessary items of information are returned. If so, break the SQL statement up into two or more statements, as required.

**Destination:** 54004

---

**-842** A CONNECTION TO `location-name` ALREADY EXISTS

**Explanation:** One of the following situations occurred:

- A CONNECT statement identifies a location with which the application process has a private connection, using system-directed access.
- SQLRULES(STD) is in effect and a CONNECT statement identifies an existing SQL connection.
- A private connection, using system-directed access, cannot be established because of an existing SQL connection to that location.
- A CONNECT (type 2) request that includes the USER/USING clause identifies an existing SQL connection.

**System Action:** The statement cannot be executed.

**Programmer Response:** The correction depends on the error, as follows:

- If the location name is not the intended name, correct it.
- If SQLRULES(STD) is in effect and the CONNECT statement identifies an existing SQL connection, replace the CONNECT with SET CONNECTION or change the option to SQLRULES(DB2).
- If the CONNECT statement identifies an existing private connection, destroy that connection (by using the RELEASE statement in a previous unit of work) before executing the CONNECT statement. If the SQL statements following the CONNECT can be executed using system-directed access, an alternative solution is to change the application to use that method.
- If system-directed access cannot be used, destroy the conflicting SQL connection (by using the RELEASE statement in a previous unit of work) before executing the SQL statement that requires system-directed access. An alternative solution is to change the application so that only application-directed access is used.
- Destroy the connection (by using the RELEASE statement in a previous unit of work) before executing the CONNECT statement which includes the USER/USING clause.

Correct the error in the application, rebind the plan or package, and resubmit the job.

**Destination:** 08002

---

**-843** THE SET CONNECTION OR RELEASE STATEMENT MUST SPECIFY AN EXISTING CONNECTION

**Explanation:** One of the following rules was violated:

- A SET CONNECTION statement must identify an existing SQL connection of the application process.
- A RELEASE statement must identify an existing connection of the application process.

**System Action:** The statement cannot be executed.

**Programmer Response:** The correction depends on the error, as follows:

- If the location name is not the intended name, correct it.
-845  A PREVIOUS VALUE EXPRESSION CANNOT BE USED BEFORE THE NEXT VALUE EXPRESSION GENERATES A VALUE IN THE CURRENT SESSION FOR SEQUENCE sequence-name

Explanation: A PREVIOUS VALUE expression specified sequence sequence-name, but a value has not yet been generated for this sequence. A PREVIOUS VALUE expression for for a sequence must not be used before a NEXT VALUE expression for that sequence is executed in this session, causing DB2 to generate a value for sequence.

System Action: The statement cannot be executed

Programmer Response: Make sure that the invocation of any PREVIOUS VALUE expression is preceded by at least one invocation of a NEXT VALUE expression for the same sequence in the session.

Destination: 51035

-846  INVALID SPECIFICATION OF AN IDENTITY COLUMN OR SEQUENCE OBJECT object_type object_name. REASON CODE = reason_code

Explanation: For an identity column or sequence, the specification of an attribute in a CREATE or ALTER statement may be invalid for one of the following reasons:

- The underlying data type of the identity column or sequence object is not supported. Identity columns and sequence objects support the following data types: SMALLINT, INTEGER, and DECIMAL with a scale of zero.
- The value for START WITH, INCREMENT BY, MINVALUE, or MAXVALUE is outside the range for the data type of the identity column or sequence object.
- MINVALUE must be less than or equal to MAXVALUE.
- An invalid value was specified for CACHE. The value must be an integer with a minimum value of 2.

System Action: DB2 cannot process the statement.

Programmer Response: Correct the syntax and resubmit the statement.

Destination: 42815

-867  INVALID SPECIFICATION OF A ROWID COLUMN

Explanation: For an ALTER or CREATE TABLE statement, the specification of a ROWID column might be invalid for one of the following reasons:

- A ROWID column can not be added to a temporary table.
- The referential-constraint clause can not specify a ROWID column as a column of a foreign key.
- A ROWID column can not be a column of a primary key.
- A ROWID column can not be a column in a table with an EDITPROC.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax and resubmit the statement.

Destination: 428C7

-870  THE NUMBER OF HOST VARIABLES IN THE STATEMENT IS NOT EQUAL TO THE NUMBER OF DESCRIPTORS

Explanation: The number of host variables in the SQL statement does not match the number of host variable descriptors.

System Action: The statement cannot be executed.

Programmer Response: Correct the application program. The most likely cause of this problem is a missing colon before a host variable.

Problem Determination: If the SQL statement is bound locally, descriptors are built by the DB2 precompiler. For a remote SQL statement, descriptors are built by DDF and are passed in the array SQLSTTVRB.

Destination: 58026

-872  A VALID CCSID HAS NOT YET BEEN SPECIFIED FOR THIS SUBSYSTEM

Explanation: A valid CCSID was not specified on either the ASCII CODED CHAR SET, EBCDIC CODED CHAR SET, or UNICODE CODED CHAR SET subsystem parameter on installation panel DSNTIPF.

System Action: The statement cannot be executed.

Programmer Response: Contact your system administrator to have the necessary CCSID defined for your system.

Destination: 51032
-873  DATA ENCODED WITH DIFFERENT ENCODING SCHEMES CANNOT BE REFERENCES IN THE SAME SQL STATEMENT

Explanation: You cannot refer to a column defined in a table in one encoding scheme in the same SQL statement as a column defined in a table of another encoding scheme.

This situation can occur when a table created in either the ASCII, EBCDIC, or UNICODE encoding schemes is referenced in a statement with a table that is not in the same encoding scheme.

This situation can also occur when a table is created; a DECP CCSID value is changed; another table is created, and then the two tables are referenced in a single SQL statement.

System Action: The statement cannot be executed.
Programmer Response: Correct the SQL statement.
Destination: 42988

-866  object CANNOT BE CREATED, REASON reason

Explanation: The object cannot be created in the SQL statement.

Possible values for 'object':
TYPE 1 INDEX
The object being created is a type 1 index.
INDEX The object being created is an index.

Possible values for 'reason':
TABLE DEFINED AS ASCII
The underlying table is defined as ASCII. Only type 2 indexes are supported for ASCII tables.

PIECESIZE IS NOT VALID
PIECESIZE is only valid for non-partitioned indexes.

PIECESIZE 4GB IS NOT VALID
PIECESIZE 4GB is only valid for non-partitioned indexes on LARGE tables.

System Action: The statement cannot be executed.
Programmer Response: Correct the SQL statement for the object being created.
Destination: 53092

-877  CCSID ASCII OR CCSID UNICODE IS NOT ALLOWED FOR THIS DATABASE OR TABLE SPACE

Explanation: The database or table space specified is required to be in EBCDIC.

System Action: The statement cannot be executed.
Programmer Response: Remove the CCSID ASCII or CCSID UNICODE clause from the statement.
Destination: 53093

-878  THE PLAN_TABLE USED FOR EXPLAIN CANNOT BE ASCII

Explanation: PLAN_TABLEs must be encoded in EBCDIC or Unicode for use with EXPLAIN.

System Action: The statement cannot be executed.
Programmer Response: Drop the existing PLAN_TABLE, and recreate it with the EBCDIC encoding scheme or use Unicode.
-879  CREATE or ALTER TABLE object-name CANNOT DEFINE A COLUMN,
DISTINCT TYPE, FUNCTION OR STORED PROCEDURE PARAMETER AS MIXED OR GRAPHIC WITH
ENCODING SCHEME encoding-scheme

Explanation: A CREATE or ALTER TABLE statement for object-name attempted to define a column, distinct type, or parameter of a user-defined function or stored procedure as mixed data or graphic when the system does not have an appropriate CCSID defined for the encoding-scheme encoding scheme.

-  A CREATE, with CCSID UNICODE clause specified, cannot be processed because the proper level of OS/390 is not installed. Refer to the Program Directory for information on the level of OS/390 required for UNICODE support.
-  A CREATE DISTINCT TYPE statement cannot define a distinct type, on EBCDIC or ASCII data, with a source type of CHAR FOR MIXED DATA, or GRAPHIC, VARGRAPHIC, or DBCLOB, when the MIXED DATA install option is set to NO.
-  A CREATE FUNCTION or CREATE PROCEDURE statement cannot define a parameter or specify a RETURNS data type, for ASCII or EBCDIC data, as CHAR FOR MIXED DATA, or GRAPHIC, VARGRAPHIC, or DBCLOB, when the MIXED DATA install option is set to NO.

Note: This error only occurs when the encoding scheme in use is EBCDIC or ASCII. The MIXED DATA install option does not affect Unicode data.

Note: This error can occur when there is an attempt to define a column or parameter as character FOR MIXED DATA even though the keywords FOR MIXED DATA do not appear in the failing statement. This occurs when the MIXED value in DECP is YES, in this case the default subtype for the character types is FOR MIXED DATA.

System Action: The statement cannot be processed.

Programmer Response: Contact your system administrator to properly setup the installation options, or change the data types of the elements in columns in your CREATE or ALTER statement.

Destination: 53095

-880  SAVEPOINT savepoint-name DOES NOT EXIST OR IS INVALID IN THIS CONTEXT

Explanation: The RELEASE TO SAVEPOINT or ROLLBACK TO SAVEPOINT statement does not identify a savepoint that exists.

System Action: DB2 does not process the statement.

Programmer Response: Correct the statement to use a valid savepoint name.

Destination: 3B001

-881  A SAVEPOINT WITH NAME savepoint-name ALREADY EXISTS, BUT
THIS SAVEPOINT NAME CANNOT BE REUSED

Explanation: The SAVEPOINT statement uses the same savepoint name as another savepoint, and it cannot be created because at least one of the savepoints was defined with the UNIQUE clause to indicate that the name cannot be reused within the transaction.

System Action: The statement is not executed and a new savepoint is not set. The old savepoint still exists.

Programmer Response: Correct the statement. Either use a different savepoint name, or omit the UNIQUE clause if the other savepoint was created without the UNIQUE clause and your intention is to reuse that savepoint name.

Destination: 3B501

-882  SAVEPOINT DOES NOT EXIST

Explanation: A ROLLBACK TO SAVEPOINT statement was specified without a savepoint name to rollback to the last active savepoint, but no savepoint exists.

System Action: The statement is not executed.

Programmer Response: Correct the application logic to either set a savepoint or to not attempt to rollback to a savepoint.

Destination: 3B502

-900  THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE THE
APPLICATION PROCESS IS NOT CONNECTED TO AN APPLICATION SERVER

Explanation: A previous failure has placed the application process in the unconnected state. The only SQL statements that can be successfully executed from the unconnected state are CONNECT, COMMIT, ROLLBACK, and local SET statements.

System Action: The statement cannot be executed.

Programmer Response: It is possible that no response is required because checking for -900 is one way of detecting the unconnected state. If this is not the case, the logic of the application program must be changed. For additional information, see the description of the CONNECT statement in Chapter 5 of [DB2 SQL Reference].
-901  UNSUCCESSFUL EXECUTION CAUSED BY A SYSTEM ERROR THAT DOES NOT PRECLUDE THE SUCCESSFUL EXECUTION OF SUBSEQUENT SQL STATEMENTS

Explanation: A system error occurred that prevented successful execution of the current SQL statement. However, the error does not prevent successful execution of further SQL statements.

The error might occur if the length of the SQL statement is less than 0, or is greater than the DB2 maximum length for a statement.

This SQLCODE might also occur when distributed commit processing encounters an error. In this case, all servers in the unit of work that support distributed two-phase commit backed out the unit of work. If a server that does not support distributed two-phase commit has updates in the unit of work, that server must be queried to determine if its updates were committed or backed out.

Finally, this error might occur during commit if post-processing cannot be completed because of an update that changes the partition of a row. Resource unavailable problems can prevent the post-processing from completing. The existence of held cursors can prevent the post-processing from completing. Commit is failed. The transaction is aborted.

System Action: The statement cannot be executed. A X'04E' abend might be requested for the application. The application program can have a recovery routine to recover from such an abend and can retry SQL statements.

Programmer Response: If an abend occurred, notify the system programmer for analysis of the abend that caused this return code.

Even if an abend occurred, an application program receiving this return code can retry and is not prohibited from executing further SQL statements.

Destination: 58004

-905  UNSUCCESSFUL EXECUTION DUE TO RESOURCE LIMIT BEING EXCEEDED, RESOURCE NAME = resource-name LIMIT = limit-amount1 CPU SECONDS (limit-amount2 SERVICE UNITS) DERIVED FROM limit-source

Explanation: The execution of the SQL statement was terminated because a resource limit was exceeded.

resource-name
The name of the resource whose limit was exceeded. It is also the name of the column in the DB2 table from which the limit was derived. The resource-name can be ASUTIME, which is the number of CPU seconds permitted for each SQL statement.

limit-amount1
The maximum number of CPU seconds permitted

limit-amount2
The maximum number of service units permitted

limit-source
The source used to derive the limit-amount: the name of a resource limit specification table, a system parameter, or the SYSSBM.SYSROUTINES catalog table. If the source is a system parameter, the resource limit specification table did not contain an applicable entry or an error occurred while accessing the table.

System Action: If the limit-source was a resource limit specification table or a system parameter, the execution of this SQL statement is terminated. A record containing more detailed information about this failure is generated. If an SQL cursor is associated with the failed instruction, its position is unchanged and a CLOSE or PREPARE command can be issued. If any other operation is attempted with the cursor, it cannot be executed and

If this is issued in connection with Multilevel Security authorization (resource-type 402), then the Security Server return and reason codes for the unavailable resource appear as the resource-name. In this case, refer to the z/OS Security Server RACROUTE Macro Reference.

System Action: The SQL statement cannot be executed. If the SQL statement being executed was a cursor FETCH, DB2 closes the cursor. Subsequent attempts to use that cursor without first doing an OPEN for it receive an SQLCODE -501.

Programmer Response: Verify the identity of the resource that was not available. To determine why the resource was unavailable, refer to the specified reason-code.

Destination: 57011

-904  UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE.
REASON reason-code, TYPE OF RESOURCE resource-type, AND RESOURCE NAME resource-name

Explanation: The SQL statement could not be executed because resource 'resource-name' of type 'resource-type' was not available at the time for the reason indicated by 'reason-code'. Refer to Table 3 in Appendix B, "Problem determination," on page 1349 for an explanation of resource type codes. Refer to Part 4, "Section 4. DB2 Codes," on page 771 for an explanation of the given reason code.

Chapter 2. SQL return codes 123
SQLCODE -905 is returned. If there is no cursor, this statement was rolled back.

**Programmer Response:** Determine why this SQL statement or stored procedure took so long and take appropriate action. Consider simplifying the SQL statement, restructuring tables and indexes, or contacting the installation group responsible for maintaining the resource limit specification tables.

If the *limit-source* was a resource limit specification table or a system parameter, the application program that receives this return code can execute additional SQL statements.

**Destination:** 57014

---

**-906**

**THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE THIS FUNCTION IS DISABLED DUE TO A PRIOR ERROR**

**Explanation:** Execution of the SQL statement failed because the requested function had been disabled by a prior error. This situation can arise if the application program has intercepted an abend (for instance, by an ON ERROR condition in a PL/I program) and continued to execute SQL statements. This situation may also arise if a DB2 CICS transaction encountered a create thread error yet continued to issue SQL requests without issuing a SYNCPOINT ROLLBACK first.

**System Action:** The statement cannot be executed.

**Programmer Response:** In general, an application program should terminate upon receipt of this return code. All subsequent attempts by the application to execute other SQL statements will also fail with the same return code. In the case of a DB2 CICS transaction, if the SQLERRP field in the SQLCA contains the module name DSNCEXT1, the transaction may issue a SYNCPOINT ROLLBACK and continue processing. If the transactions chooses to ROLLBACK and continue processing, it must be capable of correcting the situation that caused thecreate thread error to occur originally.

**Destination:** 51005

---

**-908**

**bind-type ERROR USING auth-id AUTHORITY. BIND, REBIND OR AUTO-REBIND OPERATION IS NOT ALLOWED**

**Explanation:** For BIND and REBIND, the indicated authorization ID is not allowed to perform the indicated bind-type against a plan or package. An entry in the resource limit specification table (RLST) prohibits binding and rebinding by this authorization ID, or all authorization IDs. For AUTO-REBIND, the system parameter controlling AUTO-REBIND operations is set to disallow AUTO-REBIND.

**System Action:** The statement cannot be executed.

**Programmer Response:** In case of ALTER, the logic of the application program must be modified so that a COMMIT (or the IMS or CICS equivalent) is executed between the ALTER and the failing SQL statement.

For DROP, the logic of the application program should be modified such that there is no attempt to access an object after the DROP has been executed.

---

**System Programmer Response:** If the indicated authorization id should be allowed to bind, change the entry in the active RLST table. If AUTO-REBIND operations are disabled, rebind the package before reexecuting the package.

**Destination:** 23510

---

**-909**

**THE OBJECT HAS BEEN DELETED**

**Explanation:** The application program has either:
1. Dropped a table and then attempted to access it.
2. Dropped an index and then tried to access its object table using that index.

**System Action:** The statement cannot be executed.

**System Programmer Response:** The logic of the application program must be corrected such that it does not attempt to access or use an object after it has been dropped.

Dropping indexes within an application program is especially hazardous, because there is no way of determining whether or not the plan that has been generated for the application (by BIND or REBIND) actually uses a particular index for access to its object table. If the indicated authorization ID should be allowed to bind, change the entry in the active RLST table. If AUTO-REBIND operations are disabled, rebind the package before reexecuting the package.

**Destination:** 57007

---

**-910**

**THE SQL STATEMENT CANNOT ACCESS AN OBJECT ON WHICH A DROP OR ALTER IS PENDING**

**Explanation:** The application program has issued a DROP or ALTER against an object, and then attempted to access that object before the DROP or ALTER is completed.

**System Action:** The statement cannot be executed.

**Programmer Response:** In the case of ALTER, the logic of the application program must be modified so that a COMMIT (or the IMS or CICS equivalent) is executed between the ALTER and the failing SQL statement.

For DROP, the logic of the application program should be modified such that there is no attempt to access an object after the DROP has been executed.
Note that DROP includes the case when rollback to a savepoint includes rolling back to a CREATE.

**Destination:** 57007

### -911

**THE CURRENT UNIT OF WORK HAS BEEN ROLLED BACK DUE TO DEADLOCK OR TIMEOUT. REASON reason-code, TYPE OF RESOURCE resource-type, AND RESOURCE NAME resource-name**

**Explanation:** The current unit of work was the victim in a deadlock, or experienced a timeout, and had to be rolled back.

The reason code indicated whether a deadlock or timeout occurred. Refer to message DSNT500I under Chapter 18, “DSNT... Messages,” on page 415 for an explanation of `resource-type` and `resource-name`. Refer to Table 3 in Appendix B, “Problem determination,” on page 1349 for an explanation of resource type codes.

**Note:** The changes associated with the unit of work must be entered again.

SQLERRRD(3) also contains the reason-code which indicates whether a deadlock or timeout occurred. The most common reason codes are:

- 00C90088 - deadlock
- 00C9008E - timeout

The changes associated with the unit of work must be entered again.

**System Action:** The statement cannot be executed. The application is rolled back to the previous COMMIT.

**Programmer Response:** A long-running application, or an application that is likely to encounter a deadlock, should (if possible) issue frequent COMMIT commands. This can lessen the possibility of a deadlock occurring. See message DSNT376I for possible ways to avoid future deadlocks or timeouts. On receipt of the SQLCODE -911, the application should, in general, terminate.

For more information about how IMS, CICS, and TSO handle deadlocks, see Part 4 of *DB2 Application Programming and SQL Guide*.

**Destination:** 57033

### -917

**BIND PACKAGE FAILED**

**Explanation:** An error has occurred which prevents the package from being created. This SQLCODE can be issued during bind or commit processing.

**System Action:** The bind fails and the package is not created. If issued during commit processing, all changes to the database are rolled back. If issued during bind processing, only package creation fails. Other changes within the logical unit of work are committable.

**Programmer Response:** Correct the cause of the problem and try again.

**Problem Determination:** Inspect the SQLCODES issued for the SQL statements of the package.

**Destination:** 42969

### -918

**THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE A CONNECTION HAS BEEN LOST**

**Explanation:** Execution of the SQL statement failed because a communications link between the local DB2 and at least one remote server no longer exists. A previous failure caused this condition.

**System Action:** In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

**Programmer Response:** In general, an application program should issue a static ROLLBACK. Attempts by
the application to issue SQL statements other than static ROLLBACK might fail. Once the static ROLLBACK is issued, the application can resume execution.

SQLERRP contains the name of the module that detected the previous failure and placed the application in the must-abort state.

**Destination:** 51021

---

**-919 A ROLLBACK OPERATION IS REQUIRED**

**Explanation:** The unit of work was placed in a state where a rollback operation is required. This can happen for the following reasons:

- An SQL statement updated a distributed database server, but the database server can be used only for read-only operations. Either updates are currently restricted to servers that support distributed two-phase commit and this application server does not support distributed two-phase commit, or updates are restricted to a single server that does not support distributed two-phase commit and this application server is not that server.

- An abend occurred during the execution of a stored procedure, or a restricted SQL statement was issued from a stored procedure.

- An abend occurred during the execution of a function, or a restricted SQL statement was issued from a function.

**System Action:** In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

**Programmer Response:** Correct the application, function, or stored procedure, rebind it, and resubmit the job.

SQLERRP contains the name of the module that detected the previous failure and placed the application in the must-abort state.

**Destination:** 56045

---

**-922 AUTHORIZATION FAILURE: error-type **

**Explanation:** Authorization failed because of the error indicated by *error-type*

**error-type**

- Plan access
- Duplicate exit requested
- Installation error
- Connect

**reason-code**

DB2 reason code associated with authorization failure

**System Action:** The statement cannot be processed. The connection to DB2 is not established.

**Programmer Response:** If *error-type* is user authorization, the authorization-ID specified to DB2 through your attachment facility is not valid for DB2. See your system programmer or your CICS, IMS, or TSO system administrator.

If *error-type* is plan access, then the authorization ID associated with this connection is not authorized to use the specified plan name or the specified plan name does not exist. See your system administrator.

If *error-type* is duplicate exit, then you requested a duplicate exit.

If *error-type* is installation error, a connection or sign-on exit denied your request. See your system programmer.

If *error-type* is Connect, an SQL CONNECT request failed to connect to the local DB2 with USER/USING specified. See the reason code for a description of the failure. The application program has been placed in the connectable and unconnectable state. The only SQL statements that can be successfully completed in this state are CONNET, COMMIT, ROLLBACK, and local SET statements. Any attempt to execute other SQL statements will result in an error (SQLCODE -900).

Look up the reason code in [Part 4, “Section 4. DB2 Codes,” on page 771](#) for further information.

Any attempts to issue SQL statements following the -922 SQLCODE when *error-type* is not Connect causes unpredictable results.

**Destination:** 42505

---

**-923 CONNECTION NOT ESTABLISHED: DB2 condition reason reason-code, TYPE resource-type, NAME resource-name**

**Explanation:** The connection to DB2 failed for the reason indicated by *condition*, which can be any of the following:

- DB2 not up
- DB2 not operational
- DB2 shutdown in progress
- DB2 restricted access mode
- Allocation error
- DB2 - CICS attachment not up
- DB2 - CICS ENTRY disabled
- The object is dependent on facilities of a release of DB2 that is newer than the release that you are currently running (fall back).
-924  DB2 CONNECTION INTERNAL ERROR,  
function-code, return-code, reason-code

Explanation: Connection to DB2 has failed because of an unexpected internal error, identified by the 'reason-code'.

System Action: The statement cannot be executed. The connection to DB2 is not established.

Programmer Response: Look up the abend 'reason-code' in [Part 4, "Section 4. DB2 Codes"] for further information. The requested 'function-code' and 'return-code' may provide additional information. Any attempts to issue SQL statements following the SQLCODE -924 will cause unpredictable results.

Destination: 58006

-925  COMMIT NOT VALID IN IMS, CICS OR RRS AF ENVIRONMENT

Explanation: An application executing in either an IMS or CICS environment or an application executing in an RRS AF environment when DB2 is not the only resource manager has attempted to execute a COMMIT statement. The SQL COMMIT statement cannot be executed in these environments.

System Action: The statement cannot be executed. No commit is performed.

Programmer Response: The IMS, CICS or RRS protocols should be used to commit work in these environments.

If a stored procedure is being called from IMS or CICS, ensure that the stored procedure is not defined to perform a commit on return.

Destination: 2D521

-926  ROLLBACK NOT VALID IN IMS, CICS OR RRS AF ENVIRONMENT

Explanation: An application executing in either an IMS or CICS environment or an application executing in an RRS AF environment when DB2 is not the only resource manager has attempted to execute a ROLLBACK statement. The SQL ROLLBACK statement cannot be executed in these environments.

System Action: The statement cannot be executed. No roll back is performed.

Programmer Response: The IMS, CICS or RRS protocols should be used to rollback work in these environments.

Destination: 2D521

• DB2 restarted in LIGHT(YES) mode

Possible causes of an allocation error are:

• The application plan does not exist.
• The application plan is inoperative. An explicit REBIND or BIND is required.
• The application plan is invalid. Underlying resources have changed.
• A required database, table space, table, or index is unavailable.
• Data set allocation failed for a required data set.
• There is insufficient virtual storage.
• The application is trying to execute the plan from a system (environment) that was restricted when the plan was bound or rebound. Check the SYSPLSYSTEM table to determine from which systems (for example, IMS or CICS) the plan can be executed.

If the condition is "CICS attachment not up", then NAME indicates the DB2 subsystem that is not available. The reason code indicates the reason the attachment is not available.

If the condition is "CICS entry disabled", then NAME indicates the entry that is disabled.

System Action: The statement cannot be executed. The connection to DB2 is not established.

Programmer Response: If the connection failed because either DB2 or a required database, table space, table, or index was unavailable, wait until it is available before invoking the application again.

If allocation failed for an application plan, REBIND the plan to determine the problem. Error messages are produced explaining why the plan could not be allocated.

For other types of allocation errors, installation action might be required to correct the problem.

For CICS attachment failures, resolve the primary cause as noted by the reason code. Then restart the attachment.

Problem Determination: The reason-code, resource-type, and resource-name might not be available. If they are not available, nothing appears. If they are available, refer to [Part 4, "Section 4. DB2 Codes"] for an explanation of the reason-code, resource-type, and resource-name.

Refer to message DSNT5001 under [Chapter 18 "DSNT...Messages"] for an explanation of resource type and resource name. Refer to Table 3 in [Appendix B "Problem determination," on page 1349] for an explanation of resource type codes. Any attempts to issue SQL statements after receiving SQLCODE -923 will cause unpredictable results.

Destination: 57015
THE LANGUAGE INTERFACE (LI) WAS CALLED WHEN THE CONNECTING ENVIRONMENT WAS NOT ESTABLISHED. THE PROGRAM SHOULD BE INVOKED UNDER THE DSN COMMAND

Explanation: In the TSO environment, the user has attempted to execute an application program without first establishing the correct execution environment by issuing the DSN command. In the IMS, CICS, or call attachment facility (CAF) environment, the user has attempted to execute an application program that is not using the correct language interface module.

System Action: The statement cannot be executed.

Programmer Response: In the TSO environment, DB2 application programs should be invoked under the RUN subcommand of the DSN command processor. In the IMS, CICS or CAF environment check that the application was link-edited with or is dynamically allocating the correct language interface module. The language interface modules required in each environment are as follows:

- IMS: DFSLI000
- CICS: DSNCLI
- CAF: DSNAli
- TSO: DSNELI

The DYNAM option can result in the incorrect language interface module being loaded at runtime.

Destination: 51021

FAILURE IN A DATA CAPTURE EXIT:

token

Explanation: 'token' is an information string provided by DPROP’s exit routine which captures data changes in tables defined with DATA CAPTURE CHANGES.

System Action: The information string is placed in in the SQLERRM area of the SQLCA.

System Programmer Response: For documentation of the actions associated with this SQLCODE, refer to the Data Propagator (DPROP) publications.

Destination: 58002

ROLLBACK REQUIRED DUE TO UNREQUESTED ROLLBACK OF A REMOTE SERVER

Explanation: A dynamic commit was executed preceding the execution of this request. The remote server to which the application was CONNECTed during the dynamic COMMIT successfully committed. However, at least one other remote server (which was read-only) rolled back its portion of the distributed unit of work during the dynamic commit.

To ensure that an application that uses cursor-hold cursors does not incorrectly assume cursor position is being maintained at any remote server that rolled back, the application must perform a rollback operation.

Communications are still established with all remote servers.

System Action: In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer Response: Issue the appropriate (depending on the environment) request to cause a rollback. Re-establish any cursor positioning and continue the application with the first request that received the -939 SQLCODE.

SQLERRP contains the name of the module that detected the previous failure and placed the application in the must-abort state.

Destination: 51021

THE SQL STATEMENT FAILED BECAUSE IT WILL CHANGE A TABLE DEFINED WITH DATA CAPTURE CHANGES, BUT THE DATA CANNOT BE PROPAGATED

Explanation: The DPROP SUPPORT option on the installation panel is set to 2 (support DPROP only). The SQL statement would have changed a table defined with DATA CAPTURE CHANGES. However, the data cannot be propagated because the SQL statement did not originate from an IMS subsystem, or monitor trace class 6 was not active at the beginning of the unit of work for that change.

System Action: The statement is not executed.

System Programmer Response: Take one of the following actions:

- Change the installation option to 1 (no propagation) or 3 (permit changes from any subsystem).
- Change the application program that receives this SQLCODE so that it can be run in an IMS subsystem, and activate monitor trace class 6.

If the installation option is changed to 3, SQL changes to tables defined with DATA CAPTURE CHANGES are permitted from any subsystem, but they are not propagated unless the environment is set up for propagation.

Destination: 56038

DISTRIBUTED OPERATION IS INVALID

Explanation: The unit of work was initiated before DDF was started, and the application attempted to perform a distributed operation. The unit of work must be terminated by a rollback operation.
System Action: In the IMS and CICS environments, all SQL statements are rejected until a rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer Response: An application that performs local database updates before DDF is started cannot perform distributed operations within the same unit of work. The current unit of work must be terminated by a rollback operation and a new unit of work must be initiated before any SQL operations can be performed.

Restart the current unit of work.

Destination: 56062

-950 THE LOCATION NAME SPECIFIED IN THE CONNECT STATEMENT IS INVALID OR NOT LISTED IN THE COMMUNICATIONS DATABASE

Explanation: One of the following conditions applies:

- The location name is blank.
- The data type of the host variable is not character string.
- The length attribute of the host variable is greater than 16.
- The location name does not appear in the LOCATIONS column of the SYSIBM.LOCATIONS table, nor is it the name of the local DB2 subsystem.

System Action: The statement cannot be executed. The application process is placed in the unconnected state.

Programmer Response: If the location name is specified as the value of a host variable, ensure that the name is left justified in the host variable and, if necessary, padded on the right with blanks. If this is not the problem, either SYSIBM.LOCATIONS must be updated to include the specified name, or the specified name must be changed to match a name in SYSIBM.LOCATIONS.

Destination: 42705

-952 PROCESSING WAS INTERRUPTED BY A CANCEL REQUEST FROM A CLIENT PROGRAM

Explanation: A client program issued a cancel request that terminated processing of the SQL statement.

System Action: The SQL statement was terminated and any changes made by that statement have been undone. If an SQL cursor is associated with the interrupted SQL statement, that cursor is closed.

Destination: 57014

-981 THE SQL STATEMENT FAILED BECAUSE THE RRSF CONNECTION IS NOT IN A STATE THAT ALLOWS SQL OPERATIONS, REASON reason-code.

Explanation: The application attempted to execute an SQL operation, but the RRSF connection was not in a state that allows the processing of SQL statements.

System Action: The statement cannot be executed.

Programmer Response: See reason-code in Part 4, Section 4. DB2 Codes, on page 771 for an explanation of the problem. Correct the error in the application, REBIND, and run the application again.

Destination: 57015

-989 AFTER TRIGGER trigger-name ATTEMPTED TO MODIFY A ROW IN TABLE table-name THAT WAS INSERTED BY AN INSERT STATEMENT WITHIN A SELECT STATEMENT

Explanation: An INSERT statement was specified in the FROM clause of a SELECT statement of a subselect or a SELECT INTO statement, but the underlying target base table of the INSERT has an AFTER trigger defined which modifies the table being inserted. This is disallowed.

System Action: The statement cannot be processed.

Programmer Response: Avoid using the INSERT statement within SELECT, or change the trigger so that it does not modify the table that is the target of the INSERT statement.

Destination: 560C3

-991 CALL ATTACH WAS UNABLE TO ESTABLISH AN IMPLICIT CONNECT OR OPEN TO DB2. RC1= rc1 RC2= rc2

Explanation: Call attach attempted to perform an implicit connect and open as the result of an SQL statement. The connect or open failed with the returned values.

rc1 The value returned in FRBRC1 for the failed CONNECT or OPEN request.
rc2 The value returned in FRBRC2 for the failed CONNECT or OPEN request.

System Action: The statement cannot be executed.

Programmer Response: Verify that the application intended to use the call attachment facility (CAF) as the mechanism to connect to DB2. For functions or stored procedures running in the WLM-established stored procedure address space the application must be link-edited with or dynamically allocate the RRS...
attachment language interface module (DSNRLI), not CAF.

Destination: 57015

---

**-1403**  
**THE USERNAME AND/OR PASSWORD SUPPLIED IS INCORRECT**

**Explanation:** The username and/or password supplied is incorrect. If either a username or password is supplied, then both must be supplied and both must have a non-zero length.

**System Action:** The statement cannot be executed.

**User Response:** Supply the correct username and password combination.

Destination: 08004

---

**-1760**  
**CREATE PROCEDURE FOR procedure-name MUST HAVE VALID LANGUAGE AND EXTERNAL CLAUSES**

**Explanation:** A LANGUAGE or EXTERNAL clause is missing in the CREATE statement for procedure procedure-name. This clause must be specified.

**System Action:** The statement cannot be executed.

**Programmer Response:** Change the CREATE statement to include the missing clause and reissue the statement.

Destination: 42601

---

**-2001**  
**THE NUMBER OF HOST VARIABLE PARAMETERS FOR A STORED PROCEDURE IS NOT EQUAL TO THE NUMBER OF EXPECTED HOST VARIABLE PARAMETERS. ACTUAL NUMBER sqldanum, EXPECTED NUMBER opnum**

**Explanation:** DB2 received an SQL CALL statement for a stored procedure. However, the number of host variable parameters supplied on the CALL statement does not match the expected number of host variable parameters.

- `sqldanum` The number of host variable parameters as determined by examining the SQLDA.
- `opnum` The expected number of host variable parameters as determined by parsing the statement.

**System Action:** The statement cannot be executed.

**Programmer Response:** If the SQL CALL statement is coded incorrectly, modify the SQL application to provide the correct number of parameters on the SQL CALL statement.

Destination: 53089

---

**-4302**  
**JAVA STORED PROCEDURE OR USER-DEFINED FUNCTION routine-name (SPECIFIC NAME specific-name) HAS EXITED WITH AN EXCEPTION exception-string**

**Explanation:** User-defined function or stored procedure routine-name exited with a Java exception that was not a java.sql.SQLException.

If present, `exception-string` contains as much as will fit of the toString() of the exception that was uncaught.

**System Action:** The statement cannot be executed.

**Programmer Response:** The user-defined function or stored procedure probably needs to be corrected. See your database administrator, or the author of the routine to find out if the exception can be avoided, or if the user-defined function or stored procedure needs to be fixed before it can be used.

Destination: 38000

---

**-4700**  
**ATTEMPT TO USE NEW FUNCTION BEFORE NEW FUNCTION MODE**

**Explanation:** To use the new functions that have been introduced in this release of DB2, new-function mode must first be enabled. This error code will be given after an attempt to use a new function before new-function mode has been enabled.

Additionally, the following statements are restricted in DB2 for z/OS Version 8 until new-function mode is enabled:

- Altering a table to increase the length of a VARCHAR column
- Altering a catalog table to DATA CAPTURE CHANGES

**System Action:** The statement cannot be executed.

**Programmer Response:** Either delay running your program until new-function mode has been enabled, or restrict your program to functions that are allowed before new-function mode is enabled.

Destination: 56038

---

**-4701**  
**THE NUMBER OF PARTITIONS, OR THE COMBINATION OF THE NUMBER OF TABLE SPACE PARTITIONS AND THE CORRESPONDING LENGTH OF THE PARTITIONING LIMIT KEY EXCEEDS THE SYSTEM LIMIT**

**Explanation:** When ALTER TABLE or CREATE INDEX is used to change or create limit keys, the length of the partitioning limit key exceeds the allowed maximum. The combination of the number of table space partitions and the corresponding limit key size are subject to the following limit:
A * (106 + B) < 65394

Where A = Number of partitions, and B = Limit key size (in bytes)

The intended operation would exceed this limit.

When an ALTER TABLE statement is used to add partitions, the maximum number of partitions already exist. For non-LARGE table spaces, the limit is 8, 16, 32, or 64, depending on the initial definition. For LARGE table spaces, see DB2 SQL Reference for more information on the limits.

**System Action:** The statement cannot be executed.
**Programmer Response:** Decrease the size of limit key or the number of table space partitions to satisfy the constraint.
**Destination:** 54054

---

**-4702**

**THE MAXIMUM NUMBER OF ALTERS ALLOWED HAS BEEN EXCEEDED FOR object-type**

**Explanation:** The ALTER statement cannot be processed because the maximum number of alters for the object has already been exceeded. This can occur for the following reasons:

- The SET DATA TYPE keyword was specified on an ALTER TABLE ALTER COLUMN statement, but the maximum number of ALTER statements for this table has already been reached.
- The statement attempts to alter an index, but the maximum number of ALTER statements for this index has already been reached.

**System Action:** The statement cannot be executed.
**Programmer Response:** Run MODIFY to instruct DB2 that copies of a certain age will no longer be employed in recovery, and versions only used in those copies can be reused.
**Destination:** 54055

---

**-4703**

**THE ALTER TABLE STATEMENT CANNOT BE EXECUTED BECAUSE COLUMN column-name IS MIXED DATA, OR THE DATA TYPE OR LENGTH SPECIFIED DOES NOT AGREE WITH THE EXISTING DATA TYPE OR LENGTH**

**Explanation:** The ALTER TABLE statement for column column-name could not be processed for one of the following reasons:

- the existing column is MIXED and the statement attempted to convert the column to SBCS. This conversion is not supported.
- the data type or length in the ALTER statement did not match the existing data type or length of the column in the table being altered.

**System Action:** The statement cannot be executed.
**Programmer Response:** Correct the SQL statement to specify a conversion that is supported.
**Destination:** 429BQ

---

**-5012**  
**HOST VARIABLE host-variable IS NOT EXACT NUMERIC WITH SCALE ZERO**

**Explanation:** HOST VARIABLE host-variable was specified, but it is not valid in the context in which it was used. HOST VARIABLE host-variable was specified as part of ABSOLUTE or RELATIVE in a FETCH statement, or in a ROWS clause of a FETCH or INSERT statement. The host variable was not usable for one of the following reasons:

- It is not an exact numeric type
- The scale is not zero

**System Action:** The statement cannot be processed.
**Programmer Response:** Change the host variable to be an exact numeric with a scale of zero.
**Destination:** 42618

---

**-20003**  
**GBPCACHE NONE CANNOT BE SPECIFIED FOR TABLESPACE OR INDEX IN GRECP**

**Explanation:** GBPCACHE NONE was specified on an ALTER TABLESPACE or ALTER INDEX statement, but the table space, index, or the partition to be altered is in GRECP.

**System Action:** The statement cannot be processed.
**User Response:** Use the START DATABASE command to recover the table space or index from the GRECP then STOP the table space or index before reissuing the ALTER statement.
**Destination:** 560A7

---

**-20004**  
**8K or 16K BUFFERPOOL PAGESIZE INVALID FOR A WORKFILE OBJECT**

**Explanation:** This message is issued when:

- A CREATE or ALTER DATABASE statement for a workfile database specifies an 8K or 16K pagesize in the BUFFERPOOL clause.
- A CREATE or ALTER TABLESPACE statement for a workfile database specifies an 8K or 16K pagesize in the BUFFERPOOL clause.

**System Action:** The statement cannot be executed.
**User Response:** Correct the statement to specify a 4K or 32K bufferpool pagesize.
**Destination:** 560A8
-20005  THE INTERNAL ID LIMIT OF  \_limit\_ HAS BEEN EXCEEDED FOR OBJECT TYPE \_object-type\_  

**Explanation:** An internal ID is used to uniquely identify objects of type \_object-type\_. The limit for internal IDs for this type of object is \_limit\_, and this limit has been exceeded.

This could occur during a CREATE DISTINCT TYPE, CREATE FUNCTION, CREATE PROCEDURE, CREATE SEQUENCE, or CREATE or ALTER TABLE statement that defines an identity column.

**System Action:** The SQL statement cannot be executed.

**Programmer Response:** Drop objects of \_object-type\_ that are not being used, and retry the statement.

**Destination:** 54035

-20006  LOBS CANNOT BE SPECIFIED AS PARAMETERS WHEN NO WLM ENVIRONMENT IS SPECIFIED  

**Explanation:** On a CREATE PROCEDURE statement, one or more LOBs (or distinct types based on LOBs) were specified in the parameter list, and the NO WLM ENVIRONMENT option was also specified.

Option NO WLM ENVIRONMENT cannot be used with LOBs in the parameter list for a stored procedure.

Note: This message is still issued with Version 8 prior to New Function Mode.

**System Action:** The statement is not executed.

**Programmer Response:** Either do not specify a LOB as a parameter, or specify a WLM ENVIRONMENT name rather than NO WLM ENVIRONMENT on your CREATE PROCEDURE statement.

**Destination:** 53097

-20008  UNSUPPORTED OPTION \_keyword\_ SPECIFIED  

**Explanation:** \_keyword\_ is a deprecated feature that was supported in releases prior to DB2 Version 8, and is no longer supported.

For indexes, only one type is currently supported — type 2.

**System Action:** The statement cannot be executed.

**Programmer Response:** Correct the syntax of the SQL statement to remove reference to the unsupported \_keyword\_ keyword. Refer to the [DB2 SQL Reference] for more information.

**Destination:** 560A9

-20058  THE FULLSELECT SPECIFIED FOR MATERIALIZED QUERY TABLE \_table-name\_ IS NOT VALID.  

**Explanation:** The materialized query table definition has specific rules regarding the contents of the fullselect. When DISABLE QUERY OPTIMIZATION is specified, the following additional restrictions apply:

- The fullselect cannot contain a reference to a created global temporary table or a declared global temporary table.
- The fullselect cannot reference another materialized query table.

When a materialized query table is defined with ENABLE QUERY OPTIMIZATION specified, more restrictions apply:

- The fullselect must be a subselect.
- The subselect cannot reference to a user-defined scalar or table function with the EXTERNAL ACTION or NON-DETERMINISTIC attributes, or built-in function RAND.
- The subselect cannot contain any predicates which include subqueries.
- The subselect cannot contain a nested table expression or view that requires temporary materialization.
- The subselect cannot contain a join using the INNER JOIN syntax.
- The subselect cannot contain an outer join.
- The subselect cannot contain a special register.
- The subselect cannot contain a scalar fullselect.
- The subselect cannot contain a row expression predicate.
- The subselect cannot contain sideways references.
- The subselect cannot contain table objects with multiple CCSID sets.
- The subselect cannot contain more than one table with a security label column, and the security label column must be one of the select list items of the subselect.
- If the subselect references a view, the fullselect in the view definition must satisfy the above restrictions.

**System Action:** The statement cannot be processed.

**Programmer Response:** Change the fullselect in the CREATE TABLE or ALTER TABLE statement so that it conforms to the rules listed above.

**Destination:** 428EC

-20070  AUXILIARY TABLE \_table-name\_ CANNOT BE CREATED BECAUSE COLUMN \_column-name\_ IS NOT A LOB COLUMN

**Explanation:** An auxiliary table cannot be created for a non-LOB column. A CREATE AUXILIARY TABLE
statement must refer to a LOB column in the associated base table.

**System Action:** The statement cannot be executed. The specified table was not created.

**Programmer Response:** Change the name of the column to correctly refer to a LOB column in the base table.

**Destination:** 53098

---

**-20071**

**WLM ENVIRONMENT NAME MUST BE SPECIFIED function-name**

**Explanation:** The WLM ENVIRONMENT option was not specified on CREATE FUNCTION or CREATE PROCEDURE, and there is no default WLM environment for the installation.

**System Action:** The statement could not be processed.

**Programmer Response:** Select a WLM ENVIRONMENT name and include it in the CREATE FUNCTION or CREATE PROCEDURE statement. Contact your system administrator to find out the names of the WLM environments that have been defined for your installation.

**Destination:** 53099

---

**-20072**

csect-name bind-type bind-subtype

**ERROR USING auth-id AUTHORITY OPERATION IS NOT ALLOWED ON A TRIGGER PACKAGE package-name**

**Explanation:** The package specified is a trigger package. The bind-type operation cannot be performed against a trigger package using this statement or subcommand.

**csect-name** Name of the CSECT that issued the message.

**bind-type** Type of bind operation (BIND, REBIND, DROP, or FREE).

**bind-subtype** Subtype of bind operation (COPY or blank).

**auth-id** Authorization ID of the invoker of the BIND, REBIND or FREE subcommand or primary authorization ID of the currently executing process for a DROP statement.

**package-name** Name of the package in the following format: 'collection.package'.

**System Action:** The plan or package is not bound, copied, or freed.

**System Programmer Response:** A trigger package cannot be explicitly bound. A trigger package cannot be copied. To rebind a trigger package locally, the REBIND TRIGGER PACKAGE subcommand must be used. A trigger package cannot be rebound remotely. To drop a trigger package, the DROP TRIGGER statement must be used.

**Destination:** 56052

---

**-20073**

**THE FUNCTION function-name CANNOT BE ALTERED BECAUSE IT IS REFERENCED IN EXISTING VIEW OR MATERIALIZED QUERY TABLE DEFINITIONS**

**Explanation:** The function-name in an ALTER FUNCTION statement cannot be altered to NOT DETERMINISTIC or EXTERNAL ACTION. It is referenced in one or more existing view definitions or materialized query table definitions.

**System Action:** The statement cannot be executed.

**Programmer Response:** Drop the views that reference the function before issuing the ALTER FUNCTION statement. Drop the materialized query tables that reference the functions or alter the materialized query tables that reference the functions into base tables before issuing the ALTER FUNCTION statement.

**Destination:** 42927

---

**-20074**

**THE OBJECT object-name CANNOT BE CREATED BECAUSE THE FIRST THREE CHARACTERS ARE RESERVED FOR SYSTEM OBJECTS**

**Explanation:** In general, SYS is a reserved prefix for names. The only exceptions are:

- SYSADM and SYSTOOLS are valid prefix names.
- SYSPROC is a valid schema name for stored procedures.
- SYSIBM is a valid schema name for a stored procedure when the current application process has the SYSADM or SYSCTRL privilege.
- SYSTOOLS is a valid schema name when the current application process has the SYSADM or SYSCTRL privilege.

This condition is similar to the condition reported in precompiler message DSNH794I.

This message is also issued if an attempt is made to grant the CREATEIN, ALTERIN or DROPIN privileges on a schema with the SYS prefix. The same exceptions apply to the grant.

**System Action:** The statement is not executed.

**Programmer Response:** Select a name that does not start with a reserved prefix.

**Destination:** 42939
A VIEW NAME WAS SPECIFIED AFTER LIKE IN ADDITION TO THE INCLUDING IDENTITY COLUMN ATTRIBUTES CLAUSE

Explanation: The LIKE clause specified the name of a view in combination with the INCLUDING IDENTITY COLUMN ATTRIBUTES clause. This usage is not supported.

System Action: The statement is not executed.

Programmer Response: Remove the INCLUDING IDENTITY COLUMN ATTRIBUTES clause and resubmit the statement to copy the existing view definition without the identity column attributes.

In the case of DECLARE GLOBAL TEMPORARY TABLE, it is possible to get the identity column attributes for a column of a view using the AS subselect clause with INCLUDING IDENTITY COLUMN ATTRIBUTES instead. For example:

```
DECLARE GLOBAL TEMPORARY TABLE ... 
AS (SELECT * FROM view-name) DEFINITION ONLY 
INCLUDING IDENTITY COLUMN ATTRIBUTES
```

Destination: 560AD

A VIEW WAS SPECIFIED FOR LIKE BUT IT INCLUDES A ROWID COLUMN

Explanation: The LIKE clause specified the name of a view that contains a ROWID column. This is not supported.

System Action: The statement is not executed.

Programmer Response: Specify the name of a view that does not contain a ROWID column (or distinct type column for which the source type is ROWID), or specify the name of a table and resubmit the statement.

Destination: 560AE

THE TABLE table-name CANNOT BE CONVERTED TO OR FROM A MATERIALIZED QUERY TABLE, OR THE MATERIALIZED QUERY TABLE PROPERTY CANNOT BE ALTERED. REASON CODE = reason-code.

Explanation: The ALTER TABLE statement was not able to change a table from a materialized query table to a base table, to convert a base table to a materialized query table, or to change the materialized query table properties. The ALTER TABLE statement failed because of one of the following error situations, as indicated by reason-code:

<table>
<thead>
<tr>
<th>reason-code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>The table is not a materialized query table, and DROP MATERIALIZED QUERY is specified.</td>
</tr>
<tr>
<td>4</td>
<td>The table has at least one trigger defined.</td>
</tr>
</tbody>
</table>

The table has at least one check constraint defined.

The table has at least one unique constraint or index defined.

The table has at least one referential constraint defined.

The table is referenced in the definition of an existing materialized query table, or it is referenced in the definition of a view when altering to a system-maintained materialized query table.

The table is referenced directly or indirectly (through a view, for example) in the fullselect.

The table is already a materialized query table.

The number of columns of the existing table does not match the number of columns that are defined in the select list of the fullselect.

The data types of the columns of the existing table do not exactly match the corresponding columns in the select list of the fullselect.

The column names of the columns of the existing table do not exactly match the corresponding column names in the select list of the fullselect.

The nullability, default, or other characteristics of the columns of the existing table do not exactly match the characteristics of the corresponding columns in the select list of the fullselect.

The conversion cannot be performed if there are any other table alterations in the same ALTER TABLE statement.

The table is not a materialized query table, and alteration of materialized query table properties was specified.

System Action: The statement cannot be processed.

Programmer Response: Depending on reason-code, take the following action:

<table>
<thead>
<tr>
<th>reason-code</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>There is no need to convert this table. No action is required.</td>
</tr>
<tr>
<td>4</td>
<td>Drop any triggers, and try the ALTER TABLE statement again.</td>
</tr>
<tr>
<td>5</td>
<td>Drop any check constraints, and try the ALTER TABLE statement again.</td>
</tr>
<tr>
<td>6</td>
<td>Drop any unique constraint and unique indexes. Try the ALTER TABLE statement again.</td>
</tr>
<tr>
<td>7</td>
<td>Drop the referential constraints, and try the ALTER TABLE statement again.</td>
</tr>
</tbody>
</table>
8 Drop the materialized query table that references the table, and try ALTER TABLE statement again.

9 A materialized query table cannot reference itself. Modify the fullselect to remove the direct or indirect reference to the table being altered.

10 The operation is not allowed since the table is already a materialized query table.

11 Modify the fullselect to include the correct number of columns in the select list.

12 Modify the fullselect so that the result column data types exactly match the data types of the corresponding existing columns.

13 Modify the fullselect so that the result column names exactly match the column names of the corresponding existing columns.

14 The table cannot be converted to a materialized query table unless the the nullability characteristics can be matched. Create a new materialized query table instead.

15 Perform the other table alterations in an ALTER TABLE statement that do not include the ADD MATERIALIZED QUERY clause.

16 Either correct the table name to specify a materialized query table, or use the ALTER TABLE statement to convert the table to a materialized query table with the required properties.

Destination: 428EW

-20100 AN ERROR OCCURRED WHEN BINDING A TRIGGERED SQL STATEMENT. INFORMATION RETURNED: SECTION NUMBER: section-number SQLCODE sqlcode, SQLSTATE sqlstate, AND MESSAGE TOKENS token-list

Explanation: During execution of a CREATE TRIGGER statement, the SQL statements specified in the triggered action are bound into a trigger package. During that processing, an error was discovered in one of those statements.

section-number
The section number associated with the failing triggered SQL statement. For triggers that contain a WHEN clause, the WHEN clause is section number one. The triggered SQL statements are numbered sequentially, beginning with section number two. This is true for triggers with or without a WHEN clause.

sqlcode
The SQLCODE received when binding the statement.

sqlstate
The corresponding SQLSTATE for the SQLCODE received when binding the statement.

token-list
The list of tokens from the original SQL error. This list might be truncated.

System Action: The CREATE TRIGGER statement was not processed. The trigger and the trigger package were not created.

Programmer Response: Use the section number determine the failing triggered SQL statement. Refer to the explanation of the reported SQLCODE. Follow the action suggested by that message.

Destination: 56059

-20101 THE FUNCTION function FAILED WITH REASON rc

Explanation: The statement attempted to execute a function function. The statement failed, Reason Code rc

Possible values for rc are: 00E73001, 00E73002, 00E73003, and 00E73004.

System Action: The statement cannot be executed.

Programmer Response: Correct the condition described by the DB2 reason code.

Destination: 56060

-20102 CREATE OR ALTER STATEMENT FOR ROUTINE routine-name SPECIFIED THE option option WHICH IS NOT ALLOWED FOR THE TYPE OF ROUTINE

Explanation: An option was specified that is not allowed for the type of routine being created or altered.

- MODIFIES SQL DATA is not allowed for table functions.
- ALLOW PARALLEL is not allowed for table functions.
- CARDINALITY is not allowed for non-table functions.
- LANGUAGE SQL is not allowed for non-SQL functions or procedures.
- LANGUAGE specifying something other than SQL is not allowed for SQL functions or procedures.
- LANGUAGE JAVA is not allowed for table functions.
- PARAMETER STYLE JAVA is not allowed for table functions.

System Action: The statement cannot be processed.

Programmer Response: Remove the option from the statement and reissue the failing statement.

Destination: 42849
-20104 AN ATTEMPT TO ALTER A CCSID FROM from-csid TO to-csid FAILED

Explanation: The statement attempted to alter the CCSID for a database or table space and the statement failed.

from-csid represents the CCSID that is currently in use for the database or table space.

to-csid is the CCSID that specified on the alter statement.

System Action: The statement cannot be executed.

Programmer Response: The SQL REFERENCE contains a list of CCSIDs that may be specified on this statement. Only CCSIDs specified in this appendix may be altered, and then, only to the corresponding value listed in the table. Altering the CCSID of a database or table space to a value not listed in the table is not permitted.

Destination: 42856

-20106 THE CCSID FOR TABLE SPACE OR DATABASE CANNOT BE CHANGED BECAUSE THE TABLE SPACE OR DATABASE ALREADY CONTAINS A TABLE THAT IS REFERENCED IN EXISTING VIEW OR MATERIALIZED QUERY TABLE DEFINITIONS

Explanation: An ALTER statement cannot be used to alter the CCSID for a table space or database that contains a table that is referenced in existing view definitions.

System Action: The statement cannot be executed.

Programmer Response: To alter the CCSID for the specified space, first drop any existing view definitions that refer to tables contained in the identified space and then reissue the ALTER statement.

Destination: 42945

-20107 HOST VARIABLE OR PARAMETER NUMBER position-number CANNOT BE USED AS SPECIFIED BECAUSE REASON reason

Explanation: DB2 received data that could not be used as specified in the statement because it is not convertible to an acceptable format in this machine environment.

position-number identifies either the host variable number (if the message is issued as a result of an INSERT, UPDATE, DELETE, SELECT, SET, or VALUES statement), or the parameter number (if the message is issued as the result of a CALL statement, or the invocation of a function).

reason

-20108 A RESULT SET CONTAINS AN UNSUPPORTED DATA TYPE IN POSITION NUMBER position-number FOR CURSOR cursor-name OPENED BY STORED PROCEDURE procedure-name

Explanation: Stored procedure procedure-name cannot return one or more query result sets. cursor-name indicates the first query result set that the stored procedure cannot return. The column at position-number in the query result set contains a data type that is not supported by the requester or the server.

System Action: The CALL statement cannot be executed.

Programmer Response: Modify the stored procedure at the server to return result sets that include only data types that are supported by the requester. You may also upgrade the level of code at the requester to one that supports the data type(s) that were returned by the server.

Destination: 56084

-20110 CANNOT IMPLICITLY CONNECT TO A REMOTE SITE WITH A SAVEPOINT OUTSTANDING

Explanation: The statement referenced an object at a remote DBMS with an alias or a three-part name when an active savepoint exists. Such a reference requires an implicit connection to the remote DBMS, which is not allowed when there is an outstanding savepoint.

System Action: The statement is not executed.

Programmer Response: Either release the savepoint, or move the data.

Destination: 51036

<td>3B503</td>
</tr>
<tr>
<td>-20123</td>
<td><strong>CALL TO STORED PROCEDURE procedure FAILED BECAUSE THE RESULT SET RETURNED FOR CURSOR cursor IS SCROLLABLE, BUT THE CURSOR IS NOT POSITIONED BEFORE THE FIRST ROW</strong></td>
<td>The Call to the stored procedure was unsuccessful. All result set cursors defined in the stored procedure were closed before returning to the caller. The scrollable cursor can not be used to FETCH from the result set. Actions completed by the stored procedure are not rolled back, and any external actions initiated by the stored procedure have completed because the error was detected upon completion of the stored procedure.</td>
<td>Modify the content of the stored procedure to ensure that the result set cursors are positioned before the first row before returning to the caller.</td>
<td>560B1</td>
</tr>
<tr>
<td>-20127</td>
<td><strong>VALUE SPECIFIED ON FETCH STATEMENT FOR ABSOLUTE OR RELATIVE IS TOO LARGE FOR DRDA</strong></td>
<td>The value that was specified after ABSOLUTE or RELATIVE on a FETCH statement is larger than 64 bits. DRDA limits this specification to 64 bits.</td>
<td>Modify the scroll specification on the FETCH statement.</td>
<td>56051</td>
</tr>
<tr>
<td>-20129</td>
<td><strong>LOCAL SPECIAL REGISTER IS NOT VALID AS USED</strong></td>
<td>The local special registers cannot be referenced in an assignment statement (SET or VALUES INTO) that assigns multiple values. For example, the following special registers are local: CURRENT SERVER and CURRENT PACKAGESET. Additionally, the local special registers cannot be referenced in a SET host-variable statement that has parenthesis around the special register. The following statements are not valid: SET (:hv1) = (CURRENT SERVER); SET (:hv1,:hv2) = (CURRENT SERVER,CURRENT PATH); VALUES CURRENT SERVER, CURRENT DATE INTO :c1, :c2;</td>
<td>560B2</td>
<td></td>
</tr>
</tbody>
</table>

**Explanation:**
-20111: SAVEPOINT, RELEASE SAVEPOINT, and ROLLBACK TO SAVEPOINT statements cannot be used in the body of a trigger or a global transaction.

-20123: A scrollable result set for cursor cursor has been returned by a CALL to stored procedure procedure, and one or more of these cursors is not positioned before the first row.

-20127: The value that was specified after ABSOLUTE or RELATIVE on a FETCH statement is larger than 64 bits. DRDA limits this specification to 64 bits. The statement cannot be processed.

-20129: Local special registers cannot be referenced in an assignment statement (SET or VALUES INTO) that assigns multiple values.

**Severity:**
-20111: 560B3
-20123: 560B1
-20127: 56051
-20129: 8 (error)
**System Action:** The statement cannot be executed.

**Programmer Response:**  Split the statement into multiple statements so that the local special registers are not referenced in a statement that assigns multiple values. Also be sure that a SET statement for a local special register does not use parenthesis on either side of the equal sign.

**Destination:** 560B5

### -20142

**MESSAGE:** SEQUENCE sequence-name CANNOT BE USED AS SPECIFIED

**Explanation:** sequence-name was referenced in a context in which it cannot be used. It was an invalid reference to a system-generated sequence object. sequence-name is a sequence that was generated by the system for an identity column. These sequences cannot be referenced in:

- An ALTER SEQUENCE statement
- A DROP SEQUENCE, COMMENT ON SEQUENCE, GRANT, or REVOKE statement
- A NEXTVAL or PREVVAL expression

**System Action:** The statement cannot be executed.

**Programmer Response:** Specify the name of a user-defined sequence object in this context.

**Destination:** 428FE

### -20143

**MESSAGE:** THE ENCRYPTION OR DECRYPTION FUNCTION FAILED, BECAUSE THE ENCRYPTION PASSWORD VALUE IS NOT SET

**Explanation:** The ENCRYPTION PASSWORD value is not set.

**System Action:** The statement cannot be executed.

**Programmer Response:** Issue the SET ENCRYPTION PASSWORD statement to set the ENCRYPTION PASSWORD value. The length of the PASSWORD must be a minimum of 6 bytes and a maximum of 127 bytes.

**Destination:** 51039

### -20144

**MESSAGE:** THE ENCRYPTION IS INVALID BECAUSE THE LENGTH OF THE PASSWORD WAS LESS THAN 6 BYTES OR GREATER THAN 127 BYTES

**Explanation:** The data must be encrypted with a password length between 6 and 127 bytes.

**System Action:** The statement cannot be executed.

**Programmer Response:** Ensure that your password length is between 6 and 127 bytes in length.

**Destination:** 428FC

### -20146

**MESSAGE:** THE DECRYPTION FAILED. THE DATA IS NOT ENCRYPTED

**Explanation:** The data must be encrypted before it is decrypted.

**System Action:** The statement cannot be executed.

**Programmer Response:** Ensure that the data being decrypted has been encrypted using the ENCRYPT_TDES built-in function.

**Destination:** 428FC

### -20147

**MESSAGE:** THE ENCRYPTION FUNCTION FAILED. MULTIPLE PASS ENCRYPTION IS NOT SUPPORTED

**Explanation:** Data that has already been encrypted, cannot be encrypted again.

**System Action:** The statement cannot be executed.

**Programmer Response:** Ensure that the data that is being encrypted has not already been encrypted.

**Destination:** 55048

### -20163

**MESSAGE:** HEXADECIMAL CONSTANT GX IS NOT ALLOWED

**Explanation:** A hexadecimal graphic string constant, GX, was used in a statement when one of the following two conditions was true:

- The MIXED DATA install option is set to NO.
- The application encoding scheme is UNICODE.
- The GX constant was specified as a column default value in a WITH DEFAULT clause.
- The GX constant was specified as a limit key value in a VALUES clause.

**System Action:** The statement cannot be executed.

**Programmer Response:** If your data is not graphic, use an X hexadecimal constant instead of a GX constant. If your MIXED DATA install option is set to NO, contact your system administrator to set up the installation options properly for use with the GX constant. If your application encoding scheme is UNICODE, use a UX hexadecimal constant instead of GX.

**Destination:** 560B9

### -20165

**MESSAGE:** INSERT STATEMENT WITHIN A SELECT IS NOT ALLOWED IN THE CONTEXT IN WHICH IT WAS SPECIFIED

**Explanation:** An INSERT statement can be specified in the FROM clause of a SELECT in specific contexts. It is only allowed as the only table-spec in the FROM clause of a SELECT statement (excluding the common table expressions) that is a subselect or a SELECT INTO statement.
1. System Action: The statement cannot be processed.
   Programmer Response: Change the statement so that the INSERT statement is used only in a SELECT statement that is a subselect or a SELECT INTO statement. Ensure that the INSERT statement in the FROM clause is the only table-spec in the FROM clause.
   Destination: 428FL

2. -20166 INSERT STATEMENT WITHIN A SELECT SPECIFIED A VIEW view-name WHICH IS NOT A SYMMETRIC VIEW
   Explanation: The target view of the INSERT statement within a SELECT statement must be defined WITH CASCADED CHECK OPTION or the fullselect in the view definition must not have a WHERE clause.
   A symmetric view is a view defined implicitly or explicitly with the WITH CASCADED CHECK OPTION.
   System Action: The statement cannot be executed
   Programmer Response: Do not use the INSERT statement within a SELECT with the specified view.
   Destination: 428FM

3. -20177 SET DATA TYPE CLAUSE ON ALTER TABLE SPECIFIED FLOATING POINT, BUT THIS CHANGE IS DISALLOWED
   Explanation: The SET DATA TYPE clause of an ALTER TABLE statement specified floating point as the new data type. However, there is an existing unique index or constraint that is defined on the column. This type of change is not allowed when unique indexes or constraints are defined on the column to be changed.
   Programmer Response: Change the statement to specify a different compatible data type, and resubmit the statement.
   Destination: 530A1

4. -20180 COLUMN column-name IN TABLE table-name CANNOT BE ALTERED AS SPECIFIED
   Explanation: Column column-name cannot be altered for one of the following reasons:
   • ALTER COLUMN cannot be specified on ALTER TABLE if:
     – The table is defined with DATA CAPTURE CHANGES
     – The column is involved in a referential integrity constraint (either as part of the parent key or foreign key)
     – The column has a field procedure defined
     – or the column is an identity column
     • Additionally, SET DATA TYPE cannot be specified on ALTER TABLE if:
       – The table is a materialized query table
       – The table has an edit procedure or valid procedure
   System Action: The statement cannot be executed.
   Programmer Response: Change the name of the column to a column that can be altered, or drop and recreate the table with the necessary attributes.
   Destination: 530A2

5. -20181 COLUMN CANNOT BE ADDED TO INDEX index-name
   Explanation: An ALTER INDEX ADD COLUMN statement attempted to add a column to an index that is an auxiliary index, enforces a primary key, unique key, referential constraint, or ROWID column; or, the index is a partitioning index, and index-based partitioning is being used.
   System Action: The statement cannot be executed.
   Programmer Response: Change the statement to refer to an index that can have a column added to it.
   Destination: 428FS

6. -20182 values PARTITIONING CLAUSE ON stmt-type STATEMENT FOR index-name IS NOT VALID
   Explanation: The values PARTITIONING clause was not accepted on CREATE or ALTER INDEX statement for one of the following reasons:
   • On ALTER INDEX, if the table uses table-based CONTROLED partitioning, or if the index is a partitioning index created in Version 8 or later releases.
   • On CREATE INDEX, values partitioning attributes were specified on a previous CREATE or ALTER TABLE statement for the table.
   • On CREATE INDEX, if the partitioning scheme of the index is predetermined by that of the underlying data.
   • When altering partition limit key values, if there are any large object (LOB) columns in the table.
   System Action: The statement cannot be executed.
   Programmer Response: Change the name of the index to an index for which the values partitioning clause would be valid, and resubmit the statement.
   Destination: 530A2
THE PARITIONED, ADD PART, ADD PARTITIONING KEY, OR ALTER PART CLAUSE SPECIFIED ON CREATE OR ALTER FOR name IS NOT VALID

Explanation: The PARITIONED, ADD PART, ADD PARTITIONING KEY, and ALTER PART clauses cannot be specified on ALTER TABLE, CREATE INDEX, or CREATE TABLE if:
- The table is a non-partitioned table
- The table is a materialized query table
- A materialized query table is defined on this table

Additionally, the ADD PARTITIONING KEY clause cannot be specified if the table is already complete by having established either table-based partitioning or index-based partitioning.

System Action: The statement cannot be executed.
Destination: 428FT

CURSOR cursor-name IS NOT DEFINED TO ACCESS ROWSETS, BUT A CLAUSE WAS SPECIFIED THAT IS VALID ONLY WITH ROWSET ACCESS

Explanation: The FOR ROW n OF ROWSET clause was specified on a FETCH statement, but the cursor is not defined for rowset access.

System Action: The statement cannot be executed.
Programmer Response: Remove the FOR n ROWS clause from the FETCH statement, or redefine the cursor for multiple row access with the WITH ROWSET POSITIONING clause on DECLARE CURSOR or PREPARE.
Destination: 24518

A CLAUSE SPECIFIED FOR THE DYNAMIC SQL STATEMENT BEING PROCESSED IS NOT VALID

Explanation: A clause was not valid for one of the following reasons:
- On a PREPARE statement, a FOR SINGLE ROW or FOR MULTIPLE ROWS clause was specified. However, the statement that was being prepared was not an INSERT statement.
- On a PREPARE statement, an ATOMIC or NOT ATOMIC clause was specified. However, the statement that was being prepared was not an INSERT statement.
- On an EXECUTE statement, a multiple-row-insert clause was specified. However, the statement that was being executed was not an INSERT statement.
- On a PREPARE statement, a SENSITIVE DYNAMIC clause and SCROLL clause were specified. However, the content of the query requires the use of a temporary table for processing.
- On an EXECUTE statement, a multiple-row-insert clause was specified. However, the statement that was being executed was not an INSERT statement that was prepared with FOR MULTIPLE ROWS specified as part of the ATTRIBUTES clause on the PREPARE statement.
- On an EXECUTE statement, a multiple-row-insert clause was not specified. However, the statement that was being executed was an INSERT statement, and FOR MULTIPLE ROWS was specified as part of the ATTRIBUTES clause on the PREPARE statement.
- On an EXECUTE statement, a FOR n ROWS clause was specified. However, the INSERT statement that was being executed also contained a FOR n ROWS clause.
- On an EXECUTE statement, host variable arrays were provided. However, the FOR n ROWS clause was not specified (on either the EXECUTE or INSERT statement).

System Action: The statement cannot be executed.
Programmer Response: Remove the clause that was not valid in the context in which it was used.
Destination: 07501

THE INSTALL OR REPLACE OF jar-id WITH URL url FAILED DUE TO REASON reason-code (reason-string).

Explanation: The URL that was specified on the install or replace jar procedure did not identify a valid jar file.

<table>
<thead>
<tr>
<th>jar-id</th>
<th>Name of the JAR that was specified for INSTALL_JAR or REPLACE_JAR</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>Up to 80 characters of the URL are displayed.</td>
</tr>
</tbody>
</table>

The possible values for reason-code and reason-string appear below:

1 (FILE NOT FOUND)
- No HFS file was found with the name specified.

2 (URL FORMAT)
- The URL must begin with 'file:' or 'file://'.

3 (FILE SIZE)
- The file must not be larger than 100MB.

System Action: The statement cannot be processed.
Destination: 46001

User Response: Reissue the install or replace jar procedure with a URL that identifies a valid jar file.
-20201  THE INSTALL, REPLACE, OR REMOVE OF jar-name FAILED DUE TO REASON reason-code (reason-string)

Explanation: The jar name jar-name that was specified on the install, replace, or remove jar procedure was invalid. For example, the jar may be of the improper format, may not exist to be replaced or removed, or cannot be installed as it already exists.

The possible values for reason-code and reason-string appear below:

1 (UNDEFINED JAR)
   A JAR with the name specified on REPLACE_JAR or REMOVE_JAR does not exist in DB2.

2 (SCHEMA LENGTH)
   In the jar-name parameter, the schema delimiter `. was found after more than 128 bytes, but the schema has a maximum of 128 bytes.

3 (NAME LENGTH)
   In the jar-name parameter, more than bytes were found after the schema delimiter or the default schema was used, and the Jar name exceeds the maximum of 128 bytes.

4 (PARSER ERROR)
   During INSTALL_JAR or REMOVE_JAR processing, the DB2 parser was invoked and returned an error. This may be due to invalid characters or invalid length of the jar name parameter.

5 (DUPLICATE JAR)
   A JAR with the name specified on INSTALL_JAR already exists in DB2.

System Action: The statement cannot be processed.

Destination: 46002

User Response: Correct the jar identifier parameter and re-issue the request.

-20202  THE REPLACE OR REMOVE OF jar-name FAILED AS class IS IN USE

Explanation: The specified class in the jar file is currently in use by a defined routine, or the replacement jar file does not contain the specified class for which a routine is defined.

System Action: The statement cannot be processed.

User Response: Ensure all routines referencing the classes being removed are dropped, and resubmit the replace or remove procedure.

Destination: 46003

-20203  USER-DEFINED FUNCTION OR PROCEDURE name HAS A JAVA METHOD WITH AN INVALID SIGNATURE. THE ERROR IS AT OR NEAR PARAMETER number. THE SIGNATURE IS signature.

Explanation: The signature of the java method that was used to implement the function or procedure was invalid. For example, the method may have parameters that are not mappable to the parameters on the corresponding CREATE PROCEDURE statement.

name identifies the specific name of the external Java function or procedure whose signature caused the error

number indicates the position of the parameter within the signature closest to the error

signature provides at most the first 100 characters of the invalid signature

System Action: The statement is not executed.

Programmer Response: Reissue the corresponding CREATE statement specifying parameters that match the Java method, or correct the specified procedure or function signature.

Destination: 46007

-20204  THE USER-DEFINED FUNCTION OR PROCEDURE routine-name WAS UNABLE TO MAP TO A SINGLE JAVA METHOD

Explanation: A CREATE or ALTER FUNCTION or PROCEDURE statement for routine-name specified a Java method in the EXTERNAL NAME clause that cannot be used. The EXTERNAL NAME clause did not contain a matching Java method, or contained more than one matching Java method.

System Action: The statement cannot be processed.

Programmer Response: The EXTERNAL NAME clause of the identified function or procedure must be altered to uniquely identify a valid Java method for the routine, or the Java class must be changed to have a single method with the specified or implicit signature.

Destination: 46008

-20207  THE INSTALL OR REMOVE OF jar-name SPECIFIED THE USE OF A DEPLOYMENT DESCRIPTOR.

Explanation: The DEPLOY or UNDEPLOY parameter of the install or remove jar procedure for jar-name was non-zero. Use of deployment descriptors is not supported, and this parameter must be zero.

System Action: The JAR is not installed, or removed.
**User Response:** Reissue the INSTALL_JAR or REMOVE_JAR procedure call with the DEPLOY or UNDEPLOY parameter set to zero.

**Destination:** 46501

---

**-20210**

**THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE IT WAS AT A LEVEL THAT IS INCOMPATIBLE WITH THE CURRENT VALUE OF THE ENCODING BIND OPTION OR SPECIAL REGISTER**

**Explanation:** The SQL statement was precompiled at a level prior to Version 7, but the current value of the ENCODING bind option or special register does not represent the system EBCDIC CCSIDs. The information that is necessary to execute the SQL statement is unavailable for processing, and the SQL statement cannot be successfully completed. Additional processing of the SQL statement is terminated.

An application that was precompiled prior to DB2 Version 7 may not be bound, either implicitly or explicitly, with an ENCODING bind option of anything other than ENCODING(EBCDIC) or ENCODING(ccsid) where ccsid represents the system EBCDIC CCSID. If the value of MIXED DATA for the system is YES, then ccsid must be the default EBCDIC mixed CCSID. Otherwise, ccsid must be the default EBCDIC single byte CCSID.

**System Action:** The statement cannot be executed.

**Programmer Response:** To correct the situation, you may:
- Precompile the program again using the current precompiler and reissue the BIND command
- Reissue the BIND command using ENCODING(EBCDIC) or ENCODING(ccsid) where ccsid represents the system EBCDIC CCSID.

**Destination:** 560B8

---

**-20122**

**USER-DEFINED ROUTINE name ENCOUNTERED AN EXCEPTION ATTEMPTING TO LOAD JAVA CLASS class-name FROM JAR jar-name. ORIGINAL EXCEPTION: exception-string.**

**Explanation:** A Java exception occurred while DB2 was trying to load a Java class. The error can occur when loading the class that is identified in the EXTERNAL NAME clause, or a referenced class. This message could indicate more than that a class was not found. Some examples would be an I/O error occurring when reading the JAR file, or an SQL error occurring when reading the BLOB containing the JAR from the DB2 catalog.

**name** the specific name of the external Java function or procedure that caused the ClassNotFoundException

**class-name** the Java class DB2 was trying to load when the error occurred

**jar-name** the jar that the class was being loaded from, if any

**exception-string** contains as much of the toString() of the underlying exception that resulted in this ClassNotFoundException as fits, if any

**System Action:** The CALL statement fails.

**Programmer Response:** Recreate the Java method to make returned DYNAMIC RESULT SET parameters be instances of the class produced by the DB2 for OS/390 JDBC driver (COM/ibm/db2os390/sqlj/jdbc/DB2SQLJResultSet).

**Destination:** 46502

---

**-20223**

**THE ENCRYPT_TDES OR DECRYPT FUNCTION FAILED. ENCRYPTION FACILITY NOT AVAILABLE return-code, reason-code**

**Explanation:** The encryption facility is not available, or not able to service the encryption or decryption request.

**System Action:** The statement cannot be executed.

**Programmer Response:** If the encryption facility is not installed, then install it before using the ENCRYPT_TDES or DECRYPT functions. If the encryption facility is installed, then verify that it is
working correctly. returncode and reason-code may give further information on the regarding why this message was issued. If the encryption facility is not installed, then install it before using the ENCRYPT_TDES or DECRYPT functions. If the encryption facility is installed, then verify that it is working correctly. returncode and reason-code may give further information on the regarding why this message was issued. Consult ICSF Application Programmers Guide, Appendix A, for the ICSF Return Code and ICSF Reason Codes for further information.

**Destination:** 560BF

### -20227 REQUIRED CLAUSE IS MISSING FOR ARGUMENT number OF expression

**Explanation:** The expression expression requires that a clause be specified for argument number number.

- If expression is XMLATTRIBUTES, then an AS clause is required for the XML attribute name.
- If expression is XMLFOREST, then an AS clause is required for the XML element name.

**System Action:** The statement cannot be processed.

**Programmer Response:** Correct the statement by providing the required clause for the argument.

**Destination:** 42633

### -20232 CHARACTER CONVERSION FROM CCSID from-ccsid TO to-ccsid FAILED WITH ERROR CODE error-code FOR TABLE dbid.obid COLUMN column-name REQUESTED BY csect-name

**Explanation:** A conversion error occurred during the conversion of a string to a different coded character set.

- **from-ccsid** identifies the coded character set of the string to be converted.
- **to-ccsid** identifies the coded character set to which it must be converted.
- **error-code** indicates the type of error as defined as follows:
  - 8 - Length exception (for example, expansion required for PC MIXED data exceeds the maximum length of the string).
  - 20 - Translate procedure error (for example, an error during Unicode/390 stage 2 conversions or an exit set the length control field of the string to an invalid value).
  - 24 - The conversion services have not been setup correctly or the conversion is not supported.

**dbid.obid** gives the database id and the table obid of the object with the conversion error. This could be either the target or the source of the conversion.

**column-number** gives the column number of the failing object. This could be either the target or the source of the conversion.

**csect-name** describes the reason codes returned from DB2. Reason codes returned from DB2 begin with 'DSN' and identify the context in which the conversion was requested. Values other than those that start DSN' are returned from other DB2 platforms and are described in the documentation for the platform.

**System Action:** The statement cannot be processed.

**Programmer Response:** If the error-code is 24 and the conversion request is correct, refer to Appendix B of **DB2 Installation Guide** for information on how to add conversion support. For all the other error-codes, refer to Part 2 of **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

**Destination:** 57017

### -20235 THE COLUMN column-name CANNOT BE ADDED OR ALTERED BECAUSE table-name IS A MATERIALIZED QUERY TABLE

**Explanation:** The alter table statement attempted to add or alter column column-name of materialized query table table-name. This is not allowed.

**System Action:** The statement could not be processed.

**Programmer Response:** Columns of materialized query tables cannot be added, altered, or dropped. Alter the materialized query table to become a regular table before adding, altering, or dropping a column.

**Destination:** 428FY

### -20240 INVALID SPECIFICATION OF A SECURITY LABEL COLUMN column-name REASON CODE reason-code

**Explanation:** For a security label column the specification of an attribute in a CREATE TABLE, or ALTER TABLE, DECLARE GLOBAL TEMPORARY TABLE, or CREATE GLOBAL TEMPORARY TABLE statement may be invalid for one of the following reasons:

- The underlying data type of the security label column is not supported. A security label column must be defined as CHAR(8) for single-byte data.
-20248

Explanation:
-20248 ATTEMPTED TO EXPLAIN A CACHED STATEMENT WITH STMTID OR STMTTOKEN ID-token BUT THE REQUIRED EXPLAIN INFORMATION IS NOT ACCESSIBLE.

Explanation: The EXPLAIN statement cannot be executed because the required explain information is not accessible due to one of the following reasons:
1. The SQL statement with specified ID or token has never been cached because dynamic statement caching was not on when the statement was executed.
2. The statement with specified ID or token was cached before but is not in cache anymore (it was either invalidated or removed from cache by LRU algorithm).
3. The current user is not authorized to explain the statement with specified ID or token.

System Action: The statement cannot be executed.

Programmer Response: Perform the following steps:
1. Check if dynamic statement caching is on and if the statement ID or token is correct. The EXPLAIN statement cannot be executed if dynamic statement caching has never been turned on.
2. Re-execute (or re-prepare) the statement to be explained, find the updated statement ID or token, and explain it again.
3. Correct the authorization problem and re-execute the EXPLAIN statement.

Destination: 26501

-20249

Explanation: The package needs to be rebound for one of the following reasons:
- Package package-name was bound on a system with an older maintenance level that is no longer supported. The package needs to be rebound on a system with a maintenance level that is supported.
- Package package-name was bound on a newer maintenance level, but it was sent to execute on a system with an older maintenance level. In this case, the APAR token needs to be applied to the server before executing this package.

System Action: The statement cannot be executed.

Programmer Response: Take the appropriate action as explained in the explanation.

Destination: 560C5

-20252

Explanation: A statement with the NOT ATOMIC CONTINUE ON SQLEXCEPTION clause encountered more errors than could be recorded in the diagnostics area. NOT ATOMIC processing with CONTINUE ON SQLEXCEPTION allows DB2 to continue processing a statement after one or more errors is encountered. DB2 will continue processing until it is no longer able to record errors in the diagnostic area (See the GET DIAGNOSTICS statement for information on how to retrieve error information). When DB2 is no longer able to record error diagnostics, processing of the statement is terminated, and this error is returned.

System Action: The statement is terminated.

Programmer Response: Analyze the warning and error conditions using the GET DIAGNOSTICS statement. Determine how to change the statement to eliminate or reduce the number of warnings and errors. It is up to the programmer to determine if a ROLLBACK or COMMIT should be issued for this message. Either is appropriate depending on the application logic.

Destination: 429BI

-20264

Explanation: primary-auth-id attempted an MLS READWRITE operation on a row without having the proper Multilevel Security (MLS) authorization. The RID identifies this row.

The RID may be *N when a RID identifier is not available for the row.

System Action: The operation that was attempted could not be performed.
Programmer Response: If this user is authorized to perform this operation, ensure that this user has been properly defined to MLS. If the row data needs to be viewed, use DSN1PRINT.

In the case of a view or cursor, where the primary authorization ID is able to access more rows then it can update or delete, you can add the WHERE clause to limit the rows accessed, based on the security label of the primary authorization ID. The security label can be retrieved using GETVARIABLE(SYSIBM.SECLABEL).

Destination: 42512

-20265  SECURITY LABEL IS reason FOR primary-auth-id  

Explanation: User primary-auth-id has a blank security label, or the security label is not accessible. reason is BLANK or INACCESSIBLE.

System Action: The operation that was attempted could not be performed.

Programmer Response: Ensure the value that was specified for the security label of this user is a valid security label. If it is valid, then this error may be caused if the SECLABEL class in the Security Server has not been activated.

Destination: 42501

-20266  ALTER VIEW FOR view-name FAILED INFORMATION RETURNED: SQLCODE: sqlcode, SQLSTATE: sqlstate, MESSAGE TOKENS token-list  

Explanation: An ALTER VIEW statement was issued for view-name, but the view cannot be successfully regenerated.

System Action: The statement cannot be processed.

Destination: 560C7

-20281  primary-auth-id DOES NOT HAVE THE MLS WRITE-DOWN PRIVILEGE  

Explanation: This operation requires the Multilevel Security write-down privilege.

System Action: This operation cannot be performed.

Programmer Response: Ensure that the user has the MLS write-down privilege when write-down is in effect.

Destination: 42513

-20286  DB2 CONVERTED STRING token-type token FROM from-ccsid TO to-ccsid, AND RESULTED IN SUBSTITUTION CHARACTERS  

Explanation: A conversion error occurred during the conversion of a string for token-type token to a different coded character set. One or more substitution characters have been placed in the string during the conversion process.

System Action: The statement cannot be processed.

Programmer Response: Ensure that the data that is provided to DB2 can be converted from from-ccsid to to-ccsid without data loss.

Destination: 428GB

-20289  INVALID STRING LENGTH UNIT unit SPECIFIED FOR FUNCTION function-name  

Explanation: The statement invoked a built-in function using a string length unit that is not valid with the type of data that is provided to the function. This can occur for the following reasons:

- non-string data that is specified with an explicit length unit unit for the LENGTH function. A string length unit cannot be specified for non-string data.
- bit data or binary data was specified with unit. CODEUNITS16, or CODEUNITS32 are not valid with bit data or binary string data.
- graphic data was specified with OCTETS as the string length unit. OCTETS is not valid with graphic data.

System Action: The statement cannot be executed.

Programmer Response: Change the invocation of the function to remove the invalid string length unit or change it to a valid unit for the data type being processed.

Destination: 428GC

-30000  EXECUTION FAILED DUE TO A DISTRIBUTION PROTOCOL ERROR THAT WILL NOT AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS OR SQL STATEMENTS: REASON reason-code (sub-code)  

Explanation: A DRDA protocol error has resulted which prevented successful execution of the current SQL statement. The error was such that it will not preclude the successful execution of further SQL statements.

System Action: The statement cannot be executed. The SQLCA is formatted. Message DSNL031I or DSNL032I, which might contain additional diagnostic information, might be issued to the MVS console.

Programmer Response: Notify the DBA for assistance in analysis of the SQL statement which yielded this SQLCODE.

Problem Determination: The 'reason-code' identifies the DDM code point which represents the DDM reply
message received from the remote server in response to the attempt to execute the SQL statement. These represent internal errors detected at the remote server or possibly, by the local DB2 functions.

The 'reason-code' value is the two-byte hexadecimal code point for the DDM reply message that represents the error and is one of the following:

- X'1254' - CMDCHKRM
- X'220A' - DSCINVRM
- X'220E' - DTAMCHRM
- X'1245' - PRCCNVRM
- X'2202' - QRYNOPRM
- X'220F' - QRYPOPDM
- X'2207' - RDBACCRM
- X'2204' - RDBNACRM
- X'124C' - SYNTAXRM

A two-byte 'sub-code' accompanies 'reason-codes'

- X'220A' (DSCINVRM), X'1245' (PRCCNVRM), and
- X'124C' (SYNTAXRM). In all other cases, the 'sub-code' is zero.

The 'sub-code' when nonzero, consists of two bytes such that the high-order byte indicates the site at which the error was detected. This is X'01' if the error was detected by the local DB2; it is X'02' if the error was detected by the remote server. The low-order byte is dependent on the 'reason-code' as follows:

1. Description Error Code (DSCERRCD) if 'reason-code' = X'220A' (DSCINVRM).
2. Syntax Error Code (SYNNERRCD) if 'reason-code' = X'124C' (SYNTAXRM).

Refer to the IBM Distributed Data Management (DDM) Reference Guide for a detailed discussion of the semantics of the DDM terms DSCERRCD, SYNNERRCD, and PRCCNVCD.

**Destination:** 58008

---

**-30002**

**THE SQL STATEMENT CANNOT BE EXECUTED DUE TO A PRIOR CONDITION IN A CHAIN OF STATEMENTS**

**Explanation:** An SQL statement was chained to PREPARE, but the PREPARE statement has received a warning SQLCODE that requires the program or end user to either re-issue the chained statement or issue a different SQL request. This error can occur only in a client/server environment.

- A distributed client using DRDA has chained an OPEN statement to a PREPARE, but the PREPARE statement received SQLCODE +495.

**System Action:** The statement cannot be executed as chained.

**Programmer Response:** The statement must be sent again as a separate request.

**Destination:** 57057

---

**-30005**

**EXECUTION FAILED BECAUSE FUNCTION NOT SUPPORTED BY THE SERVER**

**FUNCTION NOT SUPPORTED BY THE SERVER: LOCATION location PRODUCT ID pppvvrr REASON reason-code (sub-code)**

**Explanation:** The current SQL statement failed because the SQL statement was routed to a server that does not support the requested function. The error was such that it will not preclude the successful processing of further SQL statements.

**System Action:** The statement cannot be executed. The SQLCA is formatted.

**Programmer Response:** Notify the DBA for assistance in analyzing the SQL statement that prompted this SQL code.

**Problem Determination:** location identifies the name of the server that could not support the required database protocols to perform the requested function. The product identifier is in the form pppvvrrm. It is an eight-byte field with alphanumeric characters, and identifies the product that could not support the function. ppp identifies the specific database product. vv identifies the product version. rr identifies the product release level. m identifies the product modification level.

**Possible values for pppvvrrm:**

- ppp DSN for z/OS, ARI for VM/VSE, SQL for Unix/Windows/NT, QSQ for iSeries, and JCC for Java
- vv Version number
- rr Release level
- m Modification level

To correct the problem, first identify the function that is not supported. To determine what function was not supported, and why, refer to the reason-code that was specified. Here are the possible values for reason-code, and the functions that they correspond to:

- 0010 LONG_STMTS
- 0010 LONG255_IDS
- 0030 EXTENDED_DESCRIBE
- 0040 EXTENDED_DIAGNOSTICS
- 0050 KEEP_DYNAMIC
- 0060 MULTI_ROW_FETCH
- 0070 MULTI_ROW_INSERT
- 0080 SQL_CANCEL
- 0090 SCROLLABLE_CURSORS
Lastly, you may use the sub-code value to further identify the problem. When non-zero, the sub-code consists of a one-byte code to indicate how the error was detected in the network:

- If '01'x, then the local DB2 that is acting as the requester detected the error. The LOCATION and PRDID identify the server in error.
- If '02'x, then the server detected the error. The LOCATION and PRDID identify the location and level of the local DB2 server.
- If '03'x, then an intermediate server (hop site) detected the error. The error, the LOCATION, and PRDID identify the server in error.
- If '04'x, then an intermediate server (hop site) detected the error. The error, the LOCATION, and PRDID identify the server in error.

**Destination:** 56072

---

### -30020 EXECUTION FAILED DUE TO A DISTRIBUTION PROTOCOL ERROR THAT CAUSED DEALLOCATION OF THE CONVERSATION: REASON <reason-code (sub-code)>

**Explanation:** A DRDA protocol error has occurred that prevented the successful execution of the current SQL statement or command, as well as any subsequent SQL statements.

The 'reason-code' identifies the DDM code point which represents the DDM reply message received from the remote server in response to the attempt to execute the SQL statement. These represent internal errors detected at the remote server site or possibly, by the local DB2 functions.

The 'reason-code' value is the two-byte hexadecimal code point for the DDM reply message that represents the error and is one of the following:

- `X'1232'` - AGNPRMRM
- `X'1254'` - CMDCHKRM
- `X'220A'` - DSCINVRM
- `X'220E'` - DTAMCHR RM
- `X'0010'` - FDODSC
- `X'1218'` - MGRDPEPRM
- `X'1245'` - PRCCVNVRM
- `X'241A'` - QRYDSC
- `X'2202'` - QRYNOPRM
- `X'220F'` - QRYPOPRM
- `X'2207'` - RDBACCRM
- `X'2204'` - RDBNACRM
- `X'124C'` - SYNTAXRM

A two-byte sub-code accompanies 'reason codes'. The sub-code, when nonzero, consists of two bytes such that the high-order byte indicates the site at which the error was detected. This is X'01' if the error was detected by the local DB2; It is X'02' if the error was detected by the remote server. The low-order byte is dependent upon the 'reason code' as follows:

- **Description Error Code (DSCERRCD)** if reason code = X'220A' (DSCINVRM).
- **Syntax Error Code (SYNERRCRD)** if reason code = X'124C' (SYNTAXRM).
- **Conversational Protocol Error Code (PRCCVNCD)** if reason code = X'1245' (PRCCNVRM).
- **Manager Dependency Error Code (DEPERRCD)** if reason code = X'1218' (MGRDPEPRM).

Refer to **IBM Distributed Data Management (DDM)** Reference Guide for a detailed discussion of the semantics of the DDM terms DSCERRCD, SYNERRCRD, PRCCNVCD, and DEPERRCD.

**System Action:** The SQLCA is formatted and the conversation on which the error was detected is deallocated. Message DSNL031I or DSNL032I, which might contain additional diagnostic information, might be issued to the MVS console.

**Programmer Response:** The connection to the server has been broken, and the server has, therefore, rolled back the unit of work. In this case, the only SQL statement that may be successfully executed is ROLLBACK. However, if the requester detects this error on a COMMIT, then it is unknown whether the unit of work was committed or rolled back at the server.

**Destination:** 58009

---

### -30021 EXECUTION FAILED DUE TO A DISTRIBUTION PROTOCOL ERROR THAT WILL AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS OR SQL STATEMENTS: MANAGER manager AT LEVEL level NOT SUPPORTED ERROR

**Explanation:** A DRDA error occurred that prevented the successful execution of the current SQL statement or command and any subsequent SQL statements.

A manager-level conflict was detected during the processing of the DDM EXCSAT command. Refer to the **IBM Distributed Data Management (DDM)** Reference Guide for a detailed description of EXCSAT processing and errors.

The **manager** value is the 2-byte hexadecimal code point of the DDM manager class identified as not supported in the EXCSATRD that reported the error. Refer to the DDM term MGRRLVL in the **IBM Distributed Data Management (DDM)** Reference Guide for the 2-byte hexadecimal values.

The **level** value is the 2-byte hexadecimal value of the
manager level identified as not supported in the EXCSATRD that reported the error. Refer to the DDM term MGRVLVL in the IBM Distributed Data Management (DDM) Reference Guide for the 2-byte hexadecimal values.

**System Action:** The statement cannot be executed.

**Programmer Response:** Notify the system programmer for analysis of the condition that caused this SQLCODE.

**Destination:** 58010

-30025  EXECUTION FAILED BECAUSE
FUNCTION IS NOT SUPPORTED BY
THE SERVER WHICH CAUSED
TERMINATION OF THE CONNECTION:
LOCATION location PRODUCT ID
pppvvrre REASON reason-code (sub-code)

**Explanation:** The current SQL statement failed because the SQL statement was routed to a server that does not support the requested function. A new connection is required to allow the successful execution of further SQL statements.

**System Action:** The statement cannot be executed. The correct unit of work is rolled back. The SQLCA is formatted.

**Programmer Response:** Notify the DBA for assistance in analyzing the SQL statement that prompted this SQL code.

**Problem Determination:** location identifies the name of the server that could not support the requested database protocols to perform the requested function. The product identifier is in the form pppvvrrm. It is an eight-byte field with alphanumeric characters, and identifies the product that could not support the function. ppp identifies the specific database product. vv identifies the product version. rr identifies the product release level. m identifies the product modification level.

Possible values for pppvvrrm:

- **ppp** DSN for z/OS, ARI for VM/VSE, SQL for Unix/Windows/NT, QSQ for iSeries, and JCC for Java
- **vv** Version number
- **rr** Release level
- **m** Modification level

To correct the problem, first identify the function that is not supported. To determine what function was not supported, and why, refer to the reason-code that was specified. Here are the possible values for reason-code, and the functions that they correspond to:

| 0010 | LONG_STMTS |
| 0010 | LONG255_IDS |
| 0030 | EXTENDED_DESCRIBE |
| 0040 | EXTENDED_DIAGNOSTICS |
| 0050 | KEEP_DYNAMIC |
| 0060 | MULTI_ROW_FETCH |
| 0070 | MULTI_ROW_INSERT |
| 0080 | SQL_CANCEL |
| 0090 | SCROLLABLE_CURSORS |
| 0100 | CURSOR_ATTRIBUTES |
| 0110 | MONITORING |
| 0120 | SELECT_WITH_INSERT |
| 0130 | DATA_ENCRYPTION |
| 0140 | PACKAGE_PATH |

Lastly, you may use the sub-code value to further identify the problem. When non-zero, the sub-code consists of a one-byte code to indicate how the error was detected in the network:

- If '01'a, then the local DB2 that is acting as the requester detected the error. The LOCATION and PRIDID identify the server in error.
- If '02'a, then the server detected the error. The LOCATION and PRIDID identify the location and level of the local DB2 server.
- If '03'a, then an intermediate server (hop site) detected the error. The error, the LOCATION, and PRIDID identify the server in error.
- If '04'a, then an intermediate server (hop site) detected the error. The error, the LOCATION, and PRIDID identify the server in error.

**Destination:** 56073

-30030  COMMIT REQUEST WAS
UNSUCCESSFUL, A DISTRIBUTION
PROTOCOL VIOLATION HAS BEEN
DETECTED, THE CONVERSATION HAS
BEEN DEALLOCATED. ORIGINAL
SQLCODE=original-sqlcode AND
ORIGINAL SQLSTATE=original-sqlstate

**Explanation:** The application requested COMMIT operation was unsuccessful and the response from the remote server and the SQLCODE that was returned from the remote server are inconsistent. For example, the reply message from the remote server indicates that a COMMIT operation did not complete successfully but the SQLCODE returned from the remote server was greater than or equal to zero. The unit of work has been rolled back and the connection with the remote server has been deallocated.

**System Action:** An alert was generated. A DSNL031I message may have been written to the console. Refer to the description of this message for further information.
The SQLCODE returned by the remote server is replaced with -30030 and the SQLSTATE returned by the AS is replaced with '158013' and the connection with the remote server has been deallocated.

The SQLCODE and SQLSTATE values that were returned from the remote server are stored in the SQLERRRM field in a string of the following format: 'original-sqlcode 'FF'X original-sqlstate'

Programmer Response: Notify the system programmer for assistance in analyzing the trace data that was generated.

Destination: 58013

-30040 EXECUTION FAILED DUE TO UNAVAILABLE RESOURCES THAT WILL NOT AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS OR SQL STATEMENTS. REASON <reason-code> TYPE OF RESOURCE <resource-type> RESOURCE NAME <resource-name> PRODUCT ID <pppvvrrm> RDBNAME <rdname>

Explanation: The SQL statement or command requires a non-RDB resource that is currently unavailable. The <reason-code> identifies why the resource identified by the <resource-type> and <resource-name> is unavailable. The product, product level, and RDB are identified.

Values for <reason-code>
This is product specific and can be found in the remote server documentation.

Values for <resource-type>
Two byte hexadecimal number defined as follows:
This is product specific and can be found in the remote server documentation.

Values for <resource-name>
Variable length field with alphanumeric characters and a maximum length of 35 bytes.

Values for <pppvvrrm>
Eight-byte field with alphanumeric characters defined as follows:
ppp....... DSN for OS/390, ARI for SQL/DS SQL and QSQ for AS/400 (3 bytes)
vv........ version number (2 bytes)
r........ release number (2 bytes)
m........ modification level (1 byte)

Values for <rdname>
Sixteen-byte field with the RDBNAME.

System Action: The statement cannot be processed. The local DB2 is disconnected from the remote server.

Programmer Response: Verify the identify of the resource that was not available. The reason the resource is unavailable is identified by the <reason-code>.

Collect the following diagnostic items to help determine the cause of the unavailable resource.
- Console output from the system identified by RDBNAME, and a listing of SYSLOG data set for the period of time spanning the failure.
- Information described for the reason code received.

Destination: 57012

-30041 EXECUTION FAILED DUE TO UNAVAILABLE RESOURCES THAT WILL AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS AND SQL STATEMENTS. REASON <reason-code> TYPE OF RESOURCE <resource-type> RESOURCE NAME <resource-name> PRODUCT ID <pppvvrrm> RDBNAME <rdname>

Explanation: The SQL statement or command requires a non-RDB resource that is currently unavailable. The <reason-code> identifies why the resource identified by the <resource-type> and <resource-name> is unavailable. The product, product level, and RDB are identified.

Values for <reason-code>
Four byte binary number that is product specific. This can be found in the remote server documentation.

Values for <resource-type>
Two byte hexadecimal number that is product specific. This can be found in the remote server documentation.

Values for <resource-name>
Variable length field with alphanumeric characters and a maximum length of 35 bytes.

Values for <pppvvrrm>
Eight byte field with alphanumeric characters defined as follows:
ppp....... DSN for DB2, ARI for SQL/DS, SQL for OS/2 and QSQ for AS/400 (3 bytes)
vv........ version number (2 bytes)
r........ release level (2 bytes)
m........ modification level (1 byte)

Values for <rdname>
Sixteen byte field with the RDBNAME.

System Action: The statement cannot be executed. The local DB2 is disconnected from the remote server.
**Programmer Response:** Verify the identity of the resource that was not available. The reason the resource is unavailable is identified by the reason-code. Collect the following diagnostic items to help determine the cause of the unavailable resource.

- Console output from the system identified by RDBNAME, and a listing of SYSLOG data set for the period of time spanning the failure.
- Information described for the <reason-code> received.

**Destination:** 57013

---

**-30050**

**COMMAND OR SQL STATEMENT INVALID WHILE BIND PROCESS IN PROGRESS**

**Explanation:** A remote command or remote SQL execution was attempted while a remote bind was in progress. The only commands allowed during bind are, BIND STATEMENT, END BIND, ROLLBACK, or COMMIT.

**System Action:** The request is rejected. The local DB2 is disconnected from remote server.

**Programmer Response:** Ensure the remote bind has completed before attempting to execute an SQL statement or process a remote command. COMMIT and ROLLBACK will terminate the bind processing.

**Destination:** 58011

---

**-30051**

**BIND PROCESS WITH SPECIFIED PACKAGE NAME AND CONSISTENCY TOKEN NOT ACTIVE**

**Explanation:** Binding of a statement or end bind was attempted while the package was not undergoing bind processing.

**System Action:** The bind statement request or end bind request is rejected. The local DB2 is disconnected from the remote server.

**Programmer Response:** Ensure that the server processing the bind request was not abending when this request was being processed, or that the package name hasn’t changed before terminating the remote bind package request.

**Destination:** 58012

---

**-30052**

**PROGRAM PREPARATION ASSUMPTIONS ARE INCORRECT**

**Explanation:** The program preparation assumptions in effect for binding a statement (i.e. BINDSQLSTT command) are incorrect.

**System Action:** The statement is rejected.

**Programmer Response:** The creation of the package following this error is dependent on the package creation options specified at begin bind time.

**Destination:** 42932

---

**-30053**

**OWNER AUTHORIZATION FAILURE**

**Explanation:** An authorization error associated with the package owner is detected. The AS, for example, has determined that the binder has specified a package owner that the binder has no authorization to specify.

**System Action:** The begin bind request is rejected.

**Programmer Response:** Correct the authorization problem and reissue the request.

**Destination:** 42506

---

**-30060**

**RDB AUTHORIZATION FAILURE**

**Explanation:** The user is not authorized to access an RDB.

**System Action:** The request is rejected.

**Programmer Response:** Correct the authorization problem and resubmit the job.

**Destination:** 08004

---

**-30061**

**RDB NOT FOUND**

**Explanation:** An attempt was made to access an RDB which cannot be found. This usually means that a requester specified the server location name incorrectly. The server responded by indicating that the requester’s specification of the server location name is incorrect. Requester or server changes are needed to make the location names consistent. Location names for DB2 systems are defined in the BSDS DDF record and are also in the DSNL004I console message when DDF is started. For more information about defining location names, see Part 3 of [DB2 Installation Guide](https://www.ibm.com).

**System Action:** The request is not processed.

**Programmer Response:** Ensure the RDB name was correctly specified and resubmit the job.

**Destination:** 08004

---

**-30070**

**command COMMAND NOT SUPPORTED ERROR**

**Explanation:** The target does not support a particular command. The error causes termination of the connection between the local DB2 and the remote server.

**Values for command**

- Two byte hexadecimal DDM code point.

**System Action:** The command is rejected. The local DB2 is disconnected from the remote server.
**Programmer Response:** Ensure the proper command was issued.

**Destination:** 58014

---

**-30071**  
**object-type** OBJECT NOT SUPPORTED  
**ERROR**

**Explanation:** The target does not support a particular object. The error causes the termination of the connection between the local DB2 and the remote server.

Values for object-type

Two byte hexadecimal DDM code point.

**System Action:** The command/SQL statement is rejected. The local DB2 is disconnected from the remote server.

**Programmer Response:** Ensure the object has been correctly specified and resubmit the job or reissue the command.

**Destination:** 58015

---

**-30072**  
**parameter subcode** PARAMETER NOT SUPPORTED  
**ERROR**

**Explanation:** A particular parameter is not supported by either the application requester or the remote server.

Values for parameter

Two byte hexadecimal DDM code point.

Values for subcode

Two byte hexadecimal number defined as follows: This subcode is composed of two distinct parts, but may optionally be zero. The high-order byte (when not zero) indicates the site at which the error was detected. This is X'01' if the error was detected by the local DB2; it is X'02' if the error was detected by the remote server. The low order byte is always zero.

Common parameters that are not supported include:

**X'2450'**  
Usually this means that the server does not support the attribute clause on prepare.

**System Action:** The command/SQL statement is rejected. A disconnect has occurred.

**Programmer Response:** The connection to the server has been broken, and the server has therefore rolled back the unit of work. In this case, the only SQL statement that may be successfully executed is ROLLBACK. However, if the requester detects this error on a COMMIT, then it is unknown whether the unit of work was committed or rolled back at the server.

**Destination:** 58016

---

**-30073**  
**parameter subcode** PARAMETER VALUE NOT SUPPORTED  
**ERROR**

**Explanation:** The specified parameter value is not supported by either the local DB2 or the remote server.

The parameter, is a 2-byte hexadecimal DDM code point. See IBM Distributed Data Management (DDM) Reference Guide for a definition of the valid code points. Common values for parameter include:

**X'0035'** Usually means that a DB2 server does not support the single-byte coded character set identifier (CCSID) sent by the requester, or a DB2 requester does not support the single-byte CCSID received from a server. See X'119C' for more information.

**X'1144'** DRDA servers return this code point when a DB2 client specifies a version for a package and the DRDA server does not support versions.

**X'119C'** If the subcode information contains X'01', the requester does not support the single-byte CCSID that the server wants to use. If the subcode information contains X'02', the server does not support the single-byte CCSID that the requester wants to use.

Determine the single-byte CCSIDs for the requester and server systems. The single-byte CCSID for DB2 subsystems is defined in DSNHDEC.P. One or both partners might be using an incorrect CCSID. or support might need to be added. See [DB2 Installation Guide](#) for more information on CCSIDs.

**X'147A'**  
DB2 servers can return this code point when a numeric input host variable is not within the range that DB2 supports. See the explanation of SQLCODE -406 for more information.

**X'14AC'**  
DB2 servers return this code point when a DRDA client requests an authentication mechanism that is not supported by the DB2 server. See the explanation of DB2 reason code 00D3010E for more information.

**X'2110'** Usually means that a requester specified the server location name incorrectly. The server responded by indicating that the requester’s specification of the server location name is incorrect, and the length of the location name is longer than that supported by the server. Requester or server changes are needed so the location names are consistent. Location names for DB2 systems are defined in the BSDS DDF record and can also be seen in the DSNL004I console message when DDF is
started. See Part 3 of DB2 Installation Guide for more information about defining location names.

X'2120' Usually means that the server does not support the use of double quote string delimiters in SQL statements. DB2 COBOL applications can use double quote string delimiters in SQL statements. This requires that the program be precompiled with the SQLDELM(QOUTESQL) option. If the server product does not support double quote SQL statement string delimiters, then the program must be modified to use single quote SQL string delimiters and be precompiled with the SQLDELM(APOSTSQL) option.

X'2121' Usually means that there is a semantic error with the string that specifies the character used as a decimal delimiter in SQL statements.

X'213F' Means that the server was processing a bind or rebind command that specified an unsupported value for the DYNAMICRULES bind parameter. If the server is a DB2 Version 3 system, specify DYNAMICRULES(RUN) or omit the DYNAMICRULES parameter.

The 'subcode', which is a 2-byte hexadecimal number, consists of two distinct parts and can optionally be zero. The high-order byte (when not zero) indicates the site at which the error was detected. If the error was detected by the local DB2, it is X'01'. If the error was detected by the remote server, it is X'02'. The low-order byte is always zero.

System Action: The command or SQL statement is rejected. A disconnect occurred.

Programmer Response: The connection to the server was broken, and the server rolled back the unit of work. The only SQL statement that can be successfully executed is ROLLBACK. However, if the requester detects this error on a COMMIT, then it is unknown whether the unit of work was committed or rolled back at the server.

Destination: 58017

-30074  REPLY MESSAGE WITH codepoint                     (svrcod) NOT SUPPORTED ERROR

Explanation: A reply message codepoint is not recognized or the reply message SVRCOD is not recognized. The error does not affect the processing of subsequent DRDA commands and SQL statements issued by the application program.

Values for codepoint
- The codepoint is a two-byte hexadecimal value that represents a DDM reply message. IBM Distributed Data Management (DDM) Reference Guide defines the valid codepoints for reply messages.

Values for SVRCOD
- The SVRCOD is a one-byte hexadecimal value which represents the reply messages severity code. IBM Distributed Data Management (DDM) Reference Guide defines the valid SVRCOD for reply messages.

System Action: Processing continues.

Programmer Response: The cause of this error may be a mismatch in source and target manager levels or might be an internal error.

Destination: 58018

-30080  COMMUNICATION ERROR code (subcode)

Explanation: A SNA communications error was detected. VTAM for MVS/ESA Programming for LU 6.2 contains the valid code and subcode values that can appear in this message.

- code is VTAM's primary LU6.2 return code (RCPRI).
- subcode takes one of the following forms:
  - rcsec-sense
  - rcsec

The rcsec portion of subcode is VTAM's secondary LU6.2 return code (RCSEC).

The sense portion of subcode is VTAM's sense code. See Part 6, "SNA codes," on page 1337 for descriptions of sense codes that are often associated with SNA network definition errors.

System Action: The statement is not executed. The application was disconnected from the server because of a communication failure. A DSNL500I message containing additional diagnostic information might be issued to the MVS console.

Programmer Response: Review the diagnostic information described in VTAM for MVS/ESA Programming for LU 6.2 for the particular LU6.2 return codes. Consult with a communications expert to determine the cause of the communication failure.

Destination: 08001

-30081  prot COMMUNICATION ERROR DETECTED. API=api, LOCATION=loc, FUNCTION=func, ERROR CODES=rc1 rc2 rc3

Explanation: A communications error was detected while communicating with a remote client or server.

prot Identifies the communication protocol that encountered the error. Currently, "TCP/IP" is the only possible value.

api Identifies the communication application programming interface (API) used by DB2. Currently, 'SOCKETS' is the only possible value.
**loc** The network location of the partner system. For TCP/IP partners, this field contains the dotted decimal IP address of the partner.

**func** The communication function that failed. For TCP/IP partners, this field identifies name of the socket call that failed.

**rc1** The first return code indicator. For TCP/IP partners, this field contains the TCP/IP return code in decimal format. The return code values are documented in z/OS UNIX System Services Programming: Assembler Callable Services Reference.

**rc2** The second return code indicator. For TCP/IP partners, this field contains the TCP/IP reason code in decimal format. The reason code values are documented in z/OS UNIX System Services Programming: Assembler Callable Services Reference.

**rc3** The third return code indicator. For TCP/IP partners, this field contains zero.

**System Action:** The statement is not executed. The application is disconnected from the server.

**Programmer Response:** Consult with a communications expert to determine the cause of the communication failure.

**Destination:** 08001

**Explanation:** The attempt to connect to a remote database server was rejected due to invalid or incorrect security information. The cause of the security error is described by the reason-code and reason-string values.

The possible values for reason-code and reason-string appear below:

- **1** (PASSWORD EXPIRED) -- the password used to connect to the remote server has expired.
- **2** (PASSWORD INVALID) -- the password used to connect to the remote server does not match the password stored at the remote server.
- **3** (PASSWORD MISSING) -- the remote server rejected the connection request because the request did not include a password.
- **4** (PROTOCOL VIOLATION) -- the remote server rejected the connection request because the request did not contain the proper security information. Error messages or trace records should be produced by the server system to explain the nature of the security violation.
- **5** (USER-ID MISSING) -- the remote server rejected the connection request because the request did not specify a user-id.
- **6** (USER-ID INVALID) -- the user-id specified in the connection request is not defined at the remote server system.
- **7** (USER-ID REVOKED) -- the user-id specified in the connection request has been revoked.
- **15** (SECURITY FAILURE: secchkd:svcerno) -- Authentication failed at the remote server system. Refer to the IBM Distributed Data Management (DDM) Reference Guide for a detailed discussion of the semantics of the DDM terms SECCHKCD and SVCERRNO.
- **16** (NEW PASSWORD INVALID) -- the password specified on a change password request did not meet the server’s requirements.
- **17** (UN SUPPORTED FUNCTION) -- the security mechanism specified by the client is invalid for this server. Some typical examples:
  - The client is configured to send an Already Verified userid but the server does not support Already Verified userids. Client or server changes must be made to correct the inconsistency.
    - DB2 for z/OS server acceptance of Already Verified userids over TCP/IP connections is controlled by the TCPALVER value of the DSNTIP5 installation panel (DSN6FAC TCPALVER).
    - DB2 for z/OS client usage of Already Verified userids is controlled by the SECURITY_OUT column of the SYSIBM.LUNAMES or SYSIBM.IP NAMES table.
  - The client is configured to use one of the following security mechanisms but the server does not support the mechanism:
    - Encrypted userid and encrypted security-sensitive data.
    - Encrypted userid, encrypted password, and encrypted security-sensitive data.
  - Client changes must be made to correct the inconsistency.
    - DB2 for z/OS server acceptance of Already Verified userids over TCP/IP connections is controlled by the TCPALVER value of the DSNTIP5 installation panel (DSN6FAC TCPALVER).
    - DB2 for z/OS client usage of Already Verified userids is controlled by the SECURITY_OUT column of the SYSIBM.LUNAMES or SYSIBM.IP NAMES table.
  - The client is configured to use one of the following security mechanisms but the server does not support the mechanism:
    - Encrypted userid and encrypted security-sensitive data.
    - Encrypted userid, encrypted password, and encrypted security-sensitive data.
Client changes must be made to correct the inconsistency.
- DB2 for z/OS client usage of encryption security mechanism is controlled by the SECURITY_OUT column of the SYSIBM.IPAMES table.
- The client sent a new password value to a server that does not support the DRDA change password function.
- The client sent DCE authentication information to a server that does not support DCE.
- The client is configured to send an Already Verified userid but the server does not support Already Verified userids. Client or server changes must be made to correct the inconsistency.
  - DB2 for z/OS server acceptance of Already Verified userids over TCP/IP connections is controlled by the TCPALVER value of the DSNITIPS installation panel (DSN6FAC TCPALVER).
  - DB2 for z/OS client usage of Already Verified userids is controlled by the SECURITY_OUT column of the SYSIBM.LUNAMES or SYSIBM.IPAMES tables.

**System Action:** The attempt to connect to the remote database server fails. If the server system is a DB2 UDB for z/OS server, a DSNL030I message at the server system describes the cause.

**Programmer Response:** DB2 uses the communications database (CDB) to control network security functions. Make the appropriate changes to the CDB to correct the security failure.

**Destination:** 08001

---

**-30090 REMOTE OPERATION INVALID FOR APPLICATION EXECUTION ENVIRONMENT**

**Explanation:** An update operation or a dynamic commit or rollback was attempted at a server that was supporting an application that was in a read-only execution environment (IMS or CICS).

**System Action:** The request is rejected.

**Programmer Response:** Do not attempt to update data or issue dynamic commits or rollbacks from IMS or CICS applications that are accessing remote data.

**Destination:** 25000

---

**-30104 ERROR IN BIND OPTION option AND BIND VALUE value.**

**Explanation:** While processing the bind parameters that were passed from the requester site, either the bind option or the bind value is not acceptable to the server database, or the option/value pair is not appropriate.

**Programmer Response:** The BIND or REBIND command failed. Examine the command options and values, determine the error, and resubmit the command.

**Destination:** 56095

---

**-30105 BIND OPTION option1 IS NOT ALLOWED WITH BIND OPTION option2**

**Explanation:** While processing the bind parameters that were passed from the requester site, it was found that there is a conflict in bind options that are mutually exclusive.

**Programmer Response:** The BIND or REBIND command failed. Examine the command options, determine the cause of the conflict, and resubmit the command.

**Destination:** 56096

---

**-30106 INVALID INPUT DATA DETECTED FOR A MULTIPLE ROW INSERT OPERATION. INSERT PROCESSING IS TERMINATED**

**Explanation:** An error was detected with the input data for one row of a multiple row INSERT operation. No further rows will be inserted. For an atomic operation, all inserted rows are rolled back. For a non-atomic operation, rows inserted successfully before the row containing the invalid input data was encountered are not rolled back.

**System Action:** The statement cannot be processed.

**Programmer Response:** Correct the row containing the invalid input data and submit the multiple-row INSERT statement again for the rows that did not get inserted.

**Destination:** 22527

Chapter 3. DB2 Messages

Refer to Part 1, “Introduction,” on page 1 for a description of message types and message numbering conventions.

Unless the message is issued by a subcomponent operating outside the DB2 environment, messages are preceded by a command prefix that is defined during system installation. The command prefix is not shown in the message texts in this book.

In the TSO attachment facility, the user can control whether message IDs are displayed. To see them, type ‘PROFILE MSGID’. To suppress them, type ‘PROFILE NOMSGID’.
Chapter 4. DSNA... Messages

There are two types of messages in this chapter:
1. Messages that are written to a trace file. These are seen only if the trace is turned on (that is, ddname DSNTRACE was allocated to SYSOUT or the TSO terminal).
2. Messages that are returned by a DB2 stored procedure. These are seen only as a parameter that is returned by the stored procedure.

DSNA... messages share a basic structure. Here are the message elements, listed in order:
1. Message number (DSNAnnn).
2. The name of the CSECT responsible for writing the message.
3. TCB address of the task currently executing.
4. A series of tokens and token-explanations unique to each message.

Note: The intent of these messages is to aid IBM development and the IBM Support Center. They contain information that might not be meaningful except to IBM.

<table>

<table>
<thead>
<tr>
<th>Message Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSNA201E</td>
<td>DSNACA00 TCB=address CANNOT USE 'CONNECT', ALREADY CONNECTED TO DB2</td>
</tr>
<tr>
<td>Explanation:</td>
<td>A CONNECT request was received but a connection to DB2 already existed for the TCB identified by 'address' in the message. This is a CAF error (application program error). The message is accompanied by return code (R15) 200 and code (R0) 00C10201.</td>
</tr>
<tr>
<td>System Action:</td>
<td>No new connection is made to DB2 and an error return and reason code are issued. The DB2 call attachment facility is ready for more input.</td>
</tr>
</tbody>
</table>

| System Programmer Response: | Refer the problem to the programmer using the DB2 call attachment facility. |

<table>
<thead>
<tr>
<th>Message Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSNA202E</td>
<td>DSNACA00 TCB=address CANNOT USE 'OPEN', PRIOR OPEN OR SQL already connected application to DB2</td>
</tr>
<tr>
<td>Explanation:</td>
<td>An OPEN request was received but a DB2 thread had already been created for the specified TCB. This is a user error. The message is accompanied by return code (R15) 200 and code (R0) 00C10202.</td>
</tr>
<tr>
<td>System Action:</td>
<td>No new DB2 thread is created and an error return and reason code are issued. The DB2 call attachment facility is ready for more input.</td>
</tr>
</tbody>
</table>

| System Programmer Response: | Refer the problem to the programmer using the DB2 call attachment facility. |
| Programmer Response: | Your application program had already (explicitly or implicitly) established an OPEN level connection to DB2. You cannot do this again until the original OPEN is terminated. 'Explicit' OPENs occur when an application issues the call attachment facility OPEN request. 'Implicit' OPENs occur when an application issues SQL statements before a DB2 connection was established. Correct the logic in your application program. |
Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA203E DSNACA00 TCB=address CANNOT USE 'CLOSE', THERE WAS NO 'OPEN' IN EFFECT

Explanation: A CLOSE request was received but no OPEN level connection (implicit or explicit) existed for this task. This is a user error. The message is accompanied by return code (R15) 200 and code (R0) 00C10203.

System Action: No CLOSE is performed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application. Do not issue CLOSE unless an explicit OPEN has been performed. 'Explicit' OPENs occur when an application issues the call attachment facility OPEN request.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA204E DSNACA00 TCB=address CANNOT USE 'DISCONNECT', THERE WAS NO 'CONNECT' IN EFFECT

Explanation: A DISCONNECT request was received but no DB2 connection had been established. This is a user error. The message is accompanied by return code (R15) 200 and code (R0) 00C10204.

System Action: No DISCONNECT has been performed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application. Do not issue DISCONNECT unless a CONNECT has been performed.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA205E DSNACA00 TCB=address CANNOT USE 'TRANSLATE', THERE WAS NO CONNECTION TO DB2 OR NOTHING TO TRANSLATE

Explanation: A TRANSLATE request was received but no data was available for translation. You must have valid DB2 call attachment facility control structures before you can make a TRANSLATE request. Control structures are built when you issue explicit or implicit connection requests. This is a user error. The message is accompanied by return code (R15) 200 and code (R0) 00C10205.

System Action: No TRANSLATE is performed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application. Do not issue TRANSLATE unless a DB2 connection has been attempted.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA206E DSNACA00 TCB=address WRONG NUMBER OF PARMS OR VL BIT OFF

Explanation: An erroneous DB2 call attachment facility request was received. The request had too many or too few parameters and could not be processed. The message is accompanied by return code (R15) 200 and code (R0) 00C10206.

System Action: The previous request was not processed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application. Be sure that any parameter list passed to the DB2 call attachment facility has the correct number of parameters for the individual call, and that the high order (VL) bit is turned on to end the parameter list.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA207E DSNACA00 TCB=address DID NOT RECOGNIZE ACTION PARAMETER - parm

Explanation: An unrecognized action request type or parameter was received by the DB2 call attachment facility and could not be processed. The allowable action request types are CONNECT, OPEN, CLOSE, DISCONNECT, and TRANSLATE. For allowable parameters, refer to the CAF section in DB2 Application Programming and SQL Guide. This message is accompanied by return code (R15) 200 and code (R0) 00C10207.

System Action: Control returns to the caller. Your request was not processed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application.
application. Check the spelling of the action parameter type or keyword on the previous request passed to the DB2 call attachment facility. The action parameter type you passed is listed in the parm field of the DSNAB00I trace message. If the error is not the action parameter, the parameter in error is listed in the parm field of this message.

Problem Determination: See a DSNTTRACE trace stream to understand the context of this message.

<table>
<thead>
<tr>
<th>DSN208E</th>
<th>DSNACA00 TCB=address CANNOT HAVE 2 SSIDS (ssid1 AND ssid2) FROM 1 TCB</th>
</tr>
</thead>
</table>

Explanation: An OPEN request was received specifying a different subsystem identifier (ssid2) than the previous CONNECT request (ssid1). Your task can only be connected to a single DB2 subsystem. The message is accompanied by return code (R15) 200 and code (R0) 00C10208.

System Action: Control returns to the caller. Your request was not processed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Specify the correct DB2 subsystem identifier on both the OPEN and CONNECT requests.

Problem Determination: See a DSNTTRACE trace stream to understand the context of this message.

<table>
<thead>
<tr>
<th>DSN209E</th>
<th>DSNACA00 A STORED PROCEDURE ISSUED AN EXPLICIT CALL TO DSNALI</th>
</tr>
</thead>
</table>

Explanation: A stored procedure issued an explicit call to DSNALI. This is not allowed. Return code 200 in register 15 and code 00C10209 in register 0 accompany this message.

System Action: Control returns to the caller. The request was not processed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Remove explicit calls to DSNALI from the application program.

Problem Determination: See a DSNTTRACE trace job stream to understand the context of this message.

<table>
<thead>
<tr>
<th>DSN301I</th>
<th>THE VALUE parm-value FOR PARAMETER parm-name IS NOT VALID</th>
</tr>
</thead>
</table>

Explanation: The stored procedure DSNACICS could not run because one of the input parameters contains an incorrect value.

Severity: 12

System Action: The stored procedure DSNACICS terminates without calling the CICS transaction.

Programmer Response: Correct the input parameter value specified on the SQL CALL statement.

System Programmer Response: Ensure that the user exit DSNACICX sets the parameter to a valid value.

<table>
<thead>
<tr>
<th>DSN302I</th>
<th>THE REQUIRED INPUT PARAMETER parm-name CONTAINS NULLS</th>
</tr>
</thead>
</table>

Explanation: The stored procedure DSNACICS could not run because one or more of the required input parameters contains a null value.

Severity: 12

System Action: The stored procedure DSNACICS terminates without calling the CICS transaction.

Programmer Response: Correct the input parameter value in the SQL CALL statement, or ensure that the user exit DSNACICX sets the parameter to a non-null value.

System Programmer Response: Ensure that the user exit DSNACICX sets the parameter to a non-null value.

<table>
<thead>
<tr>
<th>DSN303I</th>
<th>THE PARAMETER NETNAME WAS NOT SPECIFIED WHEN THE CONNECT TYPE OF SPECIFIC WAS SPECIFIED</th>
</tr>
</thead>
</table>

Explanation: The input parameter NETNAME must contain a non-null value when the CONNECT TYPE parameter is set to SPECIFIC.

Severity: 12

System Action: The stored procedure DSNACICS terminates without calling the CICS transaction.

Programmer Response: Correct the input parameter value in the SQL CALL statement, or ensure the the user exit DSNACICX sets the parameter to a non-null value.

System Programmer Response: Ensure that the user exit DSNACICX sets the parameter to a non-null value.

<table>
<thead>
<tr>
<th>DSN304I</th>
<th>THE USER EXIT DSNACICX RETURNED RETURN CODE = X'hhhhhhhh' AND THE FOLLOWING ERROR MESSAGE:</th>
</tr>
</thead>
</table>

Explanation: The user exit DSNACICX returned a non-zero return code and a message to stored...
The failure can occur because the EXCI interface is not properly enabled for the CICS subsystem. For explanations of the CICS response code and reason code, see CICS Transaction Server for z/OS External Interfaces Guide.

| Severity: | 12 |
| System Action: | The stored procedure DSNACICS terminates without calling the CICS transaction. |
| Programmer Response: | Contact the system programmer. |
| System Programmer Response: | Ensure that the EXCI interface is enabled to the CICS region that the stored procedure calls. If you expect an error in the DB2 stored procedure, refer to Part 3 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem. |

Add a DSNDUMP DD statement to the JCL startup procedure for the stored procedure address space in which DSNACICS runs. Then rerun the application that calls DSNACICS. This causes DB2 to generate an SVC dump whenever it issues an error message for DSNACICS.
If you suspect an error in the DB2 stored procedure, refer to Part 3 of *DB2 Diagnosis Guide and Reference* Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]

---

**DSNA308I**  
**THE CICS EXCI DPL_REQUEST REQUEST FAILED. CICS RESPONSE CODE=0. DPL RETAREA CONTAINS**  
FIeld1=X'hhhhhhhh', FIeld2=X'hhhhhhhh', FIeld3=C'cccccc'  

**Explanation:** DSNAICS uses the CICS EXCI Call interface to request the execution of a CICS server program. The DPL_REQUEST command returned an unexpected value in the DPL RETAREA. See CICS Transaction Server for z/OS External Interfaces Guide and CICS Application Programming Guide for a full description of the meanings of FIeld1, FIeld2, and FIeld3.

**Severity:** 12

**System Action:** Stored procedure DSNAICS processes the next request.

**Programmer Response:** Correct any errors in the server program. Contact the system programmer.

**System Programmer Response:** Add a DSNDUMP DD statement to the JCL startup procedure for the stored procedure address space in which DSNAICS runs. Then rerun the application that calls DSNAICS. This causes DB2 to generate an SVC dump whenever it issues an error message for DSNAICS.

If you suspect an error in the DB2 stored procedure, refer to Part 3 of *DB2 Diagnosis Guide and Reference* Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]

---

**DSNA309I**  
**UNABLE TO LOAD USER EXIT DSNAICX. SYSTEM REASON CODE=X'hhhh' SYSTEM COMPLETION CODE=X'hhhh'**  

**Explanation:** DSNAICS was unable to load the user exit routine DSNAICX.

**Severity:** 12

**System Action:** The stored procedure DSNAICS does not call the CICS transaction. DSNAICS processes the next request.

**Programmer Response:** Contact the system programmer.

**System Programmer Response:** Ensure that the STEPLIB statement in the startup procedure for the stored procedure address space specifies the library that contains DSNAICX. A default user exit is shipped in the SDSNLOAD DB2 library.

---

**DSNA310I**  
**STORED PROCEDURE TASK CANCELLED BY OPERATOR**  

**Explanation:** The task that called the DSNAICS stored procedure was cancelled by the operator.

**Severity:** 12

**System Action:** DSNAICS terminates immediately. The CICS server program might have been called.

**Programmer Response:** Contact the system programmer.

**System Programmer Response:** Determine why the operator cancelled the stored procedure task.

---

**DSNA311I**  
**DSNAICS ABNORMALLY TERMINATED**  

**Explanation:** The task that called the DSNAICS stored procedure abnormally terminated.

**Severity:** 12

**System Action:** DSNAICS terminates immediately. The CICS server program might have been called. An SVC dump or a SYSMDUMP is generated for this error. If a CICS service encountered an error, a SYSMDUMP might be generated. For an abend in the stored procedure, an SVC dump is generated.

**Programmer Response:** Contact the system programmer.

**System Programmer Response:** Review the JES messages for the stored procedure address space in which DSNAICS runs. Look for CICS or system messages that describe the source of the problem.

If you suspect an error in the DB2 stored procedure, refer to Part 3 of *DB2 Diagnosis Guide and Reference* Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]

---

**DSNA312I**  
**USER EXIT DSNAICX ABNORMALLY TERMINATED**  

**Explanation:** User exit program DSNAICX abnormally terminated.

**Severity:** 12
System Action: DSNAICS terminates immediately. The CICS server program is not called. An SVC dump is generated for this error.

Programmer Response: Contact the system programmer.

System Programmer Response: Determine why the user exit abended. If you suspect an error in the DB2 stored procedure, refer to Part 3 of *DB2 Diagnosis Guide and Reference*. Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNA313I** DSNACICS TERMINATED BY DB2 CANCEL THREAD COMMAND

Explanation: The stored procedure DSNACICS terminated because the operator issued the DB2 CANCEL THREAD command.

Severity: 12

System Action: DSNACICS terminates immediately. The CICS server program might have been called.

Programmer Response: Contact the system programmer.

System Programmer Response: Determine why the operator issued the DB2 CANCEL THREAD command.

---

**DSNA314I** UNABLE TO LOAD CICS STUB ROUTINE DFHXCSTB. SYSTEM REASON CODE=X'hhhh' SYSTEM COMPLETION CODE=X'hhhh'

Explanation: DSNACICS was unable to load the CICS stub routine DFHXCSTB.

Severity: 12

System Action: The stored procedure DSNACICS does not call the CICS transaction. DSNACICS processes the next request.

Programmer Response: Contact the system programmer.

System Programmer Response: Ensure that the STEPLIB statement in the startup procedure for the stored procedure address space specifies the CICS library that contains DFHXCSTB. DFHXCSTB is in the CICS EXCI library (SDFHEXCI). This library must be APF authorized.

Add a DSNDUMP DD statement to the JCL startup procedure for the stored procedure address space in which DSNACICS runs. Then rerun the application that calls DSNACICS. This causes DB2 to generate an SVC dump whenever it issues an error message for DSNACICS.

If you suspect an error in the DB2 stored procedure, refer to Part 3 of *DB2 Diagnosis Guide and Reference*. Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNA315I** DSNAIMS FUNCTION func-name HAS COMPLETED SUCCESSFULLY.

Explanation: The stored procedure, DSNAIMS, executed successfully.

System Action: None.

Programmer Response: None.

---

**DSNA316I** DSNAIMS INPUT PARAMETER ERROR. CALLER MUST PROVIDE INPUT FOR PARAMETER parm-name WITH FUNCTION func-name.

Explanation: A value for parameter parm-name is required for function func-name.

System Action: DSNAIMS execution terminated before invoking IMS.

Programmer Response: Provide an appropriate value for the parameter, and re-run the function.

---

**DSNA317I** DSNAIMS ERROR IN otmaci-api API. RC=return-code, RSN1=reason-code1, RSN2=reason-code2, RSN3=reason-code3, RSN4=reason-code4.

Explanation: OTMA Callable Interface API otmaci-api encountered an error.

System Action: The DSNAIMS execution terminated after executing the specified API call.

Programmer Response: Refer to the IMS OTMA Guide and Reference for explanations of the return and reason codes.

---

**DSNA318I** DSNAIMS ERROR IN RRS CTXRCC API. RC=return-code

Explanation: An error was encountered in RRS when processing the two-phase commit.

System Action: DSNAIMS execution terminated before invoking IMS.

Programmer Response: Refer to the MVS Programming Resource Recovery manual for an explanation of the return code.

---

**DSNA319I** DSNAIMS RECEIVED UNKNOWN FUNCTION func-name

Explanation: DSNAIMS received an unknown function name in parameter 1 of the stored procedure call.

System Action: DSNAIMS terminated before invoking IMS.
Programmer Response: Specify a function name known to DSNAIMS in parameter 1.

DSNA8xx

Explanation: Messages in the DSNA800 series are intended for diagnosis and are documented in Part 8 of *DB2 Diagnosis Guide and Reference*. 
Chapter 5. DSNB... Messages

DSNB200I UPDATE VVDS FAILED. DSNAME = dsn, MMRC=cccccccc CONNECTION-ID=xxxxxxx, CORRELATION-ID=yyyyyyyyyy, LUW-ID=logical-unit-of-work-id =token

Explanation: DB2 was unable to update the data set high-used RBA in the VSAM volume data set (VVDS) when it was ready to close a data set that was used by a RECOVER, LOAD, or REORG utility job. The error was detected by the media manager catalog update function that issues system message IEC1611. The dsn indicates the DSNAME of the data set. MMRC is the return code that DB2 received from the media manager catalog update service. Refer to z/OS DFSMSdfp Diagnosis Reference for a description of these codes.

The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

An LUW-ID of "" indicates that the thread does not have an LUW-ID. If the LUW-ID is not an "", the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

System Action: DB2 continues closing this data set. However, the utility job is informed with a 00C2010C 'resource unavailable' reason code. The utility job is left in a failed state.

Operator Response: Notify the system programmer.

System Programmer Response: To determine the cause of the error, refer to system message IEC1611 in the appropriate MVS publication. Correct the error, and then notify the user to reinvoke the application.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

DSNB207I DYNAMIC ALLOCATION OF DATA SET FAILED. REASON = rrrr DSNAME = dsn

Explanation: A required data set of a DB2 table or index space could not be allocated. Reason code rrrr, which is returned by dynamic allocation, indicates the reason for the failure. Refer to the appropriate MVS publications for a description of this reason code. The dsn indicates the data set's DSNAME.

After being issued for a given data set, this message is disabled for that data set.

This message is issued by the following CSECT: DSNB1OST

System Action: Buffer manager functions that detect this condition terminate and pass a unique error return code.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the situation, and then reinvoke the application.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

DSNB209I csect-name–BUFFER MANAGER TABLESPACE/INDEXSPACE CLEAN-UP ROUTINE (DSNB1CFC) HAS BEEN SCHEDULED FOR DBNAME = dbn, SPACENAME = spn, PSID = X'psid'

Explanation: DB2 detected an abnormal condition for one of the following reasons:

- The associated table space or index space contains modified pages that cannot be written to DASD for a period of time that is longer than expected. This can be caused by either an unusually long period of contiguous update or by an internal logic error.
- This message follows an abnormal termination due to inconsistent data or an incomplete update to the page.

DB2 scheduled the table space or index space cleanup routine (DSNB1CFC) for the associated table space or index space. DSNB1CFC acquires a drain lock to ensure that no updates are in progress. Data is inaccessible to users during the cleanup process.
DSNB212I  •  DSNB219I

For recoverable inconsistent pages with unbalanced write intents, DB2 initiates the recovery process and reconstructs the pages using the DB2 log. For other modified pages with unbalanced write intents, the buffer manager forces the pages to be written back to DASD and then makes the buffer space available for reassignment.

The dbname indicates the database name with which the table space or index space is associated. The spn is the name of the table space or index space that must be cleaned up. The psid is the internal identifier for the table space or index space; it is used to associate this message with follow-on message DSNB221I, which might be issued.

System Action: DB2 is ready to clean up the associated table space or index space. However, before any cleanup is initiated, DB2 requests a drain on the table space or index space. DB2 waits indefinitely for this lock. Therefore, all activities against the table space and/or index space must be quiesced before the cleanup process can proceed. If the associated object is an index space, all activities against the table space for which the index space is defined must also be quiesced. After the cleanup process completes, the table space or index space is automatically made accessible to users.

User Response: If the clean up activity does not appear to be completed, DB2 might still be waiting for a drain lock on the table space. Issue a DISPLAY DATABASE CLAIMERS command for the table space in question (for index spaces, this would be the associated table space) to determine whether the clean up routine is still waiting for a lock and if so, to determine the holders of the table space lock. If the jobs are holding the table space lock for a very long duration (for instance, wait-for-input), it might be necessary to cancel those jobs in order to allow the clean up process to proceed.

DSNB212I  csect-name–RECOVER PAGE
STARTING DBNAME = dbname
SPACENAME = spn
PAGE NUMBER = X’pno’

Explanation: The buffer manager (BM) subcomponent of DB2 discovered an inconsistent page with unbalanced write intents. DB2 is ready to do online recovery on the page using the DB2 log. The dbname indicates the associated database name. The spn indicates the table space name or index space name. The pno is the page number (in hexadecimal) within the table space or index space that is logically inconsistent.

System Action: Processing continues.

DSNB215I  csect-name–ONLINE RECOVERY FOR AN INCONSISTENT PAGE HAS BEEN COMPLETED FOR DBNAME = dbname
SPACENAME = spn
PAGE NUMBER = X’pno’

Explanation: The recovery process for an inconsistent page completed. The dbname indicates the associated database name. The spn indicates the table space name or index space name. The pno is the page number (in hexadecimal) within the table space or index space that was logically inconsistent.

System Action: Processing continues.

DSNB217I  csect-name–ONLINE RECOVERY FOR AN INCONSISTENT PAGE WAS UNSUCCESSFUL FOR DBNAME = dbname
SPACENAME = spn
PAGE NUMBER = X’pno’

Explanation: The recovery process for an inconsistent page failed. The page is written to DASD as logically inconsistent. This message is issued in response to message DSNB212I, which was issued to indicate the start of the recovery process. The dbname indicates the associated database name. The spn indicates the table space name or index space name. The pno is the page number (in hexadecimal) within the table space or index space that was logically inconsistent.

System Action: The page is marked as logically inconsistent and is unavailable until it is repaired. The execution unit driving this function proceeds normally.

Problem Determination: A DSNJ012I message might be issued before this message to indicate the same failure. If it is, a 00C90102 abend dump might help determine the cause of this failure. Otherwise, see SYS1.LOGREC for any abend that occurred between the associated DSNB212I message and this message. Use the time stamp on the log records to find this abend.

DSNB219I  csect-name–BUFFER MANAGER TABLESPACE/INDEXSPACE
CLEAN–UP PROCESS HAS BEEN COMPLETED FOR DBNAME = dbname
SPACENAME = spn

Explanation: This message indicates that the buffer manager (BM) table space or index space cleanup process completed for the associated table space or index space. Refer to message DSNB209I for the reasons why the buffer manager schedules the table space or index space cleanup process. The dbname indicates the associated database name. The spn indicates the table space name or index space name.

System Action: Processing continues.
**DSNB221**  
csect-name–BUFFER MANAGER  
TABLESPACE/INDEXSPACE  
CLEAN-UP PROCESS WAS NOT  
REQUIRED FOR PSID = X'psid'

**Explanation:** This message indicates that the buffer manager (BM) table space or index space cleanup process was bypassed for the associated table space or index space. After quiescing all other activities against the table space or index space, the buffer manager discovered that the table space or index space is no longer in active mode; that is, it was closed.

The abnormal condition detected earlier was resolved by buffer manager close page set processing. Refer to the corresponding message, DSNB209I, using psid as the matching field, for the reasons the buffer manager schedules the table space or index space cleanup process. The psid is the internal identifier for the associated table space or index space.

**System Action:** Processing continues.

**DSNB223**  
csect-name–BUFFER MANAGER  
TABLESPACE/INDEXSPACE CLEANUP  
PROCESS WAS SKIPPED FOR PSID = X'psid'

**Explanation:** This message indicates that the table space or index space cleanup process was bypassed for the associated table space or index space. During the process of quiescing all other activities against the table space or index space, an error that is not recoverable was detected. The error might be caused by any of the following conditions:

- An out-of-storage condition was detected by IRLM.
- The table space or index space was dropped because of a backout.

It is assumed that the abnormal condition detected earlier can later be resolved by the close page set processing. Refer to the corresponding message DSNB209I (use psid as the matching field) for the reasons for scheduling the table space or index space cleanup process. The psid specifies the internal identifier for the associated table space or index space.

**System Action:** Processing continues.

**System Programmer Response:** The associated table space or index space might contain inconsistent data. Issue the DB2 STOP TABLESPACE or INDEXSPACE command to allow close page set processing to perform cleanup for the associated table space or index space.

**DSNB224I**  
csect-name–BUFFER MANAGER I/O  
ERROR DURING function,  
DBNAME=dbsn,SPACENAME=snm, DATA  
SET NUMBER=dsno, PAGE  
NUMBER=X'psid', MM ERROR  
FLAG=X'ad', CSW STATUS=X'bbbb',  
SENSE BYTES=X'cccc', SEEK  
ADDRESS=X'ddddddeeeeffffffff'

**Explanation:** An I/O error was encountered by the buffer manager (BM) subcomponent of DB2. The function specified in the message is READ, WRITE, or FORMAT. The message gives the database name, table space name or index space name, data set number, and page number (in hexadecimal) of the page for which the I/O operation was being performed. The remaining information is error information returned by the media manager and is used for error analysis by IBM support personnel.

**System Action:** The system action depends on the function being performed. If the function is WRITE, or if the function is READ and the operation was performed during restart or rollback, the I/O error page range of the data set is updated and message DSNU086I is issued. In most cases (READ, synchronous WRITE, FORMAT), a 'resource not available' is returned to the user with a reason code that identifies the nature of the problem.

After being issued 10 times for a given data set, this message is disabled for that data set until it is closed and reopened.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** See documentation in Part 4, “Section 4. DB2 Codes,” on page 771 for the reason code returned to the user in the SQLCA or in utility messages. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** See the Problem Determination section of the reason code returned to user.

Check the MVS console log for an IOS error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
**DSNB225I**  

csect-name - BUFFER MANAGER I/O ERROR DURING function  
DBNAME=dbn, SPACENAME=snm, DATA SET NUMBER=dsn, MM ERROR  
CODES=X'aaaaaaa' DB2 REASON CODE=X'bbbbbbbb'

**Explanation:** DB2 encountered an I/O error. The function specified in the message is READ, WRITE, CASTOUT, or FORMAT. The message contains the database name, table space name or index space name, data set number, media manager error information returned at the time of the failure, and the DB2 reason code associated with this failure.

**System Action:** Except for a castout error, the application terminates with abend X'04E' and reason code 00C200A4 or 00C200C0. If an error occurs during castout, processing continues.

**Operator Response:** Notify the system programmer and follow the directions given for the reason code described in [Part 4, “Section 4. DB2 Codes,” on page 771](#).

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This message is issued before the occurrence of abend X'04E' and reason code 00C200F7 to provide information about the page set involved.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#)

**DSNB227I**  
csect-name - DFHSM RECALL FAILED FOR DSNAME=dsn HSMRC=aaaaaaaaa HSMRSN=bbbbbbbb

**Explanation:** The attempt to recall a migrated data set failed. DSNAME identifies the data set. HSMRC and HSMRSN are the return code and reason code given by DFHSM.

**System Action:** A ‘resource not available’ code is returned to the user.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Use the information provided in the message to determine the reason for the DFHSM recall failure.

**Problem Determination:** Refer to [Part 4, “Section 4. DB2 Codes,” on page 771](#) for an explanation of the return and reason codes contained in this message. Refer to the DFHSM message ARC11nnl, where nn is the value of HSMRC.

**DSNB228I**  
csect-name GROUP BUFFER POOL gbpname CANNOT BE ACCESSED FOR function MVS IXLCACHE REASON CODE=reason

**Explanation:** While accessing group buffer pool gbpname for function DB2 received an error from the MVS IXLCACHE request.

**System Action:** The system action depends on the function being performed. If the function is a WRITE, or a READ performed during rollback or DB2 restart, the page is added to the logical page list (LPL) for the data set and message DSNB250E is issued. Otherwise, ‘resource unavailable’ is returned to the user with a reason code that identifies the specific problem.

**System Programmer Response:** See MVS/ESA Programming: Sysplex Services Reference for an
DSNB229I  csect-name UNEXPECTED ERROR WHEN CHECKING FOR REQUEST COMPLETION FOR GROUP BUFFER POOL gbp-name MVS IXLFCOMP REASON CODE=reason

Explanation:  DB2 received an unexpected error from MVS when checking for the completion of a write request to the secondary group buffer pool for duplexing.  gbp-name indicates the name of the group buffer pool. If the group buffer pool is duplexed and the error was encountered on a request to the secondary group buffer pool, then gbp-name indicates the name of the group buffer pool suffixed with ‘-SEC’.

reason is the reason code from the MVS IXLFCOMP service.

System Action:  DB2 returns the group buffer pool back to simplex mode. The secondary group buffer pool is deallocated.

DSNB232I  csect-name - UNEXPECTED DATA SET LEVEL ID ENCLOSED - LEVEL ID =lvclid EXPECTED LEVEL ID=xlvclid DSN=dsn

Explanation:  A required data set of a DB2 table space could not be opened. DB2 encountered an unexpected data set level ID.

lvclid  The unexpected level ID from the data set. If DB2 was unable to retrieve the level ID from the data set (for example, if the data set had been deleted and redefined), the level ID is shown as “X”.

xlvclid  The level ID recorded by DB2 previously and is the expected level ID for opening the data set.

dsn  The DSNNAME of the data set.

This problem could be the result of data sets that were restored to a level that is inconsistent with other data sets, inconsistent with the DB2 log, or both.

System Action:  DB2 sends back a ‘resource unavailable’ SQL code to the application and a reason code explaining the error.

Operator Response:  Notify the system programmer.

System Programmer Response:  To enable access to a data set reported as down level, take one of the following actions:

- Restore the page set or partition to the proper level (use DSN1COPY, DFHSM, or another tool).

Identify the level ID of a copy of the page set or partition by running the DSN1PRNT(FORMAT) utility. The level ID is found in the header page of the page set or partition.

- Recover the down level page set or partition to currency by running the RECOVER or RECOVER LOGONLY utility.

- Accept the down levelling by running the REPAIR utility with the LEVELID option. This option is only valid if DB2 is able to access the level ID (lvclid is not “X”).

Inconsistent data problems might result from this action and are the user’s responsibility.

- Replace the contents of the page set or partition using the LOAD REPLACE utility.

- Explicitly restore the page set to a prior point in time with the RECOVER utility.

If the expected level ID is less than the encountered level ID, it is possible that the object identified in the message was ported from another system improperly or it might indicate that DSNDB01.SYSLGRNX is down level. If the problem is in the object identified in the message, the actions listed above can be used to allow access to the data. If the problem is in SYSLGRNX, this is a serious situation that compromises the recoverability of all objects managed by DB2. Investigate whether SYSLGRNX might have inadvertently been restored to a point in time inconsistent with the rest of the DB2 system.

DSNB250E  csect-name A PAGE RANGE WAS ADDED TO THE LOGICAL PAGE LIST DATABASE NAME = dbn SPACE NAME = spn DATA SET NUMBER = dsono PAGE RANGE = lowpg TO highpg START LRSN = startlrsn END LRSN = endlrsn START RBA = startrba LPL TRACE ID = traceid LPL REASON TYPE = reasontype

Explanation:  DB2 added a page range to the logical page list (LPL) for the specified data set because of a problem with the pages in the page range. The startlrsn and endlrsn give the log range needed to recover the pages in the page range. These values are RBA values unless DB2 is in the data sharing environment, in which case these values are LRSN values. In the data sharing environment, startrba indicates the starting RBA value of the recovery log range if the value is not zero. The startrba only applies to log records for the DB2 member that issued the message. The zero value for endlrsn in this message refers to the current end of the recovery log. The traceid is for IBM serviceability. The reasontype explains why the pages were added into LPL; the following are the reason types:

- DASD  DB2 encountered a DASD I/O error when trying to read or write pages on DASD.

Chapter 5. DB2 Messages  171
DSNB260I • DSNB301E

LOGAPPLY  DB2 cannot apply log records to the pages.

GBP     DB2 cannot successfully read nor externalize the pages from or to the group buffer pool because of link or structure failure, the GBP is in rebuild status, or the GBP was disconnected.

LOCK    DB2 cannot get the required page latch or page P-lock on the pages.

CASTOUT The DB2 Castout processor cannot successfully cast-out the pages.

System Action: The pages are added to the LPL, and DB2 initiates the Automatic LPL Recovery. The pages remain inaccessible until they are recovered with either the START DATABASE command with the SPACNAM option, the RECOVER utility, the LOAD utility, or the Automatic LPL Recovery. Users attempting to access a page in the LPL receive SQLCODE -904 with reason code 00C20206. If MVS detects a problem during group buffer pool access processing, DB2 writes a SYS1.LOGREC entry describing the error.

System Programmer Response: Check the reason and follow the appropriate actions, based on the console message. To recover pages from the LPL, perform one of the following actions:
  • Issue the -START DATABASE command with the SPACNAM option
  • Run the RECOVER or LOAD utility

DSNB260I csect-name WARNING - A READER HAS BEEN RUNNING FOR nnnn MINUTES -
  CORRELATION NAME = xxxxxxxxxxxx,
  CONNECTION ID = yyyy yyyy, LUWID = logical-unit-of-work-id=token,
  PLAN NAME = xxxxxxxxx, AUTHID = xxxxxxxxx, END USER ID = xxxxxxxxx,
  TRANSACTION NAME = xxxxxxxxx, WORKSTATION NAME = xxxxxxxxx

Explanation: This message indicates that a long running reader has reached the time limit threshold without a COMMIT or ROLLBACK. This threshold was defined during installation.

The value nnnn is cumulative, and indicates the time in minutes that has elapsed since the beginning of this Unit of Work (UW).

CORRELATION name, CONNECTION ID, and Logical Unit of Work ID (LUWID) together identify a thread associated with the UW. token is a unique token number associated with the LUWID. If the LUWID is an "", it indicates that the thread originated at this site.

PLAN NAME and AUTHID further identify the thread associated with the UW.

If the thread's creator included End User information, then DB2 displays the End User's ID, TRANSACTION NAME, and WORKSTATION NAME. Otherwise, these fields will contain an "".

System Action: DB2 continues processing. If statistics class 3 is active, IFCID 0313 is written. This message will be repeated each additional time the threshold is reached.

System Programmer Response: Consult with the application programmer to determine if this is a problem UW. See Part 4 (Volume 1) of [DB2 Administration Guide] for more information about problems caused by uncommitted UR's.

If an application program caused the UW to reach its time limit threshold, you can use CANCEL THREAD to cancel the UR.

Programmer Response: Ensure that the application commits frequently enough, or consult with your DB2 administrator about decreasing the frequency of the check.

DSNB301E csect-name GROUP BUFFER POOL gbpname CANNOT BE CONNECTED
  DB2 REASON CODE = reason1 MVS IXLCONN REASON CODE = reason2

Explanation: DB2 was not able to connect to the named group buffer pool. This message is generally issued once for each DB2 subsystem for each DB2 reason code, except 00C20204, until the failure condition is corrected.

reason1  DB2 reason code
reason2  MVS IXLCONN reason code

For DB2 reason code 00C20204, which indicates a problem during MVS IXLCONN processing, this message is issued once for each DB2 subsystem for each IXLCONN reason code until the failure condition is corrected. If the DB2 reason code is not 00C20204, then reason2 contains zeros. See MVS/ESA Programming: Sysplex Services Reference for an explanation of MVS IXLxxx reason codes

System Action: If the connection was requested on behalf of an access request by an SQL user on this DB2, SQLCODE -904 (resource unavailable) is returned to the SQL user with the DB2 reason code shown in this message.

If the connection was requested on behalf of an SQL user on another DB2 in the data sharing group, SQLCODE -904 (resource unavailable) is returned to the SQL user with DB2 reason code 00C20252. This indicates that the requested table space or index space is unavailable because another DB2 cannot connect to the group buffer pool.

If the MVS IXLCONN reason code is xxx0C08 (structure allocation failed because there was no
suitable facility to allocate based on the preference list in the MVS CFRM administrative policy), or if the MVS IXLCONN reason code is xxxx084C (user does not have proper Security Access Facility (SAF) authorization), then IFCID 0250, if active, contains additional diagnostic information.

---

**DSNB302I**

**csect-name GROUP BUFFER POOL gbpname IS ALLOCATED IN A VOLATILE STRUCTURE**

**Explanation:** The DB2 group buffer pool structure is volatile.

One DB2 member issues this message whenever the structure has the volatile attribute. DB2 detects this either on the first connection to the group buffer pool or when the attribute changes later. DB2 always requests nonvolatile group buffer pools but allows allocation in a volatile structure if that is all that is available.

**System Action:** DB2 processing continues.

**System Programmer Response:** To cause the group buffer pools to be allocated in nonvolatile coupling facilities, ensure that:

- At least a subset of your coupling facilities are configured correctly for nonvolatility.
- The MVS CFRM policy correctly specifies the nonvolatile coupling facilities in the preference list for the group buffer pool coupling facility structures.

Even when these things are correctly done, there might be instances when a suitable coupling facility in the preference list cannot be found (for example, not enough free space), and therefore allocation occurs in a different coupling facility. MVS tries to allocate the structure in the facility that best meets the structure allocation request as follows:

**1st choice:**

- Coupling facility that meets the volatility requirement, the space requirement, and the exclusion list requirement.

**2nd choice:**

- Coupling facility that meets the volatility requirement and the storage requirement.

**3rd choice:**

- Coupling facility that has the best fit (most available free space) even though this might be less than the amount requested.

**4th choice:**

- Structure cannot be allocated.

IFCID 0250, if activated, contains a list of the coupling facilities on which allocation was attempted.

---

**DSNB303E**

**csect-name A LOSS OF CONNECTIVITY WAS DETECTED TO GROUP BUFFER POOL gbpname**

**Explanation:** Connectivity to group buffer pool gbpname was lost.

**System Action:** DB2 disconnects from the coupling facility structure with REASON=FAILURE.

The action taken in response to this problem depends on the attempted function, as follows:

- For a coupling facility read: SQLCODE -904 (resource unavailable) is returned to the SQL user with a reason code indicating the specific error.
- For a coupling facility read during rollback, backout, or restart: The inaccessible page is added to the logical page list (LPL) for the page set. Message DSNB250E is issued for the first page of each data set added to the LPL.
- For a coupling facility read during castout: The castout operation cannot complete.
- For a coupling facility write: The changed page is added to the LPL for the page set.

---

**DSNB304I**

**csect-name GROUP BUFFER POOL gbpname WAS SET TO 'DAMAGE ASSESSMENT PENDING' STATUS**

**Explanation:** A coupling facility structure for a group buffer pool was damaged.

**System Action:**

- DB2 puts the group buffer pool into 'damage assessment pending' (DAP) status. Message DSNB304I indicates the DAP status. The group buffer pool cannot be accessed until DAP status is cleared.
- The DB2 damage assessment process determines which table spaces and index spaces are using the failed group buffer pool and puts those spaces into 'group buffer pool recovery pending' (GRECP) status.
- After DB2 sets all the necessary spaces to GRECP status, the DAP status for the group buffer pool is cleared. Message DSNB305I indicates that DAP status is cleared.

**DSNB305I**

**csect-name 'DAMAGE ASSESSMENT PENDING' STATUS WAS CLEARED FOR GROUP BUFFER POOL gbpname**

**Explanation:** Damage assessment completed and the 'damage assessment pending' (DAP) status is cleared for the group buffer pool (GBP). At this point, the group buffer pool status is no longer restricted and DB2 attempts to reconnect to the group buffer pool on the next reference to a GBP-dependent page set within the associated buffer pool.

Message DSNB304I precedes this message.
**DSNB306I**  
**csect-name THE REQUESTED LENGTH OF THE LOCAL CACHE VECTOR COULD NOT BE ALLOCATED FOR GROUP BUFFER POOL gbpname**  
**REQUESTED LENGTH = length1**  
**ALLOCATED LENGTH = length2**

**Explanation:** DB2 connected to the group buffer pool indicated by gbpname, but the MVS Cross-system Extended Services (XES) component could not allocate the requested size of the local cache vector (LCV) in the hardware system area (HSA). DB2 requires an LCV size that is large enough to handle all pages in the member's buffer pool.

`length1` indicates the LCV size (in number of bits) that DB2 requested. `length2` indicates the LCV size (in number of bits) that XES was able to allocate.

To prevent flooding the operator console, this message is only issued once per DB2 member per group buffer pool until the condition is corrected.

**System Action:** DB2 disconnects from the GBP and issues message DSNB301E with reason code 00C20208, if it has not yet been issued.

SQLCODE -904 is returned to the user with a reason code of 00C20208.

**System Programmer Response:** There is not enough HSA storage on the processor to support the size of the local cache vector. The details of HSA allocation are machine-dependent and are defined by the hardware.

To correct this problem, take one or both of the following actions:

- Consult the documentation for your processor hardware to determine if the HSA storage allocation can be increased, and if so, how to do it.
- Modify the software configuration in your parallel sysplex to reduce the number or size of the vectors that are in use by other coupling facility structure users. Consider the following possible solutions:
  - Use the DB2 ALTER BUFFERPOOL command to reduce the size of this local buffer pool. This means that you might have to reduce the size of the virtual pool.
  - Use the DB2 ALTER BUFFERPOOL command to reduce the size of another local buffer pool that is already connected to a group buffer pool. This means that you might have to reduce the size of the virtual pool. If you make a connected buffer pool smaller, DB2 can usually contract the size of the corresponding LCV dynamically, making HSA storage available. However, DB2 cannot always do the dynamic LCV contraction. In cases where DB2 cannot dynamically contract the LCV size, you can use the DB2 ALTER BUFFERPOOL command to either force a deallocation of the LCV or to force a contraction of the LCV as follows:
    1. Redefine the virtual pool to be smaller than the original size.

2. Take one of the following actions:
   a. Make the virtual pool very small (perhaps 50 pages or less). Making the virtual pool sufficiently small should let DB2 dynamically contract the LCV, or
   b. Delete the virtual pool to let DB2 disconnect from the group buffer pool. This frees the entire LCV associated with that member's connection to that group buffer pool.

- Consolidate your group buffer pool-dependent page sets into fewer buffer pools to reduce the number of group buffer pool connections.
- Consult the documentation for the other software components that might be using a coupling facility cache or list structure with an associated LCV to determine whether it is possible to either delete the connection or to reduce the size of the LCV associated with the connection.

**DSNB307I**  
**csect-name GROUP BUFFER POOL gbpname WAS SUCCESSFULLY ALLOCATED BUT THE EXCLUSION LIST WAS NOT HONORED**

**Explanation:** DB2 successfully connected to the group buffer pool and allocated the group buffer pool in a coupling facility. However, the group buffer pool was allocated in a coupling facility containing a structure in the exclusion list.

**System Programmer Response:** If you require that the exclusion list be honored, you must ensure that there is sufficient space in the coupling facilities that are not in the exclusion list. IFCID 0250 provides information about which facilities were attempted.

**DSNB308I**  
**csect-name GROUP BUFFER POOL gbpname WAS SUCCESSFULLY ALLOCATED BUT THE ALLOCATED SIZE OF alloc_size IS LESS THAN THE REQUESTED SIZE OF req_size**

**Explanation:** DB2 successfully connected to the group buffer pool and allocated the group buffer pool in a coupling facility. However, the allocated size of the group buffer pool was less than the requested size in the MVS CF RM administrative policy because there is not enough space in the preference list facilities. Both alloc_size and req_size are in 4KB blocks.

**System Programmer Response:** IFCID 0250 provides information about which coupling facilities were used for attempted allocation.

**DSNB309I**  
**csect-name GROUP BUFFER POOL gbpname HAS BEEN DISCONNECTED WITH A REASON OF 'reason'**

**Explanation:** DB2 disconnected from the named group buffer pool.
reason indicates one of the following values:

NORMAL
DB2 disconnected the group buffer pool normally. MVS deletes the connection.

FAILURE
DB2 disconnected the group buffer pool abnormally. MVS puts the connection into a 'failed-persistent' state. DB2 disconnects the GBP with a reason of FAILURE when some type of error has been detected, and castout processing cannot proceed. Usually the error involves a connectivity failure to either the coupling facility or DASD. This message is preceded by message DSNB303E, and probably a series of DSNB311I and DSNB312I messages.

If this message is issued because connectivity was lost to the group buffer pool, this message signifies that this DB2 member has completed its processing of the error.

System Programmer Response: See the system programmer response for message DSNB311I or DSNB312I.

DSNB310I csect-name GROUP BUFFER POOL
gbpname IS ALLOCATED IN A NONVOLATILE STRUCTURE

Explanation: The coupling facility storage in which the group buffer pool is allocated was previously volatile, but is now nonvolatile. For availability reasons, we recommend that DB2 group buffer pools be allocated in nonvolatile coupling facility storage. When DB2 connects a group buffer pool, it requests that the backing coupling facility structure be allocated in nonvolatile storage. If the request for nonvolatile storage is not honored, DB2 issues message DSNB302I.

System Action: DB2 processing continues.

DSNB311I csect-name DBNAME database SPACE
NAME spacename PARTITION
Has PAGES IN THE LOGICAL PAGE LIST

Explanation: This message is issued after a loss of connectivity to a group buffer pool was detected. The message indicates that the named table space or index space has one or more pages in the logical page list (LPL) that need to be recovered. This message is issued after DB2 has completed its processing for the table space or index space; this is the earliest point at which you can recover LPL pages for that table space or index.

System Action: The pages in the LPL are not accessible until they have been recovered.

System Programmer Response: Issue the START DATABASE command with the named table space or index to recover the LPL pages. The START DATABASE command must be issued from a DB2 member that can connect to the group buffer pool. Alternatively, the RECOVER utility or the LOAD utility can be used to recover the LPL pages.

DSNB312I csect-name DBNAME database SPACE
NAME spacename PARTITION
part-number HAS PAGES IN THE LOGICAL PAGE LIST

Explanation: This message is issued after a loss of connectivity to a group buffer pool was detected. The message indicates that a partition of the named table space or index has one or more pages in the logical page list (LPL) that need to be recovered. This message is issued after DB2 has completed its processing for the partition; this is the earliest point at which you can recover the LPL pages for that partition.

System Action: The pages in the LPL are not accessible until they have been recovered.

System Programmer Response: Issue the START DATABASE command on the table space or index space partition to recover the LPL pages. The START DATABASE command must be issued from a DB2 member that can connect to the group buffer pool. Alternatively, the RECOVER utility or the LOAD utility can be used to recover the LPL pages.

DSNB313I csect-name GROUP BUFFER POOL
gbpname TO BE DISCONNECTED
REASON=reason LOSSCONN
PERCENTAGE=percentage

Explanation: This DB2 member is disconnecting from group buffer pool gbpname because it has lost connectivity to the coupling facility in which the group buffer pool is allocated.

reason is one of the following:

NOSFMPO
MVS cannot determine the scope of the loss of connectivity because there is no active SFM policy with CONNFAIL(YES).

LOSSCONN
MVS determined that the scope of the loss of connectivity was less than 100%.

NOXESEVL
MVS started to try to determine the scope of the loss of connectivity, but some condition occurred which prevented MVS from being able to complete the evaluation. One example of such a condition would be that the SFM policy became inactive while MVS was trying to do the evaluation.

If reason is LOSSCONN, then percentage indicates the percentage of lost connectivity that was calculated by MVS. MVS evaluates the scope of the loss of connectivity in terms of SFM weights associated with the systems which have lost connectivity and which
have active connectors to the coupling facility structure (if there are systems that do not have an active connector to the coupling facility structure, then those systems are not factored into the "percentage loss of connectivity" calculation).

If reason is not LOSSCONN, then percentage is not applicable (it should appear as zero).

System Action: The DB2 member disconnects the group buffer pool, putting its connection into a "failed-persistent" state.

If there are transactions that are in progress at the time of the connectivity failure, DB2 might need to add pages to the logical page list (LPL).

System Programmer Response: Use the START DATABASE command to recover the LPL pages. If DSNDB01 or DSNDB06 objects have LPL pages, you might need to recover these first, before proceeding with LPL recovery for other objects.

DSNB314I  csect-name DAMAGE ASSESSMENT TO BE TRIGGERED FOR GROUP BUFFER POOL gpdbname REASON=reason

Explanation: DB2 is about to initiate the damage assessment function for group buffer pool gpdbname because of a detected error in either the coupling facility in which the group buffer pool was allocated, or in the connectivity from the MVS systems to the coupling facility.

reason is one of the following:

100%LCON
An error has occurred in a coupling facility or in the attachments of MVS systems to a coupling facility which has caused all DB2 members to lose connectivity to the named group buffer pool.

STRFAIL
There was an error in the coupling facility in which the group buffer pool was allocated which caused a failure of the coupling facility structure.

CONERROR
The named group buffer pool is currently allocated in a coupling facility, but DB2 cannot connect to the group buffer pool because the system on which it is running does not currently have connectivity, and MVS has indicated that currently no other member is actively connected and has connectivity.

DAP
The named group buffer pool is in damage assessment pending (DAP) state.

System Programmer Response: Use the START DATABASE command to recover the LPL pages and GRECP objects. If DSNDB01 or DSNDB06 objects are in GRECP state or have LPL pages, you might need to recover these first, before proceeding with GRECP or LPL recovery for other objects.

DSNB315I  csect-name GROUP BUFFER POOL gpdbname IS ALLOCATED AS GBPCACHE cacheatt

Explanation:

YES
The group buffer pool will be used for data caching.

NO
The group buffer pool will not be used for data caching. It will be used for cross invalidation only.

One DB2 member issues this message whenever the structure is allocated. DB2 detects this on the first connection to the group buffer pool either in the mainline processing or during group buffer pool rebuild.

System Action: DB2 processing continues.
The amount of storage in the group buffer pool (GBP) coupling facility structure available for writing new pages is low. The GBP is 75 percent full with changed data. As the GBP fills with changed data, the castout thresholds are continuously reached, and the castout engines must continuously work to attempt to keep the number of changed pages in the GBP below the castout thresholds. Also, the more changed data the GBP contains, the less efficiently it operates. Completely running out of GBP storage can result in transaction delays and in pages being added to the logical page list (LPL).

This message stays on the MVS console and is highlighted.

**System Action:** DB2 processing continues.

This message might remain highlighted and might not be automatically deleted in a pre SP5.2.1-JES3 environment.

**Operator Response:** Contact the system programmer to fix the storage problem.

**System Programmer Response:**

You can relieve the GBP storage shortage by taking one or more of the following actions:

- Use the ALTER GROUPBUFFERPOOL command to lower the CLASST and GBPPOOL castout thresholds.
- Use the ALTER GROUPBUFFERPOOL command to lower the GBPCHKPT GBP checkpoint frequency.
- Use the MVS SETXCF START,REBUILD command to expand the GBP coupling facility structure. If you rebuild, you can use the ALTER GROUPBUFFERPOOL command to lower the RATIO so that a higher percentage of the GBP storage is given to data entries over directory entries.
- If you are running on MVS 5.2 or a subsequent release, you can use the MVS SETXCF START,ALTER command to expand the size of the GBP (the maximum size to which you can expand is determined by the SIZE parameter in the CFRM policy that was used to allocate the GBP).

If you don’t do anything to relieve the storage shortage, message DSNB325A appears if the GBP reaches 90 percent full.

Message DSNB327I appears when the GBP storage shortage is relieved.

You can monitor the amount of GBP storage in use with the DISPLAY GBPPOOL command and with the DB2 statistics trace. Monitor the castout activity to ensure that castouts are keeping up with the rate of GBP-write activity. You can use Performance trace classes 20 and 21 (specifically, IFCIDs 0261, 0262 and 0263) to do more detailed monitoring of the DB2 castout processing.

This message reports the group buffer pool recovery pending (GRECP) status of the named table space or index space partition.

**Severity:** 4 (warning)

**System Action:** The data in the named partition is not accessible.

**User Response:** Issue the -START DATABASE command on the partition to remove the GRECP status and make the data accessible again. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

This message reports the group buffer pool recovery pending (GRECP) status of the named table space or index space.

**Severity:** 4 (warning)

**System Action:** The table space or index space is not accessible.

**User Response:** Issue the -START DATABASE command on the table space or index space to remove the GRECP status and make the data accessible. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

This message reports the group buffer pool recovery pending (GRECP) status of the table space or index space partition identified by the internal identifiers DBID and PSID. This message is issued instead of message DSNB322I when the name of the table space or index space is not available. The partition cannot be automatically recovered because there are retained physical locks (P-locks) on the partition.

**Severity:** 4 (warning)
**System Action:** The data in the identified partition is not accessible.

**User Response:** Issue the -DISPLAY DATABASE(*) SPACENAM(*) RESTRICT command to determine the table spaces or index spaces partition in GRECP status. First, start the failed DB2 members that hold retained P-locks on the partition. Issue the -START DATABASE command on the partition to remove the GRECP status and make the data accessible again. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

**Explanation:** This message reports the group buffer pool recovery pending (GRECP) status of the table space or index space identified by the internal identifiers DBID and PSID. This message is issued instead of message DSNB3211 when the name of the table space or index space is not available. The table space or index space cannot be automatically recovered because there are retained physical locks (P-locks) on the space.

**Severity:** 4 (warning)

**System Action:** The table space or index space is not accessible.

**User Response:** Issue the -DISPLAY DATABASE(*) SPACENAM(*) RESTRICT command to determine the table spaces or index spaces partition in GRECP status. First, start the failed DB2 members that hold retained P-locks on the table space or index space. Issue the -START DATABASE command on the table space or index space to remove the GRECP status and make the data accessible again. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

**Explanation:** This message stays on the MVS console and is highlighted.

**System Action:** DB2 processing continues.

This message might remain highlighted and might not be automatically deleted in a pre-SP5.2.1-JES3 environment.

**Operator Response:** Contact the system programmer to fix the storage problem.

**System Programmer Response:** You can relieve the GBP storage shortage by taking one or more of the following actions:

- Use the ALTER GROUPBUFFERPOOL command to lower the CLASST and GPPOOLT castout thresholds.
- Use the ALTER GROUPBUFFERPOOL command to lower the GBPCHKPT GBP checkpoint frequency.
- Use the MVS SETXCF START,REBUILD command to expand the GBP coupling facility structure. If you rebuild, you can use the ALTER GROUPBUFFERPOOL command to lower the RATIO so that a higher percentage of the GBP storage is given to data entries over directory entries.
- If you are running on MVS 5.2 or a subsequent release, you can use the MVS SETXCF START,ALTER command to expand the size of the GBP (the maximum size to which you can expand is determined by the SIZE parameter in the CFRM policy that was used to allocate the GBP).

If you don’t do anything to relieve the storage shortage, message DSNB228I appears if a write to the GBP fails due to a ‘GBP full’ condition. If DB2 detects a ‘full’ condition, it will suspend the transaction, initiate castout activity, and then retry the write to the GBP. If the GBP write still fails after several retry attempts, then DB2 adds the page to LPL.

**Explanation:** The group buffer pool (GBP) coupling facility structure has adequate space available for the writing of new pages to the GBP. This message may be issued when either of the following occurs:

**Explanation:** The group buffer pool (GBP) coupling facility structure has adequate space available for the writing of new pages to the GBP.

You can monitor the amount of GBP storage in use with the DISPLAY GPPOOL command and with the DB2 statistics trace. Monitor the castout activity to ensure that castouts are keeping up with the rate of GBP-write activity. You can use Performance trace classes 20 and 21 (specifically, IFCIDs 0261, 0262 and 0263) to do more detailed monitoring of the DB2 castout processing.
Rebuilding of GBP reduces changed page count to 60% or less of GBP capacity.
'changed data.' entries decrease to 60% or lower when they were previously 75% GBP capacity or higher.

**System Action:** DB2 processing continues.

---

**DSNB330I**

```
csect-name GROUP BUFFER POOL gbpname CANNOT BE CONNECTED FOR REBUILD DB2 REASON CODE = reason1 MVS IXLCONN REASON CODE = reason2
```

**Explanation:** DB2 was not able to connect to the named group buffer pool for rebuild. `reason1` is the DB2 reason code. `reason2` is the MVS IXLCONN reason code. See MVS/ESA Programming: Sysplex Services Reference for an explanation of MVS IXLxxxx reason codes.

**System Action:** DB2 stops the rebuild.

**Problem Determination:** If the MVS IXLCONN reason code is xxxx0C08 (structure allocation failed because there was no suitable facility to allocate based on the preference list in the MVS CFM administrative policy), or if the MVS IXLCONN reason code is xxxx084C (user does not have proper Security Access Facility (SAF) authorization), then IFCID 0250, if active, contains additional diagnostic information.

---

**DSNB331I**

```
csect-name REBUILD STARTED FOR GROUP BUFFER POOL gbpname REASON = reason
```

**Explanation:** A rebuild has been initiated for the named group buffer pool. `reason` indicates the reason why the rebuild was initiated. `reason` can be one of the following:

**OPERATOR**
The operator initiated a SETXCF command to initiate the rebuild.

**LOSSCONN**
MVS detected a loss of connectivity to the group buffer pool.

This message is issued by each DB2 member participating in the rebuild.

**System Action:** The DB2 members that are actively connected to the named group buffer pool participate in the rebuild. DB2 accomplishes the group buffer pool rebuild processing in two phases:

1. Quiesce phase. Each member quiesces all local access to the group buffer pool.
2. Connect phase. Each member connects to the new structure. Each page set or partition castout owner that has connectivity to original structure is responsible for writing pages from the original structure to the new one. If there are not enough data entries in the new structure, the page set and partition owners cast those pages out to DASD instead. Each member issues message DSNB332I after it completes this activity. After all members have completed their castout owner rebuild work, the group buffer pool structure owner does the final sweep and checks to see if there are any changed pages still remaining in the original structure. If so, the structure owner reads the changed pages from the original structure and writes them to the new one. The structure owner issues message DSNB333I after it has completed the final sweep.

After all members have responded to MVS indicating that its connect phase processing is complete, MVS then notifies each member that the rebuild is complete. Each DB2 member issues message DSNB338I indicating that the rebuild has completed successfully.

If an error occurs during the rebuild, the rebuild is stopped. Each DB2 member issues message DSNB335I indicating the reason why the rebuild is stopping, followed by message DSNB339I indicating that the rebuild has not completed successfully. The operator can also stop rebuilds using the MVS SETXCF command.

---

**DSNB332I**

```
csect-name THIS MEMBER HAS COMPLETED CASTOUT OWNER WORK FOR GROUP BUFFER POOL gbpname PAGES CAST OUT FROM ORIGINAL STRUCTURE = value1 PAGES WRITTEN TO NEW STRUCTURE = value2
```

**Explanation:** This DB2 member has completed its part of the rebuild processing for the named group buffer pool for the page sets and partitions for which it is the castout owner.

`value1` indicates the number of pages that this member has castout to DASD for the rebuild. If the new structure has a sufficient number of data entries, then `value1` should normally be zero because DB2 writes the changed pages from the original structure to the new structure. However, if the new structure does not have sufficient space, then `value1` may be greater than zero because DB2 responds to insufficient space in the new structure by casting the changed pages in the original structure to DASD instead of writing them to the new structure.

`value2` indicates how many changed pages this member wrote to the new structure from the original as part of the rebuild process. If the new structure has sufficient space, then each DB2 that has connectivity to the original structure writes the changed pages for page sets and partitions for which it is the castout owner from the original structure to the new structure, and `value2` indicates the number of pages that the DB2 member wrote.
value1 and value2 would be zero if this member has no page set or partition castout ownership responsibility.

This message is issued by each DB2 member that has connectivity to the original group buffer pool, and it is always be preceded by message DSNB331l.

System Action: If this DB2 member is not the group buffer pool structure owner, then its rebuild work is done, and it notifies MVS that it has completed its part of the rebuild and awaits later notification that all members have completed. If this member is the structure owner, then it proceeds to its final sweep processing (see DSNB333l).

Refer to "System Action" for message DSNB331l for an explanation of the group buffer pool rebuild processing.

DSNB333I csect-name FINAL SWEEP COMPLETED FOR GROUP BUFFER POOL gbpname PAGES WRITTEN TO NEW STRUCTURE = value1

Explanation: DB2 has completed the final sweep for the rebuild of the named group buffer pool. A final sweep means that the DB2 member that is the group buffer pool structure owner ensures that all changed pages have either been cast out to DASD or have been written to the new structure after all the page set and partition owners have finished their work. If any changed pages are found in the original structure during the final sweep, then the structure owner writes them out to the new structure. value1 should be zero in most cases for a manual rebuild. value1 will probably be greater than zero in most cases where the rebuild was initiated because a DB2 lost connectivity to the group buffer pool.

This message is issued by the structure owner and is always preceded by message DSNB332l.

System Action: Immediately after issuing this message, the structure owner notifies MVS that the rebuild has completed, and MVS should begin notifying each participating member that the rebuild is complete.

Refer to "System Action" for message DSNB331l for an explanation of the group buffer pool rebuild processing.

DSNB335I csect-name REBUILD STOPPED FOR GROUP BUFFER POOL gbpname REASON = reason1 DB2 REASON CODE = reason2

Explanation: A rebuild has been stopped for the named group buffer pool.

reason1 indicates why the rebuild was stopped:

OPERATOR
The operator initiated an MVS SETXCF command to stop the rebuild.

LostConnNew
One or more of the DB2 members lost connectivity to the new group buffer pool structure while the rebuild was in progress.

LostConnOld
One or more of the DB2 members lost connectivity to the original group buffer pool structure while the rebuild was in progress.

StrFailNew
The new group buffer pool structure failed while the rebuild was in progress.

StrFailOld
The original group buffer pool structure failed while the rebuild was in progress.

DB2Reason
DB2 decided to stop the rebuild. The reason code given in reason2 indicates why DB2 stopped the rebuild.

InsuffConn
New structure does not provide connectivity that is better than or equivalent to the current structure.

NobetrConn
New structure does not provide better connectivity than the current structure for a LossConn rebuild

If reason1 indicates 'DB2Reason', then reason2 specifies a DB2 reason code that indicates why DB2 stopped the rebuild. If reason1 is not 'DB2Reason', then reason2 is zero.

This message is normally preceded by message DSNB331l, which indicates that the rebuild was started and the reason why the rebuild was started. This message is issued by each DB2 member participating in the rebuild. This message is followed by message DSNB339l.

System Action: The new structure is discarded. If the original structure is still usable, then all members that still have connectivity to the original structure resume using it. Members that do not have connectivity to the original structure disconnect, and their connections become failed-persistent.

If the original structure is not usable, then DB2 initiates damage assessment processing for the group buffer pool.

System Programmer Response: If the rebuild stopped because of "DB2Reason", see the explanation for the reason code given.
**DSNB338I** csect-name THE REBUILD FOR GROUP BUFFER POOL gbname HAS COMPLETED SUCCESSFULLY

**Explanation:** The rebuild for the named group buffer pool has successfully completed.

This message is preceded by message DSNB331I which indicates the reason why the rebuild was started. This message is issued by each DB2 member participating in the rebuild.

**System Action:** The original structure is discarded and all DB2s that are connected to the group buffer pool begin using the new structure.

---

**DSNB339I** csect-name THE STOP OF THE REBUILD FOR GROUP BUFFER POOL gbname HAS COMPLETED

**Explanation:** The stop of the rebuild for the named group buffer pool has completed.

This message is preceded by message DSNB335I which indicates the reason why the rebuild was stopped. This message is issued by each DB2 member participating in the rebuild.

**System Action:** The new structure is discarded. If the original structure is still usable, then all members that still have connectivity to the original structure resume using it, and members that do not have connectivity to the original structure disconnect and their connection goes into a failed-persistent state.

If the original structure is not usable, then DB2 initiates damage assessment processing for the group buffer pool.

---

**DSNB340I** csect-name UNEXPECTED ERROR DURING REBUILD FOR GROUP BUFFER POOL gbname MVS service-name RETURN CODE = rc MVS service-name REASON CODE = reason

**Explanation:** DB2 received an unexpected error from MVS during rebuild processing for the named group buffer pool.

service-name is one of the following:
- IXLEREBLD
- IXLEERSP

rc is the return code from the MVS service and reason is the reason code.

**System Action:** DB2 stops the rebuild.

**System Programmer Response:** See MVS/ESA Programming: Sysplex Services Reference for an explanation of the return and reason code for the named MVS service.

---

**DSNB350I** csect-name DBNAME database SPACE NAME spacename CANNOT BE AUTOMATICALLY RECOVERED. DB2 REASON CODE = reason

**Explanation:** Following a group buffer pool failure, DB2 cannot automatically recover the named table space or index space. reason specifies a DB2 reason code that indicates why DB2 could not initiate the recovery.

**Severity:** 4 (warning)

**System Action:** The table space or index space remains in group buffer pool recovery pending (GRECP) status and is inaccessible.

**User Response:** Use the DB2 -START DATABASE command on the table space or index space to remove the GRECP status and make the data accessible. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

---

**DSNB351I** csect-name DBNAME database SPACE NAME spacename PARTITION part# CANNOT BE AUTOMATICALLY RECOVERED. DB2 REASON CODE = reason

**Explanation:** Following a group buffer pool failure, DB2 cannot automatically recover the named table space or index space partition. reason specifies a DB2 reason code that indicates why DB2 could not initiate the recovery.

**Severity:** 4 (warning)

**System Action:** The partition remains in group buffer pool recovery pending (GRECP) status and is inaccessible.

**User Response:** Use the DB2 -START DATABASE command on the partition to remove the GRECP status and make the data accessible. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

---

**DSNB352I** csect-name AUTOMATIC RECOVERY CANNOT BE INITIATED FOR GROUP BUFFER POOL gbname REASON = reason

**Explanation:** Following a failure of the named group buffer pool, DB2 is not able to initiate automatic recovery.

reason indicates the reason why automatic recovery was not initiated:

**AUTORECNO**
The AUTOREC option is set to NO for the group buffer pool.
CONNRELEASE
At least one actively connected DB2 member is not at the proper release to support automatic recovery.

Severity: 4 (warning)

System Action: The page sets and partitions that are in group buffer pool recovery pending (GRECP) status remain inaccessible.

User Response: Use the DB2 -START DATABASE command on the page sets and partitions to remove the GRECP status and make the data accessible. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

If reason is AUTORECNO and you want to enable automatic recovery for the group buffer pool, use the ALTER GROUPBUFFERPOOL command to set AUTOREC to YES for the group buffer pool.

If reason is CONNRELEASE, then you must ensure that all DB2 members in the group are running at the appropriate release. Automatic recovery is not supported unless all members are running Version 5 or a later release.

---

**DSNB353I**  
csect-name ASYNCHRONOUS GRECP RECOVERY IN PROGRESS FOR GROUP BUFFER POOL bpoolname

**Explanation:** Following a group buffer pool failure, DB2 triggers an automatic recovery process to attempt to recover GRECP page sets for the specified group buffer pool. This message is issued once by any DB2 member who is the page set castout owner on one of the objects being recovered.

**System Action:** Check for the DSNB354I message to verify the completion of the automatic recovery process.

---

**DSNB354I**  
csect-name ASYNCHRONOUS GRECP RECOVERY HAS COMPLETED FOR GROUP BUFFER POOL bpoolname.

**Explanation:** DB2 has completed the GRECP recovery process for those GRECP page sets in the group buffer pool specified in the message. This message is issued once by any DB2 member who previously issued a DSNB353I message, who is the page set castout owner on one of the objects being recovered.

---

**DSNB357I**  
csect-name AUTOMATIC LPL RECOVERY SUPPRESSED FOR OBJECT TYPE object-type OBJECT NAME object-name REASON reasoncode

**Explanation:** One or more pages in the object that is identified in the message have been added to the logical page list (LPL). However, DB2 cannot initiate automatic LPL recovery due to an environmental condition that prevents automatic LPL recovery.

The object could be a table space, an index space, or a partition within a table space or an index space that is identified by the object-type. object-name identifies the name.

If the object is a table space or an index space, the format of the name is dbname.spacename. If the object is a partition within a table space or an index space, the format of the name is dbname.spacename.partnumber. dbname is the database name. spacename is the table space or the index space name. partnumber is the partition number.

reason indicates the condition that prevents DB2 from being able to initiate automatic LPL recovery. Here is a list of the potential values for reason:

- **DASD** DB2 encountered a DASD I/O error.
- **RESTART** DB2 is in Restart or End_Restart mode.
- **GBP** DB2 Group Buffer Pool structure failure or 100% loss of connectivity.

**System Action:** The Automatic LPL Recovery is not initiated.

**Programmer Response:** Check the reason that is specified to solve the system condition. To recover the LPL page, perform one of the following actions:

- Issue the START DATABASE command with the SPACENAM option
- Run the RECOVER or LOAD utility with REPLACE keyword.

---

**DSNB401I**  
BUFFERPOOL NAME bpname, BUFFERPOOL ID bpid, USE COUNT ucount

**Explanation:** This message contains the display information that results from a DISPLAY BUFFERPOOL command. For each buffer pool, this message is the first of a set of messages that display information from the DISPLAY BUFFERPOOL command.

The statistics are:

- **bpname** The buffer pool external name (BP0, BP1,..., BP49, BP8KB, BP16KB BP32K, BP32K1,..., BP32K9).
- **bpid** The buffer pool internal identifier (0-49, 80-89).
- **ucount** The number of open table spaces or index spaces that refer to this buffer pool. A zero use count means that the buffer pool is inactive.

**System Action:** Processing continues.
**DSNB402I** BUFFERPOOL SIZE = vpsize BUFFERS ALLOCATED = vpalc TO BE DELETED = vptbd IN-USE/UPDATED = vpcba

**Explanation:** This message, displayed by the DISPLAY BUFFERPOOL command, describes the allocation status of a buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

- **vpsize**: The user-specified buffer pool size
- **vpalc**: Number of allocated buffers in an active buffer pool
- **vptbd**: Number of buffers to be deleted in an active buffer pool because of pool contraction
- **vpcba**: Number of currently active (that is, not stealable) buffers in the buffer pool

**System Action:** Processing continues.

---

**DSNB404I** THRESHOLDS — VP SEQUENTIAL = vpseq DEFERRED WRITE = dwt VERTICAL DEFERRED WRT = dwv1,dwv2 PARALLEL SEQUENTIAL = vppseqt ASSISTING PARALLEL SEQT = vpxpseqt

**Explanation:** This message is displayed by the DISPLAY BUFFERPOOL command to describe the user-modifiable thresholds for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The input threshold variables are:

- **vpseq**: Sequential steal threshold for the virtual pool, expressed as a percentage of the total buffer pool size.
- **dwt**: Free buffer deferred write threshold for the buffer pool, expressed as a percentage of the total buffer pool size.
- **dwv1**: Vertical deferred write threshold for the buffer pool, expressed as a percentage of the total buffer pool size.
- **dwv2**: Vertical deferred write threshold for the buffer pool, expressed as an absolute number of buffers. **dwx2** is used to determine the threshold only if **dwv1** is zero and **dwv2** is non-zero; otherwise **dwv1** is used to determine the threshold.
- **vppseqt**: Sequential threshold for parallel query processing, expressed as a percentage of the virtual sequential steal threshold. When the threshold is set to 0, there is no parallel query processing support.

**vpxpseqt**
Assisting parallel sequential threshold, expressed as a percentage of the sequential threshold for parallel query processing. **vpxpseqt** allows you to control how much buffer resource is used when this DB2 is assisting another member of the group in parallel processing. When the threshold is set to 0, this buffer pool will not be used to assist other data sharing members in processing a query. In a non-data-sharing environment, this value is ignored.

**System Action:** Processing continues.

---

**DSNB406I** PAGE STEALING METHOD = pgsteal

**Explanation:** This message, displayed by the DISPLAY BUFFERPOOL command, describes the current and pending PGSTEAL attributes. This message is always preceded by message DSNB401I identifying the associated buffer pool.

**pgsteal** is the page stealing method (PGSTEAL) that is in use for the buffer pool.

- **LRU**: Specifies the buffer pool buffers are managed using the least recently used (LRU) algorithm. This is the default.
- **FIFO**: Specifies the buffer pool buffers are managed using the first in first out (FIFO) algorithm.

**System Action:** Processing continues.

---

**DSNB408I** NO DETAIL STATISTICS AVAILABLE FOR BUFFER POOL bpname

**Explanation:** This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It indicates that no detail statistics are available for the requested buffer pool because the pool was not activated since DB2 startup.

**System Action:** Processing continues.

---

**DSNB409I** INCREMENTAL STATISTICS SINCE basetime

**Explanation:** This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL(INTERVAL) option specified. It indicates the start time of the interval for which the statistics were accumulated (that is, either the time of the previous incremental display or the time the buffer pool was first activated, if there was no previous incremental display).

**System Action:** Processing continues.
**DSNB410I**  
*CUMULATIVE STATISTICS SINCE*  
*basetime*

**Explanation:** This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL(*) option specified. It indicates the start time of the interval for which the statistics were accumulated (that is, the time the buffer pool was first activated).

**System Action:** Processing continues.

---

**DSNB411I**  
*RANDOM GETPAGE = rgp SYNC READ*  
*I/O (R) = srr SEQ. GETPAGE = sgp*  
*SYNC READ I/O (S) = srs DMTH HIT = dmt PAGE-INS REQ = pir*

**Explanation:** This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists the page read statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

- **rgp** Number of nonsequential GETPAGE requests
- **srr** Number of synchronous read I/O operations for nonsequential GETPAGE requests
- **sgp** Number of sequential GETPAGE requests
- **srs** Number of synchronous read I/O operations for sequential GETPAGE requests
- **dmt** Number of times data management threshold was hit
- **pir** Number of page-Ins required for read I/O

**System Action:** Processing continues.

---

**DSNB412I**  
*SEQUENTIAL PREFETCH - REQUESTS = pft PREFETCH I/O = pio PAGES READ = pfp*

**Explanation:** This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists the sequential prefetch statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

- **pft** Number of times sequential prefetch was requested
- **pio** Number of sequential prefetch read I/O operations
- **pfp** Number of pages read because of sequential prefetch

**System Action:** Processing continues.

---

**DSNB414I**  
*DYNAMIC PREFETCH - REQUESTS = pft PREFETCH I/O = pio PAGES READ = pfp*

**Explanation:** This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists the dynamic prefetch statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

- **pft** Number of times dynamic prefetch was requested
- **pio** Number of dynamic prefetch read I/O operations
- **pfp** Number of pages read because of dynamic prefetch

**System Action:** Processing continues.

---

**DSNB415I**  
 PREFETCH DISABLED - NO BUFFER = pfd NO READ ENGINE = ree

**Explanation:** This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists prefetch statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

- **pfd** Number of times prefetch was disabled (no buffer)
- **ree** Number of times prefetch was disabled (no asynchronous read processor available)

**System Action:** Processing continues.
**DSNB420I** SYSPAGEUPDATES = sws SYS
PAGESWRITTEN = pws ASYNC WRITE
I/O = wio SYNC WRITE I/O = imw
PAGE-INSREQ = piri

**Explanation:** This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists page write statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sws</td>
<td>Number of system page updates</td>
</tr>
<tr>
<td>pws</td>
<td>Number of system pages written</td>
</tr>
<tr>
<td>wio</td>
<td>Number of asynchronous write I/O operations</td>
</tr>
<tr>
<td>imw</td>
<td>Number of synchronous write I/O operations</td>
</tr>
<tr>
<td>piri</td>
<td>Number of page-ins required for write I/O</td>
</tr>
</tbody>
</table>

**System Action:** Processing continues.

**DSNB421I** DWT Hit = dwt VERTICAL DWT Hit = vdw
NO WRITE ENGINE = wee

**Explanation:** This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists page-write statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dwt</td>
<td>Number of times deferred write threshold was hit</td>
</tr>
<tr>
<td>vdw</td>
<td>Number of times vertical deferred write threshold was hit</td>
</tr>
<tr>
<td>wee</td>
<td>Number of times write engine (asynchronous write processor) was not available for I/O operations</td>
</tr>
</tbody>
</table>

**System Action:** Processing continues.

**DSNB440I** PARALLEL ACTIVITY — PARALLEL REQUEST = tpa DEGRADED PARALLEL = dpa

**Explanation:** This message is issued in response to the DISPLAY BUFFERPOOL command with DETAIL specified. It lists statistics about parallel activities. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The variables are:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tpa</td>
<td>Total number of negotiations with the buffer pool for getting the requested number of sequential prefetch streams</td>
</tr>
<tr>
<td>dpa</td>
<td>Total number of times the negotiation resulted in the degraded mode of parallel operations</td>
</tr>
</tbody>
</table>

**DSNB420I** SYSPAGEUPDATES = sws SYS
PAGESWRITTEN = pws ASYNC WRITE
I/O = wio SYNC WRITE I/O = imw
PAGE-INSREQ = piri

**Explanation:** This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with LSTATS specified. It lists the number of cached pages and the number of changed pages in the buffer pool for a data set. The message is only issued if there are nonzero values to display. This message is always preceded by message DSNB401I identifying the associated buffer pool, DSNB464I or DSNB465I identifying the table space or index space, and DSNB466I identifying the data set.

The statistics are:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vcount</td>
<td>Number of cached pages in VP for the data set (that is, the number of buffers that contain pages for the data set in the buffer pool)</td>
</tr>
<tr>
<td>mvcount</td>
<td>Maximum number of cached pages in VP for the data set since the last DISPLAY BUFFERPOOL command with the LSTATS option was issued</td>
</tr>
<tr>
<td>ccoun</td>
<td>Number of changed pages in VP for the data set (that is, the number of buffers that were changed in the buffer pool for the data set)</td>

**System Action:** Processing continues.

---

**DSNB456I**  
**ASYNCHRONOUS I/O DELAYS —**  
**AVG DELAY = avd  MAXIMUM DELAY = mxd  TOTAL PAGES = tpg  TOTAL I/O COUNT = tio**

**Explanation:** This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with the LSTATS option specified. It lists asynchronous I/O delay statistics for a data set belonging to an open table space or index space associated with the buffer pool. The values listed are incremental since the last display for the data set. The message is only issued if there are nonzero values to display. This message is always preceded by message DSNB401I identifying the associated buffer pool, DSNB464I or DSNB465I identifying the table space or index space, and DSNB466I identifying the relative data set within the table space or index space.

The statistics are:

- **avd**  Average I/O delay in milliseconds for pages in the data set
- **mxd**  Maximum I/O delay in milliseconds for pages in the data set
- **tpg**  Total number of pages read or written for the data set
- **tio**  Total number of I/Os issued for the data set

**System Action:** Processing continues.

---

**DSNB459I**  
**csect-name OPEN FAILURE HAS OCCURRED FOR DATA SET dsn**

**Explanation:** This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with the LIST option specified. It indicates that a previous attempt to access a data set (identified by its relative data set number within a table space or index space) failed due to an allocation or open error.

This message is always preceded by a DSNB401I message identifying the associated buffer pool and a DSNB464I or DSNB465I message identifying the table space or index space.

**System Action:** Processing continues.

---

**DSNB460I**  
**--PAGE SET/PARTITION LIST INFORMATION—DATA SHARING INFO-- TS GBP MEMBER CASTOUT USE P-LOCK DATABASE SPACE NAME PART IX DEP NAME OWNER COUNT STATE**

**Explanation:** This message displays the column headings that indicate the beginning of a multiple line display generated by a DISPLAY BUFFERPOOL command. The format of the multiple line display has three parts:

- The column headers (DSNB460I), which are underlined
- Detailed space information for all spaces and partitions requested by the command (DSNB462I)
- An ending message (DSNB463I) that might be displayed if no spaces matched the command criteria

The text of message DSNB462I provides the detail lines that follow the headings generated by this message. If the DISPLAY BUFFERPOOL LIST command finds more than 255 lines of output to display, the report will be broken up and new headings (DSNB460I) will be displayed with "(CONTINUED)" showing in the heading text. This is needed due to the MVS limitation of 255 messages for multi-line WTO messages.

**System Action:** Processing continues.

---

**DSNB461I**

**Explanation:** This message appears within a multiple line display generated by a DISPLAY BUFFERPOOL command. It follows message DSNB460I and is used to underline the column headings that are displayed by DSNB460I.

**System Action:** Processing continues.

---

**DSNB462I**  
**database spacename part ty gbp mbr castout use p-lock**

**Explanation:** This message displays the detail lines generated by a DISPLAY BUFFERPOOL command. It follows DSNB460I.

The detail lines contain the following information (for report readability, the fields for DBNAME and SPACE NAME might be blank. When either field is blank, one of the prior detail lines contains the suppressed value).

- **database**  Name of the database that is associated with the page set/partition.
- **spacename**  Name of the table space or index space.
- **part**  The partition number. It is blank for a simple table space or simple index space. For non partitioned indexes on a partitioned table
space, it is the logical partition number preceded by the character L (for example, L01).

ty  Whether the object is a table space (TS) or an index space (IX).

gbp  Whether the page set/partition is GBP-dependent ('Y' for yes; 'N' for no).

mbr  Name of the member that the detail line pertains to.

castout  Whether the member identified in this line is the castout owner ('Y' for yes; blank for no).

use  Number of active claimers or drainers for the page set/partition for the member displayed on this detail line.

p-lock  P-lock state that the member identified in this line currently holds. Values are:

IS  R/O interest. There are other members who have interest in this page set/partition. The page set/partition is GBP-dependent.

IX  R/W interest. There are other members who have interest in this page set/partition. The page set/partition is GBP-dependent.

S  R/O interest. There may be other members reading the page set/partition. The page set/partition is not GBP-dependent.

SIX  R/W interest. There may be other members who are reading the page set/partition. The page set/partition is GBP-dependent.

NSU  R/W interest. The page set/partition is GBP-dependent.

X  R/W interest. There are no other members accessing the page set/partition. The page set/partition is not GBP-dependent.

US  A temporary state that can be held by a restarting DB2 when 'waiting for retained locks' is enabled.

###  A number that is to be used as a diagnostic aid. A number is displayed only when a DISPLAY BUFFERPOOL command encounters a lock state other than any of those defined above.

System Action:  Processing continues.

### NO OBJECTS MATCHED

**LIST/LSTATS SELECTION CRITERIA**

**Explanation:**  This message appears as part of the DISPLAY BUFFERPOOL output if the command did not find any page sets/partitions that matched the selection criterion. For example, the message would be displayed for DIS BPOOL(BP0) GBPDEP(Y) if the command did not find any page sets/partitions that were GBP-dependent.

**User Response:**  If you expected to see a list of page sets/partitions, ensure that the syntax of the command was coded correctly. Consider adding or changing the filter keywords to obtain a list of page sets/partitions.

**System Action:**  The command terminates normally.

**TS USE DATABASE SPACE NAME PART IX**

**COUNT =========**

**Explanation:**  This message displays underlined column headings that indicate the beginning of a multiple line display generated by a DISPLAY BUFFERPOOL command. The format of the multiple line display has three parts:

- Underlined column headings (DSNB464I).
- Detailed space information for the spaces and partitions that are requested by the command (DSNB465I).
- An ending message (DSNB463I) that may be displayed if no spaces matched the command criteria.

The text of message DSNB465I provides the detail lines that follow the headings generated by this message. If the DISPLAY BUFFERPOOL LIST command finds more than 255 lines of output to display, the report will be broken up and new headings (DSNB464I) will be displayed with '(CONTINUED) showing in the heading text. This is needed due to the MVS limitation of 255 messages for multi-line WTO messages.

**System Action:**  Processing continues.

**database**  

**spacenam**  

**part ty use**  

**Explanation:**  This message displays the detail lines generated by the DISPLAY BUFFERPOOL command. It follows DSNB464I.

The detail lines contain the following information (for report readability, the fields for DBNAME and SPACE NAME might be blank. When either field is blank, one of the prior detail lines will contain the suppressed value).

**database**  

Name of the database that is associated with the page set/partition.

**spacenam**  

Name of the table space or index space.
System Action: The command ignores the keyword and terminates normally.

**DSNB469I**  
**keyword1** KEYWORD IS IGNORED WHEN **keyword2** KEYWORD IS SPECIFIED

Explanation: Keyword1 is incompatible with keyword2. For example, in command DIS BPOOL(BP0) GBPDEP(Y) LSTATS(*), keyword GBPDEP indicates that a list of page sets or partitions are desired (as in LIST keyword); however, keyword GBPDEP is ignored because LIST and LSTATS are two different reports.

User Response: Omit keyword1 if keyword2 is used on the next entry of the command.

System Action: The command ignores keyword1 and terminates normally.

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with the LSTATS option specified. It identifies the page set/partition type (table space/index space), database name, space name, number of claimers/drainers and the relative data set number within a table space or index space for the statistics displayed in one or more of the messages that follow this one.

**type** Whether the page set/partition is a table space (TABLE SPACE) or an index space (INDEX SPACE).

dbname Database name

spacenam Name of the table space or index space.

dsn# The relative data set number within a table space or index space for the statistics displayed in one or more of the messages that follow this one.

ucount Number of applications with a claim or drain on the page set/partition.

System Action: Processing continues.

Explanation: An invalid buffer pool name was specified on an ALTER BUFFERPOOL or DISPLAY BUFFERPOOL command. THE VALID NAMES ARE BP0, BP1,..., BP49, BP32K, BP32K1,...BP32K9.

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER BUFFERPOOL or DISPLAY BUFFERPOOL command, specifying a valid buffer pool name.

**DSNB502I**  
**csect-name** VPSIZE FOR **bpname** MUST BE BETWEEN **llimit** AND **ulimit**

Explanation: An attempt was made to change a buffer pool's VPSIZE to an invalid value using the ALTER BUFFERPOOL command. VPSIZE is the number of buffers in the buffer pool.

**bpname** Buffer pool name.

**llimit** Lower limit for buffer pool's VPSIZE. For BP0, the lower limit is 2000. For BP8K0, the lower
limit is 1000. For BP16K0, the lower limit is 500. For all other buffer pools, the lower limit is 0.

ulimit  Upper limits for buffer pool’s VPSIZE. The upper limit is as follows:
• 250000000 for 4KB page-size buffer pools
• 125000000 for 8KB page-size buffer pools
• 62500000 for 16KB page-size buffer pools
• 31250000 for 32KB page-size buffer pools

System Action:  The request is rejected.
System Programmer Response:  Reissue the ALTER BUFFERPOOL command, specifying a legitimate VPSIZE value.

DSNB504I  VPSEQT FOR bpname MUST BE BETWEEN 0 AND 100

Explanation:  An ALTER BUFFERPOOL command was issued to try to alter a buffer pool’s VPSEQT attribute to an invalid value. VPSEQT is the buffer pool sequential steal threshold. Valid values range from 0 to 100.

System Action:  The request is rejected.
System Programmer Response:  Reissue the ALTER BUFFERPOOL command, specifying a legitimate VPSEQT value.

DSNB506I  DWQT FOR bpname MUST BE BETWEEN 0 AND 90

Explanation:  An attempt was made to change a buffer pool’s DWQT attribute value using the ALTER BUFFERPOOL command. DWQT is the free buffer deferred write threshold. Valid values range from 0 to 90.

System Action:  The request is rejected.
System Programmer Response:  Reissue the ALTER BUFFERPOOL command, specifying a legitimate DWQT value.

DSNB507I  VDWQT FOR bpname MUST BE BETWEEN 0 AND 90

Explanation:  An attempt was made to change a buffer pool’s VDWQT attribute to an invalid value using the ALTER BUFFERPOOL command. VDWQT is the vertical deferred write threshold. Valid values range from 0 to 90.

System Action:  The request is rejected.
System Programmer Response:  Reissue the ALTER BUFFERPOOL command, specifying a legitimate VDWQT value.

DSNB508I  csect-name THE TOTAL VPSIZE IS BEYOND THE MAXIMUM LIMIT

Explanation:  An ALTER BUFFERPOOL command specified a VPSIZE or VPTYPE value that would cause the sum of the $ssnm$DBM1 address space storage requirements for all buffer pools to exceed 1TB. When calculating the storage requirements for the buffer pools, DB2 uses the page size (4K, 8K, 16K, or 32K) for each pool buffer.

System Action:  The buffer pool’s VPSIZE or VPTYPE is not changed. Processing for other parameters, if requested, proceeds normally.
System Programmer Response:  Rebalance VPSIZE for all buffer pools.

DSNB509I  NO ACTION REQUESTED

Explanation:  An ALTER BUFFERPOOL command was issued, but no buffer pool attributes were specified.

System Action:  The buffer pool’s attributes are not changed.
System Programmer Response:  Reissue the ALTER BUFFERPOOL command specifying one or more buffer pool attributes.

DSNB510I  VDWQT CANNOT BE GREATER THAN DWQT

Explanation:  An ALTER BUFFERPOOL command specified a DWQT and/or VDWQT value that would result in the buffer pool’s VDWQT parameter being greater than its DWQT parameter.

System Action:  The buffer pool’s VDWQT or DWQT is not changed. Processing for other parameters, if requested, proceeds normally.
System Programmer Response:  Rebalance DWQT and VDWQT for the buffer pool.

DSNB511I  integer IS THE CURRENT VPSIZE FOR BUFFER POOL bpname

Explanation:  An ALTER BUFFERPOOL command specified a VPSIZE equal to the buffer pool’s current buffer pool size.

System Action:  The buffer pool size is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB512I  integer IS THE CURRENT VPSEQT FOR BUFFER POOL bpname

Explanation:  An ALTER BUFFERPOOL command specified an VPSEQT equal to the current sequential steal threshold of the buffer pool.

System Action:  The buffer pool sequential threshold
is not changed. Processing for other parameters, if requested, proceeds normally.

**DSNB516I**  
**integer IS THE CURRENT DWQT FOR BUFFER POOL bpname**  
**Explanation:** An ALTER BUFFERPOOL command specified a DWQT equal to the current deferred write threshold of the buffer pool.  
**System Action:** The deferred write threshold of the buffer pool is not changed. Processing for other parameters, if requested, proceeds normally.

**DSNB517I**  
**int1,int2 IS THE CURRENT VDWQT FOR BUFFER POOL bpname**  
**Explanation:** An ALTER BUFFERPOOL command specified a VDWQT equal to the current vertical deferred write threshold of the buffer pool.  
**System Action:** The vertical deferred write threshold of the buffer pool is not changed. Processing for other parameters, if requested, proceeds normally.

**DSNB519I**  
**csect-name PGSTEAL for bpname HAS BEEN SET TO value.**  
**Explanation:** This message is issued in response to an ALTER BUFFERPOOL command to indicate that the requested change to the PGSTEAL parameter was accepted.  
*bpname* is the name of the buffer pool.  
*value* is one of the following:  
LRU The buffer pool buffers are managed using the least recently used (LRU) algorithm. This is the default.  
FIFO The buffer pool buffers are managed using the first in first out (FIFO) algorithm.  
**System Action:** Processing continues.

**DSNB520I**  
**READY TO EXPLICITLY DELETE BUFFER POOL bpname**  
**Explanation:** This message is issued before draining an active buffer pool in response to an ALTER BUFFERPOOL command, which specified VPSIZE=0 against an active buffer pool.  
**System Action:** After this message is issued, DB2 quiesces all current activities against this buffer pool. DB2 locks the table space exclusively and performs physical close for all open table spaces or index spaces that reference this pool. DB2 also prevents subsequent database access that references this pool. SQL applications get an SQLCODE -904 (resource not available) with reason code 00C200E0 to indicate that the requested buffer pool size is not initialized. After the requested buffer pool is deleted, message DSNB521I is issued.

**DSNB521I**  
**BUFFER POOL bpname HAS BEEN EXPLICITLY DELETED**  
**Explanation:** This message is issued after an active buffer pool is explicitly deleted with an ALTER BUFFERPOOL command. This message is always preceded by a corresponding DSNB520I message.  
**System Action:** The virtual storage and hiperspaces associated with this buffer pool are released.

**DSNB522I**  
**VPSIZE FOR bpname HAS BEEN SET TO integer**  
**Explanation:** This message is issued in response to an ALTER BUFFERPOOL command to indicate that the requested change to the VPSIZE parameter was accepted. For an active pool, the actual expansion, contraction, or deletion does not take place until after this message is issued.  
**System Action:** Processing continues.  
**System Programmer Response:** Issue the DISPLAY BUFFERPOOL command to determine the actual virtual storage usage for this pool.

**DSNB524I**  
**VPSEQT for bpname HAS BEEN SET TO integer**  
**Explanation:** This message is issued in response to an ALTER BUFFERPOOL command. It indicates the successful modification of the sequential steal threshold of the buffer pool.

**DSNB526I**  
**DWQT FOR bpname HAS BEEN SET TO integer**  
**Explanation:** This message is issued in response to an ALTER BUFFERPOOL command. It indicates the successful modification of the deferred write threshold of the buffer pool.

**DSNB527I**  
**VDWQT for bpname HAS BEEN SET TO int1,int2**  
**Explanation:** This message is issued in response to an ALTER BUFFERPOOL command. It indicates the successful modification of the vertical deferred write threshold of the buffer pool.

**DSNB529I**  
**VPPSEQT for bpname HAS BEEN SET TO integer**  
**Explanation:** This message is issued in response to the ALTER BUFFERPOOL command. It indicates the successful modification of the parallel sequential steal threshold of the buffer pool.
**DSNB530I**  
integer IS THE CURRENT VPXPSEQT FOR BUFFER POOL bpname

**Explanation:**  
An ALTER BUFFERPOOL command specified a VPXPSEQT equal to the current parallel sequential steal threshold of the buffer pool.

**System Action:**  
The parallel sequential steal threshold of the buffer pool is not changed. Processing for other parameters, if requested, proceeds normally.

---

**DSNB531I**  
VPXPSEQT FOR bpname MUST BE BETWEEN 0 AND 100

**Explanation:**  
An ALTER BUFFERPOOL command was issued to alter a buffer pool's VPXPSEQT attribute to an invalid value. VPXPSEQT is the parallel sequential steal threshold of the buffer pool. Valid values range from 0 to 100.

**System Action:**  
The VPXPSEQT value is not changed.

**System Programmer Response:**  
Change the VPXPSEQT attribute to a valid value and reenter the command.

---

**DSNB532I**  
VPXPSEQT FOR bpname HAS BEEN SET TO integer

**Explanation:**  
This message is issued from DSNB1ABP csect in response to the ALTER BUFFERPOOL command. It indicates the successful modification of the assisting parallel sequential threshold of the buffer pool.

**System Action:**  
The assisting parallel sequential threshold of the buffer pool is not changed. Processing for other parameters, if requested, proceeds normally.

---

**DSNB533I**  
integer IS THE CURRENT VPXPSEQT FOR BUFFER POOL bpname

**Explanation:**  
An ALTER BUFFERPOOL command specified a VPXPSEQT equal to the current assisting parallel sequential threshold of the buffer pool.

**System Action:**  
The assisting parallel sequential threshold of the buffer pool is not changed. Processing for other parameters, if requested, proceeds normally.

---

**DSNB534I**  
VPXPSEQT FOR bpname MUST BE BETWEEN 0 AND 100

**Explanation:**  
An ALTER BUFFERPOOL command was issued to change a buffer pool's VPXPSEQT attribute to an invalid value. VPXPSEQT is the assisting parallel sequential threshold of the virtual buffer pool. Valid values range from 0 to 100. This message is issued from DSNB1ABP csect.

**System Action:**  
The VPXPSEQT value is not changed.

**System Programmer Response:**  
Change the VPXPSEQT attribute to a valid value and reenter the command.

---

**DSNB536I**  
csect-name THE TOTAL VIRTUAL BUFFER POOL STORAGE CAPACITY EXCEEDS THE REAL STORAGE CAPACITY

**Explanation:**  
This message is issued as a warning that the total amount of allocated virtual buffer pool storage for this DB2 subsystem has exceeded the real storage capacity of the z/OS image. The amount of real storage should be at least as much as the total amount of virtual buffer pool storage, and should also be enough to accommodate the EDM pool and DB2 working storage in addition to the virtual buffer pool storage. Paging activity in the buffers is an indication of a performance problem.

**System Action:**  
Processing continues.

**System Programmer Response:**  
Allocate more real storage to the z/OS image. If there is not enough real storage to hold the buffers, then the number of buffers needs to be reduced. This might mean fewer concurrent users. If the number of buffers is reduced, then DB2 will issue the DSNB538I message when the total amount of virtual buffer pool storage no longer exceeds the real storage capacity.

---

**DSNB538I**  
csect-name THE TOTAL BUFFER POOL STORAGE NO LONGER EXCEEDS THE REAL STORAGE CAPACITY

**Explanation:**  
This message is issued following a previous DSNB536I message to indicate that the total amount of allocated buffer pool storage for this DB2 subsystem no longer exceeds the real storage capacity of the z/OS image.

**System Action:**  
Processing continues.

---

**DSNB539I**  
KEYWORD keyw-old IS NO LONGER SUPPORTED. THE SPECIFIED VALUE IS IGNORED.

**Explanation:**  
An ALTER BUFFERPOOL command specified a keyword that is no longer supported.

**System Action:**  
The keyword and its specified value are ignored. Processing for other parameters, if requested, proceeds normally.

---

**DSNB540I**  
csect-name INSUFFICIENT LOCAL CACHE VECTOR STORAGE TO EXPAND BUFFER POOL bpname TO SPECIFIED SIZE size1. BUFFER POOL SIZE IS NOW size2.

**Explanation:**  
The specified buffer pool could not be expanded to the requested size (size1). The associated group buffer pool is connected, and the local cache vector could not be expanded to cover the requested buffer pool size.

The local cache vector is a bit array which tracks whether the page in a given buffer was modified by...
another system (cross-invalidated). There must be one bit in the vector for each buffer in the buffer pool. For more information on the local cache vector, see MVS/ESA Programming: Sysplex Services Reference.

System Action: DB2 downgrades the expansion request to the size that can be supported by the available local cache vector storage (size2).

System Programmer Response: Free local cache vector storage by contracting or deleting other buffer pools that are connected to a group buffer pool. Then reattempt the pool expansion by reissuing the ALTER BUFFERPOOL command.

DSNB551I  BSDS READ ERROR, RC= integer, RSN=integer

Explanation: This message is issued in response to a failure of a READ function on the bootstrap data set (BSDS). Users should check any previous error messages issued by MVS and DB2 against the corresponding BSDS. RC and RSN indicate an error return code and reason code from the BSDS function.

System Action: Processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the return and reason codes to determine what type of error occurred. Refer to message DSNJ107I for more information.

DSNB552I  BSDS WRITE ERROR, RC= integer, RSN=integer

Explanation: This message is issued in response to a failure of a WRITE function on the bootstrap data set (BSDS). Check any previous error messages issued by MVS and DB2 against the corresponding BSDS. RC and RSN indicate an error return code and reason code from the BSDS function.

System Action: Processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the return and reason codes to determine what type of error occurred. Refer to message DSNJ108I for more information.

DSNB553I  BSDS INSERT ERROR, RC= integer, RSN=integer

Explanation: This message is issued in response to a failure of an INSERT function on the bootstrap data set (BSDS). Check any previous error messages issued by MVS and DB2 against the corresponding BSDS. RC and RSN indicate an error return code and reason code from the BSDS function.

System Action: Processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the return and reason codes to determine what type of error occurred. For more information, refer to message DSNJ109I or other DSNJ messages related to BSDS.

DSNB602I  BUFFER POOL bpname FULL

Explanation: A buffer is required to access a database page that is not currently contained within the buffer pool. A buffer cannot be assigned because all buffers in the buffer pool are in a nondisplaceable state. (Buffers are in a nondisplaceable state when they contain actively referenced pages or updated pages for which writes are pending.)

This message can occur if there is an overload of concurrent activity for the buffer pool size. The variable bpname is the buffer pool external name.

System Action: Reason code 00C200E9 and the buffer pool external name are recorded in the cursor table (CT), which is available in the SQL communication area (SQLCA) or messages. An SQLCODE -904 (resource not available) is returned to the user.

Operator Response: Notify the system programmer.

System Programmer Response: Do one of the following:
- Reduce concurrent activity by reducing the number of DB2 threads.
- Use the ALTER BUFFERPOOL command to increase the size of the buffer pool.

DSNB602I  UNABLE TO CREATE BUFFER POOL bpname. BUFFER POOL SIZE IS ZERO

Explanation: An attempt to create the buffer pool failed while opening a DB2 table space or index that specified its use. The buffer pool size for bpname was zero. This indicates that the use of the pool is invalid.

System Action: Reason code 00C200E0 and the buffer pool external name are recorded in the cursor table (CT), which is available in the SQL communication area (SQLCA) or messages. An SQLCODE -904 (resource not available) is returned to the user.

Operator Response: Notify the system programmer.

System Programmer Response: Use the ALTER TABLESPACE or ALTER INDEX statement to modify affected table spaces or indexes to indicate a usable buffer pool. Use the DISPLAY BUFFERPOOL command to determine a usable buffer pool. If necessary, use the ALTER BUFFERPOOL command to activate the failing buffer pool by setting its VPSIZE to a nonzero value.
**DSNB603I** INSUFFICIENT STORAGE TO CREATE/EXPAND BUFFER POOL
bpname TO SPECIFIED SIZE integer.
BUFFER POOL SIZE IS NOW integer.

**Explanation:** A buffer pool could not be created or expanded to the requested size. Insufficient storage exists within the ssnmDBM1 address space to build the buffer pool. The buffer pool size is set by the ALTER BUFFERPOOL command and can be queried by using the DISPLAY BUFFERPOOL command.

**System Action:** The buffer pool is created or expanded to the size allowed by the available storage. If the buffer pool cannot be created at all, and the creation request was triggered by a page set open by an application, then an SQLCODE -904 (resource not available) is returned to the user. Reason code 00C200E8 and the buffer pool external name are recorded in the cursor table (CT), which is available in the SQL communication area (SQLCA) or messages.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Analyze the storage content of the ssnmDBM1 address space to determine further action. If appropriate, use the ALTER TABLESPACE or ALTER INDEX statement to use a different buffer pool. Otherwise, use ALTER BUFFERPOOL commands to balance storage use for all buffer pools.

---

**DSNB603I** UNABLE TO CREATE BUFFER POOL
bpname TO SPECIFIED SIZE DURING STARTUP/RESTART. INSUFFICIENT VIRTUAL STORAGE

**Explanation:** An attempt to create the buffer pool failed at the time that DB2 was performing its startup or restart processing. Insufficient virtual storage exists within the ssnmDBM1 address space for building the buffer pool. The name of the buffer pool is bpname.

**System Action:** The buffer pool is not created. The table space or index open request, which triggered the attempt to create the buffer pool, fails. An SQLCODE -904 (resource not available) is returned to the user. Reason code 00C200E8 and the buffer pool external name are recorded in the cursor table (CT), which is available in the SQL communication area (SQLCA) or messages.

**Operator Response:** Notify the system programmer. This message remains on the console until the operator deletes it.

**System Programmer Response:** Analyze the virtual storage content of the DSNDDBM1 ssnmDBM1 address space to determine further action. If appropriate, use ALTER BUFFERPOOL commands to balance virtual storage use for all buffer pools.

---

**DSNB609I** BUFFER POOL bpname CREATED USING DEFAULT SIZE integer DURING STARTUP/RESTART. BUFFER POOL SIZE IS ZERO

**Explanation:** While activating a buffer pool during DB2 startup or restart processing, the buffer pool size was zero. A zero value might be caused by an unusable bootstrap data set (BSDS) or by a DB2 abnormal termination after buffer pool size was altered to zero. The name of the buffer pool is bpname and the default buffer pool size is integer.

**System Action:** DB2 creates the buffer pool using the startup restart default value. For 4KB/32KB page-type buffer pools, the default values are 1000 and 12, respectively.

**Operator Response:** Notify the system programmer. This message remains on the console until deleted by the operator.

**System Programmer Response:** Use the ALTER TABLESPACE or ALTER INDEX statement to modify the affected table spaces or indexes to indicate a usable buffer pool. To determine a usable buffer pool, use the DISPLAY BUFFERPOOL command. If necessary, use the ALTER BUFFERPOOL command to activate the failing buffer pool by setting the VPSIZE to a nonzero value.

---

**DSNB610I** csect-name MAXIMUM ALLOCATABLE BUFFER POOL STORAGE OF int1MB HAS BEEN REACHED. UNABLE TO CREATE/EXPAND BUFFER POOL
bp-name TO SPECIFIED SIZE int2.
BUFFER POOL IS NOW int3

**Explanation:** A buffer pool could not be created or expanded to the requested size. The maximum amount of allowable buffer pool storage, indicated by int1, has been reached. The maximum allowable buffer pool storage is calculated to be twice the amount of real storage that is available on the z/OS image, or 1TB, whichever is less.

**bpname**
Indicates the name of the buffer pool that was affected.

**int2**
Indicates the size of the buffer pool that was requested.

**int3**
Indicates the actual size of the buffer pool that was created/expanded.

**System Action:** The buffer pool is created or expanded to the size allowed by the available storage within the maximum. If the maximum has already been reached, then the buffer pool is allocated at a minimum size as follows:

- 2,000 pages for 4K page size
- 1,000 pages for 8K page size
This message is issued by each DB2 member participating in establishing duplexing.

System Action: Processing of mainline requests is resumed for the group buffer pool. Writes of changed pages to the group buffer pool will be duplexed writes from this point forward.

DSNB743I csect-name DUPLEXING IS BEING STOPPED FOR GROUP BUFFER POOL gbpname FALLING BACK TO PRIMARY REASON = reason1 DB2 REASON CODE = reason2

Explanation: Duplexing is being stopped for the named group buffer pool. To stop the duplexing, the secondary group buffer pool will be deallocated, and DB2 will go back to simplex mode on the primary group buffer pool.

reason1 indicates why duplexing was stopped:

OPERATOR
The operator initiated an MVS command to stop duplexing.

POLICY
A new CFRM policy has been activated which specifies DUPLEX(DISABLED) for the group buffer pool.

LOSSCONNS
One or more of the DB2 members lost connectivity to the secondary group buffer pool structure.

STRFAILSEC
The secondary group buffer pool structure failed.

DB2REASON
DB2 decided to stop duplexing. The reason code given in reason2 indicates why DB2 stopped duplexing.

DUPCONNCHG
Duplexing rebuild stopped because of insufficient connectivity due to a change in the set of connectors.

If reason1 indicates 'DB2REASON', then reason2 specifies a DB2 reason code that indicates why DB2 stopped duplexing. If reason1 is not 'DB2REASON', then reason2 is zero.

This message is issued by each DB2 member connected to the duplexed group buffer pool.

System Action: The secondary group buffer pool structure is discarded, and DB2 enters back into simplex mode on the primary group buffer pool structure. If DUPLEX(AUTO) is specified in the active CFRM policy for the group buffer pool, then duplexing will be automatically reinitiated, if duplexing is still possible.
System Programmer Response: If the rebuild stopped because of "DB2REASON", see the explanation for the reason code given. If duplexing is not automatically reinitiated and duplexing is desired for the group buffer pool, then use the MVS SETXCF command to reestablish duplexing.

DSNB744I  csect-name DUPLEXING IS BEING STOPPED FOR GROUP BUFFER POOL gbpname, SWITCHING TO SECONDARY REASON = reason1  DB2 REASON CODE = reason2

Explanation: Duplexing is being stopped for the named group buffer pool. To stop the duplexing, the primary group buffer pool will be deallocated, and DB2 will switch to the secondary group buffer pool to go back to simplex mode.

reason1 indicates why duplexing was stopped:

OPERATOR
The operator initiated an MVS command to stop duplexing.

POLICY
A new CFRM policy has been activated which specifies DUPLEX(DISABLED) for the group buffer pool.

LOSSCONNPRI
One or more of the DB2 members lost connectivity to the primary group buffer pool structure.

STRFAILPRI
The primary group buffer pool structure failed.

DB2REASON
DB2 decided to stop duplexing. The reason code given in reason2 indicates why DB2 stopped duplexing.

If reason1 indicates 'DB2REASON', then reason2 specifies a DB2 reason code that indicates why DB2 stopped duplexing. If reason1 is not 'DB2REASON', then reason2 is zero.

This message is issued by each DB2 member connected to the duplexed group buffer pool.

System Action: The primary group buffer pool structure is discarded, and DB2 enters back into simplex mode on the secondary group buffer pool structure. If DUPLEX(ENABLED) is specified in the active CFRM policy for the group buffer pool, then duplexing will be automatically reinitiated, if duplexing is still possible.

System Programmer Response: If the rebuild stopped because of "DB2REASON", see the explanation for the reason code given. If duplexing is not automatically reinitiated and duplexing is desired for the group buffer pool, then use the MVS SETXCF command to reestablish duplexing.

DSNB745I  csect-name THE TRANSITION BACK TO SIMPLEX MODE HAS COMPLETED FOR GROUP BUFFER POOL gbpname

Explanation: The named group buffer pool has completed the transition from duplex mode back to simplex mode.

This message is preceded either by message DSNB743I or by message DSNB744I which indicates the reason why duplexing was stopped. This message is issued by each DB2 member connected to the group buffer pool.

System Action: The group buffer pool is now back in simplex mode which means that writes of changed pages to the group buffer pool are now simplexified. If DUPLEX(ENABLED) is specified in the active CFRM policy for the group buffer pool, then duplexing will be automatically reinitiated, if duplexing is still possible. This would mean that the group buffer pool is only temporarily back into simplex mode (it is soon to be entered back into duplex mode).

DSNB749I  GBPCACHE NO IS NOT ALLOWED FOR GROUP BUFFER POOL gbpname BECAUSE IT IS DUPLEXED

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that requests a change of the GBPCACHE attribute from YES to NO, but because the group buffer pool is duplexed, the change from YES to NO is not allowed.

System Action: The request to change from GBPCACHE(YES) to GBPCACHE(NO) is rejected.

System Programmer Response: GBPCACHE(NO) and duplexing are mutually exclusive. If you want GBPCACHE(NO), then you must put the group buffer in simplex mode before specifying GBPCACHE(NO). To put a duplexed group buffer pool in simplex mode, do any of the following procedures:

- Activate a new CFRM policy that specifies DUPLEX(DISABLED) for the group buffer pool. This is the preferred method if you do not intend to duplex the group buffer pool again for awhile.
- Ensure that DUPLEX(AUTO) is not specified in the active CFRM policy for the group buffer pool, and then issue the MVS command SETXCF STOP,REBUILD,DUPLEX.

DSNB750I  DISPLAY FOR GROUP BUFFER POOL gbpname FOLLOWS

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command. It signals the beginning of a display for group buffer pool gbpname if the following are true:

- It meets the selection criteria on the command.
The MVS CFRM administrative policy information for the group buffer pool is accessible.

If the CFRM policy information is unavailable, message DSNB751I signals the partial display of group buffer pool information.

The series of messages DSNB755I through DSNB759I provide information on the group buffer pool's allocation characteristics. Messages DSNB756I through DSNB769I provide information on DB2 connections to the group buffer pool, while DSNB770I through DSNB788I provide statistics on group buffer pool usage. Note that all message numbers in the range might not be used. Message DSNB790I ends the display.

**Explanation:**

**DSNB751I**

MVS CFRM POLICY INFORMATION

NOT AVAILABLE FOR GROUP BUFFER POOL gbname MVS IXQUERY

RETURN CODE = retcode MVS IXQUERY REASON CODE = reason A PARTIAL DISPLAY FOLLOWS

**Explanation:**

DB2 could not retrieve group buffer pool policy information in response to a DISPLAY GROUPBUFFERPOOL command. Either the MVS query request (IXQUERY) did not successfully complete, or the backing structure for the group buffer pool is not defined in the MVS CFRM administrative policy. To determine the exact reason, examine return code retcode and reason code reason A returned by MVS on the query request. For an explanation of the IXQUERY codes, see MVS/ESA Programming: Sysplex Services Reference. If the IXQUERY request did not complete successfully, no CONNLIST information, even if requested, is provided.

**System Action:**

Processing continues, but the information displayed is incomplete.

**DSNB752I**

GROUP DETAIL STATISTICS ARE NOT AVAILABLE FOR THE GROUP BUFFER POOL BECAUSE A REBUILD IS IN PROGRESS

**Explanation:**

Because a rebuild is in progress for the group buffer pool, DB2 cannot retrieve group buffer pool group (GDETAIL) statistics in response to a DISPLAY GROUPBUFFERPOOL command. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

**System Action:**

Processing continues.

**DSNB753I**

GROUP BUFFER POOL STRUCTURE

OWNER INFORMATION NOT AVAILABLE IRLM NOTIFY RETURN

CODE = retcode IRLM NOTIFY REASON CODE = reason

**Explanation:**

DB2 could not retrieve group buffer pool structure owner information for message DSNB798I because the IRLM Notify request did not successfully complete. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

**retcode**

Return code from IRLM on the Notify request

**reason**

Reason code from IRLM on the Notify request

For an explanation of IRLM return and reason codes, see Chapter 60, "IRLM error return and reason codes," on page 1323.

**System Action:**

Processing continues.

**DSNB755I**

DB2 GROUP BUFFER POOL STATUS

CONNECTED = status1 CURRENT

DIRECTORY TO DATA RATIO = ratio1 PENDING DIRECTORY TO DATA RATIO = ratio2 CURRENT GBPCACHE ATTRIBUTE = gcache1 PENDING GBPCACHE ATTRIBUTE = gcache2

**Explanation:**

In response to a DISPLAY GROUPBUFFERPOOL command, this is the first of two messages displaying information about the status of the group buffer pool as it is known to DB2. This message is followed by DSNB756I. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

**status1**

Whether this DB2 is connected to the group buffer pool:

YES This DB2 is actively connected to the group buffer pool.

NO This DB2 is not actively connected to the group buffer pool.

**ratio1**

The ratio of directory entries to data pages, as specified for the current allocation of this group buffer pool. If the group buffer pool is not currently allocated, this field contains blanks.

**ratio2**

The desired ratio of directory entries to data pages to take effect at the next reallocation of the group buffer pool.

**gcache1**

The GBPCACHE attribute as specified for the current allocation of this group buffer pool.

**gcache2**

The value for GBPCACHE attribute that will take effect at the next reallocation of the group buffer pool.
**Explanation:** This is the second of two messages displaying information about the status of the group buffer pool as it is known to DB2. If DB2 was successful in getting MVS CFRM policy information for the group buffer pool, messages DSNB757I through DSNB759I immediately follow this message. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

**threshold1**
The threshold at which class castouts are to be initiated. It is expressed as a percentage of the group buffer pool size.

**threshold2**
The threshold at which castout is to be initiated at the group buffer pool level. It is expressed as a percentage of the group buffer pool size.

**interval**
The time, in minutes, between successive initiations of group buffer pool checkpoint.

**status1**
The recovery status for the group buffer pool:

- **DAP** Damage assessment pending. DB2 is in the process of doing damage assessment for the group buffer pool in response to a coupling facility structure failure. The group buffer pool is temporarily stopped internally by DB2 and is unavailable for use until the damage assessment process completes.

- **NORMAL** There is no pending recovery action for this group buffer pool.

**auto-rec-parm**
Automatic recovery parameter specification:

- **YES** DB2 should automatically initiate recovery for the objects using this group buffer pool following a failure of the group buffer pool. This is the default.

- **NO** DB2 should not initiate automatic group buffer pool recovery. If the group buffer pool fails, you must manually issue DB2 -START DATABASE commands to do the recovery.

**DSNB757I**

**MVS CFRM POLICY STATUS FOR**

- **structure-name** = status2
- **MAX SIZE**
- **INDICATED IN POLICY** = psize KB
- **DUPLEX INDICATOR IN POLICY** =
  - **dupstat** CURRENT DUPLEXING MODE =
  - **dupmode** ALLOCATED = status1

**Explanation:** For a DISPLAY GROUPBUFFERPOOL command, this message gives the status for the structure associated with the group buffer pool. It is displayed only if DB2 was successful in querying the MVS CFRM administrative policy. It is immediately preceded by message DSNB756I, and if the structure is allocated, followed by messages DSNB758I and DSNB759I. A preceding DSNB750I message identifies the associated group buffer pool.

- **structure-name** The coupling facility structure name for this group buffer pool, such as DSNCAT_GBP0.

- **status2** MVS global status of the backing coupling facility structure:
  - **NORMAL** Structure is defined in the current CFRM policy and has no current MVS restrictions.
  - **CHNGP** Change pending in the structure policy.
  - **dupstat** The duplexing attribute for the coupling facility structure, as indicated by the DUPLEX parameter in the CFRM policy definition.
  - **DISABLED** DUPLEX(DISABLED) is specified for the coupling facility structure. The DUPLEX parameter is not specified.
  - **ENABLED** DUPLEX(ENABLED) is specified for the coupling facility structure.
  - **ALLOWED** DUPLEX(ALLOWED) is specified for the coupling facility structure.

- **dupmode** Indication of current status of the group buffer pool in relation to duplexing:
  - **SIMPLEX** Group buffer pool is currently in simplex mode.
  - **DUPLEX** Group buffer pool is currently in duplex mode.
  - **INTRAN** Group buffer pool is currently in a transition state. Either from simplex mode to duplex mode, or from duplex mode to simplex mode. The rebuild
status indicator in message DSNB758I gives information about the transition state.

\( psize \) The size (in kilobytes) of the coupling facility structure as indicated in the CFRM policy definition.

\( status1 \) Whether the backing coupling facility structure is currently allocated:

- YES The coupling facility structure is allocated in a coupling facility.
- NO The coupling facility structure is not allocated in any coupling facility.

**DSNB758I**

| ALLOCATED SIZE = asize KB |
| VOLATILITY STATUS = volstat |
| REBUILD STATUS = rbldstat |
| CFNAME = cfname |
| CFLEVEL - OPERATIONAL = cflevel1 |
| CFLEVEL - ACTUAL = cflevel2 |

**Explanation:** This message is the first of two messages giving the allocation details for the group buffer pool on a DISPLAY GROUPBUFFERPOOL command. It is issued only if DB2 determines, by successfully querying the MVS CFRM policy, that the group buffer pool is allocated. It is immediately preceded by message DSNB757I. A preceding DSNB750I message identifies the associated group buffer pool.

- \( asize \) The actual allocated group bufferpool structure size (in kilobytes).
- \( volstat \) The volatility status of the backing group buffer pool structure for this group buffer pool:
  - VOLATILE The backing coupling facility structure is volatile.
  - NON-VOLATILE The backing coupling facility structure is non-volatile.
- \( rbldstat \) Indication of whether or not rebuild is in progress for the group buffer pool structure, and if so, which part of the rebuild process is happening:
  - NONE Rebuild is not in progress.
  - QUIESCE Rebuild is in progress and the rebuild is currently in the rebuild quiesce phase.
  - CONNECT Rebuild is in progress and the rebuild is currently in the rebuild connect phase.
  - CLEANUP The rebuild has completed, and the connected DB2 members are making final preparations to use the new group buffer pool structure. If the duplexing status in message DSNB757I indicates 'INTRAN', then the 'CLEANUP' indication means that DB2 is in the final stages of transitioning from duplex mode back to simplex mode, switching to the secondary group buffer pool.

**STOPPING**

The rebuild is stopping, and the connected DB2 members are making preparations to fall back to the original group buffer pool structure. If the duplexing status in message DSNB757I indicates 'INTRAN', then the 'STOPPING' indication means that DB2 is transitioning from duplex mode back to simplex mode, reverting back to the primary group buffer pool.

**DUPLICATED**

The group buffer pool is in steady-state duplexing mode.

**SWITCHING**

DB2 is in the initial phase of transitioning from duplex mode back to simplex mode, switching to the secondary group buffer pool. The group buffer pool is transitioning from duplex mode back to simplex mode, switching to the secondary group buffer pool.

- \( cfname \) The name of the coupling facility in which the group buffer pool is allocated. If the group buffer pool is duplexed, this is the coupling facility name associated with the primary group buffer pool.
- \( cflevel1 \) The coupling facility level from a DB2 functionality perspective for the coupling facility in which this group buffer pool is allocated. If the group buffer pool is duplexed, \( cflevel1 \) is the coupling facility level associated with the primary group buffer pool.
- \( cflevel2 \) The coupling facility level for the coupling facility in which this group buffer pool is allocated. If the group buffer pool is duplexed, \( cflevel2 \) is the coupling facility level associated with the primary group buffer pool.

**DSNB759I**

| NUMBER OF DIRECTORY ENTRIES = dir# |
| NUMBER OF DATA PAGES = data# |
| NUMBER OF CONNECTIONS = conn# |

**Explanation:** This message is the second of two messages giving the allocation details for the group buffer pool.
buffer pool for a DISPLAY GROUPBUFFERPOOL command. It is issued only if DB2 determines, by successfully querying the MVS CFRM administrative policy, that the group buffer pool is allocated. It is immediately preceded by message DSNB758I. A preceding DSNB750I message identifies the associated group buffer pool.

<table>
<thead>
<tr>
<th>dir#</th>
<th>Actual number of directory entries allocated for the coupling facility structure.</th>
</tr>
</thead>
<tbody>
<tr>
<td>data#</td>
<td>Actual number of data pages allocated for the coupling facility structure.</td>
</tr>
<tr>
<td>conn#</td>
<td>The number of DB2 subsystems that are connected to the coupling facility structure.</td>
</tr>
<tr>
<td></td>
<td>This includes both active connections and failed-persistent connections. The CONNLIST option of the DISPLAY GROUPBUFFERPOOL command gives details of the connection status.</td>
</tr>
</tbody>
</table>

**DSNB760I**  
**GBPCACHE OPTION SET TO value FOR gbpname, IT WILL TAKE EFFECT ON THE NEXT REALLOCATION**

**Explanation:** This message is issued in response to an ALTER GROUPBUFFERPOOL command that requests a change in the GBPCACHE attribute. It is also issued for the first ALTER GROUPBUFFERPOOL command for a group buffer pool, even when the GBPCACHE option is not specified on the command. (In this case, the message shows YES for the GBPCACHE option.) The new setting takes effect the next time the coupling facility cache structure is allocated.

**System Programmer Response:** Use the MVS command SETXCF START, REBUILD command when you are ready for the change to take effect.

**System Action:** Processing continues.

**DSNB761I**  
**THE NEW SETTING WILL TAKE EFFECT AFTER THE GBPCACHE ATTRIBUTE HAS BEEN CHANGED TO YES**

**Explanation:** This message is issued in response to an ALTER GROUPBUFFERPOOL command that requests a change to RATIO, CLASST, GPPOOLT or GBPCHKPT when GBPCACHE NO is also specified on the command or when the current GBPCACHE attribute is NO. The new setting takes effect the next time the coupling facility cache structure is allocated after the GBPCACHE attribute has been changed to YES.

**System Programmer Response:** Use the ALTER GROUPBUFFERPOOL command to change the GBPCACHE attribute to YES and the MVS command SETXCF START, REBUILD when you are ready for the change to take effect.

**System Action:** Processing continues.

**DSNB762I**  
**DUPLEXING STATISTICS FOR secondary-gbpname WRITES FAILED DUE TO LACK OF STORAGE = s2 CHANGED**

**Explanation:** This message is displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option if the group buffer pool is duplexed. It lists the statistics on writes to the secondary group buffer pool and the total number of changed pages for the secondary group buffer pool. secondary-gbpname is the normal group buffer pool name (such as GBP0) suffixed with -SEC'.

**s2** Write miss cache full counter. Number of times a coupling facility write request was not completed because of a lack of storage in the secondary group buffer pool.

For information about the Group Detail Report, see [DB2 Data Sharing: Planning and Administration](#).

**DSNB763I**  
**gbpname IS NOT DEFINED WITH GBPCACHE NO**

**Explanation:** This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with TYPE(NOCACHE) and either one name or a list of names specified in the selection list. The specified group buffer pool is not defined with GBPCACHE NO, and therefore does not meet the qualification to be displayed. This message is issued once for each group buffer pool that does not match the "GBPCACHE NO" criterion.

**System Action:** The display is terminated for this group buffer pool. Command processing continues, if there are other group buffer pool names to process.

**DSNB764I**  
**DUPLEXING STATISTICS FOR secondary-gbpname WRITES FAILED DUE TO LACK OF STORAGE = s2 ASYNCHRONOUS COMPLETION CHECKS = s3**

**Explanation:** This message is displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option if the group buffer pool is duplexed. It lists the statistics on writes to the secondary group buffer pool. secondary-gbpname is the normal group buffer pool name (e.g. GBP0) suffixed with -SEC'.

**s2** Coupling facility write requests that were not completed because of a lack of storage in the secondary group buffer pool.

**s3** The number of times DB2 checked for the completion of the write of a changed page to the secondary group buffer pool, but the write had not yet completed and thus the transaction had to wait until the write to the secondary group buffer pool completed.
For information about the Member Detail Report, see
DB2 Data Sharing: Planning and Administration

**DSNB765I**  
**NO CONNLIST REPORT IS GENERATED. THERE ARE NO CONNECTIONS TO THIS GROUP BUFFER POOL.**

**Explanation:** DB2 displays this message in response to a DISPLAY GROUPBUFFERPOOL command with the CONNLIST option when there are currently no connection names to report for the group buffer pool. A preceding DSNB750I message identifies the associated group buffer pool.

**DSNB766I**  
**THE CONNLIST REPORT FOLLOWS**

**Explanation:** DB2 displays this message in response to a DISPLAY GROUPBUFFERPOOL command with the CONNLIST option to indicate the beginning of the CONNLIST display for this group buffer pool. A preceding DSNB750I message identifies the associated group buffer pool.

**DSNB767I**  
**CONNECTION NAME = conname, CONNECTION STATUS = status, CONNECTOR’S RELEASE = DB2 release**

**Explanation:** This message contains the display information that results from a DISPLAY GROUPBUFFERPOOL command with the CONNLIST option. One DSNB767I message is issued for each defined connection to the group buffer pool. The associated group buffer pool is identified on a preceding DSNB750I message.

- **conname**  
  Name of the connection. DB2 subsystems use the DB2 member name as the connection name.

- **status**  
  Status of the connection.
  - A: Active.
  - F: Failed-Persistent.
  - D: Dually connected to both the original structure and the new structure during a rebuild.

- **DB2 release**  
  The release of the connected DB2.

**DSNB768I**  
**THERE ARE NO GROUP BUFFER POOLS DEFINED WITH GBPCACHE(NO)**

**Explanation:** This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with the TYPE(NOCACHE) option and an asterisk (*) specified as the selection list when DB2 determines that there are no group buffer pools defined with the GBPCACHE(NO) attribute.

**System Action:** Command processing is terminated.

**DSNB769I**  
**THE CONNLIST REPORT IS COMPLETE**

**Explanation:** DB2 displays this message in response to a DISPLAY GROUPBUFFERPOOL command with the CONNLIST option to indicate the end of the CONNLIST display for this group buffer pool. A preceding DSNB750I message identifies the associated group buffer pool.

**DSNB770I**  
**MEMBER DETAIL STATISTICS ARE NOT AVAILABLE FOR THE GROUP BUFFER POOL. THIS DB2 HAS NEVER BEEN CONNECTED TO THE GROUP BUFFER POOL.**

**Explanation:** This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with MDETAIL specified. MDETAIL statistics are not available for the requested group buffer pool because this DB2 has not connected to the group buffer pool since startup. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

**System Action:** Processing continues.

**DSNB771I**  
**INCREMENTAL MEMBER DETAIL STATISTICS SINCE basetime**

**Explanation:** This message is displayed in response to the DISPLAY GROUPBUFFERPOOL command with MDETAIL(INTERVAL) specified. It indicates the start time of the interval for which the statistics were accumulated. This is the time of the previous MDETAIL incremental display on this DB2 or the time DB2 first connected to the group buffer pool if there was no previous MDETAIL incremental display. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

**System Action:** Processing continues.

**DSNB772I**  
**CUMULATIVE MEMBER DETAIL STATISTICS SINCE basetime**

**Explanation:** This message is displayed in response to the DISPLAY GROUPBUFFERPOOL command with MDETAIL(*) specified. It indicates the start time of the interval for which the statistics were accumulated. This is the time this DB2 first connected to the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

**System Action:** Processing continues.
**DSNB773I**  MEMEBR DETAILED STATISTICS  
**SYNCHRONOUS READS DUE TO BUFFER INVALIDATION DATA RETURNED**  =  *r1*  DATA NOT RETURNED  =  *r2*

**Explanation:** This is the first of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists some synchronous read statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. Messages DSNB774I, DSNB775I, DSNB789I, and DSNB776I through DSNB779I always follow this one. The counter descriptions are listed below. In the descriptions, the term “synchronous” means that the coupling facility interaction is done under the DB2 user’s execution unit.

- **r1**  Synchronous coupling facility read requests issued because the virtual buffer was marked “invalid”. Data is successfully returned from the group buffer pool.

- **r2**  Synchronous coupling facility read requests issued because the virtual buffer was marked “invalid”. Data is not returned from the group buffer pool.

**DSNB774I**  DUE TO DATA PAGE NOT IN BUFFER POOL DATA RETURNED**  =  *r3*  DATA NOT RETURNED  =  *r4*

**Explanation:** This is the second of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists more local synchronous read statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by message DSNB773I and followed by messages DSNB775I, DSNB789I, and DSNB776I through DSNB779I. The counter descriptions are listed below. In the descriptions, the term “synchronous” means that the coupling facility interaction is done under the DB2 user’s execution unit.

- **r3**  Synchronous coupling facility read requests issued because the required data was not in the buffer pool buffer. Data is successfully returned from the group buffer pool.

- **r4**  Synchronous coupling facility read requests issued because the required data was not in the buffer pool buffer. Data is not returned from the group buffer pool.

**DSNB775I**  PREFETCH READS DATA NOT RETURNED**  =  *r5*

**Explanation:** This is the third of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists some prefetch read statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

- **r5**  This is the number of pages that were not retrieved from the GBP following RPL request. These pages were retrieved from DASD. Note that there are not any CF interactions associated with this number; this number is incremented when the RPL feedback indicates that the page is not cached in the GBP so that DB2 can avoid a CF read request for the page and go directly to DASD.

**DSNB776I**  SYNCHRONOUS WRITES CHANGED PAGES**  =  *w1*  CLEAN PAGES**  =  *w2*

**Explanation:** This is the fifth of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists some local write statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I and DSNB775I and followed by messages DSNB777I through DSNB779I.

The counter descriptions are listed below. In the descriptions, the term “synchronous” means that the coupling facility interaction is done under the DB2 user’s execution unit.

- **w1**  Number of changed pages that were written synchronously, under a user’s execution unit, to the coupling facility.

- **w2**  Number of clean pages that were written synchronously, under a user’s execution unit, to the coupling facility.

**DSNB777I**  ASYNCHRONOUS WRITES CHANGED PAGES**  =  *w3*  CLEAN PAGES**  =  *w4*  FAILED WRITES DUE TO LACK OF STORAGE**  =  *w5*

**Explanation:** This is the sixth of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists local write and cross-invalidation statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I through DSNB775I, DSNB789I, and DSNB776I and followed by messages DSNB777I and DSNB779I.
The counter descriptions are listed below. In the
descriptions, the term "asynchronous" means that the
coupling facility interaction is done under a DB2 system
execution unit, such as with a prefetch.

<table>
<thead>
<tr>
<th>Counter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>w3</td>
<td>Number of changed pages that were written asynchronously, under a system execution unit, to the coupling facility</td>
</tr>
<tr>

</tr>
<tr>
<td>w5</td>
<td>Coupling facility write requests that were not completed because of a lack of storage in the group buffer pool</td>
</tr>
</tbody>
</table>

**Explanation:**
This is the seventh of ten messages containing local statistics, displayed as a result of the
DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists local castout threshold statistics
for the group buffer pool and also group buffer pool checkpoint and rebuild statistics. A preceding DSNB750I
or DSNB751I message identifies the associated group buffer pool. This message is always preceded by
messages DSNB773I through DSNB775I, DSNB789I, DSNB776I, and DSNB777I and followed by messages
DSNB796I, DSNB779I, and DSNB797I.

**Counters:**

<table>
<thead>
<tr>
<th>Counter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t1</td>
<td>Number of times the class castout threshold was detected</td>
</tr>
<tr>
<td>t2</td>
<td>Number of times the group buffer pool castout threshold was detected</td>

<tr>
<td>k1</td>
<td>Number of group buffer pool checkpoints that were triggered</td>
</tr>
<tr>
<td>k2</td>
<td>Number of times that this member participated in a rebuild of the group buffer pool structure</td>
</tr>
</tbody>
</table>

**Explanation:**
DB2 could not retrieve group buffer pool group (GDETAIL) statistics in response to a DISPLAY
GROUPBUFFERPOOL command because the statistics request (IXLCACHE macro) did not successfully complete. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

retcode  Return code from MVS on the statistics request
reason   Reason code from MVS on the statistics request

For an explanation of IXLCACHE return and reason codes, see MVS/ESA Programming: Sysplex Services Reference.

**System Action:** Processing continues.

**Explanation:**
This message is displayed in response to the DISPLAY GROUPBUFFERPOOL command with
GDETAIL(INTERVAL) specified. It indicates the start time of the interval for which the statistics were accumulated. This is the time of the previous GDETAIL incremental display from this DB2 or the time the group buffer pool was allocated or reallocated, if there was no previous GDETAIL incremental display.

**System Action:** Processing continues.

**Explanation:**
This message is displayed in response to the DISPLAY GROUPBUFFERPOOL command with
GDETAIL(*) specified. It indicates the start time of the interval for which the statistics were accumulated. This is the time the group buffer pool was first allocated or reallocated.

**System Action:** Processing continues.

**Explanation:**
This is the first of five messages containing group statistics, displayed as a result of the
DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It lists the successful reads for the
group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.
This message is always followed by messages DSNB785I through DSNB788I.

**System Action:** Processing continues.
r1  “Read hit” counter. Number of times that a page was returned on a coupling facility read request.

For information about the Group Detail Report, see [DB2 Data Sharing: Planning and Administration].

DSNB751I  DATA NOT RETURNED DIRECTORY
ENTRY EXISTED = r2 DIRECTORY
ENTRY CREATED = r3 DIRECTORY
ENTRY NOT CREATED = r4, r5

Explanation: This is the second of five messages containing group statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It continues the read statistics for the group buffer pool. The associated group buffer pool is identified in a preceding DSNB750I or DSNB751I message. This message is always preceded by messages DSNB784I and DSNB785I.

w1  “Changed page write hit” counter. Number of changed pages that were successfully written.

w2  “Clean page write hit” counter. NNumber of clean pages that were successfully written.

w3  “Write miss cache full” counter. Number of times a coupling facility write request was not completed because of a lack of storage in the group buffer pool.

p1  “Total changed” counter. Snapshot value of the current number of changed pages. The displayed value of this counter is not affected by whether this is an incremental or cumulative display.

For information about the Group Detail Report, see [DB2 Data Sharing: Planning and Administration].

DSNB787I  RECLAIMS FOR DIRECTORY ENTRIES
= d1 FOR DATA ENTRIES = d2
CASTOUTS= c1

Explanation: This is the fourth of five messages containing group statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It is always preceded by messages DSNB784I through DSNB786I and followed by message DSNB788I. It lists the statistics on reclaims and castouts for the group buffer pool. The associated group buffer pool is identified in a preceding DSNB750I or DSNB751I message.

d1  “Castout” counter. Number of pages that were castout.

d2  “Data entry reclaim” counter. Number of times a name assignment required that a data page be reclaimed by the coupling facility.

c1  “Castout” counter. Number of castout operations performed.

For information about the Group Detail Report, see [DB2 Data Sharing: Planning and Administration].

DSNB786I  WRITES CHANGED PAGES= w1
CLEAN PAGES = w2 FAILED DUE TO
LACK OF STORAGE = w3 CHANGED
PAGES SNAPSHOT VALUE = p1

Explanation: This is the third of five messages containing group statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It is followed by messages DSNB787I and DSNB788I. It lists the statistics on writes to the group buffer pool and the total number of changed pages for the group buffer pool. The associated group buffer pool is identified in a preceding DSNB750I or DSNB751I message. This message is always preceded by messages DSNB784I through DSNB787I.
DSNB789I  •  DSNB793I

x1 "XI for directory reclaim" counter. Number of times a directory entry was reclaimed (stolen) and XI signals had to be sent (that is, the stolen directory entry had registered DB2 interest).

x2 "XI for write" counter. Number of times a coupling facility write request caused XI to one or more registered DB2s.

x3 "XI for explicit invalidation" counter. Number of times an explicit coupling facility XI request caused XI to one or more registered DB2s.

For more information about these counters, see [Data Sharing: Planning and Administration](#).

DSNB789I  REGISTER PAGE LIST = r7 PAGES RETRIEVED = r8

Explanation: This is the fourth of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists more local read statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

The counter descriptions are listed below.

r7 The number of requests to the coupling facility to register interest in a list of pages. DB2 does this when prefetch (sequential or list) is used when the following conditions are met:
• The DB2 member is running on a particular service level of MVS 5.2 or above
• The GBP is allocated in a coupling facility with CFLEVEL=2 or above.

r8 Coupling facility read requests that were done for prefetch to retrieve a page in the group buffer pool as a result of feedback from the request to register a list of pages.

DSNB790I  DISPLAY FOR GROUP BUFFER POOL

Explanation: For a DISPLAY GROUPBUFFERPOOL command, this message signals the end of the display for group buffer pool gbpname.

DSNB791I  THIS DB2 IS NOT CONNECTED TO gbpname

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with TYPE(MCONN) and either one name or a list of names specified in the selection list. The DB2 on which the DISPLAY GROUPBUFFERPOOL command was issued is not currently connected to the specified group buffer pool. This message is issued once for each group buffer pool that does not match the "member connectivity" criterion.

System Action: The display is terminated for this group buffer pool. Command processing continues, if there are other group buffer pool names to process.

DSNB792I  NO DB2 IN THE GROUP IS CONNECTED TO gbpname

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with TYPE(GCONN) and either one name or a list of names specified in the selection list. No DB2 in the group is currently connected to the specified group buffer pool. This message is issued once for each group buffer pool that does not match the "group connectivity" criterion.

System Action: The display is terminated for this group buffer pool. Command processing continues, if there are other group buffer pool names to process.

DSNB793I  DELETE NAME LIST = s5 READ CASTOUT STATISTICS = s6 DELETE NAME = s7 OTHER ASYNCHRONOUS GBP REQUESTS = s8

Explanation: This message is displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option if the group buffer pool is duplexed. It lists the statistics on requests to the secondary group buffer pool that are related to castout processing and to garbage collection processing.

s5 The number of Delete Name List requests to delete a set of pages from the secondary group buffer pool that have just been cast out from the primary. If the group buffer pool has been duplexed for the entire reporting interval, then this number should be roughly equal to the number of Unlock Castout requests to the primary (indicated in message DSNB796I).

s6 The number of Read Castout Statistics requests to check for "orphaned data entries" in the secondary group buffer pool. The DB2 member that is the group buffer pool structure owner periodically issues these requests to determine whether garbage collection is necessary to clean up orphaned data entries from the secondary. Orphaned data entries are "changed" data entries in the secondary group buffer pool without a corresponding "changed" data entry in the primary. Orphaned data entries are to be expected from time to time and do not represent any kind of data inconsistency problem (because the page has already been cast out from the primary and such that the version of the page in the secondary is the same as the version of the page on DASD). Orphaned data entries can be introduced by certain transaction or system failures, or by new group buffer pool write
activity that encounters very unlikely timing windows when castout is concurrently processing.

The number of Delete Name requests to delete “orphaned data entries” from the secondary group buffer pool. The DB2 member that is the group buffer pool structure owner issues these requests if it determines that garbage collection is necessary. See the description above under s6 for a description of “orphaned data entries”.

The number of asynchronous CF requests sent to the secondary group buffer pool. This excludes ASYNCHRONOUS COMPLETION CHECKS as reported on the DSNB764I message.

For information about the Member Detail Report, see DB2 Data Sharing: Planning and Administration.

---

**DSNB794I**  THIS DB2 IS NOT CONNECTED TO ANY GROUP BUFFER POOL

**Explanation:**  This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with the TYPE(MCONN) option and an asterisk (*) specified as the selection list. This message is issued when DB2 determines that there are no group buffer pools having “member connectivity” from the DB2 on which the DISPLAY GROUPBUFFERPOOL command was issued.

**System Action:**  Command processing is terminated.

---

**DSNB795I**  NO DB2 IN THE GROUP IS CONNECTED TO ANY GROUP BUFFER POOL

**Explanation:**  This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with the TYPE(GCONN) option and an asterisk (*) specified as the selection list. When DB2 successfully determines (that is, no error is encountered during command processing) that there are no group buffer pools connected to any DB2 in the data sharing group.

**System Action:**  Command processing is terminated.

---

**DSNB796I**  CASTOUTS PAGES CASTOUT = c1 UNLOCK CASTOUT = c2 READ CASTOUT CLASS = c3 READ CASTOUT STATISTICS = c4 READ DIRECTORY INFO = c5

**Explanation:**  This is the eighth of ten messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists local castout statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I through DSNB775I, DSNB789I, DSNB776I through DSNB778I, and followed by messages DSNB779I and DSNB791I.

**Counters:**

- c1  Number of pages cast out.
- c2  Number of requests to unlock for castout.
- c3  Number of read castout class requests.
- c4  Number of read castout statistics requests.
- c5  Number of read directory info requests. These requests are made during group buffer pool checkpoint.

---

**DSNB797I**  OTHER INTERACTIONS REGISTER PAGE = o1 UNREGISTER PAGE = o2 DELETE NAME = o3 READ STORAGE STATISTICS = o4 EXPLICIT CROSS INVALIDATIONS = o5 ASYNCHRONOUS GBP REQUESTS = o6

**Explanation:**  This is the last of ten messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists local castout statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I through DSNB775I, DSNB789I, DSNB776I through DSNB778I, and DSNB796I.

**Counters:**

- o1  Number of requests to the coupling facility to register interest in a single page.
- o2  Number of requests to the coupling facility to remove the registered interest in a single page.
- o3  Number of requests to the coupling facility to delete the directory entries associated with a set of pages.
- o4  Number of requests to the coupling facility to read the statistics counters associated with the structure. DB2 generally issues this request once per group buffer pool checkpoint, and once per GDETAIL request on the DB2 DISPLAY GROUPBUFFERPOOL command.
- o5  Number of explicit cross-invalidations for pages in the group buffer pool.
- o6  Number of coupling facility requests to the primary group buffer pool that were converted from synchronous to asynchronous.

---

**DSNB798I**  LAST GROUP BUFFER POOL CHECKPOINT timestamp GSP CHECKPOINT RECOVERY LRSN = lrsn STRUCTURE OWNER = member-name

**Explanation:**  This message is displayed in response to the DISPLAY GROUPBUFFERPOOL command. It is
issued only if DB2 determines, by successfully querying the MVS CFRM policy, that the group buffer pool is allocated. It is immediately preceded by message DSNB759I. A preceding DSNB750I message identifies the associated group buffer pool.

**timestamp**
The date and time of the last group buffer pool checkpoint.

**lrsn**
The recovery log record sequence number (LRSN) that was recorded by the last group buffer pool checkpoint that reflects the oldest changed page clean-to-dirty LRSN value at the time of the checkpoint. If the group buffer pool were to fail, lrsn1 is used by DB2 as input to determine the starting points for the merged log scan to recover the page sets and partitions that are entered into group buffer pool recovery pending (GRECP) status. You can do more detailed monitoring of the group buffer pool checkpoint processing with IFCID 0261.

**member-name**
The member name of the group buffer pool structure owner. The structure owner’s responsibilities include the following:
- Issue the group buffer pool checkpoint.
- Detect the GBPOOLT castout threshold and initiate castout if this threshold has been reached (by notifying the pageset or partition castout owners).
- Coordinate the damage assessment process in case the group buffer pool fails.
- Coordinate the rebuild process for the group buffer pool.

‘UNKNOWN’ is displayed if DB2 is not able to determine which member is the structure owner for the group buffer pool. This should only happen in an unexpected error situation. See the message accompanying that error.

**System Action:** Processing continues.

---

<table>
<thead>
<tr>
<th>DSNB799I</th>
<th>SECONDARY GBP ATTRIBUTES</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLOCATED SIZE = ssize KB</td>
<td>VOLATILITY STATUS = svolstat</td>
</tr>
<tr>
<td>CFLEVEL - OPERATIONAL = clevel1/mv&gt; CFLEVEL - ACTUAL = clevel2</td>
<td>NUMBER OF DIRECTORY ENTRIES = sdirt# NUMBER OF DATA PAGES = sdata#</td>
</tr>
</tbody>
</table>

**Explanation:** For a DISPLAY GROUPBUFFERPOOL command, this message gives the attributes of the secondary group buffer pool if the group buffer pool is duplexed. It is displayed only if the group buffer pool is duplexed and if DB2 was successful in querying the MVS CFRM administrative policy. This message is not displayed if the group buffer pool is in a transition state between simplexing and duplexing.

| DSNB800I | DIRECTORY ENTRY TO DATA PAGE RATIO SET TO value FOR gbpname. IT WILL TAKE EFFECT ON THE NEXT REALLOCATION |

**Explanation:** This message is issued in response to an ALTER GROUPBUFFERPOOL command that requests a change to the directory entry to the data page ratio for a group buffer pool. It is also issued for the first ALTER GROUPBUFFERPOOL command for a group buffer pool, even when no ratio value is specified on the command (in this case, the default ratio value is being used). The new ratio takes effect the next time the coupling facility cache structure is allocated.

The directory entry to data page ratio determines the number of directory entries and the number of data pages that are allocated in the coupling facility cache structure for the group buffer pool. If the coupling facility structure is not allocated, the first connect from any DB2 causes allocation of the structure and the new directory entry to data page ratio to take effect.

If the structure size can be determined from the MVS CFRM administrative policy, message DSNB801I is issued to indicate an estimate of the number of directory and data entries that are allocated based on the new ratio and the current size of the coupling facility structure. Otherwise, message DSNB812I is issued.

**System Action:** Processing continues.

**System Programmer Response:** Use the -DISPLAY GROUPBUFFERPOOL command to display the number of allocated directory and data entries.
DSNB801I  MAX STRUCTURE SIZE INDICATED IN MVS CFRM POLICY = size KB
ESTIMATED NUMBER OF DIRECTORY ENTRIES = dir# ESTIMATED NUMBER OF DATA PAGES = data#

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command after
the directory entry to data page ratio is successfully updated. It is also issued for the first ALTER
GROUPBUFFERPOOL command for a group buffer pool, even when no ratio value is specified on
the command (in this case, the default ratio value is used). The group buffer pool is identified in message
DSNB800I, which immediately precedes this message.

Because the actual ratio change does not take effect until the group buffer pool is reallocated, this message
shows the estimated number of directory entries and data pages that are allocated based on the new ratio
and the maximum size of the coupling facility structure, as indicated in the active CFRM policy definition. The
actual number of entries that are allocated varies based on the amount of coupling facility storage that is
available at the time the allocation is attempted, and on the amount of storage overhead necessary for the
coupling facility control structures. Because DB2 cannot determine these variables, the estimated number of
directory and data entries displayed in this message assumes that the entire storage allocation for the
coupling facility cache structure will be used for directory and data entries, which is not the case.

To determine the actual number of directory and data entries that are allocated for this group buffer pool, you
must cause the buffer pool to be reallocated or rebuilt, as described in [DB2 Data Sharing: Planning and
Administration] then issue a DISPLAY GROUPBUFFERPOOL command.

System Action: Processing continues.

DSNB802I  "value" IS NOT A VALID PARAMETER FOR 'RATIO'

Explanation: An illegal value for the RATIO parameter was specified for an ALTER GROUPBUFFERPOOL
command. The RATIO value can be up to 6 characters, and must be a decimal number from 1.0 to 255
(inclusive). For values less than 25, any digits after the first decimal place are ignored. If the value for the
RATIO parameter is greater than or equal to 25, any digits after the decimal point are ignored. Informational
message DSNB803I is displayed if the system ignores any precision that exceeds the limits of the RATIO
parameter.

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER GROUPBUFFERPOOL command, and specify an
acceptable value for RATIO.

DSNB803I  RATIO IS TRUNCATED TO value

Explanation: The precision specified on the RATIO parameter on an ALTER GROUPBUFFERPOOL
command was greater than allowed. For decimal numbers less than 25, any digits after the first decimal
place are ignored: for example, 5.67 is treated as 5.6. For decimal numbers greater than or equal to 25, any
digits after the decimal point are ignored: for example, 25.3 is treated as 25.

System Action: Processing continues.

DSNB804I  CLASS CASTOUT THRESHOLD SET TO value% FOR gbpname

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that
requests a change to the class castout threshold value for a group buffer pool. It is also issued for the first
ALTER GROUPBUFFERPOOL command for a group buffer pool, even when no threshold value is specified on
the command (in this case, the default class castout threshold value is being used).

System Action: Processing continues.

DSNB805I  value IS NOT A VALID PARAMETER FOR 'CLASST'

Explanation: An illegal value was specified on the CLASST (class castout threshold) keyword on an
ALTER GROUPBUFFERPOOL command. The CLASST value must be an integer between 0 and 90, inclusive.

System Action: The request is rejected.

System Programmer Response: Reissue the -ALTER GROUPBUFFERPOOL command, specifying an
acceptable value for CLASST.

DSNB806I  GROUP BUFFER POOL CASTOUT THRESHOLD SET TO value% FOR gbpname

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that
successfully changes the group buffer pool castout threshold value for a group buffer pool. It is also issued for the first successful ALTER GROUPBUFFERPOOL
command for a group buffer pool, even when no threshold value is specified on the command (in this
case, the default group buffer pool castout threshold value is being used).

System Action: Processing continues.

DSNB807I  value IS NOT A VALID PARAMETER FOR 'GBPOOLT'

Explanation: An ALTER GROUPBUFFERPOOL command was issued with an illegal value specified on the
GBPOOLT (group buffer pool castout threshold)
keyword. The GBPOLT value must be an integer between 0 and 90, inclusive.

**System Action:** The request is rejected.

**System Programmer Response:** Reissue the -ALTER GROUPBUFFERPOOL command, specifying an acceptable value for GBPOLT.

---

**DSNB808I** 

**GROUP BUFFER POOL CHECKPOINT INTERVAL SET TO** value MINUTES FOR gbpname

**Explanation:** This message is issued in response to an ALTER GROUPBUFFERPOOL command that successfully changes the group buffer pool checkpoint interval value for a group buffer pool. It is also issued for the first successful ALTER GROUPBUFFERPOOL command for a group buffer pool, even when no interval value is specified on the command (in this case, the default group buffer pool checkpoint interval value is being used).

**System Action:** Processing continues.

---

**DSNB809I** 

value IS NOT A VALID PARAMETER FOR 'GBPCHKPT'

**Explanation:** An ALTER GROUPBUFFERPOOL command was issued with an illegal value specified on the GBPCHKPT (group buffer pool checkpoint) keyword. The GBPCHKPT value must be an integer between 1 and 999999, inclusive.

**System Action:** The request is rejected.

**System Programmer Response:** Reissue the -ALTER GROUPBUFFERPOOL command, specifying an acceptable value for GBPCHKPT.

---

**DSNB812I** 

SIZE ESTIMATES ARE NOT AVAILABLE FOR THE GROUP BUFFER POOL MVS IXQUERY RETURN CODE = return code MVS IXQUERY REASON CODE = reason code

**Explanation:** The directory entries and data pages estimates for the group buffer pool, identified on the preceding DSNB800I message, could not be computed because IXQUERY was unable to obtain the backing structure’s size information from the MVS CFRM administrative policy definition. This can happen if an IXQUERY processing error occurred, or if the structure was not defined in the CFRM policy. The backing structure for the group buffer pool must be defined in the CFRM policy before the group buffer pool can be allocated. The exact reason can be determined from the return code and the reason code. For an explanation of the IXQUERY codes, see MVS/ESA Programming: Sysplex Services Reference.

**System Action:** The command completes successfully, but without giving the estimates.

---

**DSNB813I** csect-name ALTER NOTIFICATION FAILED

**Explanation:** An ALTER GROUPBUFFERPOOL command failed to propagate the request for castout threshold or checkpoint interval change to other DB2s in the data sharing group. This error is triggered by an error encountered by the IRLM notification process. As a result, different DB2s in the group might have different values for the castout threshold or checkpoint interval. The RATIO change does not use the notification process and is, therefore, not affected by such a failure.

**System Action:** Processing continues.

**System Programmer Response:** Reissue the -ALTER GROUPBUFFERPOOL command with the same parameters. If the problem persists, it indicates a deeper problem, such as inadequate space for the locking structures.

---

**DSNB814I** csect-name NO CHANGES REQUESTED ON COMMAND

**Explanation:** An ALTER GROUPBUFFERPOOL command without any parameters was issued for an existing group buffer pool. If an ALTER GROUPBUFFERPOOL command without any parameters is issued for a group buffer pool that does not exist, a group buffer pool definition with default parameters values is created.

**System Action:** The command is successful and processing continues.

---

**DSNB815I** PAGE P-LOCK LOCK/UNLOCK, P-LOCK REQUESTS FOR SPACE MAP PAGES = nn P-LOCK REQUESTS FOR DATA PAGES = nn P-LOCK REQUESTS FOR INDEX LEAF PAGES = nn P-LOCK UNLOCK REQUESTS = nn

**Explanation:** This message is issued in response to a DISPLAY GROUPBUFFERPOOL command. This message reports the physical lock (P-lock) status at the Group Buffer Pool level. The accounting of these P-locks is intended for use in monitoring and tuning database performance, especially in a data-sharing environment. For more information about the DISPLAY GROUPBUFFERPOOL command, please see the DB2 Command Reference.

**System Action:** Processing Continues.
**DSNB816I** PAGE P-LOCK SUSPENSIONS/NEGOTIATIONS, P-LOCK SUSPENSIONS FOR SPACE MAP PAGES = nn P-LOCK SUSPENSIONS FOR DATA PAGES = nn P-LOCK SUSPENSIONS FOR INDEX LEAF PAGES = nn P-LOCK NEGOTIATIONS FOR SPACE MAP PAGES = nn P-LOCK NEGOTIATIONS FOR DATA PAGES = nn P-LOCK NEGOTIATIONS FOR INDEX LEAF PAGES = nn

**Explanation:** This message is issued in response to a DISPLAY GROUPBUFFERPOOL command. This message reports the physical lock (P-lock) status at the Group Buffer Pool level. These P-lock statistics are intended for use in monitoring and tuning database performance, especially in a data-sharing environment. For more information about the DISPLAY GROUPBUFFERPOOL command, please see the DB2 Command Reference.

**System Action:** Processing Continues.

---

**DSNB890I** command-verb gbp-kwd COMMAND IS ONLY VALID FOR DATA SHARING

**Explanation:** An attempt was made to issue a GROUPBUFFERPOOL command on a DB2 that was not initialized to participate in data sharing.

_command-verb_

The name of the command attempted: ALTER, or DISPLAY

gbp-kwd

The keyword GROUPBUFFERPOOL or GBPOOL

**System Action:** The command request is rejected.

---

**DSNB891I** name IS NOT A VALID GROUP BUFFER POOL OR COUPLING FACILITY STRUCTURE NAME

**Explanation:** An invalid name was specified on an ALTER GROUPBUFFERPOOL or DISPLAY GROUPBUFFERPOOL command.

_name_

Either the DB2 group buffer pool name or the backing coupling structure name

You must either specify the DB2 group buffer pool name (gbpname) or the backing coupling facility structure name (strname). Acceptable values for gbpname are GBP0, GBP1, ..., GBP49, GBP32K, GBP32K1, ..., GBP32K9. The strname has the following format:

    groupname_gbpname

The groupname is the DB2 data sharing group name. The underscore (_) is used as a delimiter between the groupname and the gbpname.

---

**DSNB892I** grpname IS NOT A VALID GROUP NAME FOR THIS DB2

**Explanation:** The group name specified as part of the full coupling facility cache structure name on an ALTER GROUPBUFFERPOOL or DISPLAY GROUPBUFFERPOOL command is incorrect. On the commands, you can specify either the correct 16-byte coupling facility cache structure name or the DB2 group buffer pool name. The coupling facility cache structure name is a 16-character name specified as follows:

    groupname_gbpname

The gbpname can be GBP0, GBP1, ..., GBP49, GBP32K, GBP32K1, ..., GBP32K9. The groupname is the DB2 data sharing group name. The underscore (_) is used as a delimiter between the groupname and the gbpname. The coupling facility cache structure names are left-justified with a blank as the rightmost padding character. DB2 adds the padding blanks if they are not specified on the command.

**System Action:** The request is rejected.

**System Programmer Response:** Reissue the command, specifying a valid group buffer pool name.
Chapter 6. DSNE... messages

In the TSO attachment facility, the user can control whether message IDs are displayed. To see them, type PROFILE MSGID. To suppress them, type PROFILE NOMSGID.

Trace messages associated with the TSO attachment facility (including DSN and DB2I) are not listed in this manual. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

All DSN command processor trace messages have the same message number: DSNET20I.

**DSNET20I**

**Explanation:** This is one of many possible trace messages bearing this message number. Complete documentation of all of the TSO attachment facility trace messages bearing this message number is found in Part 8 of DB2 Diagnosis Guide and Reference.

**DSNE004E** PROBABLE SUBSYSTEM ERROR DETECTED IN CSECT csect-name, SUBSYSTEM FUNCTION service, RETCODE retcode, REASON CODE reason-code

**Explanation:** A subsystem error has occurred. The function identified in the message as 'service' is either an MVS or a DB2 service routine. The error was discovered in the 'csect-name' indicated in the message. Refer to the appropriate MVS publications for a description of the return and reason codes.

**System Action:** This message is sometimes followed by an intentional system abend. In other instances, the DSN command processor will terminate the current subcommand and attempt to continue by issuing another DSN prompt.

**User Response:** Run the job again with a SYSUDUMP dump data set allocated and DSN tracing set to 123. Collect the DSN trace stream. If an abend occurs, collect the dump.

**DSNE005A** EXECUTION IS INTERRUPTED. ENTER C TO CANCEL, OR ANY OTHER REPLY TO RESUME THE subcmd SUBCOMMAND

**Explanation:** The Attention key was pressed. Entering a 'C' will cancel the DSN subcommand that is currently executing. If the user enters a question mark, message DSNE006A will appear. Any other reply will cause execution of the subcommand that was in progress to continue.

If the DSN prompt was issued just before the Attention key was pressed, 'subcmd' may be either 'DSN' or the previously invoked subcommand.

**User Response:** Enter a 'C' to cancel the DB2 subcommand currently executing. The DSN prompt will appear on the terminal. Enter anything else (except another attention) to resume execution.

**DSNE006A** C WILL TERMINATE THE SUBCOMMAND WITH UNCOMMITTED CHANGES BACKED OUT

**Explanation:** Enter a 'C' to terminate the subcommand. No uncommitted changes are made to the database. Any other reply causes subcommand execution to continue.

**User Response:** Enter a 'C' to terminate the subcommand. Control returns to DSN, and the DSN prompt appears on the terminal. This is a second-level help message associated with message DSNE05A.

**DSNE008I** REPLY WAS xxxxx, EXECUTION RESUMED

**Explanation:** Execution was suspended by a user ATTENTION and then was resumed, because the string specified in the message as 'xxxxx' was entered.

**System Action:** Control returns to the interrupted session.

**DSNE009I** REPLY WAS C, EXECUTION Terminated

**Explanation:** The response to message DSNE005A was a C. This caused the current subcommand to terminate.

**System Action:** The current subcommand is terminated. The DSN prompt appears on the terminal.

**User Response:** You can now enter another DSN subcommand.
DSNE010I  SUBCOMMAND subcmd CANCELED BY ATTENTION

Explanation: The subcommand specified in the messages was canceled because the user pressed the attention key and then entered a 'C'.

System Action: The current subcommand is terminated. The DSN prompt appears on the terminal.

User Response: A new subcommand can be entered.

DSNE011I  DSN COMMAND CANCELED BY ATTENTION

Explanation: The user of the DSN command processor has pressed attention. Since this occurred before DSN was fully initialized, DSN terminates. If DSN had been fully initialized, it would have prompted the user to continue or cancel.

System Action: The DSN command processor terminates. Control returns to TSO or the calling CLIST.

User Response: Restart DSN.

DSNE100I  ssid NOT OPERATIONAL, RETRY COUNT IS ZERO

Explanation: The subsystem (specified in the message as 'ssid') was not active, and no retries remain to be executed. No more connection attempts are made. The operator should be notified to start this specific subsystem, and the DSN command should be resubmitted. Issue the DSN command with the RETRY parameter set greater than zero.

System Action: Control returns to TSO.

User Response: Notify the operator to start the subsystem.

Operator Response: Start the subsystem with the 'ssid' specified in the message.

DSNE101I  ssid NOT OPERATIONAL, WILL RETRY nnn MORE TIMES

Explanation: The requested DB2 subsystem 'ssid' was not started or is not available. Connection to it will be attempted 'nnn' more times. This message is issued every 30 seconds (and each time 'nnn' is decreased by 1) until the connection is made or 'nnn' is zero.

System Action: DSN repeats the connection attempt until the connection is made or until the retry count is decreased to zero.

User Response: Notify the operator start DB2.

DSNE102I  YOU ARE NOT AUTHORIZED TO USE DB2 SUBSYSTEM ssid

Explanation: The authorization ID is not authorized to use subsystem 'ssid'.

System Action: Control returns to TSO.

User Response: Contact the system programmer, or system administrator to arrange for the required RACF or equivalent security system authorization.

DSNE103E  MAIN STORAGE REQUEST FROM csect-id FAILED

Explanation: A request for main storage failed.

System Action: The TSO attachment facility is ready for more input.

User Response: Increase the address space size. This can be done as part of the logging on process.

DSNE104E  RETRY COUNT OF number NOT VALID, SET TO 120

Explanation: An invalid 'RETRY' parameter was entered on the DSN command. It has been set to 120. Valid retry counts are integer numbers from 0 to 120.

System Action: Retry count is modified, and DSN execution continues.

User Response: The next time you invoke DSN, use a RETRY count of 0 to 120.

DSNE105E  SUBSYSTEM ssid NO LONGER OPERATIONAL

Explanation: The DB2 subsystem is down. It must be restarted before the user can continue.

System Action: Control returns to TSO attachment facility.

User Response: Before you can continue, DB2 must be restarted. You must also reissue the DSN command. ISPF users should restart their jobs.

DSNE106E  PLAN plan-id NOT AUTHORIZED FOR SUBSYSTEM ssid AND AUTH-ID auth-id

Explanation: The requested combination of plan-id, subsystem-id, and user-id is not currently authorized.

System Action: The TSO attachment facility is ready for more input.

User Response: Notify the system programmer or system administrator to obtain proper authorization.

System Programmer Response: The system administrator for the DB2 subsystem can arrange the necessary authorization.
**DSNE107E**  SUBSYSTEM RESOURCE NEEDED FOR PLAN plan-name, AUTH ID auth-id, AND SUBSYSTEM subsys IS NOT AVAILABLE

**Explanation:** The DB2 subsystem was unable to allocate a necessary resource for the requested combination of plan-id, user-id, and subsystem-id. This message is accompanied by DSNE108E. An attempt to establish connection with the DB2 subsystem has failed.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Arrange to obtain the needed resource, and resubmit the subcommand. See the explanation for message DSNE108E, which accompanies this message.

**DSNE108E**  FEEDBACK - REASON CODE reason-code TYPE= type RESOURCE NAME - 44 characters

**Explanation:** This message accompanies message DSNE107E or DSNE114E to explain the problem more clearly. RESOURCE NAME is the name of the unavailable resource. The reason code is in hexadecimal format.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Arrange for the missing resource to be available, and resubmit your job.

**Problem Determination:** The reason the resource is unavailable is identified by a reason code. The reason codes that appear in this message are described in Part 4, “Section 4, DB2 Codes,” on page 771.

**DSNE109E**  NO INPUT TO BIND, SUBCOMMAND TERMINATED

**Explanation:** No LIBRARY parameter was specified on the BIND subcommand. No DBRMLIB was allocated.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Specify the LIBRARY parameter, and resubmit the BIND subcommand. Alternatively, you could issue an ALLOCATE command for the DDNAME DBRMLIB and then resubmit the BIND subcommand as originally written.

**DSNE110E**  ssid NOT VALID SUBSYSTEM ID, COMMAND TERMINATED

**Explanation:** There is no subsystem id with the name identified in the message as 'ssid'. The subsystem identifier you specify (or default to) on the DSN command must exist. This message is the result of specifying (or defaulting to) a nonexistent subsystem identifier. For information on the SYSTEM parameter of the DSN command, refer to DB2 Command Reference

**System Action:** The DSN processor ends, and control returns to TSO.

**User Response:** Reissue the command with a valid SYSTEM parameter.

**DSNE111E**  INSTALLATION EXIT REJECTED DSNNAME data-set-name

**Explanation:** A local installation-supplied exit has rejected the data set name identified in the message as 'data-set-name'.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Either correct the data set name specified, or arrange to authorize the original data set name. Resubmit the request.

**DSNE112E**  userid STILL SIGNED ON TO SUBSYSTEM ssid

**Explanation:** An attempt was made to sign on to DB2 when the user was already signed on.

**System Action:** Control returns to TSO.

**User Response:** Log off and log on again.

**DSNE113E**  NOT ABLE TO LINK TO MODULE modname IN DSNNAME data-set-name

**Explanation:** A DB2 subsystem error occurred during an attempt to link to module 'modname' in data set 'data-set-name'.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Check that the module exists and that its name is spelled correctly. Enter the correct module name.

**DSNE114E**  THE COMBINATION OF PLAN planid, AUTH ID auth-id, AND SUBSYSTEM ssid IS NOT VALID

**Explanation:** The resource in message DSNE108E, which will follow this message, is not a valid resource name.

**System Action:** The TSO attachment facility is ready for more input.
User Response: Correct the invalid combination, and resubmit the subcommand. The problem is probably caused by a user spelling error. If it is not, check with the system administrator to determine the availability of the needed resource. Your program may need to be bound. See the explanation for message DSNE108 (which accompanies this one) for more information.

**DSNE117E NOT ABLE TO LOCATE membername IN DSNAMEx data-set-name**

Explanation: The 'data-set-name' specified does not contain the member the user wanted to run.

System Action: Control remains with the DSN command processor, and the DSN prompt appears on the terminal. The DSN command processor is ready for another command.

User Response: Correct the PROGRAM or LIBRARY parameter, and resubmit the subcommand.

**DSNE118E invalid-command NOT VALID COMMAND**

Explanation: The user entered an invalid command. A typing error may be responsible. You may be trying to run a command processor that is either not available on your system or that is not part of your current LNKLIB or STEPLIB concatenation.

System Action: The TSO attachment facility is ready for more input.

User Response: Either correct the spelling error, or rearrange your library concatenation so that you can access the required command processor. Resubmit the command.

**DSNE119E data-set-name NOT PARTITIONED DATA SET**

Explanation: The user tried to allocate a sequential data set when a partitioned data set was required.

System Action: The TSO attachment facility is ready for more input.

User Response: Check the data-set-name. The data set you specified is sequential, but you specified a member name. Remove the member name, and resubmit the job.

**DSNE120E data-set-name NOT SEQUENTIAL DATA SET**

Explanation: The user tried to allocate a partitioned data set when a sequential data set was required.

This message is issued by the following CSECT: DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Wait until the member is available.

User Response: Check the data-set-name. The data set you specified is partitioned, but you did not specify a member name. Add a member name, and resubmit the job.

**DSNE121E csect-id NOT ABLE TO OPEN DATA SET**

Explanation: The DB2 subsystem was unable to open the requested data set.

This message is issued by the following CSECTs: DSNECP23, DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: For information about why the data set could not be opened, read the explanations of the messages that accompany this message. Correct the condition, and resubmit the job.

**DSNE122E DATA SET ORGANIZATION MUST BE EITHER SEQUENTIAL OR PARTITIONED. data-set-name IS NOT**

Explanation: The DB2 subsystem was unable to open data set 'data-set-name', because it is not a sequential or partitioned data set.

This message is issued by the following CSECT: DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Correct the data-set-name, or change the data set organization. Resubmit the job.

**DSNE123I data-set-name NOT PARTITIONED DATA SET, IT IS IGNORED**

Explanation: The data-set-named in the message is required to be partitioned. It is not and, consequently, was ignored.

System Action: DSN will attempt to continue BIND processing.

User Response: Correct the subcommand, and resubmit it.

**DSNE124E DATA SET data-set-name, MEMBER member-name IN USE, TRY LATER**

Explanation: The member contained in 'data-set-name' is currently in use. This message is normally issued when another user is updating the specified member.

This message is issued by the following CSECT: DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Wait until the member is available.
and reissue your DCLGEN request.

**DSNE125E** DATA SET *data-set-name* IN USE, TRY LATER

*Explanation:* The sequential data set 'data-set-name' is currently in use. This message is normally issued when another user is updating the specified data set.

This message is issued by the following CSECT: DSNCP69

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Wait until the data set is available and reissue your DCLGEN request.

**DSNE126E** THE DB2 OPERATOR IS STOPPING THE SUBSYSTEM. PLEASE END YOUR DSN SESSION

*Explanation:* The operator has requested that DB2 quiesce. The user should promptly finish the current task and terminate the DSN session so that this can take place. This message may be followed by message DSNE127I.

This message is issued by the following CSECT: DSNCP00

**System Action:** No new users will be permitted to initiate DB2 sessions. Current users will be permitted to work until they terminate their connections to DB2.

**User Response:** End your DSN session as soon as possible.

**DSNE127I** THE DB2 OPERATOR IS STOPPING THE SUBSYSTEM. DSN IS TERMINATING

*Explanation:* The operator has requested that DB2 terminate.

**System Action:** DB2 will shut down, interrupting user activities as necessary. DSN will terminate immediately and return the user to TSO.

**User Response:** Reinitiate your session when DB2 returns.

**DSNE128I** DB2 IS ABnormally ENDING. DSN IS TERMINATING

*Explanation:* DB2 has encountered a problem from which it cannot recover.

**System Action:** DB2 is abending. DSN terminates immediately and returns the user to TSO.

**User Response:** Reinitiate your session when DB2 returns.

**DSNE130I** MAXIMUM NUMBER OF DB2 USERS REACHED. YOUR RETRY COUNT IS ZERO

*Explanation:* The number of concurrent connections to DB2 is restricted. The number is specified in the installation parameters in member DSN6SYSYP. For TSO foreground, see parameter IDFORE. For background jobs, see parameter IDBACK. The DSN request has been denied, because the current number of DB2 connections in the system has reached the installation-specified limit.

**System Action:** Control returns to TSO.

**User Response:** Resubmit the DSN command when activity using DB2 has diminished. If still unsuccessful, see the system programmer about the installation parameters.

**DSNE131I** MAXIMUM NUMBER OF DB2 USERS REACHED. WILL RETRY nnn MORE TIMES

*Explanation:* The number of concurrent connections to DB2 is restricted. The number is specified in the installation parameters in member DSN6SYSYP. For TSO foreground, see parameter IDFORE. For background jobs, see parameter IDBACK. The DSN request was denied because the current number of DB2 connections in the system reached the installation specified limit.

The DSN connection to DB2 is attempted ‘nnn’ more times. The number of retries is determined by the RETRY parameter on the DSN command. For more information, refer to [DB2 Command Reference](#).

This message is issued every 30 seconds (and each time ‘nnn’ is decreased by 1) until the connection is made or until ‘nnn’ is decreased to zero.

**System Action:** DSN repeats the connection attempt until the connection is made or the retry count is decreased to 0.

**User Response:** If all retry attempts fail, resubmit the DSN command when DB2 activity diminishes. If still unsuccessful, see the system programmer about the installation parameters.

**DSNE132I** DB2 IS OPERATING IN RESTRICTED ACCESS MODE. MAINTENANCE PERSONNEL ONLY

*Explanation:* DB2 is not available for normal operation. It is only available to service personnel.

**System Action:** Control returns to the caller. Your request was not processed. The DSN command processor was unable to connect to DB2.

**User Response:** Wait until DB2 is available for general use, then resubmit your request.
**DSNE133E**  
**csect-name RELEASE LEVELS NOT COMPATIBLE. DSN=release_level, DB2=release_level**

**Explanation:** The DSN command processor, perhaps running under the control of DB21, has detected a release level incompatibility between itself and DB2. The current release_level of the DSN command processor code and the DB2 subsystem load modules is indicated as a string of three numeric characters as follows:
- Version
- Release
- Modification level

**System Action:** The DSN command processor terminates.

**User Response:** Check that your method of invoking DSN or DB21 allocates the correct libraries for DSN. If you used JCL or a TSO logon procedure to execute DSN code, check your JOBLIB and STEPLIB allocations. If you used a CLIST to execute DSN, ensure that you obtained the correct version of the DSN code. See your system programmer if you invoke DSN using procedures supplied by your system programmer.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you are unable to determine the problem, you can trace DSN execution through DB21 or the DSN command processor.

**Problem Determination:** Insure that coexistence is supported on both release levels (DSN and DB2). If coexistence is supported, insure that the lower level release has the correct SPE level code support that is required to coexist with the current higher level release.

For more information about coexistence and SPEs, refer to the program directory or preventative service planning (PSP) updates.

---

**DSNE136I**  
**DB2 IS OPERATING IN RESTART LIGHT MODE. INDOUBT RESOLUTION ONLY**

**Explanation:** The DB2 member is not available for normal operation. It is only available to commit coordinators that have indoubt units of recovery that need to be resolved with this member.

**System Action:** Control returns to the caller. Your request was not processed. The DSN command processor was unable to connect to DB2.

**User Response:** Wait until this DB2 is available for general use, then resubmit your request. Or, request connection to a different DB2 member in the data sharing group (for example, by using the DB2 group attach name).

---

**DSNE231A**  
**ONE NAME IS REQUIRED TO FREE A PLAN OR A PACKAGE**

**Explanation:** The user has attempted to use the FREE PLAN or PACKAGE panel without specifying a plan or package name.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Enter the name of a plan or package, or (*) to indicate 'all'.

---

**DSNE232A**  
**CONNECTION NAME REQUIRES ENABLE/DISABLE OF CONNECTION TYPE**

**Explanation:** The user indicated that specific connection names were to be specified for ENABLE or DISABLE, but the associated connection type field was not updated. The ENABLE or DISABLE of connection names requires the corresponding connection type to also be specified for ENABLE or DISABLE.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Enter Y (Yes) on the connection type for the associated connection names.

---

**DSNE233A**  
**MEMBER NAME MUST NOT BE SPECIFIED MORE THAN ONCE**

**Explanation:** The LIBRARY field containing the data set name, also contains a member name.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** The member name must be specified only once, and must be specified on the MEMBER field.

---

**DSNE234A**  
**EITHER DBRM MEMBER OR INCLUDE PACKAGE LIST MUST BE SPECIFIED**

**Explanation:** The BIND PLAN subcommand requires either a DBRM member name or a package list as input, neither was specified.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Enter a DBRM member name(s), or specify that a package list is to be included. Both options are also allowed.

---

**DSNE235A**  
**plan/package NAME IS A DUPLICATE OF PRIMARY plan/package NAME**

**Explanation:** In addition to the primary 'plan' or 'package' name specified on the REBIND or FREE subcommand panel, the user also specified that additional plans or packages were to be included in the list. The primary 'plan' or 'package' name was again
specified to be included in the list.

**System Action:** The duplicate of the primary 'plan' or 'package' name is automatically deleted from the list to avoid errors during subcommand processing. The TSO attachment facility is ready for more input.

**User Response:** Complete the list of additional plans or packages.

---

**DSNE236A** SPECIFY A CONNECTION TYPE TO ENABLE OR DISABLE

**Explanation:** The user indicated that individual connection types were to be ENABLED or DISABLED, but no specific connection types were specified.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Enter Y (YES) for each individual connection type to ENABLE, or DISABLE.

---

**DSNE237A** SPECIFY ENABLE ALL OR SPECIFIC CONNECTION TYPES

**Explanation:** In addition to requesting that all connection types be enabled, the user also requested that specific connection types be enabled. The enable of all connection types includes the enable of specific connection types.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Specify specific connection types to be enabled, or specify that all connection types are to be enabled.

---

**DSNE240A** ISPF RETURNED AN UNEXPECTED CODE WHILE CLOSING A TABLE

**Explanation:** An ISPF error return code was encountered when attempting to perform a TBCLOSE for an ISPF table while processing the current subcommand panel.

**System Action:** TSO processing for the current subcommand is terminated.

**User Response:** Notify the system programmer.

**System Programmer Response:** Verify that the ISPF table library allocated to the DSNETBLS DD statement has sufficient space or directory entries available. Also refer to the ISPF error log for additional diagnostic information.

---

**DSNE241A** INTERNAL PROCEDURE WAS PASSED AN INVALID NUMBER OF ARGUMENTS

**Explanation:** A TSO Interpreter error was encountered while executing a subroutine during the processing of the current subcommand.

---

**DSNE242A** ISPF RETURNED AN UNEXPECTED CODE WHILE SETTING SEARCH ARGUMENTS

**Explanation:** An ISPF table for the current function does not contain the expected column or table format.

**System Action:** TSO processing for the current subcommand is terminated.

**User Response:** Notify the system programmer.

**System Programmer Response:** Delete the ISPF table in error. The table is recreated automatically during the next invocation of the DB2I function.

**Problem Determination:** The format of the ISPF table was changed since the last successful use of the table. Refer to the DB2I ISPF table library allocated to the DSNETBLS DD statement, and examine the ISPF error log for additional diagnostic information.

---

**DSNE243A** ISPF RETURNED AN UNEXPECTED CODE DURING A TABLE DISPLAY

**Explanation:** An ISPF error was encountered when attempting to display a DB2I table panel.

**System Action:** TSO processing for the current subcommand is terminated.

**User Response:** Notify the system programmer.

**System Programmer Response:** Insure that the DB2I panel and panel library are established correctly. If the format of both is correct, then use ISPF option 7.2 to test the panel for additional errors.

Examine the ISPF error log for additional error information and determine the name of the panel to be displayed.

---

**DSNE244A** CANNOT SAVE CREATED TABLE, VERIFY SPACE IN TABLE LIBRARY

**Explanation:** An ISPF TBSAVE function returned with a condition code greater than zero.

**System Action:** TSO processing for the current subcommand is terminated.

**User Response:** Notify the system programmer.

**System Programmer Response:** Verify that the ISPF
table library allocated to the DSNETBLS DD statement has sufficient space and directory entries available. Also refer to the ISPF error log for additional diagnostic information.

---

**DSNE245A**  
**ISPF RETURNED AN UNEXPECTED CODE WHILE ADDING A ROW TO A TABLE**

**Explanation:** An ISPF TBADD function returned with a condition code greater than four.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Enter the DB2I CANCEL command, and notify the system programmer.

**System Programmer Response:** Verify that the user has enough memory to perform ISPF functions. Also refer to the ISPF error log for additional diagnostic information.

---

**DSNE246A**  
**ISPF RETURNED AN UNEXPECTED CODE WHILE DELETING A ROW**

**Explanation:** An ISPF TBDELETE function returned with a condition code greater than zero.

**System Action:** TSO processing for the current subcommand is terminated.

**User Response:** Enter the DB2I CANCEL command, and notify the system programmer.

**System Programmer Response:** Verify that the user has enough memory to perform ISPF functions. Also refer to the ISPF error log for additional diagnostic information.

---

**DSNE247A**  
**ISPF RETURNED AN UNEXPECTED CODE WHILE UPDATING A ROW**

**Explanation:** An ISPF TBPUT function returned with a condition code greater than four.

**System Action:** TSO processing for the current subcommand is terminated.

**User Response:** Enter the DB2I CANCEL command, and notify the system programmer.

**System Programmer Response:** Verify that the user has enough memory to perform ISPF functions. Recreate the user actions that lead to the failure. Also refer to the ISPF error log for additional diagnostic information.

---

**DSNE248A**  
**COMMAND ENTERED CONTAINS INVALID CHARACTERS, RESPECIFY**

**Explanation:** The command entered at the command line contains an invalid character, the command must be reentered.

---

**DSNE250A**  
**PLEASE ENTER THE COMMAND AT THE LINE WITH THE PLAN/PACKAGE NAME**

**Explanation:** SELECT or RESET commands must be entered on the line where the PLAN/PACKAGE name is shown. This line contains the name of the PLAN/PACKAGE, while the secondary line(s) do not.

**System Action:** The line command is rejected. The TSO attachment facility is ready for more input.

**User Response:** Reenter the line command on the primary PLAN/PACKAGE line(s).

---

**DSNE252A**  
**JCL WAS NOT CREATED, ERROR errcode WHILE DOING function_name FUNCTION**

**Explanation:** Error code 'errcode' was received while doing a function 'function_name', the JCL was not created.

**Severity:** 20

**System Action:** Refer to z/OS ISPF Dialog Developer's Guide for the cause of this error.

**User Response:** Contact your systems programmer.

**Problem Determination:** Use the return code/function combination to find the causes for the problem in z/OS ISPF Dialog Developer's Guide and correct the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**DSNE283A**  
**THE , (COMMA) OPTION IS INCOMPATIBLE WITH THE hostlang LANGUAGE**

**Explanation:** The user tried to select the 'hostlang' APPLICATION LANGUAGE and the comma option of the DECIMAL POINT field on the DB2I defaults panel. This combination is not supported.

**System Action:** The defaults panel is displayed again.

**User Response:** Either change the APPLICATION LANGUAGE field or the DECIMAL POINT field. If you need the C (C/370 Compiler), then the DECIMAL POINT field must contain a decimal point (.).

---

**DSNE288A**  
**YOU CANNOT SPECIFY (RUN)=YES WITH CICS OR IMS**

**Explanation:** Application programs that make CICS or IMS calls cannot be run from the TSO environment. They can, however, be precompiled, bound, compiled,
and linked under TSO. The user should specify N on the RUN panel when preparing a CICS or IMS application.

**System Action:** The system is waiting for new input to the panel.

**User Response:** Change the RUN option to N.

---

**DSNE291A**  **ALL DB2 COMMANDS BEGIN WITH A DASH**

**Explanation:** The user omitted the DB2 command recognition character that must precede all DB2 commands.

**System Action:** The DB2 commands panel is displayed again so the user can resubmit the command.

**User Response:** Add the DB2 command recognition character, and reenter the command.

---

**DSNE292I**  **DATA SET data-set-name NOW CONTAINS YOUR JCL**

**Explanation:** DB2I has just created some JCL for you. The JCL now resides in data set 'data-set-name'. You can now edit this data, if desired. The TSO SUBMIT command will start the job running in background.

**System Action:** The system is waiting for your next request.

**User Response:** You can start another DB2I job or leave the panel.

---

**DSNE293A**  **MEMBER NAME IS REQUIRED. YOUR PROGRAM MUST BE IN A PDS**

**Explanation:** The user either has attempted to run a program that is not in a partitioned data set or has forgotten to specify a member name.

**System Action:** The RUN panel will be displayed so that the user can specify a member name and try the run again.

**User Response:** Specify a member name, and rerun the program.

---

**DSNE294I**  **SYSTEM RETCODE=hex-code USER OR DSN RETCODE=decimal-code**

**Explanation:** A DB2I function has just completed. The return codes for that function are returned in this message. The variable 'hex-code' is a 3-digit hexadecimal number; the variable 'decimal-code' is a 3-digit decimal number. Refer to the appropriate MVS publication for explanations of the return codes.

**System Action:** DB2I is ready for another execution cycle unless other messages appeared indicating that DB2 is unavailable.

**User Response:** You may have to change input parameters to correct unsatisfactory completion codes.

---

**DSNE295A**  **YOU CANNOT DISPLAY AND RESTART A UTILITY AT THE SAME TIME**

**Explanation:** You have set options on the DB2I Utilities panel that call for conflicting actions. You can either DISPLAY the status of a utility, or you can RESTART a utility, but you cannot do both.

**System Action:** The system is waiting for new input to the panel.

**User Response:** Either change the RESTART option to NO, or select a different FUNCTION.

---

**DSNE296A**  **YOU CANNOT TERMINATE AND RESTART A UTILITY AT THE SAME TIME**

**Explanation:** You have set conflicting options on the DB2I Utilities panel. You can either TERMINATE a utility, or you can RESTART a utility, but you cannot do both.

**System Action:** The system is waiting for new input to the panel.

**User Response:** Either change the RESTART option to NO, or select a different FUNCTION.

---

**DSNE297A**  **ENTER DATA SET NAME: COPYDSN OR RCPYDSN1**

**Explanation:** You have not specified a data set name for the COPY utility. A data set name for the local/current site (COPYDSN), and/or the recovery site (RCPYDSN1) is required.

**System Action:** The system is waiting for new input to the panel.

**User Response:** Enter a data set name for COPYDSN, and/or RCPYDSN1.

---

**DSNE298A**  **ERROR DURING EDIT: CLIST data set name**

**Explanation:** Errors were encountered while attempting to change the online book data set names in the DB2 CLIST member DSNEMC01. No data set names were changed.

**System Action:** The system is waiting for new input to the panel.

**User Response:** Ensure that the CLIST data set name is correct and contains the DSNEMC01 CLIST member to be changed. This CLIST data set must also be available to the TSO user ID in WRITE mode. This error will continue to be displayed on the panel until the error is resolved or the user exits the panel (END).

**System Programmer Response:** If you are unable to determine the problem, you can trace the DB2 CLIST execution while displaying this panel.
Problem Determination: Examine the CLIST trace output for any TSO/ISPF nonzero return codes encountered during CLIST execution.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Explanation:

DSNE340I INTERNAL ERROR – ILLEGAL TYPE IN MODULE module-name

User Response: Collect the SPUFI trace and ISPF log, and notify either the system programmer or the database administrator.

You may have to rerun the failing job after you have turned on trace. This will enable you to send trace messages to the ISPF log.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

System Action: SPUFI will wait until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE351A EDIT PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified an edit option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI invokes the ISPF editor to allow the user to edit the input data set.

System Action: SPUFI will wait until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE352A EXECUTE PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified an execute option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI executes the SQL statements in the user input data set.

System Action: SPUFI waits until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE353A BROWSE PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified a browse option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI invokes ISPF BROWSE to allow the user to browse the output data set.

System Action: SPUFI waits until the user specifies an output data set.

User Response: Type in the correct entry, and press 'ENTER'.

DSNE354A AUTOCOMMIT PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified an AUTOCOMMIT option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI automatically commits all the changes to the database subsystem. This was encountered as a result of executing the user's SQL statement(s). The commit is done at the end of the processing of an input data set, if it is requested and if there has been no SQL execution error.

System Action: SPUFI waits until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE355A CHANGE DEFAULTS PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified a change-default option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI displays the current-session SPUFI defaults and allows the user to change the defaults.

System Action: SPUFI waits until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE359A OUTPUT DATA SET NAME REQUIRED FOR EXECUTE OR BROWSE

Explanation: The user did not specify the name of the output data set.

System Action: SPUFI waits until the user specifies an output data set.

User Response: Type in the correct entry, and press 'ENTER'.

DSNE360A THE OUTPUT DATA SET MUST RESIDE ON DASD

Explanation: The user has attempted to send the output of SPUFI to a SYSOUT data set. He must enter a generic device class that contains only DASD devices.

System Action: SPUFI waits until the user specifies a valid output device class.

User Response: Type in the correct entry, and press 'ENTER'.

220 Messages and Codes
**DSNE361I**  
**SPUFI PROCESSING COMPLETE**

**Explanation:** This informational message is displayed after SPUFI successfully created the output data set. If errors are encountered before the completion of output data set processing, or during the subsequent BROUSE OUTPUT option for this data set, this message is replaced by either SPUFI or TSO/ISPF error messages.

**System Action:** The system waits for the next user input.

**User Response:** At this point you can change the SPUFI panel variable settings to initiate a new SPUFI request, or you can exit SPUFI.

---

**DSNE363A**  
**ONLY RR (REPEATABLE READ) OR CS (CURSOR STABILITY) ALLOWED**

**Explanation:** The user has entered an invalid isolation level. This value must be either RR or CS. 'Isolation level' here refers to the degree to which the SPUFI user wants to isolate SQL execution from the effects of other concurrently executing DB2 applications.

If the repeatable read (RR) level is specified and the AUTOCOMMIT option is 'YES', other applications can modify the selected database values as soon as the SPUFI EXECUTE phase is completed and as soon as the automatic COMMIT (or ROLLBACK, if an error was encountered,) operation is performed. Therefore, it is possible that the retrieved data being browsed by the user has already been modified by another application.

If the RR level is specified and the AUTOCOMMIT option is 'NO', no other DB2 application executing concurrently can change any of the selected database values until the SPUFI user issues either a COMMIT or a ROLLBACK. Therefore, other applications might be in a normal wait state while the SPUFI user is browsing the output data set.

If the cursor stability (CS) level is specified, it does not make any difference whether the AUTOCOMMIT option is 'YES' or 'NO'. Other concurrently executing DB2 applications can change the selected database values as soon as the SELECT has completed.

**System Action:** SPUFI waits until the user specifies either 'RR' or 'CS'.

**User Response:** Type in the correct entry, and press 'ENTER'.

---

**DSNE364A**  
**token IS INVALID AS AN SQL STATEMENT TERMINATOR**

**Explanation:** The user has entered an SQL statement terminator (token) that is not supported. The following values are not valid for use as a SQL statement terminator:

- single and double quotes
- underscore
- left and right parenthesis

**System Action:** The statement cannot be executed.

**User Response:** Specify a valid SQL statement terminator.

---

**DSNE365A**  
**SQL STATEMENT TERMINATOR HAS BEEN CHANGED TO token**

**Explanation:** The SPUFI input data set contains a #SET statement that changes the SQL statement terminator to token.

**System Action:** token is the SQL statement terminator until another #SET statement changes it or the end of the input data is reached.

---

**DSNE366A**  
**ONLY THE LISTED RECFM TYPES ARE ALLOWED**

**Explanation:** The user has entered an invalid record format for the output data set.

**System Action:** The system waits until the user enters one of the allowed RECFM types.

**User Response:** Enter a RECFM of V, VB, VBA, F, FB, or FBA.

---

**DSNE367A**  
**ACTION MUST BE C (COMMIT) OR R (ROLLBACK) OR D (DEFER)**

**Explanation:** This message requests the user to make a commit action decision.

**User Response:** To commit all the changes made since the last commit point, enter a 'C'. To undo all the changes that have been made since the last commit point, enter an 'R'. To defer the decision, enter a blank.

---

**DSNE368A**  
**YES OR NO MUST BE ENTERED FOR EACH PROCESSING OPTION**

**Explanation:** One of the processing options was left blank or set to blank by the user.

**User Response:** Enter 'YES' or 'NO' for each processing option.

---

**DSNE370A**  
**INPUT DATA SET COULD NOT BE OPENED**

**Explanation:** The input data set could not be opened because of invalid data set attributes. The logical record length (LRECL) of the input data set must be 80K. The record format (RECFM) must be either F or FB. The input data set may be either sequential or partitioned.

**User Response:** Specify an input data set having valid attributes.
<table>
<thead>
<tr>

<td><strong>User Response:</strong> Enter a valid value in the record format field.</td>
<td></td>
</tr>
</tbody>
</table>
DSNE384A  UNEXPECTED DEALLOCATION
RETURN CODE return-code, reason-code

Explanation:  A deallocation request has returned an unexpected return code.

User Response:  Refer to the appropriate MVS publication for explanations of the return and reason codes.

---

DSNE385A  ENTER MEMBER NAME. INPUT DATA SET IS PARTITIONED

Explanation:  The input data set is partitioned, and the user did not enter the member name on the SPUFI main menu.

System Action:  Processing does not begin until the panel entries are correct. If any of the processing options are changed, this message is ignored, and processing will proceed according to the new settings.

User Response:  Enter the member name.

---

DSNE386A  MEMBER member-name NOT PRESENT IN SPECIFIED INPUT DATA SET

Explanation:  The named member is not in the input data set.

System Action:  Processing does not begin until the panel entries are correct.

User Response:  Enter a correct member name or a correct data-set-name.

---

DSNE387I  DSNTIAR ERROR. RETURN CODE = return-code

Explanation:  An internal DB2 error has occurred. DSNTIAR attempted to format a message to explain a nonzero SQL code, but the attempt failed.

User Response:  Notify the system programmer.

System Programmer Response:  Print the ISPF log, and collect a dump of the TSO address space. Refer to Part 2 of DB2 Application Programming and SQL Guide for failure analysis procedures.

---

DSNE388A  INPUT DATA SET MUST BE SEQUENTIAL OR PARTITIONED

Explanation:  The input data set organization is not recognized.

System Action:  Processing does not begin until the panel entries are correct.

User Response:  Enter a data-set-name with sequential or partitioned organization. It may be necessary to allocate a sequential or partitioned data set.

---

DSNE389A  A MEMBER HAS BEEN SPECIFIED FOR A SEQUENTIAL DATA SET

Explanation:  The user has specified a member as input to SPUFI. However, the input data set specified is sequential.

System Action:  Processing does not begin until the panel entries are correct.

User Response:  Enter the data-set-name without attempting to specify a member.

---

DSNE390A  THE OUTPUT DATA SET ATTRIBUTES ARE INCONSISTENT

Explanation:  This message indicates that the user made one of three possible errors in specifying block size and logical record length (LRECL):

- The user specified a record format (RECFM) of F, but the block size is not equal to the logical record length (LRECL).

- The user specified a record format (RECFM) of F, FB, or FBA, but block size is not evenly divisible by logical record length (LRECL).

- The user specified a record format (RECFM) of VB, but the block size is less than logical record length (LRECL) + 4. The user must allow 4 bytes for the block header.

User Response:  Specify logical record length (LRECL) and block size appropriately on the DSNESP02 panel.

---

DSNE391I  FREEMAIN ERROR IN MODULE module-name

Explanation:  SPUFI encountered a FREEMAIN error in the specified module.

System Action:  This message is logged in the ISPF log data set. No abend occurs.

User Response:  Notify the system programmer or system administrator.

System Programmer Response:  Print the ISPF log, and collect a dump of the TSO address space. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

---

DSNE392I  GETMAIN ERROR IN MODULE module-name

Explanation:  SPUFI encountered a GETMAIN error in the specified module.

System Action:  This message is logged in the ISPF log data set. User abend X'00C50003' is issued.

User Response:  Notify the system programmer or system administrator.

System Programmer Response:  Ensure that enough
storage is allocated to the TSO user.

**DSNE393I  SPF VDELETE ERROR IN MODULE DSNESM90. ERROR CODE = flag**

**Explanation:** An internal SPUFI error has occurred. CSECT DSNESM90 tried to delete an ISPF dialog variable that was not previously defined.

**System Action:** This message is logged in the ISPF log data set. No abend is issued. However, if the problem persists, notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Record the error code 'flag'. It has no user significance, but it can assist the IBM Support Center in resolving the problem.

**DSNE395I UNEXPECTED RETURN CODE FROM SPF SERVICE**

**Explanation:** A return code of 4 from ISPF DISPLAY or a return code of 8 from the ISPF editor was encountered.

**System Action:** The message is displayed on the SPUFI panel and logged in the ISPF log data set. No user abend is issued.

**User Response:** Notify the system programmer.

**System Programmer Response:** If a new release of ISPF is used, determine whether the above return codes are now assigned meaning by ISPF.

**Problem Determination:** This message may be issued if a previously unassigned (by ISPF) return code from the ISPF DISPLAY or EDIT function is encountered. If a new release of ISPF is used, determine whether the above return codes are now assigned meaning by ISPF.

**DSNE396A YOU CANNOT SPECIFY DEFER WHEN LEAVING SPUFI**

**Explanation:** You have attempted to leave SPUFI with outstanding database changes not yet committed or rolled back. You can’t leave SPUFI unless a decision has been made to commit or rollback.

**System Action:** The system is waiting for new input to the panel.

**User Response:** Specify COMMIT or ROLLBACK.

**DSNE415A csect-name TYPE IS DATE**

**Explanation:** This is a SPUFI trace message. SPUFI has looked in the SQLTYPE field of the SQLDA and detected a data type of DATE.

**DSNE416A csect-name TYPE IS TIME**

**Explanation:** This is a SPUFI trace message. SPUFI has looked in the SQLTYPE field of the SQLDA and detected a data type of TIME.

**DSNE417A csect-name TYPE IS TIMESTAMP**

**Explanation:** This is a SPUFI trace message. SPUFI has looked in the SQLTYPE field of the SQLDA and detected a data type of TIMESTAMP.

**DSNE457I csect-name ARITHMETIC ERROR IN THE CURRENT ROW AND COLUMN**

**Explanation:** This is a SPUFI trace message. SPUFI has looked in the SQLDA and detected an arithmetic error. The indicator variable associated with this value contains -2.

**DSNE601I SQL STATEMENTS ASSUMED TO BE BETWEEN COLUMNS nn AND nn**

**Explanation:** This message indicates which record columns in the input data set are scanned for SQL statements. For data sets of type COBOL, columns 8 through 72 are scanned. For STANDARD data set types, if the LRECL is 79 then columns 1 through 71 are scanned, and if the LRECL is 80 then columns 1 through 72 are scanned.

**System Action:** This message is written to the SPUFI output data set along with other summary messages.

**DSNE603E INPUT STATEMENT HAS UNBALANCED APOSTROPHES**

**Explanation:** An opening apostrophe was detected in an input record, but the end of data set was reached before a closing apostrophe was encountered.

**System Action:** SPUFI processing stops. Correct the error, and start again.

**User Response:** A closing apostrophe was probably omitted from a literal value. Add the missing apostrophe, and execute the input file again.

**DSNE604E THE SQL STATEMENT EXCEEDS THE MAXIMUM ALLOWED LENGTH**

**Explanation:** This message indicates that the preceding SQL statement in the output data set exceeds the maximum length allowed. An SQL statement may span up to a maximum of 455 input records.

**System Action:** SPUFI processing stops. Correct the error, and start again.

**User Response:** Edit the SQL statement in question so that it resides on fewer input records.
**DSNE605E**  THE INPUT DATA SET IS EMPTY

**Explanation:** The user has specified an input data set that does not contain any valid SQL statements.

**System Action:** SPUFI processing stops. Correct the error, and start again.

**User Response:** Edit SQL statements into the specified data set, or specify another input data set that contains valid SQL statements.

---

**DSNE606E**  INVALID USE OF AN SQL STATEMENT TERMINATOR

**Explanation:** An SQL statement terminator has been used improperly in an SQL input statement. Either two successive statement terminators were encountered, or a series of blanks followed by a terminator was detected. The proper use of the SQL statement terminator is to delimit the end of a valid SQL statement.

**System Action:** SPUFI processing stops. Correct the error, and start again.

**User Response:** Remove the extraneous terminator from the input data set.

---

**DSNE607E**  PREVIOUS INPUT RECORD HAS UNBALANCED SO/SI CHARACTERS

**Explanation:** A shift out (SO) character was detected in the previous input record with no corresponding shift in (SI) character in the record. The SO/SI characters delimit a DBCS string in the SPUFI input data set. SPUFI requires that SO/SI characters be paired within an input record.

**System Action:** SPUFI processing stops.

**User Response:** A closing SI character was probably omitted from a literal value. Add the missing SI character, and re-execute the input file.

---

**DSNE609E**  INPUT STATEMENT HAS UNBALANCED QUOTES

**Explanation:** An opening quote ("') was detected in an input record, but a corresponding quote was not found at the end. Two sets of quotes are used to delimit a statement.

**System Action:** SPUFI processing stops.

**User Response:** A closing quote was probably omitted from a literal value. Add the missing quote, and execute the input file again.

---

**DSNE610I**  NUMBER OF ROWS DISPLAYED IS nn

**Explanation:** Execution of an SQL SELECT statement causes one or more rows of data to be displayed. This message appears in the output data set following the returned data for a SELECT. It gives a count, 'nn', of the number of rows displayed.

**System Action:** Input data set processing is completed, and this message is included in the SPUFI output.

---

**DSNE611I**  COLUMN HEADER FOR COLUMN NUMBER nn WAS TRUNCATED

**Explanation:** An SQL SELECT statement was executed, but the specified column name, identified by 'nn' in the message, was truncated. This truncation occurred either because the column name was longer than the remaining record width or because the name was longer than the user-specified maximum field length.

**System Action:** Input data set processing is completed, and this message is included in the SPUFI output.

**User Response:** If the truncation is caused by insufficient record width, use a larger LRECL for the output data set or specify fewer data columns to be returned on the SELECT statement.

If the truncation is caused by the user-specified maximum field length setting, use a larger value for this setting.

---

**DSNE612I**  DATA FOR COLUMN HEADER name COLUMN NUMBER nn WAS TRUNCATED

**Explanation:** An SQL SELECT statement was executed, but data for the specified column name, identified by 'nn' in the message, was truncated. This truncation occurred either because the data was longer than the remaining record width or because the data was longer than the user-specified maximum field length.

**System Action:** Input data set processing is completed, and this message is included in the SPUFI output.

**User Response:** If the truncation is because of insufficient record width, use a larger LRECL for the output data set or specify fewer data columns be returned on the SELECT statement.

If the truncation is because of the user-specified maximum field length setting, use a larger value for this setting.
System output.

**Explanation:**  An SQL SELECT statement was executed, but the logical record length of the output data set was not large enough to display the column names and data values of all returned columns. The columns specified following this message were not displayed because of insufficient remaining record width.

**System Action:**  Input data set processing is completed, and this message is included in the SPUFI output.

**User Response:**  This condition can be avoided by using a larger LRECL for the output data set or by specifying that fewer data columns be returned on the SELECT statement.

---

**DSNE614I**  **AUTOCOMMIT IS NO, NO CHANGES COMMITTED**

**Explanation:**  The user delayed committing or rolling back changes made during execution of the input file until later in the session. This is done by specifying an AUTOCOMMIT option of 'NO'.

**System Action:**  Input data set processing is completed, and this message is included in the SPUFI output.

**User Response:**  Commit or roll back these changes before ending the session.

---

**DSNE615I**  **NUMBER OF ROWS AFFECTED IS nn**

**Explanation:**  This message is written to the output data set following execution of an SQL UPDATE, INSERT, or DELETE statement. 'nn' in the message is a count of the number of rows that were modified as a result of executing the UPDATE, INSERT, or DELETE statement.

**Note:**  In the case of a mass delete of a table in a segmented table space where DB2 does not access nor count the individual rows, this message will not be displayed.

**System Action:**  Input data set processing is completed, and this message is included in the SPUFI output.

---

**DSNE616I**  **STATEMENT EXECUTION WAS SUCCESSFUL, SQLCODE IS number**

**Explanation:**  This message is written to the output data set following the successful execution of an SQL statement from the input data set. 'number' specifies the SQL return code for the statement. These return codes are listed in Part 2, "SQL return codes." on page 11.

**System Action:**  Input data set processing is completed, and this message is included in the SPUFI output.

---

**DSNE617I**  **COMMIT PERFORMED, SQLCODE IS number**

**Explanation:**  When an input file is executed successfully and the user specified an AUTOCOMMIT option of 'YES', this message is written to the output data set to indicate the status of the COMMIT that was performed. 'number' specifies the SQL return code for the COMMIT. These return codes are listed in Part 2, "SQL return codes." on page 11.

**System Action:**  Input data set processing is completed, and this message is included in the SPUFI output.

---

**DSNE618I**  **ROLLBACK PERFORMED, SQLCODE IS number**

**Explanation:**  When an error is encountered while executing a SPUFI input file, and the user specified an AUTOCOMMIT option of 'YES', this message will be written to the output data set to indicate the status of the ROLLBACK that was performed. 'number' specifies the SQL return code for the statement. These return codes are listed in Part 2, "SQL return codes." on page 11.

**System Action:**  Input data set processing is completed, and this message is included in the SPUFI output.

---

**DSNE620I**  **NUMBER OF SQL STATEMENTS PROCESSED IS nn**

**Explanation:**  This message is written to the output data set after processing all SQL statements in the current input data set. The term 'nn' is a count of the number of SQL statements processed.

**System Action:**  Input data set processing is completed, and this message is included in the SPUFI output.

---

**DSNE621I**  **NUMBER OF INPUT RECORDS READ IS nn**

**Explanation:**  This message is written to the output data set after processing all SQL statements in the current input data set. The term 'nn' is a count of the total number of records read from the input data set.

**System Action:**  Input data set processing is completed, and this message is included in the SPUFI output.
**DSNE622I** NUMBER OF OUTPUT RECORDS WRITTEN IS nn

**Explanation:** This message is written to the output data set after processing all SQL statements in the current input data set. The term 'nn' is a count of the total number of records written to the output data set.

**System Action:** Input data set processing is completed, and this message is included in the SPUFI output.

**DSNE623I** SYNTAX ERROR AT RECORD xx, OFFSET xx

**Explanation:** A syntax error was detected in the SQL statement preceding this message in the output data set. 'xx' identifies the erroneous line number in the SQL statement, and 'yy' identifies the offset (in characters) of the error within that record.

**System Action:** Input data set processing is completed, and this message is included in the SPUFI output.

**User Response:** Correct the specified syntax error in the input data set, and execute the job again.

**DSNE624I** UNABLE TO LOAD ISPLINK MODULE. SPUFI PROCESSING TERMINATED

**Explanation:** During SPUFI initialization processing, an error was encountered attempting to LOAD the ISPF interface module, ISPLINK. This module could not be located in the LNKLST or STEPLIB library concatenation.

**System Action:** SPUFI processing is terminated.

**User Response:** Rearrange your library concatenation so that the ISPLINK module can be located. This module resides in the ISPF load library.

**DSNE625I** CONNECT TO LOCATION (location name) PERFORMED, SQLCODE IS number

**Explanation:** The SPUFI user has indicated that the SQL statements defined in the input file are to be processed by the server at the remote location specified in the CONNECT LOCATION field of the SPUFI panel.

This message appears in the output file and indicates that an SQL CONNECT request was issued by SPUFI to the specified location name. The 'number' specifies the SQL return code associated with the CONNECT request. These return codes are listed in [Part 2, “SQL return codes,” on page 11](#).

**System Action:** Subsequent processing of the SQL statements in the input file is based upon the successful completion of the CONNECT request. If the request is unsuccessful, the SQL error number and all associated error messages are placed in the output file.

**User Response:** Respond as indicated by the SQL code returned.

**DSNE626I** MAXIMUM OUTPUT LINES FOR SELECT STATEMENT REACHED (number), PROCESSING FOR CURRENT SELECT STATEMENT TERMINATED

**Explanation:** The maximum number of output lines to be displayed for a SELECT statement was reached. Processing of the current SELECT statement is terminated. The maximum number of lines to be displayed is specified by the SPUFI user on the CURRENT SPUFI DEFAULTS panel.

This message appears in the SPUFI output file.

**System Action:** Processing of subsequent SQL statements in the input file continues.

**User Response:** If the number of lines displayed is insufficient, you can increase the maximum number of lines to be displayed for SELECT statements on the CURRENT SPUFI DEFAULTS panel and re-execute the SELECT statement.

**DSNE627I** the csect-id FOR SQLCODE = number, USER REQUESTED: action

**Explanation:** During PREPARE processing of the SQL statement, SPUFI received an SQLCODE (+495) and requested you to respond with the desired action to be taken by SPUFI (CONTINUE or BYPASS).

SPUFI does not consider this to be an SQL statement error and places this message in the SPUFI output file to document the SQLCODE received and the action you requested. number specifies the SQL return code associated with the PREPARE request. These return codes are listed in [Part 2, “SQL return codes,” on page 11](#).

**System Action:** SPUFI processing for this statement is based on action documented in the message:

- CONTINUE
  - Processing for the current SQL statement continues normally.
- BYPASS
  - Processing for the current SQL statement is terminated without error.

**User Response:** Respond as indicated by the SQL code returned.

**DSNE800A** NO DEFAULT VALUES WERE CHANGED. PRESS ENTER TO CONTINUE

**Explanation:** The user left panel DSNESP02 without changing it. This panel contains all the defaults that can be modified by the user.
DSNE803A • DSNE910E

**System Action:** This message is presented on the SPUFI panel DSNESP01. SPUFI waits for the next user input.

**User Response:** Press 'ENTER' if you want to continue.

---

**Explanation:** The user has exited from the ISPF editor without modifying the input data set.

**System Action:** The system waits for the next user input.

**User Response:** Press 'ENTER' if you want to continue. The SPUFI panel variable settings can be changed at this point.

---

**Explanation:** The user has specified the AUTOCOMMIT=NO option and now wants either to exit or to switch to another DB2 subsystem with outstanding work uncommitted on the current DB2 subsystem.

**System Action:** DB2 waits for the user to specify either the COMMIT (C) or the ROLLBACK (R) option.

**User Response:** Enter 'C' or 'R' to continue.

---

**Explanation:** The user has exited from the ISPF editor.

**System Action:** SPUFI waits for the next user input.

**User Response:** Press 'Enter' if you want to continue. Press 'END' if you want to terminate your SPUFI session. The SPUFI panel variable settings can be changed at this point.

---

**Explanation:** Execution of a subcommand has successfully completed.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Correct the parameter list in error, and resubmit the job.

---

**Explanation:** You specified the DBCSSYMBOL keyword in your DCLGEN invocation, but your LANGUAGE keyword value was not COB2. DBCSSYMBOL only applies to COB2 PICTURE clauses. DCLGEN will ignore this keyword.

**System Action:** DCLGEN processing continues.

**User Response:** In the future, do not specify the DBCSSYMBOL keyword unless the LANGUAGE keyword value is COB2.

---

**Explanation:** You specified both the OWNER keyword and a qualified table name for the TABLE keyword in
your DCLGEN invocation. The table qualifier will be used as the table owner, and the OWNER keyword will be ignored.

**System Action:** DCLGEN processing continues.

**User Response:** In the future, specify either a qualified table name for the TABLE keyword, or an unqualified table name for the TABLE keyword along with the OWNER keyword.

---

**DSNE920E** member-name ALREADY EXISTS, SPECIFY ACTION(REPLACE) TO REPLACE

**Explanation:** The DCLGEN user tried to overwrite an old declaration with a new one without specifying REPLACE on the 'ACTION' parameter.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Change the 'ACTION' parameter to REPLACE (if that's actually what you want to do), and resubmit the command.

---

**DSNE921E** REQUIRED PARAMETER table-parameter IS MISSING

**Explanation:** Your DCLGEN subcommand was missing the required TABLE parameter.

**System Action:** Your DCLGEN subcommand was not processed. The DSN command processor issued a return code of 8. DSN is ready for more input.

**User Response:** Resubmit the DCLGEN subcommand with a TABLE parameter.

---

**DSNE922E** TABLE NAME QUALIFIER OF qualifier IS TOO LONG. CANNOT EXCEED 8 CHARACTERS IN LENGTH

**Explanation:** DCLGEN detected an invalid TABLE parameter. The table name qualifier (the left portion of the table name) was too long.

**System Action:** Your DCLGEN subcommand was not processed. The DSN command processor issued a return code of 8. DSN is ready for more input.

**User Response:** Resubmit the DCLGEN subcommand with a shorter table name qualifier.

---

**DSNE923E** CSEC csect-name FOUND AN UNRECOGNIZED LANGUAGE unknown

**Explanation:** This is a DCLGEN subsystem error, not a user error. The language parameter 'unknown' is not known to the subsystem.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Notify the system programmer.

**System Programmer Response:** Re-create the problem with DSN tracing turned on. Collect the trace stream in the DSNTRACE data set. Use the ABEND subcommand of the DSN command processor to collect a dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.wss?uid=swg21702978) for information on identifying and reporting the problem.

---

**DSNE924E** PARSE FAILED IN CSEC csect-name PARAMETER parm, FLAG flag

**Explanation:** This is a DB2 subsystem error, not a user error. The 'PARM' parameter was not correctly parsed. The flag specified was detected as an inappropriate value in a parse results field.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Report the problem to the system programmer.

**System Programmer Response:** Re-create the problem with DSN tracing turned on. Collect the trace stream in the DSNTRACE data set. Use the ABEND subcommand of the DSN command processor to collect a dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.wss?uid=swg21702978) for information on identifying and reporting the problem.

---

**DSNE925E** BUFFER OVERFLOW IN CSEC csect-name WHILE WRITING string

**Explanation:** This is a DCLGEN subsystem error. CSEC 'csect-name' detected a buffer overflow condition while attempting to write 'string'.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Notify the system programmer.

**System Programmer Response:** Re-create the problem with DSN tracing turned on. Collect the trace stream in the DSNTRACE data set. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.wss?uid=swg21702978) for information on identifying and reporting the problem.

---

**DSNE926E** COMMAND REJECTED - command NOT SUPPORTED UNDER command_processor

**Explanation:** The user entered a TSO TIME or TEST command. These are not supported by DSN or DB2!

**System Action:** The user should leave DSN or DB2, return to TSO, and retry the command. DSN can be run under TSO TEST. The TSO attachment facility is ready for more input.

**User Response:** Enter the DSN subcommand, or
leave DSN to execute the requested command.

---

**DSNE927E**  RUN SUBCOMMANDS REQUIRE
(1)PROGRAM PARM OR (2)PLAN AND CP PARMS

**Explanation:** Run subcommands may contain (1) the 'PROGRAM' parameter and, optionally, the 'PLAN' parameter or (2) the 'PLAN' and command processor ('CP') parameters. Combinations of (1) and (2) are not allowed.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Correct the subcommand, and resubmit the job.

---

**DSNE928E**  RUN SUBCOMMANDS CANNOT HAVE A PROGRAM PARM AND A CP PARM

**Explanation:** A RUN subcommand cannot contain both the 'PROGRAM' and command processor ('CP') parameters. The subcommand should be resubmitted with only one of the parameters.

**System Action:** The TSO attachment facility is ready for more input.

**User Response:** Correct the subcommand, and resubmit the job.

---

**DSNE929E**  TABLE NAME LOCATION OF (location-name) IS TOO LONG. CANNOT EXCEED 16 CHARACTERS IN LENGTH.

**Explanation:** DCLGEN detected an invalid AT(location) keyword parameter. The specified location name is too long.

**System Action:** Your DCLGEN subcommand was not processed. The DSN command processor issues a return code of 8. The DSN is ready for more input.

**User Response:** Resubmit the DCLGEN subcommand specifying a location name that does not exceed 16 characters.

---

**DSNE930E**  TABLE NAME OF table-name MUST BE QUALIFIED WHEN SPECIFIED WITH LOCATION OF location-name

**Explanation:** DCLGEN detected an invalid TABLE keyword parameter. You must specify a qualified table name with the AT (location) keyword.

**System Action:** Your DCLGEN subcommand was not processed. The DSN command processor issues a return code of 8. DSN is ready for more input.

**User Response:** Specify a qualified table name and resubmit the DCLGEN command.

---

**DSNE931E**  csect-name keyword-name (parameter_value) CONTAINS AN INVALID SYMBOL (symbol)

**Explanation:** An invalid 'symbol' (symbol) was specified in the 'parameter_value' associated with the specified 'keyword-name'.

**Severity:** 8

**System Action:** Subcommand processing is terminated. The TSO attachment facility is ready for more input.

**User Response:** Correct the keyword 'parameter_value' in error, and resubmit the job.

---

**DSNE932I**  WARNING, ONLY IBM SUPPLIED names SHOULD BEGIN WITH DSN

**Explanation:** The user has issued a BIND, REBIND, or FREE subcommand, using a name or id that begins with DSN.

**System Action:** Processing continues.

**User Response:** In the future, do not use plan-names, collection-ids, or package -ids that begin with DSN. It would be a good idea to FREE the plan or package you just created and to BIND again with a new plan-name, collection-id, or package-id.

---

**DSNE935I**  ... IS THE DCLGEN COMMAND THAT MADE THE FOLLOWING STATEMENTS

**Explanation:** This message is a part of normal DCLGEN output. It identifies the DCLGEN command that produced the declaration of which it is a part.

**System Action:** This message is included in the DCLGEN output.

---

**DSNE936I**  THE NUMBER OF COLUMNS DESCRIBED BY THIS DECLARATION IS nnn

**Explanation:** This message is a part of normal DCLGEN output. It tells how many columns were in the table that was named in the DCLGEN command.

**System Action:** This message is included in the DCLGEN output.

---

**DSNE937I**  COBOL DECLARATION FOR TABLE table-name

**Explanation:** This message is a part of normal DCLGEN output. It tells the name of the table for which the declaration was created.

**System Action:** This message is included in the DCLGEN output.
DSNE938I  PLI DECLARATION FOR TABLE
    table-name
Explanation: This message is a part of normal
    DCLGEN output. It tells the name of the table for which
    the declaration was created.
System Action: This message is included in the
    DCLGEN output.

DSNE939E  csect-name THE COMBINATION
    ACQUIRE(ALLOCATE) AND
    RELEASE(COMMIT) IS NOT ALLOWED
Explanation: The BIND or REBIND subcommand was
    submitted with conflicting parameters. You cannot
    specify ACQUIRE(ALLOCATE) and
    RELEASE(COMMIT) on the same subcommand.
System Action: The subcommand is terminated and
    the DSN command processor reissues the DSN prompt
    to allow another subcommand to be entered.
User Response: Enter the corrected subcommand.
    Refer to DB2 Command Reference for additional
    information about the BIND and REBIND
    subcommands.

DSNE940E  DEFER(PREPARE) INVALID WITH
    NODEFER(PREPARE)
Explanation: The BIND or REBIND subcommand was
    submitted with conflicting parameters. You cannot
    specify DEFER(PREPARE) and NODEFER(PREPARE)
    on the same subcommand because these actions
    conflict.
System Action: The subcommand is terminated and
    the DSN command processor reissues the DSN prompt
    to allow another subcommand to be entered.
User Response: Enter the corrected subcommand.
    Refer to DB2 Command Reference for additional
    information regarding the BIND and REBIND
    subcommands.

DSNE941I  DSNBIND IS A RESERVED PLAN NAME
Explanation: This message is generated when the
    plan name is 'DSNBIND' in a BIND statement.
System Action: Subcommand processing is
    terminated. The TSO attachment facility is ready for
    more input.
User Response: Change the plan-name and resubmit
    the job.

DSNE942E  csect-name REMOTE CONNECTION
    NAME (parameter_value) HAS INVALID
    FORMAT
Explanation: The REMOTE connection name
    'parameter_value' contains a < or > character in the
    starting or ending position of the parameter, but the
    parameter value is not bracketed by both characters.
    This message is also generated if the first character of
    the connection name is not an alphabetic character.
If the LU name format of the REMOTE keyword is to be
    used, the name must be specified as <LU_name>.
Severity: 8
System Action: Subcommand processing is
    terminated. DSN command processor reissues the DSN
    prompt to allow another subcommand to be entered.
User Response: Correct the keyword
    'parameter_value' in error, and resubmit the job. Refer to
    DB2 Command Reference for additional information
    about the specification of connection names for the
    REMOTE keyword.

DSNE943E  csect-name REMOTE CONNECTION
    NAME (parameter_value) CANNOT
    EXCEED (length_value) CHARACTERS
    IN LENGTH
Explanation: The REMOTE connection name
    'parameter_value' specified is greater than the length
    'length_value' permitted for the REMOTE keyword.
This message is issued if the REMOTE location name
    format exceeds 16 characters, or the LU name format
    (<LU_name>) exceeds 10 characters in length.
Severity: 8
System Action: Subcommand processing is
    terminated. DSN command processor reissues the DSN
    prompt to allow another subcommand to be entered.
User Response: Correct the keyword
    'parameter_value' in error and resubmit the job. Refer to
    DB2 Command Reference for additional information
    about the specification of connection names for the
    REMOTE keyword.

DSNE944I  WARNING, BECAUSE YOUR TABLE OR
    COLUMN NAMES CONTAIN LOWER
    CASE OR NON-ALPHABETIC
    CHARACTERS, YOU WILL NEED TO
    USE THE SQL (NOT PL/I) INCLUDE
    STATEMENT TO INCLUDE DCLGEN
    OUTPUT INTO YOUR PROGRAM
Explanation: DCLGEN had to wrap your table or
    column name(s) in quotes so DB2 could process them.
    Quotes are not recognized by the PL/I compiler. To
    avoid compilation errors, use the SQL INCLUDE
    statement ('EXEC SQL INCLUDE membername') to
    merge the DCLGEN output with your source program.
Refer to Chapter 5 of DB2 SQL Reference for more
    information about the SQL INCLUDE statement.
System Action: DCLGEN processing continues.
User Response: If you have not coded the SQL
INCLUDE, do so before the next compile.

**DSNE947I**  QUOTE PARAMETER IS ONLY VALID WITH COBOL. IT HAS BEEN CHANGED TO APOST

**Explanation:** You specified the DCLGEN QUOTE parameter and a non-COBOL language parameter. This combination is not valid. The QUOTE parameter was specified as either a parameter on the DCLGEN subcommand or a default set for your site at DB2 installation time.

The DCLGEN processor changed the QUOTE setting (for this run) to APOST.

**System Action:** DCLGEN processing continues and should produce valid output.

**User Response:** If you used QUOTE on the DCLGEN command, you may want to change it to APOST before submitting it again.

**DSNE948I**  csect-id FURTHER subcommand PROCESSING WILL NOT BE ATTEMPTED

**Explanation:** A DSN command processor subcommand (indicated in the message) has encountered an error which stopped DSN from processing this subcommand. The subcommand will not complete normally. This message is accompanied by other messages explaining the exact nature of the problem.

**System Action:** Subcommand processing terminates. The DSN prompt is reissued, indicating DSN is ready for another subcommand.

**User Response:** Read the accompanying messages for help in deciding what to do next.

**DSNE949E**  COMMIT PROCESSING ABNORMAL TERMINATION, REASON CODE reason_code

**Explanation:** The DSN command processor has initiated a 'prepare to commit' request in DB2. The request is rejected when DB2 cannot commit the work performed.

**System Action:** Commit processing is terminated.

**User Response:** Examine the reason code associated with this message, and respond as indicated before resubmitting the job.

**Problem Determination:** Reference the associated reason code to determine why the 'prepare to commit' was not successful.

**DSNE950E**  DCLGEN DOES NOT SUPPORT THE lang LANGUAGE

**Explanation:** A DCLGEN user attempted to specify a LANGUAGE parameter, 'lang', that DCLGEN does not support.

**System Action:** DCLGEN processing terminates.

**User Response:** Correct the LANGUAGE parameter and resubmit the DCLGEN subcommand.

**DSNE952I**  C DECLARATION FOR TABLE table-name

**Explanation:** This message is a part of normal DCLGEN output. It tells the name of the table for which the declaration was created.

**System Action:** This message is included in the DCLGEN output.

**DSNE953I**  csect-name PRECISION OF DECIMAL COLUMN colname EXCEEDS THE MAXIMUM PRECISION FOR THE lang LANGUAGE.

**Explanation:** DCLGEN was building a COBOL or PL/I language declaration for a table when it encountered a decimal column with a precision greater than the precision supported by the language.

**System Action:** DCLGEN set the return code to 4 and processed the rest of the table.

**User Response:** This is a warning. Be aware that the declaration for column 'colname' causes a compiler error. You must edit the declaration before including it in an application program.

**DSNE954I**  csect-name USE OF THE DCLGEN COLSUFFIX(YES) OPTION WILL RESULT IN A MIXED FIELD NAME FOR COLUMN colname. THE lang LANGUAGE DOES NOT SUPPORT MIXED FIELD NAMES.

**Explanation:** The COLSUFFIX(YES) option and a double-byte NAMES prefix were specified in a DCLGEN invocation, but column colname contains single-byte characters. This combination would result in a generated field name with a mixture of double-byte and single-byte characters, but the lang language does not support mixed field names.

**System Action:** DCLGEN set the return code to 4 and generated the field name as requested.

**User Response:** This is a warning. Be aware that the declaration for column colname causes a compiler error. You must edit the declaration before including it in an application program.
### Explanation:
When COLSUFFIX(YES) is specified in a DCLGEN invocation, DCLGEN generates field names by concatenating the NAMES prefix with the column names. However, no NAMES prefix was specified.

### System Action:
DCLGEN set the return code to 4 and used the column names as field names.

### User Response:
This is a warning. Specify a NAMES prefix when you specify COLSUFFIX(YES).

### DSNE966A
A FIELD NAME PREFIX MUST BE SPECIFIED WHEN COLUMN SUFFIX VALUE IS YES.

### Explanation:
When YES is specified for the COLUMN SUFFIX field on the DCLGEN panel, DCLGEN generates field names by concatenating the value in the FIELD NAME PREFIX field with the column names. However, no value was specified for FIELD NAME PREFIX.

### System Action:
The DCLGEN panel generated this error message.

### User Response:
Specify a FIELD NAME PREFIX value, or change the COLUMN SUFFIX value to NO.

### DSNE960E
PARAMETER STRING EXCEEDS ALLOWABLE LIMIT OF 100 (DECIMAL) CHARACTERS

### Explanation:
The PARMS option parameter-string of the RUN subcommand cannot exceed 100 (decimal) characters in length.

### System Action:
The TSO attachment facility is ready for more input.

### User Response:
Correct the PARMS option and resubmit the job.

### DSNE964E
csect-name INVALID SYNTAX FOR keyword KEYWORD PARAMETER parameter

### Explanation:
A parameter that does not follow DB2 naming conventions was specified for keyword.

### System Action:
Subcommand processing is terminated. The DSN command processor reissues the DSN prompt to allow you to enter another subcommand.

### User Response:
Correct the keyword parameter value in error, and resubmit the command. Refer to [DB2 Command Reference](https://www.ibm.com/support/knowledgecenter/en/SSLTBK_22.1.0/com.ibm.db2.luw.sql.ref.doc/doc/c0012610.html) for additional information about the specification of a package name and the

### DSNE955I
csect-name COLSUFFIX(YES) WAS SPECIFIED WITHOUT A NAMES PREFIX. COLUMN NAMES WILL BE USED FOR FIELD NAMES

### DSNE965E
parameter_value IS NOT A VALID keyword KEYWORD PARAMETER

### Explanation:
The parameter_value is not a valid parameter value for the keyword.

### System Action:
Subcommand processing terminates. The DSN command processor reissues the DSN prompt to allow you to enter another subcommand.

### User Response:
Enter the corrected subcommand. Refer to [DB2 Command Reference](https://www.ibm.com/support/knowledgecenter/en/SSLTBK_22.1.0/com.ibm.db2.luw.sql.ref.doc/doc/c0012610.html) for additional information about the parameter values supported on the keyword.

### DSNE966E
column_type KEYWORD OMITTED FROM THE ENABLE|DISABLE DECLARATION

### Explanation:
The 'connection_type' keyword was not specified in either the ENABLE or DISABLE keywords and is required if connection-names are specified for the 'connection_type'.

### Severity:
8

### System Action:
Subcommand processing is terminated. DSN command processor reissues the DSN prompt to allow you to enter another subcommand.

### User Response:
Enter the corrected subcommand. Refer to [DB2 Command Reference](https://www.ibm.com/support/knowledgecenter/en/SSLTBK_22.1.0/com.ibm.db2.luw.sql.ref.doc/doc/c0012610.html) for additional information about the connection type parameter values supported on the ENABLE and DISABLE keywords.

### DSNE967E
keyword_name KEYWORD CANNOT BE SPECIFIED MORE THAN ONCE PER RUN

### Explanation:
Either the BIND PACKAGE MEMBER or LIBRARY keywords specified more than one parameter value. Only one member or library name is permitted.

### Severity:
8

### System Action:
Subcommand processing is terminated. DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

### User Response:

### DSNE969E
csect-name keyword1 IS MUTUALLY EXCLUSIVE WITH keyword2

### Explanation:
Both the PKLIST and NOPKLIST keywords, cannot be specified on one invocation of the REBIND PLAN subcommand. Both the ENABLE and
DISABLE keywords cannot be specified on one invocation of the BIND/REBIND PLAN/PACKAGE subcommand.

**Severity:** 8

**System Action:** Subcommand processing is terminated. DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

**User Response:** Enter the corrected subcommand. Refer to [DB2 Command Reference](#) for additional information regarding the REBIND PLAN subcommand.

---

**DSNE970E** EITHER MEMBER OR PKLIST MUST BE SPECIFIED, BOTH ARE ALSO ALLOWED

**Explanation:** The BIND PLAN subcommand requires either the MEMBER or PKLIST keyword, and neither was specified. Either keyword or both may be specified.

**Severity:** 8

**System Action:** Subcommand processing is terminated. DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

**User Response:** Enter the corrected subcommand. Refer to [DB2 Command Reference](#) for additional information regarding the BIND PLAN subcommand.

---

**DSNE971E** EITHER MEMBER OR COPY BUT NOT BOTH MUST BE SPECIFIED

**Explanation:** The BIND PACKAGE subcommand requires either the MEMBER or COPY keyword; both are not allowed on the same subcommand invocation.

**Severity:** 8

**System Action:** Subcommand processing is terminated and the DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

**User Response:** Enter the corrected subcommand. Refer to [DB2 Command Reference](#) for additional information regarding the BIND PACKAGE subcommand.

---

**DSNE974E** csect-name keyword1 KEYWORD IS INVALID WITH keyword2 KEYWORD.

**Explanation:** The keyword2 should not be specified with keyword1.

**System Action:** Subcommand processing is terminated. The DSN command processor reissues the DSN prompt to allow another subcommand to be entered.

**User Response:** Modify one of the keywords on the command and resubmit the job. Refer to [DB2](#).
Chapter 7. DSNF... messages

DSNF001I MESSAGE GENERATOR INITIALIZATION PARAMETERS NOT FOUND. DEFAULTS ASSUMED

Explanation: The message generator was unable to access the routing code initialization parameter defined by the DSN6SYSP macro. Default values defined by that macro are assumed.

System Action: Subsystem initialization continues.

Operator Response: Notify the system programmer.

System Programmer Response: It might be necessary to change the DSN6SYSP macro and replace the DSN6SYSP member of the DSNIPARM directory. Refer to Part 2 of [DB2 Installation Guide] for details of this process.

DSNF700I csect-name message-id HAS BEEN ISSUED

Explanation: An unsuccessful attempt has been made to issue the message 'message-id'. This message is issued only if the requested message could not be found in the DB2 message directory.

System Action: The system proceeds as though the requested message had been issued.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to this manual for actual message text. You need the message number ('message-id'). If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.
Chapter 8. DSNQ... messages

DSNG001I  EDM $type can not be decreased below the value isize specified at DB2 startup

Explanation: The EDM $type storage cannot be decreased below the size that was specified at DB2 startup.

System Action: Processing continues.

DSNG002I  EDM $type has an initial size isize, requested size rsize, and an allocated size asize

isize The EDM $type storage size prior to the request for a change.
rsize The requested EDM $type storage size.
asize The EDM $type storage size immediately available.
  • When increasing the EDM Pool, the asize is the storage available to satisfy the request.
  • When decreasing the EDM Pool, the asize is the initial size reduced by the amount that could be released immediately.

When the asize is larger than the rsize, the difference is marked to be released when it is no longer referenced.

System Action: Processing continues.

DSNG003I  INSUFFICIENT VIRTUAL STORAGE TO EXPAND EDM $type STORAGE

Explanation: Insufficient virtual storage exists to expand the EDM $type storage as specified.

System Action: The EDM $type storage is expanded only to the size allowed by the available virtual storage.

DSNG005I  DBD IS INCONSISTENT WITH THE CATALOG. UNABLE TO FIND A ROW IN SYSTABLES WITH DBID dbid AND OBID obid.

Explanation: This message is issued in response to a request to load a database with DBID dbid. This message is issued when the row is not found in SYSTABLES.

DBID DBID of the database that is being loaded.
OBID OBID of a table in the database.
Severity: 8 (Error)
System Action: DBD could not be loaded.

Operator Response: Based on dbid and obid from the message, verify that the row does not exist in the Catalog. REPAIR DBD TEST or DIAGNOSE can be run to gather more diagnostic information. Once you have determined that the Catalog contains the correct information, REPAIR DBD REBUILD can be run to rebuild the DBD.

DSNG006I  DBD IS INCONSISTENT WITH THE CATALOG. UNABLE TO FIND A ROW IN SYSCOLUMNS WITH DBID dbid, OBID obid, AND COLUMN NUMBER colno.

Explanation: This message is issued in response to a request to load a database with DBID dbid. This message is issued when the row is not found in SYSCOLUMNS.

DBID DBID of the database that is being loaded.
OBID OBID of a table in the database.
COLNO Column number in the table.
Severity: 8 (Error)
System Action: DBD could not be loaded.

Operator Response: Based on dbid/obid/colno from the message, verify that the row does not exist in the Catalog. REPAIR DBD TEST or DIAGNOSE can be run to gather more diagnostic information. Once you have determined that the Catalog contains the correct information, REPAIR DBD REBUILD can be run to rebuild the DBD.
Chapter 9. DSNH... Messages

Message line numbers
The line number $nnnn$ in the following compiler messages is generated by assigning sequential numbers to the original source. The numbers are printed on the SQL precompiler source listing (if the SOURCE option is specified to the precompiler).

'COL cc' in the messages identifies the source column in which the condition was detected. This is usually the location of the column containing the first character of the associated source token. However, if the precompiler cannot determine this location, it is the beginning of the statement. Because the detected error might be similar to a valid, but different, construction, the SQL parsing might indicate the wrong location for the error.

Message severity codes
One of the characters I, W, E, S, or U is shown at the beginning of each precompiler message as an aid to the programmer. These characters indicate the severity level as follows:

<table>
<thead>
<tr>
<th>Character</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>0</td>
<td>Informational</td>
</tr>
<tr>
<td>W</td>
<td>4</td>
<td>Warning</td>
</tr>
<tr>
<td>E</td>
<td>8</td>
<td>Error</td>
</tr>
<tr>
<td>S</td>
<td>12</td>
<td>Severe error</td>
</tr>
<tr>
<td>U</td>
<td>16</td>
<td>Unrecoverable error</td>
</tr>
</tbody>
</table>

When unsupported non-DB2 statements are detected during SQL(ALL) precompilation, the return code will be forced to 4 if the return code was 8, and no host-related errors were detected. This is done so that the application can proceed with the compilation and link-edit steps. This allows the syntax checking to be delayed until bind. If a severity 8 precompiler error message is not a host-related error, the precompiler treats the error as a warning and place a W instead of an E in the precompiler output listing. In this instance, the precompiler also issues DSNH049I to indicate that the actual return code 8 from the precompiler was changed to 4.

The following precompiler messages with severity levels of 8 are not changed from errors to warnings when SQL(ALL) is in effect:

- DSNH051I
- DSNH080I
- DSNH290I
- DSNH291I
- DSNH292I
- DSNH312I
- DSNH313I
- DSNH314I
- DSNH504I
Source tokens in messages

Tokens from your source program do not always appear in messages exactly as they appear in your program. For example, leading zeros are removed from integer tokens.

**DSNH003I**  
*S csectname FILE ddname\nPARAMETERS INCORRECT*  
Explanation: The file *ddname* has invalid or incorrect parameters, such as logical record length.  
Severity: 12 (severe error)  
System Action: The precompiler is terminated.  
User Response: Correct the data set or library parameters.

**DSNH004I**  
*S csectname type COULD NOT BE FOUND*  
Explanation: The precompiler could not find the indicated type of statement in the application program source. This message is only issued for HOST(COBOL) and HOST(COB2). The *type* is DATA DIVISION, WORKING-STORAGE SECTION, or PROCEDURE DIVISION. This error can cause other errors.  
Severity: 12 (severe error)  
System Action: Processing continues. Additional errors might result.  
User Response: Ensure that the host language statement in your application program is correct and that the statement is present within the proper margins.

**DSNH005I**  
*U csectname FILE ddname NO MEMBER NAME SPECIFIED*  
Explanation: The *ddname* must refer to a partitioned data set, and the member name must be specified in the allocation. This helps to prevent accidental erasure of the DBRM library.  
Severity: 16 (unrecoverable error)  
System Action: The precompiler is terminated.  
User Response: Correct the JCL or TSO allocate command to specify a member name.

**DSNH006I**  
*U csectname FILE ddname COULD NOT BE OPENED*  
Explanation: The file identified in the message is required, but it could not be opened.  
Severity: 16 (unrecoverable error)  
System Action: The precompiler is terminated.  
User Response: Ensure that the file is present in your JCL.

**DSNH007I**  
*E csectname LINE nnnn COL cc\nILLEGAL CHARACTER IGNORED: 'c' ('hh'X)*  
Explanation: The character identified in the message as *c* is not permitted. The hexadecimal representation for the character is *hh*.  
Severity: 8 (error)  
System Action: The character is ignored.  
User Response: Correct the character. It might need to be within quotation marks or apostrophes.

**DSNH008I**  
*U csectname LINE nnnn COL cc\nNESTED INCLUDE NOT SUPPORTED*  
Explanation: While processing an INCLUDE, another nested INCLUDE statement was encountered.  
Severity: 12 (severe error)  
System Action: The nested INCLUDE statement is ignored.  
User Response: Remove the nested INCLUDE statements; they are not allowed in an included file. The DB2 precompiler permits only one level of INCLUDE statements.

**DSNH009I**  
*U csectname LINE nnnn COL cc\nMEMBER name COULD NOT BE INCLUDED*  
Explanation: The identified member name was not found or could not be read.  
Severity: 12 (severe error)  
System Action: Processing continues without the data from that member.  
User Response: Ensure that the member is in the library and that its name is spelled correctly. Check and correct any JCL errors. They are likely to cause other errors. Ensure that the data set and library parameters are correct.
**DSNH010I**  
*S csectname LINE nnnn COL cc UNTERMINATED STRING CONSTANT BEGINNING text*

**Explanation:** The constant identified in the message as 'text' is not terminated properly.

**Severity:** 12 (severe error)

**System Action:** The string is treated as if it were terminated by the end of file.

**User Response:** Terminate the string constant. Check for and correct any missing or extra quotation marks and apostrophes. These errors are likely to cause others. Some statements were probably missing because of missing or extra string delimiters.

---

**DSNH010I**  
*S csectname LINE nnnn COL cc UNTERMINATED COMMENT*

**Explanation:** A comment is not terminated properly. This message is only issued for HOST(PLI) and HOST(C).

**Severity:** 12 (severe error)

**System Action:** The string is treated as if it were terminated by the end of file.

**User Response:** Ensure that the comment terminator is typed properly and that it is within the specified margins. This error is likely to cause others. Some statements were probably missing because of the missing comment terminator.

---

**DSNH012I**  
*W csectname LINE nnnn COL cc INVALID CONTINUATION*

**Explanation:** The continuation does not follow the host language rules.

**Severity:** 4 (warning)

**System Action:** Processing continues. Additional errors might result.

**User Response:** Follow the host language continuation rules and embedded SQL continuation rules. Check the margin option. This error is most common in assembler language in cases where a continuation begins before the continuation column (the continuation column is column 16 by default).

---

**DSNH013I**  
*E csectname LINE nnnn COL cc SQL STATEMENT FOUND OTHER THAN IN THE FIRST PROGRAM (OR MAIN PROGRAM)*

**Explanation:** This message is for VS COBOL II only. If any SQL statement is found in the source after the first program in a BATCH COMPILE or the end of the main program of a nested program, this message is issued.

**Severity:** 8 (error)

---

**DSNH014I**  
*S csectname LINE nnnn COL cc SQL STATEMENT IS FOUND IN AN INAPPROPRIATE PLACE*

**Explanation:** If any SQL statement is found in the COBOL DECLARATIVES section, this message is issued.

**Severity:** 12 (severe error)

**System Action:** Processing continues. Additional errors might result.

**User Response:** Move the SQL statement out of the COBOL DECLARATIVES section and resubmit the job.

---

**DSNH016I**  
*E csectname LINE nnnn COL cc token REQUIRED*

**Explanation:** The required character or keyword identified as *token* is missing.

**Severity:** 8 (error)

**System Action:** The token is assumed to be present in order to continue checking the statement syntax.

**User Response:** Correct the SQL statement. Determine if you skipped either this keyword or another keyword earlier in the SQL statement. The assumed token is printed in the SYSTEM error message. This token might not be what you intended, even though it is the only symbol allowed in the clause at this point.

---

**DSNH019I**  
*W csectname OPTION: INVALID OPTION option*

**Explanation:** The identified option was requested, but it is not a precompiler option.

**Severity:** 4 (warning)

**System Action:** The option is ignored.

**User Response:** Check the valid precompiler options to determine if your spelling is correct for this option. This problem might cause additional errors if the APOST, APOSTSQL, COMMA, HOST, MARGINS, QUOTESQL, or TWOPASS option is needed but not specified. The other options are either defaults or affect only the listing. Correct the problem and run the precompile again.

---

**DSNH021I**  
*W csectname OPTION: SUBOPTION NOT PERMITTED WITH OPTION option*

**Explanation:** The identified option cannot have suboptions, but one or more were specified.

**Severity:** 4 (warning)
<table>
<thead>
<tr>
<th>Severity</th>

<td>The suboptions are ignored.</td>
<td>None is required. However, you should remove the suboption.</td>
</tr>
</tbody>
</table>

**DSNH022I**  
`W csectname OPTION: UNMATCHED ')' TAKEN AS ''`

**Explanation:** An unmatched ending parenthesis was found before the end of the option string.

**Severity:** 4 (warning)

**System Action:** The parenthesis is assumed to be a comma.

**User Response:** Balance the parentheses.

<table>
<thead>
<tr>
<th>Severity</th>

</table>

**DSNH023I**  
`W csectname OPTION: SUBOPTION MISSING FOR OPTION option`

**Explanation:** The option is ignored.

**Severity:** 4 (warning)

**System Action:** Provide a suboption or remove the option. This problem might cause additional errors if the HOST or MARGINS option is needed but not specified. The other options are either defaults or affect only the listing. Correct the problem and run the precompile again.

<table>
<thead>
<tr>
<th>Severity</th>
<th>System Action</th>

<td>Too many suboptions were given for the identified option.</td>
<td>Add the INTO clause to the SELECT statement, and precompile the application program again.</td>
</tr>
</tbody>
</table>

**DSNH025I**  
`W csectname OPTION: EXCESSIVE SUBOPTIONS FOR OPTION option`

**Explanation:** The excess suboptions are ignored.

**Severity:** 4 (warning)

**System Action:** Remove excess suboptions.

<table>
<thead>
<tr>
<th>Severity</th>
<th>System Action</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>The version ID is greater than numofchar bytes long. The maximum length for the version ID is 64 bytes.</td>
<td></td>
</tr>
</tbody>
</table>

**DSNH027I**  
`W csectname SUBOPTION suboption TOO LONG, TRUNCATED AFTER numofchar CHARs`

**Explanation:** The version ID is truncated after numofchar bytes. The maximum length for the version ID is 64 bytes.

**Severity:** 4 (warning)

**System Action:** Refer to the 'options used' list in the precompiler output to see what version ID was used.

<table>
<thead>
<tr>
<th>Severity</th>
<th>System Action</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>The identified suboption for precompiler option ATTACH cannot take effect when the application is a FORTRAN application because the interface code for FORTRAN is always DSNHT.</td>
<td></td>
</tr>
</tbody>
</table>

**DSNH028I**  
`W csectname ATTACH SUBOPTION suboption NOT PERMITTED WITH HOST (FORTRAN) SPECIFIED`

**Explanation:** The identified suboption for precompiler option ATTACH cannot take effect when the application is a FORTRAN application because the interface code for FORTRAN is always DSNHT.

**Severity:** 4 (warning)

**System Action:** None is required. However, you can either code ATTACH(TSO) or specify no ATTACH precompiler option

<table>
<thead>
<tr>
<th>Severity</th>
<th>System Action</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>SELECT statements embedded in an application program must have an INTO clause to denote where the results of the SELECT are to be placed. Dynamic SELECT statements do not permit the INTO clause.</td>
<td>Add the INTO clause to the SELECT statement, and precompile the application program again.</td>
</tr>
</tbody>
</table>

**DSNH029I**  
`E csectname LINE nnnn COL cc INTO CLAUSE REQUIRED`

**Explanation:** SELECT statements embedded in an application program must have an INTO clause to denote where the results of the SELECT are to be placed. Dynamic SELECT statements do not permit the INTO clause.

**Severity:** 8 (error)

**System Action:** The statement is replaced by host language statements that, if executed, set an error code in the SQLCA.
**Explanation:** The number of variables specified in an INTO clause is not the same as the number of select-list elements (taking into account expansion of host structures and ‘*’ or ‘table.’* select entries according to the declarations supplied).

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** Ensure the included table declarations are correct. If the declarations are correct, this statement causes an error when the application program is bound. If the declarations are incorrect, you can proceed, but the declarations should be corrected. Otherwise, you need to correct the SQL statement and precompile again.

**Explanation:** The column name specified in a CREATE statement (name1) is not the same as the name of the corresponding column in the DECLARE TABLE statement (name2).

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** Ensure that the DECLARE TABLE matches the CREATE TABLE. You can use the cross-reference and source listings to help find the two statements.

**Explanation:** The column name is specified in a CREATE statement with a different data type or length than was specified for the corresponding column in the DECLARE TABLE statement.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** Correct the DECLARE TABLE or CREATE TABLE statement. If the DECLARE TABLE statement is incorrect, some warnings might also be incorrect or might not be generated when needed. If the CREATE TABLE statement is incorrect, you must correct it.

**Explanation:** The number of columns specified in a CREATE statement is different from the number of columns specified in the DECLARE TABLE statement.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** Ensure that the DECLARE TABLE matches the CREATE TABLE. If the DECLARE TABLE statement is incorrect, some warnings might also be incorrect or might not be generated when needed. If the CREATE TABLE statement is incorrect, you must correct it.

**Explanation:** The number of values specified in an INSERT statement is different from the number of columns specified in the DECLARE TABLE statement for the receiving table.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** Insert the correct number of values. If the DECLARE TABLE statement is incorrect, this warning might also be incorrect. If the INSERT statement is incorrect, you must correct it.

**Explanation:** The number of SQL statements in an application program or a FORTRAN subprogram is greater than 32767.

**Severity:** 12 (severe error)

**System Action:** The precompiler terminates.

**User Response:** Divide the application program or subprogram into smaller programs or reduce the SQL statements in each program unit so that the maximum number of SQL statements is not exceeded.

**Explanation:** The host language was not specified in the OPTION field.

**Severity:** 4 (warning)

**System Action:** HOST(COBOL) is assumed.
User Response: Specify the host language if it is not COBOL. It is probably best to specify the host language and remove all warnings.

**DSNH042I**

W csectname OPTION: option OPTION INVALID FOR HOST LANGUAGE

Explanation: The option identified in the message is not valid. The QUOTE and COMMA options are not permitted with HOST(ASM), HOST(PLI), or HOST(C). The TWOPASS option is not permitted with HOST(COBOL).

Severity: 4 (warning)

System Action: The specified option is ignored.

User Response: Remove the invalid option, or correct the host specification.

**DSNH049I**

W csectname RETURN CODE IS FORCED TO 4 BECAUSE OPTION SQL(ALL) IS IN EFFECT, ORIGINAL RETURN CODE WAS nnn

Explanation: One or more SQL-related error messages were detected by the precompiler, but because of option SQL(ALL), the return code is forced to 4 in order to let the application proceed with compilation.

The SQL syntax checking is deferred until bind time because the source might contain non-DB2 SQL syntax that the DB2 precompiler does not recognize and flags as an error. The DBRM produced by this precompilation cannot be bound successfully by DB2 if there are SQL syntax errors or non-DB2 SQL syntax.

The return code remains untouched if there are host-related syntax or semantic errors in the source.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure that the intention of this precompilation is for executing it in a non-DB2 system.

**DSNH050I**

I csectname WARNINGS HAVE BEEN SUPPRESSED DUE TO LACK OF TABLE DECLARATIONS

Explanation: One or more warning messages were suppressed because no table declarations were found before the first SQL statement that referenced a table or column.

Severity: 0

System Action: Processing continues. Suppression is discontinued if a table declaration is found.

User Response: Insert (or INCLUDE) table declarations before they are referenced in order to permit table and column checking.

**DSNH051I**

E csectname LINE nnnn COL cc sqltype name PREVIOUSLY DECLARED OR REFERENCED

Explanation: The variable sqltype is TABLE, CURSOR, or STATEMENT. The identifier name was already defined with the given sqltype. The definition might have occurred implicitly. For example, name might have been found in the FROM clause of a SELECT, causing it to be defined as a table.

Severity: 8 (error)

System Action: The name is installed in the symbol table as a duplicate.

User Response: Remove duplicate definitions, or correct the references. Avoid implicit definitions by inserting (or including) table declarations before they are referenced. Check the number of passes used. Use the cross-reference and source listings to help resolve this type of error.

**DSNH052I**

E csectname LINE nnnn COL cc COLUMN name IS ALREADY DEFINED IN TABLE table-name

Explanation: The identified name is already defined as a column in the table named table-name. The definition might have occurred implicitly. For example, table-name might have been found in a select-list, causing name to be defined as a column within table-name if table-name was not declared as a host variable.

Severity: 8 (error)

System Action: The name is installed in the symbol table as a duplicate.

User Response: Remove duplicate definitions, or correct the references. Avoid implicit definitions by inserting (or including) table declarations before they are referenced.

**DSNH053I**

W csectname NO SQL STATEMENTS WERE FOUND

Explanation: No SQL statements were found in the precompiler input file. An empty DBRM member was written.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If you embedded SQL statements in your application program and none were found, make sure your column margins are properly defined for your application program.
**DSNH060I**  E csectname LINE nnnn COL cc
**Invalid type specification: spec**

**Explanation:** The type is either SCALE or LENGTH. The spec is the given SCALE or LENGTH specification in an SQL declaration. Length and scale specifications must be unsigned integers. The scale specification, where permitted, cannot exceed the length. The length specification cannot be 0.

**Severity:** 8 (error)

**System Action:** Processing continues.

**User Response:** Correct the length or scaling.

---

**DSNH080I**  E csectname LINE nnnn COL cc usage
**VARIABLE name IS NOT type TYPE**

**Explanation:** The usage is INDICATOR or STRING. The type is SMALLINT, VARCHAR, or CHARACTER. The data type of the variable name is not acceptable. All indicator variables must be small integers. PREPARE and EXECUTE strings must be variable character strings, except for FORTRAN, which requires character type.

**Severity:** 8 (error)

**System Action:** If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

**User Response:** Specify a host variable of the proper type.

---

**DSNH081I**  W csectname LINE nnnn COL cc
**Statement does not conform to ANSI syntax standard - reason code ccc**

**Explanation:** When the precompiler option STDSQL(YES) is in effect, the SQL syntax is checked to see if it conforms to the ANSI/ISO SQL standard of 1992. Reason codes are:

- **000** Aggregate function with DISTINCT as an arithmetic-operation operand does not conform to the ANSI/ISO SQL standard of 1992.
- **001** FOR UPDATE OF as part of a DECLARE CURSOR statement does not conform to the ANSI/ISO SQL standard of 1992.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** You have the option of changing or not changing the syntax to conform to the ANSI syntax standard.

**System Programmer Response:** Check the SQL statement.

---

**DSNH082I**  I csectname LINE nnnn COL cc
**Statement does not conform to IBM SQL syntax or semantic standard - reason code ccc**

**Explanation:** When the precompiler option SQL(ALL) is in effect, statements that do not conform to certain IBM SQL rules are flagged.

**Severity:** 0 (informational)

**System Action:** Processing continues.

**User Response:** Change the syntax of the statement to conform to the IBM SQL standard if portability is required. Not changing the syntax means that the program is less portable within the IBM SQL environment.

---

**DSNH083I**  I csectname LINE nnnn COL cc
**IBM SQL reserved word ibmkeywd specified as an identifier name**

**Explanation:** When the precompiler option SQL(ALL) is in effect, IBM SQL reserved words should not be used as identifier names. Using IBM SQL reserved words limits the portability of the statement.

**Severity:** 0 (informational)

**System Action:** Processing continues.

**User Response:** If possible, change the identifier name to a non-IBM SQL reserved word so that the statement conforms to the IBM SQL standard. Not changing the identifier name means that the program is less portable within the IBM SQL environment.

---

**DSNH084I**  W csectname LINE nnnn COL cc
**Unacceptable SQL statement**

**Explanation:** The referenced SQL statement is not allowed in this situation, but it will not cause an error. Depending on the option specified at precompile time, one of the following occurred.

- The BEGIN DECLARE SECTION(*), END DECLARE SECTION(*), and UPDATE STATISTICS statements are flagged as not compatible.
  - For C applications, BEGIN and END DECLARE SECTION are not flagged.
- For other languages, the statement is only allowed with precompiler option STDSQL(YES).
- Using the STDSQL(YES) precompiler option, the INCLUDE SQLCA statement is flagged as a warning.

**Severity:** 4 (warning)

**System Action:** The BEGIN DECLARE SECTION, END DECLARE SECTION, and INCLUDE SQLCA statements are ignored. The other statements are replaced by host language statements that will, if executed, set a warning code or SQLCODE -84 in the SQLCA.
User Response: Unless this application program is used in a portable manner, remove the statement.

Explanation: The SQL keyword is not allowed by DB2, but it does not cause an error. This message is printed as a warning to the programmer.

Severity: 4 (warning)

System Action: The keyword and its parameters are ignored.

User Response: Unless this application program is used with both SQL/DS and DB2, remove the keyword.

User Response: If you intended that the string-expression should be treated as a string expression, then no action is required.

If the string-expression consists of just one host variable, and you intended that the string-expression should be treated as a host variable, then the host variable must be preceded by a colon, and at least one DECLARE VARIABLE statement must be contained in your program source.

If you add a DECLARE VARIABLE for any host variable in your program source, and re-precompile your application, the variable previously treated as a string-expression by the precompiler will be treated as a host variable and this message will not be issued.

User Response: Be sure that you intend to delete or update all rows, or add a suitable WHERE clause.

Explanation: The action is either DELETE or UPDATE. The referenced SOL statement has no WHERE clause and will delete or update all rows of the specified table. This message is printed as a warning to the programmer.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Correct and reissue the failing statement.

Explanation: The statement attempted to use the LONG VARCHAR or LONG VARGRAPHIC syntax. This syntax cannot be used for the following statements:
- CAST syntax
- CREATE DISTINCT TYPE
- CREATE FUNCTION
- CREATE PROCEDURE
- ALTER FUNCTION
- COMMENT ON FUNCTION
- GRANT EXECUTE ON FUNCTION
- REVOKE EXECUTE ON FUNCTION

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Break the statement into shorter or less complex SQL statements.

Severity: 16

System Action: The statement cannot be executed because it exceeds the system limits for either length or complexity.

User Response: Break the statement into shorter or less complex SQL statements.

Explanation: The character string constant that was referenced in this message is too long. The erroneous string begins with string. Most strings have these limits:
• For a hexadecimal constant (X, GX, or UX), the number of hexadecimal digits must not exceed 32704.
• Any other character string constant must be short enough so that its UTF-8 representation requires no more than 32704 bytes.
• Any other graphic string constant must be short enough so that its UTF-8 representation requires no more than 32698 bytes.

In some contexts, however, the limit is smaller; see the DB2 SQL Reference for the specific cases.

If this release of DB2 increases the maximum allowed length of a string constant, then an attempt to exploit the new length when the value of the NEWFUN option is NO (New Function Mode is NO) will produce this message.

For special registers, the allowable length depends on the particular special register. A string that exceeds the limit can be specified only through assignment from a host variable. If this release of DB2 increases the maximum allowed length of a string constant, then an attempt to exploit the new length before using the New Function Mode produces this SQL return code.

Two consecutive string delimiters are used to represent one string delimiter within the character string, but these count as 2 bytes when calculating the lengths of character string constants.

Severity: 8 (error)

System Action: If the SQL statement containing the string is a declaration, it is discarded. If the SQL statement containing the string is executable, it is replaced by host language statements that, if executed, set an error code in the SQLCA.

User Response: Correct the statement and precompile the program again.

Explanation: The token was found. It begins with a digit, but it is not a valid integer, decimal, or float literal. Identifiers cannot begin with a digit except for the WHENEVER statement with HOST(FORTRAN), and the identifiers in COBOL.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Check the indicated token for validity. Use apostrophes or quotation marks if a character literal is desired. Remove the invalid characters if a number is desired.

Explanation: A syntax error was detected where the symbol "token" occurs in the SQL statement. The list of symbols that might be legal shows some alternate symbols that could possibly be correct at that point, if the preceding part of the statement is entirely correct.

However, the preceding part of the statement might be incorrect. For example, if an important keyword is omitted, DB2 detects the error later, and not always immediately after the point where the keyword should appear. The list of alternate symbols are only suggestions.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the statement and precompile the program again.

Explanation: Incorrect graphic or mixed data literals were found on line nnnn, column cc.

Severity: 8 (error)

System Action: The literal is ignored and the SQL statement containing the problem is discarded.

User Response: Specify the correct format of literals.

System Programmer Response: Check for a quote, an apostrophe, shift-out (so) or shift-in (si) characters, G or N characters, or the number of characters within the literal.

Explanation: For each type of name, the DB2 SQL Reference lists the maximum allowed length.

If this release of DB2 increases the maximum allowed length of a name, then an attempt to exploit the new length when the value of the NEWFUN option is NO will produce this message.

Severity: 8 (error)

System Action: If the SQL statement containing the problem is a declaration, it is discarded. If the SQL
Severity:

User Response: Correct the name length.

Explanation: The type is INTO, ORDER BY, FOR UPDATE, USING, LARGE, or CORRELATION NAME.

- Embedded SELECT statements cannot include ORDER BY, because the result cannot be more than a single row.
- Embedded SELECT statements cannot include FOR UPDATE OF, because position is not retained.
- SELECT clauses used in cursor declarations or subselects cannot have an INTO clause because the INTO is on the FETCH statement.
- CREATE VIEW statements cannot include any of the above clauses.
- The UNION operator is not allowed in an embedded SELECT.
- A CREATE TABLESPACE statement cannot specify LOCKPART without the NUMPARTS option.
- An ALTER TABLESPACE statement cannot specify LOCKPART for a non-partitioned table space.
- A table space with LOCKPART YES cannot be altered to LOCKSIZE TABLESPACE.
- A table space with LOCKSIZE TABLESPACE cannot be altered to LOCKPART YES.
- The LARGE clause without the NUMPARTS option is not allowed in a CREATE TABLESPACE statement.
- DESCRIBE INPUT statement cannot have USING clause.
- The table being updated in a POSITIONED UPDATE statement cannot be assigned a correlation name.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Remove the clause. You might need to use a cursor to perform the processing. The ORDER and FOR UPDATE clauses are accepted on the DECLARE CURSOR clause. The INTO clause is accepted on the FETCH statement. The LARGE clause is accepted on a CREATE TABLESPACE statement with the NUMPARTS option.

Explanation: The string contains an invalid character. It can be a SQL ordinary identifier name, a host variable name, or a DBCS comment.

For SBCS SQL ordinary identifiers, names of buffer pools, databases, plans and storage groups must contain only uppercase alphabetic or national characters and numbers when CHARSET is KATAKANA; the first character must be alphabetic or national.

The following reason codes apply to SBCS identifiers:

000 An invalid character was found in the SBCS identifier (including the case in which a DBCS identifier was used where only an SBCS identifier is allowed). In some cases, the name of an SQL procedure may contain an underscore character. For more information, see the [DB2 SQL Reference](#).
The following reason codes apply to DBCS identifiers or comments:

101  An odd number of bytes exists between the shift-out and the shift-in character.

102  Either a shift-in or shift-out character is missing.

103  DBCS blanks X’4040’ are not allowed.

104  There are no characters between the shift-out and the shift-in characters.

105  Shift-out cannot be the first byte of the DBCS character between the shift-out and the shift-in characters.

Severity:  8 (error)
System Action:  Processing is terminated.
User Response:  Correct the name.

### DSNH115I

E csectname LINE nnnn COL cc
ILLEGA LA USE O F COMPARISON OPERATOR operator

Explanation:  The syntax is not correct for this type of comparison. A simple comparison such as ‘>‘ must not be followed by a list of items. The ANY and ALL comparisons must precede a subselect, rather than an expression or a list of items.

Severity:  8 (error)
System Action:  If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.
User Response:  Correct the syntax. If necessary, refer to Chapter 2 of [DB2 SQL Reference] for the correct syntax.

### DSNH117I

E csectname LINE nnnn COL cc
STATEMENT INSERTS THE WRONG NUMBER OF VALUES

Explanation:  The number of entries in a value-list is not the same as the number of columns specified in an INSERT statement.

Severity:  8 (error)
System Action:  Processing continues.
User Response:  Correct the syntax. If necessary, refer to Chapter 5 of [DB2 SQL Reference] for the correct syntax.

### DSNH120I

E csectname LINE nnnn COL cc
FUNCTION USAGE NOT PERMITTED: fname

Explanation:  A WHERE clause or SET clause contains an aggregate function, possibly as a result of a reference to a column that is derived from an aggregate function in a view definition. An aggregate function is allowed in a WHERE clause only if that clause appears within a subquery of a HAVING clause.

Severity:  8 (error)
System Action:  If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.
User Response:  Correct the syntax. A subselect clause might be needed to produce the function result. If necessary, refer to Chapter 4 of [DB2 SQL Reference] for the correct syntax.

### DSNH125I

E csectname LINE nnnn COL cc
INVALID ORDER BY COLUMN NUMBER: number

Explanation:  The identified column number is either less than 1 or greater than the number of items in the select-list.

Severity:  8 (error)
System Action:  The cursor declaration is discarded.
User Response:  Correct the column number. If necessary, refer to Chapter 4 of [DB2 SQL Reference] for the correct syntax.

### DSNH126I

E csectname LINE nnnn COL cc
ORDER BY CANNOT BE USED WITH A FOR UPDATE OF CLAUSE

Explanation:  The ORDER BY clause makes the cursor incapable of being updated.

Severity:  8 (error)
System Action:  The cursor declaration is discarded.
User Response:  This is a DB2 restriction. You can have either an ordered cursor or a cursor that can be updated. You cannot specify both attributes for the same cursor. You might need to change your application logic.

### DSNH129I

E csectname LINE nnnn COL cc
TOO MANY TABLES SPECIFIED IN SQL STATEMENT

Explanation:  In a subselect, (including all subqueries), there can be no more than 225 references to table names.
Severity: 8 (error)
System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.
User Response: Reduce the number of table references in each subselect. Each reference to a single table counts separately. The count only applies to table/view references in the FROM list. Each view is only counted one time. Refer to Chapter 4 of DB2 SQL Reference for the definition of a subselect.

**DSNH130I**

*E csectname LINE nnnn COL cc THE ESCAPE CLAUSE ‘x’ CONSISTS OF MORE THAN ONE CHARACTER*

Explanation: The literal x used in the ESCAPE clause is too long. Only one SBCS or one DBCS character is allowed.
Severity: 8 (error)
System Action: The corresponding SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.
User Response: Correct the string. The literal string for the ESCAPE clause can only be one SBCS or DBCS character.

**DSNH131I**

*E csectname LINE nnnn STATEMENT WITH LIKE PREDICATE HAS INCOMPATIBLE DATA TYPES*

Explanation: If the column name at the left of LIKE or NOT LIKE is a character type, the expression at the right must be a character type. If the column name is a graphic type, the expression at the right must be a graphic type.
Severity: 8 (error)
System Action: The statement is ignored.
User Response: Check the data type of every operand.

**DSNH132I**

*E csectname LINE nnnn COL cc INVALID LIKE PREDICATE*

Explanation: The value following LIKE must be an alphanumeric host variable or literal, graphic host variable or literal, or special character literal.
Severity: 8 (error)
System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.
User Response: Correct the syntax. If necessary, refer to Chapter 2 of DB2 SQL Reference for the correct syntax.

**DSNH142I**

*E csectname LINE nnnn COL cc THE SQL STATEMENT IS NOT SUPPORTED*

Explanation: The token was found. An SQL statement was detected that is not supported by the database. The statement might be valid for other IBM relational database products or it might be valid in another context. For example, statements such as VALUES and SIGNAL SQLSTATE can appear only inside a trigger.
Severity: 8 (error)
System Action: The SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.
User Response: Change the syntax of the SQL statement or remove the statement from the program.

**DSNH170I**

*E csectname LINE nnnn COL cc NUMBER OF ARGUMENTS SPECIFIED FOR function-name IS INVALID*

Explanation: An SQL statement specified the scalar function function-name with either too many or too few arguments.
Severity: 8 (error)
System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.
User Response: Correct the function call. Refer to Chapter 3 of DB2 SQL Reference for information about the number of arguments required by the scalar function function-name.

**DSNH171I**

*E csectname LINE nnnn COL cc THE DATA TYPE, LENGTH, OR VALUE OF ARGUMENT nn OF function-name IS INVALID*

Explanation: Either the data type, the length or the value of argument nn of scalar function function-name is incorrect.
Severity: 8 (error)
System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.
User Response: Correct the argument. Refer to Chapter 3 of DB2 SQL Reference for rules for each argument of the scalar function function-name.
DSNH182I  E csectname LINE nnnn COL cc AN ARITHMETIC EXPRESSION WITH A DATETIME VALUE IS INVALID

Explanation: The specified arithmetic expression contains an improperly used date/time value or labeled duration.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the indicated expression. Refer to Chapter 2 of [DB2 SQL Reference] for the rules for date/time arithmetic.

---

DSNH184I  E csectname LINE nnnn COL cc AN ARITHMETIC EXPRESSION WITH A DATETIME VALUE CONTAINS A PARAMETER MARKER

Explanation: The specified expression contains a parameter marker improperly used with a date/time value.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the indicated expression. Refer to Chapter 2 of [DB2 SQL Reference] for information about date/time arithmetic.

---

DSNH198I  E csectname LINE nnnn COL cc EMPTY SQL STATEMENT IGNORED

Explanation: The referenced SQL statement has no text between the EXEC SQL and the statement terminator.

Severity: 8 (error)

System Action: The statement is ignored.

User Response: Correct the statement, or remove it.

---

DSNH199I  E csectname LINE nnnn COL cc INVALID KEYWORD keyword; VALID SYMBOLS ARE: token list

Explanation: A syntax error was detected at the keyword specified in the message. As an aid to the programmer, a partial list of valid tokens is provided in the message. Only those tokens that fit are listed. The error might be earlier in the statement, but the syntax of the statement appears to be valid up to this point.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If the table declares are correct and the column name is not unique, this creates an error in the BIND step. Correct the DECLARE TABLE statement, or use the correct table name to qualify the column name.

---

DSNH205I  W csectname LINE nnnn COL cc COLUMN column-name WAS NOT DECLARED IN TABLE table-name

Explanation: The column name column-name is not contained in the table declarations. The name specified in a DISTINCT function must reference a column of the table. The value expression of an ALL function must reference a column of the table.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If the table declares are correct and the column name is not in the table, this creates an error in the BIND step. Correct the DECLARE TABLE statement or the column name.
DSNH206I  W csectname LINE nnnn COL cc
STATEMENT REFERENCES COLUMN column name WHICH IS NOT DECLARED IN THE SPECIFIED TABLE(S)

Explanation: The column column name is not contained in any TABLE declaration for the tables specified in the statement.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Correct the syntax. If necessary, refer to Chapter 4 of DB2 SQL Reference for the correct syntax.

DSNH207I  E csectname LINE nnnn COL cc
ILLEGAL ORDER BY SPECIFICATION

Explanation: If the select expression involves a UNION operator, the ORDER BY list must use numeric constants rather than variables.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the syntax, if necessary, refer to Chapter 4 of DB2 SQL Reference for the correct syntax.

DSNH251I  E csectname LINE nnnn COL cc TOKEN name IS NOT VALID

Explanation: The location name cannot contain alphabetic extenders for national languages (that is, #, @, and $ in the United States).

Severity: 8 (error)

System Action: Processing continues.

User Response: Correct the content of the location name.

DSNH290I  E csectname LINE nnnn COL cc
NO VALID 'END DECLARE SECTION' FOUND

Explanation: The user’s source program contains a BEGIN DECLARE SECTION, but no corresponding END DECLARE SECTION was found.

Severity: 8 (error)

System Action: Processing continues.

User Response: Correct the syntax. If necessary, refer to Chapter 4 of DB2 SQL Reference for the correct syntax.

DSNH291I  E csectname LINE nnnn COL cc NO VALID 'BEGIN DECLARE SECTION' FOUND

Explanation: The user’s source program contains an END DECLARE SECTION, but no corresponding BEGIN DECLARE SECTION was found.

Severity: 8 (error)

System Action: Processing continues.

User Response: Correct the syntax. If necessary, refer to Chapter 4 of DB2 SQL Reference for the correct syntax.

DSNH303I  W csectname LINE nnnn COL cc
STATEMENT SELECTS INCOMPATIBLE DATA TYPE INTO hostvar

Explanation: The data type of host variable hostvar is not compatible with the apparent type of the corresponding select expression. One of them is numeric and the other is character, or one of them is character and the other is graphic. If the select expression is a column reference, the data type is obtained from its declaration.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure that the table definitions are current and that the host variable has the proper data type.

System Programmer Response: Ensure that the table definitions are current, and that the host variable has the proper data type.
DSNH307I  E  csectname  HOST VARIABLE ALREADY DECLARED

Explanation: The host variable being registered with SQLGALHV has already been registered.

Severity: 8 (error)

System Action: The host variable is ignored.

User Response: Continue the compilation or precompilation process.

---

DSNH308I  U  csectname  MAXIMUM NUMBER OF HOST VARIABLES EXCEEDED

Explanation: The registration of host variables exceeded the internal symbol table storage capacity.

Severity: 16 (unrecoverable error)

System Action: Further processing halts.

User Response: Terminate compilation or precompilation.

---

DSNH310I  W  csectname  LINE  nnnn  COL  cc  language  HOST VARIABLE name WAS DECLARED IN location

Explanation: Host variable name should not be declared in this location of the source program. This message is issued only at reference time.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If this host variable is used, the user assumes responsibility for possible exposure of incorrect output. Refer to Part 2 of DB2 Application Programming and SQL Guide to determine where host variables can be validly declared.

Declaring a COBOL host variable in the File Section might lead to incorrect output from SQL statements or abend 04E with RC=00E7000C.

---

DSNH312I  E  csectname  LINE  nnnn  COL  cc  UNDEFINED OR UNUSABLE HOST VARIABLE name

Explanation: The name in the message is used in an SQL statement, but either no declaration was found in the application program so far, or the attributes are improper for this use. Declarations for host variables used in a DECLARE CURSOR statement must precede the SQL statement, regardless of the ONEPASS or TWOPASS option for the precompiler, or a parameter marker was expected in an EXECUTE IMMEDIATE statement. This message is issued only at reference time.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Check the declaration and the attributes of the named host variable. If you intended the name to refer to a column, the colon (:) should not be present. If you intended a literal, you need to enclose the value in string delimiters (apostrophes or quotation marks).

If you intended to use a host variable, only a subset of the possible variable declarations are valid for use as a DB2 host variable. The rules for host variables are listed in the application programming guides. Use the cross-reference listing and precompiler source listing to determine the source of the problem.

- If you use the STDSQL(YES) option for the precompilation, make sure that all of the host variable declarations are declared within BEGIN/END DECLARE SECTIONs.
- If the cross-reference listing does not contain the host variable name, the declaration is missing. If the source for a declaration is present, a missing terminator from a comment or from a string might cause this type of error. The margins could also cause this type of error.
- If the name is present, but the data type is not listed, the host variable is not usable; it does not follow the rules outlined for valid host variable definitions.
- If several definitions exist for the name, the first reference might occur before the definition. The use of the TWOPASS option helps by processing DECLARE statements before the other types of statements. However, host variable declarations and cursor declarations are processed in the same pass. The host variables referenced in cursor declarations must be defined before the cursor is defined in the application program.
- A parameter marker is expected rather than a host variable in an EXECUTE IMMEDIATE statement.
- The data type of a host variable passed in a CALL statement is not character or varying character.
- The length attribute of a character or varying character host variable passed in a CALL statement exceeds 255 characters.

---

DSNH313I  E  csectname  LINE  nnnn  COL  cc  INVALID TYPE OR LENGTH OF HOST VARIABLE 'name'

Explanation: The host variable name is used in an SQL statement, but either the type or the length is improper for this use.

Severity: 8 (error)

System Action: The corresponding SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.
### DSNH314I • DSNH350I

**User Response:** Check the declaration and the attributes of the named host variable. Refer to Part 2 of *DB2 Application Programming and SQL Guide* for the allowable host variable type and length.

---

#### DSNH314I  E csectname LINE nnnn COL cc REFERENCE TO HOST VARIABLE name IS AMBIGUOUS

**Explanation:** The host variable `name` was defined more than once in this application program. The precompiler cannot distinguish which host variable definition should be used here. The following table indicates some possible combinations. DB2 supports only a single adjacent qualifier for a host variable name.

<table>
<thead>
<tr>
<th>Case</th>
<th>Ref</th>
<th>Definition</th>
<th>Result</th>
<th>Suggested Change</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>a</td>
<td>x.a</td>
<td>Valid</td>
<td>None</td>
</tr>
<tr>
<td>2</td>
<td>x.a</td>
<td>x.a, y.a</td>
<td>Valid</td>
<td>None</td>
</tr>
<tr>
<td>3</td>
<td>a</td>
<td>x.a, y.a</td>
<td>DSNH314I</td>
<td>Reference x.a or y.a</td>
</tr>
<tr>
<td>4</td>
<td>a</td>
<td>x.a, a</td>
<td>Valid</td>
<td>None</td>
</tr>
<tr>
<td>5</td>
<td>x.a</td>
<td>q.x.a, v.x.a</td>
<td>Valid</td>
<td>None</td>
</tr>
<tr>
<td>6</td>
<td>a</td>
<td>a, a</td>
<td>DSNH314I</td>
<td>Variable name changes</td>
</tr>
</tbody>
</table>

**Severity:** 8 (error)

**System Action:** The statement is discarded.

**Programmer Response:** If the reason code is 012, change the text in the application program to a valid code point. If the reason code is 016, change the text in the application program to conform to the rules for well-formed mixed data.

---

#### DSNH332I  S csectname CHARACTER CONVERSION FROM CCSID from-ccsid TO CCSID 1208 IS NOT SUPPORTED, REASON reason-code

**Explanation:** DB2 parses SQL statements in Unicode UTF-8, which is also known as CCSID 1208. DB2 will convert the application program internally (not externally) to UTF-8 for processing if an application program uses a different CCSID (for example, an EBCDIC CCSID). The source CCSID can be specified by the CCSID option.

This message indicates that conversion could not take place from the source CCSID to CCSID 1208. The reason code indicates the context of this error:

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>The value of the CCSID option is neither 65535, nor in the range 1 through 65533.</td>
</tr>
<tr>
<td>001</td>
<td>No conversion is defined from the source CCSID to CCSID 1208.</td>
</tr>
<tr>
<td>002</td>
<td>No conversion is defined from CCSID 1208 to the source CCSID.</td>
</tr>
</tbody>
</table>

**Severity:** 12 (severe error)

**System Action:** The precompiler is terminated.

**User Response:** Check that the value of the CCSID option is valid. Run the precompilation again with a valid CCSID if you do not want to use the EBCDIC system CCSID.

**Programmer Response:** Make sure that the Unicode System Services conversion image includes the required conversions. See the V2R8.0-V2R10.0 z/OS Support for Unicode: Using Conversion Services.

---

#### DSNH330I  E csectname LINE nnnn COL cc TEXT COULD NOT BE CONVERTED TO CCSID 1208, REASON reason-code, CHARACTER code-point

**Explanation:** DB2 parses SQL statements in Unicode UTF-8, which is also known as CCSID 1208. DB2 will convert the application program internally (not externally) to UTF-8 for processing if an application program uses a different CCSID (for example, an EBCDIC CCSID).

Text from the application program could not be converted from the source CCSID to CCSID 1208. The reason code indicates the context of this error:

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>012</td>
<td>Invalid code point. An invalid character was sent to be converted as indicated by the code-point</td>
</tr>
</tbody>
</table>

---

#### DSNH350I  E csectname LINE nnnn COL cc INVALID SPECIFICATION OF A LARGE OBJECT COLUMN

**Explanation:** The ALTER TABLE, CREATE TABLE, or CREATE INDEX statement is invalid for one of the following reasons:
- A LOB column cannot be added to a temporary table.
- A LOB column cannot be added to a table defined with an EDITPROC.

---

254 Messages and Codes
• The **PRIMARY KEY** clause cannot specify a LOB column as a column of the primary key.
• The **UNIQUE** clause cannot specify a LOB column as a column of the unique key.
• The **referential-constraint** clause cannot specify a LOB column as a column of a foreign key.
• The CREATE INDEX statement cannot name a LOB column as a column of the index key.
• A LOB column cannot be specified in a **references** clause.
• A **table check constraint** cannot be specified in the definition of a LOB column.

**Severity:** 8 (error)

**System Action:** The statement cannot be executed.

**User Response:** Correct and reissue the failing statement.

---

**DSNH372I**

```
E csectname LINE nnnn COL cc, ONLY ONE COLUMN DEFINED AS ROWID IS ALLOWED IN A TABLE
```

**Explanation:** An attempt was made to create a table with more than one ROWID column or to add a ROWID column to a table which already has one.

**Severity:** 8 (error)

**System Action:** The statement cannot be executed.

**User Response:** For a CREATE TABLE statement, select only one column to have the row ID data type. For an ALTER TABLE statement, a ROWID column already exists for the table. Do not attempt to add another column with data type row ID to the table.

---

**DSNH401I**

```
W csectname LINE nnnn COL cc
STATEMENT SPECIFIES INCOMPATIBLE OPERANDS FOR COMPARISON OPERATOR name
```

**Explanation:** The comparison operation **name** is used with a mixture of incompatible data type operands.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** Make both operands compatible character data types. Ensure that the table declaration is correct.

---

**DSNH402I**

```
W csectname LINE nnnn COL cc
STATEMENT APPLIES name TO CHARACTER DATA
```

**Explanation:** The numeric operation or function **name** is used with a non-numeric operand.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** Make the operand numeric or use a character function. Ensure that the table declaration is correct.

---

**DSNH404I**

```
W csectname LINE nnnn COL cc
STATEMENT INSERTS OR UPDATES COLUMN name WITH VALUE THAT IS TOO LONG
```

**Explanation:** An INSERT or UPDATE statement specifies a value that is longer than the maximum length string that can be stored in that column, according to the DECLARE TABLE statement.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** Ensure that the length is allowed and that the table declaration is correct.

---

**DSNH405I**

```
E csectname LINE nnnn COL cc
LITERAL number IS OUT OF RANGE
```

**Explanation:** The number is not in the proper range:

- \(+5.4E-79\) to \(7.2E+75\) for floating-point
- \((-10^{31} - 1)\) to \(+10^{31} - 1\) for packed decimal
- \(-2147483648\) to \(2147483647\) for integers

**Severity:** 8 (error)

**System Action:** If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

**User Response:** Correct the number.
### DSNH408I

<table>
<thead>
<tr>
<th>W csectname LINE nnnn COL cc</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATEMENT INSERTS OR UPDATES</td>
</tr>
<tr>
<td>COLUMN name WITH INCOMPATIBLE</td>
</tr>
<tr>
<td>DATA TYPE</td>
</tr>
</tbody>
</table>

**Explanation:** The data type of the value to be inserted into column name by an INSERT or UPDATE statement is incompatible with the declared data type of the column. Both must be numeric or both must be character.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**Programmer Response:** Be sure that the table definitions are current, and that host variables and literals have the proper data types and are matched.

### DSNH414I

<table>
<thead>
<tr>
<th>E csectname LINE nnnn COL cc</th>
</tr>
</thead>
<tbody>
<tr>
<td>THE NUMERIC OR DATETIME COLUMN</td>
</tr>
<tr>
<td>column-name IS SPECIFIED IN A LIKE</td>
</tr>
<tr>
<td>PREDICATE</td>
</tr>
</tbody>
</table>

**Explanation:** Column column-name with a numeric data type was specified in a LIKE predicate. Columns specified in a LIKE predicate must be character or graphic string columns.

**Severity:** 8 (error)

**System Action:** If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

**User Response:** Correct the statement.

### DSNH434I

| OPTION keyword IS A DEPRECATED FEATURE |

**Explanation:** keyword is a deprecated feature that will not be supported in releases following DB2 Version 8. It is accepted, but we recommend that you discontinue the use of this keyword.

For indexes, we recommend that you use type 2 indexes rather than type 1 indexes.

**Severity:** 4 (warning)

**System Action:** Processing continues normally.

**User Response:** No change is required for the current release. However, we recommend that you change your SQL statement to remove this feature to prepare for future releases when this feature is not supported.

### DSNH449I

<table>
<thead>
<tr>
<th>W csectname LINE nnnn COL cc</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE FUNCTION OR PROCEDURE</td>
</tr>
<tr>
<td>FOR routine-name CONTAINS AN</td>
</tr>
<tr>
<td>INVALID FORMAT OF THE EXTERNAL</td>
</tr>
<tr>
<td>NAME CLAUSE OR IS MISSING THE</td>
</tr>
<tr>
<td>EXTERNAL NAME CLAUSE</td>
</tr>
</tbody>
</table>

**Explanation:** An error was found in the EXTERNAL NAME clause of the CREATE FUNCTION or CREATE PROCEDURE statement for name, or the clause is needed but was not specified.

If LANGUAGE is not COMPJAVA, the external name must follow these conventions:

- The external name must be a short identifier with letters or digits. The first character must be a letter. (This is the MVS naming convention for load modules). A possible cause for this error is the inclusion of a blank in the name.
- If the external name is omitted, the external name defaults to function-name. However, if the function or procedure name is longer than eight characters then the EXTERNAL NAME clause must be explicitly specified to specify a valid short identifier as the external name.

If LANGUAGE is COMPJAVA, the length of the EXTERNAL NAME parameter value must be less than or equal to 254 bytes.

**Severity:** 8 (error)

**System Action:** The corresponding SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

**User Response:** Correct the syntax of the SQL statement. Refer to the DB2 SQL Reference for information on the EXTERNAL NAME clause.

### DSNH457I

<table>
<thead>
<tr>
<th>E csectname LINE nnnn COL cc</th>
</tr>
</thead>
<tbody>
<tr>
<td>A FUNCTION OR DISTINCT TYPE</td>
</tr>
<tr>
<td>CANNOT BE CALLED name SINCE IT</td>
</tr>
<tr>
<td>IS RESERVED FOR SYSTEM USE.</td>
</tr>
</tbody>
</table>

**Explanation:** The user-defined function or distinct type cannot be created or referenced because the name selected is reserved for use by the system.

A number of names used as keywords are reserved for system use. These names may not be used as user-defined functions or distinct-type-names, even if they are delimited identifiers. These names are:

- `=`, `<`, `>`, `>=`, `<=`, `<>`
- `AND`, `OR`, `ANY`, `BETWEEN`, `DISTINCT` `EXCEPT`, `EXISTS`, `FALSE`, `FOR`, `FROM` `IN`, `IS`, `LIKE`, `MATCH`, `NOT` `NULL`, `ONLY`, `OR`, `OVERLAPS`, `SIMILAR` `SOME`, `TABLE`, `TRUE`, `TYPE`, `UNIQUE` `UNKNOWN`

**Severity:** 8 (error)
System Action: The statement cannot be executed.
User Response: Select a name for the function or distinct type that is not reserved for system use.

**DSNH473I**  
E csectname LINE nnnn COL cc. A USER DEFINED DATA TYPE CANNOT BE CALLED THE SAME NAME AS A SYSTEM PREDEFINED TYPE (BUILT-IN TYPE).

Explanation: The name of a data type to be created has an unqualified name that is the same as a system-predefined data type or is BOOLEAN. This is not allowed. Adding delimiters does not make the name valid. The following names are restricted:

- BIGINT
- CHARACTER
- CLOB
- DEC
- DECIMAL
- DOUBLE
- FLOAT
- INTEGER
- INTERVAL
- NUMERIC
- REAL
- ROWID
- SMALLINT
- TIME
- TIMESTAMP
- VARBINARY
- VARCHAR
- VARGRAPHIC

Severity: 8 (error)

System Action: The statement cannot be executed.
User Response: Correct the statement to use another identifier for the name of the new user-defined type.

**DSNH487I**  
E csectname LINE nnnn COL cc. object-type object-name ATTEMPTED TO EXECUTE AN SQL STATEMENT WHEN THE DEFINITION OF THE FUNCTION OR PROCEDURE DID NOT SPECIFY THIS ACTION.

Explanation: SQL procedure object-name contains SQL statements, but the SQL procedure definition specifies the NO SQL option.

System Action: The SQL statement cannot be executed.
Programmer Response: Change the definition of the SQL procedure to allow SQL statements, or remove the failing SQL statement from the SQL procedure.

**DSNH490I**  
E csectname LINE: MV.NNNN COL cc NUMBER number DIRECTLY SPECIFIED IN A SQL STATEMENT IS OUTSIDE THE RANGE OF ALLOWABLE VALUES IN THIS CONTEXT (minval, maxval)

Explanation: A number (number) was specified that is not valid in the context in which it was specified. The minimum allowed value in this context is minval. The maximum allowed value in this context is maxval. n must be within the range specified by minval and maxval (minval <= n <= maxval).

Severity: 8 (error)
System Action: The statement was not executed.

**DSNH491I**  
E csectname LINE nnnn COL cc. CREATE STATEMENT FOR USER-DEFINED FUNCTION function-name MUST HAVE A RETURNS CLAUSE, AND EITHER THE EXTERNAL CLAUSE (WITH OTHER REQUIRED KEYWORDS) OR THE SOURCE CLAUSE.

Explanation: A required clause is missing in the CREATE for function function-name. If EXTERNAL was specified, the following must also be specified:

- LANGUAGE
- PARAMETER STYLE

Severity: 8 (error)

System Action: The statement cannot be executed.
User Response: Correct and reissue the failing statement.

**DSNH504I**  
E csectname LINE nnnn COL cc. CURSOR name WAS NOT DECLARED

Explanation: Identifier name is used as a cursor, but was not declared. The declaration might have been discarded because of errors.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct or add the required cursor declaration.

**DSNH506I**  
E csectname LINE nnnn COL cc. DECLARE CURSOR FOR STATEMENT NAME MUST PRECEDE THE PREPARE STATEMENT FOR THAT STATEMENT NAME.

Explanation: This DECLARE name CURSOR statement is preceded by a PREPARE name statement. In DB2, declarations must precede action statements. This is not the same as in SQL/DS.

Severity: 8 (error)

System Action: The declaration is noted as being in error and discarded.

User Response: Move the DECLARE or PREPARE statement so that they are in the proper order, or specify the TWOPASS option if the host language is PLI, ASM, or C. The TWOPASS option has the precompiler check for declarations on the first pass and avoids this problem.
DSNH520I  E  csectname  THE OPEN STATEMENT FOR CURSOR cursor-name IS INVALID BECAUSE THE CURSOR WAS DEFINED BY AN ALLOCATE CURSOR STATEMENT.

Explanation: The cursor was not successfully declared, so it was assumed to be defined by an ALLOCATE CURSOR statement. A cursor defined by an ALLOCATE CURSOR statement is open after successful completion of the statement. Attempting to OPEN an allocated cursor is an error.

Severity:  8 (error)

System Action: The statement cannot be executed.

User Response: Add or fix the declaration of the cursor. If the cursor is supposed to be defined by an ALLOCATE CURSOR statement then remove the OPEN statement.

DSNH521I  W  csectname  THE statement FOR CURSOR cursor-name IS ASSUMED TO APPLY TO A DYNAMIC ALLOCATE CURSOR STATEMENT.

Explanation: A FETCH, CLOSE, or DESCRIBE for an undeclared cursor was issued. The cursor is assumed to be defined using a dynamic ALLOCATE CURSOR statement.

Severity:  4 (warning).

System Action: The cursor is assumed to be allocated dynamically.

User Response: Ensure that the cursor in the FETCH, CLOSE, or DESCRIBE statement is dynamically allocated.

DSNH522I  E  csectname  DESCRIBE CURSOR cursor-name IS INVALID BECAUSE THE CURSOR WAS DEFINED BY A DECLARE CURSOR STATEMENT.

Explanation: DESCRIBE CURSOR is allowed for cursors defined using the ALLOCATE CURSOR statement.

Severity:  8 (error).

System Action: The statement cannot be executed.

User Response: Remove the DESCRIBE CURSOR statement. Issue a DESCRIBE of the statement used to define the declared cursor.

DSNH527I  E  csectname  ERROR: THE PRECOMPILER ATTEMPTED TO USE THE DB2-SUPPLIED DSNHDECPI MODULE.

Explanation: The DSNHDECPI module that is supplied by DB2 is being used to run the DB2 precompiler. The precompiler requires site-dependent settings that are specified in the DSNHDECPI module that was created when DB2 was installed. The installation-generated DSNHDECPI module typically resides in the SDSNEXIT library.

System Action: Processing halts.

User Response: Check the STELIB, JOBLIB, or system linklist concatenation used in the DB2 address spaces. To ensure that the proper DSNHDECPI module is used, verify that the library that contains the DSNHDECPI module that is generated during installation precedes the SDSNLOAD library that contains the DSNHDECPI module that was supplied by DB2.

System Programmer Response: The following actions are required to enable the DSNH CLIST to load your user-supplied DSNHDECPI module rather than the DB2 DSNHDECPI module that was supplied by DB2:

1. The JOBLIB or STELIB concatenation of any job or TSO userid that calls DSNH needs to allocate the library where the user-supplied DSNHDECPI module resides (usually prefix.SDSNEXIT) ahead of the library where the DB2-supplied DSNHDECPI module resides (prefix.SDSNLOAD).

2. The DSNH call should include the PCLOAD parameter, and it should be coded as shown here: PCLOAD("*(DSNHPC)").

DSNH557I  E  csectname  LINE nnnn COL cc  INCONSISTENT GRANT/REVOKE KEYWORD keyword; PERMITTED KEYWORDS ARE keyword list

Explanation: The identified keyword is not permitted. The keyword list is a list of the keywords that are permitted in this context. The combination of privileges requested on a GRANT or REVOKE statement is not allowed. The authorities must all be of one type and consistent with the form of GRANT or REVOKE. REVOKE UPDATE(column list) is not allowed; only REVOKE UPDATE is permitted.

Severity:  8 (error)

System Action: The containing SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the syntax. If necessary, refer to Chapter 5 of DB2 SQL Reference for the correct syntax.

DSNH558I  E  csectname  LINE nnnn COL ccc  INVALID CLAUSE OR COMBINATION OF CLAUSES ON A GRANT OR REVOKE

Explanation: “PUBLIC AT ALL LOCATIONS” is invalid for non-table privilege GRANT or REVOKE statements. It is also invalid for table privilege GRANT or REVOKE statements that specify the ALTER or INDEX privilege.

Severity:  8 (error)
System Action: The statement cannot be executed.

User Response: Refer to Chapter 5 of [DB2 SQL Reference](#) for valid keywords for the GRANT or REVOKE statement.

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>DSNH577I</td>
<td>E csectname LINE nnnn COL cc object-type object-name ATTEMPTED TO MODIFY DATA WHEN THE FUNCTION OR PROCEDURE DID NOT SPECIFY THIS ACTION</td>
<td>An SQL procedure contains SQL statements that modify data, but the SQL procedure is defined with the NO SQL, READS SQL DATA, or CONTAINS SQL option.</td>
<td>8 (error)</td>
<td>The SQL statement cannot be executed.</td>
<td>Change the definition of the SQL procedure to allow SQL statements that modify data, or remove the failing SQL statement from the SQL procedure.</td>
</tr>
</tbody>
</table>
is a transition-variable, then all of the item-references in the list must be a transition-variable. If the statement is used in the triggered action of a CREATE TRIGGER statement, each item-reference must identify a transition variable. If the statement is used in any other context, each item-reference must identify a host variable.

Severity: 8 (error)

System Action: The corresponding SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

Programmer Response: Correct the statement and execute it again.

User Response: Correct the syntax of the SQL statement and precompile the program again. Refer to the DB2 SQL Reference to information on the SET assignment statement.

---

**Explanation:** Name name is a parameter, SQL variable, condition name, or label in SQL procedure routine-name. name is not unique.

**System Action:** The statement cannot be processed.

**Severity:** 8 (error)

**User Response:** Change the name to make it unique within the routine.

---

**Explanation:** Comparison functions are not created for a distinct type based on a long string data type (BLOB, CLOB, DBCLOB, LONG VARCHAR, LONG VARGRAPHIC) since the corresponding function are not available for those built-in data types.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** No action is required.

---

**Explanation:** The CREATE INDEX, CREATE TABLE, CREATE VIEW or ALTER TABLE statement specifies the same 'column-name' for two (or more) columns of the index, table, view, or the UPDATE OF clause of a trigger definition specifies the same column name more than once. Column names must be unique within an index, a table, a view, or in the UPDATE OF clause of a trigger definition. A column cannot be specified in more than one ALTER TABLE clause except if it is specified in an ALTER COLUMN clause and ADD CHECK CONSTRAINT clause.

**Severity:** 8 (error)

**System Action:** The statement cannot be executed.

**User Response:** Correct the CREATE statement to specify unique names for each of the columns of the index, table, view, or the columns in the UPDATE OF clause of a trigger definition. Correct the ALTER statement to specify unique names for each of the ALTER COLUMN clauses.

This error can also occur on CREATE TABLE when a column list of a PRIMARY KEY, FOREIGN KEY, or UNIQUE clause contains two or more occurrences of the same column name.
- A CREATE or ALTER PROCEDURE statement attempts to use the NO WLM ENVIRONMENT and
  PROGRAM TYPE SUB options. When NO WLM ENVIRONMENT is used, then PROGRAM TYPE
  MAIN must also be used.
- A CREATE or ALTER PROCEDURE statement attempts to use both NO WLM ENVIRONMENT and
  either USER or DEFINER for EXTERNAL SECURITY. When NO WLM ENVIRONMENT is used, then
  PARAMETER STYLE must be either GENERAL or SIMPLE CALL WITH NULLS.
- A CREATE or ALTER PROCEDURE statement contains both a LANGUAGE REXX clause, and a
  PARAMETER STYLE DB2SQL or PARAMETER STYLE JAVA clause.
- An ALTER TABLE statement contains both an ALTER COLUMN clause and a VALIDPROC clause.
- An ALTER TABLE statement contains both an ALTER COLUMN clause and a clause other than the check
  constraint clause.

Severity: 8 (error)

System Action: The statement was not executed.

Programmer Response: Change the options specified in the statement and reissue the statement.

---

**DSNH630I**

**E csectname LINE nnnn COL cc THE WHERE NOT NULL SPECIFICATION IS INVALID FOR TYPE 1 INDEXES**

Explanation: Type 1 indexes cannot be created with the WHERE NOT NULL specification.

Severity: 8 (error)

System Action: The statement cannot be executed.

Programmer Response: Either the index must be created as a type 2 index, or the WHERE NOT NULL
specification must not be used.

---

**DSNH637I**

**E csectname LINE nnnn COL cc DUPLICATE keyword KEYWORD**

Explanation: The identified keyword was specified twice in the statement.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL
statement is executable, it is replaced by host language statements that will, if executed, set an error code in the
SQLCA.

User Response: Remove the duplicate specification.

---

**DSNH644I**

**E csectname INVALID VALUE SPECIFIED FOR KEYWORD keyword IN stmt-type STATEMENT**

Explanation: The value specified for the keyword parameter in the stmt-type SQL statement is not a
permitted value.

Severity: 8 (error)

System Action: If the SQL statement containing the problem is a declaration, it is discarded. If the SQL
statement containing the problem is executable, it is replaced by host language statements that will, if
executed, set an error code in the SQLCA.

User Response: Correct the statement. Refer to Chapter 5 of [DB2 SQL Reference](#) for information about
the allowable values for the keyword in the stmt-type statement.

---

**DSNH683I**

**E csectname LINE nnnn COL cc, THE SPECIFICATION FOR COLUMN, DISTINCT TYPE, FUNCTION, OR
PROCEDURE data-item CONTAINS INCOMPATIBLE CLAUSES**

Explanation: There is an error in the data item specification in a statement. Incompatible specifications
are present such as “INTEGER and FOR BIT DATA”, or “INTEGER AS LOCATOR”. The location of the error is
given by data-item as follows:

- For a CREATE or ALTER TABLE statement, data-item gives the name of the column containing
  the error. The error could be an invalid specification of FOR BIT DATA, FOR SBCS DATA, FOR MIXED
  DATA, or FIELDPROC for column data-item.
- For a CREATE FUNCTION or CREATE PROCEDURE statement, data-item is a token that
  identifies the area of the problem in the statement. For example, “PARAMETER 3”, “RETURNS”, or
  “CAST FROM”.
- For a CREATE DISTINCT TYPE statement, data-item gives the name of the type being defined
  Otherwise, data-item is a token that identifies the area of the problem in a parameter list for a function.
  For example, “PARAMETER 5”.

Severity: 8 (error)

System Action: The statement cannot be processed.

User Response: Correct and reissue the failing statement.

---

**DSNH684I**

**E csectname LINE nnnn COL cc LENGTH OF LITERAL LIST BEGINNING string IS TOO LONG**

Explanation: The length of the literal list beginning with string, excluding insignificant blanks and delimiting
parenthesis, is greater than 255.
Severity: 8 (error)
System Action: The SQL statement cannot be executed.

System Programmer Response: Correct the SQL statement. Refer to Chapter 2 of [DB2 SQL Reference](#) for information about writing literal lists.

---

**DSNH700I**

**I csectname THE FIPS STANDARD IS USED FOR FLAGGING**

Explanation: This message identifies the standard used for flagging during execution.

Severity: 0 (informational)
System Action: Processing continues.

---

**DSNH701I**

**I csectname THE IBM SQL STANDARD IS USED FOR FLAGGING**

Explanation: This message identifies the standard used for flagging during execution.

Severity: 0 (informational)
System Action: Processing continues.

---

**DSNH702I**

**W csectname LINE nnnn COL cc THE STATEMENT DEVIATES FROM THE SQL STANDARD AT THE TOKEN COMMENCING WITH THE TEXT text**

Explanation: A syntax deviation from the standard named in the earlier message (FIPS or IBM SQL) was found in the SQL statement.

Severity: 4
User Response: Check and correct the SQL statement.

---

**DSNH703I**

**W csectname LINE nnnn COL cc. A DATA DEFINITION STATEMENT IS NOT WITHIN A CREATE SCHEMA STATEMENT**

Explanation: The FIPS standard requires all data definition statements to be contained within a CREATE SCHEMA statement.

Severity: 4
User Response: Check and correct the SQL statement.

---

**DSNH704I**

**W csectname LINE nnnn COL cc. THERE IS A NONSTANDARD EMBEDDED COMMENT**

Explanation: A comment embedded within an SQL statement does not meet the requirements of the standard being flagged: The FIPS standard is being checked and the comment does not begin with at least two consecutive hyphens.

Severity: 4
User Response: Check and correct the SQL statement.

---

**DSNH705I**

**W csectname LINE nnnn COL cc. AN SQL SYNTAX DEVIATION OCCURRED. THE STATEMENT IS NOT COMPLETE**

Explanation: The SQL statement terminated before all required elements were found.

Severity: 4
User Response: Check and correct the SQL statement.

---

**DSNH706I**

**W csectname LINE nnnn COL cc. THE IDENTIFIER token IS GREATER THAN 18 CHARACTERS**

Explanation: Authorization identifier, table identifier, column name, correlation name, module name, cursor name, procedure name, or parameter name has a length of more than 18 characters.

Severity: 4
User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**DSNH707I**

**W csectname LINE nnnn COL cc. THE COLUMN column HAS AN INVALID LENGTH, PRECISION, OR SCALE ATTRIBUTE**

Explanation: One of the following conditions was not met:
- The length value should be greater than zero.
- The precision value should be greater than zero.
- The scale value should not be greater than precision.

Severity: 4
User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**DSNH708I**

**W csectname LINE nnnn COL cc. THE DATA TYPE OF token SHOULD BE EXACT NUMERIC WITH A SCALE OF ZERO**

Explanation: The data type of INDICATOR PARAMETER or INDICATOR VARIABLE should be exact numeric with a scale of zero.

Severity: 4
User Response: Note the deviation from the
applicable standard. Check and correct the SQL statement.

**DSNH709I**  
**W csectname LINE nnnn COL cc. THE SET FUNCTION REFERENCES COLUMN column**

**Explanation:** One of the following conditions was not met:
- A column specification of a DISTINCT set function cannot reference a column derived from a set function specification.
- A column specification of an ALL set function cannot reference a column derived from a set function specification.

**Severity: 4**

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

**DSNH710I**  
**W csectname LINE nnnn COL cc. A VALUE EXPRESSION CONTAINING column CANNOT INCLUDE OPERATORS**

**Explanation:** A value expression cannot include operators in an outer reference column specification.

**Severity: 4**

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

**DSNH711I**  
**W csectname LINE nnnn COL cc. THE COLUMN SPECIFICATION IS MISSING OR INVALID FOR THE ALL SET FUNCTION function**

**Explanation:** The value expression of an ALL set function specification should include a column specification.

**Severity: 4**

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

**DSNH712I**  
**W csectname LINE nnnn COL cc THE COLUMN column IS NOT UNIQUE AND REQUIRES QUALIFICATION.**

**Explanation:** The identified column is duplicated within the current scope. Qualification must be given to uniquely identify the required column.

**Severity: 4**

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

**DSNH713I**  
**W csectname LINE nnnn COL cc. A VALUE EXPRESSION MAY NOT CONTAIN A SET FUNCTION SPECIFICATION**

**Explanation:** The value expression of an ALL set function might not contain a set function specification.

**Severity: 4**

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

**DSNH714I**  
**W csectname LINE nnnn COL cc. THE COLUMN column DOES NOT IDENTIFY A COLUMN OF A TABLE WITHIN THE CURRENT SCOPE**

**Explanation:** One of the following conditions was found:
- The table or correlation name used as a qualifier does not exist.
- The column name does not exist within the current scope or the scope of the qualifier.

**Severity: 4**

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

**DSNH715I**  
**W csectname LINE nnnn COL cc. A SET FUNCTION THAT CONTAINS THE OUTER REFERENCED COLUMN column IS NOT IN THE SUBQUERY OF A HAVING CLAUSE**

**Explanation:** A set function specification must be contained in a subquery of a HAVING clause if it contains an outer referenced column specification.

**Severity: 4**

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

**DSNH716I**  
**W csectname LINE nnnn COL cc THE RESULT OF A SUM OR AVG FUNCTION CANNOT BE A CHARACTER STRING**

**Explanation:** The character string is not valid for the result of a SUM or AVG set function specification.

**Severity: 4**

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.
Severity: 4
User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**DSNH718** W csectname LINE nnnn COL cc. THE exptype EXPRESSION IS COMPARING INCOMPATIBLE DATA TYPES

Explanation: The data types of one of the following (identified by `exptype`) do not match:

- **exptype**
  - Meaning: Comparison operators must match.
  - **COMPARISON**
    - The three value expressions must match.
  - **BETWEEN**
    - The three value expressions must match.
  - **IN**
    - Value expression, subquery, and all value specifications must match.
  - **QUANTIFIED**
    - Value expression and subquery must match.

Severity: 4
User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**DSNH719** W csectname LINE nnnn COL cc. THE OPERAND IN THE LIKE PREDICATE IS NOT A CHARACTER STRING

Explanation: One of the following conditions was found:

- The data type of the column in a LIKE predicate is not a character string.
- The data type of the pattern in a LIKE predicate is not a character string.

Severity: 4
User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**DSNH720** W csectname LINE nnnn COL cc. THE ESCAPE CHARACTER MUST BE A ONE-BYTE CHARACTER STRING

Explanation: The escape character in a LIKE predicate must have the data type of character string with a length of 1.

Severity: 4
User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**DSNH721** W csectname LINE nnnn COL cc. THE WHERE CLAUSE, GROUP BY CLAUSE, OR HAVING CLAUSE IS INVALID FOR THE GROUPED VIEW table.

Explanation: If the table identified in the FROM clause is a grouped view, then the table expression must not contain a WHERE clause, GROUP BY clause, or HAVING clause.

Severity: 4
User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**DSNH722** W csectname LINE nnnn COL cc. name OCCURS MORE THAN ONCE IN A FROM CLAUSE

Explanation: One of the following conditions was found:

- The table name occurs more than once in a FROM clause.
- The correlation name is identical to a table name or to another correlation name in a FROM clause.

Severity: 4
User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**DSNH723** W csectname LINE nnnn COL cc. ONLY ONE TABLE REFERENCE IS ALLOWED IN THE FROM CLAUSE FOR A GROUPED VIEW

Explanation: If the table identified by table name is a grouped view, then the FROM clause must contain exactly one table reference.

Severity: 4
User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.
**Explanation:** A value expression directly contained in the search condition of a WHERE clause must not include a reference to a column derived from a set function specification.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**Explanation:** If a value expression directly contained in the search condition is a set function specification, then the WHERE clause must be contained in a HAVING clause.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**Explanation:** If a value expression directly contained in the search condition is a function, then the column specification in the function must be an outer reference.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**Explanation:** The specified column is duplicated within the current scope.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**Explanation:** The degree of the table expression must be 1 if the result specification is 
*specified in a subquery of any predicate other than an EXISTS predicate.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**Explanation:** One of the following conditions was not met:

- If the table expression is a grouped view, the result specification of a subquery cannot contain a set function specification.
- If the table expression is a grouped view, the select list of a query specification cannot contain a function.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**Explanation:** One of the following conditions was not met:

- For a grouped table, the column specification must reference a grouping column or be specified within a set function specification.
If it is not a grouped table, and the value expression includes a set function specification, then each column specification must be specified within a set function.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

\[ DS\text{\textunderscore}732i \ W csectname \ \text{\textsc{line}} \ nnnn \ \text{\textsc{col}} \ cc. \ \text{T} \ \text{DISTINCT} \ \text{IS} \ \text{SPECIFIED} \ \text{MORE} \ \text{THAN} \ \text{ONCE}. \]

Explanation: One of the following conditions has not been met:
- DISTINCT must not be specified more than once in a query specification, excluding any subquery of that query specification.
- DISTINCT must not be specified more than once in a subquery, excluding any subquery contained in that subquery.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

\[ DS\text{\textunderscore}733i \ W csectname \ \text{\textsc{line}} \ nnnn \ \text{\textsc{col}} \ cc. \ \text{T} \ \text{THE} \ \text{COMPARISON} \ \text{PREDICATE} \ \text{SUBQUERY} \ \text{CANNOT} \ \text{CONTAIN} \ \text{A} \ \text{GROUP} \ \text{BY} \ \text{OR} \ \text{HAVING} \ \text{CLAUSE} \]

Explanation: If a subquery is specified in a comparison predicate, then the table expression whose FROM clause identifies the named table must not contain a GROUP BY clause or a HAVING clause.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

\[ DS\text{\textunderscore}734i \ W csectname \ \text{\textsc{line}} \ nnnn \ \text{\textsc{col}} \ cc. \ \text{T} \ \text{THE} \ \text{COMPARISON} \ \text{PREDICATE} \ \text{SUBQUERY} \ \text{CANNOT} \ \text{IDENTIFY} \ \text{A} \ \text{GROUPED} \ \text{VIEW} \]

Explanation: If a subquery is specified in a comparison predicate, then the table expression whose FROM clause identifies the named table must not identify a grouped view.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

\[ DS\text{\textunderscore}735i \ W csectname \ \text{\textsc{line}} \ nnnn \ \text{\textsc{col}} \ cc. \ \text{W} \ \text{csectname} \ \text{LINE} \ nnnn \ \text{COL} \ cc. \ \text{INVALID} \ \text{AUTHORIZATION} \ \text{IDENTIFIER} \ \text{authid} \]

Explanation: The authorization identifier prefixed to the table name is invalid.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

\[ DS\text{\textunderscore}736i \ W csectname \ \text{\textsc{line}} \ nnnn \ \text{col} \ cc. \ \text{THE} \ \text{TABLE} \ \text{OR} \ \text{VIEW} \ \text{name} \ \text{ALREADY} \ \text{EXISTS} \]

Explanation: The table name or view name specified already exists in the catalog.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

\[ DS\text{\textunderscore}737i \ W csectname \ \text{\textsc{line}} \ nnnn \ \text{col} \ cc. \ \text{THE} \ \text{COLUMN} \ \text{DEFINITION} \ \text{IS} \ \text{MISSING} \]

Explanation: At least one column definition should be specified for a CREATE TABLE.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

\[ DS\text{\textunderscore}738i \ W csectname \ \text{\textsc{line}} \ nnnn \ \text{col} \ cc. \ \text{THE} \ \text{DATA} \ \text{TYPE} \ \text{type1} \ \text{OF} \ \text{THE} \ \text{TARGET} \ \text{IS} \ \text{NOT} \ \text{COMPATIBLE} \ \text{WITH} \ \text{THE} \ \text{DATA} \ \text{TYPE} \ \text{type2} \ \text{OF} \ \text{THE} \ \text{SOURCE} \]

Explanation: Data types should match between source and target in a FETCH and SELECT statement.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

\[ DS\text{\textunderscore}739i \ E csectname \ \text{\textsc{line}} \ nnnn \ \text{col} \ cc. \ \text{CREATE} \ \text{FUNCTION} \ \text{function-name} \ \text{FAILED} \ \text{BECAUSE} \ \text{FUNCTIONS} \ \text{CANNOT} \ \text{MODIFY} \ \text{DATA} \ \text{WHEN} \ \text{THEY} \ \text{ARE} \ \text{PROCESSED} \ \text{IN} \ \text{PARALLEL} \]

Explanation: The function cannot be created because ALLOW PARALLEL and MODIFIES SQL DATA were both specified explicitly or implicitly. A function cannot be parallelized if it modifies data.

Severity: 8 (error)
System Action: The statement cannot be executed.

User Response: Specify DISALLOW PARALLEL or change the MODIFIES SQL DATA to NO SQL, CONTAINS SQL or READS SQL DATA.

---

DSNH740I xxxx phase FINISHED, RC = retcode, LISTING IN data-set

Explanation: The DSNH INST phase completed with return code retcode. The phase is one of the following:
- PLI Macro Pass
- Precompiler
- CICS Command Translator
- Bind Package
- Bind Plan
- Compile/assembly
- PLI
- Prelink (unique to C/370 Compiler)
- Link
- Run

If the CLIST puts the listing into a data set, the name of the data set is shown as data-set. If the PRINT parameter is LEAVE, NONE, or TERM, the ‘LISTING IN data-set’ part of this message is omitted.

Refer to message DSNH756I for an explanation of the print data set names assigned during processing.

This message is issued by the following CLIST: DSNH

Severity: retcode

System Action: Processing continues as requested.

User Response: This phase is complete. If there are errors, other messages are produced. The next phase requested begins. The order of the phases is:
1. PLI Macro Pass
2. Precompiler
3. CICS Command Translator
4. Bind Package
5. Bind Plan
6. ASM, ASMH, C (C/370 Compiler), COBOL, COBOL2, FORTRAN, PLI
7. Prelink
8. Link
9. Run

---

DSNH741I process1(NO) IMPLIES THAT process2 CANNOT BE RUN

Explanation: An inconsistent processing set was specified. An earlier phase and a later phase were requested, but not the intermediate step needed to process data between them. For example, requesting the precompile and the link edit without the compile produces this error. Values for process1 are PRECOMP, CICSSIDAT, COMPIL, LINK, or BIND. Values for process2 are COMPIL, LINK, or RUN.

This message is issued by the following CLIST: DSNH

Severity: 4 (warning)

System Action: process2 is not performed, but other processing is done.

User Response: Specify a consistent combination of processing. Application program preparation needs to run all the steps to provide a correct application program. The process does allow beginning or ending steps to be run at a different time. See message DSNH740I for the required step order.

---

DSNH750I INVALID DATA SET: clist-keyword clist-keyword-parameter

Explanation: The data set name specified on the clist-keyword-parameter contains unbalanced parenthesis.

This message is issued by the following CLIST: DSNH

Severity: 8 (error)

System Action: The CLIST is terminated.

User Response: If a member name is to be associated with the specified data set, the member name must be enclosed in parentheses.

---

DSNH751I clist ERROR IN parameter VALUE value

Explanation: The specified CLIST keyword parameter does not have an acceptable value.

Severity: 8 (error)

System Action: The CLIST processing is terminated.

User Response: Refer to the DSNH (TSO clist) section in [DB2 Command Reference] for a complete list of the supported CLIST parameters and their associated values. Correct the invalid parameter, and resubmit the job.

---

DSNH752I INPUT DATA SET NAME IS MISSING OR NONE

Explanation: The DSNH CLIST requires a value for the input data set name (INPUT). You cannot use an input data set name of NONE.

This message is issued by the following CLIST: DSNH

Severity: 0 (successful)

System Action: The CLIST prompts for a name, if prompting is allowed. If prompting is not allowed, for example in batch or when PROFILE NOPROMPT was entered, the CLIST terminates.

User Response: Specify an INPUT name. See message DSNH753I.
DSNH753I  ENTER INPUT DATA SET NAME

Explanation:  The CLIST is requesting the name of the input data set.

This message is issued by the following CLIST: DSNH

Severity:  0 (successful)

System Action:  The system waits for user to enter data set name or for the CLIST to be terminated.

User Response:  Enter the name of the data set. Do not specify the parameter or command, but just enter the name of the data set. The standard TSO prefixing will be done if the data set name is not entered within apostrophes.

DSNH754I  clist OUTNAME PARAMETER name MUST NOT CONTAIN SPECIAL CHARACTERS

Explanation:  The DSNH and DSNHC CLISTs, clist, use the OUTNAME parameter to build names for a number of data sets that are passed from phase to phase. These names are prefixed by an authorization ID or TSO prefix value and have a number of suffixes. For this reason, OUTNAME parameter name must not contain special characters. It can contain a period or national characters. It cannot have apostrophes to specify a single data set name.

Severity:  8 (error)

System Action:  The CLIST is terminated.

User Response:  Correct the input request. The default for this parameter is TEMP, which should be adequate for most usage.

DSNH755I  OUTNAME PARAMETER name MUST NOT BEGIN THE SAME AS INPUT input

Explanation:  The DSNH CLIST uses the OUTNAME parameter name to build a number of data sets that are passed from phase to phase. These data sets could conflict with the INPUT data set (input) if the names are the same, causing the INPUT data set to be overwritten. To avoid this problem, the names are not allowed to have the same initial characters.

This message is issued by the following CLIST: DSNH

Severity:  8 (error)

System Action:  The CLIST is terminated.

User Response:  Correct the input request. Specify a different OUTNAME. The default for OUTNAME is TEMP.

DSNH756I  clist PRINT PARAMETER name MUST NOT CONTAIN SPECIAL CHARACTERS

Explanation:  The DSNH and DSNHC CLISTs (clist) use the PRINT parameter to build names for data sets used for the print listings from various phases. These names are prefixed by an authorization ID or a TSO prefix value and have a number of suffixes. The PRINT parameter name can contain a period or national characters, but it cannot contain special characters. It cannot have apostrophes to specify a single data set name.

The data set names built using the PRINT(print) qualifier are the following:

- **print.CXLIST**  
  CICS Command Translator
- **print.LINKLIST**  
  Linkage Editor
- **print.LIST**  
  Compiler or Assembler
- **print.PCLIST**  
  DB2 Precompiler
- **print.SYSCPRT.LIST**  
  C/370 Compiler
- **print.SYSOUT.PRELLIST**  
  C/370 Prelink Utility

Severity:  8 (error)

System Action:  The CLIST terminates.

User Response:  Correct the name specified with the PRINT parameter.

DSNH757I  ERROR IN PLAN NAME LENGTH value

Explanation:  The value is too long for a plan name. A plan name has a maximum of 8 characters.

This message is issued by the following CLIST: DSNH

Severity:  8 (error)

System Action:  The CLIST is terminated.

User Response:  Specify a plan name with 8 or fewer characters.

DSNH758I  HOST(host-language) IS NOT PERMITTED WITH RUN(IMS) OR RUN(CICS)

Explanation:  There is no facility for connecting a FORTRAN program to either IMS or CICS.

This message is issued by the following CLIST: DSNH

Severity:  8 (error)

System Action:  The CLIST terminates.

User Response:  Use the specified language in the TSO or batch environment.
DSNH759I  clist TERMINATING, phase RC = retcode

Explanation: The DSNH or DSNHC clist terminated at phase because the return code retcode was greater than or equal to the RCTERM parameter value.

The phase is one of the following:

- ASM
- BIND Package
- COBOL
- CLIST CHECKING
- PLI
- PLI Macro Pass
- Run

Severity: retcode

System Action: The CLIST terminates.

User Response: Determine the cause for the high return code. If the parameters include TERM(NONE) and direct the PRINT to a data set, you might need to search the print data sets for the listing of the error. Refer to message DSNH756I for an explanation of the print data set names assigned during processing.

Problem Determination: The location of the messages describing the prior errors depends upon the values of the TERM and PRINT parameters. The messages can be directed to the terminal, to preallocated data sets, or to data sets dynamically allocated during CLIST processing.

If TERM(NONE) PRINT(NONE) was specified, the messages are not available. Execute the CLIST again and specify a location for the error messages.

To find the documentation, note the immediately preceding DSNH740I message for the location of the listings. If the 'LISTING IN data-set' portion of the message is missing, specify a PRINT data set, SOURCE:YES and XREF:YES, and execute the CLIST again. Use TERM(TERM) to direct error messages to your terminal. These listings and execution of the DSNH CLIST are required for problem diagnosis.

If the error is in the CLIST or the error location is CLIST CHECKING, use CONTROL(SYMLIST) to produce a detailed trace of the CLIST execution and provide the trace listing.

Check for DSNH751I messages that describe the error.

DSNH760I  PRELINK OPTION INVALID WITH HOST LANGUAGE (host-language)

Explanation: Invocation of the PRELINK step is not supported by host-language. This option is only valid for the following DSNH HOST language compilers: C, CPP, and IBMCOB.

This message is issued by the following CLIST: DSNH...
DSNH774I  W csectname LINE nnnn COL cc. THE CURSOR cursor IS ALREADY DECLARED

Explanation: The cursor specified was already declared in a DECLARE CURSOR statement.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH775I  W csectname LINE nnnn COL cc. ONLY "*" OR COLUMN NAMES ARE VALID IN THIS CONTEXT

Explanation: When UNION is specified, the select list for the specification of the two table expressions identified by the query expression and query term should consist of "*" or column specifications.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH776I  W csectname LINE nnnn COL cc. THE DESCRIPTIONS OF TABLES IDENTIFIED BY THE QUERY EXPRESSION BEGINNING WITH TABLE: table1 AND THE QUERY TERM BEGINNING WITH TABLE: table2 SHOULD BE IDENTICAL

Explanation: When UNION is specified, the descriptions of the two tables should be identical, except for the column names.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH777I  W csectname LINE nnnn COL cc. THE SORT SPECIFICATION number IS OUTSIDE THE DEGREE OF TABLE table

Explanation: If the sort specification contains an unsigned integer, it should be greater than zero and not greater than the number of columns in the table.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

---

DSNH778I  W csectname LINE nnnn COL cc. THE TABLE table IS A READ-ONLY TABLE

Explanation: A DELETE, an INSERT, or an UPDATE statement was specified on a read-only table.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH779I  W csectname LINE nnnn COL cc. THE TABLE table MUST NOT BE IDENTIFIED IN A FROM CLAUSE OF ANY SUBQUERY CONTAINED IN A SEARCH CONDITION

Explanation: A table specified in a DELETE or an UPDATE statement cannot be used in a FROM clause of any subquery contained in its search condition.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH780I  W csectname LINE nnnn COL cc. THE TABLE table1 IS NOT THE FIRST TABLE table2 SPECIFIED IN THE DECLARE CURSOR STATEMENT

Explanation: The table specified in a DELETE or an UPDATE statement should be the first table specified in the FROM clause of the DECLARE CURSOR statement.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH781I  W csectname LINE nnnn COL cc. THE NUMBER OF TARGET SPECIFICATIONS DO NOT MATCH THE DEGREE OF TABLE table

Explanation: The number of target specifications in the FETCH statement do not match the degree of the table specified.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.
**Explanation:** The named table must not be identified in a FROM clause of a query specification or of any subquery contained in the query specification.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**Explanation:** In an INSERT statement, the number of columns specified does not match the number of values specified.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**Explanation:** The number of columns specified in an INSERT statement does not match the degree of the table specified in the query specification.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**Explanation:** One of the following conditions was not met:

- If the data type of the column name is character string, then the corresponding item in the INSERT or UPDATE statement should be character string with a length equal to or less than the length of the column name.
- If the data type of the column name is exact numeric, then the corresponding item in the INSERT or UPDATE statement should be exact numeric.

- **Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**Explanation:** A value expression in a SET clause of an UPDATE statement should not include a set function specification.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**Explanation:** If NULL is specified in the SET clause of the UPDATE statement, then the corresponding column should allow nulls.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.
**DSNH790I • DSNH867I**

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**DSNH790I**  
W csectname LINE nnnn COL cc.  
THERE IS AN INVALID SQL TERMINATOR FOR THE HOST LANGUAGE

**Explanation:** The SQL statement was not terminated by the correct construct for the host language being processed.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**DSNH791I**  
W csectname LINE nnnn COL cc.  
YOU MUST DEFINE THE HOST VARIABLE identifier

**Explanation:** The host variable named was either not defined within the program or defined outside the SQL declaration section.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**DSNH792I**  
W csectname LINE nnnn COL cc.  
THE TABLE table WAS NOT FOUND IN THE CATALOG

**Explanation:** The named table does not exist in the catalog.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**DSNH793I**  
W csectname LINE nnnn COL cc.  
THERE IS AN INVALID IDENTIFIER FORMAT identifier FOR HOST LANGUAGE language

**Explanation:** The format of the identifier name displayed does not meet the requirements of the host language.

**Severity:** 4

**User Response:** Note the deviation from the applicable standard. Check and correct the SQL statement.

---

**DSNH794I**  
W csectname LINE nnnn COL cc.  
The OBJECT object-name CANNOT BE CREATED BECAUSE THE FIRST THREE CHARACTERS ARE RESERVED FOR SYSTEM OBJECTS

**Explanation:** In general, SYS is a reserved prefix for names. The only exceptions are:
- SYSPROC is a valid schema name for stored procedures.
- SYSADM is a valid schema name.

This condition is similar to the condition reported in SQLCODE -707.

**Severity:** 4

**User Response:** Select a name that does not start with a reserved prefix.

---

**DSNH795I**  
E csectname LINE nnnn COL cc.  
INVALID SPECIFICATION OF A ROWID COLUMN

**Explanation:** For a CREATE TABLE statement, the specification of a ROWID column may be invalid for one of the following reasons:
- A ROWID column cannot be a column of a temporary table.
- A ROWID column cannot be a column of a table with an EDITPROC.
- A ROWID column cannot be a column of a foreign key.
- A ROWID column cannot be a column of a primary key.
- A ROWID column cannot be referenced in the check-condition of a table check constraint.

**Severity:** 8

**System Action:** The statement was not executed.

**User Response:** Correct the syntax.

---

**DSNH867I**  
E csectname LINE nnnn COL cc.  
INVALID SPECIFICATION OF A ROWID COLUMN

**Explanation:** For a CREATE TABLE statement, the specification of a ROWID column might be invalid for one of the following reasons:
- A ROWID column cannot be a column of a temporary table.
- A ROWID column cannot be a column of a table with an EDITPROC.
- A ROWID column cannot be a column of a foreign key.
- A ROWID column cannot be a column of a primary key.
• A ROWID column cannot be referenced in the check-condition of a table check constraint.

Severity: 8
System Action: The statement was not executed.
User Response: Correct the syntax.

DSNH870I  W csectname THERE IS NOT ENOUGH MEMORY FOR THE FLAGGER; FLAGGING IS DISCONTINUED
Explanation: The flagger could not allocate enough storage to load all required modules.
Severity: 4
System Action: Precompiling continues but flagger operation is discontinued.
User Response: Increase the region size in the JCL for the application. Allocate more storage for flagger operation.

DSNH871I  W csectname AN ERROR OCCURRED WHEN ATTEMPTING TO LOAD THE FLAGGER MODULE module.
Explanation: A flagger module was not found during flagger initialization.
Severity: 4
System Action: Precompiling continues but flagger operation is discontinued.
User Response: Refer to the message produced by the operating system for details of causes and proceed as instructed for that message.

DSNH872I  W csectname AN ERROR OCCURRED WHEN INITIALIZING THE FLAGGER.
Explanation: An internal error occurred during flagger initialization.
Severity: 4
System Action: Precompiling continues but flagger operation is discontinued.
User Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

DSNH873I  W csectname THE FLAGGER COULD NOT PROCESS THE SQL STATEMENT.
Explanation: An SQL statement passed to the flagger caused an internal error within the flagger.
Severity: 4
System Action: Precompiling continues but flagger operation is discontinued.
User Response: [Refer to DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

System Action: Precompiling continues but flagger operation is discontinued.
User Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Severity: 4
System Action: Precompiling continues but flagger operation is discontinued.
User Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Severity: 4
System Action: Processing continues without semantics flagging.
User Response: Refer to the reason code returned in this message and perform corrective actions.

Severity: 4
System Action: Processing continues without semantics flagging.
User Response: Use the provided SQL return code, object type, and name to identify the problem. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.
DSNH877I W csectname NOT ENOUGH MEMORY FOR FLAGGER OPERATION: RETURN CODE: return

Explanation: Insufficient storage is available for flagger operation.

Severity: 4

System Action: Processing continues without flagging.

User Response: Check whether the storage allocation for the precompiler can be increased. Allocate more storage for flagger operation.

DSNH878I W csectname ERROR RELEASING FLAGGER MEMORY; FLAGGING IS DISCONTINUED

Explanation: An error occurred when a flagger module attempted to release storage back to the flagger pool.

Severity: 4

System Action: Processing continues without flagging.

User Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

DSNH879I W csectname ERROR RELEASING FLAGGER MEMORY; RETURN CODE return

Explanation: An error occurred when a flagger module attempted to release storage back to the operating system.

Severity: 4

System Action: Processing continues without flagging.

User Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

DSNH880I W csectname AN ERROR WAS RETURNED DURING FLAGGER ACCESS TO THE DB2 CATALOG; REASON CODE: X'reason' RETURN CODE X'return'

Explanation: An error occurred when a flagger module attempted to access the system catalog.

Severity: 4

System Action: Processing continues without flagging.

User Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

DSNH901I S csectname U LINE nnnn COL cc INTERNAL PRECOMPILER ERROR – REASON CODE ccc

Explanation: An internal compiler consistency check failed. Reason codes are:

000 The message formatter was called with an unlisted internal message number.

001 The parser received a token code of 0 from the lexical scan. Lexical scan refers to a scan of words rather than syntax.

002 Error in storage suballocation control blocks.
   • The error might have occurred because a DB2 SQL statement limitation was exceeded. The SQL statement might be referencing, creating, or declaring more columns than the DB2 defined maximum number allowed for an SQL statement. Another possibility is that too many host variables are being referenced in the SQL statement.

003 Error in a storage suballocation request.
   • This error might have occurred because of storage constraints when building the DBRM entry for the SQL statement or because the SQL statement exceeds the DB2 maximum statement length.

004 Error in pointer structures.

005 On BIND or REBIND, a host variable was not found.

006 Unexpected value for parser option.

007 The internal limit was exceeded.
   • A fully qualified name exceeds the maximum length of 255 characters.
   • The size of a DBRM record exceeds 65536 bytes of storage.

008 Internal conversion error.
   • An error occurred when converting a timestamp version-id.

Severity: 16 (unrecoverable error)

System Action: The precompiler is terminated immediately.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: A copy of the application program source and the printout is useful (specify SOURCE and XREF).
**Problem Determination:** A copy of the application program source and the print-out is useful (specify SOURCE and XREF).

**Explanation:** DB2 parses SQL statements in Unicode UTF-8, which is also known as CCSID 1208. DB2 will convert the application program internally (not externally) to UTF-8 for processing if an application program uses a different CCSID (for example, an EBCDIC CCSID). After processing, DB2 converts the output back to the original CCSID.

This message indicates that a severe error has occurred in DB2’s internal conversion. The reason code indicates the context of this error:

- **000** Substitution occurred on conversion from the source CCSID to CCSID 1208.
- **001** The internal buffer is too small for conversion from the source CCSID to CCSID 1208.
- **002** A miscellaneous error occurred on conversion from the source CCSID to CCSID 1208.
- **003** No conversion is defined from the source CCSID to CCSID 1208.
- **004** A miscellaneous error occurred on conversion from the source CCSID to CCSID 1208.
- **005** Substitution occurred on conversion from CCSID 1208 to the source CCSID.
- **006** The internal buffer is too small for conversion from CCSID 1208 to the source CCSID.
- **007** An invalid code point was found during conversion from CCSID 1208 to the source CCSID.
- **008** Another type of invalid input character was found during conversion from CCSID 1208 to the source CCSID.
- **009** A miscellaneous error occurred during conversion from CCSID 1208 to the source CCSID.
- **010** No conversion is defined from CCSID 1208 to the source CCSID.
- **011** A miscellaneous error occurred during conversion from CCSID 1208 to the source CCSID.

**Severity:** 16 (unrecoverable error)

**System Action:** The precompiler/parser is terminated immediately.

**User Response:** Correct and reissue the failing statement.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide* for information on identifying and reporting the problem.
• Row ID’s
• The same distinct types

Severity: 8 (error)

System Action: The statement cannot be processed.

User Response: Examine the current definition for the parameter or SQL variable and ensure that it has the proper data type.

---

**DSNH4700I**

<table>
<thead>
<tr>
<th>E csectname LINE nnnn COL cc</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTEMPT TO USE NEW FUNCTION</td>
</tr>
<tr>
<td>WITH NEWFUN NO</td>
</tr>
</tbody>
</table>

Explanation: When the SQL processing option NEWFUN has a value of NO, you cannot use syntax for functions that this release of DB2 introduces. An attempt was made to use one of these functions.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

Programmer Response: Do one of these things:
- Restrict your program to functions that earlier releases of DB2 introduced. These functions are allowed regardless of the value of NEWFUN.
- Process your program with a value of YES for the NEWFUN option. However, you cannot BIND the DBRM until New Function Mode has been enabled.

---

**DSNH4701I**

| S csectname OPTION: option OPTION NOT PERMITTED WITH NEWFUN NO |

Explanation: You cannot use the indicated SQL processing option when the SQL processing option NEWFUN has a value of NO.

Severity: 12 (severe error)

System Action: The precompiler is terminated.

Programmer Response: To prevent this error in the future, do one of the following:
- Restrict your precompilation to options that were introduced in earlier releases of DB2. These options are valid regardless of the value of NEWFUN.
- Process your program with a value of YES for the NEWFUN option.

---

**DSNH4702I**

| column IS NOT VALID IN THE CONTEXT WHERE IT IS USED |

Explanation: The specified column is not a column of the table or view that was specified as the object of the UPDATE or INSERT statement.

System Action: The statement cannot be executed.

No data was updated.

Programmer Response: Verify that the column and table names are specified correctly in the SQL statement. If a correlation name is specified for a table or view, verify that subsequent table references of the table or view in qualified column names use the correlation name and not the table or view name.

Destination: 42703

---

**DSNH4777I**

<table>
<thead>
<tr>
<th>E csectname LINE nnnn COL cc</th>
</tr>
</thead>
<tbody>
<tr>
<td>NESTED COMPOUND STATEMENTS</td>
</tr>
<tr>
<td>NOT ALLOWED</td>
</tr>
</tbody>
</table>

Explanation: An SQL procedure contains nested compound statements, which are not allowed.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Rewrite the SQL procedure body so that it does not contain nested compound statements.

---

**DSNH4778I**

| E csectname LINE nnnn COL cc END |
| LABEL label-name NOT SAME AS |
| BEGIN LABEL                      |

Explanation: An SQL procedure statement contains an ending label and a beginning label that do not match.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Change the ending label in the statement to match the beginning label.

---

**DSNH4779I**

| csectname LINE nnnn COL cc |
| LABEL label SPECIFIED statement IS NOT VALID |

Explanation: In an SQL procedure, label is specified on a GOTO or LEAVE statement. label is not defined or is not a valid label for the statement.

The label on a LEAVE statement must be the label for a LOOP, REPEAT, WHILE, or compound statement.

The label in a GOTO statement must be defined within a scope that the GOTO statement can reach.
- If the GOTO statement is defined in a compound statement, label must be defined inside the same compound statement.
- If the GOTO statement is defined in a handler, label must be defined in the same handler and must follow the other scope rules.
- If the GOTO statement is defined outside a handler, label must not be defined within a handler.

Severity: 8 (error)

System Action: The statement cannot be processed.

User Response: Change the label in the LEAVE statement to match the label on the LOOP, REPEAT,
WHILE, or COMPOUND statement that contains the LEAVE statement.

Ensure that the label in the GOTO statement is defined within a scope that the GOTO statement can reach.

**Explanation:** In an SQL procedure, a compound statement is defined as NOT ATOMIC, but the compound statement contains an UNDO handler. An UNDO handler can be used only for a compound statement that is defined as ATOMIC.

**Severity:** 8 (error)

**System Action:** The statement cannot be executed.

**User Response:** Define the compound statement as ATOMIC, or change the UNDO handler to a CONTINUE or EXIT handler.

**Explanation:** In an SQL procedure, a handler is declared for condition condition-name, but the SQL procedure does not contain a condition declaration statement that defines condition-name.

**Severity:** 8 (error)

**System Action:** The statement cannot be executed.

**User Response:** Include a condition declaration statement in the SQL procedure that relates condition-name to an SQLSTATE value.

**Explanation:** In an SQL procedure, a condition handler is not valid for one of the following reasons:
- The handler specifies an SQLSTATE value that is not valid.
- The handler specifies duplicate conditions.
- The handler specifies SQLWARNING, SQLEXCEPTION, or NOT FOUND with other conditions.

**Severity:** 8 (error)

**System Action:** The statement cannot be executed.

**User Response:** Specify a valid condition in the handler. Ensure that a handler specifies a condition only once.

**Explanation:** An SQL procedure contains a FOR statement in which the select list in the cursor declaration has a column that is not valid. That column is a duplicate of another column in the select list, or the column is not named.

**Severity:** 8 (error)

**System Action:** The statement cannot be executed.

**User Response:** Ensure that all columns in the select list for a cursor declaration in a FOR statement are unique and are named. If a column of the select list is the result of a column function, specify an AS clause to name the column.

**Explanation:** The declaration or use of an SQLCODE or SQLSTATE special variable is not valid for one of the following reasons:
- SQLSTATE is declared with a data type other than CHAR(5).
- SQLCODE is declared with a data type other than INTEGER.
- NULL is assigned to SQLCODE or SQLSTATE.

**Severity:** 8 (error)

**System Action:** The statement cannot be processed.

**User Response:** Declare SQLSTATE only as CHAR(5) and SQLCODE only as INTEGER. Do not assign the null value to SQLCODE or SQLSTATE.

**Explanation:** SQLGALHV received a host variable with an invalid SQL data type code.

**Severity:** 8 (error)

**System Action:** The invalid host variable is ignored.

**User Response:** Correct the SQL data type code and register the host variable again.

**Explanation:** SQLGALHV received a host variable with an invalid data area. The length of the data area in parameter SQL_LENGTH is either too large or too negative.

**Severity:** 8 (error)
**DSNH4913I** • **DSNH5011I**

System Action: The host variable is ignored.
User Response: Correct the data area length parameter and register the host variable again.

---

**DSNH4913I** E csectname TOKEN IDENTIFIER HAS ALREADY BEEN USED

Explanation: The token identifier passed to SQLGALHV already exists for another host variable.
Severity: 8 (error)
System Action: The host variable is ignored.
User Response: Assign a different token identifier and register the host variable again.

---

**DSNH4914I** E csectname INVALID TOKEN IDENTIFIER

Explanation: The token identifier passed to SQLGALHV is invalid.
Severity: 8 (error)
System Action: The host variable is ignored.
User Response: Assign a token identifier that is a 4-byte integer, and register the host variable again.

---

**DSNH4915I** E csectname SQLGINIT HAS ALREADY BEEN INVOKED

Explanation: A call to SQLGINIT has already been made.
Severity: 8 (error)
System Action: Control is returned to caller with no other action taken.
User Response: Change the compiler or precompiler code so that SQLGINIT is only called once. The compilation or precompilation currently in progress may continue.

---

**DSNH4916I** E csectname SQLGINIT HAS NOT BEEN INVOKED

Explanation: A call to SQLGINIT has not been made.
Severity: 8 (error)
System Action: Control is returned to caller with no other action taken.
User Response: Change the compiler or precompiler code so that SQLGINIT is called before any of the other API entry points.

---

**DSNH4919I** E csectname TASK ARRAY TOO SMALL

Explanation: Precompiler Services need more task array entries than the precompiler allocated.
Severity: 8 (error)

---

**DSNH4920I** E csectname TOKEN ID ARRAY TOO SMALL

Explanation: Precompiler Services needs more token identifier array entries than the precompiler allocated.
Severity: 8 (error)
System Action: Control is returned to caller with no other action taken.
User Response: Allocate a larger token identifier array and make the call to SQLGCMPL again.

---

**DSNH4941I** U csectname BLANK OR EMPTY SQL STATEMENT TEXT

Explanation: The SQL statement passed to SQLGCMPL was blank.
Severity: 8 (error)
System Action: Control is returned to caller with no other action taken.
User Response: Assign the SQL statement buffer to the correct parameter and call SQLGCMPL again.

---

**DSNH4999I** U csectname PRECOMPILER SERVICES INTERNAL ERROR

Explanation: Precompiler Services encountered an unrecoverable internal error.
Severity: 16 (unrecoverable error)
System Action: Control is returned to caller with no other action taken.
User Response: Terminate compilation or precompilation.

---

**DSNH5011I** HOST VARIABLE ARRAY

*host-variable-array* IS EITHER NOT DEFINED OR IS NOT USABLE

Explanation: Host-variable-array *host-variable-array* was specified in a multiple-row FETCH or multiple-row INSERT statement. The host-variable-array is not defined or is not usable for one of the following reasons:
- The host variable is not a valid host-variable-array.
- The host variable is not a dimensioned array.
- The host-variable-array has more than 1 dimension.
- The host-variable-array defines a structure that does not conform to the rules for defining a host-variable-array.
• The dimension of the host-variable-array used for indicators is not equal to the dimension of the main host-variable-array.

System Action: The statement cannot be processed.

Programmer Response: Correct any of the following and precompile the program again. Ensure that:
• the dimension of the indicator variable array is equal to the dimension of the main host-variable-array.
• the host-variable-array is a single-dimensional array.
• the host-variable-array or host indicator variable array do not contain structures that are not permissible. The only structures that may be defined in a host-variable-array are those that are used to define variable length string host variables.

See the DB2 Application Programming and SQL Guide for more language-specific information on how to define the host-variable-arrays in a program.

Destination:

---

**DSNH5035I DECLARE VARIABLE variable IS SPECIFIED TWICE IN A DECLARE VARIABLE STATEMENT**

Explanation: The host variable variable was specified in two or more DECLARE VARIABLE statements, or was specified two or more times in one DECLARE VARIABLE statement. A host variable can be specified once at most in a DECLARE VARIABLE statement.

Severity: 8 (error)

System Action: The statement cannot be precompiled.

User Response: Correct the definition of the host variable. Precompile the program again.

---

**DSNH5036I CCSID VALUE OUT OF RANGE**

Explanation: The CCSID for a DECLARE VARIABLE or CAST statement is outside the range of 1 to 65533, or the the value 65535. The value must be within the range of 1 to 65533, or the value must be 65535.

Severity: 8 (error)

System Action: The statement cannot be processed.

User Response: If this message is issued for a “DECLARE VARIABLE CCSID integer” or “CAST CCSID integer” statement, change the value to be within the range of 1 to 65533 or the value 65535. If this message is issued for a DECLARE VARIABLE statement with the “FOR SBCS DATA” or “FOR MIXED DATA” clause, then the CCSIDs specified on panel DSNTIPF at installation time need to be updated with valid values.

---

**DSNH5037I DECLARE VARIABLE STATEMENT FOUND WITH ONE-PASS PRECOMPIILATION**

Explanation: A DECLARE VARIABLE statement was found, but the source program is being precompiled with only one pass. If a DECLARE VARIABLE is used in an assembler source program, the ONEPASS precompiler option must not be used. If a DECLARE VARIABLE is used in a C, C++, or PL/I source program, the TWOPASS precompiler option must be used.

Severity: 8 (error)

System Action: The source program cannot be precompiled.

User Response: Specify the TWOPASS precompiler.
option or, for assembler, do not specify the ONEPASS precompiler option.

**Explanation:** *keyword* is a deprecated feature that was supported in releases prior to DB2 Version 8, and is no longer supported.

For indexes, only one type is currently supported — type 2.

**Severity:** 8 (error)

**System Action:** The statement cannot be executed.

**User Response:** Correct the syntax of the SQL statement to remove reference to the unsupported *keyword*. Refer to the [DB2 SQL Reference] for more information.

**Destination:** 560A9

---

**Explanation:** *data-type* was specified in the definition of *object-name*. *object-type* is an SQL procedure parameter or variable. *data-type* is not supported for SQL procedure parameters or variables.

You can use the same built-in data types for SQL procedure parameters or variables that you can use for the CREATE TABLE statement, except these:

- LONG VARCHAR
- LONG VARGRAPHIC
- CLOB
- DBCLOB
- BLOB
- ROWID
- distinct type

**Severity:** 8 (error)

**System Action:** The statement cannot be executed.

**User Response:** Change the syntax to specify one of the supported data types. Instead of a LONG VARCHAR or CLOB data type, use a VARCHAR data type with an explicit length. Instead of a LONG VARGRAPHIC or DBCLOB data type, use a VARGRAPHIC data type with an explicit length.

**Explanation:** An Language Environment error occurred while the DB2 precompiler was processing an SQL procedure. The reason codes and associated return codes are:

<table>
<thead>
<tr>
<th>Reason code</th>
<th>Meaning and associated return code</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>No PIPI token. Return-code is the return code from the CEEPIPI(init_sub) call.</td>
</tr>
<tr>
<td>2</td>
<td>CEE could not be loaded. Return-code is the return code from the CEEPIPI(add_entry) call.</td>
</tr>
<tr>
<td>3</td>
<td>PIPI would not terminate. Return-code is the return code from the CEEPIPI(term) call.</td>
</tr>
<tr>
<td>4</td>
<td>Call to module-name failed. Return-code is the return code from the CEEPIPI(call_sub) call.</td>
</tr>
<tr>
<td>5</td>
<td>Bad response from PIPI. Return-code is the return code from module-name.</td>
</tr>
</tbody>
</table>

See the explanation of return codes for the appropriate CEEPIPI call in z/OS Language Environment Programming Guide for explanations of the Language Environment return codes.

**Severity:** 8 (error)

**System Action:** The statement cannot be executed.

**User Response:** Correct the condition that is described by *reason-code*.

---

**Explanation:** Local special registers cannot be referenced in an assignment statement (SET or VALUES INTO) that assigns multiple values. For example, the following special registers are local: CURRENT SERVER and CURRENT PACKAGESET.

Additionally, the local special registers cannot be referenced in a SET host-variable statement that has parenthesis around the special register.

The following statements are not valid:

```
SET (:hv1) = (CURRENT SERVER);
SET (:hv1,:hv2) = (CURRENT SERVER,CURRENT PATH);
VALUES CURRENT SERVER, CURRENT DATE INTO :c1, :c2;
```
Severity:  8 (error)

System Action:  The statement cannot be executed.

User Response:  Split the statement into multiple statements so that the local special registers are not referenced in a statement that assigns multiple values. Also be sure that a SET statement for a local special register does not use parenthesis on either side of the equal sign.
Chapter 10. DSNI... Messages

**DSNI001I**  
**RESTART HAS BEEN DEFERRED**  
**REASON reason TYPE type NAME name**

**Explanation:** Restart could not be performed for one or more pages of the resource identified by type and name. Those pages are placed in the logical page list (LPL) and restart for those pages is deferred. The reason code explains why restart was not performed.

Refer to Table 3 on page 1351 for an explanation of resource type codes.

**System Action:** DB2 restart continues. Pages for which restart activity was not performed are put into the LPL.

**User Response:** Correct the problem indicated by the reason code. Then use the START DATABASE command or the RECOVER utility to remove the pages from the LPL.

**DSNI002I**  
**csect-name UNABLE TO START**  
**OBJECT TYPE object-type OBJECT NAME object-name REASON reason TYPE type NAME name**

**Explanation:** The resource identified could not be started because it was unavailable. The resource could be a database, a table space, an index space, or a partition within a table space or an index space. The 'object-type' identifies the type. The 'object-name' identifies the name. If the DB2 catalog is unavailable, 'object-type' contains binary zeros and 'object-name' contains blanks.

The resource that was unavailable is identified by 'type' and 'name'. The 'type' code identifies the type of the resource as well as the format and content of the 'name'. For an explanation of resource type codes, see [Resource types on page 1351]. The 'reason' contains the reason code explaining why the resource was unavailable.

**System Action:** The specified database, space, or partition is not started and remains in its current state. If there are other databases, spaces, or partitions to be started, they are processed normally.

**User Response:** Correct the resource unavailable problem and reissue the -START command.

**DSNI003I**  
**csect-name UNABLE TO STOP OBJECT**  
**TYPE object-type OBJECT NAME object-name REASON reason TYPE type NAME name**

**Explanation:** The identified object could not be stopped because a resource required to perform the stop was unavailable. The object could be a database, a table space, an index space, or a partition within a table space or an index space.

The 'object-type' identifies the type and 'object-name' identifies the name. If the DB2 catalog is unavailable, 'object-type' contains binary zeros and 'object-name' contains blanks.

The resource that was unavailable is identified by 'type' and 'name'. The 'type' code identifies the type of the resource as well as the format and content of the resource, 'name'. For an explanation of resource type codes, see [Resource types on page 1351]. The 'reason' contains the reason code explaining why the resource was unavailable.

**System Action:** The specified database, space, or partition is not stopped and remains in the current state. If there are other databases, spaces, or partitions to be stopped, they are processed normally.

**User Response:** Correct the resource unavailable problem and reissue the -STOP command.

**DSNI004I**  
**RESOURCE HAS BEEN STOPPED**  
**TYPE type NAME name**

**Explanation:** The resource identified by TYPE and NAME could not be opened/closed, initialized, or was found to be in an inconsistent state. The resource has been 'stopped' by DB2. If an open error occurred during DB2 startup, restart processing for the resource was deferred.

**System Action:** The database, table space or index space is stopped by DB2.

**User Response:** Previous messages provide information to allow you to determine the cause of the problem and the method of correcting it. Refer to them, and correct the problem. Then restart the database, table space, or index space using the -START command; and invoke the application again.

**DSNI005I**  
**csect-name LPL OR GRECP RECOVERY CANNOT BE DONE FOR function - ID = id OBJECT TYPE object-type OBJECT NAME object-name REASON reason TYPE type NAME name**

**Explanation:** The resource that is identified could not be recovered during a recovery function that is identified by function_id because of problems during LPL or
DSNI006I • DSNI007I

GRECP recovery. The resource could be a table space, an index space, or a partition within a table space or index space. object-type identifies the type of resource. object-name identifies the name of the resource.

The resource that could not be recovered is identified by type and name. The type code identifies the type of the resource, as well as the format and content of name. reason contains the reason code explaining why the resource could not be recovered. For an explanation of resource type codes, see [Resource types on page 1351]. reason contains the reason code explaining why the resource could not be recovered.

The potential values for function are START DATABASE COMMAND, AUTOMATIC GRECP RECOVERY, or AUTOMATIC LPL RECOVERY.

id is a decimal number that represents the recovery function that is indicated by function.

This message, in combination with message DSNI006I or DSNI022I, provides the LPL or GRECP recovery information for a recovery function that is identified by the recovery-id.

System Action: The specified space, or partition is started but remains in a LPL/GRECP state. If there are other spaces or partitions to be recovered, they are processed normally.

User Response: Correct the problem that is specified by the reason code, and reissue the -START command.

DSNI007I csect-name UNABLE TO START/RECOVER BECAUSE UNABLE TO DIRECT READ A LOG RECORD

LOGRBA logrba

Explanation: Unable to START (or RECOVER) because the necessary log records could not be accessed. Either an error occurred while attempting to allocate or open the log data set or an expected log record was not found on the log.

If the message is in response to a START command, issue the -DISPLAY command to determine which resource(s) was not started. If the message is in response to a RECOVER utility, the resource is the table space or index space that is the object of the RECOVER.

LOGRBA gives the log RBA of the log record that is unavailable.

System Action: The resource is not started (or recovered) and remains in the current state. If this is a START command, the resources are processed normally if there are other databases or spaces to be started and they do not involve reading the log.

User Response: Resubmit the utility, or reissue the START command, when the problem with the log has been resolved.

System Programmer Response: Run the print log map (DSNJU004) utility. This may be run with DB2 up or down. Find the data set that contains the requested RBA in the output of DSNJU004. If the required RBA is not in a listed data set, one of the following may have occurred:

- The data set was deleted from the bootstrap data set by a run of the change log inventory (DSNU003) utility. In this case, rerun the utility to insert the missing data set name. DB2 must be down to run this utility.
- The bootstrap data set has been damaged. In this case, the BSDDS must be restored from the dump that occurred with the most recent archive log data set.

Changes must be determined from the operator’s console listing.
If a listed log data set contains the required RBA, this message will be preceded by one or more error messages from the log manager (DSNJ). See these messages for appropriate action.

**Problem Determination:** Issue the -DISPLAY command to verify what got started.

---

**DSNI008I DATABASE VALIDATION PROCEDURE name COULD NOT BE LOADED**

**Explanation:** The database validation procedure identified by 'name' could not be loaded.

**User Response:** Correct the name, and rerun the application.

---

**DSNI009I csect-name DATABASE EDIT PROCEDURE name COULD NOT BE LOADED**

**Explanation:** The database edit procedure identified by 'name' could not be loaded.

**User Response:** Correct the name, and rerun the application.

---

**DSNI010I BROKEN PAGE ACCESSED TYPE type NAME name MODNAME csect-name CONN-ID id CORR-ID id LUW-ID id**

**Explanation:** The page identified by TYPE and NAME could not be accessed, because it is marked as logically broken. The TYPE and NAME identify the resource that is currently unavailable. The TYPE code identifies the type of the resource as well as the format and content of the resource NAME.

Type codes '00000301', '00000302', and '00000303' apply to this message. Refer to Appendix B, “Problem determination,” on page 1349 for a table showing all types and names.

'csect-name' has encountered the logically broken page. CONN-ID, CORR-ID, and LUW-ID identify the thread involved in the problem. If the LUW-ID is an ‘nn’, the thread originated at this site. Correlation IDs beginning with ‘0nn’, where ‘nn’ is a number from 01 to 28, identify system agents.

**User Response:** If the TYPE is '00000300', use NAME to determine if the page is in an index space or a table space. Use the REPAIR utility to fix the broken page. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**DSNI011I PAGE TEMPORARILY UNAVAILABLE TYPE type NAME name MODNAME modname ERQUAL erqual**

**Explanation:** The page identified by TYPE and NAME has been temporarily marked as logically broken to prevent access until it can be recovered. The TYPE and NAME identify the resource that is currently unavailable. The TYPE code identifies the type of the resource as well as the format and content of the resource NAME. Refer to Table 3 on page 1351 for an explanation of resource type codes.

The module named modname has called a page checking routine, which discovered an error in the page. The ERQUAL gives the trace id for the error in the page. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**System Action:** Automatic recovery for the page has been scheduled. The current agent will abend with reason code '00C90105', and a dump will be taken. The page will be unavailable to this and other agents until the online recovery has completed successfully. Message DSNI010I will be issued, and a 'resource unavailable' condition will be returned to any agents that attempt to access the page. If the online recovery fails, the page will be marked as broken until it is repaired or recovered (see message DSNI012I).

**User Response:** Save the dump. Watch for message DSNB215I (indicating successful recovery of the page), or DSNI012I (indicating failure of recovery of the page).

---

**DSNI012I PAGE LOGICALLY BROKEN TYPE type NAME name MODNAME modname ERQUAL erqual**

**Explanation:** The page identified by TYPE and NAME is logically incorrect. Additional attempts to access the page will be denied. The TYPE and NAME identify the resource that is currently unavailable. The TYPE code identifies the type of the resource as well as the format and content of the resource NAME. Refer to Table 3 on page 1351 for an explanation of resource type codes.

The module named 'modname' has called a page checking routine, which discovered an error in the page. The ERQUAL gives the trace id for the error in the page. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. An ERQUAL of X'0000' indicates that an abend occurred during online recovery or recover utility. The page has been marked as broken, and the recovery has failed.

**System Action:** The page is marked as logically broken, an 04E abend with reason code '00C90102' is issued, and a dump is taken. The page will be
unavailable to this and other agents until it is repaired.

**User Response:** Save the dump for analysis by IBM Support Center. Copy the table space or index space to another data set for later analysis by IBM Support Center. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** See the Explanation section of this message.

---

**DSNI013I**

csect-name POTENTIALLY INCONSISTENT DATA REASON reason ERQUAL erqual TYPE type NAME name CONN-ID id CORR-ID id LUW-ID id

**Explanation:** This message identifies a page with potentially inconsistent data. This message is issued for each page involved in the current data manager operation. The 'csect-name' in the message identifies the CSECT that issued the message.

The 'erqual' in the message identifies the specific abend in the CSECT that caused this message to be issued. This information and the reason code are used by IBM Support Center to identify the cause of the problem.

'name' and 'type' identify the page and its type. The TYPE code identifies the type, as well as the format and content, of the NAME. Refer to *Appendix B, "Problem determination," on page 1349* for a table showing all types and names.

CONN-ID, CORR-ID, and LUW-ID together identify the thread involved in the problem. If the LUW-ID is an ‘**’, the thread originated at this site. Correlation IDs beginning with ‘0nn’ where 'nn' is a number from 01 to 28, identify system agents.

For further information, see the Explanation section for the abend reason code specified in this message.

**System Action:** The job is abended shortly after this message appears.

**User Response:** Notify the system programmer.

**Operator Response:** Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

**System Programmer Response:** See the Problem Determination section for the specific abend reason code.

**Problem Determination:** See the System Programmer Response section of the abend reason code specified in this message.

---

**DSNI014I**

csect-name DATA IN USE DURING ABEND REASON 00C90101 ERQUAL erqual TYPE type NAME name CONN-ID id CORR-ID id LUW-ID id

**Explanation:** This message identifies a page that was in use at the time an abend condition occurred with reason code 00C90101. This message is issued for each page involved in the current operation.

ERQUAL identifies the specific abend in the CSECT that caused this message to be issued. This information and the reason code are used by IBM Support Center to identify the cause of the problem.

NAME and TYPE identify the page and its type. The TYPE code identifies the type, as well as the format and content, of the NAME. Refer to *Table 3 in Appendix B, "Problem determination," on page 1349* for an explanation of resource type codes.

CONN-ID, CORR-ID, and LUW-ID together identify the agent involved in the problem. If the LUW-ID is an ‘**’, the thread originated at this site. Correlation IDs beginning with ‘0nn’ where 'nn' is a number from 01 to 28, identify system agents.

**System Action:** The job abends with reason code 00C90101 after this message appears.

**User Response:** Notify the system programmer.

**Operator Response:** Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

**System Programmer Response:** See abend reason code 00C90101 for more information.

**Problem Determination:** In general, the data in these pages is fine. However, if problems are reported that repeatedly involve the same pages or if the same pages are reported by other abends, you might want to analyze the set of pages involved.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**DSNI015I**

**OBJECT name is already started for RW access. The object will remain started for RW access**

**Explanation:** The -START DATABASE command with the ACCESS(FORECE) keyword was entered, but the object specified was already started for read/write access.
DSNI016I  RESOURCE TYPE type NAME name MUST FIRST BE STOPPED BEFORE IT CAN BE STARTED IN A DIFFERENT ACCESS MODE

Explanation: When issuing the -START DATABASE command on the ROSHARE OWNER system, the object to be started must first be stopped before changing access modes. For example, if a table space in a database defined as ROSHARE OWNER is started for RW access, before it can be started for RO access it must be stopped via the -STOP DATABASE command. It can then be started for RO access via the -START DATABASE command.

Severity: 8 (error)

System Action: The -START DATABASE command is not allowed to proceed.

User Response: Issue a -STOP DATABASE command to stop the object before attempting to start it.

DSNI017I  RESOURCE TYPE type NAME name IS INCONSISTENT DUE TO ONE OR MORE PENDING STATES

Explanation: There are two possible reasons for this message:

1. The header page of a table space, index, or partition belonging to a database defined as ROSHARE OWNER could not be marked as consistent during the processing of the STOP DATABASE command because one or more of the following was true:
   - The table space, index, or partition is in recovery pending status.
   - The table space, index, or partition is in check pending status.
   - The table space, index, or partition has pages in the logical page list (LPL).
   - The table space, index, or partition has status a utility in progress (UTUT status on the output from a DISPLAY DATABASE command).
   - The table space, index, or partition has a utility in progress that allows read-only access (UTRO on the output from a DISPLAY DATABASE command).
   - An I/O error range exists.

2. A retained lock is held on the table space, index, or partition. The retained lock could be signifying a pending status.

If the STOP DATABASE command was issued without specifying the SPACENAM parameter, then one or more of the conditions stated above is true for one or more table spaces, indexes, or partitions in the specified database.

Severity: 4 (warning)

System Action: For case 1, if the STOP DATABASE command was specified with the SPACENAM parameter, the table space, index, or partition is stopped. DB2 does not allow access to an inconsistent table space, index, or partition by any ROSHARE READ system.

For case 2, no access to an inconsistent table space, index, or partition is allowed until the retained lock is released by the failed system at completion of its restart.

User Response: Issue a DISPLAY DATABASE command to display the status of the object in question. Resolve the pending states and then reissue the STOP DATABASE command to ensure that the consistency indicator is reset.

DSNI018I  UNABLE TO GET LOCK FOR RESOURCE TYPE type NAME name. WILL RETRY TO GET LOCK.

Explanation: The resource identified by 'type' and 'name' could not be locked because of lock contention. The lock request is made again for this resource.

The 'type' and 'name' identify the resource trying to get a lock. The 'type' code identifies the type of resource as well as the format and content of the resource 'name'.

Refer to Table 3 in Appendix B, "Problem determination," on page 1349 for an explanation of resource type codes.

Severity: 0 (informational)

System Action: The lock request is made again for the specified resource.

DSNI019I  THE STOP COMMAND FOR OBJECT name WAS OVERRIDDEN BY A START FORCE. THE STOP COMMAND IS IGNORED.

Explanation: The object identified by 'name' was not stopped because a START FORCE command on this object was subsequently issued and processed.

This message is informational only.

Severity: 0 (informational)

System Action: The object is not stopped.

DSNI020I  csect-name UNABLE TO DRAIN RESOURCE TYPE type NAME name. WILL RETRY DRAINING THE RESOURCE.

Explanation: The resource identified by 'type' and 'name' could not be drained. The 'type' code identifies the type of resource as well as the format and content of the resource 'name'. The drain request is made again for this resource.

Refer to Table 3 in Appendix B, "Problem determination," on page 1349
System Action: The drain request is made again for the specified resource.

**Explanation:** The group buffer pool recovery pending (GRECP) or logical page list (LPL) exception state of the table space or index space has been cleared. The table space or index space can be identified by type and name.

The potential values for function are START DATABASE COMMAND, AUTOMATIC GRECP RECOVERY, or AUTOMATIC LPL RECOVERY.

id is a decimal number that represents a recovery function.

Refer to [Resource types](#) for an explanation of resource type codes.

This message is always preceded by the DSNI006I message, which indicates the beginning of the LPL or GRECP recovery for the object.

**System Action:** The identified table space or index space is started normally.

**Explanation:** This message periodically shows the progress of the LPL or GRECP recovery of a START DATABASE command, AUTOMATIC GRECP RECOVERY, or AUTOMATIC LPL RECOVERY.

The potential values for function are START DATABASE COMMAND, AUTOMATIC GRECP RECOVERY, or AUTOMATIC LPL RECOVERY.

id is a decimal number that represents a recovery function.

xxx is the LOGPOINT of the log record currently being processed. yyy is the LOGPOINT of the last log record that will be applied in this recovery. The value of logpoint is RBA in a non-data sharing environment and LRSN in a data sharing environment.

This message, in combination with message DSNI006I, DSNI005I, or DSNI021I, provides the LPL or GRECP recovery information for the recovery function that is identified by function.

**System Action:** The LOGAPPLY phase continues normally.

**Explanation:** ‘Status’ is either RESTP (Restart Pending) or AREST (Advisory Restart Pending). This message indicates that the named UR has backout work pending against the named page set or partition. The backout work for this UR against this page set or partition will be complete once backward processing of the log reaches the identified RBA.

For non-partitioned page sets, the partition given in the message is the string n/a.

**Explanation:** This message indicates that backout processing is complete for the named table space, index space, or partition. If the object was in restrictive restart pending state, that state is lifted. If the object was in an advisory restart pending state, locks held on the object on behalf of postponed abort URs by the DB2 member issuing the message are released. The advisory restart pending state is lifted if the DB2 member issuing the message is the only member still contributing to the state.

For non-partitioned page sets, the partition given in the message is the string "n/a".

**Explanation:** The Fast Log Apply process could not obtain all the required storage. However, the storage acquired is enough for the Fast Log Apply process to continue.

**Severity:** 0 (Informational)

**System Action:** The Fast Log Apply process continues with the smaller amount of storage for the log buffers.

**Explanation:** There is no ssnmDBM1 storage available for the Fast Log Apply process to use. There are too many jobs (RECOVER or -START DB command) running in parallel.

**Severity:** 0 (Informational)

**System Action:** The recovery of the requested objects continues without the Fast Log Apply process.
### DSN027I csect-name THE FAST LOG APPLY PROCESS IS DISABLED BECAUSE IT IS UNABLE TO ACQUIRE THE MINIMUM REQUIRED STORAGE

**Explanation:** There is not enough ssnmDBM1 storage available or reserved for the Fast Log Apply process to use.

**Severity:** 0 (informational)

**System Action:** The recovery of the requested objects continues without the Fast Log Apply process.

### DSN028I csect-name THE NUMBER OF QUALIFIED LOG RECORDS READ DURING THE FAST LOG APPLY PROCESS IS log-records AND THE NUMBER OF FAST LOG APPLY BUFFERS PROCESSED ARE fla-buffers

**Explanation:** This informational message is issued during the Fast Log Apply process. log-records indicates the number of log records that have been applied during the Fast Log Apply process. fla-buffers indicates the number of buffers used by the Fast Log Apply process.

**Severity:** 0 (informational)

### DSN029I csect-name THE FAST LOG APPLY PROCESS IS ACTIVE AND THE AVAILABLE ssnmDBM1 STORAGE IS bytes BYTES

**Explanation:** This informational message is issued during the Fast Log Apply process for member ssnm. There is sufficient storage for the Fast Log Apply process to continue, and the remaining amount of available storage is displayed in hexadecimal as bytes.

**Severity:** 0 (informational)

### DSN030I csect-name BACKOUT PROCESSING IS CONTINUING BEYOND THE REQUESTED LIMIT DUE TO CATALOG OR DIRECTORY ACTIVITY OF UR urid.

**Explanation:** The number of log records requested to be processed during restart’s backward phase have been processed. Under other circumstances further backout processing would be postponed. However, because the indicated UR has catalog or directory updates that are not backed out yet (and because backout against catalog or directory page sets cannot be postponed), backout processing is continuing. It will continue until this UR’s backout is complete.

**System Action:** Backout processing continues.

### DSN031I csect-name - LOCK ESCALATION HAS OCCURRED FOR RESOURCE NAME = name, LOCK STATE = state, PLAN NAME : PACKAGE NAME = id1:id2, COLLECTION-ID = id11, STATEMENT NUMBER = id3, CORRELATION-ID = id4, CONNECTION-ID = id5, LUW-ID = id6, THREAD-INFO = id7:id8:id9:id10

**Explanation:** Lock escalation balances concurrence with performance by using page locks while a process accesses relatively few pages, then changing to table space or table locks when the process accesses a number of pages that exceeds a defined threshold (LOCKMAX) for the tablespace.

- **name** The name of the escalated resource. The format of name depends on the type of table space. For simple or partitioned table spaces, the format is database-name.tablespace-name. For a segmented table space, the format is creator-name.table-name (or DBID.OBID of the table).
- **state** The lock state (after escalation) of the escalated resource.
- **id1** The name of the executing plan associated with this thread.
- **id2** The name of the executing package (if any) associated with this thread.
- **id3** The statement number of the executing SQL statement associated with this plan.
- **id4** The correlation identifier of the thread associated with the escalated resource.
- **id5** The connection identifier of the thread associated with the escalated resource.
- **id6** The logical-unit-of-work identifier of the thread associated with the escalated resource.
- **id7** Thread Info - the primary authorization_id associated with the thread.
- **id8** Thread Info - Work station name of the end user’s work station. An asterisk (*) indicates that it is not relevant to the thread or was not provided by the client.
- **id9** Thread Info - User-Id of the end user. An asterisk (*) indicates that it is not relevant to the thread or was not provided by the client.
- **id10** Thread Info - Application name of the end user’s application. An asterisk (*) indicates that it is not relevant to the thread or was not provided by the client.
- **id11** The collection-id of the package (if any). resource.

**System Action:** Escalation has occurred for the specified object
DSNI032I  csect-name CANCEL THREAD
NOBACKOUT COMMAND FAILED FOR
THE THREAD = token REASON =
reason

Explanation: DB2 displays this message when it cannot grant a request to cancel a thread without backing out data changes. The reason code explains why the request was rejected.

token  Identifies a thread whose processing you requested to cancel. The token is a 1- to 15-digit decimal number.

reason  Indicates the reason why the command failed.

System Action: Processing terminates normally.

User Response: The reason code specifies the action to be taken.

DSNI033I  csect-name PAGE SET dbname,psname
PART part IS MARKED REFP AND
status ON BEHALF OF UR ur-id.
RECOVERY TO logout IS REQUIRED.

Explanation: No further backout processing will be attempted on the specified page set or partition because backout for unit of recovery ur-id has been cancelled. The specified page set or partition is marked Refresh pending (REFP).

Severity: 0 (informational)

User Response: If the object in Refresh pending status is a table space, you can resolve the REFP,LPL state of the specified page set or partition in more than one way. You can run the RECOVER utility to perform point-in-time recovery, or run the LOAD utility with the REPLACE option to resolve the REFP,LPL state.

If page set is an index space, run the REBUILD utility to perform point-in-time recovery and resolve the REFP,RBDP or REFP,LPL status. You can use the RBA;LRSN value indicated in this message for point-in-time recovery.

DSNI034I  csect-name TABLE SPACE
table-space-name IS IN AUX WARNING
STATE

Explanation: DB2 attempted to recover table space table-space-name, but no log records exist because the table space was created with the LOG NO option. The table space is placed in an auxiliary warning state. You can use SQL statements to update the LOB values that are in error or to delete the row that contains the LOB values. In addition, you can use SQL statements to access valid LOBs. However, you cannot use SQL statements to retrieve a LOB value that is not valid.

Severity: 0 (informational)

System Action: DB2 marks the LOB values that are in error as not valid. Processing continues.

Programmer Response: Use SQL statements to update or delete the LOB values in error. Use the CHECK LOB utility to verify that all errors were corrected and to reset the auxiliary warning state. The auxiliary warning state can also be reset using the REPAIR utility with SET NOAUXWARN.

DSNI035I  csect-name THE REAL-TIME
STATISTICS COLLECTION PROCESS
IS STOPPED

Explanation: The statistics database stopped successfully, and the real-time statistics process is halted.

Severity: 0 (informational)

System Action: DB2 will not externalize in-memory statistics.

DSNI036I  csect-name THE REAL-TIME
STATISTICS COLLECTION PROCESS
IS DISABLED

Explanation: An error prevents DB2 from externalizing the in-memory statistics. The error is generally a persistent error and must be remedied before the process can be enabled. Look for prior messages to identify the nature of the problem.

System Action: The statistics database is implicitly stopped and no further attempt will be made to externalize the in-memory statistics.

Operator Response: Notify the system programmer.

System Programmer Response: Inspect the console for prior messages and refer to those messages for problem determination.

DSNI037I  csect-name THE REAL-TIME
STATISTICS COLLECTION PROCESS
COULD NOT ACCESS AN OBJECT IN
THE REAL-TIME STATISTICS
DATABASE

Explanation: An error prevents DB2 from externalizing the in-memory statistics. An attempt failed to insert, update, or delete a row in the statistics database. The error is generally transient (lock time-out or resource unavailable). If the operation is retried, it is likely to succeed.

System Action: The statistics are kept in-memory until the next opportunity to externalize them.

DSNI038I  csect-name THE REAL-TIME
STATISTICS COLLECTION PROCESS
IS ENABLED

Explanation: The statistics database started successfully. The required object descriptors in the statistics database exist and have the correct attributes.
DB2 proceeds to externalize in-memory statistics for all modified objects.

**Severity:** 0 (informational)

**System Action:** The database is started R/w.

---

**DSNI041I**

`csect-name START ACCESS(FORCE) CANNOT BE ISSUED AGAINST TARGET obj-type obj-qual.obj-name part DUE TO STOPPED UTILITIES ON VERSION version-number. REQUEST IS REJECTED.`

**Explanation:** The object cannot be started due to outstanding utilities on a different version. The status of the object is unchanged.

`version-number` is the version on which the utility was running.

`obj-type` is table space or index space.

`obj-qual` is the database name.

`obj_name` is the table space or index space name.

`part` represents the partition number for a partitioned table space.

**System Action:** The request is rejected.

**User Response:** Use the DISPLAY UTILITY command to see what utilities are outstanding. Issue the -START DATABASE ACCESS(FORCE) command on the same version as the version on which the stopped utility was running. If there is more than one utility outstanding on the object and the utilities were submitted on a different release of DB2, start the correct version of DB2 and use the -TERM UTILITY command to terminate each utility.
Chapter 11. DSNJ... Messages

**DSNJ001**

```
csect-name CURRENT COPY n ACTIVE
LOG DATA SET IS DSNAME=..., STARTRBA=..., ENDRBA=...
```

**Explanation:** This message is generated for one of two reasons:

1. When the log manager is initialized, it sends this informational message to identify the current active log data sets (copy-1 and, if dual logging is used, copy-2).
2. When the current active log data set is full, DB2 will switch to the next available active log data set. This message identifies the next available active log data set which will be used for logging.

The value specified by the STARTRBA=value keyword is the RBA of the first byte of log data in the named data set. The value specified by the ENDRBA=value keyword is the RBA of the last possible byte in the data set. These values may later be needed for a conditional restart.

**System Programmer Response:** None required. However, if recovery is required, information from this message may be required as input to the change log inventory (DSNJU003) utility.

**DSNJ002**

```
FULL ACTIVE LOG DATA SET
DSNAME=..., STARTRBA=..., ENDRBA=...
```

**Explanation:** This message is sent at the time the log manager fills an active log data set and switches to a new empty data set. The message shows the name and log RBA range of the full data set.

**System Programmer Response:** None required. However, if recovery is required information from this message may be required as input to the change log inventory (DSNJU003) utility.

**DSNJ003**

```
csect-name FULL ARCHIVE LOG
VOLUME DSNAME=..., STARTRBA=..., ENDRBA=..., STARTxxxx=..., ENDxxxx=..., UNIT=..., COPYnVOL=..., VOLSPAN=..., CATLG=...
```

**Explanation:** Offloading for the specified archive log data set was successfully completed for the given volume. If the data set spans multiple tape volumes, this message is generated for each tape volume. If the data set spans multiple dadas volumes, only one message will be generated displaying the first VOLSER appended with a ‘+’ to indicate the data set spans multiple volumes. ‘xxxx’ is replaced by either TIME or LRSN.

**System Action:** An archive log data set has been created, and the archive log data set inventory in the bootstrap data set (BSDS) has been updated with the information in the message:

- **DSNAME**
  The name of the archive log data set.
- **STARTRBA**
  The starting RBA contained in the volume.
- **ENDRBA**
  The ending RBA contained in the volume.
- **STARTLRSN**
  The starting LRSN contained in the volume for data sharing systems.
- **ENDLRSN**
  The ending LRSN contained in the volume for data sharing systems.
- **STARTTIME**
  The starting store-clock value of the log records in the volume for non-data sharing systems.
- **ENDTIME**
  The ending store-clock value of the log records in the volume for non-data sharing systems.
- **UNIT**
  The device unit to which the data set was allocated.
- **COPYnVOL**
  The name of the volume. This message keyword is displayed as COPY1VOL if this is the copy-1 archive log data set, and as COPY2VOL if this is the copy-2 archive log data set.
- **VOLSPAN**
  An indicator to denote one of four conditions:
  - If ‘00’, the data set is entirely contained on the volume specified by ‘COPYnVOL’.
  - If ‘01’, this is the first entry of a multivolume data set.
  - If ‘11’, this is the middle entry of a multivolume data set.
  - If ‘10’, this is the last entry of a multivolume data set.
- **CATLG**
  An indicator to denote one of two conditions:
  - If ‘NO’, the archive log data set is uncataloged.
  - If ‘YES’, the archive log data set is cataloged.

The BSDS is automatically updated with the information contained in this message; however, if recovery is required, information from this message may be required as input to the change log inventory (DSNJU003) utility.

**DSNJ004**

```
ACTIVE LOG COPY n INACTIVE, LOG IN SINGLE MODE, ENDRBA=...
```

**Explanation:** This message is sent when the dual active logging option is selected and copy ‘n’ becomes inactive. A log copy becomes inactive when the next active log data set is not ready when required. ENDRBA

---

© Copyright IBM Corp. 1983, 2004
is the last byte of log data written on copy 'n'. This is usually caused by a delay in off-load.

System Action: The log is switched to single mode until the next data set for copy 'n' is ready for logging.

If DB2 is shut down or abends while in single mode with the ZPARM option still set for dual active data sets, the previous state of the active log data sets determines what happens when DB2 is started, as follows:

- If fewer than two data sets are available (not flagged as STOPPED) for each set of active logs, DB2 startup terminates and message DSNJ12E is issued.
- If an active log data set is in NOTREUSABLE state, DB2 can be started in single logging mode, but dual mode takes effect when the other active log data set becomes available after offloading.

Operator Response: Execute an MVS Display System Requests command (D R,L for example) to ensure that there are no outstanding requests that are related to the log off-load process. Take the necessary action to satisfy any requests, and permit off-load to continue.

System Programmer Response: If the switch to single mode was caused by the lack of a resource required for off-load, the necessary resource should be made available to allow off-load to complete and thus permit dual logging to proceed. If recovery is required, information from this message might be required as input to the change log inventory (DSNU003) utility.

---

**Explanation:** This message is sent when copy 'n' of the log becomes active after previously being flagged as inactive. STARTRBA is the RBA of the first byte of log data written on copy 'n' after it was activated.

System Programmer Response: None required. However, if recovery is required, information from this message may be required as input to the change log inventory (DSNU003) utility.

---

**Explanation:** This message is sent if the operator answers 'N' to the WTOR message DSNJ008E.

System Action: If the allocation is for copy 1 archive log data set, off-load terminates processing until the next time it is activated. If copy 1 has already been allocated and this request is for copy 2, off-load switches to single off-load mode for this data set only.

---

**Explanation:** If the operator answers 'N' to the WTOR message DSNJ009I, this message is issued. The variable 'volser' is the volume serial of an archive log volume required for the read request.

System Action: The read request for the archive log volume fails. If the request was issued with the COND=YES parameter, return code 12 and reason code 00D1032B are returned to the requester. Otherwise, DB2 abends with reason code 00D1032B.

---

**Explanation:** The installation has requested a WTOR before archive log data set allocation. DB2 needs a scratch volume for offloading an active log data set.

System Action: The off-load task waits for the operator's reply.

Operator Response: The operator has three options:

- Get a scratch volume ready, make sure there is an available unit for the volume, and reply 'Y'. DB2 then continues with the off-load.
- Determine from the number of active log data sets available whether the off-load can be delayed until the next time an active log data set becomes full. If the process can be delayed, then reply 'N'.

This response has two possible effects.
- If dual archive logging is in effect and this allocation is for a copy 1 archive data set, the 'N' response delays the off-load process until the next active log data set becomes full.
- However, if the copy 1 archive data set has already been allocated and this request is for copy 2, the 'N' response causes the off-load to switch to single archive mode (the switch is for this data set only).
- Defer giving a response. This causes off-load to wait before processing. However, because off-load is a separate service task, the wait does not affect DB2 performance.

If offloading to DASD, an error has occurred attempting to allocate an archive log data set. Reply 'Y' to receive the error messages.
Explanation: The installation requested WTOR before archive volume data set allocation. DB2 needs the specified archive volume for a read operation. The subsystem name is 'ssname'.

System Action: The archive log read service task waits for the operator's reply. This wait affects the agent for which the log read was issued and any other agents that might be waiting on the log read service task queue.

Operator Response: Locate the requested volume, ensure that a device is available, and reply 'Y'. DB2 continues with dynamic allocation and then begins reading the log.

If dual archiving is in effect, a response of 'N' causes archive read to reissue the message for the copy 'Z' copy 2 archive VOLSER with the same RBA range. A response of 'N' to this second WTOR, or to the initial WTOR for single archiving, causes the archive read service task to fail with unpredictable results.

**Explanation:**

- **DSNJ009E** ssname NEEDS VOL SER=nnnnnn. REPLY Y TO CONTINUE OR N TO CANCEL
- **Explanation:** The installation requested WTOR before archive volume data set allocation. DB2 needs the specified archive volume for a read operation. The subsystem name is 'ssname'.
- **System Action:** The archive log read service task waits for the operator's reply. This wait affects the agent for which the log read was issued and any other agents that might be waiting on the log read service task queue.
- **Operator Response:** Locate the requested volume, ensure that a device is available, and reply 'Y'. DB2 continues with dynamic allocation and then begins reading the log.

If dual archiving is in effect, a response of 'N' causes archive read to reissue the message for the copy 'Z' copy 2 archive VOLSER with the same RBA range. A response of 'N' to this second WTOR, or to the initial WTOR for single archiving, causes the archive read service task to fail with unpredictable results.

- **DSNJ010I** csect-name INVALID RESPONSE. WTOR WILL BE REPEATED.
  - **Explanation:** A WTOR was issued during archive volume data set allocation. The user did not respond correctly to the message. Either 'Y' or 'N' must be entered.
  - **System Action:** The original WTOR is repeated.
  - **Operator Response:** Reply as indicated in the repeated message.

- **DSNJ0111** CONDITIONAL RESTART RECORD rrr CREATED AT .... WAS FOUND. REPLY Y TO USE, N TO CANCEL
  - **Explanation:** When the log manager was initialized, a conditional restart control record was found in the bootstrap data set. Both the record identifier (a 4 byte hexadecimal number) and the creation time stamp (yy.ddd hh:mm) are displayed to help identify the conditional restart record which will be used. If you want a conditional restart using that record, reply 'Y' to the message. Otherwise, reply 'N' and notify the system programmer.
  - **System Action:** If 'Y' is the response, DB2 is started conditionally, using the record found. If 'N' is the response, DB2 startup is terminated.
  - **Operator Response:** If a DB2 conditional restart is to be done and if the date and time displayed are correct, then reply 'Y' to the outstanding message. If you are not sure, then contact the system programmer.
  - **System Programmer Response:** If a normal restart of DB2 has failed and you have created a conditional restart control record with the change log inventory (DSNJU003) utility, check whether the time and date in the message agree with when you created that record. If they do, reply 'Y' to the outstanding WTOR. If they do not, reply 'N' and investigate the discrepancy.

- **DSNJ012I** ERROR ccc READING RBA rrr IN DATA SET ddd CONNECTION-ID=xxxxxxxx, CORRELATION-ID=yyyyyyyyyyyy
  - **Explanation:** While scanning log records read into a buffer, the log manager detected a logical error with reason code 'ccc'. 'rrr' is the log RBA of the segment in the buffer at which the error was detected. 'ddd' is the name of the active or archive log data set from which the record was read. If 'ddd' is blank, the data was read from an active log output buffer.

The connection and correlation IDs identify the user or application that encountered the problem. Messages that have the same connection ID and correlation ID relate to the same user. Correlation IDs beginning with '0nn' where 'nn' is a number from 01 to 28, identify system agents.

Refer to Part 4 (Volume 1) of [DB2 Administration Guide](#) for information about recovery from log failures.

- **DSNJ013I** TERMINAL ERROR ccc IN BUFFER rrr BEFORE ACTIVE LOG WRITE
  - **Explanation:** A scan of the log output buffer just prior to writing the buffer detected an inconsistency in the log data. 'ccc' is the abend reason code associated with the SDUMP that is produced. 'rrr' is the log RBA at which the error was detected.
  - **System Action:** DB2 will terminate with a dump, and will not write the damaged buffer to either COPY 1 or COPY 2 active log data set.
  - **Operator Response:** Notify the system programmer. Start DB2 after it terminates.
  - **System Programmer Response:** Because the damaged buffer has not been written to a log data set, DB2 may be restarted. No corrective action is required.

- **Problem Determination:** In the DB2 formatted block section of the dump, locate the chain of LBCE blocks. Those are log buffer control elements, and each LBCE controls one 4KB log output buffer. LBCEBUFF, at offset X'20' in the LBCE, points to the buffer, which is always on a 4KB boundary. The log RBA of the first byte of the buffer is in a 6-byte field at offset X'FF2' in the buffer itself. The layout of the buffer is described by the DSNLCLID mapping macro. The header of each record within the buffer is described by the DSNDLRH mapping macro. Locate the buffer that contains the log RBA from the message and find the damage by referring to the
description of the reason code later in this book.

**DSNJ014I**  TERMINAL ERROR ccc IN BUFFER rrr AFTER ACTIVE LOG WRITE.

**Explanation:** A scan of the log output buffer, after writing to the COPY 1 active log data set and before writing to COPY 2, detected an inconsistency in the log data. 'ccc' is the abend reason code associated with the SDUMP that is produced. 'rrr' is the log RBA at which the error was detected.

**System Action:** DB2 will terminate with a dump, and will not write the damaged buffer to the COPY 2 data set.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The block containing the indicated log RBA may be damaged. The buffer was found to be in error at the completion of the write to the COPY 1 data set of the active log.

If dual active logs are being used, use print log map (DSNJU004) to list the active log data sets for both copies of the active log. Find the COPY 2 data set with the corresponding RBA, and copy that data set (using access method services REPRO) to the COPY 1 data set. Start DB2.

If only a single active log is used, contact the IBM support center for assistance. An attempt to start DB2 may succeed if the damage to the buffer occurred after completion of the write to DASD.

**Problem Determination:** In the DB2 formatted block section of the dump, locate the chain of LBCE blocks. Those are log buffer control elements, and each LBCE controls one 4KB log output buffer. LBCEBUFF, at offset X'20' in the LBCE points to the buffer, which is always on a 4KB boundary. The log RBA of the first byte of the buffer is in a 6-byte field at offset X'FF2' in the buffer itself. The layout of the buffer is described by the DSNDLCID mapping macro. The header of each record within the buffer is described by the DSNDLRH mapping macro. Locate the buffer that contains the log RBA from the message and find the damage by referring to the description of the reason code later in this book.

**DSNJ015I**  CSRONLY PROHIBITS LOG ALTERATIONS. RECORD rrr CREATED .... REPLY Y TO USE, N TO CANCEL.

**Explanation:** During DB2 startup, the log manager found an inactive conditional restart control record in the bootstrap data set. Because this control record indicates CSRONLY, no log data sets will be modified. If log truncation was specified, it will be simulated. Only the first phase of restart (current status rebuild) will be performed. The hexadecimal identifier (rrr) and creation timestamp (yy.ddd hh:mm) identify the record found.

**System Action:** A 'Y' reply will continue the conditional restart. A 'N' reply will terminate DB2 startup.

**Operator Response:** To continue this CSRONLY processing, reply 'Y' to this message. If you are not sure, contact the system programmer.

**System Programmer Response:** The conditional restart control record will not be deactivated at the end of the CSRONLY processing. To deactivate this record, either cancel this record or create a new record. Refer to Part 4 (Volume 1) of [DB2 Administration Guide] for more information.

**DSNJ016E**  csect-name WARNING - SYSTEM CHECKPOINT PROCESSOR MAY HAVE STALLED. LAST CHECKPOINT WAS TAKEN date-time.

**Explanation:** While switching active log data sets, DB2 found that there has not been a system checkpoint taken since the last time DB2 switched active log data sets. date-time is the date and time of the last system checkpoint. There should be at least one system checkpoint on each log data set.

**System Action:** DB2 continues processing. If statistics class 3 is active, IFCID 0335 is written. This message will be deleted when a system checkpoint is taken.

**System Programmer Response:** This may be an indication that the system checkpoint processor may no longer be functioning. This situation can result in a very long restart if logging continues without a system checkpoint. You should monitor system checkpoint activity very closely. You can use the -DISPLAY LOG command or run the Print Log Map utility (DSNJU004) to display the most recent checkpoint. If DB2 continues logging beyond the defined checkpoint frequency, you should quiesce activity and terminate DB2 to minimize the restart time.

Prior to terminating DB2, obtain a dump of the DB2 address spaces for problem determination.

**DSNJ017E**  csect-name WARNING - OFFLOAD TASK HAS BEEN ACTIVE SINCE date-time AND MAY HAVE STALLED.

**Explanation:** While switching active log data sets, DB2 found that the offload task has been active since the last time DB2 switched active log data sets. The offload task began archiving an active log data set at date-time.

**System Action:** DB2 continues processing. If statistics class 3 is active, IFCID 0335 is written. This message will be deleted when the offload task completes the archive process.

**System Programmer Response:** This may be an indication that there may be an outstanding tape mount request or that the offload task may no longer be functioning. This situation can result in a log-full situation if DB2 can not archive log data sets when they fill. You should reply to any tape mount requests and monitor offload activity very closely. You can issue the
-DISPLAY LOG command to display the status of the offload task, and the -ARCHIVE LOG CANCEL OFFLOAD command can be used to terminate and restart the offload process.

Prior to terminating the offload task, obtain a dump of the DB2 MSTR address space for problem determination.

---

**Explanation:** This message indicates that a unit of recovery (UR) reached the threshold number of log records written without a COMMIT or ROLLBACK. This threshold was defined during installation.

The value \( n \) is cumulative, and indicates the number of log records that were written since the beginning of the UR.

**System Action:** DB2 continues processing. If statistics class 3 is active, IFCID 0313 is written. This message will be repeated each additional time the threshold is reached.

**System Programmer Response:** Consult with the application programmer to determine if this is a problem UR. See Part 4 (Volume 1) of the [DB2 Administration Guide](https://www.ibm.com) for more information about problems caused by uncommitted UR's.

If an application program caused the UR to reach its threshold number of log records, you can use CANCEL THREAD to cancel the UR. If you cancel an uncommitted UR, DB2 will undo the changes. The amount of time required for this process depends on the amount of work done by the UR. The amount of time required for this process depends on the amount of work done by the UR.

**Programmer Response:** Ensure that the application commits frequently enough, or consult with your DB2 administrator about decreasing the frequency of the check.

---

**Explanation:** The named load module was not link edited with the required RMODE(24) attribute.

**System Action:** DB2 startup is terminated.
Operator Response:  Notify the system programmer of the failure.

System Programmer Response:  Verify that all installation and maintenance activities against this module were executed using SMP. Verify that the JCLIN for SMP includes the correct RMODE control statement, and that the Linkage Editor provided with the Data Facility Product (DFP) for the version of MVS being used was invoked by SMP for the link edits. Correct the procedure or JCL which caused the error and rerun the necessary SMP jobs.

Problem Determination:  The MVS service aid AMBLIST provides Linkage Editor module attributes in the summary section of the LISTLOAD function output.

---

DSNJ070I  
csect-name ARCHIVE LOG DSN PREFIX NOT IN PROPER FORMAT TO RECEIVE TIMESTAMP DATA. TIMESTAMPING OF dsname BYPASSED

Explanation:  By way of a ZPARM parameter, the user has specified that the date and time of creation of an archive log data set be included as part of the archive log data set name (DSN). To accomplish this, the DB2 subsystem requires that the length of the archive log data set name prefix not exceed 19 characters if using the standard DATE format (YYDDD), or 17 characters if using the extended DATE format (YYYYDDD). If the prefix requirement is not met, this message is issued just prior to the allocation of the archive log data set specified in the message.

System Action:  The archive log data set will be allocated using the archive log prefix. However, the archive log DSN will not contain the date and time as the user requested.

---

DSNJ072E  ARCHIVE LOG DATA SET dsname HAS BEEN ALLOCATED TO NON-TAPE DEVICE AND CATALOGED. ZPARM CATALOG OPTION OF 'NO' HAS BEEN OVERRIDDEN.

Explanation:  By way of an archive log DSNZPARM parameter, the user specified that all archive log data sets should be uncataloged (CATLG=NO). However, DB2 requires that all archive log data sets allocated to nontape devices must be cataloged. The archive log data set specified by 'dsname' has been allocated to a nontape device, and has thus been cataloged. The user’s DSNZPARM CATLG=NO setting has been overridden.

System Action:  The archive log data set has been allocated to a nontape device, and has been cataloged. The DSNZPARM CATLG=NO setting has been overridden. The BSDS reflects that the data set has been cataloged.

Operator Response:  Notify the system programmer.

System Programmer Response:  The DSNZPARM parameters for the log archive function must be changed. Specifically, the ARCHCTLG and ARCHDEVT fields are not consistent with one another. For details concerning the course of action required to eliminate this problem, refer to Part 2 of [DB2 Installation Guide] under the DSN7IPA panel and DSN6ARVP macro subtopics.

---

DSNJ073I  LOG ARCHIVE UNIT ALLOCATION FAILURE DETECTED, RETURN CODE=nnnn. ALLOCATION OR OFF-LOAD OF ARCHIVE LOG DATA SET MAY FAIL.

Explanation:  While building the SVC99 text entries to dynamically allocate a new archive log data set, a unit allocation failure was detected. This message is only generated when a trace for IFCID 320 is active. The reason code, indicated by 'nnnn' in the message, further clarifies the problem as follows:

4 (X'04')  
The device type (unit name) on which the archive log data set is to be allocated is specified by the user in the DB2 system parameters. No UCBs could be found for the device type (unit name).

8 (X'08')  
The device type (unit name) on which the archive log data set is to be allocated is specified by the user in the DB2 system parameters. This device type (unit name) could not be found in the MVS eligible device table (EDT).
32 (X'20')
DB2 was able to obtain a list of devices corresponding to the device type (unit name) specified in ZPARMs. However, it was determined by DB2 that this list contained a mixture of tape and nontape devices.

40 (X'28')
The device type (unit name) specified by the user in ZPARMs is valid. However, no devices are currently associated with the given device type (unit name).

44 (X'2C')
The device type (unit name) specified by the user in ZPARMs is valid. However, no DASD volumes are available with a volume use attribute of 'storage'.

48 (X'30')
The CVT indicates that UCB services are not available.

System Action:   This message is issued by DB2 after the SVC99 text entries are built, but prior to the allocation of the new archive log data set. As a result of the error, the dynamic allocation of the archive log data set will be attempted using standard default values. The standard default values are generally acceptable; however, the allocation may fail or the subsequent off-load may produce undesirable processing results. For example:

- A return code of 4 or 44 (X'2C') will foretell an allocation error (DSNJ103I) when the SVC99 is issued for the archive data set.
- Off-load processing to tape may fail. DB2 uses a volume count of 20 when allocating to tape, and uses the standard MVS volume count default of 5 volumes when writing to nontape devices. In the case of most of the above errors, it would be impossible for the DB2 subsystem to determine the device type on which the data set is to be allocated. Therefore, the standard MVS default is assumed for the volume count. If the data set is successfully allocated to a tape device, and the volume of data is such that more than five volumes will be used for the archive data set, the off-load processing will receive an MVS ABEND 837-08 with message IEC028I when attempting to write to the sixth tape volume.
- Off-load processing to a direct access device may fail. When allocating a new archive log data set on a direct access device, the DB2 subsystem will use a unit count to facilitate multivolume archive data sets. With most of the above errors, it may be impossible for the DB2 subsystem to correctly determine the type of device on which the data set is to be allocated. Therefore, the standard default (1) is assumed for the unit count. If the data set is successfully allocated to a direct access device, and during the off-load processing it becomes necessary to extend the data set to another device, the off-load processing will receive an MVS B37 (out of space) ABEND, and the archive log data set will be deallocated.

Operator Response:   Notify the system programmer.

System Programmer Response:   The required action is based on the return code indicated in the message.

4 (X'04') or 8 (X'08')
The most likely cause is an incorrect specification in the archive log ZPARMs (DSNTIPA panel). Correct the DEVICE TYPE field. If the DEVICE TYPE field from the archive log ZPARMs appears to be correct, check the EDT to ensure that the esoteric or generic unit name specified in the ZPARMs is actually in the EDT. Subsequent off-load processing will archive the log data which could not be previously archived due to the allocation failure (DSNJ103I).

32 (X'20') or 40 (X'28')
To correct this situation, change the archive log DEVICE TYPE ZPARM to use a device type (unit name) which contains homogenous devices, or modify the device list associated with the device type (unit name) via a system generation to supply a list of homogenous devices.

44 (X'2C')
To correct this situation, issue an MVS mount command to change the volume use attribute of a mounted 'private' volume to 'storage'. If this is a recurring problem, a system generation may be required to add permanently resident volumes with a volume use attribute of 'storage' to the esoteric or generic unit, or ZPARMs may have to be changed to use a different esoteric or generic unit name for the DEVICE TYPE (on the DSNTIPA installation panel).

48 (X'30')
UCB services became available in MVS/ESA Version 4.1 (HBB4410).

DSNJ096E  csect-name CRCR ENDLRSN RBA VALUE OF rr IS INVALID, NO TRUNCATION WILL OCCUR

Explanation:   Truncation cannot take place because the RBA value specified on the active CRCR record is not equal to the RBA of a log record. rr is the ENDLRSN specified in the active record. The ENDLRSN RBA value must match the start of a log record in a non-data sharing environment.

System Action:   DB2 startup is terminated.

Operator Response:   Notify the system programmer.

System Programmer Response:   Confirm that the ENDLRSN value specified in the Conditional Restart
**DSNJ098E • DSNJ101E**

Control record is correct. Run the Change Log Inventory (DSNJU003) utility with the CRESTART CANCEL parameters to cancel the conditional restart. If log truncation is desired, run the DSNJU003 utility with the correct ENDLRSN value. Restart DB2.

---

**DSNJ098E**

csect-name CRCR ENDLRSN OF rr IS xxx THAN ANY KNOWN yyyy, NO TRUNCATION WILL OCCUR

**Explanation:** Truncation cannot take place because the CRCR ENDLRSN is not in the range of LRSN or RBA values known to either the active or archive logs. 
rr is the end LRSN specified in the active record. xxx is replaced by either HIGHER or LOWER. In a data sharing environment, if xxx is HIGHER, the CRCR ENDLRSN is higher than the LRSN of the last record written to the log data sets. If xxx is LOWER, the CRCR ENDLRSN is lower than the starting LRSN of the oldest archive data set. yyyy is replaced by LRSN. In a non-data sharing environment, if xxx is HIGHER, the CRCR ENDLRSN is higher than the RBA of the last record written to the log data sets. If xxx is LOWER, the CRCR ENDLRSN value is an RBA value that is lower than the starting LRSN of the oldest archive data set. yyyy is replaced by RBA.

**System Action:** DB2 startup is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Confirm that the ENDLRSN value specified in the Conditional Restart control record is correct. If it is not correct, run the Change Log Inventory (DSNJU003) utility with the CRESTART CANCEL parameters to cancel the conditional restart. If log truncation is desired, run the DSNJU003 utility with the correct ENDLRSN. Restart DB2.

---

**DSNJ099I**

LOG RECORDING TO COMMENCE WITH STARTRBA=...

**Explanation:** This message is generated when the log manager is initialized during DB2 startup. The value specified by the STARTRBA=value keyword is the RBA of the next byte of log data to be recorded in the DB2 active log data set(s). This information may later be needed for a conditional restart.

This message is preceded by one DSNJ001I message (if single logging) or two DSNJ001I messages (if dual logging).

**System Programmer Response:** None required. However, if recovery is required, information from this message may be required as input to the change log inventory (DSNJU003) utility.

---

**DSNJ100I**

csect-name ERROR OPENING BSDSn
DSNAME=..., ERROR STATUS=eel

**Explanation:** Log manager initialization or the -RECOVER BSDS command could not open the specified bootstrap data set (BSDS). BSDSn matches the ddbname in the log startup JCL of the data set that cannot be opened. The value of 'n' is 1 or 2. Refer to Part 4 (Volume 1) of [DB2 Administration Guide](#) for information about recovery from BSDS or log failures.

**System Action:** When this error occurs at initialization time, DB2 startup must be terminated, because the log data sets cannot be determined and allocated without the BSDS. When this error occurs during -RECOVER BSDS processing, the command is terminated, and the system continues in single BSDS mode.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Recover the BSDS that cannot be opened. Normally, if dual BSDSs are being used, recovery consists of making a copy of the remaining good BSDS.

**Problem Determination:** The 'error status' contains the VSAM open return code in 'ee', and the VSAM open reason code in 'ii'. Refer to [z/OS DFSMS: Macro Instructions for Data Sets](#) for a list of the VSAM open return codes and reason codes, and the steps required to take corrective action.

---

**DSNJ101E**

csect-name CRCRERBA OF rr IS xxx THAN ANY KNOWN RBA, BUT COLD START WAS NOT SPECIFIED

**Explanation:** Truncation cannot take place because the CRCR end RBA is not in the range of RBA values known to either the active or archive logs. 'rr' is the end RBA specified in the active record. 'xxx' is replaced by either HIGHER or LOWER. If HIGHER is the case, the CRCRERBA is higher than the end RBA of the most recent active log data set. LOWER means the CRCRERBA is lower than the starting RBA of the oldest archive data set.

**System Action:** DB2 startup is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Most likely, the archive log data set that contained the requested RBA has been deleted from the bootstrap data set (BSDS) by the change log inventory (DSNJU003) utility. Locate the output from an old Print Map run, and identify the data set that contains the missing RBA. If the data set has not been reused, run the DSNJU003 utility to add this data set back into the inventory of log data sets. Restart DB2.
### DSNJ102I

**LOG RBA CONTENT OF LOG DATA**

**SET DSNAMES=..., STARTRBA=..., ENDRBA=..., DOES NOT AGREE WITH BSDS INFORMATION**

**Explanation:** The log RBA range shown in the BSDS for the specified data set does not agree with the content of the data set. This message indicates that the change log inventory (DSNJU003) utility was used incorrectly or that a down-level volume is being used.

**System Action:** DB2 startup processing is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Use the print log map (DSNJU004) and change log inventory (DSNJU003) utilities to make the BSDS consistent with the log data sets.

---

### DSNJ103I

**csect-name LOG ALLOCATION ERROR**

**DSNAME=dsname, ERROR**

**STATUS=eeeeeiii, SMS REASON CODE=ssssssss**

**Explanation:** The log manager encountered an error while attempting to allocate the active or archive log data set indicated by the DSNAMES=keyword. The STATUS=keyword indicates the error reason code returned by MVS dynamic allocation (SVC99).

This message might be preceded by message DSNJ073I.

**System Action:** Subsequent log manager actions are based upon the type of data set involved.

For active log data sets, if the error is encountered during log manager initialization, DB2 startup is terminated. If two copies of the active log data sets are defined, this message appears only once.

For archive log data sets, if two copies of the archive log data sets are defined, processing continues on the remaining archive log data set.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The error status portion of this message contains a 2-byte error code (S99ERROR) followed by the 2-byte information code (S99INFO) from the SVC99 request block. If the S99ERROR code indicates an SMS allocation error (97XX), then 'ssssssss' contains additional SMS reason code information obtained from S99ERSN. Refer to z/OS MVS Programming: Authorized Assembler Services Guide for a description of the SVC99 codes. Additional SMS reason codes can be found in z/OS DFSMSdip Diagnosis Reference.

For active log data sets, if the problem occurred during DB2 initialization, you can resolve the problem by either:

- Resolving the error associated with the active log data set as indicated by STATUS=keyword
- Using AMS, providing another copy of the active log data set
- Updating the BSDS with the change log inventory (DSNJU003) utility
- Restarting DB2.

For archive log data sets:

- If the problem occurred during allocation with the intent to write the data set, no immediate action is required. However, failure to resolve the SVC99 error (indicated by the STATUS value in the message) might eventually cause the available space in the active log to be exhausted (DSNJ111E), since all future off-loads might fail due to the same error.
- If the problem occurred during allocation with the intent to read the data set, determine the problem, and use the DSNJU003 utility DELETE function to delete the active log data set from the BSDS archive log inventory. Then use the NEWLOG function to add the data set back into the archive log inventory, pointing to the correct volume and device.

If additional information is required about recovery from log failures, refer to Part 4 (Volume 1) of DB2 Administration Guide.

This message can also be issued as the result of a possible user error. If the STATUS=keyword displays a value of '17080000', then the site might have one or more active log data sets defined in the BSDS, but not allocated on DASD. To correct the situation, print the contents of the current active log data set inventory using the print log map (DSNJU004) utility, and then do one of the following:

- For each active log data set listed in the BSDS, but not actually allocated on DASD, allocate the active log data set using access method services. The access method services command syntax for active log data sets can be found in the DSNTIJIN installation job stream.
- Use the DSNJU003 utility DELETE statement to delete the errant active log data set name, and the NEWLOG statement to add the correct name to the active log data set inventory. The name specified on the NEWLOG statement must be the same as the name of the actual DB2 active log data set allocated on DASD.

---

### DSNJ104I

**csect-name RECEIVED ERROR STATUS**

**nnn FROM macro-name FOR DSNAMES=dsname**

**Explanation:** DB2 encountered an error while issuing macro 'macro-name'. Error status is the return code from the specified macro.

- For an OPEN of a VSAM data set, the return code in the error field of the access method services control block is included in this message as the error status.
value. Refer to the appropriate VSAM publication for a definition of these values.

- If the OPEN was for a non-VSAM data set, the error status is zero.
- For MMSRV errors, error status contains the error information returned by media manager services. If an MMSRV CATUPDT failure occurs attempting to truncate an active log data set, the log data set will be unavailable to DB2 and the status of the log data set will be flagged as 'STOPPED' in the BDS.
- For VSAM OPEN and MMSRV errors, this message is preceded by an IEC1611 message that defines the error that occurred.
- For a PROTECT of an archive log data set, the return code is from DADSM PROTECT. Refer to the appropriate MVS publication for a description of the MMSRV return codes.
- For a CLOSE of an archive log data set, the return code is the TCB completion code for an abend received during CLOSE processing. This abend is normally preceded by an IEC2101 or IEC2121 message that defines the error.
- For EDTINFO and UCBLOOK errors, the first 2 bytes contain the return code and the second 2 bytes contain the reason code.

Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

**System Action:** If this condition is encountered during log manager initialization, DB2 startup is terminated. If the error occurs later and the data set is needed either for offload or for input operations, DB2 processing continues. If a second copy of the data is available, DB2 attempts to allocate and open the second data set.

If the data set is needed as an active log data set, the log manager attempts to retry the failing request. If the retry fails, the DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If the error occurred during initialization, the installation must either correct the problem so that the data set is available or provide another copy of the data set and change the BSDSs to point to the new data set.

If the error occurred during DB2 processing, the return code should be reviewed and the appropriate action taken to correct the problem so that the data set can be used at a later time or the data set entry can be removed from the BSDS via the change log inventory (DSNJU003) utility.

If the error was received from PROTECT, there may be a problem with the PASSWORD data set. You should refer to the appropriate DADSM publication to determine the cause of the problem. When the problem has been corrected, you should ensure that the archive log data sets receiving the error are added to the PASSWORD data set. If these archive log data sets are not added to the PASSWORD data set, archive read will fail when attempting to OPEN these data sets.

If the error was received from EDTINFO or UCBLOOK and the allocation for the archive log data set fails, verify that the archive UNIT names are correct in ZPARMs.

**DSNJ105I**

```
csect-name LOG WRITE ERROR
DSNAME=..., LOGBA=..., ERROR STATUS=ccccffss
```

**Explanation:** The log manager encountered a write error in the specified active log data set. If 'csect-name' is DSNJW107, the error occurred writing the log buffers to an active log data set. If 'csect-name' is DSNJW207, the error occurred while preformatting the next control area before writing log data into it.

Error status contains the error information returned by media manager in the form 'ccccffss', where 'cccc' is a 2-byte return code that describes the error, 'ff' is a 1-byte code that defines the functional routine that detected the error, and 'ss' is the 1-byte status code that defines a general category of error. Refer to the appropriate MVS publication for a description of the MMMCALL return codes.

If the dual active logging option is selected, the log manager switches to the next data set for this copy. If the next data set is not ready, the log manager temporarily enters single logging mode and allocates a replacement data set for the one that encountered the error. Dual logging is resumed as soon as possible.

If single active logging option is selected and the next data set is not ready, the log manager waits for that data set to be available. In this case, log writing is inhibited until the replacement is ready for output.

**System Action:** See the Explanation section of this message.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** See the Explanation section of this message.

**DSNJ106I**

```
LOG READ ERROR DSNAME=..., LOGBA=..., ERROR STATUS=ccccffss
```

**Explanation:** The log manager encountered an error while reading an active log data set. The 'error status' contains the error information returned by the media manager in the form 'ccccffss', where 'cccc' is a 2-byte return code that describes the error, 'ff' is a 1-byte code that defines the functional routine that detected the error, and 'ss' is the 1-byte status code that defines a general category of error.

**System Action:** If another log data set contains the data, the log manager attempts to read the data from the alternate source. If an alternate source is not available, the log manager returns a read error return code to the program requesting the log data.
Operator Response: Notify the system programmer.

System Programmer Response: If the site is using dual logging, the requested RBA was probably retrieved from the corresponding dual active log data set, and no immediate response is necessary. However, if this error occurs frequently, or if the site is using single logging, immediate attention may be required.

Since this condition might indicate an error detected by the media manager, refer to z/OS DFSMSdfp Diagnosis Reference for a description of media manager return codes. Take corrective action based on these codes.

It might be necessary to replace the bad data set with a new data set containing the log data, and to update the BSDSs to reflect the new data set using the change log inventory (DSNJU003) NEWLOG operation.

For additional information about recovery from log failures, refer to Part 4 (Volume 1) of DB2 Administration Guide.

This message can also be issued as the result of a possible user error. If the data set name associated with the DSNNAME=keyword is missing, and the STATUS=keyword displays a value of '00180408' or '00100408', then the site is using dual logging, but only one set of active log data sets are defined in the BSDS.

To resolve this condition, do one of the following:

- Define a second set of active log data sets using access method services (if they are not defined already), and update the BSDS log inventory using the DSNJU003 NEWLOG operation.
- Reset the log parameters ZPARAM to indicate single logging. To do this, set the TWOACTV parameter in the DSN6LOGP ZPARAMs to NO.

| DSNJ107I | READ ERROR ON BSDS DSNNAME=NAME ERROR STATUS=STATUS |

**Explanation:** The log manager encountered an error while reading the specified bootstrap data set. Error Status contains the VSAM return and feedback codes. It is a 2-byte field with the first byte containing the hexadecimal return code and the second containing the hexadecimal feedback code. Refer to the appropriate MVS publication for a description of VSAM return and reason codes.

Refer to Part 4 (Volume 1) of DB2 Administration Guide for information about recovery from BSDS or log failures.

**System Action:** If dual BSDSs are available, the log manager attempts to read from the other BSDS. If read from the second BSDS fails or if there is only one BSDS, an error code is returned to the log request that caused access to the BSDS.

If read error is detected during start-up, DB2 initialization process is terminated to prevent users from operating in a cripple mode. User should take action to correct the problem.

Operator Response: Notify the system programmer.

System Programmer Response: It may be necessary to replace or repair the BSDS, depending on what conditions resulted from the read error. To replace a BSDS, first delete the bad BSDS, and then define the new BSDS with the same name and attributes. If a new name is used for the new BSDS, change the log startup JCL to specify the new BSDS name.

| DSNJ108I | WRITE ERROR ON BSDS DSNNAME=NAME ERROR STATUS=STATUS |

**Explanation:** The log manager encountered an error while writing to the specified bootstrap data set. Error Status contains the VSAM return and feedback codes. It is a 2-byte field with the first containing the hexadecimal return code and the second containing the hexadecimal feedback code. Refer to the appropriate VSM publication for a description of VSAM return and reason codes.

**System Action:** If dual BSDSs are available, the log manager enters single BSDS mode using the remaining good BSDS. Otherwise, an error code is returned to the log request that caused access to the BSDS.

Operator Response: Notify the system programmer.

System Programmer Response: If dual BSDS mode is being used, execute an offline access method services job to rename the error BSDS and define a new BSDS with the same name. Then enter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

If dual BSDS mode is not being used, the DB2 subsystem must be shut down, and the BSDS must be recovered from a backup copy. To recover the BSDS, use the change log inventory (DSNJU003) utility.

| DSNJ109I | OUT OF SPACE IN BSDS DSNNAME=NAME |

**Explanation:** There is no more space in the specified bootstrap data set. The operation that encountered the out-of-space condition did not complete properly.

**System Action:** If dual BSDSs are available, the log manager enters single BSDS mode using the remaining good BSDS. Otherwise, an error code is returned to the log request that caused access to the BSDS.

Operator Response: Notify the system programmer.

System Programmer Response: If dual BSDS mode is being used, execute an offline access method services job to rename the full BSDS and define a new, larger BSDS with the same name. Enter the DB2 -RECOVER BSDS command to reestablish dual BSDS mode.

If dual BSDS mode is not being used, the DB2 subsystem must be shut down and the BSDS recovered offline. In this case, execute the same access method services job mentioned above to rename the full data set.
set and define a larger data set. Next, execute an access method services REPRO job to copy the full BSDS into the new BSDS.

DSNJ110E LAST COPYn ACTIVE LOG DATA SET IS nnn PERCENT FULL

Explanation: This message is issued when the last available active log data set is 5% full, and is reissued after each additional 5% of the data set space is filled.

System Action: Each time the message is issued, the off-load processing is retried. If the situation is not corrected, the active log data space fills to capacity, message DSNJ111E is issued, and the DB2 online processing halts.

Operator Response: To clear this condition, steps must be taken to complete other waiting off-load tasks. Once an active log data set is made available (reusable) by completing the off-load process for it, the DB2 logging activity can continue.

Execute an MVS Display System Requests command (D R,L for example) to determine the outstanding requests related to the log off-load process. Take the necessary action to satisfy any requests, and permit off-load to continue. If off-load fails to complete normally or cannot be initiated, notify the system programmer.

System Programmer Response: Either correct the problem that is causing the off-load process to fail, or add more active log data sets. Note that the latter action requires DB2 to be down and the change log inventory (DSNJU003) utility to be run.

Possible causes for the shortage of active log data space are:

- Excessive logging. For example, too many users have requested logs at the same time or too many utilities have specified LOG(YES).
- Delayed or slow off-loading. For example, failure to mount archive volumes, incorrect replies to off-load messages, or slow device speeds.
- Excessive use of the -ARCHIVE LOG command. Each invocation of the -ARCHIVE LOG command causes the DB2 subsystem to switch to a new active log data set and to initiate an off-load of the active log. Although the -ARCHIVE LOG command will not be processed when only one active log data set remains in a copy of the active log (see DSNJ319I), excessive use of the command could have consumed all space in the active log except the current active log data sets.
- Off-loads failed. See Operator Response.
- Insufficient active log space. See Operator Response.
- Offload task no longer functioning. Issue the -ARCHIVE LOG CANCEL OFFLOAD command to abnormally terminate and restart the offload process.

DSNJ111E OUT OF SPACE IN ACTIVE LOG DATA SETS

Explanation: Due to delays in off-load processing, all available space in all active log data sets has been exhausted. DB2 recovery logging cannot continue.

System Action: The DB2 log manager waits for an available data set.

Operator Response: Execute an MVS Display System Requests command (D R,L for example) to ensure that there are no outstanding requests that are related to the log off-load process. Take the necessary action to satisfy any requests, and permit off-load to continue.

System Programmer Response: If the delay was caused by the lack of a resource required for off-load, the necessary resource must be made available to allow off-load to complete and thus permit logging to proceed. For additional information on recovery from this condition, refer to the discussion on DB2 system resource failures and active log failures in Part 4 (Volume 1) of DB2 Administration Guide.

DSNJ112E csect-name INSUFFICIENT ACTIVE LOG DATA SETS DEFINED IN BSDS

Explanation: There are not enough active log data sets defined in the BSDS to start DB2. This condition usually exists for one of the following reasons:

- Fewer than two data sets are defined for one of the active log copy sets.
- DSN6LOGP specified TWOACTV=NO in DB2 initialization parameters, but data sets for two copies of active log are not defined in BSDS.
- Fewer than two data sets are available (not flagged as STOPPED) for one of the active log copy sets.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Use the change log inventory (DSNJU003) utility to make the number of active log data sets defined in the BSDS consistent with the parameters specified on DSN6LOGP. Log data sets that are flagged as STOPPED will not be reused by DB2. These data sets must be recovered (either redefined or recovered from the other copy of the log) and the log data sets must be deleted and re-added to the BSDS (using DSNJU003) with the appropriate RBA’s, to clear the STOPPED status. Restart DB2.

DSNJ113E csect-name log-type log-value NOT IN ANY ACTIVE OR ARCHIVE LOG DATA SET. CONNECTION-ID=aaaaaaa, CORRELATION-ID=aaaaaaa, MEMBER-ID=member-id

Explanation: A request was made to read the log starting at this log-value and log-type (RBA or LRSN).
However, the log value cannot be found in any active or archive log data set for the indicated member. The member-id contains the ID of the data sharing member whose logs were being requested at the time of the failure or zero if data sharing is not active. The connection and correlation IDs identify the user or application that encountered the problem. Correlation IDs beginning with 'onn' where 'nn' is a number from 01 to 28, identify system agents. Refer to Part 4 (Volume 1) of **DB2 Administration Guide** for information about recovery from log failures.

**System Action:** Depending upon what log record is being read and why, this may result in an abend with a reason code of '00D1032A'.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Probable user error. Most likely, the archive log data set that contained the requested log value has been deleted from the bootstrap data set (BSDS) by the change log inventory (DSNJU003) utility. Locate the output from an old print log map run of the BSDS for the DB2 member identified by member-id, and identify the data set that contains the missing log-value. If the data set has not been reused, run the DSNJU003 utility to add this data set back into the inventory of log data sets. Restart DB2.

---

**DSNJ114I**  
ERROR ON ARCHIVE DATA SET, OFFLOAD CONTINUING WITH ONLY ONE ARCHIVE DATA SET BEING GENERATED

**Explanation:** An error occurred while accessing one of the archive data sets being created by off-load. Because the dual archive option is specified, off-load is continuing with the other archive data set. For the RBA range being off-loaded, there is only one copy of archive instead of the usual two copies.

**System Action:** Off-load produces a single archive data set.

**System Programmer Response:** A second copy of this archive log data set can be made, and the BSDS(s) can be updated with the change log inventory (DSNJU003) utility.

---

**DSNJ115I**  
OFFLOAD FAILED, COULD NOT ALLOCATE AN ARCHIVE DATA SET

**Explanation:** Off-load could not allocate an archive log data set. The off-load was not performed. This message is usually preceded by message DSNJ103I.

**System Action:** Off-load will be tried at a later time.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Review the error status information of message DSNJ103I. Correct the condition that caused the data set allocation to fail so that, on retry, the off-load can take place.

---

**DSNJ116I**  
ERROR ATTEMPTING TO ADD ARCHIVE ENTRY TO BSDS

**Explanation:** Off-load could not add an archive entry to the BSDS. The off-load is considered incomplete. The active log data set is not marked as reusable for new log data. This message is preceded by message DSNJ107I, DSNJ108I, or DSNJ109I.

**System Action:** Off-load will be retried at a later time.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Refer to the specific preceding message for action.

---

**DSNJ117I**  
INITIALIZATION ERROR READING BSDS DSNAME=....., ERROR STATUS=...

**Explanation:** The log manager encountered an error during initialization reading from the specified bootstrap data set. Error status contains the VSAM return and feedback codes. It is a two byte field with the first containing the hexadecimal return code and the second byte containing the hexadecimal feedback code. Refer to the appropriate VSAM publication for a description of VSAM return and reason codes.

**System Action:** DB2 startup is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the cause of the read error using the VSAM error status information provided. Restart DB2.

---

**DSNJ118I**  
LOG INITIALIZATION RECEIVED RETURN CODE nnn FROM xxxxxxx MACRO

**Explanation:** Log manager initialization received a bad return code from the named macro.

**System Action:** DB2 initialization is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the problem from the documentation on the named macro and return code. Then take appropriate steps, and restart the DB2 subsystem.

---

**DSNJ119I**  
BOOTSTRAP ACCESS INITIALIZATION PROCESSING FAILED

**Explanation:** During log manager initialization, the bootstrap data set access function was unable to complete its initialization process. Refer to Part 4 (Volume 1) of **DB2 Administration Guide** for information about recovery from BSDS or log failures.

**System Action:** DB2 startup is terminated.

**Operator Response:** Notify the system programmer.
System Programmer Response: One or more error messages describing the specific error have preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

**DSNJ120I**  
**DUAL BSDS DATA SETS HAVE UNEQUAL TIMESTAMPS, BSDS1 SYSTEM=..., UTILITY=..., BSDS2 SYSTEM=..., UTILITY=...**

**Explanation:** When the log manager was initialized, the time stamps of the dual bootstrap data sets (BSDS) did not agree. The time stamps from the system and from the change log inventory (DSNJU003) utility are shown for each BSDS. The time stamps have the format yy.ddd hh:mm:ss.th.

**System Action:** DB2 attempts to re-synchronize the BSDS data sets to restore dual BSDS mode. If re-synchronization is successful, DB2 restart continues.

**Operator Response:** If restart fails, notify the system programmer.

**System Programmer Response:** If restart fails, run the print log map (DSNJU004) utility against each BSDS. From the output, determine which data set is obsolete, delete it, define a replacement for it, and copy the remaining BSDS to the replacement.

If output from the print log map (DSNJU004) utility for both data sets is similar, delete the data set with the oldest time stamp, and copy the data set with the most recent time stamp.

**DSNJ121I**  
**LOG MANAGER ENCONTRUED AN ERROR READING THE JFCB. DDNAME=nnnnnnnn**

**Explanation:** During log manager initialization (if dual BSDS data sets are specified), the job file control block (JFCB) in MVS is read to obtain the data set names associated with DDNAME BSDS1 and BSDS2. This error is caused by a missing DD statement.

**System Action:** DB2 is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Ensure a DD statement exists in the DB2 startup procedure for DDNAME BSDS1. If dual BSDS data sets are used, ensure that a DD statement also exists in the DB2 startup procedure for DDNAME BSDS2.

**DSNJ122I**  
**DUAL BSDS DATA SETS ARE OUT OF SYNCHRONIZATION**

**Explanation:** During log manager initialization, the dual BSDS data sets were found to differ in content.

**System Action:** DB2 startup is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Run the print log map (DSNJU004) utility against each BSDS to determine which data set was last used as copy 1. Delete the copy 2 data set, define a replacement for the deleted data set, and copy the remaining BSDS to the replacement.

**DSNJ123I**  
**CHANGE LOG INVENTORY FAILURE DETECTED**

**Explanation:** During log manager initialization, the BSDS data set was found to have been incompletely processed by the change log inventory (DSNJU003) utility.

**System Action:** DB2 startup is terminated.

**System Programmer Response:** Run the print log map (DSNJU004) utility to determine what operation against the BSDS did not complete. Run the change log inventory (DSNJU003) utility against the BSDS(s) to allow any unfinished processing to be completed.

**DSNJ124I**  
**OFFLOAD OF ACTIVE LOG SUSPENDED FROM RBA xxxxxx TO RBA xxxxxx DUE TO I/O ERROR**

**Explanation:** During off-load, an unrecoverable I/O error was encountered on an active log data set. The data set experiencing the error is marked unusable, and no further logging is done to that data set.

**System Action:** Active log data sets continue to be off-loaded as they become full.

**Operator Response:** Notify the system programmer to allow recovery actions to be initiated.

**System Programmer Response:** Recover the data manually from the data set, copy it to an archive data set, run the change log inventory (DSNJU003) utility to make the new archive data set available to the DB2, and remove the error-prone active log data set from DB2 by using the change log inventory utility.

**DSNJ125I**  
**ERROR DUMPING BSDS, OFFLOAD CONTINUING WITHOUT PRODUCING THE BSDS DUMP**

**Explanation:** An error occurred while dumping the BSDS data set during the off-load process. The data set is not produced, but the off-load process continues. The volume containing the off-loaded data set does not contain a BSDS for recovery use.

**System Action:** The system continues the off-load process without producing a dump of the bootstrap data set.
**DSNJ126I** BSDS ERROR FORCED SINGLE BSDS MODE  
**Explanation:** The log manager encountered an I/O error or a VSAM logical error on a bootstrap data set. This message is preceded by message DSNJ107I or DSNJ108I.  
**System Action:** The log manager enters single BSDS mode using the remaining BSDS.  
**Operator Response:** Notify the system programmer.  
**System Programmer Response:** Execute an offline access method services job to rename the error BSDS and define a new BSDS with the same name. Then enter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

**DSNJ127I** SYSTEM TIMESTAMP FOR BSDS=...
**Explanation:** When the log manager is initialized, the system time stamp for the bootstrap data sets (BSDS) is displayed. The time stamp is of the format yy:ddd hh:mm:ss:th. This time stamp should be close to the last time at which this subsystem was stopped. If not, then it may indicate a restart is being attempted with the wrong BSDS.  
**System Action:** DB2 startup continues.  
**Operator Response:** If the time displayed does not appear to be close to the time this subsystem was last stopped, contact the system programmer.  
**System Programmer Response:** If you cannot explain the apparent time discrepancy, cancel the subsystem. From the startup procedure for the subsystem services address space, determine the data set names of the bootstrap data sets and run the print log map (DSNJU004) utility. Check whether the active and archive log data sets all belong to this subsystem. If not, then change the startup procedure for the subsystem services address space to use the correct bootstrap data sets.

**DSNJ128I** LOG OFFLOAD TASK FAILED FOR ACTIVE LOG nnnnn
**Explanation:** The off-load task abended while attempting to offload the relative byte address (RBA) range in active log data set 'nnnnn'.  
**System Action:** The off-load task terminates and the archive data sets allocated to the off-load task are deallocated and deleted. The status of the active log data sets involved in the failed off-load processing remains set to 'not reusable'.  

The log off-load task will be reinitiated by one of several events. The most common are:  
- The master address space is started, but data in the active log has not been archived.  
- An I/O error occurs on the active log, which will force the system to truncate and off-load the active log data set, and switch to a new active log data set.  

**Operator Response:** This message is the result of an off-load failure, and will be preceded by one or more DB2 messages (for example, DSNJ073I) and/or MVS ABEND messages (for example, IEC030I, IEC031I, IEC032I). If DB2 is operating with restricted active log resources (see message DSNJ110E), quiesce the system to restrict logging activity until the ABEND or the DSNJ110E condition can be resolved. Notify the system programmer.  
**System Programmer Response:** This message is the result of an off-load failure and will be preceded by one or more DB2 messages (for example, DSNJ073I) and/or MVS ABEND messages (for example, IEC030I, IEC031I IEC032I). Investigate and correct the cause of the ABEND before the off-load is attempted again by DB2.  
**Problem Determination:** This message is the result of an off-load ABEND and will be preceded by one or more DB2 messages and/or MVS ABEND messages. See the documentation for the associated DB2 and/or MVS messages to formulate a course of corrective action. Use the print log map (DSNJU004) utility to print the BSDS (both copies if running in dual mode), and then use the DSNJU004 output to determine the current status of the active and archive log data sets.  

This message can be generated for a variety of reasons. However, the most likely are:  
- Archive log data set allocation errors. Refer to the text for message DSNJ103I for corrective action.  
- The size of the archive log data set is too small to contain the active log data set(s) during off-load processing. All secondary space allocations have been used. This condition is normally accompanied by MVS ABEND message IEC030I.  
- All available space on the DASD volume(s) to which the archive data set is being written has been exhausted. This condition is normally accompanied by MVS ABEND message IEC032I.  
- The primary space allocation for the archive log data set (as specified in ZPARMs) is too large to allocate to any available online DASD device. This condition is normally accompanied by MVS ABEND message IEC032I.

**DSNJ129I** END OF log-rba eol-rba X COULD NOT BE FOUND IN ANY ACTIVE LOG DATA SET HIGHEST RBA FOUND WAS hi-rba X  
**Explanation:** The log manager has been requested to find 'eol-rba', the log record which has been recorded in the bootstrap data set (BSDS) as the highest RBA written. This RBA cannot be found in any active log data.
set. The highest RBA which could be found in any active data set was 'hi-rba'.

**System Action:** DB2 startup processing is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Most likely, the active log data set containing the requested RBA has been deleted from the BSDS by the change log inventory (DSNU003) utility. If the data set has not been reused, run DSNU003 to add this data set back into the BSDS. Restart DB2.

If the data set is not available, a conditional restart must be performed to either truncate the log prior to the RBA value of the missing data set, or to cold start at a higher RBA value. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for more information.

---

**DSNJ1301**  CSECT-NAME OFFLOAD COMPLETE FOR LOG TRUNCATION FROM AN ARCHIVE LOG COMMAND, ENDRBA=xxxxxxxxxxxx

**Explanation:** This message indicates that the offload of the truncated active logs, resulting from an -ARCHIVE LOG command, has completed successfully. xxxxxxxxxxxx is the ENDRBA of the truncated active logs and the newly created archive log data sets.

---

**DSNJ1391**  LOG OFFLOAD TASK ENDED

**Explanation:** Processing of the active log off-load ended.

**System Action:** This message is written to the MVS console.

**Operator Response:** This message does not guarantee that the off-load completed without errors. Check the console log and task messages to review the execution of the off-load task to determine whether any abnormal events occurred during the off-load.

---

**DSNJ1401**  CSECT-NAME INVALID BSDS RELEASE

**LEVEL ACTIVE=xxxxxx ARCHIVE=yyyyyy DSN=zzzzzz

**Explanation:** At initialization time DB2 detected that the BSDS log records are not at the proper release level for this release of DB2. 'xxxxxx' contains the release level for the ACTIVE log records and 'yyyyyy' contains the release level for the ARCHIVE log records. 'zzzzzz' contains the data set name for the BSDS encountering the error.

**System Action:** DB2 startup will be terminated.

**Operator Response:** Notify the system programmer so operating procedures can be changed.

**System Programmer Response:** Run the appropriate conversion program (DSNJMG0 or DSNJFA0) to convert the BSDS data set to a compatible release level.

---

**DSNJ150E**  LOG CAPTURE EXIT ABEND, EXIT DEACTIVATED

**Explanation:** An abnormal program interrupt was detected while executing in the installation-supplied log capture exit code (i.e. entry point DSNJW117 in load module DSNJL004). As a result of the abend, the log capture exit will no longer be active; log data will no longer be available for Exit capture/processing.

This message can only occur when an installation-supplied log capture exit (entry DSNJW117) is active for this instance of DB2.

**System Action:** The log capture exit (entry point DSNJW117) is terminated. No further calls will be...
attempted for this DB2 instance. A full dump is provided for diagnostic purposes.

**User Response:** See “System Programmer Response” below.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the cause of the DSNJL04 load module (DSNJW117 entry point) and take corrective action.

**Note:** A correctly-functioning copy of load module DSNJL04/entry DSNJW117 must be available in order to start DB2. If the problem which caused the above abend cannot be corrected, ensure that the default DSNJW117 entry (load module DSNJL04 supplied with the DB2 release) is available during the next DB2 subsystem start.

---

**DSNJ151**

csect-name IN READING log-type
log-value, A NONZERO REASON CODE WAS RETURNED. CONNECTION-ID=xxxx, CORRELATION-ID=yyyyyy,
REASON-CODE=ccc,
MEMBER-ID=member-id

**Explanation:** DB2 could not successfully complete the read of this 'log-value' and 'log-type' (RBA or LRSN) due to reason code 'ccc'. The member-id contains the ID of the data sharing member whose logs were being requested at the time of the failure or zero if data sharing is not active. The user or application that encountered the error is identified by the connection and correlation ID. Messages that have the same connection ID and correlation ID relate to the same application. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

**System Action:** DB2 attempts to recover from the error.

**System Programmer Response:** If DB2 was able to recover from the error and successfully complete the application, no further action is required. If the application abnormally terminated or DB2 could not recover successfully, this message is followed by one or more messages. Refer to the information in these messages and the subsequent messages to determine the appropriate corrective action. For information about recovery from log failures, refer to Part 4 (Volume 1) of *DB2 Administration Guide*.

---

**DSNJ153**

csect-name CRITICAL LOG READ ERROR
CONNECTION-ID = connection-id
CORRELATION-ID = correlation-id
LUWID = logical-unit-of-work-id:token
REASON-CODE = reason-code

**Explanation:** While processing a DB2 must-complete function, DB2 encountered an error during an attempt to access the required log data sets.

**System Action:** The DSNJ1541 message requests to retry the log-read request, and immediately follows this error message. DB2 will wait for a reply to message DSNJ1541 before retrying the failed log-read request, or before abending.

**System Programmer Response:** Review the description of the reason-code associated with the log-read failure. Examine the system console log for additional messages regarding the log-read error. Correct the cause of the error, if possible, and reply 'Y' to the DSNJ1541 message in order to retry the log-read request. If it is not possible to correct the problem causing the log-read errors, quiesce the work on the
DB2 system before replying 'N' to the DSNJ154I message in preparation for DB2 termination.

---

**DSNJ154I**  csect-name **REPLY Y TO RETRY LOG READ REQUEST, N TO ABEND**

**Explanation:** While processing a DB2 must-complete function, DB2 encountered an error during an attempt to access the required log data sets.

**System Action:** The DSNJ153E message identifies the critical log-read error, and immediately precedes this message. DB2 will wait for the operator's reply to proceed with the log-read request.

**Operator Response:** Notify the system programmer. Once actions have been taken to correct the cause of the log-read errors, reply 'Y' to request a retry of the failing log-read request. A reply of 'N' will fail the log-read request and DB2 will abend.

**System Programmer Response:** Review the description of the reason-code associated with the log-read failure, and examine the system console log for additional messages regarding the log-read error. Correct the cause of the error, if possible, and reply 'Y' to the DSNJ154I message to retry the log-read request. If it is not possible to correct the problem causing the log-read errors, quiesce the work on the DB2 system before replying 'N' to the DSNJ154I message in preparation for DB2 termination.

---

**DSNJ155I**  MAXARCH SUBSYSTEM PARAMETER VALUE OF nnnn IS TOO LARGE

**Explanation:** The MAXARCH subsystem parameter that was specified is too large for the current BSDS format. MAXARCH, which is specified as RECORDING MAX on panel DSNTIPA, indicates the maximum number of archive log volumes per log copy to record in the BSDS. The maximum value depends on whether or not you have performed a BSDS conversion. The limit for archive volumes recorded in the BSDS is 1,000 per copy if no conversion has occurred, or 10,000 per copy if the BSDS has been converted.

**System Action:** The MAXARCH subsystem parameter is set to 1,000 archive log volumes, and restart continues.

**Operator Response:** Notify the system programmer.

---

**DSNJ156I**  INVALID BSDS CONVERSION, DSN=xxxxxx

**Explanation:** During initialization time, DB2 detected an invalid BSDS. An invalid BSDS can result from a failure during a prior attempt to run conversion program DSNJCNVB. xxxxxx is the data set name for the BSDS encountering the error.

**System Action:** DB2 startup will be terminated.

**System Programmer Response:** The procedure for running program DSNJCNVB includes making a copy of the BSDS prior to conversion. Restore the BSDS to the original pre-conversion copy, and retry the conversion. Once the conversion is successful, restart DB2.

---

**DSNJ200I**  csect-name xxxxxx UTILITY PROCESSING COMPLETED SUCCESSFULLY

**Explanation:** The control section 'csect-name' successfully completed the 'xxxxxxx' utility.

**System Action:** DB2 writes this message to the SYSPRINT data set, not to a console.

---

**DSNJ201I**  csect-name xxxxxx UTILITY PROCESSING WAS UNSUCCESSFUL

**Explanation:** The control section 'csect-name' was unable to successfully complete processing of 'xxxxxxx' utility.

**System Action:** The current utility is terminated. DB2 writes this message to the SYSPRINT data set, not to a console.

**User Response:** Review other messages produced by the utility to determine the appropriate action to be taken.

---

**DSNJ202I**  csect-name xxxxxx INSUFFICIENT VIRTUAL STORAGE AVAILABLE TO CONTINUE WITH UTILITY

**Explanation:** A GETMAIN macro instruction has failed, because virtual storage is unavailable for the job-step.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Rerun the utility after providing a larger virtual storage allocation for the job-step.

---

**DSNJ203I**  xxxxxx OPERATION IS INVALID

**Explanation:** The user entered a utility control statement operation of 'xxxxxxx' that is invalid.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Correct the control statement, and rerun the utility.

---

**DSNJ204I**  xxxxxx PARAMETER IS INVALID

**Explanation:** The user specified a utility control statement parameter of 'xxxxxxx' that is invalid.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.
User Response: Correct the control statement, and rerun the utility.

**DSNJ205I**  
```xxxxxxx PARAMETER HAS NO ARGUMENT```

Explanation: 'xxxxxxx' contains the name of a parameter that requires an argument.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Specify an argument for the identified parameter and then rerun the utility.

**DSNJ206I**  
```xxxxxxx PARAMETER REQUIRES NO ARGUMENT```

Explanation: 'xxxxxxx' contains the name of the parameter that has been incorrectly followed by an = symbol.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

**DSNJ207I**  
```csect-name PARAMETERS INCONSISTENT WITH SPECIFIED OPERATION```

Explanation: The user has specified utility control statement parameters that are inconsistent with the specified utility operation.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

**DSNJ208I**  
```csect name MEMBER member name WAS NOT FOUND IN THE BSDS SPECIFIED IN THE GROUP DD STATEMENT.```

Explanation: You are running the print log map (DSNJU004) utility. No member record exists for this member in the bootstrap data set (BSDS) specified in the GROUP DD statement.

System Action: The log map for this member is not printed. If the records for other members are requested and are found in the BSDS specified in the GROUP DD statement, they are printed.

User Response: Use the DISPLAY GROUP command to verify that the member name is a valid name and that the member has successfully joined the group. Also verify that the BSDS specified in the GROUP DD statement is correct. If the member name and the BSDS name are correct, then the most likely causes of this message are:

- The 'missing member' never joined the group because it was never started.
- The member whose BSDS you specified in the GROUP DD statement was down when the missing member joined the group and has not been restarted.

To gather the information from the missing member, you can rerun the utility, using the BSDS DDNAME option to point to the missing member's BSDS. To avoid this problem in the future, make sure the BSDS named in the GROUP statement is from a recently started member.

**DSNJ209I**  
```ENDRBA VALUE MUST BE GREATER THAN STARTRBA VALUE```

Explanation: The 'STARTRBA' and 'ENDRBA' parameters specify an RBA range. Hence, the ENDRBA value must be greater than the STARTRBA value.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

**DSNJ210I**  
```OLD ICF CATALOG NAME=oldname, NEW CATALOG NAME=newname```

Explanation: Change log inventory (DSNJU003) utility processing for the NEWCAT control statement has completed successfully.

- **oldname**: Either:
  - The name of the prior ICF catalog or
  - 'NULL' if no prior name existed.

- **newname**: The name of the ICF catalog defined by the VSAMCAT keyword.

**DSNJ211I**  
```UNEXPECTED END OF DATA ON SYSIN DATA SET```

Explanation: Additional control statements were expected but could not be found.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement(s), and rerun the utility.
**DSNJ212I**  
_csect-name_ ERROR RETURNED FROM BSDS READ, RPLERRCD=yy, DDNAME=xxxxxxxx

**Explanation:** A VSAM GET was issued that resulted in a nonzero return code. ‘yy’ contains the error code returned by VSAM. ‘xxxxxxxx’ contains the ddname of the BSDS encountering the error.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** The action taken is dictated by the return code. The BSDS may have to be recovered by use of a backup copy.

---

**DSNJ213I**  
_csect-name_ ERROR RETURNED FROM BSDS WRITE, RPLERRCD=yy, DDNAME=xxxxxxxx

**Explanation:** A VSAM PUT was issued that resulted in a nonzero return code. ‘yy’ contains the error code returned by VSAM. ‘xxxxxxxx’ contains the ddname of the BSDS encountering the error.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** The action to be taken is dictated by the return code. The BSDS may have to be recovered by use of a backup copy.

---

**DSNJ214I**  
SPECIFIED DSNAME ALREADY EXISTS IN BSDS, DDNAME=xxxxxxxx

**Explanation:** The user attempted a NEWLOG operation with a data set name that already exists in the BSDS. An entry is never made in a BSDS if the specified DSNAME currently exists in either the active or archive records of that BSDS. ‘xxxxxxxx’ contains the ddname of the subject BSDS.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Either correct the control statement and rerun the utility, or delete the existing DSNAME from the BSDS and rerun the utility.

---

**DSNJ215I**  
_csect-name_ SVC 99 INFORMATION REQUEST FOR DD NAME ‘ddname’ FAILED. RC= rc, RSN= rsncd, AND INFO CODE info code.

**Explanation:** The Print Log Map utility requested information from the MVS Dynamic Allocation facility about the DD name shown in the message, but the system was unable to provide the information. The return code, reason code, and information code were returned by the system’s SVC 99 facility. See MVS/ESA Programming: Authorized Assembler Services Guide for an explanation of these codes.

**System Action:** If the information request was for the SYSIN DD statement, the Print Log Map utility assumes the control statement was not provided and attempts to continue the request using the SYSUT1 DD statement to locate the BSDS to be mapped.

If the information request was for the DD name of a BSDS, attempts to get information about BSDS data sets is terminated. If information about any BSDS data sets was previously acquired, the maps of those BSDS data sets are printed. Otherwise, the utility terminates.

**System Programmer Response:** Use the MVS manual (or the equivalent manual for the level of MVS on your system) to help you in problem determination.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](http://www.ibm.com/support/knowledgecenter/SSDPPQ_12.5.0/com.ibm.db2.luw.admin.dbconcept.db2_diagnosis.doc/doc/c109969.html) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNJ216I**  
NO SPACE IN BSDS FOR ADDITIONAL ACTIVE LOG ENTRIES, DDNAME=xxxxxxxx

**Explanation:** The maximum number of active log data sets is fixed. No further entries can be inserted after the maximum has been reached. ‘xxxxxxxx’ contains the ddname of the subject BSDS.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Run the print log map utility to determine the current status of the BSDS. Subsequent actions can then be formulated, depending upon the status of the BSDS.

---

**DSNJ217I**  
SPECIFIED DSNAME DOES NOT EXIST IN BSDS, DDNAME=xxxxxxxx

**Explanation:** The DELETE operation specifies a DSNAME that cannot be found in the BSDS. ‘xxxxxxxx’ contains the ddname of the subject BSDS.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Correct the control statement, and rerun the utility.

---

**DSNJ218I**  
SPECIFIED VOLUME DOES NOT EXIST IN BSDS, DDNAME=xxxxxxxx

**Explanation:** The DELETE operation specifies a COPY1VOL or COPY2VOL argument that cannot be
found in the BSDS. 'xxxxxxx' contains the ddname of the subject BSDS.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Correct the control statement, and rerun the utility.

---

**DSNJ219I**  

csect-name OPEN ERROR,  
DDNAME=xxxxxxx

**Explanation:** An error occurred when the CSECT 'csect-name' tried to open a data set named 'xxxxxxx'.

This error can be caused by a number of different conditions. The most probable conditions are:

1. The ddname of the SYSPRINT, SYSIN, or SYSUT1 data set was not specified in the user's job control language (JCL).
2. The DB2 subsystem is currently executing.
3. The bootstrap data set (BSDS) was allocated by another job with a disposition (DISP) that conflicts with the DISP specified in the user's JCL.
4. The data set associated with 'xxxxxxx' is already open, possibly due to an earlier system abend.
5. The user is not authorized to access the data set associated with 'xxxxxxx'.
6. Insufficient virtual storage is available to perform the OPEN command.
7. The catalog indicates that the data set associated with 'xxxxxxx' has an invalid physical record size.

**System Action:** The current utility is terminated.

DB2 writes this message to the SYSPRINT data set, not to a console.

**User Response:** The user's action depends on the condition that caused the OPEN error. The following is a list of appropriate actions corresponding to the conditions listed in the explanation:

1. Provide the missing DD statements, and then rerun the utility. Refer to [DB2 Utility Guide and Reference](#) for details about the required DD statements.
2. Wait until the DB2 subsystem is inactive before running the utility again because the log utility cannot execute while the DB2 subsystem is active.
3. Correct the disposition conflict and then rerun the utility.
4. Submit an access method services (IDCAMS) VERIFY job against the data set associated with 'xxxxxxx'. Rerun the log utility job.
5. In the case of an authorization failure, a separate message is usually generated from the authorization facility (RACF, for example). Investigate the authorization messages and obtain the proper authorization before running the utility again.

---

6. Insufficient virtual storage is usually accompanied by a separate error from the MVS operating system. Increase the REGION size on the JCL job step and rerun the utility.
7. Contact the system programmer.

---

**DSNJ220I**  

BSDS IN CREATE MODE. NO DATA TO MAP, DDNAME=nnnnnnnn

**Explanation:** A utility found the BSDS to be in create mode, meaning it contains no data. nnnnnnnn contains the ddname of the BSDS data set.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Ensure that the BSDS data set name specified as input to the utility is correct.

---

**DSNJ221I**  

PREVIOUS ERROR CAUSED xxxxxxxx OPERATION TO BE BYPASSED

**Explanation:** DB2 encountered errors while processing a utility. These errors subsequently caused 'xxxxxxx' to be bypassed.

This message is a warning only and is displayed after messages that specify the error or errors that caused the utility operation to be bypassed. Note that the error or errors may not be associated with the current 'xxxxxxx' operation; rather, under log utility processing, a significant error in any operation causes the control statements for this and any subsequent operations to be checked for syntax only. BSDS updates do not occur for any operation specified in this message.

**System Action:** The log utility continues to process. However, for this and all subsequent operations, the bootstrap data set (BSDS) is not updated and the utility only checks the syntax of the control statements.

DB2 writes this message to the SYSPRINT data set, not to a console.

**User Response:** Consult the previous messages and correct any errors that caused this message to be generated. Resubmit the log utility job for all operations that have been bypassed.

---

**DSNJ222I**  

INVALID SPECIFICATION OF xxxx PARAMETER ARGUMENT

**Explanation:** You specified the parameter 'xxxx'. This parameter is not valid for the argument.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Correct the parameter argument on the control statement, and rerun the utility.
**DSNJ223I**  
xxxx PARAMETER ARGUMENT EXCEEDS MAXIMUM ALLOWABLE LENGTH  

**Explanation:** The argument value of the parameter named ‘xxxx’ exceeds the maximum length allowed.  

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.  

**User Response:** Correct the parameter argument on the control statement, and rerun the utility.  

---  

**DSNJ224I**  
xxxx PARAMETER APPEARS TOO OFTEN  

**Explanation:** The parameter named ‘xxxx’ was specified more than once on the same control statement.  

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.  

**User Response:** Remove the redundant parameter, and rerun the utility.  

---  

**DSNJ225I**  
xxxx OPERATION COMPLETED SUCCESSFULLY  

**Explanation:** The change log inventory (DSNJV003) utility operation named ‘xxxx’ completed successfully.  

**System Action:** This message is written to the SYSPRINT data set, not to a console.  

---  

**DSNJ226I**  
SPECIFIED VOLUME ALREADY EXISTS IN BSDS, DDNAME=xxxxxxx  

**Explanation:** The specified volume currently exists in the archive log records of the BSDS. ‘xxxxxxx’ specifies the ddname of the subject BSDS.  

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.  

**User Response:** Either correct the parameter argument on the control statement, or delete the specified volume and rerun the utility.  

---  

**DSNJ227I**  
NO SPACE AVAILABLE IN BSDS FOR ADDITIONAL ARCHIVE VOLUME ENTRIES, DDNAME=xxxxxxx  

**Explanation:** The maximum number of archive volumes has been exceeded, and no more space is available for volume entries in the copy specified.  

**System Action:** The current utility is terminated.  

**User Response:** Delete some of the archive entries in the specified copy number, and rerun the utility.  

---  

**DSNJ228I**  
csect-name LOG DEALLOCATION ERROR DSNAME=dsname, ERROR STATUS=eeeeeiii, SMS REASON CODE=ssssssss  

**Explanation:** The log manager encountered an error while trying to dynamically deallocate the data set. Error status is the error reason code returned by MVS dynamic allocation.  

**System Action:** Log manager processing continues.  

**Operator Response:** Notify the system programmer.  

**System Programmer Response:** The error status portion of this message contains the 2-byte error code (S99ERROR) followed by the 2-byte information code (S99INFO) from the SVC request block. If the S99ERROR code indicates an SMS deallocation error (97XX), then ‘sssssssss’ contains additional SMS reason code information obtained from S99ERSN. Refer to the MVS/ESA SPL: Application Development Guide for a description of these codes.  

---  

**DSNJ229I**  
csect-name OPEN FAILED FOR SYSIN  

**Explanation:** An error occurred when the DB2 Print Log Map utility tried to open the SYSIN data set. Possible causes are:  

1. The DD name of the SYSIN data set was not specified in the user’s job control language (JCL).  
2. Insufficient virtual storage is available to perform the OPEN command.  
3. The characteristics of the SYSIN data set are different from those expected by the print log map (DSNJV004) utility.  

**System Action:** DSNJV004 attempts to continue processing without an input control statement. DB2 writes this message to the SYSPRINT data set, not to the system console.  

**User Response:** Take one of the following actions based on the cause of the error.  

1. Provide the missing DD statement and rerun the utility. Refer to [DB2 Utility Guide and Reference](https://www.ibm.com/support/knowledgecenter/en/SSLTBW_2.2.1.0/dm2com/omv23550.html) for details about the required DD statements.  
2. Insufficient virtual storage is usually accompanied by a separate error message from the MVS operating system. Increase the REGION size on the JCL job step and rerun the utility.  
3. Check that the SYSIN data set is a fixed record format (blocked or unblocked) with an LRECL of 80. You might need to contact the system programmer for help if this is a JES data set.
DSNJ230I  LOG OFFLOAD SUBCOMPONENT
INITIALIZATION PROCESSING FAILED

Explanation: During log manager initialization, the off-load function was unable to complete its initialization process.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate actions to take.

---

DSNJ231I  LOG COMMAND INITIALIZATION
PROCESSING FAILED

Explanation: During log manager initialization, the log command function was unable to complete its initialization process.

System Action: DB2 startup is terminated.

Operator Response: The rest of subsystem termination will direct the actions you should take.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take. This message will be of interest to the IBM support center when the problem is described.

---

DSNJ232I  OUTPUT DATA SET CONTROL
INITIALIZATION PROCESSING FAILED

Explanation: During log manager initialization, the output data set control function was unable to complete its initialization process.

System Action: DB2 startup is terminated.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message for error analysis and the appropriate action to take. This message will be of interest to the IBM support center when the problem is described.

---

DSNJ233I  ARCHIVE LOG READ INITIALIZATION
PROCESSING FAILED

Explanation: During log manager initialization, the archive log read function was unable to complete its initialization process.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

---

DSNJ234I  ARCHIVE LOG COMMAND QUIESCE
INITIALIZATION PROCESSING FAILED

Explanation: During log manager initialization, the quiesce function which supports the -ARCHIVE LOG MODE(QUIESCE) command processing was unable to complete its initialization process.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

---

DSNJ235I  OUTPUT BUFFER WRITER
INITIALIZATION PROCESSING FAILED

Explanation: During log manager initialization, the output buffer writer function was unable to complete its initialization process.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

---

DSNJ236I  BOOTSTRAP ACCESS TERMINATION
PROCESSING FAILED

Explanation: During log manager termination, the bootstrap data set access function was unable to complete its termination process.

System Action: Log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

---

DSNJ237I  csect-name INVALID CONTROL
STATEMENT. THE FIRST WORD MUST
BE 'MEMBER'.

Explanation: The print log map (DSNJU004) utility read an invalid control statement from the SYSIN data set.

System Action: DSNJU004 ignores the control statement and attempts to continue processing by looking for a SYSUT1 DD statement to describe the BDSNS that is to be printed.

User Response: Refer to DB2 Utility Guide and
**Reference** for information on creating a print log map (DSNJ004) utility control statement. Correct or remove the control statement and rerun the job.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

---

**DSNJ238I**  **LOG OFFLOAD TERMINATION PROCESSING FAILED**

**Explanation:** During log manager termination, the off-load function was unable to complete its termination process.

**System Action:** Log manager shutdown continues to the next step.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

---

**DSNJ239I**  **LOG COMMAND TERMINATION PROCESSING FAILED**

**Explanation:** During log manager termination, the log command function was unable to complete its termination process.

**System Action:** Log manager shutdown continues to the next step.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

---

**DSNJ240I**  **OUTPUT DATA SET CONTROL TERMINATION PROCESSING FAILED**

**Explanation:** During log manager termination, the output data set control function was unable to complete its termination process.

**System Action:** The log manager shutdown continues to the next step.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

---

**DSNJ241I**  **ARCHIVE LOG READ TERMINATION PROCESSING FAILED**

**Explanation:** During log manager termination, the archive log read function was unable to complete its termination process.

**System Action:** Log manager shutdown continues to the next step.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

---

**DSNJ242I**  **ARCHIVE LOG COMMAND QUIESCE TERMINATION PROCESSING FAILED**

**Explanation:** During log manager termination, the quiesce function which supports the -ARCHIVE LOG MODE(QUIESCE) command processing was unable to complete its termination process.

**System Action:** Log manager shutdown continues to the next step.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

---

**DSNJ243I**  **OUTPUT BUFFER WRITER TERMINATION PROCESSING FAILED**

**Explanation:** During log manager termination, the output buffer writer function was unable to complete its termination process.

**System Action:** Log manager shutdown continues to the next step.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

---

**DSNJ244I**  **LOG TERMINATION RECEIVED RETURN CODE nnn FROM xxxxxxx MACRO**

**Explanation:** Log manager termination was passed a bad return code from the named macro.

**System Action:** Log manager termination processing continues.

**Operator Response:** Record the return code and macro-name, and notify the system programmer.

**System Programmer Response:** This message is
associated with a failure in the named macro. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**DSNJ245I**  
**CONDITIONAL RESTART RECORD INDICATES TRUNCATION AT xxx rrr. REPLY Y TO CONTINUE, N TO CANCEL**

**Explanation:** The conditional restart control record in use indicates that the DB2 log should be truncated at the specified RBA or LRSN.xxx is replaced by either RBA or LRSN, and rrr is the value specified in the current record.

**System Action:** If Y, DB2 startup continues. If N, DB2 startup is terminated.

**Operator Response:** Reply N if the truncation is going to occur at an undesirable point. Notify system programmer. Reply Y to continue the restart.

**System Programmer Response:** Rerun the change log inventory (DSNJU003) utility to modify the conditional restart record.

**DSNJ246I**  
**CONDITIONAL RESTART RECORD INDICATES COLD START AT RBA rrr. REPLY Y TO CONTINUE, N TO CANCEL**

**Explanation:** The conditional restart control record in use indicates that DB2 is to be cold started and that logging is to begin at the specified RBA.

**System Action:** If ‘Y’, DB2 startup continues. If ‘N’, DB2 startup is terminated.

**Operator Response:** Reply ‘N’ if the truncation is going to occur at an undesirable point. Notify the system programmer. Reply ‘Y’ to continue the cold start.

**System Programmer Response:** Rerun the change log inventory (DSNJU003) utility to modify the conditional restart record.

**DSNJ247E**  
**csect-name I/O ERROR DURING PROCESSING OF rrr RC = rc, REASON = reason**

**Explanation:** The I/O error occurred at record ‘rrr’. ‘rc’ indicates the return code received from the I/O operation. ‘reason’ indicates the reason code received from the I/O operation.

If a return code ‘4’ was received, this indicates that the log manager detected a problem. If a return code ‘8’ was received, this indicates a VSAM error.

**System Action:** DB2 startup terminates.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** For a return code of ‘4’, if you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. For a return code of ‘8’, execute an offline access method services job to determine the cause of the VSAM error.

**DSNJ248I**  
**ARCHIVE LOG READ DEALLOCATION INITIALIZATION PROCESSING FAILED**

**Explanation:** During log initialization, the archive log read deallocation process was unable to complete its initialization.

**System Action:** DB2 startup is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** One or more error messages describing the specific error precede this message. Refer to these messages for error analysis and the appropriate action to take.

**DSNJ249I**  
**ARCHIVE LOG READ SCHEDULER INITIALIZATION PROCESSING FAILED**

**Explanation:** During log initialization, the archive log read scheduling process was unable to complete its initialization.

**System Action:** DB2 startup is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** One or more error messages describing the specific error precede this message. Refer to these messages for error analysis and the appropriate action to take.

**DSNJ250E**  
**csect-name DATA SHARING REQUIRES ALL ACTIVE LOG DATA SETS TO BE DEFINED WITH SHAREOPTIONS(2 3) OR HIGHER.**

**Explanation:** DB2 detected an active log data set defined with share options that do not permit recovery operations in a data sharing environment. This message is followed by message DSNJ251E, which identifies the specific active log data set.

All active log data sets for a DB2 data sharing member must be defined with a minimum of SHAREOPTIONS(2 3) for successful DB2 initialization. See the description of message DSNJ251E for more details.

**System Action:** The DB2 subsystem detecting this condition is terminated.

**DSNJ251E**  
**csect-name DATA SET dname FAILS TO MEET THE MINIMUM REQUIRED SHAREOPTIONS FOR DATA SHARING.**

**Explanation:** The share options defined for the data set named in the message are too low to permit the data set to participate in a DB2 data sharing group. All active log data sets must be defined with
SHAREOPTIONS(2 3) or higher in order to participate in a data sharing group.

**System Action:** The DB2 subsystem detecting this error is terminated.

**System Programmer Response:** Using IDAMS LISTCAT or TSO LISTCAT, display the share options of all of the active log data sets of all of the members in the data sharing group. For any active log data set that is defined with less than SHAREOPTIONS(2 3), use IDAMS ALTER or TSO ALTER to alter the data set definitions to SHAREOPTIONS(2) or higher.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](http://www.ibm.com/support/docview.wss?uid=swg21349115) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

- **DSNJ252I**
  - `xxxx NUMBER OF PARAMETER ARGUMENTS EXCEED MAXIMUM VALUE`
  - **Explanation:** The number of arguments for the parameter named `xxxx` exceed the maximum value allowed.
  - **System Action:** The current operation is terminated. This message is written to the SYSPRINT data set, but not written to a console.
  - **User Response:** Change the number of parameter arguments on the control statement, and rerun the utility.

- **DSNJ253I**
  - `csect_name alias-port USE IS INVALID`
  - **Explanation:** The `alias-port` value has been used in an invalid manner. The **error could be due to one of the following conditions:**
    - `alias-port` was specified after more than one `alias-name` parameter
    - `alias-port` duplicates the port value for the PORT or RESPORPort parameters which have been specified with this update, or are already stored in the BSDS
  - **System Action:** The update of the BSDS will not be performed.
  - **User Response:** Retry the BSDS update with unique `alias-port` values, which also do not match the values for the PORT or RESPORPort parameters.

- **DSNJ260I**
  - `csect_name BSDS CONVERSION FOR DDNAME=nnnnnnnn COMPLETED SUCCESSFULLY`
  - **Explanation:** The BSDS conversion utility issues this message to indicate a successful conversion for the BSDS data set specified by the `nnnnnnnn` DDNAME.

- **DSNJ261I**
  - `csect_name BSDS CONVERSION FOR DDNAME=nnnnnnnn WAS NOT SUCCESSFUL`
  - **Explanation:** The BSDS conversion utility issues this message to indicate conversion was not successful for the BSDS data set specified by the `nnnnnnnn` DDNAME.
  - **System Action:** The action taken depends on whether dual BSDS data sets are specified, and if so, which conversion failed. The DDNAME in the message indicates the failing BSDS data set.
    - If dual BSDS data sets are specified, the SYSUT1 data set is converted first. If that conversion is successful, the SYSUT2 data set is then converted. A failure at this point does not affect the successful SYSUT1 conversion.
    - If conversion fails for the SYSUT1 data set, processing is terminated at that point. In this case, any SYSUT2 data set that was specified will not be converted.
  - **User Response:** Review other messages produced by the utility to determine the cause of the failure and the resulting action to take.

- **DSNJ266I**
  - `WARNING - BSDS UTILITY TIMESTAMP MISMATCH DETECTED. PROCESSING TERMINATED.`
  - **Explanation:** DB2 detected a mismatch in the timestamps for the SYSUT1 and SYSUT2 BSDS copies during execution of BSDS conversion utility DSNJCNVB. This indicates the possibility that the dual BSDSs are out of sync.
  - **System Programmer Response:** Run the print log map utility (DSNU004) against each BSDS. From the output, determine which data set is obsolete, delete it, and define a replacement for it. Then copy the remaining data set into the replacement and retry the utility.
    - If output from the print log map utility for both data sets is similar, delete the data set with the oldest time stamp, and copy the data set with the most recent time stamp into the replacement.

- **DSNJ301I**
  - `csect-name ERROR action ONLINE BOOTSTRAP DATA SET`
  - **Explanation:** During command processing for the -RECOVER BSDS command or the -ARCHIVE LOG command, an error occurred while performing an operation on the Bootstrap Data Set. The type of operation is specified in the `action` keyword in the message text:
- **ACCESSING** Unable to OPEN the BSDS.
- **READING** Unable to read a required record from the BSDS.
- **UPDATING** Unable to write a required record to the BSDS.
- **RESTORING DUAL** The contents of the stable BSDS was successfully copied to the replacement BSDS; however, the DB2 subsystem was unable to successfully restore dual BSDS operation.

**System Action:** If this message was received during processing of the -RECOVER BSDS command, then the DB2 subsystem will continue in single BSDS mode. If this message was received during processing of the -ARCHIVE LOG command, the archive log history record in the BSDS will not be updated to reflect the occurrence of an -ARCHIVE LOG command; logging and the off-load processing will continue.

**Operator Response:** Inform the system programmer of the type of error that occurred, and whether the error occurred while processing a -RECOVER BSDS command or an -ARCHIVE LOG command.

**System Programmer Response:** If this message was received during processing of the -RECOVER BSDS command, then recovery action must be performed on the bootstrap data set before reentering the command. If this message was received during processing of the -ARCHIVE LOG command, no action is necessary.

---

**DSNJ302I** ALLOCATION ERROR ON REPLACEMENT BSDS DSNAME=... ERROR STATUS=...

**Explanation:** The RECOVER BSDS command encountered an error while trying to dynamically allocate the specified data set. DSNAME is the data set name. Error Status is the error code and information code returned by MVS dynamic allocation.

**System Action:** Processing of the command is terminated. The system continues in single BSDS mode.

**Operator Response:** Determine the cause of the error from the error status contained in the message, and correct the condition. Then reenter the -RECOVER BSDS command.

**System Programmer Response:** The error status portion of this message contains the 2-byte error code (S99ERROR) followed by the 2-byte information code (S99INFO) from the SVC request block. Refer to the appropriate MVS publication for a description of these codes.

---

**DSNJ303I** WRITE ERROR ON REPLACEMENT BSDS DSNAME=... ERROR STATUS=...

**Explanation:** The -RECOVER BSDS command encountered an error while attempting to write to the specified bootstrap data set. Error Status contains the VSAM return and feedback codes. It is a 2-byte field with the first containing the hexadecimal return code and the second containing the hexadecimal feedback code.

**System Action:** Processing of the command is terminated. The system continues in single BSDS mode.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Execute an offline access method services job to delete or rename the replacement BSDS and define a new BSDS with the same name. Reenter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

---

**DSNJ304I** ERROR CLOSING REPLACEMENT BSDS DSNAME=... ERROR STATUS=...

**Explanation:** The -RECOVER BSDS command encountered an error while attempting to close the specified bootstrap data set. Error Status contains the VSAM return and feedback codes. It is a 2-byte field with the first containing the hexadecimal return code and the second containing the hexadecimal feedback code.

**System Action:** Processing of the command is terminated. The system continues in single BSDS mode.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Execute an offline access method services job to delete or rename the replacement BSDS and define a new BSDS with the same name. Reenter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

---

**DSNJ305I** REPLACEMENT BSDS NOT EMPTY DSNAME=...

**Explanation:** The -RECOVER BSDS command was issued, but the replacement bootstrap data set was not empty; that is, it contained data.

**System Action:** Processing of the command is terminated. DB2 continues in single BSDS mode.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Execute an offline access method services job to delete or rename the error BSDS and define a new BSDS with the same name. Reenter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

---

**DSNJ306I** DUAL BSDS MODE ALREADY ESTABLISHED

**Explanation:** The -RECOVER BSDS command was issued, but DB2 was already in dual BSDS mode.

**System Action:** The command is ignored.
**DSNJ307I** LOG INITIALIZED IN SINGLE BSDS MODE

**Explanation:** The -RECOVER BSDS command was issued, but the system was initialized in single BSDS mode.

**System Action:** Processing of the command is terminated. The system continues in single BSDS mode.

**DSNJ310I** (A)SYNCHRONOUS ARCHIVE LOG COMMAND QUIESCE PROCESSING STARTED FOR MAXIMUM OF xxx SECONDS

**Explanation:** An -ARCHIVE LOG command with the MODE(QUIESCE) option has been accepted by the DB2 subsystem. The quiesce processing has commenced.

**System Action:** The DB2 subsystem will attempt to stop all updates to DB2 resources within the time period specified in the message. Users/jobs operating on the DB2 subsystem will be allowed to reach a point of consistency (commit point) before being blocked from further update activity. Jobs and users will be suspended until they are released by DB2 following the initiation of the off-load processing. If the DB2 subsystem can effectively block all users from performing updates before the maximum specified time, then the off-load will be initiated immediately, and normal processing will be resumed.

The message will display either the word SYNCHRONOUS or ASYNCHRONOUS, to inform the user of the type of quiesce processing which has been used.

- If the word SYNCHRONOUS is displayed, then the invoker used the WAIT(YES) option. This means that quiesce processing will be synchronous to the user; that is, the user can enter additional DB2 commands, but the commands will not be processed by the DB2 command processor until the quiesce processing has ended.

- If the word ASYNCHRONOUS is displayed, then the invoker used the WAIT(NO) option, or did not specify the WAIT option. This means that quiesce processing will be asynchronous to the user; that is, control will be returned to the invoker as soon as the quiesce task has been started. Thus, the DB2 command processor will accept - and process - any new DB2 commands while the quiesce task is running.

This message will be followed by message DSNJ311I or DSNJ317I.

**Operator Response:** No operator response is necessary. However, it can be expected that users and jobs using DB2 resources will be suspended (queued) by DB2 through the duration of the specified time interval, or until the DB2 subsystem can be certain that all update activity has been effectively blocked. At some point, this message will be followed by the DSNJ311I message or DSNJ317I message.

**DSNJ311I** csect-name ASYNCHRONOUS LOG ARCHIVE (OFFLOAD) TASK INITIATED

**Explanation:** A user-initiated -ARCHIVE LOG command has been accepted by the DB2 subsystem. An asynchronous task to archive (off-load) the active log data set has been started.

**System Action:** The current active log data set(s) will be truncated and switched to the next available active log data set(s), and an asynchronous off-load task will be initiated to archive the Active log data set(s).

The term ASYNCHRONOUS is used to indicate that control will be returned to the invoker as soon as the off-load task has been started. Thus, the DB2 command processor will accept — and process — any DB2 commands while the off-load task is running.

This message is followed by message DSNJ312I if the MODE(QUIESCE) option was used with the -ARCHIVE LOG command.

**Operator Response:** The operator should respond per normal operational procedures when the off-load task begins.

**DSNJ312I** ARCHIVE LOG QUIESCE ENDED. UPDATE ACTIVITY AGAINST DB2 RESOURCES IS NOW RESUMED.

**Explanation:** An -ARCHIVE LOG command with the MODE(QUIESCE) option was processed by the DB2 subsystem. As part of the MODE(QUIESCE) processing, an attempt was made to stop all new update activity against DB2 resources. This message signals the end of the quiesce processing, and the resumption of normal DB2 activity for all users and jobs which were blocked during the quiesce period.

This message follows message DSNJ311I or DSNJ317I.

**System Action:** The DB2 subsystem has now resumed all normal DB2 activity for all users and jobs that were blocked during the quiesce period.

**DSNJ313I** PARAMETER SPECIFIED ON THE keyword KEYWORD (value) IS NOT IN THE RANGE OF ALLOWABLE VALUES

**Explanation:** This message was generated by an error occurring in one of the following commands:

- ARCHIVE LOG command with MODE(QUIESCE)
- SET ARCHIVE
- SET LOG

You specified a value for one of the command options that was outside of the range of allowed values.
System Action: This message is informational only. The DB2 subsystem determined that 'xxxx' units of recovery (URs) did not reach a point of consistency during the quiesce period, and therefore could not be stopped from continuing their associated update processing.

Consequently, the -ARCHIVE LOG processing will be terminated. The current active log data set(s) will not be truncated, and will not be switched to the next available active log data set(s). The log archive (off-load) task will not be created. All jobs and users suspended during the quiesce will be resumed, and normal update activity against DB2 resources will be commenced.

This message will be followed by the DSNJ312I message.

Operator Response: Contact the system programmer.

System Programmer Response: A determination must be made whether the outstanding (nonquiesced) URs represent significant work.

Each user on the system has a unit of recovery if they are modifying DB2 resources. URs are also created by the DB2 subsystem itself for internal processing. Since the purpose of the MODE(QUIESCE) option is to have all URs reach a point of consistency (commit point) before the active log data set is truncated and off-loaded, determine all outstanding nonqueued jobs and users by using -DISPLAY THREAD and the MVS 'D A,L' operator command.

It should be noted that URs may be outstanding due to lock contention between a user or job which holds a resource (and has reached a point of consistency), and a user or job which wants a lock (and therefore cannot reach a point of consistency).

Before resubmitting the -ARCHIVE LOG command with the MODE(QUIESCE) option, either:

- Wait until the threads have been deallocated.
- Wait until the DB2 subsystem is less busy.
- Force the offending thread(s) to terminate.
- Use the TIME option to dynamically override and extend the maximum quiesce time period specified in ZPARMS.
- Or, if having all URs reach a point of consistency in the active log is no longer critical, issue the -ARCHIVE LOG command without the MODE(QUIESCE) option.

Important: If the decision is made to use the -ARCHIVE LOG command without the MODE(QUIESCE) option, the active log data set(s) will be truncated without regard to quiescing activity on the DB2 subsystem. If the resulting archive log data set is used for recovery, it is possible that some URs may be found to be In-flight, In-Abort, In-Commit, or In-doubt during DB2 initialization.
If expiration of the quiesce period before all URs reach a consistent point are a chronic problem, an adjustment to ZPARMs may have to be made. The quiesce period is controlled by the 'Maximum Quiesce Period' ZPARM. Refer to the discussion about the Archive Log Parameters (DSNTIIPA) panel in Part 2 of DB2 Installation Guide.

**DSNJ318I** ARCHIVE LOG COMMAND ALREADY IN PROGRESS

**Explanation:** An attempt was made to issue an ARCHIVE LOG command when an ARCHIVE LOG command was already in progress. In data sharing, the ARCHIVE LOG command currently in progress could be initiated by another member.

**Operator Response:** If the conflicting command satisfies your archival request, do not reissue the command. Otherwise, wait for the conflicting command to complete and then reissue the -ARCHIVE LOG command.

**DSNJ319I** csect name CURRENT ACTIVE LOG DATA SET IS THE LAST AVAILABLE ACTIVE LOG DATA SET. ARCHIVE LOG PROCESSING WILL BE TERMINATED.

**Explanation:** The -ARCHIVE LOG command was rejected because the current active log is the last available active log data set. To process the command when these conditions exist would cause the DB2 subsystem to exhaust its available active log resources and immediately halt processing.

**System Action:** Processing for the command is terminated. If the situation is not corrected, the DB2 subsystem will issue the DSNJ110E message (if it has not already done so) as the available active log data space reaches critically low levels. Ultimately, message DSNJ111E will be issued when the available active log data space is exhausted, and the DB2 online processing will halt until active log space is made available.

**User Response:** Notify the operator or system programmer.

**Operator Response:** To clear this condition, steps must be taken to complete other waiting off-load tasks. Once another active log is made available (re-usable) by completing the off-load process for it, the command processing for the current active log can proceed.

Execute an MVS Display System Requests command (D R,L for example) to determine the outstanding requests related to the log off-load process. Take the necessary action to satisfy any requests, and permit off-load to continue. If off-load fails to complete normally, or cannot be initiated, notify the systems programmer.

**System Programmer Response:** Either correct the problem that is causing the off-load process to fail, or add more active log data sets. Note that the latter action requires DB2 to be down and the change log inventory (DSNJU003) utility to be run.

Possible causes for the shortage of active log data space are:

- Excessive logging. For example, too many users requesting logs at the same time, or too many utilities specifying LOG (YES).
- Delayed or slow off-loading. For example, failure to mount archive volumes, incorrect replies to off-load messages, or slow device speeds.
- Excessive use of the -ARCHIVE LOG command. Each invocation of the command causes the DB2 subsystem to switch to a new active log data set. Excessive use could consume the available active log data space if the resulting off-loads were not processed in a timely manner.
- Off-loads(s) failed (see Operator Response).
- Insufficient active log space (see Operator Response).

**DSNJ320I** csect-name UNABLE TO PROCESS LOG TRUNCATION REQUEST DUE TO SUBSYSTEM COMPONENT action FAILURE

**Explanation:** While processing an -ARCHIVE LOG command, an internal request was made of the log buffer output routine to force-write the log buffers and to truncate and switch the active log to the next available active log data set(s). The request failed during the processing of the 'action' specified in the message.

**System Action:** Processing for the command is terminated.

**User Response:** Notify the system programmer.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This error is an internal error detected by the DB2 subsystem. The error may be caused by an unrelated ABEND in the Log Buffer Writer component (DSNJWxxx), by a -STOP DB2 MODE(FORECE) command, or by abnormal subsystem termination. Refer to messages and ABENDS which precede this message.

**DSNJ321I** UNABLE TO CONTINUE ARCHIVE LOG QUIESCE DUE TO INTERNAL SUBSYSTEM ERROR. ARCHIVE LOG PROCESSING WILL BE TERMINATED, AND UPDATE ACTIVITY AGAINST DB2 RESOURCES WILL BE RESUMED.

**Explanation:** An -ARCHIVE LOG command with the MODE(QUIESCE) option was processed by the DB2 subsystem. As part of the MODE(QUIESCE) processing, an attempt was made to stop all new update activity against DB2 resources. During the internal subsystem interaction between the log manager...
and the recovery manager, an internal interface error was detected by the recovery manager.

**System Action:** The -ARCHIVE LOG MODE (QUIESCE) processing is terminated. This message will be followed by message DSNJ312I after all users and jobs quiesced by the MODE (QUIESCE) processing are resumed.

**User Response:** Notify the system programmer.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This error is an internal error detected by the DB2 subsystem. Retry the -ARCHIVE LOG MODE (QUIESCE) command. If the error persists, the active log data sets may be switched using the -ARCHIVE LOG command without the MODE (QUIESCE) option.

---

**DSNJ322I**  
**DISPLAY ARCHIVE REPORT**  
**FOLLOWS—**

**Explanation:** This message is always generated as the title for the -DISPLAY ARCHIVE command report output. It precedes the other messages generated by this command.

The series of messages DSNJ323I through DSNJ329I provide the formatted report for -DISPLAY ARCHIVE.

---

**DSNJ323I**  
**COUNT TIME**

**Explanation:** The column headings for the list of parameter specifications generated by the -DISPLAY ARCHIVE command are displayed. The message number is not included in this message.

---

**DSNJ324I**  
**(TAPE UNITS) (MIN,SEC)**

**Explanation:** The format of the COUNT and TIME parameter specifications displayed by the -DISPLAY ARCHIVE command are shown. The message number is not included in this message.

---

**DSNJ325I**  
**name count time**

**Explanation:** This message, in combination with messages DSNJ323I and DSNJ324I, provides the parameter information that is a part of the -DISPLAY ARCHIVE report.

- **name** Identifies the count and time values in the message line.
- **DSNZPARN** Values specified during DB2 installation.
- **CURRENT** Current values in the DB2 system.
- **count** The value for COUNT as specified in name.
- **time** The value for TIME as specified in name.

The message number is not included in this message.

---

**DSNJ326I**

**Explanation:** This message separates messages DSNJ325I and DSNJ327I that are generated by the -DISPLAY ARCHIVE command. The message number is not included in this message.

---

**DSNJ327I**  
**ADDR STATUS CORR-ID VOLSER DATASET_NAME**

**Explanation:** This message displays the column headings for the DISPLAY ARCHIVE report.

The message number is not included in this message.

---

**DSNJ328I**  
**tapeaddr status corr-id vname dsname**

**Explanation:** This message, in combination with message DSNJ327I, provides the tape unit information that is part of the -DISPLAY ARCHIVE report.

- **tapeaddr** The physical tape address of the tape unit allocated to read archive log.
- **status** Status of tape address:
  - **BUSY** Tape address is actively processing an archive log data set.
  - **PREM** Tape address is active and allocated for premount.
  - **AVAIL** Tape unit is inactive and waiting for work.
- **corr-id** The correlation id associated with the user of the tape being processed. If the status is PREM or AVAIL, this column must contain "*****", indicating no current user is associated with this tape.
- **vname** The name of the tape volume that is mounted on the tape address.
- **dsname** The data set on the tape volume that is being processed (BUSY and PREM) or was last processed (AVAIL).

The message number is not included in this message.

---

**DSNJ329I**  
**END OF DISPLAY ARCHIVE REPORT.**

**Explanation:** This message follows messages DSNJ322I through DSNJ328I and indicates that the -DISPLAY ARCHIVE report was generated successfully. The message number is not included in this message.
**DSNJ330I** ARCHIVE LOG VOLUMES REQUIRED FOR CONNECTION ID conn-id CORRELATION ID corr-id

**Explanation:** This message is the title for the ARCHIVE LOG VOLUMES report output. The ARCHIVE LOG VOLUMES report lists the archive log volumes needed by the correlation ID for that connection ID. This message is generated automatically by the archive read process at the first archive log tape mount for corr-id. This message precedes the other messages generated by this action.

This message, in combination with messages DSNJ331I and DSNJ332I, provides the formatted report for the ARCHIVE LOG VOLUMES requested.

**conn-id**
An identifier representing the 'connection name' used to establish the thread.

**corr-id**
An identifier associated with a specified thread. In TSO, it is either the authorization ID or the job name.

**DSNJ331I** avolume, avolume, avolume, avolume ...

**Explanation:** This message provides the tape volume information for the Archive Log Volumes report output.

**avolume**
The name of the archive log volume required for this correlation ID. An ‘avolume’ prefixed with an ‘@’ signifies that the data on the archive log volume is also mapped by an active log data set. As such, the ‘avolume’ might not be required for the read process, since the data is read from the active log, if possible.

**DSNJ332I** END OF ARCHIVE LOG VOLUMES REPORT

**Explanation:** This message follows messages DSNJ330I and DSNJ331I and indicates that the ARCHIVE LOG VOLUMES report was generated successfully. The message number is not included in this message.

**DSNJ333I** csect-name SYSTEM CHECKPOINT INITIATED

**Explanation:** This message indicates that the SET LOG command processed successfully and that a system checkpoint has been initiated.

**DSNJ334I** PARAMETER SPECIFIED ON THE keyword KEYWORD (VALUE) CONTAINS INVALID CHARACTERS

**Explanation:** A -SET ARCHIVE command was processed by the DB2 subsystem. One of the command keywords specified a value that contains an invalid character.

**System Action:** Processing for the -SET ARCHIVE command is terminated. This message is followed by the DSNJ9023I message.

**Operator Response:** Refer to DB2 Command Reference for the syntax of the command. Correct the syntax and reenter the command.

**DSNJ335I** INVALID KEYWORDS COMBINATION IN SET ARCHIVE COMMAND

**Explanation:** This command requires that keyword COUNT or keyword TIME be specified. If both are omitted, the keyword DEFAULT must be specified. It is invalid to specify keyword DEFAULT when either the COUNT keyword or TIME keyword is specified.

**System Action:** Processing for the -SET ARCHIVE command is terminated. This message is followed by the DSNJ9023I message.

**Operator Response:** Refer to DB2 Command Reference for the syntax of the command. Correct the syntax and reenter the command.

**DSNJ336I** UNABLE TO ALLOCATE TAPE UNIT FOR conn-id corr-id, x ALLOCATED, y ALLOWED.

**Explanation:** An attempt to allocate a tape unit for connection ID ‘conn-id’ failed. The current maximum tape unit specified is ‘y’, but only ‘x’ are physically available.

**System Action:** The ‘conn-id corr-id’ process is queued until either an allocated tape unit becomes free or more tape units are varied online and made available to the DB2 archive read task.

**Operator Response:** This situation rectifies itself over time as currently allocated tape units become available. To improve throughput, vary additional tape units online and make them available to DB2. Note that a queue rescan is not attempted until the -SET ARC READ COUNT command is issued or when an allocated tape dismounts.

**DSNJ337I** SET ARCHIVE COMMAND COMPLETED COUNT(count) TIME(minute,second)

**Explanation:** This message indicates that the -SET ARCHIVE command processed successfully and displays the current values for COUNT and TIME.

**count** The value for the COUNT parameter

**minute** The ‘minute’ value for the TIME parameter

**second** The ‘second’ value for the TIME parameter
DSNJ338I  NO TAPE ARCHIVE READING ACTIVITY

Explanation: This message indicates that there is no current archive tape reading activity to report.

The message number is not included in this message.

---

DSNJ339I  csect-name SET LOG COMMAND COMPLETED, type(quantity)

Explanation: This message indicates that the SET LOG command processed successfully, and displays the current checkpoint frequency. The checkpoint frequency remains in effect until DB2 is restarted or until the value is modified by a SET LOG or SET SYSPARM command.

- **type**: Along with quantity, determines the current system checkpoint frequency. It indicates MINUTES for a time-based checkpoint frequency, or LOGRECORDS if the checkpoint frequency is determined by the number of log records that are written.

- **quantity**: The number of minutes, or the number of log records that determine the current checkpoint frequency.

---

DSNJ340I  csect-name COMMAND KEYWORD xxx IS ONLY VALID FOR DATA SHARING

Explanation: An attempt was made to issue a DB2 command with KEYWORD xxx on a DB2 that was not initialized to participate in data sharing.

**System Action:** The command request is rejected.

---

DSNJ341I  csect-name -ARCHIVE LOG COMMAND NOT ALLOWED, LOGGING IS SUSPENDED

Explanation: An attempt to issue an -ARCHIVE LOG command failed because a -SET LOG SUSPEND command has suspended logging.

**System Action:** Command processing terminates for the -ARCHIVE LOG command. You may reissue the command when logging has been resumed by the -SET LOG RESUME command.

---

DSNJ350I  csect-name (A)SYNCHRONOUS ARCHIVE LOG COMMAND QUIESCE PROCESSING STARTED IN DATA SHARING

Explanation: The DB2 subsystem of a data sharing group accepted an ARCHIVE LOG command with the MODE(QUIESCE) option.

Each active DB2 member in the data sharing group performs the quiesce operation. The member originating the quiesce issues message DSNJ350I; all other members issue DSNJ310I as they start quiescing.

---

DSNJ351I  csect-name MEMBER member name STATUS=member status

Explanation: This message appears in response to MODE(QUIESCE) being specified with the ARCHIVE LOG command. It is one of a list of elements that display archive related status of the indicated member of the data sharing group. These member status messages are preceded by the message DSNJ359I and are followed by DSNJ361I.

- **member name**: identifies the member of the data sharing group.

- **member status**: indicates archive related status of the named member. It appears as one of the following:

**ABNORMALLY TERMINATING**

The named member was undergoing abnormal subsystem termination at the time ARCHIVE LOG processing was active for the data sharing group. ARCHIVE LOG command processing for the remainder of the data sharing group terminates unsuccessfully.

**ARCHIVE ALREADY ACTIVE**

ARCHIVE LOG command processing was running at the named member at the time a succeeding ARCHIVE LOG command was issued. The succeeding ARCHIVE LOG command terminates unsuccessfully for the remaining members of the data sharing group.

**CANCELED**

ARCHIVE LOG command processing for the named member was canceled due to a problem encountered elsewhere in the data sharing group. The quiesce operation is interrupted and terminated and update activity against DB2 resources is resumed before command processing is terminated for the member.

**COMMUNICATIONS FAILURE**

A communications failure occurred between the named member and one or more other members in the data sharing group. The quiesce operation is interrupted and update activity against DB2 resources is resumed before command processing is terminated for the member. ARCHIVE LOG command processing for the remainder of the data sharing group terminates unsuccessfully.

**FAILED**

The named member was inactive at the time the ARCHIVE LOG command was issued. Termination of the DB2 subsystem for this member was abnormal. This status, if displayed for any member, will cause ARCHIVE...
DSNJ352W  •  DSNJ355I

LOG command processing for the entire data sharing group to terminate unsuccessfully.

NOT AVAILABLE
Archive command status for the named member could not be determined. This condition typically occurs when the named member fails to respond during ARCHIVE LOG command processing and is usually accompanied by message DSNJ353I and/or message DSNJ355I.

QUIESCED
The named member was active at the time the ARCHIVE LOG command was issued. Update activity against DB2 resources had successfully quiesced for that member (no active URs) in response to specifying MODE(QUIESCE).

QUIESCED/OFFLOADING
The named member was active at the time the ARCHIVE LOG command was issued. Update activity against DB2 resources had successfully quiesced for that member (no active URs) in response to specifying MODE(QUIESCE). The active log at the time was truncated and an offload process was initiated after all members in the data sharing group had reached a quiesce point.

STOPPED
The named member was inactive at the time the ARCHIVE LOG command was issued. Termination of the DB2 subsystem for this member was normal with no incomplete URs outstanding. Log truncation and offload processing are scheduled to be performed automatically the next time the named member is started. When the member is started, it is important to ensure that archive processing occurs automatically. Certain error conditions might require entering an ARCHIVE LOG command via the operator console to cause log truncation and offload processing to be performed. This member status is accompanied by warning message DSNJ362A.

TIME EXCEEDED
The named member could not quiesce its update activity within the allotted period of time. The incomplete quiesce operation is interrupted and update activity is resumed before command processing is terminated for the member. ARCHIVE LOG command processing for the remainder of the data sharing group is unsuccessfully terminated.

DSNJ352W  csect-name MEMBERS WERE NOT OFFLOADED
Explanation: DB2 issues this message during processing of an ARCHIVE LOG command with the MODE(QUIESCE) option. One or more quiesced members were not available to receive the archive request. DSNJ351I messages follow to display the quiesced members.

At the next start up of the quiesced member, DB2 switches (truncates) the current active log and initiates the archive task.

DSNJ353I  csect-name DSNJ353I MEMBER name NOT RESPONDING.

Explanation: This message is displayed when a response is needed but not received within an expected period of time during ARCHIVE LOG MODE(QUIESCE) command processing. This can occur as a result of abnormal subsystem termination under the named member or, possibly from communications problems among members of the data sharing group.

Operator Response: Examine the console log of the named member for operator information messages that might relate to the problem.

DSNJ354I  csect-name DSNJ354I ARCHIVE LOG: ALL ACTIVE MEMBER(S) STARTED OFFLOAD TASKS

Explanation: This message is displayed when MODE(QUIESCE) is specified with the ARCHIVE LOG command, after all active members in the data sharing group have successfully quiesced their update activity within the allotted time period. For each active member in the data sharing group, the active log is truncated and switched, and an offload task is initiated to begin the offload process. Log truncation, switch and offload processing for stopped (and quiesced) members is performed the next time they are started.

DSNJ355I  csect-name ARCHIVE LOG: ONE OR MORE ACTIVE MEMBERS FAILED TO RESPOND OR START OFFLOAD TASKS

Explanation: This message is displayed when MODE(QUIESCE) is specified with the ARCHIVE LOG command, and one or more active members could not successfully quiesce their update activity in the time allotted. Subsystem activity already quiesced is resumed, and ARCHIVE LOG command processing terminates unsuccessfully for all active members in the data sharing group. Message DSNJ353I might also appear with this message.

Operator Response: See the list of DSNJ351I member status messages following message DSNJ359I to determine the reason for the archive command failure.
**DSNJ356I  csect-name COMMUNICATIONS FAILURE TERMINATED COMMAND**

Explanation: This message appears as a result of the failure of a communications request by one or more members of the data sharing group. This message is likely to be accompanied by DSN7xxx or other error messages and/or an SVC dump.

**System Action:** ARCHIVE LOG command processing terminates unsuccessfully for all members in the group.

**DSNJ357E  csect-name SYSTEM QUIESCE FAILED**

Explanation: This message indicates the unsuccessful outcome of an ARCHIVE LOG MODE (QUIESCE) command. This message indicates that one or more members were unable to quiesce their update activity in the time allowed. It is usually accompanied by one or more related messages (e.g., DSNJ355I), and a list of member status messages indicating the reason for the failure.

**Operator Response:** Refer to messages DSNJ359I, DSNJ351I and DSNJ361I to determine archive related status of members in the data sharing group.

**DSNJ359I  MEMBER RESPONSES**

Explanation: This message marks the beginning of a list of one or more DSNJ351I member status messages and precedes the first status message in the list.

**DSNJ361I  csect-name END OF MEMBER RESPONSES LIST**

Explanation: This message marks the end of a list of one or more DSNJ351I member status messages and follows the last status message in the list.

**DSNJ362E  csect-name WARNING: LOGS OF nn STOPPED OR FAILED MEMBERS NOT OFFLOADED.**

Explanation: This message is displayed when either MODE (QUIESCE) or SCOPE (GROUP) is specified with the ARCHIVE LOG command, and one or more members of the data sharing group either stopped or failed and were not available to receive the archive request. Active log truncation, log switch and offload processing for these inactive members is scheduled to be performed the next time those members are started.

**Operator Response:** Verify that log switch and offload processing does automatically occur when the inactive members are started. Certain error conditions might require the ARCHIVE LOG command to be individually issued for a member if ARCHIVE LOG processing does not occur automatically. Refer to messages DSNJ359I, DSNJ351I, and DSNJ361I to identify the inactive members.

**DSNJ370I  csect-name LOG DISPLAY CURRENT COPY1 LOG = dsname1 IS pct% FULL CURRENT COPY2 LOG = dsname2 IS pct% FULL H/W RBA = hw-rba, H/O RBA = ho-rba FULL LOGS TO OFFLOAD = nn OF mm, OFFLOAD TASK IS status**

Explanation: This message, in combination with message DSNJ371I, provides the output from the DISPLAY LOG command.

- **dsname1** The data set name of the current active log copy1 data set. If this copy of the log is not currently active, dsname1 will display INACTIVE.
- **dsname2** The data set name of the current active log copy2 data set. If this copy of the log is not currently active, dsname2 will display INACTIVE.
- **pct** The percentage of log space within the active log data set that has been written.
- **hw-rba** The RBA of the most recently written log record.
- **ho-rba** The highest log RBA that has been offloaded to an archive log data set.
- **nn** The number of full active log data sets that have not been archived.
- **mm** The total number of active log data sets.
- **status** Status of the offload task:
  - **BUSY,ALLC** Task is busy, allocating an archive log data set. This could indicate a tape mount request is outstanding.
  - **BUSY,BSDS** Task is busy, copying the BSDS data set.
  - **BUSY,ACTV** Task is busy, copying an active log data set.
  - **BUSY** Task is busy, other processing.
  - **AVAILABLE** Task is available for work.

**DSNJ371I  DB2 RESTARTED time-date-1 RESTART RBA str-rba CHECKPOINT FREQUENCY quantity type LAST SYSTEM CHECKPOINT TAKEN time-date-2**

Explanation: This message, in combination with message DSNJ370I, provides the output from the DISPLAY LOG command.

Chapter 11. DB2 Messages 327
**ALREADY SUSPENDED**  
A -SET LOG SUSPEND command was issued while update activity was suspended by a previous command.

**DB2 STOPPING**  
A -SET LOG SUSPEND command was issued, but DB2 is stopping.

**QUIESCE ACTIVE**  
A -SET LOG SUSPEND command was issued, but a system quiesce that was initiated by an -ARCHIVE LOG command is in progress.

**NOT SUSPENDED**  
A -SET LOG RESUME command was issued, but update activity is not suspended.

**COMMAND ABEND**  
A -SET LOG command abnormally terminated. Update activity is not suspended.

**LOCK TIMEOUT**  
A lock timeout has occurred. Update activity is not suspended.

**System Action:** Command processing terminates.

---

**DSNJ401I**  
ccsect-name rrr RECORD NOT FOUND

**Explanation:** An attempt was made to read the 'rrr' record from the BSDS. In so doing, the read routine (DSNJU01B) could not find the record.

**System Action:** Utility processing continues. This message is written to the SYSPRINT data set, not to a console.

---

**DSNJ402I**  
UNABLE TO LOCATE aaaa TBLSPACE NAME IN SYSTEM CATALOG OR DIRECTORY DATABASES

**Explanation:** The table space name specified on the TBLSPACE parameter of the change log inventory (DSNJU003) utility SYSTEMDB statement could not be found in any DB2 subsystem catalog or directory database. The table space name in error is named in the 'aaaa' message keyword.

**System Action:** All subsequent DSNJU003 utility statements are bypassed, and DSNJU003 processing is terminated with a return code of 4. The DB2 SYSTEMDB record is not updated.

This message is written to the SYSPRINT data set, not to a console.

**User Response:** Correct the table space name specified on the TBLSPACE parameter, and resubmit the change log inventory (DSNJU003) utility job.
**DSNJ403I**  CAPACITY OF BSDS SYSTEMDB RECORD EXCEEDED

**Explanation:** The BSDS SYSTEMDB record contains VSAM passwords for data sets in the DB2 catalog and directory, and has a maximum capacity of 168 entries. This message is issued when the number of eligible DB2 catalog and directory data sets exceeds the maximum capacity of the BSDS SYSTEMDB record. This is an internal error.

**System Action:** All subsequent change log inventory (DSNJU003) utility statements are bypassed, and DSNJU003 processing is terminated with a return code of 4. The DB2 SYSTEMDB record is not updated.

This message is written to the SYSPRINT data set, not to a console.

**User Response:** Notify the systems programmer.

---

**DSNJ404E**  keyword NOT ALLOWED FOR operation OPERATION

**Explanation:** An invalid keyword was used during the operation named 'operation'.

**System Action:** The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Correct the control statement and rerun the utility.

---

**DSNJ405E**  keyword1 KEYWORD MUTUALLY EXCLUSIVE WITH keyword2 KEYWORD

**Explanation:** 'keyword1' and 'keyword2' are mutually exclusive and cannot appear on the same control statement.

**System Action:** The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Determine the extraneous keyword and remove it from the control statement. Rerun the utility.

---

**DSNJ406E**  EITHER keyword1 KEYWORD OR keyword2 KEYWORD MUST BE SPECIFIED

**Explanation:** A required keyword was not used on the control statement. Use either 'keyword1' or 'keyword2' with the attempted control statement type.

**System Action:** The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Correct the control statement and rerun the utility.

---

**DSNJ407E**  csect-name NO VALID CHECKPOINT RBA FOUND

**Explanation:** After completing its search through the resource manager status table and the checkpoint queue, no valid checkpoint RBA was found within the specified range.

**System Action:** The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** The last 100 checkpoints are recorded in the BSDS, including the log STARTRBA and log ENDRBA of the checkpoint range. When either STARTRBA/STARTLRSN or ENDRBA/ENDLRSN are specified, the change log inventory (DSNJU003) utility attempts to locate a valid checkpoint in the range. In this case, DSNJU003 was unsuccessful in finding a valid checkpoint.

Do one of the following, as appropriate:

- If no checkpoint exists in the STARTRBA/ENDRBA range (STARTLRSN/ENDLRSN in Datasharing), set STARTRBA=ENDRBA and cold start DB2.

- If the ENDRBA/ENDLRSN is less than all recorded checkpoints or the STARTRBA/STARTLRSN is higher than all recorded checkpoints, then use DSN1LOGP SUMMARY(ONLY) option to find a valid checkpoint. Use DSN1LOGP the log RBA of the checkpoint. Update the CHKPTRBA parameter using the log RBA identified in DSN153I and resubmit DSNJU003.

---

**DSNJ408I**  csect-name CHECKPOINT RBA FOUND, RBA = rba, TIME = time

**Explanation:** After completing its search through the resource manager status table and the checkpoint queue, 'rba' was the most recent checkpoint RBA in the specified range and 'time' was the time of the checkpoint.

**System Action:** Utility processing continues.

---

**DSNJ409I**  UNABLE TO WRITE ACTIVE LOG RECORD TO THE BSDS DATASET. DDNAME=xxxxxx

**Explanation:** A program encountered an I/O error when attempting to write a BSDS active log record to the BSDS data set. 'xxxxxx' is the DDNAME of the BSDS data set being accessed.

**System Action:** The program will terminate.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** One or more error messages describing the specific error preceded this message. This error is considered unrecoverable and will leave the BSDS data set in an uncertain state. It will
be necessary to either: recreate the data set using access method service routines and then use change log inventory (DSNJ003) to make the active and archive log data set(s) known to the BSDS, or recover the BSDS using a backup copy.

**DSNJ410E**  
*csect-name I/O ERROR DURING nnn PROCESSING OF yyyy RECORD*  
Explanation: An I/O error occurred during a READ or WRITE of a record. 'nnn' is either READ or WRITE, depending on the operation. 'yyyy' specifies the Conditional Restart control record, checkpoint queue record, archive log command history record, or resource manager status table.  
System Action: The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console, and will be accompanied by message DSNJ212E or DSNJ213E.  
User Response: Determine the cause of the I/O error based upon the error status information provided in messages DSNJ212E or DSNJ213E.

**DSNJ411I**  
*csect-name CRESTART nnnn FOR CRCRID = yyyy, DDNAME = ddname*  
Explanation: A CRESTART request has just completed. 'nnnn' is either CREATE or CANCEL. 'yyyy' is the restart control record hexadecimal identifier and 'ddname' is the BSDS data set (SYSUT1 or SYSUT2) associated with the request.  
System Action: Current utility processing continues. This message is written to the SYSPRINT data set, not to a console.  
User Response: Note the record identifier for future reference.

**DSNJ412E**  
*csect-name RESTART CONTROL RECORD NOT FOUND IN BSDS*  
Explanation: The CRESTART CANCEL keyword was specified but the conditional restart control record does not exist in the BSDS data set.  
System Action: Current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.  
User Response: CREATE the conditional restart control record prior to attempting the CANCEL function.

**DSNJ413E**  
*csect-name INVALID LOG RANGE SCOPE OR CHECKPOINT SPECIFIED*  
Explanation: The values specified thru the STARTRBA, ENDRBA, and CHKPTRBA keywords are invalid.  
System Action: Current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.  
User Response: Ensure that the log range values are correct and correspond to the other log range values either specified or defaulted. A valid log range is where STARTRBA is less than or equal to CHKPTRBA, and CHKPTRBA is less than ENDRBA. The STARTRBA must be less than or equal to the ENDRBA.

**DSNJ414I**  
*csect-name COLD START WILL RESULT FROM THIS RESTART CONTROL RECORD. FORWARD AND BACKOUT SET TO NO.*  
Explanation: STARTRBA and ENDRBA are equal. A cold start will result if this restart control record is used during DB2 restart. No forward or backout processing will be performed.  
System Action: CRESTART processing continues.  
User Response: No additional actions are required if a cold start of the system is desired. If a cold start is not desired, reissue the CRESTART and either CANCEL the current restart control record, or CREATE a new restart control record.

**DSNJ415E**  
*csect-name ENDRBA = rba IS INVALID, MUST BE A MULTIPLE OF 4K*  
Explanation: The specified ENDRBA at 'rba' is not a multiple of 4KB.  
System Action: CRESTART processing is terminated.  
User Response: Correct the ENDRBA value on the CRESTART statement and rerun the utility.

**DSNJ416I**  
*WARNING - BSDS UTILITY TIMESTAMP MISMATCH DETECTED. PROCESSING CONTINUES.*  
Explanation: As a result of a change log inventory (DSNJ003) update, it was discovered that the SYSUT1 BSDS and SYSUT2 BSDS timestamps are unequal. Being unequal indicates the possibility of a BSDS mismatch.  
System Action: Current utility processing continues.  
User Response: Run the print log map (DSNJ004) utility against the SYSUT1 BSDS and SYSUT2 BSDS. Determine if each BSDS is current. If each BSDS is current, this warning can be ignored. If either BSDS is not current, delete the obsolete data set and define a replacement data set, then copy the current BSDS into the replacement data set.
DSNJ417I  REQUIRED xxxxxxxx PARAMETER FOR yyyy yyyy. OPERATION IS MISSING

**Explanation:** A required parameter 'xxxxxxx' for a Log utility operation was missing from the Log utility control statement. The attempted operation is 'yyyyyyyy'.

**System Action:** The Log utility 'yyyyyyyy' operation does not perform its function. All subsequent Log utility control statements are processed. A nonzero return code is issued by the utility.

DB2 writes this message to the SYSPRINT data set, not to a console.

**User Response:** Add the missing parameter to the control statements associated with the specified operation and rerun the utility.

---

DSNJ418I  WARNING - A NOTREUSEABLE ACTIVE LOG DATA SET WAS DELETED FROM BSDS LOG INVENTORY, STARTRBA=..., ENDRBA=...

**Explanation:** The data set name specified on the DSNAME parameter of the change log inventory (DSNJU003) utility DELETE statement was a NOTREUSABLE active log.

**System Action:** DSNJU003 processing continues, it will terminate with a return code of 4. This message is written to the SYSPRINT data set, not to a console.

**User Response:** No additional actions are required if a deletion of a NOTREUSABLE active log was desired. If this was not desired, recreate the deleted log by using the NEWLOG statement with the RBA values specified in the warning message.

---

DSNJ419I  UNABLE TO WRITE ARCHIVE LOG RECORD TO THE BSDS DATASET. DDNAME=xxxxx

**Explanation:** A program encountered an I/O error when attempting to write a BSDS archive record to the BSDS data set. 'xxxxx' is the DDNAME of the BSDS data set being accessed.

**System Action:** The program will terminate.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** One or more error messages describing the specific error preceded this message. This error is considered unrecoverable and will leave the BSDS data set in an uncertain state. It will be necessary to either: recreate the data set using access method service routines and then use change log inventory (DSNJU003) utility to make the active and archive log data set(s) known to the BSDS, or recover the BSDS using a backup copy.

---

DSNJ420I  UNABLE TO WRITE BCR1 RECORD TO BSDS DATASET. DDNAME=xxxxx

**Explanation:** A program encountered an I/O error when attempting to write the BSDS control record to the BSDS data set. 'xxxxx' is the DDNAME of the BSDS data set being accessed.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

---

DSNJ421I  THE BSDS IS NOT AT THE PROPER RELEASE LEVEL. DDNAME=xxxxx

**Explanation:** This message is issued when a program attempting to access The BSDS data set is not at a compatible release level. This can be one of the following:
- The program accessing the BSDS data set is at a NEW release level and the BSDS is at the old level.
- The program accessing the BSDS data set is at an OLD release level and the BSDS is at the NEW level.
- The program encountered an UNKNOWN release level on the BSDS data set.

**System Action:** The program will terminate with no action taken.

**System Programmer Response:** If the program that encountered the error was one of the BSDS conversion programs (DSNJMIG0 or DSNJFAL0) an unrecoverable error was found on the BSDS data set and it must be recreated. If the error was encountered running some other utility program (i.e., change log inventory or print log map), one of the following actions may be taken:
- Run a version of the program that is compatible with the release level of the BSDS.
- Run the appropriate formatting program (DSNJMIG0 or DSNJFAL0) to convert the BSDS data set to a release level compatible with the running program. If this was successful, rerun the original program.

---

DSNJ422I  LOG RECORDS HAVE ALREADY BEEN FORMATTED - THIS UTILITY WILL TERMINATE

**Explanation:** This message will occur when one of the BSDS formatting programs detects the BSDS had already been re-formatted or was already at the desired format level.

**System Action:** The program will terminate without any action being taken.

**System Programmer Response:** If the appropriate BSDS formatting program was being run, no further action is necessary.
**DSNJ423I**  ACTIVE LOG MAY NOT HAVE BEEN ARCHIVED. DSN=xxxxxxx

**Explanation:** The program was attempting to convert an old BSDS data set with more than 31 active log data sets to the new format. The program will drop the oldest active log data set(s) to get to the new maximum (31) limit. When dropping one of the old active log data sets from the BSDS, it was found to have been flagged as NOT REUSABLE (i.e., this data set MAY NOT have been archived). ‘xxxxxx’ will contain the data set name of the active log in question.

**System Action:** The program will remove this active log data set from the BSDS and continue.

**System Programmer Response:** Check to see if this data set had been archived. The active log data set was not deleted on disk but removed only from the BSDS data set, so it may still be archived, if needed. Use access method service routines to copy the VSAM active log data set to a sequential archive log data set.

**DSNJ424I**  csect-name INVALID CONTROL STATEMENT. THE SECOND WORD MUST BE 'DDNAME' OR '"' OR MUST START WITH A PARENTHESIS.

**Explanation:** The control statement is invalid.

**System Action:** The control statement is ignored. DB2 uses the SYSUT1 DD statement to locate the BSDS to be mapped. If the SYSUT1 DD statement is not available, the utility terminates.

**User Response:** Refer to **DB2 Utility Guide and Reference** for information on creating a print log map (DSNJU004) utility control statement. Correct or remove the control statement and rerun the job.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

**DSNJ425I**  INVALID xxxxxx VALUE/FORMAT FOR yyyy yyyy PARAMETER (YYYYYYYYYYYYYHMMSST)

**Explanation:** ‘xxxxxx’ is the field in the ‘yyyyyyyy’ parameter that contains an incorrect value or incorrect format.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Correct the control statement and rerun the utility.

**DSNJ426I**  ENDTIME VALUE CANNOT BE LESS THAN STARTIME VALUE

**Explanation:** The 'STARTIME' and 'ENDTIME' parameters specify a time range. Hence, the ENDTIME value must be equal to or greater than STARTIME value.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Correct the control statement and rerun the utility.

**DSNJ427I**  CHECKPOINT RECORD ADDED TO QUEUE

**Explanation:** The checkpoint record specified has been added to the checkpoint queue.

**System Action:** The BSDS checkpoint queue is modified as stated. This message is written to the SYSPRINT data set, not to a console.

**DSNJ428I**  CHECKPOINT RECORD DELETED FROM QUEUE, STARTRBA=startrba, ENDRBA=endrba

**Explanation:** The checkpoint record specified has been deleted from the Checkpoint Queue. ‘startrba’ and ‘endrba’ was the RBA range indicated in the deleted checkpoint record.

**System Action:** The BSDS checkpoint queue is modified as stated. This message is written to the SYSPRINT data set, not to a console.

**DSNJ429I**  RBA RANGE CONFLICTS WITH EXISTING CHECKPOINT RECORD RBA RANGE

**Explanation:** The specified RBA range for the new checkpoint record either exists or overlaps an existing RBA range in the checkpoint queue.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Run the print log map (DSNJU004) utility against the SYSUT1 BSDS and SYSUT2 BSDS. Determine the correct RBA range and correct the STARTRBA and ENDRBA parameters and rerun the utility.

**DSNJ430I**  SPECIFIED ENTRY CANNOT BE ADDED WITHOUT OVERLAYING EXISTING LOWEST ENTRY

**Explanation:** The specified RBA range for the new checkpoint record is less than the existing lowest entry. The checkpoint queue is currently full and cannot add
the new entry without overlaying the lowest entry.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Run the print log map (DSNJU004) utility against the SYSUT1 BSDS and SYSUT2 BSDS. Determine the lowest existing entry and either change the STARTRBA and ENDRBA parameters or delete the existing lowest entry and add the new low checkpoint entry and rerun the utility.

---

**DSNJ431I** STARTRBA SPECIFIED NOT FOUND IN CHECKPOINT QUEUE

**Explanation:** The specified STARTRBA could not be located in the checkpoint queue.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Run the print log map (DSNJU004) utility against the SYSUT1 BSDS and SYSUT2 BSDS. Determine the correct STARTRBA value and correct the STARTRBA parameter and rerun the utility.

---

**DSNJ432I** THE OFFLRBA VALUE MUST END WITH ‘FFF’

**Explanation:** The OFFLRBA value is invalid. It must end with ‘FFF’.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Correct the control statement and rerun the utility.

---

**DSNJ433I** csect-name INVALID CONTROL STATEMENT. A MEMBER LIST MUST CONTAIN AT LEAST ONE MEMBER NAME.

**Explanation:** The control statement is invalid. The member list is either empty or in the wrong format.

**System Action:** The control statement is ignored. DB2 uses the SYSUT1 DD statement to locate the BSDS to be mapped. If the SYSUT1 DD statement is not available, the utility terminates.

**User Response:** Refer to [DB2 Utility Guide and Reference](https://www.ibm.com/support/knowledgecenter/SSEPGU_12.1.0/com.ibm.db2.luw.admin.sql.ref.doc_12.1.0/r_dbsvc_r_csectname_invalid_control_statement.html) for information on creating a print log map (DSNJU004) utility control statement. Correct or remove the control statement and rerun the job.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/knowledgecenter/SSEPGU_12.1.0/com.ibm.db2.luw.admin.sql.diag.doc_12.1.0/r_dbsvc_r_csectname_invalid_control_statement.html) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNJ435I** csect-name THE MEMBER LIST OF A CONTROL STATEMENT MUST BE TERMINATED WITH A PARENTHESIS.

**Explanation:** The control statement contained the correct format for starting a list of members, but the terminating parenthesis was not found.

**System Action:** The control statement is accepted with an assumed parenthesis after the last member name recognized, and processing continues.

**User Response:** Refer to [DB2 Utility Guide and Reference](https://www.ibm.com/support/knowledgecenter/SSEPGU_12.1.0/com.ibm.db2.luw.admin.sql.ref.doc_12.1.0/r_dbsvc_r_csectname_invalid_control_statement.html) for information on creating a print log map (DSNJU004) utility control statement. Correct or remove the control statement and rerun the job.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/knowledgecenter/SSEPGU_12.1.0/com.ibm.db2.luw.admin.sql.diag.doc_12.1.0/r_dbsvc_r_csectname_invalid_control_statement.html) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNJ436I** csect-name THE DD STATEMENT FOR ddname IS MISSING.

**Explanation:** The print log map (DSNJU004) utility requested information about the identified ddname from the MVS Dynamic Allocation facility, but the DD statement was not found in the job.

**System Action:** The job is terminated.
User Response: Refer to **DB2 Utility Guide and Reference** for information on required JCL statements. Correct the JCL and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNJ437I**  
**csect-name UNABLE TO ALLOCATE BSIDS dsname. SVC 99 RTN CODE rc, RSN CODE rsnec, INFO infodc.**

**Explanation:** The print log map (DSNJU004) utility attempted to allocate a BSIDS data set using the MVS Dynamic Allocation facility, but the system was unable to complete the allocation. The return code, reason code, and information code were returned by the system’s SVC 99 facility. See MVS/ESA Programming: Authorized Assembler Services Guide for an explanation of these codes.

**System Action:** The processing of the BSIDS named in the message is terminated. If this is the last (or only) BSIDS to be processed by this job, the job is terminated.

**User Response:** Refer to **DB2 Utility Guide and Reference** for information on required JCL statements. Correct the JCL and rerun the job.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of **DB2 Utility Guide and Reference** for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNJ438I**  
**csect-name THE xxx VALUE MUST END WITH ‘yyy’**

**Explanation:** The STARTRBA or ENDRBA value specified on the NEWLOG statement is invalid. ‘xxx’ is either STARTRBA or ENDRBA, depending on which parameter is invalid. If ‘xxx’ equals STARTRBA, then ‘yyy’ equals ‘000’ and if ‘xxx’ equals ENDRBA, then ‘yyy’ equals ‘FF’.

**System Action:** The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

**User Response:** Correct the control statement and rerun the utility.

---

**DSNJ439I**  
**csect-name NEW FUNCTION MODE REQUIRED FOR xxxxxx OPERATION**

**Explanation:** An attempt was made to run a log utility requiring New Function mode while DB2 was in Compatibility mode or Enabling New Function mode.

DB2 must be in New Function mode before the utility program can run successfully. xxxxxx is the name of the attempted operation requiring New Function mode.

**System Action:** The program will terminate with no action taken.

**System Programmer Response:** Convert DB2 to New Function mode and retry the program.

---

**DSNJ440I**  
**BSDS HAS ALREADY BEEN CONVERTED, DDNAME=nnnnnnnn**

**Explanation:** This message occurs when the BSIDS conversion program DSNJCNVB detects that the BSIDS data set that was specified by DDNAME nnnnnnnn has already been converted.

**System Action:** If only SYSUT1 was specified, or both SYSUT1 and SYSUT2 data sets have already been converted, the program will terminate with no action taken. In the case where both are specified, but only SYSUT1 was previously converted, the program will continue to process the conversion for SYSUT2.

**System Programmer Response:** No further action is necessary.

---

**DSNJ441I**  
**INVALID BSDS CONVERSION, DDNAME=xxxxxx**

**Explanation:** This message is issued when a program attempting to access the BSIDS data set encounters an invalid BSIDS. An invalid BSIDS is the result of a failure during a prior attempt to run conversion program DSNJCNVB. xxxxxx is the DDNAME of the BSIDS data set being accessed.

**System Action:** The program will terminate with no action taken.

**System Programmer Response:** The procedure for running program DSNJCNVB includes making a copy of the BSIDS prior to conversion. Restore the BSIDS to the original pre-conversion copy, and retry the conversion. Once the conversion is successful, retry the program.

---

**DSNJ700I**  
**csect_name ERROR ATTEMPTING TO ACCESS BSIDS FOR PEER MEMBER ID= member-id, MEMBER NAME= member-name, REASON-CODE= reason-code.**

**Explanation:** DB2 issues this message to identify the peer member ID, and if known, the peer member name associated with listed DB2 reason code.

**System Action:** An execution unit issues this message and then, if this was an unconditional request, writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates.

**Operator Response:** Collect all relevant diagnostic information.
materials, including SYS1.LOGREC, SVC dump, and console output of peer and host.

**System Programmer Response:** Review the explanation for the associated DB2 reason code for further action.

---

**DSNJ701E**  
**csect-name MEMBER NAME**  
**IN BSDS DOES NOT MATCH MEMBER NAME**  
**IN DB2 SYSTEM PARAMETERS dsnzparm**

**Explanation:** During startup, DB2 detected that the member name listed in its bootstrap data set (BSDS) does not match the member name in the DB2 system parameters load module.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Restore the BSDS or specify a different system parameters load module on the START DB2 command.

---

**DSNJ702E**  
**csect_name GENERIC LU NAME**  
**lu-name IN BSDS DOES NOT MATCH THE GENERIC LU NAME**  
**lu-name ASSOCIATED WITH THE DATA SHARING GROUP.**

**Explanation:** DB2 issues this message during startup when it detects that the generic LU name in the bootstrap data set (BSDS) does not match the generic LU name in the shared communications area (SCA) structure.

**System Action:** DB2 startup continues.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Depending on the accuracy of the BSDS value, take one of the following actions:

- BSIDS value is correct: DB2 startup will automatically replace the generic LU name in the SCA with the correct value. The BSDS for each member of this DB2 data sharing group must specify this same value for generic LU name. If any member specifies a different value for generic LU name, use the change log inventory utility (DSNJU003) to change the generic LU name, as described in [DB2 Utility Guide and Reference](#).

- BSIDS value is not correct: DB2 startup will replace the generic LU name in the SCA. The SCA value will be incorrect when startup is complete. Take the following actions to correct this situation:
  - Stop this DB2 subsystem.
  - Use the change log inventory utility (DSNJU003) to change the generic LU name of this member, as described in [DB2 Utility Guide and Reference](#).

---

**DSNJ703E**  
**csect-name GROUP NAME**  
**IN BSDS DOES NOT MATCH GROUP NAME**  
**IN DB2 SYSTEM PARAMETERS dsnzparm**

**Explanation:** During startup, DB2 detected that the group name listed in its bootstrap data set (BSDS) does not match the group name in the DB2 system parameters load module.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Restore the BSDS or specify a different system parameters load module on the START DB2 command.

---

**DSNJ704I**  
**csect-name NEW MEMBER**(member-name)  
**START-UP NOT ALLOWED WHEN GROUP-RESTART IS REQUIRED FOR GROUP**(group-name).

**Explanation:** One of the following occurred:

- A new member member-name tried to start when a group restart of data sharing group group-name is required.

- A member other than the originating member of a data sharing group attempted to start the new DB2 data sharing group. The originating member of a group is either an existing DB2 subsystem which formed the data sharing group or a new DB2 subsystem which was installed to form the group.

**System Action:** The DB2 subsystem stops.

**Operator Response:** Start a previously active member of this group. When the required group restart is completed, start the new member again.

If this is the very first startup of the group, you must start the originating member first before starting any other member.

---

**DSNJ705I**  
**csect-name THE DB2 SYSTEM PARAMETERS SPECIFY DATA SHARING, BUT THE BSDS SPECIFIES NON-DATA SHARING.**

**Explanation:** The system parameters passed on the DB2 start command specified data sharing, but the bootstrap data set (BSDS) did not indicate this DB2 is a data sharing member.

**System Action:** The DB2 subsystem stops.

**Operator Response:** If this DB2 should be a member of a data sharing group, inform the system programmer. If this DB2 is not a member of a data sharing group, restart DB2 with the correct system parameters load module.
**System Programmer Response:** If this DB2 should be a member of a data sharing group, execute the installation job DSNTIJUZ, which updates the BSDS for data sharing.

If this DB2 is not a member of a data sharing group, reassemble the system parameters load module and specify DSHARE=NO.

If this DB2 is attempting to disable the data sharing group, then reassemble the system parameters load module and specify DSHARE=NO, then execute the installation job DSNTIJGF, and then restart this DB2. Job DSNTIJGF must be used with caution, this will disable the data sharing group. For more information, see Chapter 2 of *DB2 Data Sharing: Planning and Administration*.

**Explanation:** The system parameters passed on the DB2 START command specified non-data sharing, but the bootstrap data set (BSDS) indicates this is a data sharing member.

**System Action:** The DB2 subsystem stops.

**Operator Response:** If this DB2 is a member of a data sharing group, restart DB2 with the correct system parameters load module. If this DB2 is not a member of a data sharing group, inform the system programmer.

**System Programmer Response:** If this DB2 should be a member of a data sharing group, reassemble the system parameters load module and specify DSHARE=YES. If this DB2 is not a member of a data sharing group, execute the installation job DSNTIJGF, which updates the BSDS for non-data sharing.

**Explanation:** DB2 issues this message during startup when it detects that the LOCATION name in the bootstrap data set (BSDS) does not match the LOCATION name in the system communications area (SCA) structure.

**System Action:** DB2 startup continues.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Depending on the accuracy of the BSDS value, take one of the following actions:

- BSDS value is correct: DB2 startup will automatically replace the LOCATION name in the SCA with the correct value. The BSDS for each member of this DB2 data sharing group must specify this same value for LOCATION. If any member specifies a different value for LOCATION, use the change log inventory utility (DSNJU003) to change the LOCATION name, as described in *DB2 Utility Guide and Reference*.

- BSDS value is not correct: DB2 startup will replace the LOCATION name in the SCA. The SCA value will be incorrect when startup is complete. Take the following actions to correct this situation:
  - Stop this DB2 subsystem.
  - Use the change log inventory utility (DSNJU003) to change the LOCATION name of this member, as described in *DB2 Utility Guide and Reference*.
  - Issue START DB2 for this member. START DB2 will correct the LOCATION name contained in the SCA.

**Explanation:** A new data sharing member attempted to join the data sharing group when the data sharing group is in System Recover Pending mode.

**System Action:** DB2 startup terminates.

**Operator Response:** When the data sharing group is no longer in System Recover Pending mode, start the new member again.

**Explanation:** A failure occurred during command processing in an attempt to open an object in the SCA.

**System Action:** Command processing terminates unsuccessfully.

**System Programmer Response:** Obtain SYS1.LOGREC and possible SVC dump for analysis.

**Problem Determination:** Review the DB2 system console for possible DSN7xxxx and/or SVC dump messages that could relate to this problem.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Explanation:** A failure occurred during command processing attempting to read from the SCA.

**System Action:** Command processing terminates unsuccessfully.

**System Programmer Response:** Obtain SYS1.LOGREC and possible SVC dump for analysis.
Problem Determination: Review the DB2 system console for possible DSN7xxxx and/or SVC dump messages that could relate to this problem.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**DSNJ713E** csect-name SCA WRITE FAILURE ENCOUNTERED.

Explanation: A failure occurred during command processing attempting to write to the SCA.

System Action: Command processing terminates unsuccessfully.

System Programmer Response: Obtain SYS1.LOGREC and possible SVC dump for analysis.

Problem Determination: Review the DB2 system console for possible DSN7xxxx and/or SVC dump messages that could relate to this problem.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**DSNJ990I** csect-name SHOWCB ERROR, RETURN CODE = error-code

Explanation: SHOWCB failed with error-code error-code. An error-code of 4 means that the log data set was allocated greater than 4 gigabytes in size, which is not supported.

Severity: 8 (error).

System Action: Processing terminates.

User Response: Notify the system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. Refer to z/OS DFSMS: Macro Instructions for Data Sets. See also MVS/DFP V3R3 Diagnosis Guide for more information about the VSAM procedures.

**DSNJ991I** csect-name START OF LOG DATA SET PREFORMAT FOR JOB job-name step-name

Explanation: The active log data set preformat utility has started.

Severity: 0 (informational)

**DSNJ992I** csect-name LOG DATA SET NAME = data-set-name

Explanation: The indicated data-set-name is to be preformatted.

Severity: 0 (informational)

**DSNJ993I** csect-name LOG DATA SET IS NOT A VSAM DATA SET

Explanation: The input log dataset is not a VSAM data set.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Use the AMS IDCAMS Service to define the active log data set as a VSAM Linear data set.

**DSNJ994I** csect-name VSAM OPEN ERROR, ACBERRFLG = error-code

Explanation: VSAM OPEN failed with the indicated ACB error-code.

Severity: 8 (error) if error is greater than or equal to 128; otherwise, 4 (warning)

System Action: Processing terminates if the error code is greater than or equal to 128; otherwise, processing continues normally.

User Response: Notify the system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. Refer to z/OS DFSMS: Macro Instructions for Data Sets. See also MVS/DFP V3R3 Diagnosis Guide for more information about the VSAM procedures.

**DSNJ995I** csect-name VSAM PUT ERROR,RPLERREG = return-code, RPLERRCD = reason-code

Explanation: VSAM PUT failed with the indicated return-code and reason-code.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Notify system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. Refer to z/OS DFSMS: Macro Instructions for Data Sets. See also MVS/DFP V3R3 Diagnosis Guide for more information about the VSAM procedures.

**DSNJ996I** csect-name LOG PREFORMAT COMPLETED SUCCESSFULLY,nn RECORDS FORMATTED

Explanation: The active log data set has been preformatted successfully. ‘nn’ records (or VSAM control intervals) have been formatted.

Severity: 0 (informational)
DSNJ997I  csect-name LOG PREFORMAT TERMINATED

Explanation:  Preformatting of the active log data set did not complete successfully.

Severity:  8 (error)

System Action:  Processing terminates.

User Response:  Examine other error messages associated with this job.

DSNJ998I  csect-name LOG DATA SET IS NOT EMPTY

Explanation:  The input log data set is not an empty data set. The input data set must be empty to prevent the loss of actual log data.

Severity:  8 (error)

System Action:  Processing terminates.

User Response:  Use the AMS IDCAMS Service to delete and redefine the active log data set or correct the input log data set name.
Chapter 12. DSNL... Messages

DSNL001I  DDF IS ALREADY STARTED
Explanation: The distributed data facility (DFD) was already active when you issued -START DDF command.
System Action: The issued command is not executed.

DSNL002I  DDF IS ALREADY STOPPED
Explanation: The distributed data facility (DFD) had already been stopped when the -STOP DDF command was issued.
System Action: The issued command is not executed.

DSNL003I  DDF IS STARTING
Explanation: The distributed data facility (DFD) -START command is starting.
System Action: DB2 begins processing the -START DDF command.

DSNL004I  csect DDF START COMPLETE
LOCATION locname LU netname.luname GENERICLU netname.gluname DOMAIN domain TCPPORT tcpport RESPORT report

Explanation: The distributed data facility (DFD) started.

locname The LOCATION of the DB2 subsystem.
netname.luname The fully qualified LU name for the DB2 subsystem.
netname.gluname The fully qualified VTAM generic LU name for the DB2 subsystem. The value '-NONE' indicates that no VTAM generic LU name is used by the DB2 subsystem.
domain For non-data sharing systems, domain is the name returned by the DNS for the system's default IP address. For data sharing systems, domain is the name that represents the DB2 group. For the remote DB2 data sharing group, the DRDA requester should use a domain name of the following form:

location.sysplex.domainname

where location is the DB2 location name, sysplex is the sysplex name in the COUPLEExx parmlib member and domainname is the domain name specified in the TCP/IP.DATA file. If you are an MVS requester, the domain name is specified in column IPADDR of catalog table SYSIBM.IPNAMES. If you are a DB2 Connect requester, the CATALOG TCP/IP NODE command (or the equivalent command for your environment) is used to specify the TCP/IP domain name. The value '-NONE' indicates that TCP/IP is not supported, TCP/IP initialization failed, or DB2 has been started in restricted access mode.
tcpport The TCP/IP port number used by this DB2 subsystem to accept incoming DRDA connection requests.
- A zero indicates TCP/IP is not supported. The BSDS DDF record is not configured with a PORT.
- A value of '-NONE' indicates that DB2 will not accept connections on this port. This may be due to specifying 0 for the DSN6SYSP MAXDBAT installation parameter defined in DSNZPARM. For more information, see the "MAX REMOTE ACTIVE" specification of the DSNTIPE installation panel in the DB2 Installation Guide.
report The TCP/IP port number used by this DB2 subsystem to accept incoming two-phase commit resynchronization requests.
A zero indicates TCP/IP is not supported. The BSDS DDF record is not configured with a RESPORT.

System Action: The DDF start up process completed. However, it might fail for reasons specified by messages DSNL013I, DSNL015I, DSNL016I, DSNL017I, DSNL018I, DSNL019I, DSNL700I, or DSNL705I.

System Programmer Response: Use the recommended domain name when configuring network definitions for TCP/IP requesters.

DSNL005I  DDF IS STOPPING
Explanation: The distributed data facility (DFD) -STOP command has been initiated.
System Action: The -STOP DDF command is initiated.

DSNL006I  DDF STOP COMPLETE
Explanation: The distributed data facility (DFD) -STOP command has completed.
System Action: The DDF has stopped.
DSNL007I  DDF IS ABNORMALLY TERMINATING

Explanation: Abnormal termination of the distributed data facility (DDF) has started.

System Action: Abnormal termination of the DDF is starting.

DSNL008I  DDF ABNORMAL TERMINATION COMPLETE

Explanation: Abnormal termination of the distributed data facility (DDF) has completed.

System Action: The DDF has stopped.

DSNL009I  INVALID DDF THREAD logical-unit-of-work-id SPECIFIED

Explanation: No distributed transaction with the specified 'logical-unit-of-work-id' exists.

System Action: The specified thread is not canceled.

User Response: Determine the correct 'logical-unit-of-work-id' of the distributed thread that is to be canceled and then reissue the command.

Problem Determination: Determine the correct value. The -DISPLAY THREAD command can be used to display all distributed activity.

DSNL010I  DDF THREAD logical-unit-of-work-id HAS BEEN CANCELED

Explanation: The distributed data facility (DDF) thread 'logical-unit-of-work-id' was canceled.

If 'logical-unit-of-work-id' is an LUWID (LU network name and an LUW instance number) instead of an LUWID TOKEN, then in rare circumstances more than one DDF thread might be canceled.

This situation only arises when an application accesses the same DB2 server by different access paths (for example, A->B->C and A->D->C). In such a case, multiple threads with the same LUWID exist at the server (for example, C). If CANCEL DDF THREAD is issued at the server specifying this LUWID, every thread at the server with the LUWID is canceled.

System Action: The specified thread is canceled.

DSNL011I  VTAM STOPPING DDF

Explanation: The operator issued a HALT NET command to terminate VTAM.

System Action: The distributed data facility (DDF) -STOP command is initiated.

DSNL012I  VTAM TERMINATING DDF

Explanation: The operator issued a HALT NET QUICK command or a HALT NET CANCEL command, or VTAM is terminating abnormally. This message can be issued any time after -START DDF and occurs when VTAM is stopped, which can occur prior to DDF termination. This message is not issued when DDF terminates normally.

System Action: Termination of the distributed data facility is initiated.

DSNL013I  VTAM OPEN ACB FAILED

ERROR=error-code

Explanation: VTAM returned a nonzero return code after DB2 invoked the OPEN ACB macro instruction during termination of the distributed data facility (DDF). VTAM return codes for OPEN error conditions are defined in VTAM for MVS/ESA Programming.

System Action: Termination of the distributed data facility is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the OPEN ACB failure, correct the error, and issue the -START DDF command.

Problem Determination: Refer to VTAM for MVS/ESA Programming for failure analysis during an OPEN macro instruction.

DSNL014I  VTAM CLOSE ACB FAILED

ERROR=error-code

Explanation: VTAM returned a nonzero return code after DB2 invoked the CLOSE ACB macro instruction during termination of the distributed data facility (DDF). VTAM return codes for CLOSE error conditions are defined in VTAM for MVS/ESA Programming.

System Action: Termination of DDF continues.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the failure, fix the error condition, and then issue the -START DDF command.

Problem Determination: Refer to VTAM for MVS/ESA Programming for failure analysis during a CLOSE macro instruction.

DSNL015I  VTAM SETLOGON FAILED

RTNCD=error-code FDBK2=open-flags

Explanation: VTAM returned a nonzero return code after DB2 invoked the SETLOGON macro during initialization of the distributed data function (DDF). VTAM return codes are defined in VTAM for MVS/ESA Programming.
System Action: Termination of the DDF is started.
Operator Response: Notify the system programmer.

System Programmer Response: Refer to VTAM for MVS/ESA Programming to determine the cause of the failure. After the error is fixed, issue the -START DDF command.

**DSNL016I** DDF RECORD NOT FOUND IN BSDS
Explanation: DDF cannot find the DDF communication record in the BSDS.
System Action: DDF termination process is initiated.
Operator Response: Notify the system programmer.

System Programmer Response: Use the change log inventory to add the DDF communication record to the BSDS.

**Problem Determination:** Collect the following diagnostic item:
- Print the contents of the BSDS using the print log map utility.

**DSNL017I** INVALID DDF RECORD FOUND IN BSDS
Explanation: A invalid or incomplete DDF communication record was found in the BSDS.
System Action: DDF termination process is initiated.
Operator Response: Notify the system programmer.

System Programmer Response: Use the change log inventory to add a valid DDF communication record to the BSDS.

**Problem Determination:** Collect the following diagnostic item:
- Print the contents of the BSDS using the print log map utility.

**DSNL018I** VSAM ERROR READING DDF RECORD IN BSDS RPLERRCD=error-code
Explanation: A VSAM GET command was issued that resulted in a nonzero return code. RPLERRCD 'error-code' is the VSAM return code.
System Action: Termination of the distributed data facility (DDF) is initiated.
Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the failure, fix the error condition, and issue the -START DDF command.

The cause of the failure is dictated by the VSAM return code. The BSDS may have to be recovered by using a backup copy.

**Problem Determination:** Refer to the appropriate VSAM publications.

**DSNL019I** VTAM DOES NOT SUPPORT APPC FUNCTIONS
Explanation: The installed release of VTAM does not support the advanced program-to-program communications (APPC) application program interface (API). The APPC API bit is not set in the VTAM function-list vector in the access-method-support vector list.
System Action: Termination of the distributed data facility (DDF) is initiated.
Operator Response: Notify the system programmer.

System Programmer Response: Determine whether the installed release of VTAM supports the APPC API. If VTAM does not support the APPC API, a VTAM release that supports the APPC API must be installed before the DDF can be started.

**DSNL020I** KEYWORD 'THREAD' PARAMETER FORMAT IN ERROR

**Explanation:** The parameter value specified for the logical-unit-of-work ID on the CANCEL DDF THREAD has an invalid format. The correct form is 'netid.luname.luwanique', where:

- **netid** A 1- to 8-character network ID.
- **luwaname** A 1- to 8-character luname.
- **luwanique** A 12-character hex number.

Luname and luwanique are separated by a '.' delimiter. Netid is optional. If netid is specified, then netid and luname are separated by a '.' delimiter. If netid is not specified, then the '.' delimiter before luname is not present.

System Action: The specified thread is not canceled.

User Response: Determine the correct logical-unit-of-work ID of the distributed thread that is to be canceled and reissue the command.

**Problem Determination:** Determine the correct value. The -DISPLAY THREAD command can be used to display all distributed activity.

**DSNL021I** command ACCEPTED

**Explanation:** The 'command' command has been accepted and asynchronous processing of 'command' has been initiated. The command can only be -START or -STOP the distributed data facility.

System Action: The command was accepted and asynchronous processing has been initiated.
**DSNL022I**  csect-name DDF THREAD logical-unit-of-work-id WAS PREVIOUSLY CANCELED

**Explanation:** A command to cancel the distributed data facility (DDF) thread logical-unit-of-work-id was previously issued. Either the CANCEL DDF THREAD or the CANCEL THREAD command was entered. The thread is currently being canceled. The CANCEL command terminates a thread only if the thread is processing in DB2 or is currently suspended by DB2. The thread might not be processing in DB2 in these situations:

- The thread is processing in the application and has not made a request to DB2. The DISPLAY THREAD command indicates this.
- The user placed the thread on an MVS resource using the ENQUE command. The CANCEL command has no effect on the thread until ENQUE completes and the thread returns to DB2.
- The thread is processing in VTAM and is waiting for a response from a partner. The DISPLAY THREAD DETAIL command indicates this. In this case the thread does not terminate until VTAM returns to DB2.

VTAM commands, which will terminate the session or LU, can be used to cause VTAM to return to DB2.

**DSNL023I**  DDF IS ALREADY IN THE PROCESS OF STARTING

**Explanation:** The distributed data facility (DDF) was starting when the -START DDF or -STOP DDF command was issued.

**System Action:** The issued command is not executed.

**DSNL024I**  DDF IS ALREADY IN THE PROCESS OF STOPPING

**Explanation:** The distributed data facility (DDF) was stopping when the -STOP DDF or -START DDF command was issued.

**System Action:** The -START or -STOP DDF command is not executed.

**DSNL025I**  A DISTRIBUTED AGENT FOR luw-id-token EXISTS AT THIS LOCATION BUT NOT AT SITE WITH LOCATION location AND LU luname

**Explanation:** The DDF error monitor has detected that a distributed agent exists at this location but not at the named partner location.

Where

- **luw-id-token** The logical unit of work ID of the thread followed by an '=' sign and a token which may be used in place of 'luw-id' in any DB2 command that accepts 'luw-id' as input.
- **location** The location name of the partner site where a thread with the same 'luw-id' exists.
- **luname** The 8-character LUNAME of the partner location.

**Operator Response:** Determine if the inconsistency is

**DSNL026I**  luw-id-token appears to be suspended partner location location partner lu luname

**Explanation:** The DDF error monitor has detected that a distributed agent with the specified 'luw-id' at this location and at the named partner 'location' may be suspended indefinitely.

Where

- **luw-id-token** The logical unit of work ID of the thread followed by an '=' sign and a token which may be used in place of 'luw-id' in any DB2 command that accepts 'luw-id' as input.
- **location** The location name of the partner site where a thread with the same 'luw-id' exists.
- **luname** The 8-character LUNAME of the partner location.

**Operator Response:** Determine if the inconsistency is
due to network conditions or a DB2 error. If a DB2 error is suspected, acquire documentation to diagnose the problem.

1. Console dump of DB2 address spaces (ssnmDBM1, ssnmMSTR, ssnmDIST), VTAM, and hung user's address space at the requesting site.
2. Console dump of DB2 address spaces (ssnmDBM1, ssnmMSTR, ssnmDIST), and VTAM as the server site.
3. SYSLOG from requesting and server sites.
4. LOGREC from requesting and server sites.

If an indefinite inconsistency is suspected, use the CANCEL DDF THREAD command to terminate the thread. If CANCEL DDF THREAD fails to terminate the agent, use VTAM commands to terminate the thread conversations.

**Problem Determination:** Use the DB2 DISPLAY THREAD command with DETAIL option at each DB2 subsystem to display information about the agent and its conversations. Use VTAM commands to display additional information about the conversations being used by the thread and also about network conditions.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

| DSNL027I | dis-agent-type DISTRIBUTED AGENT WITH LUW-ID luw-id=token THREAD-INFO thread-info RECEIVED ABEND=abnd REASON=reason |

**Explanation:** A distributed agent has abended at this location. This message will be followed by zero or more occurrences of DSNL028I, each of which describes a remote location where the distributed agent also exists and where diagnostic information might also need to be collected. This message is informational and with the DSNL028I message(s) identifies the remote locations where diagnostic information may have to be collected.

Where

- **dis-agent-type**
  - ‘REQUESTING’ if the thread that abended is an allied thread that has distributed activity and SERVER if the thread that abended is a database access thread.

- **luw-id=token**
  - The logical-unit-of-work ID of the thread followed by an ‘=’ sign and a 5 digit token value which may be used in any DB2 command that accepts luw-id as input.

- **thread-info**
  - Thread-info contains additional identifiers that define more specific information regarding the identity of the thread.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end user.

The following identifiers, separated by a colon(·), are provided:

- The primary authorization-ID associated with the thread.
- Work station name of the end user’s work station. An asterisk (*) indicates that it is not relevant to the thread or was not provided by the client.
- End user’s user-ID. An asterisk (*) indicates that it is not relevant to the thread or was not provided by the client.
- Application name of the end user’s application. An asterisk (*) indicates that it is not relevant to the thread or was not provided by the client.

**DSNL028I** luw-id=token ACCESSING DATA preposition LOCATION location nettype netvalue

**Explanation:** This message follows DSNL027I and identifies a remote location where work might have been occurring for the distributed thread. This message is informational and with the DSNL027I message identifies a remote location where diagnostic information might have to be collected.

- **luw-id=token**
  - The logical unit-of-work ID of the thread followed by an ‘=’ sign and a token which may be used in place of 'luw-id' in any DB2 command that accepts 'luw-id' as input.

- **preposition**
  - ‘FOR’ if the thread is a database access thread and ‘AT’ if the thread is an allied thread that has distributed activity.

- **location**
  - The LOCATION name of the remote site.

- **nettype**
  - Identifies the type of network used to access the remote site. There are two possible values:
    - **LU --** indicates that VTAM is used to connect to the remote site.
DSNL029I  •  DSNL031I

IPADDR --
indicates that TCP/IP is used to
connect to the remote site.

netvalue
The network address of the remote location.
netvalue can be blank.
  • If nettype is LU, netvalue specifies the
    VTAM LU name of the remote location.
  • If nettype is IPADDR, netvalue specifies the
dotted decimal IP address of the remote
location.

Problem Determination:  See message DSNL027I.

DSNL029I  DDF IS NOT INITIALIZED

Explanation:  A -START DDF or -STOP DDF
call was issued before DDF was initialized during
DB2 startup processing.

Operator Response:  Wait for the DSN9022I 'START
DB2' NORMAL COMPLETION message and re-issue
the command.

DSNL030I  csect-name DDF PROCESSING
FAILURE FOR LUWID=luwid
AUTHID=authid REASON=reason

Explanation:  A requesting conversation was
terminated because of DDF processing failure. The
requesting agent is identified by the 'luwid' and 'authid'
values, if they are available. If the authorization ID is not
available, the value '-UNKNOWN' will be displayed. If
the 'luwid' is not available, the string
'netid.luname.000000000000' will be displayed,
describing the LU that made the request.

The reason code in this message describes the nature
of the DDF processing failure.

System Action:  The system will eventually abend the
database access agent.

Operator Response:  Notify the system programmer
for analysis.

System Programmer Response:  If you suspect an
error in DB2, refer to Part 2 of DB2 Diagnosis Guide
and Reference for information on identifying and
reporting the problem.

Problem Determination:  Inspect the reason code and
determine if the system is operating as expected.
Collect the following diagnostic items listed in

DSNL031I  csect-name DRDA EXCEPTION
CONDITION IN RESPONSE FROM
SERVER LOCATION=location FOR
THREAD WITH LUWID=luwid
REASON=reason code ERROR
ID=module_name and source id
CORRELATION ID=correlation-id
CONNECTION ID=connection-id
IFCID=ifcid SEE TRACE RECORD WITH
IFCID SEQUENCE NUMBER=seq-no

Explanation:  A DRDA exception condition was
detected in response data returned from the application
server (AS) with location name location.

A DRDA exception condition, detected at the application
requester, is one of the following:
  • An error reply message and severity code received
    from the server.
  • A parsing error detected while processing a reply
    message or reply data object
  • A DRDA protocol violation. (for example, an object
    returned that is not valid for this command).

The variables have the following meanings:

luwid  The logical unit of work (LUW) ID that identifies
the thread and is also included in the trace record.
reason  The DB2 reason code for this specific error.
error id  The module name concatenated with a 4-byte
source id that uniquely determines the source
within the module where the exception is
encountered.
correlation-id  The correlation identifier of the thread that
detected the DRDA exception condition.
Correlation-IDs beginning with '0nn', where nn
is a number from 01 to 28, identify system
agents.

connection-id  The connection name of the thread that
detected the DRDA exception condition.
ifcid  The IFCID number of the trace record that was
written.
seq-no  The IFCID sequence number associated with the
trace record. The trace record contains
information that can be used to determine what
caused the DRDA exception condition, and is
written to statistics class 4. Statistics class 4 is
directed to SMF by default during DB2
installation, and must be directed to a
permanent destination (SMF or GTF) for the
trace record to be accessible. The message
and the trace record are only written the first
time an error is detected. This avoids flooding
the console and the trace. The sequence number is printed in hexadecimal.

If the sequence number is zero this has been caused by one of two conditions:

- statistics class 4 was not directed to a permanent destination
- statistics class 4 was directed to the resident trace table as its permanant destination.

If this message first occurred because statistics class 4 was not directed to a permanent destination, then the same message recurs later (along with trace record) when the statistics class is directed to the resident table as its permanent destination instead of SMF or GTF.

System Action: An alert was generated. Additionally, the system wrote a trace record with IFCID=ifcid to statistics class 4 that can be used to diagnose the problem.

Problem Determination: Determine the destination of statistics class 4 and locate and print the trace record with SEQUENCE NUMBER=seq-no. The reason code is described in Part 4, “Section 4. DB2 Codes,” on page 771. The description of the reason code can be used in conjunction with the publication Distributed Relational Database Architecture Reference to determine the type of DRDA exception that has been detected. Use the procedures described in Part 4 of DB2 Diagnosis Guide and Reference to determine the problem and which system is responsible.

```
DSNL032I csect-name DRDA EXCEPTION CONDITION IN REQUEST FROM REQUESTER LOCATION=location FOR THREAD WITH LUWID=luid REASON=reason code ERROR ID=module_name and source id IFCID=ifcid SEE TRACE RECORD WITH IFCID SEQUENCE NUMBER=seq-no
```

Explanation: A DRDA exception condition was detected while processing a command or command data received from the application requester (AR) with location name location. A DRDA exception condition, detected at the application server (AS), is a parsing error detected while processing a command or a command data object.

**location**

This field contains one of the following:

- The requester's relational database name (location name)
- The requester's VTAM LU name (<luname>)
- The requester's dotted decimal IP address (nnn.nnn.nnn.nnn)

**luid** The logical unit of work (LUW) ID that identifies the thread and is also included in the trace record, or 'NETID.LUNAME.000000000000' if the error detected involves an invalid FMH5.

**reason** The DB2 reason code for this specific error.

**error id** The module name concatenated with a 4-byte source id that uniquely determines the source within the module where the exception was encountered.

**ifcid** The IFCID sequence number associated with the trace record. The trace record contains information that can be used to determine what caused the DRDA exception condition, and is written to statistics class 4. Statistics class 4 is directed to SMF by default during DB2 installation, and must be directed to a permanent destination (SMF or GTF) for the trace record to be accessible. The message and the trace record are only written the first time an error is detected. This avoids flooding the console and the trace. The sequence number is printed in hexadecimal.

If the sequence number is zero this has been caused by one of two conditions:

- statistics class 4 was not directed to a permanent destination
- statistics class 4 was directed to the resident trace table as its permanent destination.

If this message first occurred because statistics class 4 was not directed to a permanent destination, then the same message recurs later (along with trace record) when the statistics class is directed to the resident table as its permanent destination instead of SMF or GTF.

System Action: An alert was generated and the system wrote a trace record with IFCID=ifcid to statistics class 4 that can be used to diagnose the problem.

Operator Response: Notify the system programmer for analysis.

System Programmer Response: Determine the destination of statistics class 4 and locate and print the trace record with SEQUENCE NUMBER=seq-no. The reason code is described in Part 4, “Section 4. DB2 Codes,” on page 771. The description of the reason code can be used in conjunction with the publication Distributed Relational Database Architecture Reference to determine the type of DRDA exception that has been detected. Use the procedures described in DB2 Diagnosis Guide and Reference to determine the problem and which system is responsible.
DSNL033I  csect-name DDF TERMINATION SCHEDULED DUE TO DETECTION OF ABEND abend REASON reason

Explanation: A severe error was detected during DDF processing. DDF processing can no longer continue so DDF termination has been scheduled. 'Csect-name' is the DB2 module that detected the condition and requested DDF termination.

The abend and reason may also contain additional information about the cause.

abend The abend code or zeros if no abend is associated with the termination of DDF.

If the abend was a DB2 04E abend, the reason code will contain additional information about the abend.

reason The DB2 reason code or zeros if no DB2 reason code is associated with the termination of DDF.

If no abend is associated with the problem, the reason code describes the cause for the termination.

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer for analysis.

System Programmer Response: Determine the cause of the failure. Correct the condition and restart DDF using the -START DDF command.

Problem Determination: If an abend is associated with the failure, a dump may have been provided. LOGREC will also contain information about the abend.

DSNL034E  DDF CANNOT BE STARTED BECAUSE OF BSDS INCONSISTENCIES, ORIGINAL LUNAME=luname1, BSDS LUNAME=luname2, ORIGINAL LOCATION=location1, BSDS LOCATION=location2

Explanation: The LUNAME or the LOCATION name stored in the bootstrap data set (BSDS) was changed since the distributed data facility (DDF) was last started, but DDF still has resynchronization responsibility with one or more partner logical units using the old LUNAME and LOCATION name. Both the original and current BSDS values of LUNAME and LOCATION name are displayed.

luname1 The LUNAME required for resynchronization

luname2 The LUNAME currently stored in the BSDS

location1 The LOCATION name required for resynchronization

location2 The LOCATION name currently stored in the BSDS

System Action: DDF cannot be started until the inconsistencies are corrected.

Operator Response: Inform the database administrator.

Database Administrator Action: You have the following options, depending on whether there is a requirement to change the LUNAME or LOCATION name in the BSDS:

- If the names were changed in error, use the change log inventory (DSNJU003) utility to change the LUNAME and/or LOCATION name back to the correct value. Then START DDF.

- If the name must be changed, you must first remove all of the resynchronization responsibility that DB2 had using the old names. You can purge this information, allow automatic resynchronization to take place, or use a combination of both.

You can purge resynchronization information by using the RESET INDOUBT command with the FORCE option. You can purge all information regardless of partner name (LOCATION (*)), or you can selectively purge by specifying a location name. DDF does not have to be started to use this command. You can use the DISPLAY THREAD command to generate a report of indoubt threads. This report indicates all resynchronization responsibility known by DB2.

If you do not purge the resynchronization information, or only selectively purge, and you want automatic resynchronization to occur before changing the names, you must first use the change log inventory (DSNJU003) utility to change the LUNAME and/or LOCATION name back to the correct value. Then START DDF. At this point, automatic resynchronization begins. You can monitor the progress by periodically using the DISPLAY THREAD command for TYPE (INDOUBT) threads.

Resynchronization does not complete until all needed communications paths are available and all needed partner logical units are available. If you cannot wait for availability, use the RESET INDOUBT command with the FORCE option to purge information associated with unavailable partners.

DSNL035I  DDF CANNOT BE STOPPED BECAUSE AN INDOUBT DATA BASE ACCESS THREAD EXISTS

Explanation: DDF is the connection manager for a database access thread (DBAT) that is indoubt. A STOP DDF MODE(QUIESCE) command is rejected until the indoubt logical unit of work is resolved.
System Action:  DDF is not stopped.

Operator Response:  Inform the database administrator.

Database Administrator Action:  You have the following options:

- Wait for automatic resynchronization to be performed. When this occurs, either message DSNL467I or DSNL415I is displayed.
- After the indoubt thread is resolved, reissue the STOP DDF command.
- Use the DISPLAY THREAD TYPE(INDOUBT) command to find the LOCATION that has coordinator responsibility for the indoubt LUW. Contact that location and determine whether the LUW committed or aborted. Then use the RECOVER INDOUBT command to cause the indoubt DBAT to be resolved with the same decision.
- After the indoubt thread is resolved, reissue the STOP DDF command.
- Issue the STOP DDF MODE(FORCE) command. The indoubt thread remains indoubt and can be resolved by using automatic resynchronization after DDF is started again, or it can be resolved manually as described above.

DSNL036I  DDF THREAD logical-unit-of-work-id SPECIFIED IS INDOUBT

Explanation:  A database access thread that is indoubt cannot be canceled by using the -CANCEL DDF THREAD command.

System Action:  The specified thread is not canceled.

Operator Response:  Use the -DISPLAY THREAD TYPE(‘) command to display all distributed activity.

DSNL037I  csect-name RESET GENERICLU lu SUCCESSFUL

Explanation:  The RESET GENERICLU command successfully purged the VTAM sysplex information from shared memory.

lu  The value supplied on the RESET GENERICLU command

System Action:  The VTAM information contained in the sysplex shared memory for the indicated LU is purged.

DSNL038E  csect-name RESET GENERICLU lu FAILED DUE TO VTAM RTNCD=xx and FDB2=yy

Explanation:  The VTAM CHANGE,OPTCD=(SYN,ENDAFFIN) macro returned an unexpected return code, which is described by the indicated VTAM RTNCD and FDB2 values.

lu  The value supplied on the RESET GENERICLU command
xx  The hexadecimal value of the VTAM RTNCD field
yy  The hexadecimal value of the VTAM FDB2 field

System Action:  VTAM was not able to purge the sysplex shared memory information for the indicated LU.

System Programmer Response:  Refer to VTAM for MVS/ESA Programming for the meaning of the VTAM RTNCD and FDB2 values.

DSNL039E  csect-name RESET GENERICLU lu FAILED DUE TO ACTIVE VTAM SESSIONS

Explanation:  The RESET GENERICLU command was not accepted because one or more active VTAM sessions exist to the indicated LU. All VTAM sessions must be terminated before the command is accepted.

lu  The value supplied on the RESET GENERICLU command

System Action:  The command is rejected.

System Programmer Response:  Terminate the VTAM sessions to the remote LU and reissue the -RESET GENERICLU command.

DSNL040E  csect-name RESET GENERICLU lu FAILED DUE TO INDOUBT RESOLUTION INFORMATION

Explanation:  The RESET GENERICLU command was not accepted because information is currently being retained for resolution of indoubt threads for the indicated partner LU. The DISPLAY THREAD TYPE(INDOUBT) command can be used to view this information.

lu  The value supplied on the RESET GENERICLU command

System Action:  The command is rejected.

System Programmer Response:  Make sure that all indoubt threads at the remote site are resolved before issuing the RESET GENERICLU command.

When DB2 performs automatic indoubt thread resolution, the information contained in the DISPLAY THREAD TYPE(INDOUBT) display is purged at the end of the resynchronization process.

If required, use the -RESET INDOUBT command to manually purge the indoubt resolution information.
**DSNL041E**  
*csect-name DB2 GENERIC LUNAME REQUESTED, BUT REQUIRED VTAM LEVEL IS NOT INSTALLED*

**Explanation:** The DB2 GENERIC LUNAME installation option was specified. This option requires VTAM Version 4 Release 2 or a later release.

**System Action:** The DB2 GENERIC LUNAME installation option is ignored.

**System Programmer Response:** If the DB2 GENERIC LUNAME is required, install VTAM Version 4 Release 2 or a later release.

**DSNL042E**  
*csect-name DB2 SYSPLEX TP WAS INVOKED BY LU lu, BUT REQUIRED MVS LEVEL IS NOT INSTALLED*

**Explanation:** A request for the DB2 syplex transaction program (TP) was received by a DB2 server that is a member of a data sharing group. The DB2 syplex TP is used by the requesting systems to determine which DB2 systems within the group are currently available for DDF conversations.

The DB2 syplex TP uses Work Load Manager (WLM) functions in MVS Version 5 Release 2 or a later release to balance distributed workload among the DB2 systems in the group. Because the required MVS release is not installed or DB2 is not registered with WLM, the DB2 syplex TP is not able to provide the requested information.

*lu* The name of the LU in the network that invoked the DB2 syplex TP

**System Action:** The DB2 syplex TP returns the NETID.LUNAME of the local DB2 system as the only available DB2 server in the group. The requester is not provided the names of other DB2 systems in the group, so all sessions from the requester are routed to the local DB2 server.

**System Programmer Response:** Install MVS Version 5 Release 2 or a later release if you want to have the DB2 syplex TP return multiple NETID.LUNAME values to the requester or refer to the DSNL044I on why DB2 could not register with WLM.

**DSNL043I**  
*csect-name RESET GENERICLU luname INVALID*

**Explanation:** The luname value specified is invalid. The correct format is either a

- 1 to 8 character luname, or
- 1 to 8 character network ID, a period, and a 1 to 8 character luname.

**System Action:** The parameter is ignored. Processing continues with the next luname, if any.

**User Response:** Determine the correct luname and reissue the command.

**DSNL044I**  
*csect-name MVS macname MACRO FAILED WITH RETCODE=xx AND RSNCODE=yy*

**Explanation:** An MVS Workload Manager (WLM) macro returned an unexpected return code, which is described by the indicated RETCODE and RSNCODE values. DDF uses MVS Workload Manager macros to obtain data sharing sysplex routing information for incoming DDF work requests, and to establish an MVS enclave for the execution environment of the distributed thread.

*macname*
The name of the MVS macro that returned the unexpected return code. The possible values are:

- IWMSRSRG: Register with WLM for sysplex routing.
- IWMSRSRS: Request sysplex routing information.
- IWMSRDRS: Deregister with WLM for sysplex routing.
- IWMECR: Create enclave.

The WLM sysplex routing service macros will be appended with the contents of the LOCATION parameter passed to it. The contents of the LOCATION parameter will either be the member’s location name or one of the alias-names being defined to subset the data sharing group. If the member’s location name is displayed, then this member will not participate in WLM workload balancing. If a subsetting alias-name is displayed, then subsetting of the data sharing group by that alias-name will be disabled. However, a connection to this member of the data sharing group will be accepted when using the alias-name instead of the member’s location name.

*xx* The hexadecimal value of the MVS RETCODE field.

*yy* The hexadecimal value of the MVS RSNCODE field.

**System Action:** If a sysplex routing macro failed, then sysplex routing may not be performed in which case, all SQL statements received from the client will be processed by this DB2 subsystem. If an enclave macro failed, the distributed thread may not be able to execute in an MVS enclave, however the distributed thread will continue to execute as an MVS SRB.

**System Programmer Response:** Refer to MVS/ESA Programming: Workload Management Services for the meaning of the MVS RETCODE and RSNCODE values.
DSNL045I  csect-name ICSF macname CALL FAILED WITH RETCODE=return-code AND RSNCODE=reason-code

Explanation: An Integrated Cryptographic Service Facility (ICSF) call returned an unexpected return code, which is described by the indicate RETCODE and RSNCODE values. DDF uses ICSF calls to create connection keys, to generate a shared private key, to encrypt data, and to decrypt data.

macname
The name of the ICSF call that returned the unexpected return code. The possible values are:
- CSNBRNG: Random Number Generate.
- CSNBCKM: Multiple Clear Key Import.
- CSNDPKB: Key Token Build.
- CSNDPKE: Key Encrypt.
- CSNBENC: Encipher data.
- CSNBDECD: Decipher data.

return-code
The hexadecimal value of the ICSF return_code field.

reason-code
The hexadecimal value of the ICSF reason_code field.

System Action: The encryption function cannot be processed.

System Programmer Response: System Programmer Response: If the encryption facility is not installed, then install it before requesting encryption. If the encryption facility is installed, then verify that it is working correctly. Refer to z/OS Integrated Cryptographic Service Facility - Application Programmer’s Guide, Appendix A, ICSF Return Codes and ICSF Reason Codes for further information.

DSNL065I  csect-name CURRENT DDF STATE DOES NOT PERMIT STOP DDF MODE(SUSPEND)

Explanation: The current DDF state does not allow suspend processing to be initiated. DDF must be started for normal processing in order for suspend processing to be initiated.

System Action: The command is not executed.

DSNL066I  csect-name STOP DDF MODE(SUSPEND) COMPLETE

Explanation: DDF suspend processing has completed successfully. DDF has suspended all inbound activity.

System Action: Processing continues normally.

DSNL067I  csect-name CURRENT DDF STATE DOES NOT PERMIT START DDF

Explanation: The current DDF state does not allow START DDF processing to be initiated.

System Action: The command is not executed.

DSNL068I  csect-name START DDF (RESUME PROCESSING) COMPLETE

Explanation: DDF has resumed normal processing.

System Action: Processing continues normally.

DSNL069I  csect-name DDF IS SUSPENDING

Explanation: DDF has initiated suspend processing.

System Action: Processing continues normally.

DSNL070I  csect-name DDF IS RESUMING

Explanation: DDF has initiated resume processing.

System Action: Processing continues normally.

DSNL071I  csect-name WAIT OR CANCEL REQUIRES KEYWORD SUSPEND

Explanation: The WAIT(n) or CANCEL(n) keywords require that MODE(SUSPEND) be specified. For information about the STOP DDF command, see DB2 Command Reference.

System Action: The command is not executed.

DSNL072I  csect-name WAIT TIME EXPIRED, DDF RESUME PROCESSING INITIATED

Explanation: The DDF suspend process has not completed successfully in the period of time specified for the WAIT keyword, so DDF resume processing has been initiated. For information about the STOP DDF command, see DB2 Command Reference.

System Action: DDF resume processing has been initiated.

DSNL073I  csect-name CANCEL TIME EXPIRED, CANCEL ACTIVE DBAT PROCESSING HAS BEEN INITIATED

Explanation: The DDF suspend process has not completed successfully in the period of time specified for the CANCEL keyword so DDF is cancelling all active data base access threads (DBATS). For information about the STOP DDF command, see DB2 Command Reference.

System Action: DDF is attempting to terminate all active database access threads.
DSNL080I  csect DISPLAY DDF REPORT FOLLOWS:

Explanation: This message is issued as a result of the DISPLAY DDF command. This message is always generated as the title for the DISPLAY DDF command report output. It precedes the other messages generated by this command.

System Action: Processing continues normally.

DSNL081I  STATUS=status

Explanation: This message is issued as a result of the DISPLAY DDF command. This message displays the status of DDF where status is

STARTD   Started
STARTG   Starting
STOPDF   Stopped Force. Last stopped abnormally, such as by "Stop DDF Mode(Force)" command
STOPDQ   Stopped Quiesce. Last stopped normally, such as by the "Stop DDF Mode(Quiesce)" command or DDF has not yet been started
STOPGF   Stopping Force. Currently stopping abnormally, such as by the "Stop DDF Mode(Force)" command
SUSPND   Suspended. Currently suspended, such as by the "Stop DDF Mode(Suspend)" command
SUSPNG   Suspending. Currently suspending, such as by the "Stop DDF Mode(Suspend)" command
NOINIT   Not initialized. DDF is not configured. A "DDF STARTUP OPTION" value of "NO" is specified in the DSNTIPR installation panel.

System Action: Processing continues normally.

DSNL082I  LOCATION LUNAME GENERICLUC

Explanation: This message is issued as a result of the DISPLAY DDF command. This message displays the column headings for the DSNL083I message that follows

System Action: Processing continues normally.

DSNL083I  location luname genericluc

Explanation: This message is issued as a result of the DISPLAY DDF command. This message provides the column values for the headings described by the DSNL082I message.

location

The location name of DDF as defined by the "DB2 LOCATION NAME" value in the DSNTIPR installation panel. Also, it is the location value of the BSDS DDF record that is defined by the 'LOCATION' value in the DDF satatement of the DSNUJ003 Change Log Inventory utility. A value of 'NONE' indicates that a location name has not been configured.

This information also appears in message DSNL004I when DDF is started. See the DSNL004I message for additional information.

luname

The DDF LU name. You can determine the LU name from the 'DB2 NETWORK LUNAME' value in the DSNTIPR installation panel. You may also determine the LU NAME from the LU name value of the BSDS DDF record that is defined by the 'LUNAME' value in the DDF statement of the DSNUJ003 Change Log Inventory utility. A value of 'NONE' indicates that an LU name has not been configured.

If an LU name has been configured, then the field will contain the fully qualified LU name that consists of a network ID, a period delimiter, and the LU name. The network ID is determined from VTAM once DDF is started. A network ID of 'NONE' indicates that DDF has not yet ben started, or initialization with VTAM has failed.

This information also appears in message DSNL004I when DDF is started. See the DSNL004I message for additional information.

genericluc

The DDF generic LU name. The generic LU name is determined from the 'DB2 GENERIC LUNAME' value in the DSNTIPR installation panel, and the generic LU name value of the BSDS DDF record which is defined by the 'GENERIC' value in the DDF statement of the DSNUJ003 Change Log Inventory utility. A value of 'NONE' indicates that a generic LU name has not been configured.

If a generic LU name has been configured, then the field will contain the fully qualified generic LU name which consists of a network ID, a period delimiter, and the generic LU name. The network ID is determined from VTAM once DDF is started. A network ID of 'NONE' indicates that DDF has not yet been started, or initialization with VTAM has failed.

This information also appears in message DSNL004I when DDF is started. See the DSNL004I message for additional information.

System Action: Processing continues normally.
**DSNL084I** IPADDR TCPPORT RESPOR

**Explanation:** This message is issued as a result of the DISPLAY DDF command. This message displays the column heading for the DSNL085I message that follows.

**System Action:** Processing continues normally.

**DSNL085I** ip-address tcpport respport

**Explanation:** This message is issued as a result of the DISPLAY DDF command. This message provides the column values for the headings described by the DSNL084I message.

**ip-address**

The IP address of DDF.

During DDF start processing, DDF issues a GetHostId (USP BPX1HST macro) socket call to determine its IP address if the listener ports are defined. A value of '-NONE' indicates that DDF is not configured to use TCP/IP network protocols (see tcpport). DDF has not yet been started, or TCP/IP initialization has failed.

**tcpport**

The SQL listener TCP/IP port number.

The SQL listener port is determined from the 'DRDA PORT' value in the DSNTIP5 installation panel, and the port value of the BSDS DDF record. The 'PORT' value in the DDF statement of the DSNJU003 Change Log Inventory utility defines the port value of the BSDS DDF record.

- A value of 0 indicates that an SQL listener port has not been specified, and DDF is not configured to use TCP/IP network protocols.
- A value of 'NONE' indicates that DB2 will not accept connections on this port. This may be due to specifying 0 for the DSN6SYSP MAXDBAT installaiton parameter defined in DSNZPARM. For more information, see the 'MAX REMOTE ACTIVE' specification in the DSNTIE installation panel in the DB2 Installation Guide. The current 'MAX REMOTE ACTIVE' value can also be seen in theMDBAT value of the DSNL090I message that is included in the 'DISPLAY DDF DETAIL' report.

This information also appears in message DSNL004I when DDF is started. See the DSNL004I message for additional information.

**resport**

The two phase commit resynchronization (resync) listener TCP/IP port number.

The resync listener port is determined from the 'RESYNC PORT' value in the DSNTIP5 installation panel, and the resynchronization port value of the BSDS record. The 'RESPORT' value in the DDF statement of the DSNJU003 Change Log Inventory utility defines the resynchronization port value of the BSDS DDF record. A value of 0 indicates that a resynchronization listener port has not been specified, and DDF is not configured to use TCP/IP network protocols.

This information also appears in message DSNL004I when DDF is started. See the DSNL004I message for additional information.

**DSNL086I** domain-type DOMAIN=domain-name

**Explanation:** This message is issued as a result of the DISPLAY DDF command. This message displays a TCP/IP domain name associated with DDF.

**domain-type**

The type of domain name that is displayed, which can be one of the following:

**SQL**

The domain name is used to accept inbound SQL requests from remote partners. The tcpport value of message DSNL085I message provides the port number that is used to accept inbound connections.

**RESYNC**

The domain name is used to accept inbound two-phase commit resynchronization requests from remote partners. The resport value of message DSNL085I provides the port number that is being used to accept inbound connections.

Normally, the SQL and RESYNC domain names will be the same. However, in data sharing environments, the SQL domain name will be different than the RESYNC domain name. See the [DB2 Data Sharing: Planning and Administration](https://www.ibm.com) manual for more information.

**domain-name**

The domain name associated with the domain type. A value of `-NONE` indicates that the use of TCP/IP is not configured or that TCP/IP initialization has failed.

This information also appears in message DSNL519I and/or message DSNL004I when DDF is started. See the DSNL519I and DSNL004I messages for additional information.

**System Action:** Processing continues normally.
DSNL090I  CONDBAT=condbat
MDBAT=mdbat

Explanation: This message is issued as a result of the DISPLAY DDF DETAIL command. This message displays some of the system parameter information associated with DDF.

- **dt**: DDF thread value. It indicates the "DDF THREADS" value specified in the DSNTIPR installation panel.
  - A - DDF is configured with DDF THREADS ACTIVE
  - I - DDF is configured with DDF THREADS INACTIVE

- **condbat**: Maximum number of inbound REMOTE connections as determined by the "MAX REMOTE CONNECTED" value in the DSNTIPE installation panel.

- **mdbat**: Maximum number of database access threads as determined by the "MAX REMOTE ACTIVE" value in the DSNTIPE installation panel. This effectively determines the maximum number of active slots. That is, the maximum number of concurrent active database access threads that could potentially be executing SQL.

**System Action:** Processing continues normally.

DSNL092I  ADBAT=adbat QUEDBAT=queued
IN1DBAT=in1dbat CONQUED=conqued

Explanation: This message is issued as a result of the DISPLAY DDF DETAIL command.

- **adbat**: Current number of active database access threads. This value increases as new database access threads get created or become active. The value decreases as database access threads terminate or become inactive. When this value reaches or exceeds the **mdbat** value that is indicated in the DSNL090I message, then new or inactive (previously called type 1) database access threads (DBATs), or new or inactive (previously called type 2) connections must be queued.

- **queued**: This value reflects a cumulative counter that is always incremented when the **mdbat** has been reached. When this message is issued, the value for **queued** is equal to the cumulative number of database access threads that have been suspended because the **mdbat** value has been reached. See message DSNL090I for information about the **mdbat** and **adbat** values. Also note that the queued counter is only reset at restart for this DB2 subsystem.

- **in1dbat**: Current number of inactive DBATs (previously called type 1 inactive threads). This value only applies if the **dt** value specified in the DSNL090I message indicates that DDF INACTIVE support is enabled. Any database access threads reflected here can also be observed in the DISPLAY THREAD TYPE(INACTIVE) command report.

- **conqued**: Current number of connection requests that have been queued and are waiting to be serviced. Only applies if the **dt** value that is specified in the DSNL090I message indicates that DDF INACTIVE support is enabled.

These connections can represent newly attached connections, or inactive connections for which a new request has arrived from the client (connections that were represented in the **inacconn** value of the DSNL093I message).

If the maximum number of database access threads has been reached (**adbat** value is equal to or greater than the DSNL090I **mdbat** value) and there are no disconnected database access threads to service the request (see DSNL093I **dsdcbat** value), or if DDF is suspended or suspending (see DSNL081I **status** value), then these requests cannot yet be serviced.

If DDF is suspending or stopped suspended (see DSNL081I **status** value), then these conquered connections will not be processed until DDF is started (resumed). If the **adbat** value is equal to or greater than the DSNL090I **mdbat** value, then these conquered connections will not be processed until another active database access thread releases its slot by either terminating or by moving to the inactive state (see the **in1dbat** or DSNL093I **inacconn** value).

**System Action:** Processing continues normally.

DSNL093I  DSCDBAT=dscdbat IN2CONS=in2cons

Explanation: This message is issued as a result of the DISPLAY DDF DETAIL command.

- **dscdbat**: Current number of disconnected database access threads. Only applies if the **dt** value specified in the DSNL090I message indicates that DDF INACTIVE support is enabled. This is effectively the number of DBAT pool threads. DBAT pool threads are the database access threads that are available to service queued connections requests (see DSNL092I **conqued** value). Database access threads reflected here will also be accounted for in the DSNL092I **adbat** value.
Over time, disconnected DBATs may hold allocation duration locks, such as locks related to DDL. These disconnected DBATs can be terminated by the STOP DDF MODE SUSPEND command, which allows their held allocation duration locks to be released. Stopping DDF with mode SUSPEND allows these disconnected DBATs to be terminated without affecting current or new connections, although activity on these current or new connections will not be processed until DDF is started (resumed). Disconnect DBATs can also be made to terminate when they have been unused for a certain length of time, thus releasing their allocate duration locks. This can be done by adjusting the DBAT pool thread timeout value as described by "POOL THREAD TIMEOUT" in the DSNTIP5 installation panel.

inacinn
Current number of inactive (previously called type 2) connections. This value only applies if the dt value specified in the DSNL090I message indicates that DDF INACTIVE support is enabled. This value represents connections with clients where the client last ended a unit of work (commit or rollback) and thus DB2 changes the state of the connection to inactive. That means that the DBAT is separated from the connection, and the connection becomes inactive while the DBAT is made available to service new client connections or to service new requests on existing client connections. This value is not included in the DSNL092I in1dbat value. When a new request arrives from the client system on the connection, the connection will then be moved to the DSNL092I conquered value. Any connections reflected here can also be observed in the DISPLAY THREAD TYPE(INACTIVE) command report.

System Action: Processing continues normally.

**DSNL099I**  
**csect DISPLAY DDF REPORT COMPLETE**

Explanation: This message indicates that the DISPLAY DDF report successfully completed.

System Action: Processing continues normally.

**DSNL200I**  
**DISPLAY LOCATION REPORT FOLLOWS-**

Explanation: This message is the title for the -DISPLAY LOCATION command report output. It precedes the other messages generated by this command. This message is followed by messages DSNL201I and DSNL202I. The final message for the report is the message DSNL205I.

**System Action:** The -DISPLAY LOCATION command continues normally.

**DSNL201I**  
**LOCATION PRDID LINKNAME REQUESTERS SERVERS CONVS**

Explanation: The column headings for the list of locations generated by the -DISPLAY LOCATION command are displayed. The definitions are listed below:

**Heading**  
**Description**

**LOCATION**  
The location name associated with the remote site

**PRDID**  
Identifies the database product at the location

**LINKNAME**  
The VTAM LU name associated with the remote location

**REQUESTERS**  
The number of agents at this site that are requesting data from the remote location

**SERVERS**  
The number of agents at this site that are acting as a server to the remote location

**CONVS**  
The total number of conversations in use between this site and the remote location

See message DSNL201I for more specific description of these items.

The message number and subsystem recognition character are not included in this message.

**System Action:** Processing continues normally.

**DSNL202I**  
**LOCATION PRDID LINKNAME REQUESTERS SERVERS CONVS**

Explanation: This message lists the status of communications between a remote location and this DB2 subsystem. Information about the status appears below:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>LOCATION</strong></td>
<td>A 16-byte name for the remote site.</td>
</tr>
<tr>
<td><strong>PRDID</strong></td>
<td>Identifies the database product at the location in the form nnnvrm.</td>
</tr>
<tr>
<td>• nnn</td>
<td>Identifies the database product. E.g., DSN=DB2.</td>
</tr>
<tr>
<td>• vv</td>
<td>Product version.</td>
</tr>
<tr>
<td>• rr</td>
<td>Product release.</td>
</tr>
<tr>
<td>• m</td>
<td>Product modification level.</td>
</tr>
</tbody>
</table>
**DSNL203I**  L203-SYSTASK SESSID A ST TIME

**Explanation:** This message indicates that the DB2 system thread is being processed. It provides details about the threads and conversations associated with the remote location.

**Systask**
Describes the DB2 system threads as follows:
- SYSCON-x
  Where x =
  - O: The system thread that manages 'outbound' DB2 system conversations.
  - I: The system thread that manages 'inbound' DB2 system conversations.

When DB2 is communicating with other DB2 locations using system-directed access, DB2 establishes 'system conversations' to the remote DB2 location. DB2 uses these conversations internally. The conversations created are one directional. That is, DB2 has a conversation that it uses to send information to the remote site, and another that it uses to receive information from the remote site. A DB2 system thread is created to manage 'outbound' (used for sending) conversations and another to manage 'inbound' (used for receiving) conversations.

- RESYNC
A conversation used to resynchronize a unit of work that encountered a previous thread or communication error. There can be one entry representing each thread needing resynchronization with the remote site.

**Sessid**
Two possible values can appear in this column:

1. For VTAM network connections, this column contains the VTAM-defined session instance identifier of the session on which the conversation is executing. If the session identifier is not applicable, this field contains zeros.

   VTAM does not supply the entire session id to DB2. The first two digits of the session id are incorrect. Therefore, the session id, as presented in this message, is not acceptable in VTAM commands. Use the VTAM DISPLAY NET,ID=db2-luname,SCOPE=ACT command to obtain the full session ID. The DISPLAY NET command lists all sessions (SID) for the
DB2 logical unit. Scan the DISPLAY NET output for the complete SID.

2. For TCP/IP network connections, this column contains a string of the form 'local:remote', where:
   - local -- specifies the local DB2 system's TCP/IP port number
   - remote -- specifies the remote partner's TCP/IP port number

active One of the following:
- V The conversation is active within VTAM or TCP/IP.
- W The conversation is suspended in DB2 waiting for VTAM or TCP/IP notification that the function is complete.
  Blank, otherwise.

status Status of the conversation:
- A Conversation in allocation.
- C Session limits are being negotiated with the partner (CNOS) prior to conversation allocation.
- D Conversation in deallocation.
- R Receiving.
- S Sending.
  Blank otherwise.

time The timestamp (yydddhhmmssth) of the last message sent or received on the conversation.

The message number and subsystem recognition character are not included in this message. However, L204 is included in the message text to identify the message.

System Action: Command processing continues

DSNL205I DISPLAY LOCATION REPORT COMPLETE

Explanation: This message follows messages DSNL200I, DSNL201I, and DSNL202I and indicates that the -DISPLAY LOCATION report successfully completed.

The message number and subsystem recognition character are not included in this message.

System Action: Processing continues normally.

DSNL206I csect-name named-command COMMAND INVALID, DDF NOT STARTED

Explanation: The 'named-command' command was issued before the distributed data facility (DDF) was started. The 'named-command' command executes successfully only if the DDF is operating.

System Action: Processing continues normally.

DSNL207I DISPLAY LOCATION NO LOCATIONS FOUND

Explanation: The -DISPLAY LOCATION command was unable to find any locations associated with the specified list of locations. If all locations were specified, there is no distributed activity.

System Action: Processing completed normally.

User Response: If a location list was specified, reissue the -DISPLAY LOCATION command using the LOCATION(‘) parameter to display information for all locations, if desired.

DSNL208I DISPLAY LOCATION TERMINATED WITH MAX LINES

Explanation: The message indicates the -DISPLAY LOCATION report was truncated. The report was generated in response to a command from an MVS console and more than 254 response messages were generated. Only 254 response messages are returned.

System Action: Command processing completes. The truncated report is written to the MVS console.

User Response: Reissue the -DISPLAY LOCATION request specifying a specific location or list of locations.

DSNL400E INDOUBT THREAD RESOLUTION WITH COORDINATOR location SHOWS HEURISTIC DAMAGE FOR luwid=token - REMOTE COMMIT VERSUS LOCAL ABORT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=207 AND IFCID SEQUENCE NUMBER=seq-no1 AND IN TRACE RECORD WITH IFCID=203 AND IFCID SEQUENCE NUMBER=seq-no2

Explanation: DB2 has participant responsibility in the logical unit of work identified by 'luwid=token'. Resolution with the coordinator identified by 'location' shows heuristic damage occurred. The DB2 thread representing the logical unit of work was previously resolved using the RECOVER INDOUBT command. The action taken was to abort the thread. Subsequently, communication was reestablished with the coordinator and resolution shows that the coordinator committed the thread.
  - The application was told that commit succeeded.
DSNL401E

- Any resources updated at the coordinator were committed.
- Updated resources at this DB2 were rolled back.

location
The field contains one of the following:
- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid=token
The global logical unit of work id and the local token that identify the thread.

seq-no1
The IFCID sequence number associated with the 207 trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF. This trace record is written when the heuristic damage condition was detected and contains information about the damage condition.

seq-no2
The IFCID sequence number associated with the 203 trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 203 was not active or it was active with a destination of the resident trace table only. IFCID 203 is a member of statistics class 4, which has a default destination of SMF. This trace record was written when the heuristic decision to commit or abort was made and contains information about the decision, including the names of any downstream participants.

System Action: Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the coordinator completes.

System Programmer Response: Determine the destination of statistics class 4 and locate and print the trace record with SEQUENCE NUMBER='seq-no1'. Call the database administrator.

Database Administrator Action: Correct the damage. This is not an easy task. Since the time of the heuristic action, the data that was aborted with the RECOVER INDOUBT command might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:
- The statistics trace class 4 contains an IFCID 207 trace record. This record contains the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message.
- The DSN1LOGP utility provides a summary report that identifies the table spaces modified by the logical unit of work and any downstream participant locations involved in the logical unit of work.
- DISPLAY THREAD TYPE(INDOUBT) displays the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message. This information continues to appear in the DISPLAY THREAD report until it is purged with the RESET INDOUBT command.

Contact your IBM Support Center for further assistance.

DSNL401E INDOUBT THREAD RESOLUTION WITH COORDINATOR location SHOWS HEURISTIC DAMAGE FOR luwid=token - REMOTE ABORT VERSUS LOCAL COMMIT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=207 AND IFCID SEQUENCE NUMBER=seq-no1 AND IN TRACE RECORD WITH IFCID=203 AND IFCID SEQUENCE NUMBER=seq-no2

Explanation: DB2 has participant responsibility in the logical unit of work identified by 'luwid=token'. Resolution with the coordinator identified by 'location' shows heuristic damage occurred. The DB2 thread representing the logical unit of work was previously resolved with the RECOVER INDOUBT command. The action taken was to commit the thread. Subsequently, communication was reestablished with the coordinator and resolution shows that the coordinator aborted the thread.
- The application was told that commit failed.
- Any resources updated at the coordinator were rolled back.
- Updated resources at this DB2 were committed.

location
The field contains one of the following:
- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid=token
The global logical unit of work id and the local token that identify the thread.

seq-no1
The IFCID sequence number associated with the 207 trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF. This trace record is written
when the heuristic damage condition was detected and contains information about the damage condition.

seq-no2
The IFCID sequence number associated with the 203 trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 203 was not active or it was active with a destination of the resident trace table only. IFCID 203 is a member of statistics class 4, which has a default destination of SMF. This trace record was written when the heuristic decision to commit or abort was made and contains information about the decision, including the names of any downstream participants.

System Action: Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the coordinator completes.

System Programmer Response: Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER=’seq-no1’. Call the database administrator.

Database Administrator Action: Correct the damage. This is not an easy task. Since the time of the heuristic action, the data that was committed with the RECOVER INDOUBT command might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:

- The statistics trace class 4 contains an IFCID 207 trace record. This record contains the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message.
- The DSN1LOGP utility provides a summary report that identifies the table spaces modified by the logical unit of work, and any downstream participant locations involved in the logical unit of work.
- DISPLAY THREAD TYPE(INDOUBT) displays the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message. This information continues to appear in the DISPLAY THREAD report until it is purged with the RESET INDOUBT command.

Contact your IBM Support Center for further assistance.

manually resolved the indoubt thread identified by '
luwid=token'. The action taken was to abort the thread.
This is inconsistent with the commit decision of the
coordinator.

- The application was told that commit succeeded.
- Any resources updated at the participant were rolled
back.
- Updated resources at this DB2 were committed.

**location**
The relational database name (location-name),
SNA LU name (<luname>), or dotted decimal
IP address of the participant.

**luwid=token**
The global logical unit of work id and the local
token that identify the thread.

**seq-no**
The IFCID sequence number associated with
the trace record. The sequence number is
printed in hexadecimal format. If the sequence
number is zero, IFCID 207 was not active or it
was active with a destination of the resident
trace table only. IFCID 207 is a member of
statistics class 4, which has a default
destination of SMF.

**System Action:** The indoubt thread remains indoubt.
Alert A003 is generated. A trace record whose
IFCID=206 is written.

**System Programmer Response:** This is an
APARable error, probably at the coordinator, but
possibly at the DB2 participant. The DB2 documentation
required is contained in the statistics class 4 trace
record that was written. Determine the destination of
statistics class 4. Locate and print the trace record with
SEQUENCE NUMBER=‘seq-no’.

Call the database administrator.

**Database Administrator Action:** DB2 does not attempt
to automatically resolve the indoubt thread. The indoubt
thread must be manually resolved. The commit or abort
decision made at the coordinator must be determined
so that the same decision can be made at this
participant DB2.

Contact the database administrator at the coordinator
location to determine whether the thread with
LUWID=luwid committed or aborted.

If the coordinator system is another DB2, the following
steps can be taken at the DB2 coordinator to determine
the commit or abort decision.

1. If the coordinator DB2 system is running and a DB2
   conditional restart was not performed since the error
   was detected at this (the participant) location, ask
   the database administrator at the DB2 coordinator
   location to issue one of the following DISPLAY
   THREAD TYPE(INDOUBT) commands:
   - A -DISPLAY THREAD TYPE(INDOUBT), using
     the LOCATION keyword and specifying the
     location name of the local DB2.
   - A -DISPLAY THREAD TYPE(INDOUBT)
     LUWID=luwid

   If a thread with LUWID=luwid appears in the display,
   then the display also includes the commit or abort
decision. If no thread with LUWID=luwid appears in
the display, the thread was aborted.

2. If the DB2 coordinator is down, or if a conditional
   restart was performed there, ask the database
   administrator at the DB2 coordinator to run
   DSN1LOGP, specifying SUMMARY(ONLY) FILTER
LUWID(luwid). The output from DSN1LOGP includes the commit or abort decision.

Use the RECOVER INDOUBT command at this (the participant) location to resolve the indoubt thread.

**DSNL405I** THREAD luwid=token PLACED IN INDOUBT STATE BECAUSE OF COMMUNICATION FAILURE WITH COORDINATOR location. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=209 AND IFCID SEQUENCE NUMBER=seq-no

**Explanation:** During execution of the two phase commit protocol with the coordinator identified by 'location', communication failed. Phase 1 of the protocol completed and the thread is prepared for either commit or abort.

The thread is placed in the indoubt state and appears in a DISPLAY THREAD TYPE (INDOUBT) report. Periodic attempts are made to reestablish communication with the coordinator for automatic indoubt resolution. If successful, message DSNL407 or DSNL415 is written.

luwid=token
The global logical unit of work id and the local token that identify the thread.

location
The field contains one of the following:
- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

seq-no
The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 209 was not active or it was active with a destination of the resident trace table only. IFCID 209 is a member of statistics class 4, which has a default destination of SMF.

**System Action:** Alert A006 is generated. A trace record whose IFCID=209 is written.

**Operator Response:** If message DSNL407 or DSNL415 for the LUWID specified in the DSNL405 message does not appear in a reasonable amount of time, call the system programmer.

**System Programmer Response:** Determine the cause of the communication failure and have the problem fixed. DB2 periodically attempts to reestablish communication. If the problem cannot be fixed in a reasonable amount of time, call the database administrator. Manual resolution of the indoubt thread might be necessary to release locked resources.

**Database Administrator Action:** Take the following actions to resolve this thread using manual means (that is, take heuristic action) if it is necessary to release locks held by this thread.
- Determine the proper commit or abort decision by contacting the database administrator at the coordinator 'location' shown in this message in order to determine whether the thread with LUWID=luwid committed or aborted.

If the coordinator system is another DB2, the following steps can be taken at the DB2 coordinator to determine the commit or abort decision.

1. If the coordinator DB2 system is running and a DB2 conditional restart was not performed since the error was detected at this (the participant) location, ask the database administrator at the DB2 coordinator location to issue one of the following DISPLAY THREAD TYPE (INDOUBT) commands:
   - A -DISPLAY THREAD TYPE (INDOUBT), using the LOCATION keyword and specifying the location name of the local DB2.
   - A -DISPLAY THREAD TYPE (INDOUBT) LUWID(luwid)

   If a thread with LUWID=luwid appears in the display, then the display also includes the commit or abort decision. If no thread with LUWID=luwid appears in the display, then the thread was aborted.

2. If the DB2 coordinator is down or if a conditional restart was performed there, ask the database administrator at the DB2 coordinator to run DSN1LOGP, specifying SUMMARY(ONLY) FILTER LUWID(luwid). The output from DSN1LOGP includes the commit or abort decision.
   - Use the RECOVER INDOUBT command to commit or abort the thread.

**DSNL406I** THREAD luwid=token AT PARTICIPANT location MAY BE INDOUBT BECAUSE OF A COMMUNICATION FAILURE. DB2 COMMITTED THE THREAD. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=209 AND IFCID SEQUENCE NUMBER=seq-no

**Explanation:** During execution of the two phase commit protocol with the participant identified by 'location', communications failed. Phase 1 of the protocol completed with the participant, which is prepared to either commit or abort. The decision to commit the thread was made, but cannot be communicated to the participant at this time. The participant is indoubt.

DB2 becomes responsible for indoubt resolution with the participant. This responsibility appears in a DISPLAY THREAD TYPE (INDOUBT) report. Periodic attempts are made to reestablish communication with
the participant for automatic indoubt resolution. If successful, message DSNL423 is written.

\textbf{luwid=token}

The global logical unit of work id and the local token that identify the thread.

\textbf{location}

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

\textbf{seq-no}

The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 209 was not active or it was active with a destination of the resident trace table only. IFCID 209 is a member of statistics class 4, which has a default destination of SMF.

\textbf{System Action:}

Alert A006 is generated. A trace record whose IFCID=209 is written.

\textbf{Operator Response:}

If message DSNL423 for the LUWID specified in message DSNL406 does not appear in a reasonable amount of time, call the system programmer.

\textbf{System Programmer Response:}

Determine the cause of the communication failure and have the problem fixed. DB2 periodically attempts to reestablish communication. If the problem cannot be fixed in a reasonable amount of time, call the database administrator. The participant might need to manually resolve the indoubt state to release locked resources.

\textbf{Database Administrator Action:}

If the unit of work with LUWID=luwid is indoubt at 'location', inform the database administrator that the logical unit of work with LUWID=luwid was committed to assist in manual resolution of the indoubt thread at 'location'.

\textbf{DSNL407I} \hspace{1em} \textbf{AUTOMATIC RESOLUTION OF}

\textbf{luwid=token WITH COORDINATOR location RESULTED IN COMMIT}

\textbf{Explanation:}

The identified indoubt logical unit of work was automatically resolved by communication with the coordinator location. After automatic resolution, this message is issued if message DSNL405 was previously issued to report the thread as indoubt. This message is not issued if message DSNL405 occurs in one restart of DDF or DB2, and automatic resolution occurs in a different restart of DDF or DB2.

\textbf{luwid=token}

The global logical unit of work id and the local token that identify the thread.

\textbf{location}

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

\textbf{System Action:}

Processing continues normally.

\textbf{DSNL408I} \hspace{1em} \textbf{INDOUBT THREAD RESOLUTION WITH COORDINATOR location SHOWS HEURISTIC DAMAGE AT PARTICIPANT location FOR luwid=token - COORDINATOR COMMIT VERSUS PARTICIPANT ABORT. INFORMATION Recorded in Trace Record with IFCID=207 AND IFCID SEQUENCE NUMBER=seq-no}

\textbf{Explanation:}

DB2 has participant responsibility in the logical unit of work identified by 'luwid=token' for the coordinator at COORDINATOR 'location' and coordination responsibility in the same logical unit of work for the participant at PARTICIPANT 'location'. Heuristic damage occurred.

- The application was told that commit succeeded.
- Any resources updated at the coordinator and at this DB2 were committed.
- Updated resources at the participant were rolled back.

\textbf{location}

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

\textbf{luwid=token}

The global logical unit of work id and the local token that identify the thread.

\textbf{seq-no}

The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF.

\textbf{System Action:}

Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the coordinator completes.

\textbf{System Programmer Response:}

Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER=`seq-no`. Call the database administrator.

\textbf{Database Administrator Action:}

Inform the database
Contact your IBM Support Center for further assistance.

**DSNL409I**  
**INDOUBT THREAD RESOLUTION WITH COORDINATOR 'location' SHOWS HEURISTIC DAMAGE AT PARTICIPANT 'location' FOR luwid-token - COORDINATOR ABORT VERSUS PARTICIPANT COMMIT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID 207 AND IFCID SEQUENCE NUMBER=seq-no**

**Explanation:** DB2 has participant responsibility in the logical unit of work identified by 'luwid-token' for the coordinator at COORDINATOR 'location' and coordination responsibility in the same logical unit of work for the participant at PARTICIPANT 'location'. Heuristic damage occurred.

- The application was told that commit failed.
- Any resources updated at the coordinator and at this DB2 were rolled back.
- Updated resources at the participant were committed.

**location**
The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

**luwid-token**
The global logical unit of work id and the local token that identify the thread.

**seq-no**
The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF.

**System Action:** Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the coordinator completes.

**System Programmer Response:** Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER=seq-no. Call the database administrator.

**Database Administrator Action:** Inform the database administrator at the coordinator 'location' and at the participant 'location' of the problem.

Correcting the damage at the participant is not an easy task. Since the time of the heuristic action, the data that was committed using manual means might have been used by many applications - read and/or write.

Correcting the damage might involve reversing the effects of these applications as well. The following information that is available at DB2 might be helpful in correcting the problem:

- The statistics trace class 4 contains an IFCID 207 trace record. This record contains the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message.

- The DSN1LOGP utility provides a summary report that identifies the table spaces modified by the logical unit of work at the local DB2 as well as any downstream participant locations involved in the logical unit of work. This information, while not directly related to the damage at the participant, might be useful in determining the scope of the problem.

- DISPLAY THREAD TYPE(INDOUBT) displays the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message. This information continues to appear in the DISPLAY THREAD report until it is purged with the RESET INDOUBT command.

Contact your IBM support center for further assistance.
**Explanation:** An attempt to make a warm start connection with a partner was rejected because the partner specified a different set of sync point parameters than the ones that were in use when communications were lost. DB2 has knowledge of indoubt threads that involve the partner as either the coordinator or a participant. This error might be a recoverable error if the partner can restart with the original sync point parameters. If this is not possible, then the partner must perform a cold start connection with DB2.

**location**  
The 'location' with which the connection failed: either the relational database name (location-name) or the logical unit name (<luname>) of the partner.

**oldourname**  
The log name for this DB2 subsystem. This value is null if the partner did not initiate the log name exchange.

**newourname**  
The log name for this DB2 subsystem, as remembered by our partner and sent to us in the attempted warm start connection. This value is null if the partner did not initiate the log name exchange.

**oldtheirname**  
The log name used by the partner during the last connection, as remembered by DB2.

**newtheirname**  
The log name used by the partner in the attempted warm start connection.

**oldpa**  
The sync point protocol used during the last connection, as remembered by the DB2 (PA - Presumed Abort, PN - Presumed Nothing).

**newpa**  
The sync point protocol used during the last connection, as remembered by the partner (PA - Presumed Abort, PN - Presumed Nothing).

**oldfb**  
The use of the PS header byte 2 during the last connection, as remembered by DB2 (F - used as flag byte, N - not used as flag byte).

**newfb**  
The use of the PS header byte 2 during the last connection, as remembered by the partner (F - used as flag byte, N - not used as flag byte).

**oldccls**  
Whether the luname of the conversation correlator was exchanged as part of the sync point protocol during the last connection, as remembered by DB2. (E - was exchanged, N - was not exchanged).

**newccls**  
Whether the luname of the conversation correlator was exchanged as part of the sync point protocol during the last connection, as remembered by the partner (E - was exchanged, N - was not exchanged).

**seq-no**  
The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 0205 was not active or it was active with a destination of the resident trace table only. IFCID 0205 is a member of statistics class 4, which has a default destination of SMF.

**System Action:** The connection with the partner is rejected. Alert A002 is generated. DB2 retains indoubt knowledge.

**System Programmer Response:** Call the database administrator.

**Database Administrator Action:** Contact the database administrator at the partner 'location' and determine if it is possible for the partner to perform a warm start with same sync point parameters as ours ('oldourname', 'oldtheirname', 'oldpa', 'oldfb', 'oldccls'). If this is possible, the next attempt to connect will succeed.

If this cannot be done, then there are two other possible solutions:

- Have the partner 'location' perform a cold start connection with this DB2 subsystem.
- Use the RESET INDOUBT command with the FORCE option in conjunction with the LOCATION parameter to cause the next connection with the partner to be a cold start connection.

**Explanation:** DB2 has participant responsibility for indoubt threads. The coordinator informed DB2 that it performed a cold start operation and lost all knowledge of indoubt threads. The indoubt threads at this DB2 must be manually resolved with the RECOVER INDOUBT command.
location

The field contains one of the following:
- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

seq-no

The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 204 was not active or it was active with a destination of the resident trace table only. IFCID 204 is a member of statistics class 4, which has a default destination of SMF.

System Action:
The connection with the partner is accepted. Alert A001 is generated. A trace record whose IFCID=204 is written.

System Programmer Response: Call the database administrator.

Database Administrator Action: DB2 is a participant with one or more indoubt threads where the coordinator is ‘location’. The DBMS at ‘location’ performed a cold start. The DB2 participant assumes that the coordinator recovery log was lost or damaged and indoubt thread resolution cannot be achieved. There is probably inconsistent data at the coordinator. A list of indoubt threads involving the coordinator ‘location’ can be displayed using the DISPLAY THREAD command for indoubt type threads by including the LOCATION('location') parameter in the command.

The heuristic decision (that is, to commit or abort the logical unit of work) should be coordinated with any other participants. The existence of other participants might not be easy to determine. The information might be available in the coordinators recovery log even though the coordinator performed a cold start. If the coordinator is a DB2, then it might be possible to execute the DSN1LOGP utility to produce a summary report. If this is possible, the following information might be produced:
- The LUWID of the thread.
- The NID used by IMS or CICS to identify the thread.
- The name of all participants.
- The name of an upstream coordinator if the coordinator is also a participant. This could happen when an application requester accesses a DB2 AS using application-directed access, which in turn accesses another DB2 server with system-directed access. (The local DB2 might be the third system in this scenario.)

At this DB2 participant, all indoubt threads coordinated by the cold starting location must be resolved with the RECOVER INDOUBT command. Locked data remains unavailable until resolution. Threads that were already resolved with this command are discarded. Threads not yet resolved are discarded after resolution with the command.

The commit or abort decision provided using the RECOVER INDOUBT command for a logical unit of work are propagated to all downstream participants, if any.

DSNL412I  PROTOCOL ERROR DETECTED IN SYNCPPOINT REQUEST/RESPONSE FROM COORDINATOR location LUWID=luwid=token. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=208 AND IFCID SEQUENCE NUMBER=seq-no

Explanation: DB2 is a participant in the logical unit of work identified by ‘luwid=token’. A protocol error occurred during the SNA sync point exchange with the coordinator identified by ‘location’. The protocol error fits into one of the following categories:
- An unknown SNA PS header was received.
- An SNA PS header was received in the wrong sequence.
- An invalid LU6.2 verb sequence was used to deliver the SNA PS header.
- A DEALLOCATE TYPE(ABEND_SVC) was received from the coordinator, indicating that the coordinator detected a protocol violation in the PS headers transmitted by DB2.

location

Either the relational database name (location-name) or the logical unit name (<luname>) of the coordinator.

luwid=token

The global logical unit of work id and the local token that identify the thread.

seq-no

The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 208 was not active or it was active with a destination of the resident trace table only. IFCID 208 is a member of statistics class 4, which has a default destination of SMF.

If the protocol error was detected before the commit decision, the unit of work at the DB2 system might be indoubt. DB2 does not automatically resolve such an indoubt thread.

If the protocol error was detected after the commit decision, the unit of work either completed commit or abort processing.

System Action: Alert A005 is generated. A trace record whose IFCID=208 is written.
System Programmer Response: This is an APARable error, probably at the coordinator, but possibly at DB2. The DB2 documentation required is contained in the statistics class 4 trace record. Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'.

The database administrator might need to manually resolve the indoubt thread.

Database Administrator Action: Determine if the 'luwid' is indoubt by using the DISPLAY THREAD command for type indoubt threads and including the LUWID('token') parameter in the command. If the thread is indoubt, it must be manually resolved using the RECOVER INDOUBT command. The commit or abort decision made at the coordinator must be determined so that the same decision can be made at DB2.

Contact the database administrator at the coordinator location to determine whether the thread with LUWID=luwid committed or aborted.

If the coordinator system is another DB2, then the following steps can be taken at the DB2 coordinator to determine the commit or abort decision.

1. If the coordinator DB2 system is running and a DB2 conditional restart was not performed since the error was detected at this (the participant) location, ask the database administrator at the DB2 coordinator location to issue one of the following DISPLAY THREAD TYPE(INDOUBT) commands:
   - A DISPLAY THREAD TYPE(INDOUBT), using the LOCATION keyword and specifying the location name of the local DB2.
   - A DISPLAY THREAD TYPE(INDOUBT) LUWID(luwid)

   If a thread with LUWID=luwid appears in the display, then the display also includes the commit or abort decision. If no thread with LUWID=luwid appears in the display, then the thread was aborted.

2. If the DB2 coordinator is down or if a conditional restart was performed there, ask the database administrator at the DB2 coordinator to run DSN1LOGP, specifying SUMMARY(ONLY) FILTER LUWID(luwid). The output from DSN1LOGP includes the commit or abort decision.

If the protocol error is detected before the commit decision, the unit of work is backed out.

If the protocol error is detected after the commit decision, the outcome of the unit of work is unchanged. In this case, the remote participant might be indoubt. DB2 does not automatically resolve the indoubt thread with the partner 'location' after a protocol error is detected.

System Action: Alert A005 is generated. A trace record whose IFCID=208 is written.

System Programmer Response: This is an APARable error, probably at the participant, but possibly at the DB2 coordinator. The DB2 documentation required is contained in the statistics class 4 trace record. Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'.

Call the database administrator. The participant might need to manually resolve the indoubt thread.

Database Administrator Action: The DB2 coordinator does not know the status of the thread at the participant. The DB2 coordinator assumes that it is indoubt and maintains knowledge of the indoubt participant until it is purged with the RESET INDOUBT command. If the thread is indoubt at the participant, it must be resolved using manual (heuristic) means. The status of the thread at the local DB2 (the coordinator) can be determined with the DISPLAY THREAD command for type indoubt threads by including the LUWID('token') parameter in the command.
If the 'participant' location is also a DB2, the RECOVER INDOUBT command can be used at the participant to resolve the indoubt thread.

**DSNL414E**  PROTOCOL ERROR DURING INDOUBT THREAD RESOLUTION WITH PARTICIPANT location
luwid=token
INFORMATION
RECORDED IN TRACE RECORD WITH IFCID=206 AND IFCID SEQUENCE NUMBER=seq-no

**Explanation:** DB2 has coordinator responsibility for the logical unit of work identified by 'luwid=token'. The DB2 thread associated with the logical unit of work is either committed or aborted. A protocol error occurred during indoubt resolution with the participant identified by 'location'.

The thread at the participant remains indoubt. DB2 rejects further attempts to automatically resolve the indoubt thread.

**location**
The relational database name (location-name) of the participant.

**luwid=token**
The global logical unit of work id and the local token that identify the thread.

**seq-no**
The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 206 was not active or it was active with a destination of the resident trace table only. IFCID 206 is a member of statistics class 4, which has a default destination of SMF.

**System Action:** Alert A003 is generated. A trace record whose IFCID=206 is written.

**System Programmer Response:** This is an APARable error, probably at the participant, but possibly at the DB2 coordinator. The DB2 documentation required is contained in the statistics class 4 trace record. Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER=’seq-no’.

Call the database administrator. The participant might need to manually resolve the indoubt thread.

**Database Administrator Action:** The DB2 coordinator maintains knowledge of the indoubt participant until it is purged with the RESET INDOUBT command. If the thread is indoubt at the participant, it must be manually (heuristically) resolved. The status of the thread at the local DB2 (the coordinator) can be determined with the DISPLAY THREAD command for type indoubt threads by including the LUWID('token') parameter in the command.

If the participant is another DB2, the RECOVER INDOUBT command can be used to resolve the indoubt thread.

**DSNL415I**  AUTOMATIC RESOLUTION OF luwid=token WITH COORDINATOR location RESULTED IN ABORT

**Explanation:** The identified indoubt logical unit of work was automatically resolved by communication with the coordinator location. After automatic resolution, this message is issued if message DSNL405 was previously issued to report the thread as indoubt. This message is not issued if message DSNL405 occurs in one restart of DDF or DB2, and automatic resolution occurs in a different restart of DDF or DB2.

**luwid=token**
The global logical unit of work id and the local token that identify the thread

**location**
The field contains one of the following:
- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

**System Action:** Processing continues normally.

**DSNL416I**  COLD START CONNECTION REJECTED BY PARTNER location

**Explanation:** DB2 attempted to make a cold-start connection with a partner location. The partner rejected this attempted connection. DB2 never rejects cold-start connections by partners.

**location**
Either the relational database name (location-name) or the logical unit name (<luname>) of the partner.

**System Action:** The connection was not made.

**System Programmer Response:** Call the database administrator.

**Database Administrator Action:** DB2 is not able to connect the partner 'location' until the partner 'location' allows a cold-start connection with DB2. Contact the database administrator at the partner 'location'.

Contact your IBM Support Center for further assistance.
**DSNL417E**

**csect-name COLD START DETECTED AT COORDINATOR LOCATION location FOR INDoubT THREAD WITH luwid=token. MANUAL RESOLUTION IS REQUIRED. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=204 and IFC SEQUENCE NUMBER=seq-no.**

**Explanation:** DB2 has resync responsibility for the indoubt thread identified. The partner location informed DB2 that it had performed a cold start operation and lost all knowledge of this indoubt thread. This indoubt thread must be manually resolved with the RECOVER INDOUBT command, followed by the RESET INDOUBT command.

**location**

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

**luwid=token**

The logical unit of work id and the local token that identify the thread.

**seq-no**

The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 204 was not active or it was active with a destination of the resident trace table only. IFCID 204 is a member of statistics class 4, which has a default destination of SMF and contains information about a partner's cold start.

**System Action:** Alert A001 is generated. A trace record whose IFCID=204 is written.

**System Programmer Response:** Call the database administrator.

**Database Administrator Action:** DB2 is a participant with one or more indoubt threads where the coordinator is 'location'. The DBMS at 'location' performed a cold start. The DB2 participant assumes that the coordinator recovery log was lost or damaged and indoubt thread resolution cannot be achieved. There may be inconsistent data at the coordinator. A list of indoubt threads involving the coordinator 'location' can be displayed using the DISPLAY THREAD command for indoubt type threads by including the LOCATION('location') parameter in the command.

The heuristic decision (that is, to commit or abort the logical unit of work) should be coordinated with any other participants. The existence of other participants might not be easy to determine. The information might be available in the coordinators recovery log even though the coordinator performed a cold start. If the coordinator is a DB2, then it might be possible to execute the DSN1LOGP utility to produce a summary report. If this is possible, the following information might be produced:

- The LUWID of the thread.
- The NID used by IMS or CICS to identify the thread.
- The name of all participants.
- The name of an upstream coordinator if the coordinator is also a participant. This could happen when an application requestor accesses a DB2 AS using application-directed access, which in turn accesses another DB2 server with system-directed access. (The local DB2 might be the third system in this scenario.)

At this DB2 participant, all indoubt threads coordinated by the cold starting location must be resolved with the RECOVER INDOUBT command. Locked data remains unavailable until resolution. Threads that were already resolved with this command are discarded. Threads not yet resolved are discarded after resolution with the command.

The commit or abort decision provided using the RECOVER INDOUBT command for a logical unit of work are propagated to all downstream participants, if any.

---

**DSNL418E**

**csect-name COLD START DETECTED AT PARTICIPANT LOCATION location FOR INDoubT THREAD WITH luwid=token. POSSIBLE DAMAGE. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=204 and IFC SEQUENCE NUMBER=seq-no.**

**Explanation:** DB2 has coordinator responsibility for the indoubt thread identified. The partner location informed DB2 that it had performed a cold start operation and lost all knowledge of this indoubt thread. There might be damage at the participant.

**location**

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

**luwid=token**

The global logical unit of work id and the local token that identify the thread.

**seq-no**

The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 204 was not active or it was active with a destination of the resident trace table only. IFCID 204 is a
member of statistics class 4, which has a default destination of SMF.

**System Action:** Alert A001 is generated. A trace record whose IFCID=204 is written.

**System Programmer Response:** Call the database administrator.

**Database Administrator Action:** DB2 is the coordinator with indoubt thread resolution responsibility for one or more indoubt logical units of work at 'location'. The DBMS at 'location' performed a cold start. DB2 assumes that the participant recovery log was lost or damaged and indoubt thread resolution cannot be achieved. There is probably inconsistent data at the participant. Minimally, the participant might not completely reflect the final outcome of the threads that were indoubt at the time the failure occurred. A list of indoubt threads involving the partner 'location' can be displayed using the DISPLAY THREAD command for type indoubt threads by including the LOCATION('location') parameter in the command.

Information about the indoubt participant continues to appear in the DISPLAY THREAD TYPE(INDOUBT) report until it is purged with the RESET INDOUBT command.

**DSNL419I** PARTNER location HAS RESOLVED WARM START STATUS AND CONNECTION IS ACCEPTED

**Explanation:** A successful warm start connection was made with a partner. A previous attempt to make a warm start connection with the partner was rejected with a DSNL410I message because the partner specified an incorrect log name.

**location**

Either the relational database name (location-name) or the logical unit name (<luname>) of the partner

**System Action:** The connection was successful. Normal processing continues.

**DSNL420I** COLD START CONNECTION BY PARTICIPANT location ACCEPTED. POSSIBLE DAMAGE. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=204 AND IFCID SEQUENCE NUMBER=seq-no

**Explanation:** DB2 has coordinator responsibility for indoubt threads at a participant and just connected with the participant, which lost all knowledge of indoubt threads because of a previous cold start. There might be damage at the participant.

**location**

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

**seq-no** The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 204 was not active or it was active with a destination of the resident trace table only. IFCID 204 is a member of statistics class 4, which has a default destination of SMF.

**System Action:** The connection with the partner is accepted. Alert A001 is generated. A trace record whose IFCID=204 is written.

**System Programmer Response:** Call the database administrator.

**Database Administrator Action:** DB2 is the coordinator with indoubt thread resolution responsibility for one or more indoubt logical units of work at 'location'. The DBMS at 'location' performed a cold start. DB2 assumes that the participant recovery log was lost or damaged and indoubt thread resolution cannot be achieved. There is probably inconsistent data at the participant. Minimally, the participant might not completely reflect the final outcome of the threads that were indoubt at the time the failure occurred. A list of indoubt threads involving the partner 'location' can be displayed using the DISPLAY THREAD command for type indoubt threads by including the LOCATION('location') parameter in the command.

Information about the indoubt participant continues to appear in the DISPLAY THREAD TYPE(INDOUBT) report until it is purged with the RESET INDOUBT command.

**DSNL421I** SNA XLN PROTOCOL VIOLATION BY PARTNER location. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=0236 AND IFCID SEQUENCE NUMBER=seq-no

**Explanation:** DB2 detected a protocol violation in the SNA Exchange Log Names (XLN) exchange with the partner at the specified location.

**location**

Either the relational database name (location-name) or the logical unit name (<luname>) of the partner that sent the invalid XLN message.

**seq-no** The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 0236 was not active or it was active with a destination of the resident trace table only. IFCID 0236 is a member of statistics class 4, which has a default destination of SMF.
System Action: The attempt to connect with the remote site fails. DB2 writes a trace record with IFCID 0236.

Operator Response: Call the system programmer.

System Programmer Response: Contact the system programmer for the remote site. The invalid XLN message is recorded in the IFCID 0236 trace record. The system logic error that causes the invalid XLN message must be corrected at the remote site.

DSNL422I WARM START CONNECTION BY PARTNER location REJECTED BECAUSE THE PARTNER REMEMBERS OUR LOG NAME INCORRECTLY. OUR LOG NAME is name1 AND THE PARTNER REMEMBERS IT AS name2

Explanation: An attempt to make a warm start connection with a partner was rejected because the partner specified our log name as name2. Our log name is name1, which is the LUNAME of the local DB2. This error might be a recoverable error if the partner can restart with our log name as name1. If this is not possible, then the partner must perform a cold start connection with DB2.

location The 'location' with which the connection failed: either the relational database name (location-name) or the logical unit name (<luname>) of the partner.

name1 Our log name, as remembered by us.

name2 Our log name, as remembered by our partner and sent to us in the attempted warm start connection.

System Action: The connection with the partner is rejected. DB2 retains indoubt knowledge.

System Programmer Response: Call the database administrator.

Database Administrator Action: Contact the database administrator at the partner 'location' and determine if it is possible for the partner to perform a warm start with our log name specified as the LUNAME of this DB2. If this is possible, the next attempt to connect will succeed.

If this cannot be done, then there are two other possible solutions.

- Have the partner 'location' perform a cold start connection with this DB2 subsystem.
- Use the RESET INDOUBT command with the FORCE option in conjunction with the LOCATION parameter to cause the next connection with the partner to be a cold start connection.

---

DSNL423I AUTOMATIC RESOLUTION OF luwid=token WITH PARTICIPANT location RESULTED IN COMMIT

Explanation: The identified indoubt logical unit of work was automatically resolved through communication with the participant location. After automatic resolution, this message is issued if message DSNL406 was previously issued reporting the thread as indoubt. This message is not issued if message DSNL406 occurs in one restart of DDF or DB2, and automatic resolution occurs in a different restart of DDF or DB2.

luwid=token The global logical unit of work id and the local token that identify the thread.

location The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

System Action: Processing continues normally.

---

DSNL424I AUTOMATIC RESOLUTION OF luwid=token WITH PARTICIPANT location RESULTED IN ABORT

Explanation: The identified indoubt logical unit of work was automatically resolved by communication with the participant location. After automatic resolution, this message is issued if message DSNL425 was previously issued reporting the thread as being indoubt. This message is not issued if message DSNL425 occurs in one restart of DDF or DB2, and automatic resolution occurs in a different restart of DDF or DB2.

luwid=token The global logical unit of work id and the local token that identify the thread.

location The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

System Action: Processing continues normally.
DSNL425I THREAD luwid-token AT PARTICIPANT location MAY BE INDOUBT BECAUSE OF A COMMUNICATION FAILURE. DB2 ABORTED THE THREAD.

INFORMATION RECORDED IN TRACE RECORD WITH IFCID=209 AND IFCID SEQUENCE NUMBER=seq-no

Explanation: During execution of the two phase commit protocol with the participant identified by ‘location’, communications failed. Phase 1 of the protocol completed with the participant and it is prepared for either commit or abort. The decision to abort the thread was made, but cannot be communicated to the participant at this time. The participant is indoubt.

DB2 becomes responsible for indoubt resolution with the participant. This responsibility appears in a DISPLAY THREAD TYPE (INDOUBT) report. Periodic attempts are made to reestablish communication with the participant for automatic indoubt resolution. If successful, message DSNL424 is written.

luwid-token The global logical unit of work id and the local token that identify the thread.

location The field contains one of the following:
- The relational database name (location name)
- The VTAM LU name (<luiname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 209 was not active or it was active with a destination of the resident trace table only. IFCID 209 is a member of statistics class 4, which has a default destination of SMF.

System Action: Alert A006 is generated. A trace record whose IFCID=209 is written.

Operator Response: If message DSNL424 for the LUWID specified in message DSNL406 does not appear in a reasonable amount of time, call the system programmer.

Database Administrator Action: If the unit of work with LUWID=luwid is indoubt at 'location', inform the database administrator there that the logical unit of work with LUWID=luwid was aborted to assist in manual resolution of the indoubt thread at 'location'.

DSNL429I INCONSISTENT DDF LOG DATA, THE FIRST CONNECTION WITH EACH REMOTE LOCATION WILL BE A COLD START CONNECTION

Explanation: DB2 detected an inconsistency in the DB2 log during restart operations. Since the log is inconsistent and cannot be trusted, DB2 performs a cold start connection with each partner LU the next time a connection with that LU is attempted. If DB2 has indoubt resolution responsibility either as a coordinator or as a participant, then this information is lost as indicated by messages DSNL438 and/or DSNL439, which might follow this message. This means that:

- All information that DB2 maintained about having coordinator responsibility for remote participants was purged. These remote participants need manual resolution for any indoubt threads for which DB2 was the coordinator. A DSNL439I message is displayed for each indoubt remote participant.
- All information that DB2 maintained about having participant responsibility for remote coordinators was purged. A DSNL438I message is displayed for each database access thread that has a remote coordinator. If a database access thread remains indoubt at the end of restart, then the thread must be manually resolved. A -DISPLAY THREAD (*) TYPE(INDOUBT) LOCATION (*) command provides a report that lists the indoubt threads that need manual resolution.

System Action: Processing continues normally.

System Programmer Response: Call the database administrator.

Database Administrator Action: See the DSNL438I and DSNL439I messages to determine what action to take.

DSNL432I DDF IS COORDINATOR FOR nnnn THREADS WITH mmmm INDOUBT REMOTE PARTNERS

Explanation: This message is issued when DDF is started or stopped, if DDF determines that this DB2 has coordinator responsibility for one or more indoubt threads with one or more partners. This is a summary status message.

nnnn The number of indoubt threads for which DB2 is the coordinator

mmm The number of remote partners where the threads are indoubt

System Action: Processing continues normally.

Operator Response: If the message was issued as a
result of DDF starting, no action is necessary. If the message was issued as a result of DDF stopping, contact the database administrator.

**Database Administrator Action:** If the message was issued as a result of stopping DDF, then DB2 maintained all information necessary to perform automatic resynchronization with partner locations and resolve all indoubt units of work. Issue the START DDF command to initiate this process.

If the message was issued as a result of starting DDF, then DDF started automatic resynchronization.

---

**Explanation:** This message is issued when DDF is started or stopped, if DDF determines that this DB2 has participant responsibility for one or more indoubt threads with one or more partners. This is a summary status message.

**Message:**

```
 nnnn  The number of indoubt threads for which DB2 is the participant

 mmmm  The number of remote partners that have coordinator responsibility
```

**System Action:** Processing continues normally.

**Operator Response:** If the message was issued as a result of DDF stopping, no action is necessary. If the message was issued as a result of DDF starting, contact the database administrator.

**Database Administrator Action:** If the message was issued as a result of stopping DDF, then DB2 maintained all information necessary to perform automatic resynchronization with partner locations and resolve all indoubt units of work. Issue the START DDF command to initiate this process.

If you do not want to perform automatic resynchronization, you can still resolve the indoubt units of work for which DB2 is a participant and which hold database resources locked. Use the DISPLAY THREAD command for type indoubt threads to produce a display that lists these threads. Then use the RECOVER INDOUBT command to either commit or abort these units of work.

To avoid data inconsistency, coordinate this manual resolution with the database administrators at the locations that have coordinator responsibility for each indoubt unit of work. If any of the indoubt units of work at DB2 also have coordinator responsibility for participant locations, then you should notify the database administrators at the participant locations of the commit or abort decision so they can make the same decision.
was in the “must-complete” phase of abort, but abort has not yet completed.

C INCOMMIT: The logical unit of work was in the “must-complete” phase of commit, but commit has not yet completed.

D INDOUBT: The logical unit of work completed the first phase of commit, but DB2 has not yet received the commit or abort decision from the coordinator.

F INFLIGHT: The logical unit of work has not yet completed the first phase of commit and should be backed out.

U UNKNOWN: The status of the logical unit of work is not known to DB2 because of conditional restart.

| seq-no | The IFCID sequence number associated with the trace record. The trace record is written to statistics class 4, which is started to SMF as a default during DB2 installation. Statistics class 4 must be started to a permanent destination (SMF or GTF) for the trace record to be accessible. The sequence number is printed in hexadecimal.
| --- | --- |

**System Action:** Processing continues normally.

**System Programmer Response:** Call the database administrator.

**Database Administrator Action:** The resynchronization information that was purged by DB2 is recorded in this message. To determine the proper commit or abort decision made by the coordinator at 'location', use the status code as follows:

A The correct decision is to abort the logical unit of work.

C The correct decision is to commit the logical unit of work.

D Contact the database administrator at 'location' to determine the correct decision.

F The correct decision is to abort the logical unit of work.

U Contact the database administrator at 'location' to determine the correct decision.

---

<table>
<thead>
<tr>
<th>seq-no</th>
<th>The IFCID sequence number associated with the trace record. The trace record is written to statistics class 4, which is started to SMF as a default during DB2 installation. Statistics class 4 must be started to a permanent destination</th>
</tr>
</thead>
</table>

**Explanation:** DB2 is purging the information related to resynchronization with the remote participant location for the logical unit of work identified by 'luwvid', which is displayed in this message. Automatic indoubt resolution responsibility for this distributed logical unit of work can no longer be performed.

This situation can arise in one of two ways:

- A DB2 conditional restart (other than a DB2 cold start; that is, a DB2 conditional restart with STARTRBA=ENDRBA) is being performed.
- An inconsistency in the DB2 log was detected during DB2 restart processing (indicated by a DSNL429I message).

**location** The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

**luwvid** The global logical unit of work id that identifies the logical unit of work.

**urid** The unit of recovery identifier. This is the RBA on the DB2 recovery log of the log record that marks the beginning of the logical unit of work. This is the earliest RBA required to process the logical unit of work during restart.

**s** Restart status of the logical unit of work. When DB2 came down, the logical unit of work was in one of these states:

A INABORT: The logical unit of work was in the “must-complete” phase of abort, but abort has not yet completed.

C INCOMMIT: The logical unit of work was in the “must-complete” phase of commit, but commit has not yet completed.

D INDOUBT: The logical unit of work completed the first phase of commit, but DB2 has not yet received the commit or abort decision from the coordinator.

F INFLIGHT: The logical unit of work has not yet completed the first phase of commit and should be backed out.

U UNKNOWN: The status of the logical unit of work is not known to DB2 because of conditional restart.
DSNL440I - DSNL442I

(System or GTF) for the trace record to be accessible. The sequence number is printed in hexadecimal.

**System Action:** Processing continues normally.

**System Programmer Response:** Call the database administrator.

**Database Administrator Action:** The resynchronization information that was purged by DB2 is recorded in this message. When communicating the proper commit or abort decision to the database administrator at 'location', use the status code as follows:

- **A** Abort the logical unit of work.
- **C** Commit the logical unit of work.
- **D** See the DSNL438I message produced for the same 'luwid' and 'urid' to determine the coordinator 'location'. Contact the database administrator at 'location' to determine the correct decision.
- **F** Abort the logical unit of work.
- **U** If there is a DSNL438I message for the same 'luwid' and 'urid', proceed as described above under 'D'. Otherwise, there might be information available on the DB2 log that a DSN1LOGP summary report can provide. If this is not successful, contact the IBM Support Center.

---

**DSNL440I csect-name RESET INDOUBT COMMAND SPECIFICATION IN ERROR**

**Explanation:** A RESET INDOUBT command was issued, but the specification of keywords or keyword parameter values was in error.

**System Action:** No indoubt information was purged. System processing continues normally.

**User Response:** One of the following errors was made in the RESET INDOUBT command specification:

- RESET INDOUBT was issued without any other keywords specified. At least one of the following keywords must also be specified: LUNAME, IPADDR, LOCATION, or LUWID.
- RESET INDOUBT was issued with both the LUWID and LOCATION keywords specified, but a list of LOCATION keyword parameter values was specified. When both the LUWID and LOCATION keywords are specified only one LOCATION keyword parameter value is allowed.
- RESET INDOUBT was issued with at least one LOCATION keyword parameter value that began with a '<', but did not end with a '>', or the length of the bracketed value was not 1 to 8 characters. When the LOCATION keyword parameter value is specified in the <luname> format, the luname value must be bracketed with '<' and '>' and be 1 to 8 characters long.
- RESET INDOUBT was issued with an invalid IPADDR keyword parameter value. Verify that the specified IPADDRs are in the proper dotted decimal form, that there is a colon delimiter between the IPADDR and port, and that the port number is valid.

If needed, issue the DISPLAY THREAD TYPE((INDOUBT)) command to display information (including LOCATION, LUWID, and LUNAME values) about all indoubt threads. Correct the RESET INDOUBT command specification, and reissue the command.

---

**DSNL441I KEYWORD 'LUWID' PARAMETER VALUE parmvalue FORMAT IN ERROR**

**Explanation:** A RESET INDOUBT command with the LUWID parameter was issued, but the specified parameter value (parmvalue) has an invalid format for an LUWID. There are two correct formats for the LUWID parameter. The first correct format is called a token, and is a 1 to 5 digit decimal number. The second correct format is 'netid.luname.luwnunique.comseq', where:

- **netid** A 1 to 8 character network ID
- **luname** A 1 to 8 character luname
- **luwnunique** A 12 character hexadecimal number
- **comseq** A 4 character hexadecimal number

All fields in the second correct format must be separated by a period (.) delimiter.

**System Action:** Indoubt information about the specified logical unit of work is not purged from the system.

**User Response:** To determine the correct LUWID value for the unit of work indoubt information that you want to purge, issue the DISPLAY THREAD TYPE((INDOUBT)) command to display all units of work for which indoubt information exists. Then reissue the RESET INDOUBT command, specifying the correct LUWID parameter value.

---

**DSNL442I QUALIFYING INDOUBT INFORMATION FOR LOCATION location NOT FOUND**

**Explanation:** A -RESET INDOUBT LOCATION('location') command was issued, but DB2 has no indoubt information about the specified location.

**System Action:** No indoubt information was purged. System processing continues normally.

**User Response:** Use the -DISPLAY THREAD(*)
TYPE(INDOUBT) LOCATION(*) command to list the locations for which DB2 has indoubt information. After determining the correct location, reissue the command.

**DSNL43I** QUALIFYING INDOUBT INFORMATION FOR LUWID=value NOT FOUND

**Explanation:** A -RESET INDOUBT LUWID('value') command was issued where 'value' is either an luwid or the local token that represents an luwid. Either DB2 has no indoubt information about the specified luwid or token, or DB2 has indoubt information that cannot be purged using the -RESET INDOUBT command with the LUWID option.

**value** The global logical unit of work id or the local token that was specified for the LUWID keyword in the RESET INDOUBT command.

**System Action:** No indoubt information was purged. System processing continues normally.

**User Response:** Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to list the indoubt information known to DB2. If the -DISPLAY THREAD output does not include information about the specified luwid, then that is the reason the message was issued. If the -DISPLAY THREAD output does include information about the specified luwid, this information cannot be purged using the -RESET INDOUBT command with the LUWID option. Refer to the description of each message produced by the -DISPLAY THREAD output that relates to the specified luwid in order to determine how to proceed. After determining the correct luwid or token, reissue the command.

**DSNL44I** QUALIFYING INDOUBT INFORMATION FOR LOCATION location HAS BEEN PURGED

**Explanation:** A -RESET INDOUBT LOCATION(location) command issued to purge indoubt information about the named location completed successfully and the indoubt information was purged.

**location** Either the relational database name (location-name) or the logical unit name (<luname>) that was specified after the LOCATION keyword on the RESET INDOUBT command.

**System Action:** The specified indoubt information was purged. System processing continues normally.

**DSNL44I** QUALIFYING INDOUBT INFORMATION FOR LUWID value HAS BEEN PURGED

**Explanation:** A -RESET INDOUBT LUWID('value') command, which was issued to purge indoubt information about the specified luwid, completed successfully. The indoubt information was purged.

**value** The value specified for the LUWID keyword in the -RESET INDOUBT LUWID(value) command that is being processed.

**System Action:** System processing continues normally.

**DSNL446I** COLD START WILL BE PERFORMED WITH nettype netvalue

**Explanation:** A -RESET INDOUBT LUNAME(luname) FORCE or a -RESET INDOUBT IPADDR(ipaddr) FORCE command issued to force a cold start completed successfully. The next connection with 'luname' or 'ipaddr' is a cold start.

**nettype** Identifies the type of network used to access the remote site. There are two possible values:

- **LU --** indicates that VTAM is used to connect to the remote site.
- **IPADDR --** indicates that TCP/IP is used to connect to the remote site.

**netvalue** The network address of the remote location.

- If **nettype** is LU, **netvalue** specifies the VTAM LU name of the remote location.
- If **nettype** is IPADDR, **netvalue** specifies the dotted decimal IP address of the remote location.

**System Action:** System processing continues normally.

**DSNL447I** CANNOT DELETE ENTRY 'value' BECAUSE THERE IS AN INDOUBT THREAD TO BE RESOLVED FIRST

**Explanation:** A -RESET INDOUBT command was issued with LUNAME(value), IPADDR(value), LOCATION(value), or LUWID(value). The 'value' is an LU name, an IP address, a location, or a LUWID (or its token), that identifies a logical unit of work for which DB2 has participant indoubt resolution responsibility, coordinator indoubt resolution responsibility, or both.

**System Action:** Resynchronization responsibility information was not purged. System processing continues normally.

**User Response:** Use the information in this section to determine the correct action to take. Then issue the proper command to perform that action.

The two most probable causes for the problem are that the -RESET INDOUBT command was issued with the wrong parameters, or that an incorrect 'value' was specified. Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to display the indoubt information known to DB2.
1. If the intent was to purge participant or coordinator indoubt resolution responsibility, then examine the -DISPLAY THREAD output to determine the location name, or names, for which this responsibility is to be purged. Then use the -RESET INDOUBT LUNAME(luname) command with the FORCE option or the -RESET INDOUBT IPADDR(ipaddr) command with the FORCE option to purge this responsibility. 
To determine the luname or IP address and resync port for an upstream coordinator that can be used with the FORCE option, look at the coordinator information from the DSNV408I message in the -DISPLAY THREAD output. There are two tokens associated with the coordinator information that are delimited by a colon (":").
   - The first token is the partner location name or "<luname>" for an SNA connection, or the dotted decimal IP address for a TCP/IP connection (nnn.nnn.nnn.nnn).
   - The second token is the partner LU name for an SNA connection, or the resync port number for a TCP/IP connection.

To determine the luname or IP address and resync port for downstream participants that can be used with the FORCE option, look at the location names from the DSNV408I and DSNV446I messages. There are two or three tokens associated with the participant location which are delimited by a colon (":").
   - The first token is the partner location name.
   - The second token is the partner LU name for an SNA connection, or the dotted decimal IP address for a TCP/IP connection (nnn.nnn.nnn.nnn).
   - The third token only appears if the second token is an IP address in which case the third token is the partner resync port number.

See the description of the -RESET INDOUBT command in [DB2 Command Reference] for more information.

Remember that the FORCE option causes DB2 to purge all knowledge of indoubt resolution responsibility involving the luname or ipaddr specified on the command.

Use caution when using the FORCE parameter to purge participant indoubt information when no errors are precluding automatic resolution. Normally, after the use of the RECOVER INDOUBT command, automatic resolution with the coordinator determines if heuristic damage occurred. This detection is lost if RESET INDOUBT is used before automatic resolution with the coordinator can be achieved.

Use caution when using the FORCE parameter to purge coordinator indoubt information when no errors are precluding automatic resolution. Once the information is purged, any participant that is indoubt is forced to use a heuristic decision process to resolve the indoubt logical unit of work.

2. Examine the -DISPLAY THREAD output. If the value specified in the command (and displayed in the DSNL447I message) is incorrect, determine the correct value and reissue the command using the correct value.

---

**DSNL448I**  UNABLE TO FORCE COLD START WITH nettype netvalue, SESSION STILL EXISTS

**Explanation:** A -RESET INDOUBT LUNAME('luname') FORCE or a -RESET INDOUBT IPADDR('ipaddr') FORCE command was issued to force a cold start, but network connections still exist between DB2 and the partner 'luname' or 'ipaddr'. The information related to this partner was not purged, so a cold start is not performed.

**nettype**
Identifies the type of network used to access the remote site. There are two possible values:

- **LU** – indicates that VTAM is used to connect to the remote site.
- **IPADDR** -- indicates that TCP/IP is used to connect to the remote site.

**netvalue**
The network address of the remote location.

- If nettype is LU, netvalue specifies the VTAM LU name of the remote location.
- If nettype is IPADDR, netvalue specifies the dotted decimal IP address of the remote location.

**System Action:** System processing continues normally.

**User Response:** For SNA, you can use the VTAM command DISPLAY NET to determine the existence of sessions between two logical units. Terminate the sessions by using the VTAM command VARY NET,TERM to allow the RESET INDOUBT to occur. For TCP/IP, terminate all connections to the IP address. Determine the correct luname or ipaddr and reissue the command.

---

**DSNL449I**  DB2 HAS NO INFORMATION RELATED TO LUNAME luname

**Explanation:** A -RESET INDOUBT LUNAME('luname') FORCE command was issued but DB2 has no knowledge of the specified 'luname'.

**luname**
The logical unit name, as defined to VTAM, of the coordinator or participant

**System Action:** No information was purged. System
processing continues normally.

**User Response:** Determine the correct luname as follows:
- Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to determine locations for which DB2 has indoubt responsibility.
- Query the SYSIBM.LOCATIONS table to correlate a location name with an luname. The LINKNAME column contains the luname associated with the location name in the LOCATION column.

Then reissue the command, specifying the correct luname.

---

**DSNL450I**

**Explanation:** The identified DDF thread was in a prepared state waiting for the commit or backout decision of the commit coordinator. The thread cannot be canceled in this state. However, the thread was removed from the active state and placed into the indoubt state. The conversation with the coordinator was deallocated. The thread is now indoubt and appears in the display thread report for indoubt threads. The resources held by the thread continue to be held. Automatic resolution of the indoubt state is attempted periodically. Resources held by the thread are released after indoubt resolution occurs.

**luwid=token**
The global logical unit of work id and the local token that identify the thread

**System Action:** Processing continues normally.

**Operator Response:** If the purpose of canceling this thread was to free the resources held by the thread, call the database administrator.

**Database Administrator Action:** To release the resources held by the indoubt thread before automatic resolution with the coordinator, a manual commit or abort decision can be made with the RECOVER INDOUBT command. First, issue the DISPLAY THREAD command for an indoubt thread report, which includes the subject thread. From this report, determine the name of the coordinator. Contact the coordinator system and find out whether a commit or abort decision was made.

---

**DSNL452I**

**Explanation:** A -RESET INDOUBT LUNAME('luname') command was issued, which was issued to purge indoubt information about the specified luname completed successfully. The indoubt information was purged.

**luname**
The luname specified for the LUNAME keyword in the -RESET INDOUBT LUNAME('luname') command being processed.

**System Action:** The specified indoubt information was purged. System processing continues normally.

---

**DSNL453I**

**Explanation:** A -RESET INDOUBT IPADDR('ipaddr') command was issued, but DB2 has no indoubt information about the specified IP address.

**csect**
The CSECT name of the DB2 module that issued the message

**ipaddr**
The dotted decimal IP address of the coordinator or participant

**System Action:** No indoubt information was purged. System processing continues normally.

**User Response:** Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to list the locations for which DB2 has indoubt information. Entries associated with TCP/IP have a string with this format in the LOCATION field: "nnn.nnn.nnn.nnn".

After determining the correct ipaddr, reissue the command.
**DSNL454I**  
**csect** QUALIFYING INDOUBT INFORMATION FOR IP ADDRESS ipaddr HAS BEEN PURGED

**Explanation:** A -RESET INDOUBT IPADDR('ipaddr') command, which was issued to purge indoubt information about the specified IP address completed successfully. The indoubt information was purged.

**csect** The CSECT name of the DB2 module that issued the message.

**ipaddr** The IP address specified for the IPADDR keyword in the -RESET INDOUBT IPADDR(ipaddr) command being processed.

**System Action:** The specified indoubt information was purged. System processing continues normally.

**DSNL455I**  
**csect** DB2 HAS NO INFORMATION RELATED TO IP ADDRESS ipaddr

**Explanation:** A -RESET INDOUBT IPADDR('ipaddr') FORCE command was issued but DB2 has no knowledge of the specified 'ipaddr'.

**csect** The CSECT name of the DB2 module that issued the message.

**ipaddr** The dotted decimal TCP/IP address of the coordinator or participant.

**System Action:** No information was purged. System processing continues normally.

**User Response:** Determine the correct luname as follows:

- Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to determine locations for which DB2 has indoubt responsibility. Entries associated with TCP/IP locations specify "nnn.nnn.nnn.nnn" in the LOCATION field.

Reissue the command; specify the correct ipaddr.

**DSNL500I**  
**CONVERSATION FAILED TO LOCATION=luname RESOURCE=luname.modename. convid.sessid RTNCD=global vtam primary return code FDBK2=global vtam secondary return code RCPR1=appc-specific primary return code RCSEC=appc-specific secondary return code SENSE=sna sense code

**Explanation:** An advanced program-to-program communications (APPC) conversation failed, or could not be allocated, because a VTAM return code indicates a conversation failure. VTAM return codes are defined in VTAM for MVS/ESA Programming for LU 6.2.

SNA sense codes that start with 00 represent DB2 reason codes. Refer to Part 6, “SNA codes,” on page 1337 for a description of more common SNA sense codes returned to DB2 by VTAM.

The variables that are not return codes are described as follows:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>luname</td>
<td>The VTAM LU name associated with the remote location.</td>
</tr>
<tr>
<td>modename</td>
<td>The logon mode used by DB2 to allocate the conversation.</td>
</tr>
<tr>
<td>sessid</td>
<td>The session identifier given DB2 by VTAM when the conversation was allocated.</td>
</tr>
</tbody>
</table>

**System Action:** All communication to the remote location fails until the limits can be negotiated with the remote location.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Refer to VTAM for MVS/ESA Programming for LU 6.2 for failure analysis or Part 4, “Section 4. DB2 Codes,” on page 771 for information on reason codes.
Part 4, “Section 4. DB2 Codes,” on page 771 for information on reason codes.

**DSNL502I**  
**SYSTEM CONVERSATION FAILED TO LOCATION** locname  
**RESOURCE**=luname.modename.  
**convid.sessid RTNCD=global vtam**  
**primary return code** FDBK2=global vtam  
**secondary return code**  
**RCPRI=appc-specific primary return code**  
**RCSEC=appc-specific secondary return code**  
**code SENSE=sna sense code**

**Explanation:** A system conversation failed, or could not be allocated, because VTAM returned a nonzero return code. VTAM return codes are defined in *VTAM for MVS/ESA Programming for LU 6.2*.

SNA sense codes that start with 00 represent DB2 reason codes. Refer to Part 6, “SNA codes,” on page 1337 for a description of more common SNA sense codes returned to DB2 by VTAM.

The variables are described as follows:

**Variable**  
**locname**  
The location name associated with the remote site.

**luname**  
The VTAM LU name associated with the remote location.

**modename**  
The logon mode used by DB2 to allocate the conversation.

**convid**  
The conversation identifier given DB2 by VTAM when the conversation was allocated.

**sessid**  
The session identifier given DB2 by VTAM when the conversation was allocated.

**System Action:** Communication on the conversation is not allowed.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Refer to *VTAM for MVS/ESA Programming for LU 6.2* for failure analysis or Part 4, “Section 4. DB2 Codes,” on page 771 for information on reason codes.

**DSNL504I**  
**csect-name RESOURCE UNAVAILABLE**  
**REASON=reason TYPE=type**  
**LOCATION=location NAME=name**

**Explanation:** The requested function requires a resource that is currently unavailable. The reason code, type, location, and name identifies the resource.

**Operator Response:** Note the reason, type codes, location, and name.

**Problem Determination:** The reason for the resource’s unavailability is identified by the reason code. The reason codes that appear in this message are described in Part 4, “Section 4. DB2 Codes,” on page 771. Refer to Table 3 in Appendix B, “Problem determination,” on page 1349 for an explanation of resource type codes.

**DSNL510I**  
**csect-name CONVLIMIT NEGOTIATED FROM x TO y WITH LOCATION locname FOR LU luname AND MODE modename**

**Explanation:** The maximum conversation limit is changed for a mode with a remote subsystem. The limit might change when a CNOS request is received from or sent to a remote subsystem, and the limit is determined by VTAM.

**x** The most recent value of CONVLIMIT before the last CNOS request was processed by advanced program-to-program communications (APPC)/VTAM for the specified mode name to the specified location.

**y** The current value of CONVLIMIT for the specified mode name to the specified location.

**locname**  
The location name associated with the remote site that sent the CNOS request to the local DB2 subsystem, or received the CNOS request from the local DB2 subsystem.

**luname**  
The VTAM LU name associated with the remote location that had its CONVLIMIT changed.

**modename**  
The logon mode for the specified location that had its CONVLIMIT changed.

**System Action:** Conversation requests are queued when the maximum conversation limit is reached for a mode to remote subsystem.

**DSNL511I**  
**csect TCP/IP CONVERSATION FAILED TO LOCATION** locname  
**IPADDR=ipaddr PORT=port**  
**SOCKET=socket RETURN CODE=rc**  
**REASON CODE=reasonX**

**Explanation:** A TCP/IP socket call failed with the error condition identified by rc and reason.

**Variable**  
**Description**

**csect**  
The CSECT name of the DB2 module that issued the message.

**locname**  
The location name associated with the remote site.

**ipaddr**  
The IP address of the remote site in dotted decimal format.
DSNL512I

port  The TCP/IP port used by the remote site.

socket The TCP/IP socket call that returned the error.

rc The error condition reported by TCP/IP. The return code values are documented in z/OS UNIX System Services Programming: Assembler Callable Services Reference.

dsn1 System The System Operator call reason.

reason Provides further detail associated with the TCP/IP return code. The reason code values are documented in z/OS UNIX System Services Programming: Assembler Callable Services Reference.

System Action: Communication on the conversation is discontinued.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to z/OS UNIX System Services Programming: Assembler Callable Services Reference for an explanation of the error.

Problem Determination: See System Programmer Response.

DSNL512I  csect TCP/IP socket FAILED WITH RETURN CODE=rcX AND REASON CODE=reasonX

Explanation: A TCP/IP socket call used to establish communication between DB2 and TCP/IP failed.

Variable Description

csect The CSECT name of the DB2 module that issued the message.

socket The name of the TCP/IP socket call that failed.

rc The return code reported by TCP/IP. The return code values are documented in z/OS UNIX System Services Programming: Assembler Callable Services Reference.

reason The reason code reported by TCP/IP. The reason code values are documented in z/OS UNIX System Services Programming: Assembler Callable Services Reference.

System Action: DB2 may periodically retry the socket call to establish TCP/IP communication.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to z/OS UNIX System Services Programming: Assembler Callable Services Reference for an explanation of the error.

• If socket=SETRLIMIT and reason code=1148033C, then you should define DB2 as a superuser. See DB2 Installation Guide for instructions on enabling DDF as a superuser.

• If socket=TCPKEEPALIVE, then DB2 issues this socket call as a result of the TCP/IP KeepAlive value specified in the DB2 parameters module (usually DSNZPARM). You may specify this value by the TCP/IP KEEPALIVE value in the DSNTP5 installation panel. Another way to specify the value is through the TCPKPALV value in the DSN6FAC macro, used to build the DB2 parameters module.

In this situation, processing continues, and DB2 does not retry the socket call. Verify that the TCP/IP stack being used by DB2 contains the required companion support for this function. If not, modify the DB2 parameter module to prevent DB2 from attempting to override the TCP/IP stack value.

• If socket=GETHOSTBYADDR(ip-address), then DB2 invoked a TCP/IP GetHostByAddr socket call to determine the domain name for the specified IP address. However, the call failed, and DB2 is not able to determine the domain name. DB2 retries the socket call periodically.

During DDF initialization, DB2 first determines the IP address via a GetHostID socket call. The IP address returned is the first IP address listed in the HOME statement of the TCP/IP profile for the selected TCP/IP stack. Verify the IP address. DDF must be stopped and restarted in order for DDF to obtain a new IP address.

Note: The IP address returned could depend on the selected TCP/IP stack, in the event that there are multiple TCP/IP stacks. DB2 requires OS/390 Open Edition sockets, and it is Open Edition that determines the TCP/IP stack to use. OS/390 Open Edition provides a way for users to select a specific TCP/IP stack by using the BPXTCAFF utility. For more information on BPXTCAFF, see UNIX System Services Planning, SC28-1890.

Using this IP address, DB2 issues a GetHostByAddr socket call to determine the associated domain name. The OS/390 Resolver handles the GetHostByAddr socket call because DB2 uses the OS/390 Open Edition Asynchronous Sockets interface. This resolver uses the resolver configuration information available to DDF. Until this information for the selected TCP/IP stack is correctly specified for DDF, the OS/390 Resolver will be unable to determine the domain name for DB2. You can find the search order for the “resolver configuration files” for an OS/390 application, such as DDF, in the IP Configuration manual for your OS/390 operating system.

Problem Determination: See System Programmer Response.
**DSNL513I**  

csect TCP/IP GETHOSTBYNAME FAILED WITH ERRNO=errno FOR DOMAIN domain  

**Explanation:** DB2 encountered a TCP/IP gethostbyname socket call error when attempting to convert a TCP/IP domain name into an IP address.  

**Variable**  

| Description |  
|---|---|  
| csect | The CSECT name of the DB2 module that issued the message. |  
| errno | The error condition reported by TCP/IP. The errno values are documented in IBM TCP/IP for MVS: Application Programming Reference. |  
| domain | The TCP/IP domain name that DB2 wants to convert into an IP address. DB2 obtains the domain value from the IPADDR column of the SYSIBM.IPINES communications database table. |  

**System Action:** The row in SYSIBM.IPINES containing the specified domain in the IPADDR column is invalid. If the error occurs during DDF startup, the row in SYSIBM.IPINES is ignored. If the error occurs during an SQL statement, the SQL statement fails and the location associated with the SYSIBM.IPINES row is not available for TCP/IP communication.  

**User Response:** Notify the system programmer.  

**Operator Response:** Notify the system programmer.  

**System Programmer Response:** Refer to IBM TCP/IP for MVS: Application Programming Reference for an explanation of the error. Correct the IPADDR column value in SYSIBM.IPINES or register the domain with TCP/IP.  

**Problem Determination:** See System Programmer Response.  

---  

**DSNL515I**  

csect TCP/IP BIND FOR PORT port FAILED WITH RETURN CODE=rcX AND REASON CODE=reasonX  

**Explanation:** DB2 encountered an error on the TCP/IP bind socket call while attempting to register a TCP/IP port number with the TCP/IP instance.  

**Variable**  

| Description |  
|---|---|  
| csect | The CSECT name of the DB2 module that issued the message. |  
| port | The TCP/IP port number DB2 wants to register with the TCP/IP instance. |  
| rc | The return code reported by TCP/IP. The return code values are documented in z/OS UNIX System Services Programming: Assembler Callable Services Reference. |  
| reason | The reason code reported by TCP/IP. The reason code values are documented in z/OS UNIX System Services Programming: Assembler Callable Services Reference. |  

**System Action:** If this error occurs for the TCP/IP port that is used for incoming DRDA requests, the error is probably caused by DB2 restarting on a CEC that already has another DB2 subsystem using the DRDA port number. DB2 will continue to try to activate the TCP/IP port number periodically.  

If this error occurs for a TCP/IP port that is used for incoming DRDA requests to an ALIAS, the error is probably caused by some of the reasons that an error would occur for the normal DRDA request port. Check to ensure that the port value was also not previously reserved for another application in the system's TCP/IP profile. DB2 will continue to try to periodically activate the TCP/IP port number.  

If this error occurs for the DRDA resynchronization port, DB2 invokes internal processing that is equivalent to STOP DDF MODE(FORCE).  

**User Response:** Notify the system programmer.  

**Operator Response:** Notify the system programmer.  

---  

**DSNL514I**  

csect-name TCP/IP SERVICE serv IS NOT DEFINED  

**Explanation:** The TCP/IP getservbyname socket call did not find a matching definition for serv.  

**Variable**  

| Description |  
|---|---|  
| serv | The TCP/IP service name that DB2 wants to convert into a TCP/IP port number. DB2 obtains the service name from the PORT column of the SYSIBM.LOCATIONS communication database table. |  

**System Action:** The row in SYSIBM.LOCATIONS containing the specified service name in the PORT column is invalid. The associated LOCATION cannot be used for TCP/IP communication. If the error occurs during an SQL statement, the SQL statement fails.  

**User Response:** Notify the system programmer.  

**Operator Response:** Notify the system programmer.
System Programmer Response: Refer to z/OS UNIX System Services Programming: Assembler Callable Services Reference for an explanation of the error.
"determination,Figure 18.2."

Problem Determination: See System Programmer Response.

---

**DSNL516I**

csect-name LANGUAGE ENVIRONMENT SERVICES NOT AVAILABLE. CEEPIPI ROUTINE CANNOT BE LOADED

**Explanation:** DB2 must load the Language Environment interface module (CEEPIPI) to process functions requiring Language Environment services. These Language Environment services are required for TCP/IP socket calls, encryption and decryption, and so on. If the CEEPIPI module is not included in an accessible data set such as STEPLIB data sets or the LPA library, DDF is unable to use the Language Environment.

**System Action:** DDF startup continues, but DDF users cannot use DB2 functions that require Language Environment services.

**System Programmer Response:** Add the Language Environment library to the DDF STEPLIB concatenation or to the LPA library. The Language Environment library must be APF authorized when it appears in the DDF STEPLIB concatenation.

**Problem Determination:** Collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1349.

---

**DSNL517I**

csect-name CEEPIPI func SERVICE FAILED WITH RETURN CODE=rc

**Explanation:** DB2 uses the Language Environment CEEPIPI service to issue certain TCP/IP socket calls. The Language Environment return code rc was not expected for the indicated Language Environment function call.

**func** The function requested by DB2. Possible values are:

- **add_entry(module-name)**
  Add an entry to the Language Environment PIPI table dynamically. Module-name is the name of the module that failed to be added to the PIPI table.

- **call_sub**
  Run a program that issues a TCP/IP socket call using an existing Language Environment run time environment.

**rc** The return code received from CEEPIPI.

**System Programmer Response:** See Problem Determination.

**Problem Determination:** Collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1349.

---

**DSNL518I**

csect-name LE/370 ENCLAVE FAILED WITH RETURN CODE=erc AND FEEDBACK=fi

**Explanation:** DB2 uses the Language Environment CEEPIPI call_sub service to execute certain TCP/IP socket calls. The CEEPIPI interface returned information indicating a failure occurred while executing the TCP/IP socket.

**erc** The Language Environment enclave return code.

**fi** Contains one or two message identifiers. The message identifiers are constructed from the Language Environment condition token.

**System Action:** The SQL statement fails with SQLCODE -904.

**System Programmer Response:** A description of the
Language Environment enclave return code and the condition token are documented in Language Environment for OS/390 & VM Programming Guide.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

DSNL519I  csect TCP/IP SERVICES AVAILABLE FOR DOMAIN tcpdomain PORT tcpport

Explanation: DB2 encountered a TCP/IP failure during DDF startup processing. The DSNL515I message identifies the cause of the failure. After the failure is detected, DDF periodically attempts to reinitialize TCP/IP to allow remote connections. This message is issued when reinitialization is successful.

Variable
Description

csect  The CSECT name of the DB2 module that issued the message.
domain  The TCP/IP port number used by this DB2 subsystem to accept incoming DRDA connection requests.

System Action: The DB2 TCP/IP port number is available to accept incoming DRDA connection requests.

DSNL520I  csect TCP/IP SERVICES AVAILABLE FOR RESPORT port

Explanation: DB2 encountered a TCP/IP failure during DDF startup processing. The DSNL515I message identifies the cause of the failure. After the failure is detected, DDF periodically attempts to reinitialize TCP/IP to allow remote connections. This message is issued when reinitialization is successful.

Variable
Description

csect  The CSECT name of the DB2 module that issued the message.
port  The TCP/IP port number used by this DB2 subsystem to accept incoming resynchronization connection requests.

System Action: The DB2 TCP/IP port is available to accept incoming resynchronization connection requests.

DSNL521I  csect-name INVALID DDF BSDS VALUES DETECTED (PORT=port,RESPORT=rport).

Explanation: DB2 encountered invalid values for the TCP/IP port numbers in the DDF record of the BSDS. Valid TCP/IP port numbers must obey the following rules:

- If PORT is non-zero, RESREPORT must also be non-zero.
- If RESREPORT is non-zero, PORT must also be non-zero.
- PORT and RESREPORT must not specify the same value.

Variable
Description

port  The TCP/IP port number used by this DB2 subsystem to accept incoming DRDA SQL connection requests.
rport  The TCP/IP port number used by this DB2 subsystem to accept incoming 2-phase commit resynchronization requests.

System Action: DDF startup terminates abnormally.

System Programmer Response: Use the Change Log Inventory utility (DSNJU003) to correct the TCP/IP port numbers used by DB2.

DSNL522I  csect-name REQUIRED TCP/IP SUPPORT NOT AVAILABLE

Explanation: The DB2 BSDS indicated that TCP/IP access was required, but the required TCP/IP interfaces were not available on this system. The required TCP/IP interfaces are provided by OS/390 Release 3.

System Action: DDF startup terminates abnormally.

System Programmer Response: Take one of the following actions:

- Install OS/390 Release 3 or later, so that the required TCP/IP interfaces are available.
- Use the Change Log Inventory utility (DSNJU003) to deactivate DB2’s TCP/IP support, by specifying PORT=0 and RESREPORT=0 on the DDF statement.

DSNL600I  RESOURCE UNAVAILABLE
CORRELATION ID=correlation-id
CONNECTION ID=connection-id LUW ID=luw-id=token REASON=reason-code
TYPE=resource-type
LOCATION=location-name
NAME=resource-name

Explanation: This message is produced at the requesting site when a distributed request requires a resource that is not available.

The resource identified by ‘resource-name’ and ‘resource-type’ was not available at ‘location-name’ due to the indicated reason code.

correlation-id  The correlation identifier of the thread associated with the requester of the resource. Correlation IDs beginning with ‘0nn’ where ‘nn’ is a number from 01 to 28, identify system agents.

Chapter 12. DB2 Messages 381
connection-id
The connection identifier of the requester.

luw-id=token
The logical unit of work ID of the thread followed by an '=' sign and a token which may be used in place of luw-id in any DB2 command that accepts luw-id as input.

Refer to message DSNT500I under Chapter 18, “DSNT... Messages,” on page 415 for an explanation of the resource type and resource name.

System Action: The SQL statement cannot be executed.

Operator Response: See Problem Determination.

Problem Determination: The reason the resource is unavailable is identified by the reason code. The reason codes are described in Part 4, “Section 4. DB2 Codes,” on page 771. Collect the information described for the reason code received.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

DSNL700I csect-name CDB RESOURCE UNAVAILABLE, DEFAULTS MAY BE USED REASON=reason TYPE=type NAME=name

Explanation: This message indicates that a requested function required the CDB which is currently unavailable. Defaults can be used to allocate conversations or set conversation limits with VTAM and TCP/IP partners.

System Action: If the SYSIBM.MODESELECT table is unavailable, VTAM defaults are used to allocate conversations. If the the SYSIBM.LUMODES table is unavailable, VTAM defaults can be used for conversation limits. If the SYSIBM.LOCATIONS, SYSIBM.IPNAMES, SYSIBM.LULIST, or SYSIBM.LUNAMES tables are unavailable, conversations can not be allocated to remote LOCATIONs.

Operator Response: Note the REASON code, the TYPE code, and the NAME. See Problem Determination section for an explanation of the collected data.

Problem Determination: The reason the resource is unavailable is identified by a reason code. The reason codes that appear in this message are described in Part 4, “Section 4. DB2 Codes,” on page 771. Use the table defined for message DSNT500I to find the TYPE of resource identified in the message.

---

DSNL701I CDB OBJECT object-name DOES NOT EXIST

Explanation: The communications database (CDB) does not contain object-name. The incorrect object-name can be the database name, the table name, or the table space name.

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine what caused the failure, define the object as required, and issue the -START DDF command.

Problem Determination: Print the definition of the communications database (CDB).

---

DSNL702I CDB TABLE table-name DOES NOT HAVE PROPER COLUMN DEFINITIONS, COLUMN column-name IS MISSING OR INCORRECTLY DEFINED

Explanation: The communications database (CDB) needs a definition for 'column-name' in 'table-name'. The current definition is missing or incorrect.

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine what caused the failure, define the column as required, and issue the -START DDF command.

Problem Determination: Print the definition of the communications database (CDB).

---

DSNL703I CDB TABLE table-name DOES NOT HAVE PROPER INDEX DEFINITIONS, INDEX index-name IS MISSING OR INCORRECTLY DEFINED

Explanation: The communications database (CDB) requires an index name for table-name. The current definition is missing or incorrect.

System Action: The distributed data facility (DDF) terminates.

Operator Response: Notify the system programmer.

System Programmer Response: Define the index as required and issue the -START DDF command. Refer to Part 3 of DB2 Installation Guide.

Problem Determination: Print the definition of the communications database (CDB).

---

DSNL704I CDB OBJECT object-name DOES NOT HAVE PROPER REFERENTIAL CONSTRAINT DEFINITIONS

Explanation: The communications database (CDB) requires referential constraint definitions for 'object-name'. The current definition is missing or incorrect.
System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine what caused the failure, define the missing referential constraint, and issue the -START DDF command. Refer to Part 3 of [DB2 Installation Guide].

Problem Determination: Print the definition of the communications database (CDB).

---

**DSNL705I CDB IS UNAVAILABLE OR INCORRECTLY DEFINED**

Explanation: During start-up of the distributed data facility, the required CDB was unavailable or incorrectly defined.

System Action: Termination of the DDF is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to the previous message that specifies the cause of the CDB failure (DSNL700I, DSNL701, DSNL702I, DSNL703I, or DSNL704I). Determine what caused the failure, fix the error condition, and issue the -START DDF command.

Collect the following diagnostic items listed in Appendix B, “Problem Determination,” on page 1349.

---

**DSNL706I csect-name AN ERROR HAS OCCURRED IN DDF EXIT ROUTINE routine**

Explanation: An error occurred following invocation of a DDF exit routine by DB2.

The variable "routine" is the name of the exit routine, DSNLHLIx, invoked by DB2.

System Action: The system abends the failing database-access agent.
Chapter 13. DSNM... messages

All of the DSNM... messages are sent to the IMS master terminal operator (MTO), and to the appropriate MVS console.

<table>
<thead>
<tr>
<th>DSNM001I</th>
<th>IMS/TM xxxx CONNECTED TO SUBSYSTEM yyyy</th>
</tr>
</thead>

</tr>
<tr>
<td>System Programmer Response:</td>
<td>Refer to Part 4 (Volume 1) of <a href="#">DB2 Administration Guide</a> for failure analysis procedures. DB2 commands (DISPLAY THREAD and RECOVER INDUBT) may be used to display and resolve the work unit(s) that are indoubt.</td>
</tr>
</tbody>
</table>
| Problem Determination: | Recovery information is available on the DB2 log and IMS/TM log to assist in the resolution of the work unit(s) indoubt. For each
DSNM005I  IMS/TM RESOLVE INDOUBT PROTOCOL PROBLEM WITH SUBSYSTEM xxxx

Explanation: The DB2 subsystem ID of ‘xxxx’ has protocol incompatibilities with IMS/TM. The DB2 resolve indoubt process received an unknown or invalid recovery request (RRE) from IMS/TM. The request was rejected by DB2 and kept by IMS/TM. The message is sent to the IMS/TM master terminal operator.

System Action: The connection between the DB2 and IMS/TM subsystems remains active, and applications can access DB2 resources.

Operator Response: Notify the system programmer.

System Programmer Response: Call the support center after extracting from the IMS/TM log the IMS/TM attachment facility snap records (code X'5501FE') using the IMS/TM utility DFSERA10.

These records contain the complete request from IMS/TM to DB2, the request type is at offset X'01C', this is a four-character identifier which should contain any of the following words:

'SHOW', 'IDBT', 'COMM', or 'ABRT'.

If the IMS/TM recovery request (RRE) found in the log is an invalid one, (not 'COMM' or 'ABRT'), you may manually delete it using the IMS/TM/CHANGE SUBSYS RESET command after consulting with the support center.

If the IMS/TM request is a valid one (abort or commit), you must find the action that IMS/TM performed for that RRE by locating the X'3730' (commit) or X'3801' (abort) record in the IMS/TM log and perform the same action under DB2 by using the -RECOVER INDOUBT command. Also refer to Part 4 (Volume 1) of DB2 Administration Guide for more information about resolve-indoubt failure analysis.

Problem Determination: Recovery information is available on the DB2 log and IMS log to assist in the resolution of the problem. For each indoubt work unit, an IMS/TM attachment facility snap record (code X'5501FE') is written to the IMS/TM log.

---

DSNM104I  xxxx COMMAND FAILED

Explanation: The DB2 command specified by ‘xxxx’ failed to complete.

System Action: The command terminated without providing an output message. Commands will still be allowed by the IMS/TM attachment facility.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: If the command failed because of an abend, a snap record (X'5501FF') is written to the IMS/TM log and SYS1.LOGREC information is available.

---

DSNM005I  SUBSYSTEM xxxx NOT AVAILABLE

Explanation: The IMS/TM command facility which routes commands to the DB2 subsystem cannot perform its functions because the DB2 subsystem named ‘xxxx’ is considered not operational.

System Action: The connection to the DB2 subsystem failed for the command. The command is rejected.

System Programmer Response: If the DB2 subsystem is operational, and if you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem. The person entering the request may not be authorized to execute the command. If the DB2 subsystem is not operational, DB2 commands from IMS/TM cannot be processed.

Problem Determination: A snap record (X'5501FF') is written to the IMS/TM log if a connection request failed.
Chapter 14. DSNN... message

DSNN40  THE NUMBER YOU SELECTED IS NOT A VALID SQL RETURN CODE NUMBER

Explanation:  The user looking at the SQL Return Codes Menu in DB2 HELP selected a number that is not a valid SQL return code.

System Action:  The SQL Return Codes Menu continues to be displayed.

User Response:  Select a valid SQL return code number, and try again.

Operator Response:  Select a valid SQL return code number, and try again.
Chapter 15. DSNP... messages

The DSNP-prefixed messages contain a connection ID, a correlation ID, and a logical-unit-of-work ID. Messages that have the same connection ID, correlation ID, and logical-unit-of-work ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

<table>
<thead>
<tr>
<th>DSNP001</th>
<th>csect – data-set-name IS WITHIN nk BYTES OF AVAILABLE SPACE.</th>
</tr>
</thead>
<tbody>
<tr>
<td>RC=rrrrrr CONNNECTION-ID=xxxxxxxxx,</td>
<td></td>
</tr>
<tr>
<td>CORRELATION-ID=yyyyyyyyyyyy,</td>
<td></td>
</tr>
<tr>
<td>LUW-ID=logical-unit-of-work-id=token</td>
<td></td>
</tr>
</tbody>
</table>

Explanation: This message warns of an impending space shortage. The data space manager (DSM) extend function CSECT 'DSNPmmmm' detected the space shortage through the use of a 'hedge' quantity 'n'. Reason code 'rrrrrr' gives some information about why space could not be obtained. (See Part 4, "Section 4.1 DB2 Codes," on page 771.)

There might also be some preceding DSM and VSAM messages that can help to determine why space cannot be obtained. The connection, correlation, and logical-unit-of-work IDs identify the user or application that encountered the problem. Correlation IDs beginning with '0nnn', where 'nnn' is a number, identify system agents.

A LUW-ID of "" indicates that the thread does not have a LUW-ID. If the LUW-ID is not an "" the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

System Action: If sufficient space is available for the current request, continue. Otherwise, message DSNP001I follows, and the current SQL request fails.

Operator Response: DSM messages are directed to the database administrator (DBA) or system administrator. However, the DBA or system administrator can request that the operator issue an MVS WRITELOG operator command (for example, 'W A') to obtain MVS SYSLOG output. The SYSLOG sometimes contains media manager messages that might be helpful to the DBA or system administrator in determining why space could not be allocated.

System Programmer Response: Based on the reason code (RC) in the message, as well as information that might be available in access method services or VSAM messages preceding this one, try one of the following:

- If you do not anticipate further extension of this table space or index, ignore the message.
- If the table space or index is backed by storage group-defined data sets and this data set is not at maximum (123) extents, use the ALTER STOGROUP statement to add volumes to the storage group (up to 133 of them).
- If the table space or index is backed by 'user-defined' data sets, and not at maximum (123) extents for the data set, issue an ALTER ADDVOLUMES access method services command to provide additional volumes (up to 133 of them). Or, if the table space is nonpartitioned and the high allocated RBA is greater than or equal to 2GB (2,147,483,648) for the indicated data set, define the data set required for the next sequential piece. (Actually, in this case, there should be an indication in console messages or the reason code that the data set required for the next piece was not found.)
- If the data set is at maximum (123) extents, try reorganizing the table space or index into a data set or data sets having larger primary and secondary values. This process is discussed in Part 2 (Volume 1) of DB2 Administration Guide.

Problem Determination: Examine the console messages, SYS1.LOGREC information, and SYSLOG to determine the reason for the condition. Try to resolve it by the methods described in the Operator Response section of this message. If you feel that this message indicates a problem in an IBM program, you should provide the following sources of information about the problem:

- Console sheet showing the message and related messages that might precede or follow it.
- System log printout (obtained via MVS WRITELOG operator command) showing related VSAM/media manager messages that might appear there (usually needed only if you have a message or reason code that indicates a media manager services problem occurred).
- Integrated catalog facility (ICF) catalog listing showing characteristics of the data set in question and of the ICF catalog itself.
- VTOC listing of packs associated with the request, showing space available for data sets, catalogs, VTOC index, and the VTOC itself, as well as data set extent information.
- Any associated dumps.
- SYS1.LOGREC listing showing entries at or near the time of the problem (unless these appear in an associated dump).
DSNP002I  csect – DEFINE FAILED FOR
  data-set-name  RC=rrrrrr
  CONNECTION-ID=xxxxxx,
  CORRELATION-ID=yyyyyyyyy,
  LUW-ID=logical-unit-of-work-id =token

Explanation: Data set definition failed (in CSECT 'DSNPmmmm') for the reason identified by RC. (See Part 4, “Section 4. DB2 Codes,” on page 771.) The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and tie together activities involving a given user.

System Action: The data space manager (DSM) terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to either the database administrator or the system administrator. Bring the message to their attention if it appears on the MVS operator’s console. The installation should consider directing DB2 messages to a console other than the operator’s console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding access method services messages, if any, and correct it, if possible. If an out-of-space condition exists, see the description of message DSNP001I for actions to consider.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP003I  csect – RESET FAILED FOR
  data-set-name,  RC=rrrrrr
  CONNECTION-ID=xxxxxx,
  CORRELATION-ID=yyyyyyyyy,
  LUW-ID=logical-unit-of-work-id =token

Explanation: Reset, a data space manager (DSM) function invoked by DB2 utilities, failed in CSECT 'DSNPmmmm' for the reason identified by RC. (See Part 4, “Section 4. DB2 Codes,” on page 771.) The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and tie together activities involving a given user.

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person’s attention if it appears on the MVS operator’s console. The installation should consider directing DB2 messages to a console other than the operator’s console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding DB2, access method services, or VSAM messages, if any, and correct it, if possible.

It might be necessary to delete and redefine the data set using access method services. Consider making a backup copy before doing this. (Use DB2 utilities to make the copy; in general, VSAM utilities do not work on DB2 database services data sets.)

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP004I  csect – DELETE FAILED FOR
  data-set-name,  RC=rrrrrr
  CONNECTION-ID=xxxxxx,
  CORRELATION-ID=yyyyyyyyy,
  LUW-ID=logical-unit-of-work-id =token

Explanation: Deletion failed in CSECT 'DSNPmmmm' for the reason identified by RC. (See Part 4, “Section 4. DB2 Codes,” on page 771.) The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the
problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

The value of the LUWID is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

Severity: 8 (error)

System Action: DB2 terminates its actions associated with the current SQL request. DB2 might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding access method services messages if any, and correct it, if possible. Check the data set and delete it by using access method services directly if reasonable to do so. Consider making a backup copy before doing this. (Use DB2 utilities to make the copy; in general, VSAM utilities do not work on DB2 data sets.)

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP005I  csect – COULD NOT REMOVE EXCESS VOLUMES FROM CANDIDATE LIST OF data-set-name CONNECTION-ID=xxxxxxxx, CORRELATION-ID=yyyyyyyyyyyy, LUW-ID=logical-unit-of-work-id=token

Explanation: Volumes from a storage group were entered in the data set's candidate list and could not be removed by CSECT 'DSNPmmm' after some data space manager (DSM) operation. The connection ID, correlation ID, and logical-unit-of-work ID (LUWID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of ‘’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘’, the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

This is not a major problem. However, the data set will not properly reflect subsequent deletions from the volume list in its storage group (via ALTER STOGROUP command in SQL), because the data set's integrated catalog facility (ICF) catalog entry still contains the volume serial numbers.

If needed, the storage group in question can be identified by issuing an SQL SELECT to get information about the table space or index that is identified by the third and fourth qualifiers (database name, table space name) in the data set name.

System Action: Operation continues.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person’s attention if it appears on the MVS operator’s console. The installation should consider directing DB2 messages to a console other than the operator’s console.

System Programmer Response: Look for associated DSM and access method services messages preceding this one to get additional information. Attempt an ALTER REMOVEVOLUMES access method services command, if appropriate, after issuing a LISTCAT to see which volumes are recorded as 'candidate' in the integrated catalog facility (ICF) catalog.

Problem Determination: See Problem Determination for message DSNP001I for this information. (However, there should not be a need for VTOC or SYSLOG information for this case.)

DSNP006I  csect – REQUIRED STOGROUP DEFINED DATA SET NOT AVAILABLE— data-set-name RC=rrrrrr CONNECTION-ID=xxxxxxxx, CORRELATION-ID=yyyyyyyyyyyy, LUW-ID=logical-unit-of-work-id=token

Explanation: An attempt to alter the shareoptions of this data set failed. The data set could not be accessed for the reason indicated by RC. (See Part 4, Section 4.3, "DB2 Codes," on page 771.) The connection ID, correlation ID, and logical-unit-of-work ID (LUWID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

The value of the LUWIDs a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of the logical-unit-of-work-id in any DB2 command that accepts the logical-unit-of-work-id as input.

Messages having the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.
Severity: 8 (error)

System Action: DB2 terminates its actions associated with the current SQL request. DB2 might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person’s attention if it appears on the MVS operator’s console. The installation should consider directing DB2 messages to a console other than the operator’s console.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP0071  csect – EXTEND FAILED FOR
data-set-name, RC=rrrrrrrr
CONNECTION-ID=xxxxxxxxx,
CORRELATION-ID=yyyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: Extension failed in CSECT ‘DSNPmmm’ of the data space manager (DSM). The ‘data-set-name’ identifies the data set that is being extended. RC is the reason code, which indicates why the extend process failed. (See Part 4, “Section 4. DB2 Codes,” on page 771.) The ‘connection ID’, ‘correlation ID’, and ‘logical-unit-of-work ID’ (LUW-ID) identify the user or application that encountered the problem. Correlation IDs beginning with ‘0nn’, where ‘nn’ is a number, identify system agents.

A LUW-ID of ‘’ indicates that the thread does not have a LUW-ID. If the ‘LUW-ID’ is not an ‘’, the value is a ‘logical-unit-of-work-id’ that is assigned to the thread followed by an ‘ ’ sign and a token value, which can be used in place of ‘logical-unit-of-work-id’ in any DB2 command that accepts ‘logical-unit-of-work-id’ as input.

Messages that have the same ‘connection ID’, ‘correlation ID’, and ‘LUW-ID’ relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

System Action: The DSM terminates its actions associated with this extend request. Higher level functions might terminate if they cannot continue without a successful extend. In this case, additional console messages and/or SQL codes are produced. In other cases, higher level functions might be able to resolve the space need without the extend, so they continue normally.

System Programmer Response: The following sources of information are available to help determine the cause of the failure:

- See the Programmer Response for message DSNP001I.
- Analyze the RC value in conjunction with the console messages.
- The reason code might apply to the data set identified in the message or to another data set that is needed for the extend process. If the reason code indicates a data set access failure, the console messages indicate the data set name. For example, if the RC indicates ‘resource unavailable’, console messages identify the resource that is unavailable. Most likely, the message will be DSNT500I.
- Retrieve diagnostic information from the output of the DISPLAY DB…RESTRICT or DISPLAY UTIL(“)... commands.
- If the extend failed on a result table space, refer to “Sort Data Sets” in Part 5 (Volume 2) of DB2 Administration Guide.
- If the extend failed on an SQL insert or update, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
- If you need to enlarge your data set, refer to “Out of DASD Space” in Part 4 (Volume 1) of DB2 Administration Guide.
- To find out how the extend function operates, refer to “Improving DASD Utilization” in Part 5 (Volume 2) of DB2 Administration Guide.

Operator Response: See Operator Response for message DSNP001I for this information.

System Programmer Response: See System Programmer Response for message DSNP001I for this information.

Problem Determination: See Problem Determination for message DSNP001I.

DSNP0081  csect– REQUIRED USER-DEFINED DATA SET NOT AVAILABLE—data-set-name RC=rrrrrrrr CONNECTION-ID=xxxxxxxxx, CORRELATION-ID=yyyyyyyyyyyyy, LUW-ID=logical-unit-of-work-id =token

Explanation: One of the following actions applied against user-defined data sets failed in CSECT ‘DSNPmmm’ of the data space manager (DSM):

- Create table space or index
- Extend table space or index
- Process the SQL ALTER DATABASE statement
- Process the REORG TABLESPACE utility with SHRLEVEL REFERENCE or CHANGE

Correlation IDs beginning with ‘0nn’, where ‘nn’ is a number, identify system agents.

One or more of the data sets could not be accessed for the reason indicated by RC. (See Part 4, “Section 4. DB2 Codes,” on page 771.) The connection ID,
correlation ID, and logical-unit-of-work ID (LUWID) identify the user or application that encountered the problem.

The value of the LUWID is a logical-unit-of-work-id that is assigned to the thread followed by an ‘-‘ sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages having the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

If the name of the data set in the message is different from the name of the original data set (for example, ‘.....A002’ instead of ‘.....A001’), a new data set might need to be created. A different name indicates that the original data set exceeded its limit.

Severity: 8 (error)

System Action: DB2 terminates its actions associated with the current SQL request or utility. DB2 might terminate the current SQL request or utility or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person’s attention if it appears on the MVS operator’s console. The installation should consider directing DB2 messages to a console other than the operator’s console.

System Programmer Response: Refer to the reason code in Part 4, “Section 4. DB2 Codes,” on page 771. The return code description might indicate that one of the following actions needs to be performed or it indicates the necessary steps:

- If the data set does not exist, create it before attempting the create table space/index or extend data set again.
- If the data set shareoptions are incorrect, modify the shareoptions with access method services (AMS).
- The appropriate AMS command is ALTER SHAREOPTIONS.

Problem Determination: See Problem Determination for message DSNP001I for this information.

---

DSNP009I  THE FOLLOWING ERROR MESSAGES
            WERE RECEIVED FOR operation ON
data-set-name

DSNP010I  END OF ERROR MESSAGES.
        CONNECTION-ID=xxxxxxxxx,
        CORRELATION-ID=yyyyyyyyyyyy,
        LUW-ID=logical-unit-of-work-id=token

Explanation: Messages DSNP009I and DSNP010I enclose a block of messages that are received by the data space manager (DSM) subcomponent of DB2 in response to an access method services (AMS) operation.

operation  The access method services operation that was being performed.

data-set-name  The data set on which the operation was being performed.

The prefix of the messages in the block is usually IDC (access method services messages). However, the prefix can also be IKJ (dynamic allocation) or other subcomponent IDs. Refer to the appropriate MVS publication for descriptions of the enclosed messages.

The operation can be DEFINE CLUSTER, ALTER ADDVOLUMES, ALTER REMOuveLUMES, or DELETE CLUSTER. One or more other DSM messages follow this message to explain what happened as a result of the failure of this access method services request. The connection ID, correlation ID, and logical-unit-of-work ID (LUWID) identify the user or application that encountered the problem.

A LUW-ID of ‘’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘’, the value is a logical-unit-of-work-id that is assigned to the thread followed by an ‘-‘ sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with ‘onnn’, where ‘nnn’ is a number, identify system agents.

System Action: Operation continues.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person’s attention if it appears on the MVS operator’s console. The installation should consider directing DB2 messages to a console other than the operator’s console.

System Programmer Response: Use this information to help resolve problems indicated by other DSM messages that follow this one.

Problem Determination: See Problem Determination for message DSNP001I for this information.
Explanation: The MMRC is the return code that DB2 received from media manager services. Refer to the appropriate MVS publication for a description of these codes. DSMRC is a DSM reason code that indicates which of the media manager services functions, update or extend, failed. (See Part 4, “Section 4. DB2 Codes,” on page 771.) The message is from CSECT 'DSNPmmm'm of the data space manager (DSM). The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nnn', where 'nnn' is a number, identify system agents.

A LUW-ID of ‘’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘ ’, the value is a logical-unit-of-work-id that is assigned to the thread followed by an ‘-’ sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

System Action: The DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: DSM messages are directed to either the database administrator (DBA) or the system administrator. However, they can request that the operator issue an MVS WRITELOG operator command (for example, 'W A') to obtain MVS SYSLOG output. The SYSLOG sometimes contains media manager messages that might be helpful to the DBA or system administrator in determining why space could not be allocated.

System Programmer Response: This message might be preceded by one or more IEC or ICY messages on the console or in SYSLOG. These messages help to determine what happened and what action to take.

Problem Determination: See Problem Determination for message DSNP0011 for this information.

Explanation: CTLGRC and CTLGRSN are the return and reason codes that DB2 received from the SVC 26 (ICF catalog locate function). The reason code is in the same format as that returned to DB2 by the SVC 26. In it, zzzzz is the hexadecimal value of the last two characters of the SVC 26 CSECT that set the code. The full CSECT name is derived by appending these two characters to 'IG00CL'; rrrr is the numeric part of the reason code, in hexadecimal.

See the description of access method services message IDC3009I in the appropriate MVS publication for explanations of the return code and the numeric portion (rrrr) of the reason code. The values documented there are decimal, whereas the value in this message is hexadecimal.

The connection ID, correlation ID, and LUW-ID identify the user or application that encountered the problem. Correlation IDs beginning with '0nnn', where 'nnn' is a number, identify system agents.

An LUW-ID of ‘’ indicates that the thread does not have an LUW-ID. If the LUW-ID is not an ‘ ’, the value is a 'logical-unit-of-work-id' that is assigned to the thread followed by an ‘-’ sign and a token value, which can be used in place of 'logical-unit-of-work-id' in any DB2 command that accepts 'logical-unit-of-work-id' as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

System Action: DB2 terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

System Programmer Response: Correct the problem indicated by the catalog return and reason codes.

Problem Determination: See Problem Determination for message DSNP011I for this information.

Explanation: Data space manager (DSM) discovered that the primary space quantity given in the data set definition was not large enough. Formatting of required control information in the first several pages was not possible. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of ‘’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘ ’, the value is a 'logical-unit-of-work-id' that is assigned to the thread followed by an ‘-’ sign and a token value, which can be used in place of 'logical-unit-of-work-id' in any DB2 command that accepts 'logical-unit-of-work-id' as input.
Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

**System Action:** DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

**Operator Response:** This message is directed to the database administrator or the system administrator. Bring it to that person’s attention if it appears on the MVS operator’s console. The installation should consider directing DB2 messages to a console other than the operator’s console.

**System Programmer Response:** This should occur only for table spaces or indexes that are not storage group defined. (The DB2 interpreter forces the initial allocation to be large enough if a storage group is used.) Check both the page size specification (4KB or 32KB) and the number of control pages required (2 for table space, 3 for index space). Specify the primary allocation value again so that at least (pages × page size) bytes are allocated.

**Problem Determination:** See Problem Determination for message DSNP001I for this information.

---

**DSNP014I**  
IRLM MANUAL LOCK REQUEST
FAILED FOR data-set-name.
RC=rr,SC=ssssssss,
CORRELATION-ID=yyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

**Explanation:** DB2 requested a manual lock on a data set, but the lock could not be obtained for reasons specified in RC and SC. RC and SC are the return code and reason code from IRLM. RC and the first two digits of SC are documented in [Part 5, “IRLM messages and codes,” on page 1303.](#) The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of ‘’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘’, the value is a logical-unit-of-work-id that is assigned to the thread followed by an ‘=’ sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. DSNP001I or DSNP007I follow this message. Correlation IDs beginning with ‘0nn’, where ‘nn’ is a number, identify system agents.

If message DSNT376I was received before message DSNP014I, the lock request failed because of a timeout condition. Otherwise, refer to the IRLM return and reason codes for an explanation of the failure.

**System Action:** The current SQL or the unit of recovery that issued the request might be terminated.

**Operator Response:** This message is directed to the database administrator or the system administrator. Bring it to that person’s attention if it appears on the MVS operator’s console. The installation should consider directing DB2 messages to a console other than the operator’s console.

**Problem Determination:** Provide the console sheet and a dump. A GTF trace might also be required. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem. Refer to the explanation section of this message for additional problem determination information.

---

**DSNP015I**  
csect – IRLM MANUAL UNLOCK
REQUEST FAILED FOR data-set-name.
RC=rr,SC=ssssssss,
CORRELATION-ID=yyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

**Explanation:** DB2 requested a manual unlock on a data set, but the unlock could not be performed for reasons specified in RC and SC. RC and SC are the return code and reason code from IRLM. RC and the first two digits of SC are documented in [Part 5, “IRLM messages and codes,” on page 1303.](#) The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of ‘’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘’, the value is a logical-unit-of-work-id that is assigned to the thread followed by an ‘=’ sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with ‘0nn’, where ‘nn’ is a number, identify system agents.

**System Action:** The current SQL or the unit of recovery that issued the request might be terminated.

**Operator Response:** This message is directed to the database administrator or the system administrator. Bring it to that person’s attention if it appears on the MVS operator’s console. The installation should consider directing DB2 messages to a console other than the operator’s console.
DSNP016I - DSNP018I

System Programmer Response: Investigate the problem indicated by the IRLM return and reason code.

Problem Determination: Provide the console sheet and a dump. A GTF trace might also be required. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem. See the explanation section of this message for additional problem determination information.

---

DSNP016I

CREATE FAILED FOR pageset-name.
RC=rrrrrrr CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyyy
LUW-ID=logical-unit-of-work-id =token

Explanation: Creation of a table space or index space failed in the data space manager (DSM) for the reason given in RC. (See Part 4, “Section 4. DB2 Codes,” on page 771.) The pageset-name format is 'dbname.tiname', where 'dbname' is the database name and 'tiname' is the table space or index space name.

This message identifies the function that was in progress at the time of a failure. The specific failure is usually identified by a preceding message. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of ‘*’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘*’, the value is a logical-unit-of-work-id that is assigned to the thread followed by an ‘=’ sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding messages, and correct it, if possible.

Problem Determination: See Problem Determination for message DSNP0011 for this information.

---

DSNP017I

RESET FAILED FOR pageset-name.
RC=rrrrrrr CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyyy
LUW-ID=logical-unit-of-work-id =token

Explanation: Reset failed in the data space manager (DSM) subcomponent of DB2 for a table space or index space for the reason given in RC. (See Part 4, “Section 4. DB2 Codes,” on page 771.) The 'pageset-name' format is 'dbname.tiname', where 'dbname' is the database name and 'tiname' is the table space or index space name.

This message identifies the function that was in progress at the time of a failure. The specific failure is usually identified by a preceding message. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of ‘*’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘*’, the value is a logical-unit-of-work-id that is assigned to the thread followed by an ‘=’ sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding messages, and correct it, if possible.

Problem Determination: See Problem Determination for message DSNP0011 for this information.

---

DSNP018I

DROP FAILED FOR pageset-name.
RC=rrrrrrr CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyyy
LUW-ID=logical-unit-of-work-id =token

Explanation: Drop failed in the data space manager (DSM) subcomponent of DB2 for a table space or index space for the reason given in RC. Refer to Part 4, “Section 4. DB2 Codes,” on page 771.) The 'pageset-name' format is 'dbname.tiname', where 'dbname' is the database name and 'tiname' is the table space or index space name.

This message identifies the function that was in progress at the time of a failure. The specific failure is usually identified by a preceding message. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of ‘*’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘*’, the value is a logical-unit-of-work-id that is assigned to the thread followed by an ‘=’ sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding messages, and correct it, if possible.

Problem Determination: See Problem Determination for message DSNP0011 for this information.

---

396 Messages and Codes
space or index space name. This message identifies the function that was in progress at the time of a failure. The specific failure is usually identified by a preceding message. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of "*" indicates that the thread does not have a LUW-ID. If the LUW-ID is not an "*", the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding messages, and correct it, if possible.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP020I  

**csect-name - USER DEFINED ATTRIBUTES INCORRECT FOR**

data-set-name, RC=rrrrrr
CONNECTION-ID=xxxxxxxxx,
CORRELATION-ID=yyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

**Explanation:** The specified data set was access method services user-defined and does not have the required DB2 attributes. The connection ID, correlation ID, and LUW-ID identify the user or application that encountered the problem.

The value of the LUWID is a 'logical-unit-of-work-id' that is assigned to the thread, followed by an '=' sign and a token value, which can be used in place of 'logical-unit-of-work-id' in any DB2 command that accepts 'logical-unit-of-work-id' as input.

Messages having the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

This message is issued by the following CSECTs: DSNPATS0 DSNPSCT0 DSNPSCTC DSNPRNM0

**Severity:** 8 (error)

System Action: No action is taken with the named data set. An error code is returned and a dump is not taken.

Operator Response: Notify the system programmer.

System Programmer Response: Delete the named data set and define it with the correct attributes.

**Problem Determination:** Obtain an access method services LISTCAT for the named data set's attributes. Refer to Part 2 (Volume 1) of [DB2 Administration Guide](https://www.ibm.com/support/docview/groups.html?rs=6000&mi=pubn0017) for the correct data set definition attributes.
### DSNP021I - DSNP027I

<table>
<thead>
<tr>
<th>DSNP021I</th>
<th>csect-name EXTEND NOTIFY FAILED FOR data-set-name, RC=rrrrrrrr, NOTESC=nnnnnnnn, CONNECTION-ID=xxxxxxxxx, CORRELATION-ID=yyyyyyyyyyyy, LUW-ID=logical-unit-of-work-id=token</th>
</tr>
</thead>
</table>

**Explanation:**
This is an internal error. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

An LUW-ID of ‘”’ indicates that the thread does not have an LUW-ID. If the LUW-ID is not an ‘”’, the value is a logical-unit-of-work-id that is assigned to the thread followed by an ‘=*’ sign and a token value, which can be used in place of the logical-unit-of-work-id in any DB2 command that accepts the logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with ‘0nn’, where ‘nn’ is a number, identify system agents.

**System Action:**
The current SQL statement or the unit of recovery that issued the request might be terminated.

**Problem Determination:**
Obtain the console sheet and a dump. A GTF trace might also be required.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

<table>
<thead>
<tr>
<th>DSNP026I</th>
<th>csect-name DATASET IS NOT ALLOWED TO BE DELETED data-set-name, RC=rrrrrrrr, CONNECTION-ID=xxxxxxxxx, CORRELATION-ID=yyyyyyyyyyyy, LUW-ID=logical-unit-of-work-id=token</th>
</tr>
</thead>
</table>

**Explanation:**
During clean up of the shadow data set in the final step of online REORG, an error is detected due to an attempt to delete a regular table or index space data set. Refer to Part 2 of [DB2 SQL Reference](#) for information about online REORG. The connection ID, correlation ID, and logical unit of work ID (LUWID) identify the user or application that encountered the problem. Correlation IDs beginning with ‘0nn’, where ‘nn’ is a number, identify system agents.

The value of the LUWID is assigned to the thread followed by an ‘=*’ sign and a token value, that can be used in place of the LUWID in any DB2 command that accepts it as input.

Messages that have the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

**System Action:**
No action is taken with the named data set. An error code is returned and a dump is not taken.

**Operator Response:**
Notify the system programmer.

**System Programmer Response:**
Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

<table>
<thead>
<tr>
<th>DSNP022I</th>
<th>csect-name EXTEND DBET RECORDING FAILED FOR data-set-name, RC=rrrrrrrr, SC=ssssssss, DBETSC=nnnnnnnn, CONNECTION-ID=xxxxxxxxx, CORRELATION-ID=yyyyyyyyyyyy, LUW-ID=logical-unit-of-work-id=token</th>
</tr>
</thead>
</table>

**Explanation:**
This is an internal error. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

An LUW-ID of ‘”’ indicates that the thread does not have an LUW-ID. If the LUW-ID is not an ‘”’, the value is a logical-unit-of-work-id that is assigned to the thread followed by an ‘=*’ sign and a token value, which can be used in place of the logical-unit-of-work-id in any DB2 command that accepts the logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with ‘0nn’, where ‘nn’ is a number, identify system agents.

**System Action:**
The current SQL statement or the unit of recovery that issued the request might be terminated.

**Problem Determination:**
Obtain the console sheet and a dump. A GTF trace might also be required.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

<table>
<thead>
<tr>
<th>DSNP027I</th>
<th>csect-name RENAME FAILED OLD DATASET=data-set-name, NEW DATASET=data-set-name, RC=rrrrrrrr, CONNECTION-ID=xxxxxxxxx, CORRELATION-ID=yyyyyyyyyyyy, LUW-ID=logical-unit-of-work-id=token</th>
</tr>
</thead>
</table>

**Explanation:**
An attempt to alter the data set name failed. The connection ID, correlation ID, and logical unit of work ID (LUWID) identify the user or application that
encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

The value of the LUWID is assigned to the thread followed by an '=' sign and a token value, that can be used in place of the LUWID in any DB2 command that accepts it as input.

Messages that have the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

Severity: 8 (error)

System Action: DB2 terminates its actions associated with the current SQL request. DB2 might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Problem Determination: See 'Problem Determination' for message DSNP001I for this information.

### DSNP028I
csect-name HSM RECALL FAILED FOR
DSNAME = dsn
HSMRC=rrrrrrrr, HSMRSN=ssssssss
CONNECTION ID=xxxxxxxxx,
CORRELATION ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: This message indicates that a required data set was migrated by HSM and an attempt to recall the data set failed, preventing DB2 from accessing the data set. The HSMRC and HSMRSN fields can be used to determine the HSM failure. See Problem Determination below. The connection ID, correlation ID, and 'logical-unit-of-work ID' (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of ‘’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘’, the value is a 'logical-unit-of-work-id' that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of 'logical-unit-of-work-id' in any DB2 command that accepts 'logical-unit-of-work-id' as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: DSM terminates its action with the associated data set. Higher level functions that issued the recall request might terminate.

Operator Response: Notify the system programmer.

System Programmer Response: Investigate the reason for the HSM recall failure. Use the information in this message to help resolve this problem. Additional messages on the MVS operator's console might be associated with this message.

Problem Determination: If the HSMRSN is 999, refer to the following list for the explanation:

<table>
<thead>
<tr>
<th>HSMRC Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>HSM is not active.</td>
</tr>
<tr>
<td>8</td>
<td>No storage is available for MWE in CSA.</td>
</tr>
<tr>
<td>36</td>
<td>Input MWE is not within user storage.</td>
</tr>
<tr>
<td>40</td>
<td>Allocated amount of CSA for MWEs was exceeded.</td>
</tr>
<tr>
<td>100</td>
<td>There was an invalid function used.</td>
</tr>
</tbody>
</table>

For all other reason codes (HSMRSN), refer to the z/OS DFSMShsm Managing Your Own Data for an explanation of HSM user messages. The HSM user messages can be determined by appending the value in the HSMRC field of this message to ARC1101I (that is, HSMRC=12, HSM message is ARC1112I). The HSMRSN reason code is referenced in the ARC1101I messages.

### DSNP030I
csect-name THE CURRENT EXTENT REACHES THE LAST VOLUME FOR data-set-name.
CONNECTION-ID=xxxxxxxxx, CORRELATION-ID=yyyyyyyyyyyy, LUW-ID=logical-unit-of-work-id=token

Explanation: This message indicates that the last volume to which the data set data-set-name can extend has been reached. You cannot add more volumes if the current volume runs out of space.

The connection, correlation, and logical-unit-of-work IDs identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of ‘’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘’, the value is a 'logical-unit-of-work-id' that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of 'logical-unit-of-work-id' in any DB2 command that accepts 'logical-unit-of-work-id' as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

Severity: 0 (informational)

System Action: If sufficient space in current volume is available for the current request, DB2 continues.
Otherwise, message DSNP007I is issued, and the current SQL request fails.

**Operator Response:** For more information, issue an MVS WRITELOG operator command (for example, ‘WA’) to obtain MVS SYSLOG output. The SYSLOG sometimes contains VSAM or media manager messages that might be helpful in determining why space could not be allocated.

**System Programmer Response:** Depending on what information is available in the access method services or VSAM messages preceding this one, try one of the following:

- If you do not anticipate further extension of this table space or index, ignore the message.
- If the table space or index is backed by SMS-managed data sets, use LISTCAT to choose another SMS storage group that has more space available and recover or reorganize the table space or index into the new SMS storage group.
- If the table space or index is DB2-managed but is not SMS-managed, rearrange the DB2 storage group volume list by shifting volumes with free space or by adding new volumes. Use the SQL statements ALTER STOGROUP ADD VOLUMES and ALTER STOGROUP REMOVE VOLUMES and then recover or reorganize the table space or index.
- If the table space or index is user-managed and not SMS-managed, delete and redefine the data set with more space and then recover or reorganize the table space or index.

**Problem Determination:** Obtain an access method services LISTCAT for the named data set’s VOLUME list for current extent space distribution of volumes.

See the Problem Determination section of message DSNP001I for more information.

---

**DSNP031I**

csect-name CURRENT SPACE HAS cc EXTENTS FOR data-set-name. THE MAXIMUM EXTENTS WITH DFSMS vv,rr IS mm. CONNECTION-ID=xxxxxxxx, CORRELATION-ID=yyyyyyyyyy, LUW-ID=logical-unit-of-work-id=token

**Explanation:** This message indicates that data set data-set-name has almost reached the maximum number of extents. The maximum number is indicated by mm. You cannot add more volumes if the current volume runs out of space.

The current version and release of DFSMS are indicated by vv and rr.

The connection, correlation, and logical-unit-of-work IDs identify the user or application that encountered the problem. Correlation IDs beginning with ‘0nn’, where ‘nn’ is a number, identify system agents.

A LUW-ID of ‘*’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘*’, the value is a logical-unit-of-work-id that is assigned to the thread followed by an ‘-‘ sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

**Severity:** 0 (informational)

**System Action:** DB2 continues. If the table space or index space is not able to extend when needed, Message DSNP007I is issued and the current SQL request fails.

**Operator Response:** For more information, issue an MVS WRITELOG operator command (for example, ‘WA’) to obtain MVS SYSLOG output. The SYSLOG sometimes contains VSAM or media manager messages that might be helpful in determining why space could not be allocated.

**System Programmer Response:** Based on the information that might be available in the access method services or VSAM messages preceding this one, try one of the following actions:

- If you do not anticipate further extension of this table space or index, ignore the message.
- If the table space or index is DB2-managed and has not yet reached the maximum number of extents, obtain an access method services LISTCAT for the named data set’s to see how the extensions are distributed. Your options then include:
  - If there are multiple small extents, you can use the SQL statement ALTER TABLESPACE SECQTY to alter to a larger secondary space allocation quantity.
  - Otherwise, use the ALTER STOGROUP statement to add volumes to the storage group (up to 133 of them).
- If the table space or index is user-managed and has not yet reached the maximum number of extents, issue the access method services command ALTER ADDVOLUMES to provide additional volumes (up to 59 of them).
- If the data set is at the maximum number of extents, recover or reorganize the table space or index into a data set or data sets having larger primary and secondary values. This process is discussed in Part 2 (Volume 1) of [DB2 Administration Guide](#).

**Problem Determination:** Obtain an access method services LISTCAT for the named data set’s VOLUME list for the extent space distribution.

See the Problem Determination section of message DSNP001I for more information.
Chapter 16. DSNQ... messages

DSNQ001I MQListener was invoked with no major function on the command line.

Explanation: The MQListener command line failed to specify a major function, such as help, run, add, remove, or show.

Severity: 8 (Error)

User Response: Consult MQListener documentation and re-run MQListener with the function that was intended. For more information, run:

- db2mqln1/db2mqln2 help

DSNQ002I MQListener was invoked with an unknown command line parameter name.

Explanation: The MQListener command line contained an unknown parameter name.

Severity: 8 (Error)

User Response: Consult MQListener documentation and re-run MQListener with the desired parameters. For more information, run:

- db2mqln1/db2mqln2 help

DSNQ003I MQListener was invoked without the required command line parameter name.

Explanation: The MQListener command line was missing the parameter name, which was required.

Severity: 8 (Error)

User Response: Consult MQListener documentation and re-run MQListener with the parameter that was required. For more information, run:

- db2mqln1/db2mqln2 help

DSNQ004I MQListener was invoked with an illegal value for the parameter name command line parameter: parameter value.

Explanation: The MQListener command line contained an illegal value for the parameter name parameter. The illegal value was parameter value.

Severity: 8 (Error)

User Response: Consult MQListener documentation and re-run MQListener with the desired parameters. For more information, run:

- db2mqln1/db2mqln2 help

DSNQ010I MQListener encountered a database error accessing subsystem subsystem name during operation operation name: sqlstate = sqlstate value (sqlcode = sqlcode value).

Explanation: MQListener encountered a DB2 database error accessing subsystem subsystem name while executing operation operation name. The resulting sqlstate was sqlstate value (sqlcode sqlcode value).

Severity: 8 (Error)

User Response: Consult MQListener documentation and ensure that MQListener is properly installed in the specified DB2 subsystem and access to MQListener packages and configuration tables has been granted to the user running MQListener.

DSNQ011I MQListener failed to make RRS connection to the subsystem subsystem name during operation operation name: reason code = reason code value ( return code = return code value ).

Explanation: MQListener encountered a DB2 database error while attempting to connect to subsystem subsystem name during operation operation name. The resulting reason code was reason code value ( return code return code value).

Severity: 8 (Error)

User Response: Ensure that the DB2 subsystem subsystem name is active and running.

DSNQ012I MQListener failed to terminate RRS connection from the subsystem subsystem name during operation operation name: reason code = reason code value ( return code = return code value ).

Explanation: MQListener encountered a DB2 database error while attempting to disconnect from subsystem subsystem name during operation operation name. The resulting reason code was reason code value ( return code return code value).

Severity: 4 (Warning)

User Response: Ensure that the DB2 subsystem subsystem name is active and running. Consult the DB2 documentation, regarding the exact meaning of the reason and return code.

402 Messages and Codes
### DSNQ060I

**Explanation:** MQListener encountered a DB2 database error while removing a task from configuration `configuration name` in subsystem `subsystem name`. The input queue specified was `input queue name` and the queue manager specified was `queue manager name`. The resulting `sqlstate` was `sqlstate value` ( `sqlcode = sqlcode value` ).

**Severity:** 8 (Error)

**User Response:** Consult MQListener documentation and ensure that MQListener is properly installed in the specified subsystem. Also, ensure that access to MQListener packages and configuration tables has been granted to the user who is running MQListener.

### DSNQ070I

**Explanation:** MQListener has encountered a DB2 database error preparing to run the stored procedure `schema name. procedure name in subsystem name`. The resulting `sqlstate` was `sqlstate value` ( `sqlcode = sqlcode value` ).

**Severity:** 8 (Error)

**User Response:** Ensure that MQListener configuration is correctly specified and that a stored procedure of the specified schema and name exists with a correct signature and is accessible to the user running MQListener.

### DSNQ071I

**Explanation:** MQListener encountered an unsupported datatype in the signature of the stored procedure `schema name. procedure name in subsystem name`. The datatype was `datatype value`.

**Severity:** 8 (Error)

**User Response:** Consult the MQListener documentation and ensure that the stored procedure has the correct datatype.

### DSNQ072I

**Explanation:** MQListener was unable to start a thread running a task specified in the configuration `configuration name` by the input queue `input queue name` and queue manager `queue manager name`. The ECF error code was `error code value`.

**Severity:** 8 (Error)

**User Response:** Ensure that MQListener configuration is correct, especially the `-numInstances` parameter, and that the MQListener process has sufficient system resources to execute the required number of simultaneous tasks.

### DSNQ073I

**Explanation:** MQListener started a thread running the task specified in the configuration `configuration name` by the input queue `input queue name` and queue manager `queue manager name`.

**Severity:** 0 (Informational)

**User Response:** None. This is the formal notification of a thread start, expected during startup or restart.

### DSNQ074I

**Explanation:** A thread running the task specified in the configuration `configuration name` by the input queue `input queue name` and queue manager `queue manager name` has exited.

**Severity:** 0 (Informational)

**User Response:** None. This is the formal notification of a thread exit, expected during shutdown or restart.
DSNQ075I  MQListener encountered a DB2 database error while running the stored procedure `schema name`. `procedure name` in subsystem `subsystem name` during operation `operation name`. The resulting sqlstate was `sqlstate value` (sqlcode = `sqlcode value`).

**Explanation:** MQListener encountered a DB2 database error while running the stored procedure `schema name`. `procedure name` in subsystem `subsystem name` during operation `operation name`. The resulting sqlstate was `sqlstate value` (sqlcode = `sqlcode value`).

**Severity:** 8 (Error)

**User Response:** Consult MQListener documentation and ensure that MQListener is properly installed in the specified subsystem and access to MQListener packages and configuration tables has been granted to the user running MQListener. Ensure that the stored procedure executes correctly.

---

DSNQ082I  MQListener received a restart message on admin queue `admin queue name`, queue manager `queue manager name`.

**Explanation:** MQListener received a restart message on admin queue `admin queue name`, queue manager `queue manager name`.

**Severity:** 0 (Informational)

**User Response:** None. This is a formal notification on receiving a restart message.
Chapter 17. DSNR... Messages

The following information messages indicate the progress of DB2 through a restart process.

**DSNR001I RESTART INITIATED**

**Explanation:** This message delimits the beginning of the restart process within startup. The phases of restart are about to begin. These phases are necessary to restore the operational environment to that which existed at the time of the previous termination and to perform any recovery actions that may be necessary to return DB2-managed resources to a consistent state.

**DSNR002I RESTART COMPLETED**

**Explanation:** This message delimits the completion of the restart process within startup.

**DSNR003I RESTART...PRIOR CHECKPOINT**

**RSAB=xxxxxxxxxxxxx**

**Explanation:** The message indicates the first phase of the restart process is in progress and identifies (as 'xxxxxxxxxxxx') the log positioning RBA of the checkpoint from which the restart process will obtain its initial recovery information.

**DSNR004I RESTART...UR STATUS COUNTS IN**

**COMMIT=xnnn, INDOUBT=xnnn,**

**INFLIGHT=xnnn, IN ABORT=xnnn,**

**POSTPONED ABORT=xnnn**

**Explanation:** This message indicates the completion of the first phase of the restart process. The counts indicate the number of units of work whose execution state during a previous DB2 termination was such that (to ensure DB2 resource consistency) some recovery action must be performed during this restart process or (by the user) upon completion of the restart process. The counts of IN COMMIT, INDOUBT, INFLIGHT and IN ABORT may provide an indication of the time required to perform the remaining two phases of restart (forward and backward recovery). The counts of POSTPONED ABORT URs may provide an indication of the time required to perform -RECOVER POSTPONED processing.

The IN COMMIT count specifies the number that had started but not completed phase 2 of the commit process. These must undergo forward recovery to complete the commit process.

The INDOUBT count specifies the number that were interrupted between phase 1 and phase 2 of the commit process. These must undergo forward recovery to ensure resources modified by them are unavailable until their indoubt status is resolved.

The INFLIGHT count specifies the number that neither completed phase 1 of the commit process nor began the process of backing out. These must undergo backward recovery to restore resources modified by them to their previous consistent state.

The IN ABORT count specifies the number that were in the process of backing out. These must undergo backward recovery to restore resources modified by them to their previous consistent state.

The POSTPONED ABORT count specifies the number whose backout was postponed in an earlier restart process and not attended to prior to this restart process. These must undergo backward recovery after completion of restart, via the -RECOVER POSTPONED command, to restore resources modified by them to their previous consistent state.

This message is issued by the following CSECT: DSNRRCST.

**DSNR005I RESTART...COUNTS AFTER FORWARD**

**RECOVERY IN COMMIT=xnnn,**

**INDOUBT=xnnn**

**Explanation:** The message indicates the completion of the forward recovery restart phase. The counts indicate the number of units of work whose recovery actions could not be completed during the phase. Typically, those in an IN COMMIT state remain because the recovery actions of some subcomponents have not been completed. Those units of work in an INDOUBT state will remain until connection is made with the subsystem that acts as their commit coordinator.

**Operator Response:** No action is required unless the conditions persist beyond some installation-defined period of time. Recovery action will be initiated when the resource is brought online. Indoubt resolution will be initiated as part of the process of reconnecting the subsystems.

**DSNR006I RESTART...COUNTS AFTER**

**BACKWARD RECOVERY**

**INFLIGHT=xnnn, IN ABORT=xnnn,**

**POSTPONED ABORT=xnnn**

**Explanation:** The message indicates the completion of the backward recovery restart phase. The counts indicate the number of units of work whose recovery actions could not be completed during the phase.

When INFLIGHT or IN ABORT URs do not complete backout during restart, they are converted to POSTPONED ABORT status, so the INFLIGHT and IN
ABORT counts should be zero. The POSTPONED ABORT count indicates the number of URs for which backout work still exits (from this or a previous restart).

Backout work for the POSTPONED ABORT URs should be completed by the user (via the -RECOVER POSTPONED command), once DB2 restart has completed.

This message is issued by the following CSECT: DSNRRAUB

**Operator Response:** No action is required unless the condition persists beyond some installation-defined period of time. Recovery action will be initiated when the resource collection is brought online.

---

**DSNR007I**  
**RESTART...STATUS TABLE**

**Explanation:** This message precedes a table showing the status of units of recovery (URs) after each restart phase. The message and the table will accompany the DSNR004I, DSNR005I, or DSNR006I message after each nested phase. At the end of the current status rebuild phase, it shows the status of any URs that require processing. At the end of the forward recovery and backout phases, it shows the status of only those URs which needed processing but were not processed. The table helps to identify the URs that were active when DB2 came down, and to determine the log scope required to bring DB2 up.

The format of the table is shown below:

```
T CONID CORRID AUTHORIZATION ID PLAN S URID DAY TIME
```

where the columns contain the following information:

- **T**: Connection type. The values may be:
  - B: Batch: a batch program or QMF user.
  - I: Internal: a system service being performed on some user's behalf.
  - S: Subsystem: work that originated from an attached subsystem, either CICS or IMS/VS.

- **CONID**: Connection identifier for related URs. Batch connections are not related to any other connection. Subsystem connections with the same identifier indicate URs that originated from the same subsystem.

- **CORRID**: Correlation identifier; unique within a subsystem connection, it relates a UR to a particular CICS or IMS/VS transaction.

- **AUTHORIZATION ID**: Authorization identifier of the user for whom this UR was created.

- **PLAN**: Name of the plan allocated to the UR.

- **S**: Restart status of the UR. When DB2 came down, the UR was in one of these situations:
  - A: INABORT: The UR was in the 'must-complete' phase of abort, and is yet to be completed.
  - C: INCOMMIT: The UR was in the 'must-complete' phase of commit, and is yet to be completed.
  - D: INDOUBT: The UR had completed the first phase of commit, but DB2 had not received the second phase instruction. The UR must be remembered so it can be resolved when the owning subsystem reattaches.
  - F: INFLIGHT: The UR had not completed the first phase of commit, and will be backed out.
  - P: POSTPONED ABORT: The UR has not yet completed backout. Backout must be completed outside of DB2 restart by means of the -RECOVER POSTPONED command.

- **URID**: UR identifier, the log RBA of the beginning of this unit of work. It is the earliest RBA required to process the UR during Restart.

- **DAY**: The day the UR was created, in the format 'ddd'. It is approximately the time of the first SQL statement of the application or the first SQL statement following a commit point.

- **TIME**: The time the UR was created, in the format 'hh mm ss '. It is approximately the time of the first SQL statement of the application or the first SQL statement following a commit point.

This message is issued by the following CSECT: DSNRUDIS

---

**DSNR009I**  
**STORAGE IS NOT AVAILABLE FOR THE UR DISPLAY TABLE, THE SIZE REQUESTED = xxxx, STORAGE MANAGER REASON CODE = yyyy yyyy**

**Explanation:** There was not enough storage available during the creation of the recoverable UR (RURE) display table (DSNDRUDT).

**System Action:** The system continues to restart but the RESTART... STATUS TABLE is not displayed.

**System Programmer Response:** Increase the region size of the ssnmMSTR address space before restarting DB2 again.

**Operator Response:** Save the console output and inform the system programmer.

**Problem Determination:** The size requested is approximately 110 bytes for each unit of recovery (UR). See the message DSNR004I to determine the total number of URs to process. Then get the 00E2xxxx
reason code from the DSNR009I header. Use these two numbers to determine the reason for the shortage.

**DSNR010I**  
**AN ERROR OCCURRED IN THE RURE STATUS TABLE SORT/TRANSLATE MODULE (DSNRUSOR), THE ERROR LOCATION CODE = xxxx**

**Explanation:** There was an error in processing the RURE display table. One of these ERROR LOCATION CODES tells what function the module was attempting to perform:

- X'0001'  
  Trace entry to the module
- X'0002'  
  Sort the recoverable UR display table
- X'0003'  
  Translate the recoverable UR table
- X'0004'  
  Convert the store clock value for display
- X'0005'  
  Trace exit from the module

**System Action:** The system continues to restart but the RESTART... STATUS TABLE is not displayed.

**System Programmer Response:** Use the error code in the message to fill in the problem description.

**Operator Response:** Save the console output and inform the system programmer.

**Problem Determination:** The ERROR CODE tells the problem area and should be used in the problem description. A record was added to the SYS1.LOGREC that contains the PSW and module at the time of the error. This error indicates an application program check of some type.

**DSNR011I**  
**AN ERROR OCCURRED IN THE RURE STATUS TABLE DISPLAY MODULE (DSNRUDIS), THE ERROR LOCATION CODE = xxxx**

**Explanation:** There was an error in processing the RURE display table. One of these ERROR LOCATION CODES tells what function the module was attempting to perform:

- X'0001'  
  Trace entry to the module
- X'0002'  
  Build header for the display table
- X'0003'  
  Build entries for the display table
- X'0004'  
  Call DSNRWTO to display the table
- X'0005'  
  Trace exit from the module
- X'0006'  
  Get message text

**System Action:** The system continues to restart but the RESTART... STATUS TABLE is not displayed.

**System Programmer Response:** Use the error code in the message to fill in the problem description.

**Operator Response:** Save the console output and inform the system programmer.

**Problem Determination:** The ERROR CODE describes the problem area and should be used in the problem description. A record was added to the SYS1.LOGREC containing the value DSNRUDIS, and the PSW and CSECT at the time of the error. This error indicates an application program check of some type.

**DSNR014I**  
**EXCLUDED RURE TABLE**

**Explanation:** This is a list of RUREs which are being bypassed because of the conditional restart. Either they were to be processed in a phase that was bypassed or they were outside the log range.

The following shows the format of the table headings. See message DSNR007I for an explanation of the table columns.

**T CONID CORRID AUTHORIZATION ID PLAN S URID DAY TIME**

**System Action:** Restart continues.

**DSNR015I**  
**THE CHKPTRBA xxxxxxxxxx SPECIFIED IN THE CRCR IS INVALID**

**Explanation:** The checkpoint RBA specified in the conditional restart control record (CRCR) is either not available or is not a begin checkpoint record.

**System Action:** Restart is abended with reason code '00D99001'.

**Operator Response:** Inform the system programmer.

**System Programmer Response:** By specifying the STARTRBA and/or ENDRBA on the CRESTART control statement, change log inventory (DSNJR003) utility selects an appropriate RBA.

**Problem Determination:** Print the complete checkpoint records queue by using the print log map (DSNJR004) utility. Select a checkpoint RBA from this queue or let the change log inventory (DSNJR003) utility make the selection.

**DSNR016I**  
**STARTRBA xxxxxxxxxx VALIDATION FAILED**

**Explanation:** A scan from the STARTRBA failed to find a complete log record. Either the entire log was scanned and no complete record was found, or the log manager found an invalid log record. The log manager sends the error messages to the console indicating a bad log record.

**System Action:** Restart abends.

**Operator Response:** Record the log manager message numbers and inform the system programmer.

**System Programmer Response:** Use DSN1LOGP to determine a STARTRBA to use for restart. The recovery manager uses the STARTRBA as a starting point for its search of the beginning of a valid log record.
**DSNR017I**  
**RESTART IS BEING TERMINATED BECAUSE OF CSORONLY SPECIFICATION IN CRCR**

**Explanation:** The restart procedure only completed the first phase of startup. The status displayed during this partial restart can be used to build the conditional restart control record (CRCR).

**System Action:** Restart is abended.

**System Programmer Response:** To prevent the restart control record from being reused during the next restart attempt, the current restart control record must be canceled. Use the change log inventory (DSNJU003) CRESTART CANCEL option, or create a new restart control record. The newly created restart control record will automatically cancel the previous record.

---

**DSNR018I**  
`csect-name RESTART...BACKWARD RECOVERY PROCESSED FROM RBA  ffffffff TO RBA ttttttttt`

**Explanation:** This message indicates the range of log processed during the backward phase of RESTART when postponed backout processing has been requested. Processing began with the LR of RBA `fffffff` and proceeded backwards to the LR of RBA `ttttttttt`.

**System Action:** This message is followed by messages DSNR006I and DSNR007I. The former tells how many URs had some backout work postponed. The latter, identifies the postponed abort URs. The amount of log that need to be processed to complete backout processing for the postponed abort URs can be gauged by comparing the RBA reached during RESTART's backward processing (`RBA ffffffff`), and the URIDs of the postponed abort URs.

---

**DSNR020I**  
`csect-name START MEMBER member, OR REPLY 'NO' OR 'QUIESCED'`

**Explanation:** During a group restart, the group member issuing this message attempted to access the BSDS for member `member`, and either was not able to access the BSDS, or discovered that the BSDS was modified by the change log inventory (DSNJU003) utility since that member was last started. In either case, this DB2 is not able to perform peer restart for member `member`.

For group restart to continue, the identified member must be started.

If it is not possible to start the other member and you want to terminate this group restart, you can reply 'NO' to this message. Replying 'NO' to this message causes this DB2 to terminate with a reason code of 00D900E1. You then have to reply 'NO' to this message for all remaining members participating in this group restart.

If you are sure that the identified member was quiesced the last time it was started, that is, it was stopped with a -STOP DB2 MODE (QUIESCE) command and it stopped with no indoubt units of recovery and no distributed resynchronization responsibility, then you can reply 'QUIESCED' to this message. Replying 'QUIESCED' to this message causes message DSNR030I to be issued as a reminder that group restart will continue **without using the log** from the identified member.

**System Action:** This group member waits for the identified member to be started or for a valid reply to this message.

- If the identified member is started, group restart continues.
- If the reply is 'NO', this DB2 terminates with a reason code of 00D900E1.
- If the reply is 'QUIESCED', group restart continues **without using the log** from the identified member.

---

**DSNR021I**  
`csect-name DB2 SUBSYSTEM MUST PERFORM GROUP RESTART FOR PEER MEMBERS`

**Explanation:** This DB2 subsystem must perform the group restart phase to recover either the shared communications area (SCA) or the retained locks for nonstarting members in the data sharing group.

This message marks the beginning of group restart processing for peer members. Messages DSNR023I and DSNR024I or messages DSNR025I and DSNR026I are issued for each peer that is processed by this DB2 subsystem. Message DSNR022I marks the end of group restart processing for peer members.

This message is issued before this DB2 member enters the group restart process. The group restart process is synchronized among all group members that are starting and therefore participating in this group restart. After this DB2 member synchronizes with other members, it is possible that no peer processing will be necessary; in that case message DSNR022I immediately follows this message.

If it is necessary to recover both the SCA and retained locks, this message is issued twice; once for SCA recovery and again for the recovery of the retained locks.

**System Action:** The subsystem begins group restart processing.

---

**DSNR022I**  
`csect-name DB2 SUBSYSTEM HAS COMPLETED GROUP RESTART FOR PEER MEMBERS`

**Explanation:** This DB2 subsystem, which previously issued message DSNR021I, completed the group restart phase to recover the shared communications area (SCA) or retained locks for nonstarting DB2 members in the data sharing group.

**System Action:** The subsystem continues with the next restart phase of its own subsystem.
DSNR023I  csect-name GROUP RESTART INITIATED TO RECOVER THE SCA FOR GROUP MEMBER membname

Explanation: The DB2 subsystem that issued this message is performing the group restart phase to recover the shared communications area (SCA) for nonstarting member membname of the data sharing group.

This message is followed by message DSNR024I after the group restart phase to recover the SCA for the identified member is complete.

System Action: The subsystem continues the group restart process.

DSNR024I  csect-name GROUP RESTART COMPLETED TO RECOVER THE SCA FOR GROUP MEMBER membname

Explanation: The DB2 subsystem that issued this message completed the group restart phase to recover the shared communications area (SCA) for member membname of the data sharing group.

This message is issued only if messages DSNR021I and DSNR023I were issued.

System Action: The subsystem continues the group restart process.

DSNR025I  csect-name GROUP RESTART INITIATED TO RECOVER RETAINED LOCKS FOR GROUP MEMBER membname

Explanation: The DB2 subsystem that issued this message is performing the group restart phase to recover the retained locks for nonstarting member membname of the data sharing group.

This message is followed by message DSNR026I after the group restart phase to recover the retained locks for the identified member is complete.

System Action: The subsystem continues the group restart process.

DSNR026I  csect-name GROUP RESTART COMPLETED TO RECOVER RETAINED LOCKS FOR GROUP MEMBER membname

Explanation: The DB2 subsystem that issued this message completed the group restart phase to recover the retained locks for member membname of the data sharing group.

This message is issued only if messages DSNR021I and DSNR025I were issued.

System Action: The subsystem continues the group restart process.

DSNR030I  csect-name WILL CONTINUE WITHOUT THE member MEMBER'S LOG, REPLY 'YES' OR 'NO'

Explanation: The reply to message DSNR020I was 'QUIESCED'. This message is issued as a reminder that group restart will continue without using the log from the identified member.

If you are sure that the identified member was quiesced the last time it was started, that is, it was stopped with a -STOP DB2 MODE(QUIESCE) command and it stopped with no indoubt units of recovery and no distributed resynchronization responsibility, then reply 'YES'; otherwise, reply 'NO'.

System Action: This group member waits for a valid reply to this message.

- If the reply is 'YES', group restart continues without using the log from the identified member.
- If the reply is 'NO', message DSNR020I is reissued to allow you to enter a different response.

DSNR031I  csect-name PROCESSING LOG RECORD AT RBA rba1 TO RBA rba2

Explanation: This message is produced periodically during the forward and backward processing phases of restart. The RBAs presented in this message can be used to monitor the progress of the phases of restart.

Forward processing occurs between messages DSNR004I and DSNR005I. During forward processing, the log is read in a forward direction.

Backward processing occurs between messages DSNR005I and DSNR006I. During backward processing, the log is read in a backward direction and will stop reading at the RBA matching the URID of the oldest in-flight or in-abort UR.

rba1 is the RBA of the log record currently being processed. rba2 is the RBA of the last log record that will be read in this phase of restart.

System Action: DB2 restart continues.

User Response: This is an information only message.

DSNR032E  csect-name DB2 IS STARTING AT RELEASE LEVEL release-level-1, WHICH IS NOT COMPATIBLE WITH RELEASE LEVEL release-level-2

Explanation: The DB2 you tried to start is not at the proper code release, or does not have the correct fallback/coexistence SPE applied.

code-level-1 and code-level-2 are a string of three numeric characters as follows:

- Version
- Release
- Modification level
code-level-1
The current release level of the starting DB2.

code-level-2
One of the following:
  • In non-data-sharing, the highest release with which this DB2 has ever been started.
  • In a data sharing environment, the highest release with which any DB2 in the data sharing group has ever been started. This is known as the group release level.

This message can occur in the following situations:
  • The starting DB2 fell back from a later release and does not have the proper fallback SPE applied.
  • The starting DB2 does not have the proper coexistence SPE to start in a data sharing group, which is at the higher release level.
  • The starting DB2 is at a release in which coexistence with the current group release level is not supported.

System Action: DB2 terminates with reason code 00D900FA.

System Programmer Response: Verify that:
  • Coexistence is supported between the releases you are trying to run.
  • The startup procedure is pointing to the correct set of load libraries.
  • The correct SPE has been applied.

For more information about what SPE is needed, see the program directory or preventative service planning (PSP) updates.

DSNR033E csect-name MEMBER member-name IS AT RELEASE LEVEL code-level-1 WHICH IS NOT COMPATIBLE WITH THE STARTING MEMBER AT RELEASE LEVEL code-level-2

Explanation: The code level for the started DB2 member and the starting DB2 member are not compatible until you apply the correct SPE to the lower level release.

code-level-1 and code-level-2 are a string of three numeric characters as follows:
  • Version
  • Release
  • Modification level

code-level-1
The release level of the active DB2 member member-name.

code-level-2
The release level of the starting DB2.

This message occurs when a starting DB2 member is at a higher release than can coexist with an existing DB2 member.

DSNR033E csect-name MEMBER member-name IS AT RELEASE LEVEL code-level-1 WHICH IS NOT COMPATIBLE WITH THE STARTING MEMBER AT RELEASE LEVEL code-level-2

System Action: After detecting the first member with which it cannot coexist, DB2 terminates with reason code 00D900FA.

System Programmer Response: If you want to start a higher release level of DB2, you must ensure that all active members in the group have the proper SPE applied. If you intended to start a lower release level of DB2, make sure your startup procedure is pointing to the correct set of load libraries.

For more information about what SPE is needed, see the program directory or preventative service planning (PSP) updates.

DSNR034E csect-name THERE CANNOT BE MORE THAN TWO RELEASE LEVELS OF DB2 RUNNING IN THE GROUP

Explanation: You attempted to start a DB2 that was at a release level that cannot coexist in the data sharing group. There are already two different releases of DB2 currently running in the data sharing group.

System Action: DB2 terminates.

System Programmer Response: If you are sure that the startup procedure is pointing to the correct set of load libraries, you must stop any DB2 subsystems that cannot coexist with the one you are attempting to start.

See DB2 Data Sharing: Planning and Administration for more information about release coexistence in a data sharing group.

DSNR035I csect-name WARNING - UNCOMMITTED UR AFTER nn CHECKPOINTS - CORRELATION NAME = xxxxxxxx xxxx CONNECTION ID = yyyy yyyy LUWID = logical-unit-of-work-id=token PLAN NAME = xxxxxxxx AUTHID = xxxxxxxx END USER ID = xxxxxxxx TRANSACTION NAME = xxxxxxxx WORKSTATION NAME = xxxxxxxx

Explanation: This message indicates that during checkpoint, DB2 encountered an uncommitted UR that has an INFLIGHT status.

The value nn is cumulative, and it indicates the number of checkpoints taken since the beginning of the UR. CORRELATION name, CONNECTION ID, and LUWID together identify a thread associated with the UR. If the LUWID is an "", it indicates that the thread originated at this site. token is a unique token number associated with the LUWID. PLAN NAME and AUTHID further identify the thread associated with the UR. If the thread was created with client End User information, the End User’s ID, TRANSACTION NAME, and WORKSTATION NAME will be displayed. Otherwise, these fields will contain an "".

System Action: DB2 continues processing. If statistics class 3 is turned on, IFCID 0313 is written.
**System Programmer Response:** Consult with the application programmer to determine if this is a problem UR. See Part 4 (Volume 1) of [DB2 Administration Guide](http://example.com) for more information about problems caused by uncommitted URs. If the UR is caused by an application program, you can use **CANCEL THREAD** to delete the UR, if necessary. If an uncommitted UR is deleted, DB2 will undo the changes. The amount of time required for this process depends on the amount of work done by the UR.

**Programmer Response:** Ensure that the application commits frequently enough, or consult with your DB2 administrator about decreasing the frequency of the check.

---

**DSNR036I** csect-name UNRESOLVED UR ENCOUNTERED DURING CHECKPOINT
- CORRELATION NAME = xxxxxxxxxx
- CONNECTION ID = yyyyyyyy
- LUWID = logical-unit-of-work-id
- PLAN NAME = xxxxxxxx
- AUTHID = xxxxxxx

**Explanation:** DB2 has detected an INDOUBT unit of recovery (UR) during a checkpoint. The purpose of this message is to remind the operator that an INDOUBT UR or POSTPONED ABORT UR exists.

CORRELATION name, CONNECTION ID, and LUWID together identify a thread associated with the UR. If the LUWID is an ‘*’, it indicates that the thread originated at this site. PLAN NAME and AUTHID further identify the thread associated with the indoubt UR.

**System Action:** DB2 continues processing. If statistics class 3 is turned on, IFCID 0313 is written.

**System Programmer Response:** Consult with the application programmer to determine whether this is a problem UR. See Part 4 (Volume 1) of [DB2 Administration Guide](http://example.com) for more information about resolving INDOUBT URs.

---

**DSNR037I** csect-name WARNING - THE TCP/IP DRDA PORT NUMBER IS CHANGED FROM port_1 TO port_2

**Explanation:** The TCP/IP DRDA port number specified in the DB2 BSDS is different from the value used the last time a member of the DB2 data sharing group started. All members of a DB2 data sharing group must use the same TCP/IP DRDA port number.

**System Action:** DB2 accepts the new TCP/IP DRDA port number, and DB2 startup continues.

**Operator Response:** Contact the system programmer.

**System Programmer Response:** If the TCP/IP DRDA port number was changed inadvertently, stop DB2 immediately. Use the change log inventory utility (DSNU003) to correct the PORT value, and restart DB2.

If this message reflects a change that you want to make to DB2’s DRDA port number, no action is required. The DRDA port number stored in the coupling facility for this member is updated, and this new port number will be used when DB2 validates the resynchronization port number for other DB2 members.
DSNR039I  csect-name WARNING - TCP/IP RESYNCHRONIZATION PORT NUMBER port_1 IS THE SAME AS MEMBER member_name

Explanation: The TCP/IP resynchronization port number of the starting DB2 is the same as the member indicated by member_name.

port_1 The TCP/IP resynchronization port number that was obtained from the DB2 BSDS during DB2 startup.

member_name The member name of the DB2 data sharing member that used the same resynchronization port number.

System Action: The TCP/IP port number specified in the BSDS is accepted, and DB2 startup continues.

Operator Response: Contact the system programmer.

System Programmer Response: Each member of the DB2 data sharing group should have a unique TCP/IP resynchronization port number. Use the change log utility (DSNJU003) to specify a unique RESPORT value for this DB2 member and the DB2 member identified by member_name.

DSNR040I  csect-name TRACKER RESTART ENDLRSN lrsn DOES NOT MATCH ENDLRSN lrsn ASSOCIATED WITH THE DATA SHARING GROUP

Explanation: In a data sharing environment, a TRKRSITE DB2 will not restart if it detects inconsistencies in the reported values for ENDLRSN. The ENDLRSN specified on the Conditional Restart Control Record does not match the ENDLRSN in the system communications area (SCA) structure for the data sharing group.

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump, and contact the system programmer.

System Programmer Response: If the ENDLRSN value for this member is incorrect, take the following actions:

- Restore the BSDS and Logs for this Tracker DB2 from the primary DB2
- Ensure the Conditional Restart Control Record is correct
- Restart DB2

If the ENDLRSN value in the SCA is incorrect, delete the SCA structure and restart all members of the TRKRSITE data sharing group with the same ENDLRSN.

DSNR042I  csect-name WARNING - UR ROLLBACK HAS BEEN CANCELED AND IS INCOMPLETE FOR CORRELATION NAME = corrId CONNECTION ID = connId AUTHID = authid PLAN NAME = plan-name URID = urid

Explanation: DB2 issues this message when rollback for the indicated thread has been canceled by either the CANCEL THREAD NOBACKOUT command or the RECOVER POSTPONED CANCEL command.

System Action: Rollback processing for the thread stops and the unit of recovery is logged as canceled and complete.

User Response: Examine the console messages indicating what objects are being marked as REFP, RECP; those objects will need to be recovered.

DSNR043E  csect-name DB2 IS STARTING WITH AN UNSUPPORTED CODE LEVEL. CURRENT LEVEL: current-code-level VALID LEVEL(S): valid-code-levels

Explanation: The DB2 that is starting is not at the proper code level. Some required maintenance, such as a fallback or coexistence SPE, has not been applied. The level information is different for each SPE level and each release. This information is for the use of your IBM service representative.

This message can occur in the following situations:

- The DB2 that is starting has completed a fallback from a later release and does not have the proper fallback SPE applied.
- The DB2 that is starting does not have the proper coexistence SPE to start in a data sharing group, which is at a later release level.
- The DB2 that is starting is not at a release level that supports coexistence with the data sharing group.

System Action: DB2 terminates with reason code 00D900FA.

Operator Response: Save the console output and inform the system programmer.

System Programmer Response: Check the DB2 Program Directory and Preventive Service Planning updates (PSP) to determine what SPE you need.

Verify that:

- Coexistence is supported between the releases you are trying to run.
- The DB2 startup procedure points to the correct set of load libraries.
- The correct SPE has been applied.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 134B.
**DSNR044E**  
Movie-name MEMBER member-name IS STARTED AT A LEVEL OF CODE started-code-level WHICH IS NOT COMPATIBLE WITH THE STARTING MEMBER. VALID LEVEL(S) valid-code-levels

**Explanation:** The code levels are not compatible between the DB2 member that has already started and the DB2 member that is starting. You need to apply the correct SPE to the DB2 member that is at the earlier level.

The level information is different for each SPE level and each release. This information is for the use of your IBM service representative.

This message occurs when a starting DB2 member is at a later release level that cannot coexist with an existing DB2 member.

**System Action:** After detecting the first member with which it cannot coexist, DB2 terminates with reason code 00D900FA.

**Operator Response:** Save the console output and inform the system programmer.

**System Programmer Response:** Check the Program Directory and Preventive Service Planning updates (PSP) to ensure that all active members in the group have the proper SPE applied.

Verify that:

- Coexistence is supported between the releases you are trying to run.
- The DB2 startup procedure points to the correct set of load libraries.
- The correct SPE has been applied.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNR045I**  
csect-name DB2 SUBSYSTEM IS STARTED AND IT WAS NOT STARTED IN A PREVIOUS RELEASE WITH THE FALLBACK SPE APPLIED. FALLBACK SPE APAR: apar-number NEW RELEASE LEVEL: release KNOWN LEVEL(S): level

**Explanation:** DB2 was not started with the FALLBACK SPE active before an attempt was made to start DB2 in a new release. The FALLBACK SPE must be applied, and the system must be started before DB2 can be started in a new release.

**release level**  
The release and level are different for each release, and are for the use of the IBM service representative.

---

**DSNR046I**  
csect-name INCOMPLETE UNITS OF RECOVERY EXIST FOR subsys

**Explanation:** This message is issued during DB2 shutdown if any incomplete units of recovery exist for the referenced member of a data sharing group. The message indicates that retained locks will be held by subsystem subsys.

**System Action:** DB2 shutdown continues normally.

**User Response:** Restart DB2 and resolve the incomplete units of recovery to release the retained locks held by subsystem subsys.

---

**DSNR047I**  
csect-name POSTPONED ABORT BACKOUT PROCESSING LOG RECORD AT RBA rba1 TO RBA rba2

**Explanation:** This message is produced periodically during the backupout processing of postponed abort units of recovery, initiated by the -RECOVER POSTPONED command. The RBAs in this message can be used to monitor the backupout progress.

During the backupout process, DB2 reads the log in a backward direction and stops reading the log at the RBA matching the URID of the oldest postponed-abort UR rba2. rba1 is the RBA of the log record currently being processed.

**System Action:** Backout processing continues.

**System Programmer Response:** This is an information-only message. If the message continues to be issued and rba1 remains the same, make sure there are no outstanding archive tape mount that may be delaying the log read process. Otherwise, obtain a dump of the DB2 address spaces for problem determination.

The -DISPLAY THREAD TYPE(POSTPONED) command can be issued to display information about the postponed abort units of recovery. It is also possible to stop the backupout process with the -RECOVER POSTPONED CANCEL command, but this will leave objects in an inconsistent state. See the [DB2 Command Reference](#) for more information regarding the CANCEL option of the -RECOVER POSTPONED command.
**DSNR048I**  
**csect-name** UR BACKOUT  
**PROCESSING LOG RECORD AT RBA**  
**rba1** TO RBA **rba2** FOR CORRELATION  
**NAME = xxxxxxxxxxxx** CONNECTION ID  
**LUWID = yyyyyyyyy**  
**NAME = xxxxxxxx** AUTHID = xxxxxxxx  
**END USER ID = xxxxxxxx**  
**TRANSACTION NAME = xxxxxxxx**  
**WORKSTATION NAME = xxxxxxxx**  

**Explanation:** This message is produced periodically during the backup process of an in-abort unit of recovery. The RBAs in this message can be used to monitor the backup progress. Together, CORRELATION name, CONNECTION ID, and LUWID identify a thread associated with the UR. If the LUWID is "", the thread originated at this site. **token** is a unique token number associated with the LUWID. PLAN NAME and AUTHID further identify the thread associated with the UR. If the thread was created with client end user information, the end user’s USERID, TRANSACTION NAME, and WORKSTATION NAME are displayed. Otherwise, these fields contain an "".

During the backup process, DB2 reads the log in a backward direction and stops reading the log at the RBA matching the URID of the in-abort UR **rba2**. **rba1** is the RBA of the log record currently being processed.

**System Action:** Backout processing continues.

**System Programmer Response:** This is an information-only message. If the message continues to be issued and **rba1** remains the same, make sure there are no outstanding archive tape mounts that might be delaying the log read process. Otherwise, obtain a dump of the DB2 address spaces for problem determination.

It might be possible to stop the backup process with the NOBACKOUT option of the -CANCEL THREAD command, but this leaves objects in an inconsistent state. See the [DB2 Command Reference](#) for more information regarding the NOBACKOUT option of the -CANCEL THREAD command.

**DSNR050I**  
**csect-name** DB2 STARTED IN SYSTEM RECOVER PENDING MODE  

**Explanation:** DB2 has started in System Recover Pending mode in preparation for the RESTORE SYSTEM utility. No database update activity is allowed, and DB2 is in restricted access mode.

**System Action:** DB2 startup continues.

**DSNR051I**  
**csect-name** SYSPITR RESTART  
**ENDLRSN lrsn DOES NOT MATCH**  
**ENDLRSN lrsn ASSOCIATED WITH THE DATA SHARING GROUP**

**Explanation:** For a System Level Recovery restart, all members of the data sharing group must truncate their logs with the same LRSN value that was specified in the SYSPITR conditional restart parameter.

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump, and contact the system programmer.

**System Programmer Response:** Ensure that the conditional restart control record is correct, and then restart DB2. You can run the Print Log Map utility (DSNJU004) to examine the current conditional restart record.

**DSNR052I**  
**csect-name** DB2 MEMBER TO REMAIN ACTIVE IN LIGHT MODE TO RESOLVE INDOUBT UNITS OF RECOVERY  

**Explanation:** This message is issued at the end of restart when the DB2 member has been restarted with the LIGHT(YES) parameter and there are indoubt units of recovery (URs).

**System Action:** The DB2 member remains up and running in light mode. This DB2 member will only allow connections for the purpose of resolving the indoubt URs. Also, certain commands are allowed. Any attempt to connect to this DB2 to submit new SQL work will be disallowed with reason code 00F300A2.

**User Response:** Ensure that the appropriate commit coordinators are started so that the can resync with the DB2 member to resolve the indoubts. Alternatively the -RECOVER INDOUBT command can be used to manually resolve the indoubts.

**DSNR053I**  
**csect-name** ALL INDOUBT UNITS OF RECOVERY HAVE BEEN RESOLVED. LIGHT MODE DB2 NORMAL TERMINATION TO FOLLOW  

**Explanation:** This message is issued following DSNR052I after all indoubt units of recovery have been resolved for this DB2 member, which was restarted with the LIGHT(YES) parameter.

**System Action:** DB2 subsystem shutdown is initiated.
Chapter 18. DSNT... Messages

Messages issued by DSNTINST, DSNTINS1, and DSNTINS2 installation CLISTs have an internal severity level as follows:

0 Successful execution: CLIST progress and tracing messages (processing continues)

4 Warning: some adjustments might be made by the installation CLISTs (processing and JCL editing continues)

8 Error: unable to continue (no JCL is edited)

**DSNT101I** A VSAM ERROR HAS BEEN ENCOUNTERED WHILE CSECT DSNSTSTR2 WAS READING THE DB2 BSDS VSAM RETURN CODE = x, VSAM REASON CODE = y

**Explanation:** CSECT DSNSTSTR2 attempted to read the DB2 bootstrap data set (BSDS), and a VSAM error has occurred. In the message, 'x' is a 1-byte VSAM return code and 'y' is a 1-byte VSAM reason code.

**System Action:** The start up process continues. However, any references to password-protected system databases will cause a 'resource unavailable' error. Any agent-related requests for subsystem database resources will result in an SQLCODE -904. Any requests that are not agent-related for unavailable resources will result in the following messages:

- DSNi001i DSNi002i DSNi003i DSNi004i
- DSNi005i DSNi006i DSNi0108i DSNi014i
- DSNi015i DSNi016i DSNi017i DSNi050i

Abend X'04E' with reason code X'00E30010' is also produced. However, the error results in a retry. DB2 does not terminate, but a dump is produced.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide] and Reference for information on identifying and reporting the problem.

**Problem Determination:** This message is generated when the recovery log manager (RLM) subcomponent of DB2 encounters an invalid DB2 database services password record. A copy of the BSDS record with key '20000001', which is the invalid database services record retrieved, should be obtained.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1 2 5 16]

**DSNT103I** THE CURRENTLY LOADED DSN6SPRM IS NOT THE MVS/XA VERSION

**Explanation:** A -START DB2 PARM=xxxxxxxx was issued where 'xxxxxxxx' is the version of the system parameter CSECTs. DB2 executes in a MVS/XA environment and will not execute in any other environment.

**System Action:** The message DSNV086E is generated with a reason code of X'00E30008'. DB2 is
terminated with abend code X'04F'.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Restart DB2 with a -START DB2 PARM= command, where the parameter block that follows the 'PARM=' parameter specifies an MVS/XA version of the DB2 subsystem parameters.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNT104I**  
THE CURRENTLY LOADED DSN6SPRM IS NOT THE MVS/370 VERSION

**Explanation:** A -START DB2 PARM=xxxxxx was issued, where 'xxxxxxx' is the version of the system parameter CSECTs. DB2 executes in an MVS/370 environment and does not execute in any other environment.

**System Action:** Message DSNV086E is generated with reason code X'00E30009'. DB2 is terminated with abend code X'04F'.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Restart DB2 with a -START DB2 PARM= command, where the parameter block that follows the PARM= parameter specifies an MVS/370 version of the DB2 subsystem parameters.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNT105I**  
THE LOADED DSN6SPRM CSECT IS OBSOLETE. PLEASE REASSEMBLE THE DSN6SPRM CSECT AND RELINKEDIT THE DSNZPARM LOAD MODULE.

**Explanation:** DSNTSTR2 loaded an out-of-date system parameter CSECT DSN6SYSP. This error can only occur if code maintenance has been applied and CSECT DSN6SYSP has not been reassembled. This CSECT is contained in the load module specified in the 'PARM=' parameter of the -START DB2 command.

**System Action:** The message DSNV086E is generated with a reason code of X'00E30008'. DB2 is terminated with abend code X'04F'.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Reassemble DSN6SYSP, and relink-edit the DSNZPARM load module. This is done by submitting the install job stream, DSNTIJUZ, that built the load module that is named following the 'PARM=' parameter of the -START DB2 command.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNT106I**  
THE LOADED DSN6SYSP CSECT IS OBSOLETE. PLEASE REASSEMBLE THE DSN6SYSP CSECT AND RELINKEDIT THE DSNZPARM LOAD MODULE.

**Explanation:** DSNTSTR2 loaded an out-of-date system parameter CSECT DSN6SYSP. This error can only occur if code maintenance has been applied and CSECT DSN6SYSP has not been reassembled. This CSECT is contained in the load module specified in the 'PARM=' parameter of the -START DB2 command.

**System Action:** The message DSNV086E is generated with a reason code of X'00E30008'. DB2 is terminated with abend code X'04F'.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Reassemble DSN6SYSP, and relink-edit the DSNZPARM load module. This is done by submitting the install job stream, DSNTIJUZ, that built the load module that is named following the 'PARM=' parameter of the -START DB2 command.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNT107I**  
INVALID AMODE OR RMODE ATTRIBUTE FOUND FOR LOAD MODULE module-name

**Explanation:** During DB2 startup, the service controller establishes the addressability to the DB2 database services functional recovery and the emergency shutdown routines. Two load modules, DSNFT, and DSNTLCE, are loaded into CSA. In the MVS/XA environment, DSNTLCE must be link-edited with attributes AMODE(24) and RMODE(ANY). At least one of the modules did not have the correct addressing attribute when it was loaded. 'module-name' in the error message is the name of the first load module that has an invalid addressing mode.

**System Action:** DB2 database services start up is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Verify that all install and maintenance activities against these modules were executed using SMP. Verify that the JCLIN for SMP includes the correct AMODE and RMODE control statements, and that the linkage editor provided with the Data Facility Product (DFP) was invoked by SMP for the link edits. Correct the procedure or JCL which caused the error and rerun the necessary SMP jobs.

**Problem Determination:** A DB2 dump was requested to an MVS/XA SYS1.DUMP data set.

The MVS service aid AMBLIST provides linkage editor
module attributes in the summary section of the LISTLOAD function output.

**DSNT200I**  type bind-type FOR PLAN plan-id SUCCESSFUL

**Explanation:** A BIND, REBIND or FREE PLAN subcommand has completed successfully.

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Indicates that a test bind was in progress. A test bind means that no plan name was specified. The token is omitted if a normal BIND PLAN was processed.</td>
</tr>
<tr>
<td>bind-type</td>
<td>Type of bind subcommand: BIND, REBIND, or FREE.</td>
</tr>
<tr>
<td>plan-id</td>
<td>Name of application plan specified in the subcommand.</td>
</tr>
</tbody>
</table>

**System Action:** The plan was successfully bound, rebound, or freed.

**DSNT201I**  type bind-type FOR PLAN plan-id NOT SUCCESSFUL

**Explanation:** Errors have been detected during the processing of the indicated BIND, REBIND, or FREE PLAN subcommand.

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Indicates that a test bind was in progress. A test bind means that no plan name was specified. The token is omitted if a normal BIND PLAN was processed.</td>
</tr>
<tr>
<td>bind-type</td>
<td>Type of bind subcommand: BIND, REBIND, or FREE.</td>
</tr>
<tr>
<td>plan-id</td>
<td>Name of application plan specified in the subcommand.</td>
</tr>
</tbody>
</table>

**System Action:** The BIND, REBIND, or FREE PLAN was not performed.

**System Programmer Response:** See other messages issued to determine the error that caused the bind subcommand to terminate unsuccessfully.

**DSNT202I**  MESSAGE LIMIT EXCEEDED

**Explanation:** A fixed amount of space exists in which to generate bind subcommand messages. This message says that the bind subcommand generated more messages than will fit in that space.

**System Action:** For bind subcommands that affect a single plan, the bind subcommand process continues. However, no other messages are generated except for message DSNT200I or DSNT2011. For bind subcommands that affect more than one plan, the bind subcommand process terminates and no other messages are generated.

**System Programmer Response:** The 'FLAG'

parameter of the bind subcommand can be used to limit the types of messages that are generated.

**DSNT205I**  name IS A DUPLICATE name-type, IT WILL BE USED ONLY ONCE

**Explanation:** Name 'name' has been specified more than once in a list of names.

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name that was specified more than once.</td>
</tr>
<tr>
<td>name-type</td>
<td>Indicates the type of list in which the name was duplicated.</td>
</tr>
<tr>
<td>members</td>
<td>List of DBRM Members</td>
</tr>
<tr>
<td>plan-id</td>
<td>List of plan IDs</td>
</tr>
<tr>
<td>connection</td>
<td>List of system connection names on a DISABLE or ENABLE list.</td>
</tr>
<tr>
<td>package</td>
<td>List of package IDs</td>
</tr>
</tbody>
</table>

**System Action:** Duplicates are removed from 'name-type' list and the bind process continues.

**System Programmer Response:** Verify the list that contains the duplicate. If the error is only in entering a name incorrectly, which happens to duplicate another entry, enter the name correctly and reissue the bind statement. If the entry is really a duplicate, no action is required.

**DSNT207I**  PROGRAM program-name WITH MARK release-dependency-mark FAILED BECAUSE IT DEPENDS ON FUNCTIONS OF THE RELEASE FROM WHICH FALL BACK HAS OCCURRED

**Explanation:** Program 'program-name' depends on a function of DB2 that is not supported by the current active release.

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program-name</td>
<td>Name of the application program.</td>
</tr>
<tr>
<td>release-dependency-mark</td>
<td>A one-character mark showing the oldest DB2 release supporting this program.</td>
</tr>
</tbody>
</table>

This message is issued by the following CSECTs: DSNTBCM1, DSNTBCM2

**System Action:** The bind operation for this plan or package is not performed.

**User Response:** The program cannot be used until the DB2 subsystem is remigrated to the newer release. Notify the system programmer.

**System Programmer Response:** Warn users not to use plans or packages containing this program until the DB2 subsystem has been remigrated to the newer release.
DSNT208I  PROGRAM program-name
PRECOMPILED WITH INCORRECT LEVEL FOR THIS RELEASE

Explanation: Program 'program-name' was precompiled under a release not supported by the current level of DB2, or the contents of the DBRM have been modified after the precompilation phase.

System Action: The BIND operation was not performed.

User Response: Precompile the named program again using the current precompiler. Reissue the BIND command.

Problem Determination: If the application program was precompiled at an appropriate release, and the problem persists, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

DSNT209I  bind-type FOR PLAN plan-id WITH
MARK release-dependency-mark FAILED
BECAUSE PLAN DEPENDS ON
FUNCTIONS OF THE RELEASE FROM
WHICH FALL BACK HAS OCCURRED.

Explanation: Plan 'plan-id' depends on a function of DB2 which is not supported by the currently active release.

bind-type
REBIND

plan-id Name of the application plan

release-dependency-mark
A one-character mark showing the oldest release of DB2 which can support this plan. The release dependency mark for the plan is kept in the IBMREQD columns in the DB2 catalog in SYSIBM.SYSPLAN.

System Action: The REBIND operation for this plan is not performed.

User Response: The plan cannot be used until the DB2 subsystem is remigrated to the newer release.

Operator Response: Notify the system programmer.

System Programmer Response: Warn users not to use the plan until the DB2 subsystem has been remigrated to the newer release.

DSNT210I  bind-type AUTHORIZATION ERROR
USING authorization-id AUTHORITY
PLAN=plan-id PRIVILEGE=privilege

Explanation: The indicated authorization ID does not have the indicated privilege and therefore cannot invoke the indicated BIND subcommand against the indicated application plan.

bind-type
Type of BIND subcommand: BIND, REBIND, FREE.

authorization ID
Authorization ID of the plan owner.

plan-id Application plan specified in the BIND subcommand.

privilege
Missing privilege: BIND, BINDADD

System Action: The BIND, REBIND, or FREE operation for 'plan-id' is not performed.

System Programmer Response: If the indicated privilege is BINDADD, then the privilege to invoke the BIND subcommand with the ACTION(ADD) option must be granted to the indicated authorization ID. If the indicated privilege is BIND, the privilege to invoke a BIND subcommand against the indicated application plan must be granted to the indicated authorization ID.

DSNT211I  REBIND FOR PLAN plan-id FAILED
BECAUSE IBMREQD OF ibmreqd IS INVALID

Explanation: The IBMREQD column of the SYSIBM.SYSPLAN catalog table for the named plan contains an unrecognizable character.

System Action: The REBIND operation for the plan was not performed.

System Programmer Response: You must do a BIND ACTION(REPLACE) for this plan.

DSNT212I  bind-type AUTHORIZATION ID auth-id IN
THE OWNER KEYWORD IS INVALID

Explanation: The authorization ID specified in the OWNER keyword of the BIND or REBIND subcommand is invalid. To specify an OWNER that is not the primary authorization ID, or one of the secondary IDs of the process requires additional authority. See DB2 Command Reference for the authority required.

bind-type
Type of bind subcommand: BIND or REBIND

auth-id The authorization ID specified as owner.

System Action: The BIND or REBIND subcommand is not executed.

System Programmer Response: Rerun the subcommand and specify a valid authorization ID for the OWNER keyword. You may need to add the required authorization ID for this user to the security system.
DSNT213I THE DCB BLOCK SIZE OF THE INPUT
DBRM LIBRARY IS INVALID

Explanation: An invalid DCB block size is specified for the
DBRM library of the BIND subcommand.

System Programmer Response: Correct the DCB
block size of the DBRM library, and reissue the BIND
subcommand.

DSNT214I I/O ERROR ON DBRM LIBRARY DBRM
MEMBER= dbrr-name DBRM
LIBRARY= dbrr-pds-name xxxxxx

Explanation: An I/O error was encountered attempting
to read database request module (DBRM) during a
BIND subcommand. 'xxxxxx' is a portion of the message
text generated by the SYNADEF macro instruction to
describe the permanent I/O error. This text may contain
information such as jobname, stepname, unit address,
device type, ddname, operation attempted, and error
description.

dbrr-name
Name of the DBRM associated with the error.

dbrr-pds-name
Partitioned data set associated with the error.

System Action: No application plan is created.

System Programmer Response: Determine if an
incorrect dbrr-pds-name was specified in the LIBRARY
parameter of the BIND subcommand, or an incorrect
data set name was specified for the DBRMLIB DD
statement. Check correctly specified data sets for I/O
errors or modified DCB attributes.

DSNT220I BIND ADD ERROR USING auth-id
AUTHORITY PLAN plan-id ALREADY EXISTS

Explanation: An attempt was made to use the BIND
subcommand with the 'ACTION(ADD)' option that
specified a 'plan-id' that already exists.

auth-id Authorization ID of the owner of the plan.

plan-id Application plan specified in the BIND
subcommand.

System Action: No application plan is created.

System Programmer Response: Check the
SYSIBM.SYSPLAN catalog table for names of existing
application plans. Reinvoke the BIND subcommand with
a 'plan-id' that is not in use.

DSNT221I bind-type ERROR USING auth-id
AUTHORITY PLAN plan-id DOES NOT EXIST

Explanation: The indicated bind subcommand was
issued against an application plan that does not exist.
The individual variable fields contain:

bind-type
Type of bind subcommand: REBIND or FREE.

auth-id Authorization ID of the plan owner.

plan-id Application plan specified in the BIND
subcommand.

System Programmer Response: Check the
SYSPLAN catalog table for the correct 'plan-id' to use.

DSNT223I csect-name bind-type WARNING FOR
object-type = object-name USE OF
OPTHINT IS DISALLOWED BY A DB2
SUBSYSTEM PARAMETER. THE
DEFAULT OPPTHINT VALUE IS USED.

Explanation: The DB2 subsystem parameters have not
been configured to enable the use of OPPTHINT in
the bind-type subcommand. The default OPPTHINT value
of all blanks is used.

bind-type
Type of BIND subcommand: BIND or REBIND.

object-type
PLAN or PACKAGE

object-name
If object-type is PLAN, object-name is the
name of the plan.

If object-type is PACKAGE, object-name is the
name of the package in the format
'location-id.collection-id.package-id'.

System Action: Processing continues normally using
the default OPPTHINT value.

System Programmer Response: Enable the use of
OPPTHINT by changing the value of OPTIMIZATION
HINTS on the DB2 Installation panel, DSNTIP4.

If, after further consideration, you do not want to use
OPPTHINT, remove OPPTHINT from the bind-type
subcommand or set the value to all blanks.

DSNT224I csect-name bind-type ERROR FOR
object-type object-name CCSID = ccsid IS
INVALID FOR ENCODING SCHEME =
scheme

Explanation: The system does not have a valid
CCSID defined for the specified encoding scheme, or
the specified CCSID is not defined on the system.

bind-type
Type of bind subcommand: BIND or REBIND.

object-type
PLAN or PACKAGE.

object-name
If object-type is PLAN, object-name is the
name of the application. Otherwise, it is the
name of the package in
'location.collection.package' format.
scheme

The encoding scheme specified in the ENCODING bind option on the subcommand or defaulted from the system default Application Encoding Scheme. If scheme is UNKNOWN, then the CCSID value specified in the ENCODING bind option or defaulted from the system default Application Encoding Scheme is not defined, and therefore the encoding scheme is not known.

ccsid

The numeric CCSID corresponding to the specified ccsid-type.

Severity: 8 (error)

System Action: The bind-type operation is not performed

User Response: Verify that the correct encoding scheme was specified in the ENCODING bind option on the bind-type subcommand. If correct, see System Programmer Response and contact the System Programmer. If incorrect, specify the correct scheme in the ENCODING option and reissue the bind-type subcommand.

System Programmer Response: If the bind option ENCODING was not specified, and instead the value for ENCODING was defaulted from the system default Application Encoding Scheme, verify the Application Encoding Scheme is set to a defined CCSID.

If the value specified for the ENCODING option was ASCII, EBCDIC or UNICODE, verify the corresponding CODED CHAR SET subsystem parameter on the installation panel DSNTIPF has been set to a defined CCSID.

Otherwise, inform the user of the correct CCSID. Refer to Appendix A of [DB2 Installation Guide] for more information regarding CCSIDs and character sets.

<table>
<thead>
<tr>
<th>DSNT228I</th>
<th>BIND ERROR, ATTEMPTING TO REPLACE PACKAGE = package_name WITH VERSION = (version2) BUT THIS VERSION ALREADY EXISTS</th>
</tr>
</thead>
</table>

Explanation: An attempt is made to create a version of a package that already exists. The version specified in the REPLVER keyword is different from the version specified for the precompile. The version specified for the precompile already exists in the catalog. The combination of 'location.collection.package.version' must be unique in the SYSIBM.SYSPACKAGE catalog table. A common mistake is that the user may believe that the version he is creating is the one specified in the REPLVER keyword. This is not the case. The version specified in the REPLVER keyword is the name of the version being replaced. The version that will be created is the version that was given to the program when it was precompiled.

<table>
<thead>
<tr>
<th>package_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fully qualified package name</td>
</tr>
</tbody>
</table>

Version2

Version-id of package that is to be created

System Action: The bind will fail.

System Programmer Response: There are two approaches to solve this problem. The first is to re-precompile the program with a new version name and re-issue the original BIND subcommand. The other approach is not to do the precompile but re-issue the BIND subcommand without the REPLVER parameter.

---

<table>
<thead>
<tr>
<th>DSNT229I</th>
<th>BIND ERROR, ATTEMPTING TO REPLACE PACKAGE = package_name THERE ARE ENABLE OR DISABLE ENTRIES CURRENTLY ASSOCIATED WITH THE PACKAGE</th>
</tr>
</thead>
</table>

Explanation: The BIND subcommand was issued to replace a package that has ENABLE or DISABLE entries currently associated with the package. The individual variable fields contain:

| package-name
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name of the package</td>
</tr>
<tr>
<td>(location.collection.package)</td>
</tr>
</tbody>
</table>

System Action: Package not bound.

System Programmer Response: FREE the package first and then BIND the package.

---

<table>
<thead>
<tr>
<th>DSNT230I</th>
<th>BIND DBRM MEMBER NAME ERROR USING auth-id AUTHORITY object-type = object-name MEMBER dbrm-name NOT FOUND IN PDS SEARCH ORDER</th>
</tr>
</thead>
</table>

Explanation: The indicated 'dbrm-name' was not found in the search order in the PDSs specified on the BIND PLAN or BIND PACKAGE subcommand.

<table>
<thead>
<tr>
<th>auth-id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authorization ID of the plan or package owner</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>object-type</th>
</tr>
</thead>
<tbody>
<tr>
<td>The type of object being bound: PLAN or PACKAGE</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>object-name</th>
</tr>
</thead>
<tbody>
<tr>
<td>If 'object-type' is PLAN, 'object-name' is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>dbrm-name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Member name of the DBRM that was not found</td>
</tr>
</tbody>
</table>

System Action: The bind is unsuccessful.

System Programmer Response: Determine if an incorrect 'dbrm-member-name' or PDS was specified. Reinvoke the BIND subcommand specifying the correct names.
**DSNT231I**  BIND DBRM ERROR USING **auth-id**
**AUTHORITY** object-type = object-name

DBRM **dbrm-name** IS IN AN INCONSISTENT STATE

**Explanation:** The contents of a DBRM have been modified after the precompilation process, or the DBRM contains incorrect information in the header.

- **auth-id** Authorization ID of the invoker of the BIND subcommand.
- **object-type** The type of object being bound: PLAN or PACKAGE
- **object-name** If 'object-type' is PLAN, 'object-name' is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format.
- **dbrm-name** Name of the DBRM that is in error.

**System Action:** The bind is unsuccessful.

**System Programmer Response:** Precompile the application program associated with the indicated DBRM. Reinvoke the BIND subcommand.

---

**DSNT232I** SUCCESSFUL **bind-type** FOR PACKAGE = **package-name**

**Explanation:** A BIND, REBIND or FREE PACKAGE subcommand has completed successfully.

- **bind-type** Type of bind subcommand: BIND, REBIND, or FREE
- **package-name** Name of the package in the following format: 'location.collection.package.(version)'

**System Action:** The package was successfully bound, rebound, or freed.

---

**DSNT233I** UNSUCCESSFUL **bind-type** FOR PACKAGE = package-name

**Explanation:** Errors have been detected during the processing of the indicated BIND, REBIND, or FREE PACKAGE subcommand.

- **bind-type** Type of bind subcommand: BIND, REBIND, or FREE
- **package-name** Name of the package in the following format: 'location.collection.package.(version)'

**System Action:** The indicated package was not bound, rebound, or freed.

**System Programmer Response:** See other messages issued to determine the error that caused the subcommand to terminate unsuccessfully.

---

**DSNT234I** MESSAGE LIMIT EXCEEDED

**Explanation:** A fixed amount of space exists in which to generate bind subcommand messages. This message says that the bind subcommand generated more messages than will fit in that space.

**System Action:** For bind subcommands that affect a single package, the bind subcommand process continues. However, no other messages are generated except for completion message DSNT232I or DSNT233I. For bind subcommands that affect more than one package, the bind subcommand process terminates and no other messages are generated.

**System Programmer Response:** The 'FLAG' parameter of the bind subcommand may be used to limit the types of messages that are generated.

---

**DSNT235I** csect-name **bind-type** AUTHORIZATION ERROR USING **auth-id**
**AUTHORITY** PACKAGE = **package-name** PRIVILEGE = **privilege**

**Explanation:** The authorization ID given does not have the **privilege** indicated and cannot invoke the bind subcommand on the named package.

- **bind-type** Type of bind subcommand: BIND, REBIND, or FREE
- **auth-id** Authorization ID of the package owner
- **package-name** Name of the package in the following format: 'location.collection.package.(version)'
- **privilege** Name of the privilege not held:
  - BINDADD or BINDADD *
    - The authority to create a new package using BIND with the ADD option.
  - BIND *
    - The authority to BIND (REPLACE) or REBIND a package.
  - FREE *
    - There is no FREE privilege, but the user needs the proper authority to free the package.
  - COPY *
    - The authority to COPY from the indicated package.
  - CREATE IN or CREATE IN *
    - The authority to create a package in the indicated collection.
A blank and asterisk ( * ) in the privilege values 'BINDADD *', 'BIND *', and 'CREATE IN *' in the message indicates that the DB2 system parameter BIND NEW PACKAGE has the value BIND. When * * does not appear in these privilege values, BIND NEW PACKAGE has the value BINDADD.

The system parameter BIND NEW PACKAGE affects the authorization required to add a new package or a new version of an existing package to a collection. For more information about this system parameter, see:

- "Installing, Migrating, and Updating System Parameters" (Panel: DSNTIPP) in Part 2 of DB2 Installation Guide
- "Controlling Access to DB2 Objects" in Part 3 (Volume 1) of DB2 Administration Guide.

**System Action:** The indicated package is not bound, rebound, or freed.

**System Programmer Response:** You must grant the indicated privilege to the authorization ID of the package owner.

**Explanation:** The IBMREQD column of the SYSIBM.SYSPACKAGE catalog table for the named package contains an unrecognizable character. This usually means that the package depends on a function of DB2 which is not supported by the currently active release.

This message is issued by the following CSECT: DSNTBRRB2

```
package-name
Name of the package in the following format:
'location.collection.package.(version)'
```

**System Action:** The package was not rebound.

**System Programmer Response:** Warn users not to use the package until the DB2 subsystem is remigrated to the newer release.

**Explanation:** An attempt is made to add a package that already exists. The combination of 'location.collection.package.version' must be unique in the SYSIBM.SYSPACKAGE table. In addition, the combination of 'location.collection.package.consistency-token' must be unique.

```
sub-type
The sub-type can have the values: COPY, ADD or REPLACE.
```

**auth-id** Authorization ID of the owner of the package.
**DSNT240I csect-name bind-type ERROR, ASTERISK NOT ALLOWED ON REMOTE bind-type PACKAGE**

**Explanation:** When remotely rebinding or freeing a package, an asterisk (*) cannot be specified anywhere in the name of a package. In other words, it is not possible to remotely rebind or free multiple packages.

**System Programmer Response:** Remove the asterisk and rebind, or free a specific package. Refer to [DB2 Command Reference] for the correct syntax for REBIND or FREE PACKAGE.

**DSNT241I bind-type AUTHORIZATION error-type ON PLAN plan-id AUTHORIZATION ID auth-id NOT AUTHORIZED TO EXECUTE PACKAGE package-name**

**Explanation:** The indicated authorization ID does not have EXECUTE authority on the specified package in the package list.

**bind-type**
Type of bind subcommand: BIND or REBIND

**error-type**
Type of error: WARNING or ERROR. If VALIDATE(BIND) was specified, this is an ERROR message. Otherwise, it is a WARNING message.

**plan-id** Name of application plan specified in the subcommand.

**auth-id** Authorization ID of the plan owner.

**package-name**
Name of the package (collection.package). The location of the package is the local DB2 location name.

**System Action:** If the bind subcommand was invoked with VALIDATE(BIND), the BIND or REBIND operation is not performed. If VALIDATE(RUN) was used then the BIND or REBIND operation will continue.

**System Programmer Response:** The indicated plan owner should be granted the EXECUTE privilege on the package.

**DSNT242I bind-type ERROR USING auth-id AUTHORITY NO BIND OR REBIND SUBCOMMANDS ARE ALLOWED FOR THIS AUTHID**

**Explanation:** The authorization ID is not allowed to perform the indicated 'bind-type' against a plan or package because entries in the RLST table prohibit binding and rebinding by this authorization ID, or all authorization IDs.

**bind-type**
Type of bind subcommand: BIND or REBIND

**auth-id** Authorization ID of the plan or package owner.

**System Action:** The plan or package is not bound or rebound.

**System Programmer Response:** If the indicated authorization ID should be allowed to bind, change the entry in the active RLST table.

**DSNT243I BIND ERROR FOR PACKAGE = pkg-id CONTOKEN = 'contoken'X IS NOT UNIQUE SO IT CANNOT BE CREATED**

**Explanation:** An attempt is made to add or replace a package with a consistency token that is not unique for that package. In other words, the combination of 'location.collection.package.consistency-token' already exists.

**pkg-id** Fully qualified name of the package.

**contoken** Consistency token in hexadecimal.

**System Action:** The BIND will fail.

**System Programmer Response:** Check the SYSIBM.SYSPACKAGE catalog table for names of existing application packages with the indicated consistency token. Re-issue the BIND subcommand such that the 'location.collection.package.consistency-token' is unique within the catalog. The following SQL statement can be used to query the catalog,

```
SELECT COLLID,NAME FROM loc-id.SYSIBM.SYSPACKAGE WHERE HEX(CONTOKEN) = 'contoken';
```

**DSNT244I bind-type ERROR keyword KEYWORD IS NOT SUPPORTED FOR REMOTE PROCESSING**

**Explanation:** The indicated keyword is not supported for the remote bind or rebind subcommand.

**bind-type**
Type of bind subcommand: BIND or REBIND

**keyword**
Name of the keyword that is not supported.

**Programmer Response:** Check [DB2 Command Reference] for the correct syntax.

**DSNT245I LOCATION location CANNOT BE SPECIFIED. THE LOCAL DB2 IS NOT DEFINED**

**Explanation:** Since the local DB2 location name is undefined, no location name may be given when specifying a package name on a bind subcommand.

**location**
Location specified on the bind subcommand.

**System Action:** The bind subcommand was not performed.
System Programmer Response: The location name of the local DB2 must be defined in BDS if the location is used in the BIND, REBIND, or FREE subcommand.

**DSNT246I**

<table>
<thead>
<tr>
<th>bind-type FOR PACKAGE</th>
<th>package-name WITH MARK</th>
<th>release-dependency-mark</th>
<th>FAILED BECAUSE PACKAGE DEPENDS ON FUNCTIONS OF THE RELEASE FROM WHICH FALL BACK HAS OCCURRED</th>
</tr>
</thead>
</table>

Explanation: The named package depends on a function of DB2 which is not supported by the currently active release.

**bind-type**
Type of bind subcommand: REBIND

**package-name**
Name of the package in the following format: 'location.collection.package.(version)'

**release-dependency-mark**
A one-character mark showing the oldest release of the DB2 which can support this package. The release dependency mark for the package is kept in the IBMREOD column in the DB2 catalog in SYSIBM.SYSPACKAGE.

**System Action:** The 'bind-type' operation for this package is not performed.

**User Response:** The package cannot be bound until the DB2 subsystem is remigrated to the newer release.

**System Programmer Response:** Warn users not to use plans containing this package until the DB2 subsystem has been remigrated to the newer release.

**DSNT247I**

<table>
<thead>
<tr>
<th>bind-type ERROR</th>
<th>object-type NOT FOUND FOR</th>
<th>object-name</th>
</tr>
</thead>
</table>

Explanation: You attempted to FREE or REBIND multiple plans or packages using the asterisk (*) but no plans or packages were found.

**bind-type**
Type of bind subcommand: REBIND or FREE

**object-type**
Type of object to be freed or rebound: PLAN or PACKAGE

**object-name**
If object-type is PLAN, object-name is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format.

**System Action:** The REBIND or FREE operation is not performed.

**User Response:** Check the plan or package name. If it is correct, no plans or packages were found and no operation can be performed; otherwise, correct the plan or package name and reissue the REBIND or FREE subcommand.

**DSNT248I**

| csect-name bind-type ERROR FOR | object-type object-name | CCSID = ccsid IS INVALID FOR ENCODING SCHEME = scheme |

Explanation: The system does not have a valid CCSID defined for the specified encoding scheme, or the specified CCSID is not defined on the system.

**bind-type**
Type of bind subcommand: BIND or REBIND.

**object-type**
PLAN or PACKAGE

**object-name**
If object-type is PLAN, object-name is the name of the application. Otherwise, it is the name of the PACKAGE in 'location.collection.package' format.

**scheme**
This field displays the encoding scheme specified in the ENCODING bind option on the bind-type subcommand or defaulted from the system default Application Encoding Scheme. If scheme is UNKNOWN, then the CCSID value has not been defined in the ENCODING bind option or by the system default Application Encoding Scheme, and therefore the encoding scheme is not known.

**ccsid**
This field displays the numeric CCSID specified in the ENCODING bind option or the numeric CCSID corresponding to the scheme specified in the ENCODING bind option. Otherwise, ccsid displays the numeric CCSID corresponding to the specified ccsid-type.

**Severity:** 8 (error)

**System Action:** The bind-type operation is not performed

**User Response:** Verify that the correct encoding scheme was specified in the ENCODING bind option on the bind-type subcommand. If correct, see System Programmer Response and contact the system programmer. If incorrect, specify the correct scheme in the ENCODING option and reissue the bind-type subcommand.

**System Programmer Response:** If the bind option ENCODING was not specified, and the value for ENCODING was defaulted from the system default Application Encoding Scheme instead, verify the Application Encoding Scheme is set to a defined CCSID.

If the value specified for the ENCODING option was ASCII, EBCDIC or UNICODE, verify the corresponding CODED CHAR SET subsystem parameter on the
installation panel DSNTIPF has been set to a defined CCSID.

Otherwise, inform the user of the correct CCSID. Refer to Appendix A of the DB2 Installation Guide for more information regarding CCSIDs and character sets.

-----

**DSNT249I**  
csect-name bind-type WARNING FOR  
PLAN plan-name keyword LOCATION-ID location-id NOT FOUND IN  
SYSIBM.LOCATION

**Explanation:** A 'location-id' was specified on the PKLIST or CURRENTSERVER keyword on a bind subcommand. That location is not defined in the SYSIBM.LOCATIONS table.

**bind-type**  
Type of bind subcommand: BIND or REBIND

**plan-name**  
Name of the plan

**keyword**  
The bind subcommand containing the nonexistent location: PKLIST or CURRENTSERVER

**location-id**  
The nonexistent location

**System Action:** The bind process will continue.

**System Programmer Response:** Define the appropriate 'location-ids' in the SYSIBM.LOCATION catalog table prior to executing the plan.

-----

**DSNT250I**  
BIND UNABLE TO OPEN DBRM LIBRARY USING  
authorization-id AUTHORITY object-type = object-name

**Explanation:** The BIND subcommand was unable to open the DBRM partitioned data set(s).

**authorization-id**  
Authorization ID of the invoker of the BIND subcommand.

**object-type**  
PLAN | PACKAGE

**object-name**  
If 'object-type' is PLAN, 'object-name' is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format.

**User Response:** Contact the system programmer, providing all material associated with the error.

**System Programmer Response:** Determine why the BIND subcommand was unable to open the DBRM library, and correct the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349: 1 2 3 32

-----

**DSNT252I**

**Severity:** 0 (informational)
**bind-type**
Type of bind subcommand: BIND or REBIND

**plan-name**
Name of plan

**location-id**
Location of CURRENTSERVER

**System Action:** The bind process will continue.

**System Programmer Response:** Add a package list with package(s) that reference the location specified in the CURRENTSERVER or delete the CURRENTSERVER from the BIND or REBIND subcommand.

---

**DSNT259I**
**bind-type WARNING FOR PLAN**
plan-name NO PACKAGES IN THE
PACKAGE LIST REFERENCE THE
LOCATION-ID location-id SPECIFIED IN
CURRENTSERVER

**Explanation:** There are no packages in the package list that reference the location specified in the CURRENTSERVER keyword.

**bind-type**
Type of bind subcommand: BIND or REBIND

**plan-name**
Name of plan

**location-id**
Location of CURRENTSERVER

**System Action:** The bind process will continue.

**System Programmer Response:** Change 'location-ids' for the packages in the package list to reference the location in the CURRENTSERVER or change the location specified in CURRENTSERVER.

---

**DSNT260I**
csect-name bind-type - THE SUBMITTED
PARAMETERS RESULT IN AN INVALID
COMBINATION OF bind-option1 AND
bind-option2 FOR object-type =
object-name

**Explanation:** The BIND or REBIND subcommand has been submitted with an invalid combination of bind option or parameter values.

**bind-type**
Type of bind subcommand: BIND or REBIND.

**object-type**
PLAN or PACKAGE

**object-name**
If object-type is PLAN, object-name is the name of the application plan. If object_type is PACKAGE, object_name is the name of the package in the format 'location-id.collection-id.package-id'.

---

**bind-option1 and bind-option2**
The invalid combination of bind option values, where bind-option1 and bind-option2 are each an option name and value.

If object-type is PLAN, then one of the following applies:
- bind-option1 was used on the REBIND subcommand and bind-option2 exists in the SYSIBM.SYSPLAN catalog table for PLAN object-name, or
- bind-option2 was used on the REBIND subcommand and bind-option1 exists in the SYSIBM.SYSPLAN catalog table for PLAN object-name.

If object-type is PACKAGE, then one of the following applies:
- bind-option1 was used on the BIND COPY or REBIND subcommand and bind-option2 exists in the SYSIBM.SYSPACKAGE catalog table for PACKAGE object-name, or
- bind-option2 was used on the BIND COPY or REBIND subcommand and bind-option1 exists in the SYSIBM.SYSPACKAGE catalog table for PACKAGE object-name.

The combination of bind-option1 and bind-option2 is not supported by DB2.

**System Action:** The BIND or REBIND process is terminated for the indicated plan or package.

**User Response:** Refer to [DB2 Command Reference](#) for valid combinations of the indicated bind option values, and reissue the BIND or REBIND subcommand with a valid combination.

**Problem Determination:** See the Explanation section of this message.

---

**DSNT261I**
**bind-type WARNING FOR object-type =
object-name ALL CONNECTION TYPES
ARE DISABLED**

**Explanation:** All possible connection types are disabled. The plan or package cannot be executed.

**bind-type**
Type of bind subcommand: BIND or REBIND

**object-type**
PLAN or PACKAGE

**object-name**
If object-type is PLAN, object-name is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format.

**System Action:** The bind process will continue.

**System Programmer Response:** Delete one or more connection types from DISABLE clause or add a list of
connection names associated with one of the connection types (DLIBATCH, CICS, IMSBMP, IMSMPP, or REMOTE. REMOTE is only valid for BIND/REBIND PACKAGE)

**DSNT262I**  
csect-name bind-type WARNING -  
ISOLATION old-iso NOT SUPPORTED.  
CHANGING TO ISOLATION new-iso

**Explanation:** DB2 does not support the isolation level specified on the local BIND or REBIND PACKAGE subcommand. The isolation level specified by new-iso is used instead.

**Severity:** 4  
**System Action:** Processing continues

**User Response:** If the new isolation level is not satisfactory, change the ISOLATION option on the BIND or REBIND PACKAGE subcommand and rebind the package. Use a value that DB2 supports.

---

**DSNT263I**  
csect-name bind-type FOR object-type =  
object-name FAILED BECAUSE THE  
bind-type DEPENDS ON FUNCTIONS IN  
A LATER DB2 RELEASE WITH MARK  
release-dependency-mark OR HIGHER

**Explanation:** The current DB2 does not support a bind option or feature specified in the indicated bind subcommand. The bind option or feature depends on functions in a later DB2 release.

*bind-type*  
Type of bind subcommand: BIND or REBIND

*object-type*  
PLN or PACKAGE

*object-name*  
If object-type is PLAN, object-name is the name of the plan.

If object-type is PACKAGE, object-name is the name of the package in the format 'location-id.collection-id.package-id'.

*release-dependency-mark*  
A one-character mark indicating the oldest DB2 release that can support the bind subcommand.

This message can be issued in the following situations:

- When the DSN command explicitly or implicitly uses the name of a DB2 subsystem that does not support a bind option or feature used in the DSN bind subcommand *bind-type*, or
- When the DSN command uses a group attachment name for a DB2 data sharing group and the receiving DB2 data sharing member does not support a bind option or feature used in the DSN bind subcommand *bind-type*.

**System Action:** The *bind-type* operation is not performed.

**User Response:** In the DSN command, specify the name of a DB2 subsystem having release dependency mark *release-dependency-mark* or higher that supports all of the bind options or features used in the *bind-type* subcommand.

For a list of the DB2 release dependency marks and their meanings, refer to the IBMREQD column in the SYSIBM.SYSPLAN or SYSIBM.SYSPACKAGE DB2 catalog tables described in Appendix D of [DB2 SQL Reference](#).

**System Programmer Response:** See the 'User Response' section of this message.

---

**DSNT264I**  
csect-name bind-type bind-subtype  
ERROR USING auth-id AUTHORITY  
PACKAGE package-name IS A  
TRIGGER PACKAGE

**Explanation:** To rebind a trigger package, you must use the DSN subcommand REBIND TRIGGER PACKAGE. To free a trigger package, you must use the SQL statement DROP TRIGGER. You cannot copy a trigger package.

*bind-type*  
Type of bind subcommand: BIND, REBIND, or FREE

*bind-subtype*  
Subtype of bind subcommand: COPY or blank

*auth-id*  
Authorization ID attempting the prohibited action

*package-name*  
Name of the package in the following format: 'collection.package'

**System Action:** The trigger package is not copied, rebound, or freed.

**System Programmer Response:** Check the SYSIBM.SYSPACKAGE catalog table for names of existing trigger packages. Re-invoke the bind subcommand with a 'collection.package' that is not a trigger package.

---

**DSNT265I**  
csect-name bind-type bind-subtype  
ERROR USING auth-id AUTHORITY  
PACKAGE package-name IS NOT A  
TRIGGER PACKAGE

**Explanation:** The subcommand REBIND TRIGGER PACKAGE can be used only for trigger packages.

*bind-type*  
Type of bind subcommand: REBIND

*bind-subtype*  
Subtype of bind subcommand: TRIGGER
**System Programmers**

auth-id Authorization ID attempting the REBIND
package-name Name of the package in the following format: ‘collection.package’

**System Action:** The package specified is not rebound.

**System Programmer Response:** For a package that is not a trigger package, rebound using the subcommand REBIND PACKAGE. Re-invoke the bind subcommand with a ‘collection.package’ that is a trigger package.

---

**DSNT266I**

csect-name bind-type FOR object-type = object-name FAILED. THE TOTAL LENGTH OF THE PATH SCHEMA NAME LIST EXCEEDS 254 CHARACTERS WITH SCHEMA NAME schema-name

**Explanation:** DB2 uses the schema name list you specified in the bind option PATH to set the DB2 SQL Path that will be used for the bind process. The SQL Path is a VARCHAR(254) string containing the list of schema names you specified, where each schema name is delimited with double quotes and separated from the next schema name by a comma. The total length of this SQL Path string, including the delimiters and commas, cannot exceed 254 characters. The indicated schema name schema-name in the bind option PATH causes the SQL Path string to exceed 254 characters.

bind-type Type of bind subcommand: BIND or REBIND
object-type PLAN or PACKAGE
object-name
If object-type is PLAN, object-name is the name of the plan.
If object-type is PACKAGE, object-name is the name of the package in the format 'location-id.collection-id.package-id.(version-id)'.
schema-name The schema name specified in the bind option PATH causing the SQL Path to exceed 254 characters.

**System Action:** The bind-type operation is not performed.

**User Response:** In the bind option PATH, specify a schema name list that does not cause the SQL Path to exceed 254 characters. For more information about the bind option PATH and the schema name list, please see Command Reference.

**System Programmer Response:** See the ‘User Response’ section of this message.

---

**DSNT267I**

csect-name A TRIGGER PACKAGE CANNOT BE FREED USING THE FREE PACKAGE COMMAND

**Explanation:** A FREE PACKAGE command was received that identified the trigger package to be freed. Trigger packages can only be deleted using the DROP TRIGGER SQL statement.

**System Action:** The TSO Attachment Facility is ready for more input.

**User Response:** Use the SQL statement DROP TRIGGER to delete the trigger package.

---

**DSNT268I**

csect-name A BIND COMMAND USING THE COPY OPTION NAMED A TRIGGER PACKAGE AS THE SOURCE FOR THE BIND

**Explanation:** A trigger package cannot be used as the source for a BIND COPY command.

**System Action:** The TSO Attachment Facility is ready for more input.

**User Response:** Correct the BIND command and resubmit.

---

**DSNT270I**

THE FOLLOWING SQLCA INFORMATION WAS RETURNED FROM subsystem

:  
SQLCODE = sqlcode
SQLSTATE = sqlstate
SQLERRMT = tokens
SQLWARN warn_fields

**Explanation:** A warning or error has been received from a database server using Advanced SQL protocols (ASP) of the Distributed Relational Database Architecture (DRDA), during remote program BIND processing. The tokens of the message are:
1. subsystem - the database server,
2. sqlcode - SQL return code,
3. sqlstate - additional set of return codes common to the four relational products,
4. tokens - specific tokens passed in the message portion of the SQLCA for problem determination, and
5. warn_fields - the warning information indicators.

This message is issued by the following CSECT: DSNLXMSG

**System Action:** See the System Action associated with the indicated SQL return code.

**System Programmer Response:** See the Programmer Response associated with the indicated SQLCODE and/or SQLSTATE. Take note of the warning or error (as indicated in the SQLCODE, SQLSTATE, or one or more of the SQLWARN fields), and determine if
a program change is necessary. SQLWARNx fields are described in Appendix C of DB2 SQL Reference. A change to the application may be necessary or the
system programmer may have to be consulted depending on the situation.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

| DSNT271I THE FOLLOWING SQLCA INFORMATION WAS RETURNED FROM subsystem |
| SQLCODE = sqlcode |
| SQLSTATE = sqlstate |
| SQLERRMT = tokens |
| SQLWARN warn_fields |
| STATEMENT = stmt_num |

Explanation: A warning or error has been received from a database server using advanced SQL protocols (ASP) of the Distributed Relational Database Architecture (DRDA), during remote program BIND processing. The tokens of the message are:
1. subsystem - database server,
2. sqlcode - SQL return code,
3. sqlstate - additional set of return codes common to the four relational products,
4. tokens - specific tokens passed in the message portion of the SQLCA for problem determination,
5. warn_fields - the warning information indicators, and
6. stmt_num - the statement number of the failing statement.

This message is issued by the following CSECT: DSNLXMSG

System Action: See the System Action associated with the indicated SQLCODE.

System Programmer Response: Take note of the warning or error (as indicated in the SQLCODE, SQLSTATE, or one or more of the SQLWARN fields), and determine if a program change is necessary. SQLWARNx fields are described in Appendix C of DB2 SQL Reference. A change to the application may be necessary or the system programmer may have to be consulted depending on the situation.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

| DSNT301I INVALID DATABASE dbname |
| Explanation: The databases named in the -START, -STOP, or -DISPLAY DATABASE command do not exist. The name of the database is 'dbname'. |
| System Action: The request is rejected. This message may be repeated. |
| System Programmer Response: Reissue the command with a valid name. |

| DSNT302I INVALID NAME spname |
| Explanation: In the message, 'spname' is the name of the table space or index space. The 'spname' specified in the SPACENAM keyword on the -START, -STOP, or -DISPLAY DATABASE command does not exist. |
| System Action: The request is rejected. This message may be repeated. |
| System Programmer Response: Reissue the command with a valid table space name or index name. |

| DSNT304I csect-name INSTALLATION SYSOPR IS NOT AUTHORIZED TO CHANGE OBJECT STATUS ON DATABASE dbname. REQUEST REJECTED |
| Explanation: INSTALLATION SYSOPR is not authorized to perform the START DATABASE command function on this database because the command can change an objects status in this database. INSTALL SYSOPR can use the START DATABASE command only to recover LPL pages or GRECP objects. The name of the database is 'dbname'. |
| System Action: The request is rejected. |
| Operator Response: Reissue the -START DATABASE command using the correct access mode or contact your system programmer. |
**DSNT305I** SUBSYSTEM FAILURE DURING
**command-name** DATABASE COMMAND
PROCESSING. RC = yy, REASON = zz

Explanation: An error was found while processing the
-START, -STOP or -DISPLAY DATABASE command. In
the message, 'command-name' is the string 'DISPLAY',
'STOP', or 'START' (depending upon the command
processed).

System Action: Originating from CSECT DSNTDCST:
- For relational data system (RDS) subcomponent
  errors:
  - 'yy' is a 4-byte return code of 8.
  - 'zz' is a 4-byte abend code of '00E30085'.
- For data manager (DM) subcomponent errors:
  - 'yy' is a 4-byte return code consisting of a 2-byte
    return code and a 2-byte reason code returned by
    the data manager function invoked by
    DSNTDCST.
  - 'zz' is a 4-byte abend code '00E30086'.
    A record is written to SYS1.LOGREC, and an SVC
dump is requested before the execution unit is
abended.

Originating from CSECT DSNTDDIS:
- 'yy' is a 4-byte return code of 12.
- 'zz' is a 4-byte abend code of '00E30089'.
  The request is abended.

Originating from CSECTs DSNTMUL or DSNTDMG:
- 'yy' is a 4-byte return code returned by the message
generator.
- 'zz' is a 4-byte abend code of '00E30084'.
  The request is abended.

System Programmer Response: Refer to [Part 4.](#)
"Section 4. DB2 Codes," on page 771 for the particular
abend reason code issued.

Problem Determination: Collect the following
diagnostic items listed in [Appendix B.](#) "Problem
determination," on page 1349 [1 2 5 17] for

**DSNT306I** RESPONSE MESSAGE LIMIT HAS
BEEN REACHED

Explanation: A fixed amount of space exists in which
to generate DISPLAY, START, or STOP database
command messages. This message indicates that the
DISPLAY, START, or STOP database command that
was specified generated more messages than will fit in
that space.

User Response: Specify individual databases and/or
table spaces rather than specifying "*" (that is, all
names).

**DSNT307I** INVALID RANGE SPECIFICATION
string1 IS GREATER THAN string2

Explanation: A range was specified on a DISPLAY
DB(string1:string2) or DISPLAY DB(\(_\))
SPACENAM(string1:string2) command or on a database
command (START DB, STOP DB, or DISPLAY DB) on
PART(string1:string2) keyword where the first string,
specified alphanumerically, collates after the second
string.

User Response: Specify the command again. Make
sure the first string does not alphanumerically collate
after the second string specified.

**DSNT308I** AFTER KEYWORD ONLY VALID FOR A
SINGLE DATABASE OR A SINGLE
TABLESPACE/INDEXSPACE WITHIN A DATABASE. REQUEST REJECTED

Explanation: The AFTER keyword may be specified
by one of the following:
- A single database name after the keyword
  DATABASE
- A single table space name or index space name after
  the keyword SPACENAM.

User Response: Specify the command correctly.

**DSNT309I** csect-name object_name IS CURRENTLY
state.

Explanation: One of the following is already in the
requested state:
- A database listed in START DB(list) or STOP DB(list)
- A table space listed in START DB(name)
  SPACENAM(list) or STOP DB(name)
  SPACENAM(list)
- An index space listed in START DB(name)
  SPACENAM(list) or STOP DB(name)
  SPACENAM(list)
- A partition of a partitioned table space listed in
  START DB(list) SPACENAM(list) PART(n), STOP
  DB(list) SPACENAM(list) PART(n), START DB(list)
  SPACENAM(list), or STOP DB(list) SPACENAM(list)

In the message:
- The 'object' is the database, table space, index space
  or partition number with table space name or the
  index space name.
  - TABLESPACE, if the specified table space was
    currently in the requested state
  - INDEXSPACE, if the specified index space was
    currently in the requested state
  - DATABASE, if the database was currently in the
    requested state
  - PARTITION, if the specified partition of a
    partitioned table space or partitioned index was
    currently in the requested state
• The 'state' is:
  – START RW, if the specified object is currently started read/write
  – START RO, if the specified object is currently started read only
  – START UT, if the specified object is currently started for utility processing
  – STOPPED, if the specified object is currently stopped or is stopping
  – STOP PENDING, if the specified object currently is in stop pending status.

If there are pages in the logical page list (LPL) for the object, or if the object is in group buffer pool recovery pending (GRECP) status, a START DATABASE ACCESS(RO) or START DATABASE ACCESS(RW) command triggers a recovery of that object even if this message is issued for that object. For each object that has LPL or GRECP recovery that is initiated, DB2 issues a DSNIO06 message followed by either a DSNI021 message (when the recovery completes successfully) or a DSNI005 message (when the recovery is unsuccessful).

User Response: No response is necessary. This message is informational only.

If there are pages in the logical page list (LPL) for the object, or if the object is in group buffer pool recovery pending (GRECP) status, a START DATABASE ACCESS(RO) or START DATABASE ACCESS(RW) command triggers a recovery of that object even if this message is issued for that object. For each object that has LPL or GRECP recovery that is initiated, DB2 issues a DSNI006 message followed by either a DSNI021 message (when the recovery completes successfully) or a DSNI005 message (when the recovery is unsuccessful).

User Response: No response is necessary. This message is informational only.

---

**DSNT310I**

csect-name ALL object CURRENTLY state.

Explanation: A database and all of its table spaces and index spaces are already in the requested state. This occurred following the processing of one of these commands:
  • START DB(*)
  • STOP DB(name)
  • START DB(name) SPACENAM(*)
  • STOP DB(name) SPACENAM(*).

In this message:
  • The 'object' is either:
    – TABLESPACE(S) if the specified table space was currently in the requested state
    – INDEXSPACE(S) if the specified index space was currently in the requested state
    – DATABASE(S) if the database was currently in the requested state.
  • The 'state' is either:
    – START RW if the specified table space is currently started read/write
    – START RO if the specified table space is currently started read only
    – START UT if the specified table space is currently started for utility processing
    – STOPPED if the specified table space is currently stopped, has a stop pending against it, or is stopping.

---

**DSNT311I** MESSAGE LIMIT EXCEEDED. DISPLAY IS TERMINATED.

Explanation: The number of messages generated exceeds the maximum number of messages specified in the LIMIT keyword or exceeds the system default.

---

**DSNT312I** object name MUST BE STARTED RW. NO ACTION TAKEN.

Explanation: The ACCESS keyword is either RO or UT, and the object must be started ACCESS (RW).

In the message, 'object' is either:
  • TABLESPACE(S) IN if the START DB(name) SPACENAM(...) is specified, or
  • DATABASE if the START DB(name) is specified.

---

**DSNT313I** ACCESS(FORCE) IS VALID ONLY WITH EXPLICIT TABLESPACE OR INDEXSPACE NAMES. COMMAND IS REJECTED

Explanation: The ACCESS(FORCE) keyword can be specified when either:
  • A single table space or index space name appears after the keyword SPACENAM in a START DATABASE command.
  • A list of table space and/or index space names appears after the keyword SPACENAM in a START DATABASE command.

Operator Response: Specify the command correctly.

---

**DSNT314I** csect_name INVALID PARTITION SPECIFICATION FOR OBJECT object-name

Explanation: The PART keyword is invalidly specified in a START DATABASE, STOP DATABASE, or DISPLAY DATABASE command.

The PART keyword is invalid if it is specified for:
  • A nonpartitioned table space
  • A nonpartitioned type 1 index
  • A type 2 index not defined on a partitioned table space
The object object-name can be either a table space or an index space.

No action for this table space or index space is performed by the START DATABASE, STOP DATABASE or DISPLAY DATABASE command. Any other valid table space or index space specified is processed by the command.

Severity: 8 (error)

System Action: The desired command is not processed for the table space or index space in question. All other valid table spaces or index spaces specified in the command are processed.

User Response: Resubmit the command for the nonpartitioned table space or index space without using the PART keyword.

Problem Determination: SYSIBM.SYSTABLESPACE in the DB2 catalog indicates whether a table space is partitioned. SYSIBM.SYSINDEXSPACE in the DB2 catalog indicates whether an index space is partitioned and whether the index space is a type 1 or a type 2 index. Type 2 nonpartitioned indexes can be started, stopped, or displayed at the logical partition level; type 1 cannot.

DSNT315I  csect-name INVALID PARTITION NUMBER OR RANGE SPECIFIED FOR OBJECT object-name

Explanation: An invalid partition number or range was specified in the PART keyword for a START DATABASE, STOP DATABASE or DISPLAY DATABASE command.

Partition number or range part-num is invalid for the object object-name.

Severity: 8 (error)

System Action: The part number or range is ignored. All other valid partitions specified are processed if PART was specified as list.

User Response: Determine the correct partition specification for the table space or index that was the subject of the specified command and resubmit the command.

Problem Determination: SYSIBM.SYSTABLESPACE in the DB2 catalog indicates the correct range of partition numbers for the table space. SYSIBM.SYSINDEXSPACE in the DB2 catalog indicates whether an index space is partitioned and whether the index space is a type 1 or a type 2 index. Type 2 indexes can be started, stopped, or displayed at the logical partition level; type 1 cannot.

DSNT316I  csect-name A LOGICAL PARTITION OF AN INDEX WHICH HAS PAGES IN THE LPL OR HAS BEEN MARKED GRECP CANNOT BE STARTED FOR RW OR RO ACCESS

Explanation: The START DATABASE command was specified for a logical partition of a nonpartitioned index which has pages in the logical page list (LPL) or is marked group buffer pool recovery pending (GRECP). To start a nonpartitioned index with one of these exception conditions, the START DB command must be specified without the PART keyword.

Severity: 8 (error)

System Action: The command is not processed for the index space. All other valid table spaces or index spaces specified in the command are processed.

User Response: Submit the command for the nonpartitioned index space without using the PART keyword.

Problem Determination: If more information on the status of the index space is required, use the -DISPLAY DATABASE command.

DSNT317I  csect-name ANY USER-DEFINED INDEXES ON DSNDDB06 COULD NOT BE cmd-type DUE TO A RESOURCE UNAVAILABLE ON THE CATALOG OR DIRECTORY.

Explanation: If user-defined indexes exist on DSNDDB06, they could not be displayed, started or stopped (depending on cmd-type) because the catalog or directory was not available. DB2-defined indexes and table spaces are not affected by this unavailability.

Programmer Response: When you get this message, correct the resource unavailable problem and reissue the command.

System Action: Any user-defined indexes on DSNDDB06 were not affected by the command issued. All other table spaces and index spaces were processed by the command.

DSNT331I  csect-name DATABASE name AND ANY SPACE IT CONTAINS CANNOT BE STOPPED. IT IS THE ACTIVE COMMUNICATIONS DATABASE

Explanation: The database specified in the message cannot be stopped because it is the active communications database. In addition, spaces within the active communications database cannot be stopped.

System Action: Nothing is stopped.

Operator Response: If the database or any space within it must be stopped, you must stop the distributed data facility (STOP DDF). In a DB2 data sharing environment, you must stop the distributed data facility
on all members of the DB2 data sharing group.

**DSNT332I** TABLESPACES AND INDEXSPACES ARE UNAVAILABLE BECAUSE DATABASE name IS STOPPED

**Explanation:** The database 'name' is currently marked as stopped. Consequently, its table spaces and index spaces are unavailable even though they may have been started.

**DSNT350I** --luw-id ACCESSING DATA FOR location

**Explanation:** This message follows message DSNT394I or DSNT396I for each thread reported that is participating in distributed data access (database access thread). This additional line reports the distributed identification as follows:

- **luw-id:** The logical-unit-of-work identifier (LUW-ID) is a unique identifier that is assigned to the thread followed by an '=' sign and a token. The token can be used in place of luw-id in any DB2 command that accepts luw-id as input.

- **location:** The LOCATION name assigned to the requesting site.

The message number and subsystem recognition character are not included in this message.

This message is issued by the following CSECT: DSNTDMUL

**DSNT358I** `csect_name` INVALID PARTITION SPECIFICATION FOR OBJECT object-name

**Explanation:** Specification of the PART keyword in a DISPLAY DATABASE command is invalid.

The PART keyword is invalid if it is specified for:
- A nonpartitioned table space
- A nonpartitioned type 1 index
- A type 2 index not defined on a partitioned table space

The object object-name can be either a table space or an index space.

No action for this table space or index space is performed by the DISPLAY DATABASE command. Any other valid table space or index space specified is processed by the command.

**Severity:** 8 (error)

**System Action:** The desired command is not processed for the table space or index space in question. All other valid table spaces or index spaces specified in the command are processed.

**User Response:** Resubmit the command for the nonpartitioned table space or index space without using the PART keyword.

**Problem Determination:** SYSIBM.SYSTABLESPACE indicates whether a table space is partitioned. SYSIBM.SYSINDEXSPACE indicates whether an index space is partitioned and whether the index space is a type 1 or a type 2 index. Type 2 nonpartitioned indexes can be displayed at the logical partition level; type 1 indexes cannot.

**DSNT359I** `csect_name` INVALID PARTITION NUMBER SPECIFIED - part-num FOR OBJECT object-name

**Explanation:** An invalid partition number was specified in the PART keyword for a DISPLAY DATABASE command.

Partition number part-num is invalid for the object object-name.

**Severity:** 8 (error)

**System Action:** The part number is ignored. All other valid partitions specified are processed.

**User Response:** Determine the correct partition specification for the table space or index that was the subject of the specified command and resubmit the command.

**Problem Determination:** SYSIBM.SYSTABLESPACE in the DB2 catalog indicates the correct range of partition numbers for the table space. SYSIBM.SYSINDEXSPACE in the DB2 catalog indicates whether an index space is partitioned and whether the index space is a type 1 or a type 2 index. The PART keyword can be used to display the status of logical partitions of type 2 indexes but not type 1 indexes.

**DSNT360I** ****************************

**Explanation:** This message consists of 35 asterisks that begin the display of any database and the display of space names for any database.

**DSNT361I** *DISPLAY DATABASE SUMMARY* report-type-list

**Explanation:** This message is a multiple-line message that labels the requested set of databases, table spaces, and index spaces.

In the message, 'report-type-list' lists all options specified on the command delimited by spaces. Possible values are:

**ACTIVE** All allocated databases are listed.
GLOBAL
All requested database information is listed. This title is produced if ACTIVE, DISABLED, and RESTRICT are omitted.

LOCKS
The connection identifiers and correlation identifiers of all applications holding, retaining, or waiting for locks on the specified table spaces or index spaces are displayed.

RESTRICT
All databases with restricted usage (that is, RO, started UT) are listed.

USE
The connection identifiers and correlation identifiers of all allocated applications are listed.

CLAIMERS
The connection identifiers and correlation identifiers of all applications holding claims on the specified database are displayed.

LPL
The page number ranges of the pages that are included in the logical page list for the table space or index space.

OVERVIEW
All table spaces and index spaces that are contained within the databases that are specified.

**DSNT362I** DATABASE = data-base-name STATUS = status DBD LENGTH = dbd-length

**Explanation:** This message signals the beginning of display information from the DISPLAY DATABASE command. It lists the name, status, and DBD length of the database. All table space and index space names listed in the following DSNT392I, DSNT394I, or DSNT396I messages are contained within this database.

data-base-name
The database name.

status
A combination of one or more of the following strings delimited by a comma. The maximum length of the string is 18 characters.

RO
The database is started for read activity only.

RW
The database is started for read and write activity.

STOP
The database is stopped.

STOPP
A stop is pending or is in progress for this database.

UT
The database is started for utility processing only.

---

**DSNT363I** PHYSICAL ERROR PAGE RANGE FOR DATA SET data-set-name LOW=lowphy, HIGH=hiphy

**Explanation:** This message is the response to a -DISPLAY DATABASE command when the SPACENAM keyword is specified in order to notify the user of any physical I/O errors encountered on a data set.

In the message, 'data-set-name' is the name of the data set with errors. The variables 'lowphy' and 'hiphy' identify the range of physical pages, within the data set, that were being read when the I/O errors occurred.

Physical page numbers are assigned in relationship to the beginning of the data set in which the pages reside.

This message is always preceded by messages DSNT360I and DSNT361I, which identify the name of the database and page set that the specified data set supports.

Page sets (table spaces or index spaces) are made up of supporting data sets. Physical pages are pages in supporting data sets that are numbered from the beginning of the particular data set in which they reside. This message refers to physical pages in a data set that support (are part of) some page set.

**System Action:** See the Explanation section for this message.

---

**DSNT364I** csect-name KEYWORD ONLY IS USED INCORRECTLY

**Explanation:** Keyword ONLY is used incorrectly in the DISPLAY DATABASE command. When the SPACENAM keyword is specified, keyword ONLY is valid only if one of the following keywords is also used:

LOCKS
LPL
CLAIMERS
WEPR
USE

**System Action:** The DISPLAY DATABASE command is not processed.

**User Response:** Add one of the keywords mentioned above in the explanation to the DISPLAY DATABASE command and issue the command again.

---

**DSNT365I** NO DATABASES FOUND

**Explanation:** This message is produced when a DISPLAY DB(name) is entered and no databases were found to satisfy the request.

**System Action:** The process continues normally.
**DSNT366I** DATABASE name NOT type

**Explanation:** A database listed in the DISPLAY DB(...) is not of the correct type. The variables are as follows:

name The name of the object.

type The type of request specified: ACTIVE, RESTRICTED, ACTIVE OR RESTRICTED

Note that either DSNT301I or DSNT302I is produced if no object is found and the keywords ACTIVE and RESTRICT are omitted.

**System Action:** Processing continues normally.

**DSNT368I** csect-name MORE THAN ONE MUTUALLY EXCLUSIVE KEYWORD WAS SPECIFIED IN THE DISPLAY DATABASE COMMAND.

**Explanation:** The keywords, LOCKS, LPL, CLAIMERS, WEPR and USE are mutually exclusive. Only one should be specified in a DISPLAY DATABASE command. The precedence order for which keyword takes precedence over the others is:

1. LPL
2. CLAIMERS
3. LOCKS
4. USE
5. WEPR

**System Action:** The DISPLAY DATABASE command is processed with this warning message.

**User Response:** Remove keywords from DISPLAY DATABASE command until only one of these mutually exclusive keywords is specified.

**DSNT367I** NO INFORMATION AVAILABLE

**Explanation:** This message indicated there is no LOCK, USE, LPL, WEPR or CLAIMER information available when DISPLAY DB(...) SPACENAM(...) ONLY is entered with the keywords LOCKS, USE, LPL, WEPR or CLAIMERS.

**System Action:** The process continues normally.

**DSNT375I** PLAN=plan-id1 WITH CORRELATION-ID=id1 CONNECTION-ID=id2 LUW-ID=id3 THREAD-INF0= id4 IS DEADLOCKED WITH PLAN=plan-id2 WITH CORRELATION-ID=id5 CONNECTION-ID=id6 LUW-ID=id7 THREAD-INF0= id8 ON MEMBER id9

**Explanation:** This message is issued whenever plan plan-id1 with correlation id1, connection id2, and LUW id3 is denied an IRLM lock because of a detected deadlock. Plan plan-id2 identifies one of the members of the deadlock.

DB2 does not attempt to identify all survivors of a deadlock or all participants in a deadlock in the DSNT375I message. Plan plan-id2 in message DSNT375I might be just one of several plans holding locks on the desired resource.

If multiple deadlocks are detected during the same deadlock-detection interval, the lock holder identified by plan-id2 in one DSNT375I message might be selected to break a deadlock identified by a different DSNT375I message. The lock holder identified by plan-id2 is not guaranteed to be a winner in all deadlocks in which it participates.

A DB2 IFCID 172 trace record contains the information needed to determine all participants in, and survivors of, a given deadlock.

**plan-id1, plan-id2**

The names of the executing plans.

**id1** The correlation identifier of the thread associated with plan-id1. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify a system agent.

**id2** The connection identifier of the thread associated with plan-id1.

**id3** The logical-unit-of-work identifier of the thread associated with plan-id1. An asterisk (*) indicates that the thread does not have an LUW-ID. If the LUW-ID is not an asterisk, the value is a logical-unit-of-work identifier that is assigned to the thread. It is followed by an equal (=) sign and a token value, which can be used in place of the logical-unit-of-work identifier in any DB2 command that accepts a logical-unit-of-work identifier as input.

**id4** This ID contains additional identifiers that define more specific information regarding the identity of the agent.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If provided by the client, the additional tokens further assist in identifying the client end-user.

The following identifiers, separated by a colon (:), are provided:

- The primary authorization-ID associated with the thread.
- Workstation name of the end-user’s workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- End-user’s user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
• Application name of the end-user’s application. An asterisk (*) indicates that is not relevant to the thread or was not provided by the client.

id5 The correlation identifier of the thread associated with plan-id2.

id6 The connection identifier of the thread associated with plan-id2.

id7 The logical-unit-of-work identifier of the thread associated with plan-id2. An asterisk (*) indicates that the thread does not have an LUW-ID. If the LUW-ID is not an asterisk, the value is a logical-unit-of-work identifier that is assigned to the thread followed by an equal (=) sign and a token value, which can be used in place of logical-unit-of-work identifier in any DB2 command that accepts logical-unit-of-work identifier as input.

id8 This ID contains additional identifiers that define more specific information regarding the identity of the agent.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If provided by the client, the additional tokens further assist in identifying the client end-user.

The following identifiers, separated by a colon (:), are provided:
• The primary authorization-ID associated with the thread.
• Workstation name of the end-user’s workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
• End-user’s user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
• Application name of the end-user’s application. An asterisk (*) indicates that is not relevant to the thread or was not provided by the client.

id9 Identifies the member name of the DB2 subsystem on which the thread associated with plan-id2 is executing.

If you receive a system plan in this message, see the information about system plans in message DSNT376l.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

```
DSNT376l  PLAN=plan-id1  WITH
           CORRELATION-ID=id1
           CONNECTION-ID=id2  LUW-ID=id3
           THREAD-INFO=id4  IS DEADLOCKED
           WITH  PLAN=plan-id2  WITH
           CORRELATION-ID=id5
           CONNECTION-ID=id6  LUW-ID=id7
           THREAD-INFO= id8  ON MEMBER id9
```

Explanation: This message is issued whenever plan plan-id1 with correlation id1, connection id2, and LUW id3 is denied a lock by IRLM, because the amount of time to wait for a locked resource was exceeded. Plan plan-id2 identifies one of the plans holding a lock on the desired resource. The listed plan is not necessarily responsible for the time-out condition.

plan-id1, plan-id2

The names of the executing plans.

id1 The correlation identifier of the thread associated with plan-id1. If the execution of the plan was switched by DB2 to a system agent, the correlation identifier identifies the system agent. Correlation IDs beginning with '0n', where 'nn' is a number from 01 to 28, identify system agents.

id2 The connection identifier of the thread associated with plan-id1. If the execution of the plan was switched by DB2 to a system agent, the connection identifier is the DB2 subsystem name.

id3 The logical-unit-of-work identifier of the thread associated with plan-id1. An "=*" indicates that the thread does not have a LUW-ID. If the LUW-ID is not an "=*", the value is a logical-unit-of-work-ID that is assigned to the thread followed by an "=*" sign and a token value, which can be used in place of logical-unit-of-work-ID in any DB2 command that accepts logical-unit-of-work-ID as input.

id4 This ID contains additional identifiers that define more specific information regarding the identity of the agent.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If provided by the client, the additional tokens further assist in identifying the client end-user.

The following identifiers, separated by a colon (:), are provided:

DB2 can recover from a lock denial in some cases and can complete successfully. In such a case, the SQLCA is not filled in. One example is during setup of performance enhancements during bind time for execution time.

The SQLCA corresponding to correlation id id1, connection id id2, and LUW-ID id3 contains an SQLCODE of -904, -911, -913, or -923 and the name of the resource involved in the deadlock.
The primary authorization-ID associated with the thread.

Workstation name of the end-user’s workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.

End-user’s user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.

Application name of the end-user’s application. An asterisk (*) indicates that is not relevant to the thread or was not provided by the client.

id5 The correlation identifier of the thread associated with plan-id2. If the execution of the plan was switched by DB2 to a system agent, the correlation identifier identifies the system agent. Correlation IDs beginning with ‘0nn’, where ‘nn‘ is a number from 01 to 28, identify system agents.

id6 The connection identifier of the thread associated with plan-id2. If the execution of the plan was switched by DB2 to a system agent, the connection identifier is the DB2 subsystem name.

id7 The logical-unit-of-work identifier of the thread associated with plan-id2. An ‘’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘’ , the value is a logical-unit-of-work-ID that is assigned to the thread followed by an ‘=’ sign and a token value, which can be used in place of logical-unit-of-work-ID in any DB2 command that accepts logical-unit-of-work-ID as input.

id8 This ID contains additional identifiers that define more specific information regarding the identity of the agent.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If provided by the client, the additional tokens further assist in identifying the client end-user.

The following identifiers, separated by a colon (:), are provided:

• The primary authorization-ID associated with the thread.

• Workstation name of the end-user’s workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.

• End-user’s user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.

Application name of the end-user’s application. An asterisk (*) indicates that is not relevant to the thread or was not provided by the client.

id9 Identifies the member name of the DB2 subsystem on which the thread associated with plan-id2 is executing.

DB2 can recover from a lock denial in some cases and can complete successfully. In such a case, the SQLCA is not filled in. One example is during setup of performance enhancements during bind time for execution time.

The SQLCA corresponding to correlation-ID id1, connection-ID id2, and LUW-ID id3 contains an SQLCODE of -904 or -923 and the name of the resource involved in the timeout.

Several different system plans can appear in plan-id1 and plan-id2. These system plans are not documented in SYSPM,SYSPLAN. If you receive a system plan in this message, you are in contention with another user. If you are not doing an automatic rebind, message DSN5001 or DSN501I might accompany this message and identify that resource. If you need additional information, refer to the SQLCA and any additional bird messages. If you are doing an auto rebind, the SQLCA is not available. Refer to Part 5 of [DB2 Application Programming and SQL Guide] for more information about automatic rebinding. The system plans are:

- ACT
- BCT
- DIESTSERV
- DSNBIND
- STARTCT
- DSNUTIL.

Operator Response: Notify the system programmer.

System Programmer Response: Timeouts can happen for many reasons, including factors relating to DB2 or IRLM. Some of those reasons are listed below along with possible ways to reduce or eliminate your timeout. Refer to Part 5 (Volume 2) of [DB2 Administration Guide] for more detail about the concepts discussed in this list. See also SQLCODEs -911 and -913.

Timeouts can result from the definition of objects or the structure of applications as explained below:

• If the resource involved in the timeout is listed in the DSN5001/DSN501I message as a table or table space, check the following items for other possible causes of timeout:

  1. Check the LOCKRULE column value in SYSPM,SYSTABLESPACES for the table space being accessed. A lock size of TABLE or TABLESPACE could cause a timeout. If your application does not need to lock the entire table...
or table space, you can resolve the timeout by changing the lock size to PAGE or ANY using the ALTER statement.

2. Check the number of LOCKS PER TABLE/SPACE, which was set at the time DB2 was installed. If a large number of page or row locks are acquired and held, a small value for LOCKS PER TABLE/SPACE could be causing lock escalation to a table or table space lock. The timeout can be resolved by changing the value on the DSNTIPK update panel or by binding the application's plan with RELEASE(COMMIT) and doing commits more frequently.

3. You can use EXPLAIN (described in Part 5 of DB2 Application Programming and SQL Guide) with the failing SQL statement and check the TSLOCKMODE column for every table/table space in the EXPLAIN output. If the competing applications are attempting to obtain incompatible locks, you might be able to resolve the timeout by running the applications sequentially rather than concurrently or by following the suggestions in other steps listed here, such as changing lock size, ACQUIRE/RELEASE parameters or ISOLATION type.

4. Check the ACQUIRE/RELEASE values specified on the plan. ACQUIRE(ALLOCATE) acquires all locks for all tables and table spaces referenced in the plan, even if the program logic does not cause the table/table space to be accessed. Binding with RELEASE(DEALLOCATE) causes table, table space and DBD locks to be held longer than binding with RELEASE(COMMIT), possibly causing a timeout.

5. Use the DISPLAY DB LOCKS command during program execution to verify that the locks being held at the time of the timeout are as expected. If they are not, you may need to use ALTER to change the locksize of the table space if possible, or rebinding your plan with different ACQUIRE, RELEASE or ISOLATION values.

6. ISOLATION level affects the mode of table/table space locks chosen and may be of concern if the plan is bound with RR and there is a page set scan.

- Check the ISOLATION level specified on the plan in SYSIBM.SYSPLAN. A value of RR is more likely to cause a timeout because it requires more page or row locks and also has a greater potential than CS for causing lock escalation, which can cause timeouts as noted above.

- Check the frequency of COMMITs in the application. A large number of updates without any COMMITs can cause a timeout because the more pages that are changed, the more page or row locks held, and the greater potential for lock escalation.

This condition might be caused by an undetected deadlock, for example, an agent holding a lock on the resource for a period of time that exceeds either the specified time or the IRLM default wait time.

If the time limit is too small, you can increase the limit by specifying a new IRLM locked resource wait time limit. To do this, you can either use the parameter in the DSN6SPRM assembler macro in the DSNTIJUZ job stream or update the ‘wait-time’ field of the DB2 installation IMS Resource Lock Manager panel, IRLMRWT. You must also specify all other parameters contained in this version of the CSECT. Then do one of the following:

- Resubmit installation job DSNTIJUZ with the link-edit SYSIN file ‘NAME’ parameter that matches the -START DB2 ‘PARM=’ parameter.

- Reassemble DSN6SPRM and relink-edit DSNZPARM by resubmitting installation job DSNTIJUZ. The link-edit SYSIN file ‘NAME’ parameter must match the -START DB2 ‘PARM=’ parameter.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 349:

<table>
<thead>
<tr>
<th>DSNT377I</th>
<th>PLAN=plan-id1 WITH CONNECTION-ID=id1 THREAD-INF0=thread-id2 LUW-ID=id3</th>
<th>MEMBER id5</th>
<th>id1</th>
<th>id2</th>
<th>id3</th>
<th>id4</th>
</tr>
</thead>
</table>

**Explanation:** This message is issued by the service controller subcomponent. A plan cannot gain an IRLM lock because a required resource is currently undergoing recovery. The message identifies the plan in this way:

plan-id1

The name of the executing plan.

id1 The correlation identifier (ID) of the thread associated with plan plan-id1. Correlation IDs beginning with ‘0nn’, where ‘nn’ is a number from 01 to 28, identify system agents.

id2 The connection-ID of plan plan-id1.

id3 The logical-unit-of-work identifier (‘LUW-ID’) of plan-id1. An ‘*’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘*’, the value is a logical-unit-of-work ID that is assigned to the thread followed by an ‘=”’ sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

id4 This ID contains additional identifiers that define more specific information regarding the identity of the agent.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If
provided by the client, the additional tokens further assist in identifying the client end-user.

The following identifiers, separated by a colon (:), are provided:

- The primary authorization-ID associated with the thread.
- Workstation name of the end-user’s workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- End-user’s user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- Application name of the end-user’s application. An asterisk (*) indicates that is not relevant to the thread or was not provied by the client.

id5 Identifies the member name of the DB2 subsystem on which the indoubt thread is executing.

The SQLCA corresponding to correlation-ID id1, connection-ID id2, and LUW-ID id3 contains an SQLCODE -904, -911, -913, or -923 and the name of the resource currently being recovered by DB2.

If you receive a system plan in this message, see the information about system plans in message DSNT376i.

System Action: Processing continues.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**Explanation:** A plan cannot get an IRLM lock because the resource is held by a retained lock on behalf of another member in the data sharing group, and the amount of time to wait for the locked resource was exceeded. The member holding the retained lock is either failed, or is in the process of restarting to recover its retained locks. This message is issued if the RETLWAIT installation parameter in DSN6SPRM is set to ‘YES’. If RETLWAIT is set to ‘NO’ (this is the default), then any IRLM lock that conflicts with a retained lock will not wait, but instead will be immediately rejected (see reason codes 00C900BE and 00C20254).

The following identifiers are used in the message:

- plan-id1: The name of the executing plan.
- id1: The correlation identifier (ID) of the thread associated with plan plan-id1. Correlation IDs beginning with ‘0nn’, where ‘nn’ is a number from 01 to 28, identify system agents.
- id2: The connection-ID of plan plan-id1.
- id3: The logical-unit-of-work identifier (LUW-ID) of plan-id1. An ‘*’ indicates that the thread does not have a LUW-ID. If the LUW-ID is not an ‘*’, the value is a logical-unit-of-work id that is assigned to the thread followed by an ‘*’ and a token value, which can be used in place of logical-unit-of-work id in any DB2 command that accepts logical-unit-of-work-id as input.
- id4: This ID contains additional identifiers that define more specific information regarding the identity of the agent.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If provided by the client, the additional tokens further assist in identifying the client end-user.

The following identifiers, separated by a colon (:), are provided:

- The primary authorization-ID associated with the thread.
- Workstation name of the end-user’s workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- End-user’s user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- Application name of the end-user’s application. An asterisk (*) indicates that is not relevant to the thread or was not provied by the client.

id5 Identifies the member name of the failed or restarting DB2 subsystem which holds the conflicting retained lock.

System Action: The SQLCA corresponding to correlation-ID id1, connection-ID id2, and LUW-ID id3 contains an SQLCODE -904, -911, -913 or -923 and the name of the resource involved in the timeout.

System Programmer Response: Restart the member holding the retained lock if it has not yet been restarted.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**Explanation:** Either an attempt was made to identify the IRLM with a subsystem name not recognized by MVS, or the IRLM is not currently active. This message
is also issued if common service area (CSA) storage is insufficient.

**System Action:** DB2 abends with a reason code of X'04E'.

**Operator Response:** Notify system programmer.

**System Programmer Response:** This is probably a user error. Change the IRLMSID parameter in the DB2 DSN6SPRM initialization macro to match the MVS subsystem table, or start IRLM if IRLM is not already up. See return code 00E30079 for further information about determining the cause of the error.

---

**DSNT380I** CANNOT IDENTIFY TO IRLM, SSNAME ALREADY IN USE

**Explanation:** Either DB2 previously terminated and did not successfully sign off from IRLM, or another subsystem is identified to IRLM with this installation-defined SSNAME. This message accompanies abend reason code X'00E30071'.

**System Action:** DB2 is abended with an abend code of X'04E'.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Either manually stop IRLM, or change the installation-defined SSNAME.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**DSNT381I** IRLM QUIT REQUEST FAILED, RC = xx, SC = yy

**Explanation:** During the QUIT (or signoff) request to the IMS/VS Resource Lock Manager, a return code and subcode were returned indicating an unsuccessful completion of the request. Refer to Part 5, “IRLM messages and codes,” on page 1303, for IRLM return codes and subcode meanings.

**System Action:** This message indicates that the DB2 subsystem shutdown could not be completed normally.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the cause of the failure from the return code and subcode, and correct the error. Refer to Part 5, “IRLM messages and codes,” on page 1303, for IRLM return codes and subcode meanings. DB2 has terminated but has not signed off from IRLM. It will be necessary to issue the 'F ilmproc, ABDUMP' command to stop the IRLM. This must be done before issuing another -START DB2 command.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**DSNT382I** IRLM AUTO-START FAILED

**Explanation:** During the IDENTIFY to IRLM, the AUTO-START of IRLM using SVC 34 failed. This message accompanies abend code 'X'00E30080'.

**System Action:** DB2 is terminated with an abend code of X'04E'.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the cause of failure from the SVC 34 return code preserved in register 2.

---

**DSNT383I** csect-name IRLM AUTO-STOP FAILED

**Explanation:** During a sign off from IRLM caused by either DB2 normal shutdown (CSECT DSNTLQUI) or DB2 subsystem termination (CSECT DSNTLCLCE), an AUTO-STOP of IRLM using SVC 34 failed. If this occurred during normal sign off, this message accompanies abend reason code X'00E30075'.

**System Action:** DB2 abends.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Manually stop IRLM.

**Problem Determination:** Determine the cause of failure from the SVC return code preserved in register 2.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**DSNT384I** IRLM AUTO-START WAIT TIME EXCEEDED

**Explanation:** An attempt was made to automatically start IRLM. However, the wait time specified was exceeded.

**System Action:** DB2 is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Either manually start IRLM or modify the installation-defined auto-start wait time. Restart DB2.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

Check the IRLMID given in the IRLM procedure against the IRLMSID in macro DSN6SPRM which was in the DSNZPARM used at startup.

---

**DSNT386I** NAME TYPE PARTS

**Explanation:** This message forms the headings of a display for a set of messages. This message is always followed by multiple DSNT387I messages. These DSNT387I messages are used to display information...
that is received as a result of a DISPLAY DATABASE command when the keyword OVERVIEW is specified. Refer to message DSNT387I for a description of the data these headings identify.

**DSNT387I**  space type parts

**Explanation:** This message contains the results from a DISPLAY DATABASE command when the keyword OVERVIEW is specified. This message contains data that describes the status of a tablespace or index space in the database that is listed in the preceding DSNT362I message. The data in this message is always preceded by the column headings in message DSNT386I. The message number for this message is not displayed. However, messages DSNT386I, DSNT387I, and DSNT390I are always produced with a multiple line WTO and are never interrupted.

- **space**  Tablespace name, index space name, or table OBID.
- **type**  TS for a tablespace, IX for an index space, LS for a LOB tablespace, or TB for a table
- **parts**  Indicates the number of partitions in the tablespace, index space, or LOB tablespace. It is blank for a simple tablespace, simple index space, or segmented tablespace.

**DSNT388I**  NAME TYPE PART STATUS CONNID CORRID CLAIMINFO

**Explanation:** This message is the heading for a set of messages that display information as a result of a DISPLAY DATABASE command when the keyword CLAIMERS is specified. The message number for this message is not displayed. This message is always followed by multiple DSNT389I messages containing the column data. Refer to message DSNT389I for a description of the data these headings identify.

**DSNT389I**  space type part status conn-id corr-id claims

**Explanation:** This message contains the display information that results from a DISPLAY DATABASE command when the keyword CLAIMERS is specified. This message contains the column data describing the status of a table space or index space in the database listed in message DSNT362I.

- **space**  The table space name or index space name.
- **type**  TS for a table space, IX for an index space, LS for a LOB table space.
- **part**  The partition number. For a nonpartitioned table space or an index on a nonpartitioned table space, it is blank. For nonpartitioned indexes on a partitioned table space, it is the logical partition number preceded by the character L (for example, L0001). For data-partitioned secondary indexes, the prefix for this value will be the character D (for example, D0001).

- **status**  Blank, or one or more of the following, delimited by commas. The maximum length of the string is 17 characters.
  - **ACHKP**  The table space is in aux check pending state. ACHKP on a table space indicates that CHECK DATA detected an orphan or missing LOB or an out-of-sync condition between the row in the base table and the LOB in the LOB table space.
  - **ARBDP**  Advisory Rebuild Pending status is set when indexes with varying length columns are changed from VARYING NO to VARYING YES.
  - **AREO**  The table space is placed in Advisory Reorg status. This may be because of a change in the table or index information. It also occurs because the table space, index, or partition identified in this status should be reorganized for optimal performance.
  - **AREST**  The object (a table space, index space, or a physical partition of a table space or index space) is in an Advisory Restart Pending state. If backout activity against the object is not already underway, it should be initiated either by issuing the RECOVER POSTPONED command or by recycling the system with the system parameter LBACKOUT=AUTO.
  - **AUXW**  The table space is in aux warning state. AUXW on a LOB table space indicates that one or more LOBs in the LOB table space is invalid. AUXW on a base table space indicates that CHECK DATA detected an orphan or missing LOB or an out-of-sync condition between the row in the base table and the LOB in the LOB table space.
  - **CHKP**  The object (a table space or a partition within a table space) is in check pending status.
  - **COPY**  The object (a table space or a partition within a table space) is in copy pending status. An image copy is required for this object.
  - **GRECP**  The object (a table space, a table space partition, index space, or index space partition) is marked recovery pending because of the failure of a a group buffer pool. This status value appears only on spaces. It does not
apply to databases. See DB2 Data Sharing: Planning and Administration for information about resolving this restricted status.

ICOPY
The object (an index space or index partition) is in informational copy pending status.

LPL
The object has pages or ranges of pages that are unavailable because of logical or physical damage.

LSTOP
The logical partition is stopped.

PSRBD
The index space is in page set rebuild pending status.

RBDP
The object (an index space, index partition or logical index partition) is in rebuild pending status. For logical partitions, the RBDP status can appear as RBDP*.

RBDP
Indicates that the entire index is inaccessible to SQL applications, however only the logical partition needs to be recovered.

RECP
The object (a table space, table space partition, index space, index partition or logical index partition) is in recovery pending status.

REFP
The object (a table space, a table space partition, index space, or index space partition) in in refresh pending status. For a table space, run LOAD REPLACE or the RECOVER utility to resolve this restricted status, or use the REBUILD INDEX utility to rebuild the index from the data.

REORP
The object (a table space or table space partition) is in recovery pending status.

RESTP
The object is in the Restart Pending state. Backout activity against the object must be completed by using the -RECOVER POSTPONED command, or by recycling the system with system parameter LBACKOUT=AUTO.

RO
The table space, table space partition, index space or index space partiti is started for read-only activity.

RW
The table space, table space partition, index space or index space partiti is started for read and write activity.

STOP
The table space, table space partition, index space or index space partiti is stopped.

STOPE
The table space or index space was implicitly stopped because there is a problem with the log RBA in a page. Message DSNT500I or DSNT501I is issued when the error is detected to indicate the inconsistency.

STOPP
A stop is pending for the database, table space, table space partition, index space or index space partition.

UT
The table space, table space partition, index space or index space partiti is started for utility processing only.

UTRO
A utility is in process on the table space, table space partition, index space, or index space partition that allows only RO access.

UTRW
A utility is in process on the table space, table space partition, index space or index space partition that allows RW access.

UTUT
A utility is in process on the table space, table space partition, index space or index space partition that allows only UT access.

WEPR
This object has pages or ranges of pages that are unavailable because of physical damage. To reset this flag, you can use either the RECOVER utility with the option as ERROR RANGE or the LOAD utility with the option as REPLACE.

If the status for a nonpartitioned index is blank, then the status information is displayed at the logical partition level. If the type is TB, the status is blank.

conn-id
A connection identifier for the thread.

corr-id
A correlation identifier of the thread associated with the space name.

claims
The type and duration of currently held claims.

The claim is composed of a claim class descriptor and a claim duration descriptor.

The claim class descriptor has one of the following values:

CS
Cursor stability claim class

RR
Repeatable-read claim class

WR
Write claim class

The claim duration descriptor describes the duration of the claims as follows:

A
The claim is held until deallocation.

C
The claim is held until the next commit point.

H
The claim is held across commit.

DSNT390I * DISPLAY OF DATABASE name action*

Explanation: This message indicates the end of a set of DSNT391I and DSNT392I messages, a set of DSNT393I and DSNT394I messages, or a set of DSNT395I and DSNT396I messages.

In this message:
- The 'name' is the name of the database.
- The 'action' is one of the following:
CONTINUES  
The remaining table space and index space names within this database are continued to a new display.

TERMINATED  
The remaining table space and index space names within this database are terminated.

ENDS  
The display for this database is complete.

DSNT391I  NAME TYPE STATUS PHYERRLOW PHYERRH CATALOG PIECE
Explanation:  This message indicates the beginning of a set of messages used to display information as a result of a DISPLAY DATABASE command when the keywords WEPR, LOCKS, LPL, CLAIMERS and USE are omitted. (The message appears in one continuous line across the screen, not as shown above.) This message forms the headings of the display and is always followed by multiple DSNT392I messages containing the column data. Refer to message DSNT392I for a description of the data these headings identify.

DSNT392I  space type part status lo-page hi-page cat-name piece
Explanation:  This message contains the display information as a result of a DISPLAY DATABASE command when the keywords LOCK, CLAIMERS, LPL and USE are omitted. This message contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by its column headings in message DSNT391I. The message number for this message is not displayed. However, messages DSNT391I, DSNT392I, and DSNT390I are always produced with a multiple line WTO and are never interrupted.

In this message:
• The space is the table space name or index space name.
• The type is TS for a table space, IX for an index space or LS for a LOB table space.
• The part is the partition number. It is blank for a simple table space, simple index space, or segmented table space. For nonpartitioned secondary indexes, it is the logical partition number preceded by the character L (for example, L0001). For data-partitioned secondary indexes, the prefix for this value will be the character D (for example, D0001).
• See DSNT389I for a list of the possible status display strings.
• When a data set supporting the specified table space or index space has physical I/O errors, lo-page is a hexadecimal number identifying the lowest page number containing an I/O error. This column is blank if there are no physical errors.
• When a data set supporting the specified table space or index space has physical I/O errors, hi-page is a hexadecimal number identifying the highest page number containing an I/O error. This column is blank if there are no physical errors.
• When a data set supporting the specified table space or index space has physical I/O errors, cat-name identifies the catalog owning the data set with the I/O errors. This column is blank if there are no physical errors.
• When a data set supporting the specified table space or index space has physical I/O errors, piece is an integer number identifying the piece within the table space or index space having the error. This column is blank if there are no physical errors.

The piece number can be used to construct the name of the data set supporting the space containing the physical error as follows:
cat-name.DSNDBC.databases name.space-name.10001.Axxxx

The value xxxx is the piece number plus one and database-name is the name displayed in the preceding DSNT362I message. If the table space or index space is partitioned, the partition number should equal the piece number plus one.

DSNT393I  NAME TYPE PART STATUS CONNID CORRID USERID
Explanation:  This message indicates the beginning of a set of messages used to display information as a result of a DISPLAY DATABASE command when the keyword USE is specified. This message contains the headings of the display. (The message appears in one continuous line across the screen, not as shown above.) This message is always followed by multiple DSNT394I messages containing the column data. Refer to message DSNT394I for a description of the data these headings identify.

DSNT394I  space type part status conn-id corr-id user-id
Explanation:  This message contains the display information resulting from a DISPLAY DATABASE command when the keyword USE is specified. This message contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by message DSNT393I containing the column headings. The message number for this message is not displayed. However, messages DSNT393I, DSNT394I, and DSNT390I are always produced with a multiple line WTO and are never interrupted.

In this message:
• The type is TS for a table space, IX for an index space or LS for a LOB table space.
• The type is TS for a table space or IX for an index space.
• The part is the partition number. It is blank for a simple table space, simple index space, or segmented table space. For nonpartitioned secondary indexes, it is the logical partition number preceded by the character L (for example, L0001). For data-partitioned secondary indexes, the prefix for this value will be the character D (for example, D0001).
• See DSNT389I for a list of the possible status display strings.
• The conn-id is a connection identifier for the thread. It is one of the following:
  – BATCH if the thread is from a batch region.
  – TSO if the thread is from a TSO terminal.
  – UTILITY if the thread is from a utility.
  – ‘IMS identifier’ if the thread is from an IMS terminal.
  – ‘CICS identifier’ if the thread is from a CICS terminal.
  – CONSOLE if the thread is from the console.
• The corr-id is a correlation identifier of the thread associated with the space name. It is one of the following:
  – ‘job name’ if the thread is from a batch region.
  – ‘TSO logon identifier’ if the thread is from a TSO terminal.
  – PST#.PSBNAME if the thread is from an IMS terminal.
  – ‘entry ID.thread number.tran id’ if the thread is from a CICS terminal.
  – CONSOLE if the thread is from the console.
  – ‘0nn’, where ‘nn’ is a number, if the thread is for a system agent.
• For distributed database access threads, this field contains the following:
  - While the thread is being created:
    1. ‘028.DBAA nn’, where nn ranges from 01 to 99. This indicates that the database access agent (DBAA) is in its connection processing, which consists of establishing the DBAA thread, and validating and verifying the user’s ID. Refer to “Controlling Access to a DB2 Subsystem” in [DB2 Administration Guide](#) for descriptions of the authorization checks that might be performed.
    All RACF requests are serialized on a single DB2 RACF service task, which might increase the validation time when multiple DBAAs are being created concurrently.
  - After the thread is created:

1. For threads using system-directed access and threads using application-direct access from a DB2 requester, this variable displays the correlation ID of the thread at the requesting location.
2. For threads using application-directed access from a non-DB2 requester, this variable displays the first twelve characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL CONNECT.

• The user-id is one of the following:
  – ‘TSO logon identifier’ if the thread is from a TSO terminal.
  – 'sign-on id' or the LTERM if the thread is from an IMS message-drive region.
  – AXBUSER if the thread is from an IMS message-driven region and RACF is used.
  – ‘PSB name’ if the thread is from an IMS nonmessage-driven region and RACF is not used.
  – ‘user-id’, ‘term id’, ‘tran id’ or other, as specified in the resource control table (RCT), if the thread is from CICS.

---

**DSNT395I**  
**NAME TYPE PART STATUS CONNID CORRID LOCKINFO**

**Explanation:** This message indicates the beginning of a set of messages used to display information as a result of a DISPLAY DATABASE command when the keyword LOCKS is specified. This message forms the headings of the display. (The message appears in one continuous line across the screen, not as shown above.) This message is always followed by multiple DSNT396I messages containing the column data. Refer to message DSNT396I for a description of the data these headings identify.

---

**DSNT396I**  
**space type part status conn-id corr-id lock**

**Explanation:** This message contains the display information that results from a DISPLAY DATABASE command when the keyword LOCKS is specified. This message contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by its column headings in message DSNT395I. The message number for this message is not displayed. However, the messages DSNT395I, DSNT396I, and DSNT390I are always produced with a multiple line WTO and are never interrupted.

In this message:
  - The space is the table space name, index space name, or table OBID.
  - The type is TS for a table space, IX for an index space, LS for a LOB table space or TB for a table.
  - The part is the partition number. It is blank for a simple table space, simple index space, or
segmented table space. For nonpartitioned secondary indexes, it is the logical partition number preceded by the character L (for example, L0001). For data-partitioned secondary indexes, the prefix for this value will be the character D (for example, D0001).

- See DSNT389I for a list of the possible status display strings. If the type is TB, the status field is blank.
  - The conn-id is a connection identifier for the thread. It is one of the following:
    - BATCH if the thread is from a batch region.
    - TSO if the thread is from a TSO terminal.
    - UTILITY if the thread is from a utility.
    - 'IMS identifier' if the thread is from an IMS terminal.
    - 'CICS identifier' if the thread is from a CICS terminal.
    - CONSOLE if the thread is from the console.

When the displayed lock is a P-lock or a retained lock, conn-id is not specified.

- The corr-id is a correlation identifier of the thread associated with the space name. It is one of the following:
  - 'job-name' if the thread is from a batch region.
  - 'TSO logon identifier' if the thread is from a TSO terminal.
  - PST#.PSBNAME if the thread is from an IMS terminal.
  - 'entry ID.thread number.tran id' if the thread is from a CICS terminal.
  - CONSOLE if the thread is from the console.
- For distributed database access threads, this field contains the following:
  - While the thread is being created:
    1. '028.DBAA nn', where nn ranges from 01 to 99. This indicates that the database access agent (DBAA) is in its connection processing, which consists of establishing the DBAA thread, and validating and verifying the user’s ID. Refer to "Controlling Access to a DB2 Subsystem" in [DB2 Administration Guide] for descriptions of the authorization checks that might be performed.

    All RACF requests are serialized on a single DB2 RACF service task, which might increase the validation time when multiple DBAAs are being created concurr.
  - After the thread is created:
    1. For threads using system-directed access and threads using application-directed access from a DB2 requester, this variable displays the correlation ID of the thread at the requesting location.

2. For threads using application-directed access from a non-DB2 requester, this variable displays the first twelve characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL CONNECT.

corr-id is not specified when the displayed lock is a P-lock or a retained lock.

- The lock describes the type and duration of locks:
  - Transaction locks (also called L-locks) are identified by their corresponding agents’ connection and correlation IDs.

    Multiple locks held by an agent are listed on multiple lines of the report followed by any locks the agent is currently awaiting.
  - Physical locks (P-locks) and retained locks are identified by their DB2 data sharing member names.

    Multiple P-locks or retained locks held by a DB2 data sharing member are listed on multiple lines of the report followed by any locks the member is currently awaiting.

The lock is composed of a 'lock status' and followed by a dash '-', a 'lock state' followed by a 'lock type', and a 'lock duration' delimited by commas.

- The 'lock status' is a value of:
  - H The lock is held by the agent or the DB2 member.
  - W The agent or the member is awaiting the lock.
  - R The lock is retained.

- The 'lock state' describes the mode of the lock as follows:
  - For L-locks and drain locks,
    - IS A lock with read intentions.
    - IX A lock with update intentions.
    - S A lock with read-only capability.
    - U A lock with update capability.
    - SIX A table space or table lock with a protocol that does not lock a page while reading, but locks the page with update intention while updating.
    - X An exclusive lock.
  - For L-locks on LOB table spaces,
    - IS A lock with intent to reserve space within the LOB table space
    - IX A lock with intent to insert LOBs in the LOB table space.
    - S A lock which reserves space within the LOB table space.
SIX  A lock which allows the owner to read and update LOBs.
X  An exclusive lock.
- For P-locks,
  IS  This DB2 member has R/O interest. The page set or partition is group buffer pool (GBP) dependent.
  IX  This DB2 member has R/W interest. The page set or partition is GBP-dependent.
  S  This DB2 member has R/O interest. The page set or partition is not GBP-dep
  SIX This DB2 member has R/W interest. The page set or partition is GBP-dependent.
  NSU This DB2 member has R/W interest. The page set or partition is GBP-dependent.
  X  This DB2 member has R/W interest. The page set or partition is not GBP-dep
- The 'lock type' describes the type of locking as follows:
  S  A table space L-lock
  T  A table L-lock
  C  A cursor-stability read drain lock
  R  A repeatable-read drain lock
  W  A write drain lock
  P  A partition L-lock
  PP  A page set or partition P-lock
- If the 'lock status' is H, the 'lock duration' describes the duration of the lock:
  A  The lock is freed at deallocation.
  C  The lock is freed at commit.
  H  The lock is freed when all cursors are closed.
  M  The lock is freed by the system.
  P  The lock is freed when the plan is complete.
  I  The lock is a page set or partition P-lock. It is released when the pageset or partition data set is closed.
- If the 'lock status' is W, the 'lock duration' is a 2-digit number indicating the waiter's position in the local DB2 system's lock waiting queue. When this lock is acquired, its duration is the same as all locks held by the user.
- For a P-lock, the lock is owned by the system, not the user, and its duration is not related to the duration of the locks that are owned by the user.
- Retained locks do not have a lock duration.

All index spaces on tables are implicitly locked with transaction locks at the same level as the table spaces containing those tables. P-locks are acquired by DB2 on index spaces as well as on table spaces.

**DSNT397I**

**Explanation:** This message indicates the beginning of a multiple line display generated as a result of a DISPLAY DATABASE command. The format of this multiple line display has three parts:

- The column headers, which are dependent on the keywords issued. The headers are underlined.
- The space information for all spaces and partitions requested by the command
- An ending message to state whether the spaces were displayed or not.

There are six different headers for the DISPLAY DATABASE commands. The headers are dependent on the presence of the keywords: CLAIMERS, LOCKS, USE, LPL, OVERVIEW, or no keyword. These five different DISPLAY DATABASE command formats are described below.

- **DISPLAY DATABASE CLAIMERS**
  This DISPLAY DATABASE command displays the claims that are on certain table spaces, index spaces, and partitions.
  The column headers in this command are as follows:
  NAME TYPE PART STATUS CONNID CORRID CLAIMINFO
  - NAME is the table space name or index space name.
  - TYPE is TS for a table space, IX for an index space, LS for a LOB table space.
  - PART is the partition number. It is blank for a simple table space or simple index space. For nonpartitioned indexes on a partitioned table space, it is the logical partition number preceded by the character L (for example, L0001). For data-partitioned secondary indexes, the prefix for this value will be the character D (for example, D0001).
  - See DSNT389I for a list of the possible status display strings.
  - For L-locks on LOB table spaces,
    IS  A lock with intent to reserve space within the LOB table space
    IX  A lock with intent to insert LOBs in the LOB table space.
    S  A lock which reserves space within the LOB table space.
A lock which allows the owner to read and update LOBs.

An exclusive lock.

If the type is TB, the status field is blank.

If the status for an index is blank, then the status information is displayed at the logical partition level.

- The CONNID is a connection identifier for the thread. It is one of the following:
  - BATCH if the thread is from a batch region.
  - TSO if the thread is from a TSO terminal.
  - UTILITY if the thread is from a utility.
  - 'IMS identifier' if the thread is from an IMS terminal.
  - 'CICS identifier' if the thread is from a CICS terminal.
  - CONSOLE if the thread is from the console.
- For distributed database access threads, this field contains the following:
  - For threads using system-directed access and for threads using application-directed access from a DB2 Version 3 or later requester, this variable displays the connection name of the thread at the requesting location.
  - For threads using application-directed access from a non-DB2 requester or from a DB2 Version 2 Release 3 requester, this field displays the constant SERVER.
- CORRID is a correlation identifier of the thread associated with the space name. It is one of the following:
  - 'job name' if the thread is from a batch region.
  - 'TSO logon identifier' if the thread is from a TSO terminal.
  - PST#.PSNAME if the thread is from an IMS terminal.
  - 'entry ID.thread number.tran id' if the thread is from a CICS terminal.
  - CONSOLE if the thread is from the console.
  - 'nnn', where 'nnn' is a number, if the thread is for a system agent.
- For distributed database access threads, this field contains the following:
  - While the thread is being created:
    1. '028.DBAA nn', where nn ranges from 01 to 99. This indicates that the database access agent (DBAA) is in its connection processing, which consists of establishing the DBAA thread, validating and verifying the user's ID. Refer to "Controlling Access to a DB2 Subsystem" in *DB2 Administration Guide* for descriptions of the authorization checks that might be performed.

All RACF requests are serialized on a single DB2 RACF service task, which might increase the validation time when multiple DBAAs are being created concurrently.

- After the thread is created:
  1. For threads using system-directed access and threads using application-directed access from a DB2 requester, this variable displays the correlation ID of the thread at the requesting location.
  2. For threads using application-directed access from a non-DB2 requester, this variable displays the first twelve characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL CONNECT.

- CLAIMINFO is the type and duration of currently held claims. The claim is composed of a claim class descriptor and a claim duration descriptor.

The claim class descriptor has one of the following values:

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS</td>
<td>Cursor stability class</td>
</tr>
<tr>
<td>RR</td>
<td>Repeatable-read class</td>
</tr>
<tr>
<td>WR</td>
<td>Write claim class</td>
</tr>
</tbody>
</table>

The claim duration descriptor describes the duration of the claims as follows:

<table>
<thead>
<tr>
<th>Letter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>The claim is held until deallocation.</td>
</tr>
<tr>
<td>C</td>
<td>The claim is held until the next commit point.</td>
</tr>
<tr>
<td>H</td>
<td>The claim is held across commit.</td>
</tr>
</tbody>
</table>

- DISPLAY DATABASE LOCKS

This DISPLAY DATABASE command displays the locks that are on certain table spaces, index spaces and partitions.

The column headers in this command are as follows:

NAME TYPE PART STATUS CONNID CORRID LOCKINFO

- The NAME column states the table space name, index space name, or table object ID.
- The TYPE column states TS for table space, IX for index, or TB for table.
- The PART, STATUS, CONNID, and CORRID columns are described in the DISPLAY DATABASE CLAIMERS section.
- The conn-id and corr-id are not specified when the display lock is a P-lock or a retained lock (either L-lock or P-lock). For page set P-locks, the DB2 member name is used to identify the lock.
- The LOCKINFO describes the type and duration of locks used by corresponding agents identified by their connection and correlation IDs (for transaction locks, which are also called L-locks) or...
used by corresponding subsystems identified by their DB2 data sharing member names (for physical locks, which are called P-locks, and retained locks). Multiple locks held by an agent are listed on multiple lines of the report followed by any locks the agent is currently awaiting. Multiple P-locks or retained locks held by a DB2 data sharing member are listed on multiple lines of the report followed by any locks the member is currently awaiting. The LOCKINFO consists of a 'lock status', followed by a dash '-', a 'lock state', a 'lock type' and a 'lock duration' delimited by commas.

- The 'lock status' is a value of:
  - **H** The lock is held by the agent or the DB2 member.
  - **W** The agent or the member is awaiting the lock.
  - **R** The lock is retained.

- The 'lock state' describes the mode of lock as follows:
  - For L-locks and drain locks,
    - **IS** A lock with read intentions.
    - **IX** A lock with update intentions.
    - **S** A lock with read-only capability.
    - **U** A lock with update capability.
    - **SIX** A lock with a protocol that does not lock a page while reading, but locks the page with update intention while updating.
    - **X** An exclusive lock.
  - For P-locks,
    - **IS** This DB2 member has R/O interest. The page set or partition is group buffer pool (GBP) dependent.
    - **IX** This DB2 member has R/W interest. The page set or partition is GBP-depend
    - **S** This DB2 member has R/O interest. The page set or partition is not GBP-dependent.
    - **SIX** This DB2 member has R/W interest. The page set or partition is GBP-depend
    - **NSU** This DB2 member has R/W interest. The page set or partition is GBP-depend
    - **X** This DB2 member has R/W interest. The page set or partition is not GBP-dependent.

- The 'lock type' describes the type of locking as follows:
  - **S** A table space L-lock
  - **T** A table L-lock
  - **C** A cursor-stability read drain lock

- If the 'lock status' is **H**, the 'lock duration' describes the duration of the lock:
  - **A** The lock is freed at deallocation.
  - **C** The lock is freed at commit.
  - **H** The lock is freed when all cursors are closed.
  - **M** The lock is freed by the system.
  - **P** The lock is freed when the plan is complete.
  - **I** The lock is a page set or partition P-lock. It is released when the page set or partition data set is closed.

- If the 'lock status' is **W**, the 'lock duration' is a 2-digit number indicating the waiters position in the local DB2 system's lock waiting queue. When this lock is acquired, its duration is the same as all locks held by the user.

- For a P-lock, the lock is owned by the system, not the user, and its duration is not related to the duration of the locks that are owned by the user.

- Retained locks do not have a lock duration.

There are no explicit index space locks. However, all index spaces on tables are implicitly locked at the same level as the table spaces containing those tables. P-locks are acquired by DB2 on index spaces as well as on table spaces.

### DISPLAY DATABASE USE

This DISPLAY DATABASE command displays the user IDs that are accessing certain table spaces, index spaces, and partitions.

The column headers in this command are as follows:

```
NAME TYPE PART STATUS CONNID CORRID USERID
```

- The **NAME**, **TYPE**, **PART**, **STATUS**, **CONNID**, and **CORRID** columns are described in the DISPLAY DATABASE CLAIMERS section.

- The **USERID** is one of the following:
  - 'TSO logon identifier' if the thread is from a TSO terminal.
  - 'sign-on id' or the LTERM if the thread is from an IMS message-drive region.
  - **AXBUSER** if the thread is from an IMS message-driven region and RACF is used.
  - 'PSB name' if the thread is from an IMS nonmessage-driven region and RACF is not used.

| R | A repeatable-read drain lock |
| W | A write drain lock |
| P | A partition L-lock |
| PP | A page set or partition P-lock |
- `userid`, `term id`, `tran id` or other, as specific in the resource control table (RCT), if the thread is from CICS.

**DISPLAY DATABASE LPL**

**NAME TYPE PART STATUS LPL PAGES**

This message contains the display information resulting from a DISPLAY DATABASE command when the keyword LPL is specified. It contains the column data describin the status of a table space or index space in the database listed in the preceding DSNT3621 message. This message is always preceded by its column headings message DSNT805I. The message number for this message is not displayed.

In this message:
- The LPL PAGES column lists the pages in the specified space that are unavailable because of logical or physical damage.

**DISPLAY DATABASE (with no LOCKS, USE, LPL or CLAIMERS keyword)**

This DISPLAY DATABASE command displays the error page range information for certain table spaces, index spaces, and partitions.

The column headers in this command are as follows:

**NAME TYPE PART STATUS PHYERRLO PHYERRHI CATALOG PIECE**

In this message:
- The NAME, TYPE, PART, and STATUS columns are described in the DISPLAY DATABASE CLAIMERS section.
- When a data set supporting the specified table space or index space has physical I/O errors, PHYERRLO is a hexadecimal number identifying the lowest page number containing an I/O error. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, PHYERRHI is a hexadecimal number identifying the highest page number containing an I/O error. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, CATALOG identifies the catalog owning the data set with the I/O errors. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, PIECE is an integer number identifying the piece within the table space or index space having the error. This column is blank if there are no physical errors.

The piece number can be used to construct the name of the data set supporting the space containing the physical error as follows:

```
cat-name.DSND8C.database-name.space-name.I0001.Axxxx
```

The value xxxx is the piece number plus one and database-name is the name displayed in the preceding DSNT3621 message. Note that if the table space or index space is partitioned, the partition number should equal the piece number plus one.

There are other informational messages that can be displayed that are not related to one specific keyword. They are listed below:

- **-luw-id ACCESSING DATA FOR location**
  This message is issued for each thread reported that is participating in distributed data access (database access thread). The thread that corresponds to this message is the thread named by the correlation id and connection id of the data line preceding this message. This additional line reports the distributed identification as follows:

  **luw-id-token**
  The logical-unit-of-work identifier (LUW-ID) is a unique identifier that is assigned to the thread followed by an `=' sign and a token. The token can be used in place of luw-id in any DB2 command that accepts luw-id as input.

- **-MEMBER NAME member-name**
  This message is issued with messages DSNT389I, DSNT394I or DSNT396I for each thread in a data sharing environment. This additional line reports the member name of the DB2 subsystem accessing this object.

  If the characters `(CO)` follow the member name, then this member is the castout owner for the page set or partition. The castout owner for a page set or partition is the DB2 member responsible for doing all of the castout I/O for that page set or partition.

  The message number and subsystem recognition character are not included in this message.

- **INVALID space-name**
  The space-name specified in the SPACENAM keyword on the -DISPLAY DATABASE command does not exist. The name of the table space or index space is `space-name`. The request is rejected.

- **NO SPACES FOUND**
  This message is produced when a DISPLAY DB(name) SPACENAM is entered and no spaces were found to satisfy the request. SPACENAM(...) might have been entered as a range, a subset, or a list of spaces.

- **spacetype name NOT type**
This message is produced when no table space or index space listed in the DISPLAY DB(...) SPACENAM(...) satisfies your request.

**spacetype**
- TABLESPACE if the space is a table space or INDEXSPACE if the space is an index space.

**name** The name of the space.

**type** A character string that indicates the type of request specified. The string is a list of the following, delimited by 'OR':
- ACTIVE if the keyword ACTIVE is specified
- RESTRICTED if the keyword RESTRICT is specified.

**NO INFORMATION AVAILABLE**
This message is produced when there is no LOCK or USE information available. When DISPLAY DB(...) is entered, and DB(...) is a list of databases or a list of names, this message indicates that no listed database has LOCK or USE information available.

If DISPLAY DB(...) or DISPLAY DB(...) SPACENAM(“) is entered, and DB(...) is a range or subset of databases, or all databases (""), this message indicates that no databases, for which the invoker has authority to display, have LOCK or USE information available. This message is produced only when the keywords USE and LOCKS are specified.

The ending message looks like this:

* DISPLAY OF DATABASE name action *

In this message:

**name** The name of the database

**action** One of the following:
- **CONTINUES** The remaining table space and index space names within this database are continued to a new display.
- **TERMINATED** The remaining table space and index space names within this database are terminated.
- **ENDS** The display for this database is complete.

**DSNT398I**

**Explanation:** This message appears within a multiple line WTO message set and precedes DSNT391I, DSNT393I, and DSNT395I. It is used to underscore the column headings.

This message is issued by CSECT: DSNTDMUL

**DSNT399I** INVALID space-name

**Explanation:** The space-name specified in the SPACENAM keyword on the -DISPLAY DATABASE command does not exist. The name of the table space or index space is 'space-name'. The request is rejected.

**DSNT400I** SQLCODE = 0, SUCCESSFUL EXECUTION

**Explanation:** The SQLCODE was 0, indicating successful execution of the function. SQLWARN indicators may note some warnings. SQLWARNx fields are described in Appendix C of [DB2 SQL Reference](#).

**DSNT401I** DSNT401I WARNING - HELP IS NOT INSTALLED

**Explanation:** You invoked the installation process with the DSNTINST CLIST. To enable online help, you must use the DSNTINS0 CLIST instead of the DSNTINST CLIST.

This message is issued by panel: DSNTIPA1

**System Action:** The panel is displayed with the warning message.

**User Response:** No response is necessary if you do not desire online help for the panel. Press ENTER to continue with the installation process after filling in desired panel values. If panel help is desired: exit this panel, make sure BookManager or the online help reader is installed on your system, and invoke the installation process with the DSNTINS0 CLIST.

**DSNT402I** ONLINE BOOK DATA SET NAMES MUST END IN ‘.BOOK’

**Explanation:** All book names entered on this panel must end in "BOOK".

This message is issued by panel: DSNTIPA0

**System Action:** The panel is redisplayed with the error message.

**User Response:** Replace the book name or names with a value that ends in "BOOK".

**DSNT403I** SQLCODE = xxx, explanation

**Explanation:** This message contains an SQL return code and a brief explanation, with text inserted from the SQLERRM field. The SQL return code is positive, indicating a warning condition. For more information about this SQL return code, see [Part 2, "SQL return codes," on page 11](#).

**System Programmer Response:** Determine the cause for the SQL warning code, and correct the situation if needed. Rerun the application program or SQL statement.
DSNT405E  csect-name DISPATCH PRIORITIES
NOT IN SYNC: ccccccc1: hhh1
COMPARED TO ccccccc2: hhh2

Explanation: The dispatch priorities of task 'ccccccc1'
(dispatch priority 'hhh1') and task 'ccccccc2' (dispatch
priority 'hhh2') are found to be incorrect in relation
to each other. This can cause severe performance
problems and possible failure of either task 'ccccccc1',
task 'ccccccc2', or other tasks.

System Action: DB2 continues with possible problems
described above.

Operator Response: Notify the system programmer.

System Programmer Response: Modify the dispatch
priority algorithms for the two tasks to meet documented
requirements. For instance, IRLM must have a higher
dispatch priority than DB2.

DSNT406I  THE ART/ORT ESCAPE CHARACTER
CANNOT BE % OR _

Explanation: You specified the percent sign (%) or the
underscore character (_) as the application registration
table/object registration table (ART/ORT) escape
character. The ART/ORT escape character can be any
other character.

System Action: The panel is redisplayed and the
cursor is placed on the field that produced the error.

User Response: Change the ART/ORT escape
character value.

DSNT407I  THIS FIELD HAS AN INVALID FORMAT

Explanation: The field must be NOLIMIT, 1440, 0, or
minutes and seconds separated by a comma.

This message is issued by the following panel:
DSNTIPA

System Action: The panel is redisplayed and the
cursor is placed on the field in error.

User Response: Correct the input.

DSNT408I  SQLCODE = xxxx, explanation

Explanation: This message contains an SQL return
code and a brief explanation, with text inserted from the
SQLERRM field. The SQL return code is negative,
indicating that an error has occurred. For more
information about this SQL return code, see Part 2,
"SQL return codes," on page 11

System Programmer Response: Determine the
cause for the SQL error by using information about that
specific SQLCODE. Correct the error if desired. Rerun
the application program or SQL statement.

Problem Determination: Collect the following
diagnostic items listed in Appendix B, "Problem"
DSNT413I SQLCODE = xxx, INVALID SQLCODE

Explanation: The SQL return code is not a valid value.

System Programmer Response: Either the SQLCA area is invalid or the maintenance was not coordinated correctly. As a result, the SQL return code was added to the DB2 subsystem but not to the formatting routine.

An invalid SQLCA area is usually the result of one of the following:
- Calling the DSNTIAR formatting routine before an SQL statement initializes the area
- Overlaying the SQLCA area
- Passing the wrong address to the DSNTIAR routine.

If the maintenance was not coordinated correctly, the DSNTIAR and DSNTIAM CSECTs were probably not replaced in the code that is now running. Link-edit the load module, and replace DSNTIAR and DSNTIAM. Correct the error, and rerun the application program.

DSNT414I SQLERRM = xxxx, SQLCA ERROR MESSAGE INSERTION TEXT

Explanation: This message results from an SQL return code that is not recognized by DSNTIAR. SQLERRM contains error message text.

System Programmer Response: Either the SQLCA area is invalid or the maintenance was not coordinated correctly. As a result, the SQL return code was added to the DB2 subsystem but not to the formatting routine.

An invalid SQLCA area is usually the result of one of the following:
- Calling the DSNTIAR formatting routine before an SQL statement initializes the area
- Overlaying the SQLCA area
- Passing the wrong address to the DSNTIAR routine.

If the maintenance was not coordinated correctly, the DSNTIAR and DSNTIAM CSECTs were probably not replaced in the code that is now running. Link-edit the load module, and replace DSNTIAR and DSNTIAM. Correct the error, and rerun the application program.

DSNT415I SQLERRP = xxxx, SQL PROCEDURE DETECTING ERROR

Explanation: The name of the procedure detecting the error is provided in the SQLERRP.

System Programmer Response: (The SQL procedure detecting the error may be of help in diagnosing an error or warning.) Correct the error if there is one noted in other messages. Rerun the program or SQL statement.

DSNT416I SQLERRD = xx,xx,xx,xx,xx,xx SQL DIAGNOSTIC INFORMATION

Explanation: At least one of the six diagnostic fields is not the expected value. The expected values are:
- 00, 00, 00, 00, 00, 00 or
- 00, 00, 00, -1, 00, 00

The SQL diagnostic information for each of the six values is as follows:
1. DB2 unique internal relational data system code
2. DB2 internal data manager error code
3. One of the following:
   - Number of rows inserted, updated, or deleted following an INSERT, UPDATE, or DELETE statement

Note: A ‘-1’ in this field indicates that a mass delete of a table in a segmented table space was performed, wherein DB2 does not access nor count individual rows.
- For SQLCODE -911 or -913, a reason code that indicates whether a deadlock or timeout occurred.

Note: The most common reason codes are:
- 00C90088 - deadlock
- 00C9009E - timeout

4. Reserved
5. Position or column of a syntax error for PREPARE or EXECUTE IMMEDIATE
6. DB2 internal buffer manager error code

System Programmer Response: Refer to Appendix C of DB2 SQL Reference for further information on the contents of the SQLERRD fields. The SQL diagnostic information may be of help in diagnosing an error or in indicating the results of successful execution. If this error or warning should not occur, correct the error. Rerun the program or SQL statement.

DSNT417I SQLWARNn-n SQL WARNINGS

Explanation: At least one of the 11 warning values is not the expected value (a blank). A nonblank value in one of the 11 warning fields has the following meaning:

SQLWARN0 Any other warning code is set.

SQLWARN1 String truncation.

SQLWARN2 Null value(s) eliminated.

SQLWARN3 Number of host variables provided did not equal degree of the table.
SQLWARN4
No WHERE clause on UPDATE or DELETE.

SQLWARN5
Not a DB2 SQL statement.

SQLWARN6
Date or timestamp value adjusted.

SQLWARN7
Conversion of decimal number from precision 31 to precision 15 caused truncation of fractional digits.

SQLWARN8
Untranslatable character replaced with substitute.

SQLWARN9
Arithmetic exceptions have been ignored during processing of COUNT DISTINCT.

SQLWARNA
At least one character field of the SQLCA is invalid due to a string translation error.

User Response: The SQL warning information may be of help in diagnosing an error or in indicating the results of successful execution. If this warning should occur, correct the error and rerun the program or SQL statement.

DSNT418I SQLSTATE = sqlstate, SQLSTATE RETURN CODE

Explanation: The SQLSTATE is a return code that indicates the outcome of the most recently executed SQL statement. The execution of every SQL statement sets SQLSTATE to a five-digit code in the range of 00000 to 65535. This has no effect on the existing use of any other field in the SQLCA.

User Response: For further information on the meaning of an SQLSTATE return code, see the "SQL return codes," on page 11. If necessary, correct the SQL statement and return it.

DSNT419I WARNING - MAX REMOTE ACTIVE PREVIOUSLY SPECIFIED AS 0.

Explanation: You specified a value of 0 for the number of active database access threads on a previous panel. This value might be inconsistent with a DDF STARTUP OPTION of AUTO or COMMAND.

This message is issued by the following panel: DSNTIPR

Severity: 4 (warning)

System Action: The panel is redisplayed and the cursor is placed on the DDF STARTUP OPTION field.

User Response: No response is necessary if your intent is to have DDF started with no active database access threads allocated and DDF is used as a requester only. Press ENTER to continue. Otherwise, either change the DDF STARTUP OPTION to NO or MAX REMOTE ACTIVE to the number of threads you want.

DSNT420I YOU NEED AT LEAST 1 32K DS IF THE TEMP 32K SPACE IS GREATER THAN 0

Explanation: You entered zero for the TEMP 32K DATA SETS field on the SIZES panel. You need at least one TEMP 32K DATA SET if TEMP 32K SPACE on DSNTIPD is not zero.

This message is issued by the following panel: DSNTIPD

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Enter a value of one or greater for the TEMP 32K DATA SETS field or change the TEMP 32K SPACE value to zero.

DSNT421I YOU NEED AT LEAST 1 32K BUFFER FOR THE <num32kds> 32K DATA SETS

Explanation: You specified zero for the 32KB buffers. If field TEMP 32K DATA SETS on installation panel DSNTIPD is greater than zero, you need at least one 32KB buffer on installation panel DSNTIP2.

This message is issued by the following panel: DSNTIP2

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Enter a value of 1 or more for at least one of the buffer pools (BP32K - BP32K9) on panel DSNTIP2, or change the TEMP 32K DATA SETS value to zero.

DSNT422I THE ART TABLE NAME MUST BE DIFFERENT FROM THE CRT TABLE NAME

Explanation: You entered the same name for the Application Registration Table and the Object Registration Table on the Data Definition Control Support panel.

This message is issued by the following panel: DSNTIPZ

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change either the APPL REGISTRATION TABLE field or the OBJT REGISTRATION TABLE field to make these two fields unique with respect to each other.
OUTPUT DATA SETS MUST BE DIFFERENT FROM THE INPUT DATA SETS

Explanation: You specified an output data set name that is the same as one of the input data set names built from the PREFIX and SUFFIX fields on the main panel DSNTIPA1.

This message is issued by the following panel: DSNTIPT

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Either change the data set name under the cursor or change the PREFIX or SUFFIX fields on panel DSNTIPA1.

ALL THREE OUTPUT DATA SETS MUST BE UNIQUE

Explanation: You specified the same name for two or more of the output data sets.

This message is issued by the following panel: DSNTIPV

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the data set name under the cursor or the data set field(s) that are the same as the one under the cursor.

ALL THREE DATA SETS ARE REQUIRED FOR OUTPUT

Explanation: You specified one or more output data sets and left one or more output data set fields blank.

This message is issued by the following panel: DSNTIPT

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: You must specify all or none of the output data set fields. Leave blank all output data set fields if you do not want the installation CLIST to edit any CLISTs or JCL.

THE DATA SET OR MEMBER SPECIFIED COULD NOT BE LOCATED

Explanation: The input parameter member for the INPUT MEMBER NAME field or the DATA SET NAME(MEMBER) field for migration could not be found.

This message is issued by the following panel: DSNTIPA1

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Verify that you entered an existing data set and member in that data set. Also verify that the data set is cataloged.

WHEN USING TIMESTAMPS, THE PREFIX MUST BE <= preflen CHARACTERS LONG

Explanation: YOU HAVE ENTERED AN ARCHIVE LOG PREFIX LONGER THAN ALLOWED. The archive log prefix names must not exceed 19 characters when the TIMESTAMP ARCHIVES value is YES and must not exceed 17 characters when the TIMESTAMP ARCHIVES value is EXT.

This message is issued by the following panel: DSNTIPTH

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Reduce the length of the prefix or change the TIMESTAMP ARCHIVES value to NO.

THE SUM OF MAX USERS AND MAX REMOTE ACTIVE MUST BE <= TO 5000

Explanation: The total number of threads determined by MAX USERS and MAX REMOTE fields is too large.

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Reduce the MAX USERS field, or the MAX REMOTE field, or both.

THIS FIELD MAY ONLY BE FILLED IN FOR MIGRATE MODE

Explanation: You can only specify the FROM RELEASE or DATA SET NAME(MEMBER) fields for INSTALL TYPE of MIGRATE.

This message is issued by the following panel: DSNTIPA1

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the INSTALL TYPE to MIGRATE or blank out the field under the cursor.

DDF, MIXED DATA, OR DEF ENCODING SCHEME CONFLICTS WITH CODED CHAR SET

Explanation: You have entered an invalid EBCDIC or ASCII coded character set (CCSID) value for the DDF, MIXED DATA, or DEF ENCODING SCHEME value you specified. The following restrictions apply to these values:

- With a MIXED DATA value of ‘YES’, you must choose a valid mixed CCSID value for the EBCDIC CODED CHAR SET. The ASCII CODED CHAR SET must be a valid mixed value or zero.
1. With a MIXED DATA value of 'NO', you must choose a valid SBCS CCSID value or zero for EBCDIC or ASCII CODED CHAR SETs.

2. With a DDF value of 'AUTO' or 'COMMAND', you must choose a non-zero value for the EBCDIC CODED CHAR SET.

3. With a DEF ENCODING SCHEME value of 'ASCII', you must choose non-zero values for EBCDIC and ASCII CODED CHAR SETs.

Refer to Appendix C of [DB2 Installation Guide] for a list of the best general CCSID for each country.

This message is issued by the following panels: DSNTIPP, DSNTIPR

**System Action:** The panel is redisplayed and the cursor is placed on the field in error.

**User Response:** Correct either the DDF, MIXED DATA, or DEF ENCODING SCHEME value or the EBCDIC or ASCII CODED CHAR SET value to correct the incompatibility.

---

**DSNT433I** MAX REMOTE ACTIVE MUST BE <= MAX REMOTE CONNECTED.

**Explanation:** The number of active database access threads cannot be larger than the number of concurrent database access threads.

This message is issued by the following panel: DSNTIPE

**Severity:** 8 (error)

**System Action:** The panel is redisplayed and the cursor is placed on the field in error.

**User Response:** Reduce the MAX REMOTE ACTIVE field, increase the MAX REMOTE CONNECTED field, or both.

---

**DSNT434I** WARNING, DATA SETS MARKED WITH ASTERISKS EXIST AND WILL BE OVERWRITTEN

**Explanation:** The data sets marked with asterisks already exist. If you continue, the installation process will delete the existing data set and allocate a new one for tailored job output.

This message is issued by the following panel: DSNTIPT

**Severity:** 4

**User Response:** You should:
1. Press ENTER to continue; the data set(s) will be deleted and reallocated OR
2. Press RETURN to leave the installation process; the data set(s) will not be deleted OR

---

**DSNT435I** DSNT435I OVERRIDE VALUES ARE IN Effect

**Explanation:** Calculated values for EDMPOOL, SORTPOOL, or RIDPOOL on panel DSNTIPIC were previously overridden. Installation uses any override values displayed.

**Severity:** 4

**System Action:** Override values are used instead of calculated values, when displayed.

**User Response:** No response is necessary if you want to use the override values. If you want to use the calculated values, erase the values in the override column.

---

**DSNT436I** REGION SIZE MAY BE TOO LARGE

**Explanation:** The numbers you specified produced a region size estimate of more than 5000KB. This region size estimate does not include the storage required for SWA because it is assumed that SWA has been placed above the line. If a larger private area is permitted, you should increase the region size on the DB2 start procedures. The region size calculation is shown in the DSNT485I through DSNT487I messages and is discussed in Part 2 of [DB2 Installation Guide].

This message is issued by the following installation CLIST: DSNTINST

**Severity:** 4 (warning)

**System Action:** The CLIST continues.

**User Response:** Check the values entered for numbers of concurrent users and databases, buffers, and plan sizes. Check the available private region size.

If this region size is not permitted, these numbers need to be reduced. If the size is permitted, this warning can be ignored.

**Problem Determination:** If you suspect an error in the process, set CONTROL(CONLIST) and invoke the CLIST. This produces tracing for error documentation.

---

**DSNT437I** REGION SIZE IS TOO LARGE

**Explanation:** The numbers you specified produced a region size estimate of more than 8000KB. This estimate does not include the storage required for SWA, because it is assumed that you placed SWA above the 16MB line. The region size calculation is discussed in Part 2 of [DB2 Installation Guide].

This message is issued by the following installation CLIST: DSNTINST

**Severity:** 8 (error)
System Action: The CLIST continues, but does not produce edited jobs.

User Response: Check the numbers entered for numbers of concurrent users and databases, buffers, and plan sizes. One or more of these numbers needs to be reduced.

Problem Determination: If you suspect an error in the process, set CONTROL(CONLIST) and invoke the CLIST. This produces tracing for error documentation.

---

**DSNT438I** WARNING, IRLM LOCK MAXIMUM SPACE = irlmreg G, AVAILABLE SPACE = irlmav G

Explanation: You specified a maximum number of locks per user that could use a total space larger than that available to the IRLM, causing it to abend. It is not likely that all threads will have the maximum number of locks, but if the maximum exceeds the amount of space by a significant factor, the possibility of abends in the IRLM is increased.

The available space is specified in the MAX STORAGE FOR LOCKS field of the DSNTIPJ installation panel, and is never less than 2 GB. The maximum space used is estimated as the sum of the MAX USERS AND MAX REMOTE ACTIVE values from the DSNTIPE panel times the number of LOCKS PER USER value on the DSNTIPJ panel times 540 bytes per lock.

Severity: 4 (warning)

System Action: The CLIST will continue.

User Response: Choose one of the following responses:
- Ensure that you can run with the overcommitment of lock address space, or
- Lower the value(s) of the MAX USERS, MAX REMOTE ACTIVE, or LOCKS PER USER fields, or
- Increase the value of the MAX STORAGE FOR LOCKS field.

---

**DSNT439I** IRLM NO LOCK ESCALATION OR NO USER MAXIMUM

Explanation: You specified the number 0 for:
- The number of table or table space locks that will cause lock escalation, or
- The number of locks that will terminate a DB2 user.

A lock escalation value of 0 turns off lock escalation and means that DB2 cannot use this means of conserving lock space. A user maximum of 0 means that the calculation noted in the DSNT438 message cannot be performed to see if the IRLM has sufficient address space for all users, since there is no maximum per user.

This message is issued by the following installation CLIST: DSNTINST

Severity: 4 (warning)

---

**DSNT440I** TOTAL BP SIZE TOO LARGE

Explanation: The total size of a buffer pool is too large. The summation of the ssmnDBM1 address space storage requirements for all buffer pools cannot exceed 1TB. When calculating the requirements for the buffer pools, DB2 uses the page size (4K, 8K, 16K, or 32K) for each buffer.

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Reduce one or more of the buffer pool sizes.

---

**DSNT442E** ERROR, VIRTUAL STORAGE OF main EXCEEDS THE SYSTEM LIMIT OF 2 GIGABYTES

Explanation: The total of all virtual storage calculations exceeds the maximum amount possible for an address space.

This message is issued by the following CLIST: DSNTINST

Severity: 8 (error)

System Action: The installation CLIST returns to the initial panel without editing the installation jobs.

User Response: Respecify installation values that determine storage sizes so that the 2 GB limit is not exceeded.

---

**DSNT443I** VALUES MARKED WITH AN ASTERISK HAVE BEEN UPDATED

Explanation: An asterisk is placed before the description of fields which were generated by the DSNTINST CLIST. This message only appears when you update field(s) from a prior panel used to generate the fields on the current panel.

This message is issued by the following panels: DSNTIPA, DSNITPL

System Action: The panel is displayed.

User Response: Verify that the current value is what you want. If it is not, enter the desired value.

---

**DSNT444I** SCROLLING BACKWARD MAY CHANGE FIELDS MARKED WITH ASTERISKS

Explanation: The marked fields on the current panel are generated from fields on other panels. If you scroll backward, these fields may be updated to reflect new
values from other panels. For example, the ARCHIVE
PREFIX field is generated from the CATALOG ALIAS
field on DSNTIP2. Message DSNT443I will be
displayed to inform you when fields are changed by the
DSNTINST CLIST.

This message is issued by the following panels:
DSNTIPA, DSNITPL

System Action: The panel is displayed.
User Response: No action required.

---

**DSNT445I**

REMOTE LOCATION NAME MUST NOT BE THE SAME AS LOCAL LOCATION

Explanation: The name entered for the remote sample location was the same as the local location name.

This message is issued by the following installation panel: DSNTIPY

System Action: The panel is displayed.
User Response: Enter a remote location name or leave the field blank to indicate that the organization sample will only be executed locally.

---

**DSNT446I**

SAMPLE LOCATION MUST BE BLANK IF LOCAL LOCATION IS BLANK

Explanation: In order to edit the remote sample jobs, both the DB2 LOCATION NAME (local location) on panel DSNTIPR and the REMOTE LOCATION must have valid names. If the DB2 LOCATION NAME is unknown, leave both fields blank and the remote sample jobs will not be edited.

This message is issued by the following panel: DSNTIPY

System Action: The panel is displayed.
User Response: Either scroll back to the DISTRIBUTED DATA FACILITY panel and enter a value for the DB2 LOCATION NAME, or enter a blank in the REMOTE LOCATION field on the job editing panel.

---

**DSNT448I**

STG AVAILABLE ABOVE 2GB = size T

Explanation: This is the estimated amount of real storage recommended to support the virtual storage sizes chosen.

The amount of real storage needed will vary greatly. Some customers will find that they need several times the estimate shown. For more information on storage calculations, refer to Part 2 of [DB2 Installation Guide](http://example.com/databasemanagementguides).

This message is issued by the following CLIST: DSNTINST

Severity: 0 (successful execution)
System Action: The CLIST continues.

---

**User Response:** Compare this recommended value with the actual available real storage.

---

**DSNT449I**

NUMBER OF LOGS REDUCED FROM old-num TO MAXIMUM OF 31

Explanation: The number of active log data sets used in the DB2 release you are migrating from is greater than the new maximum number of data sets allowed for the current release of DB2. Installation job DSNTIJUZ will update your bootstrap data sets to contain only the last 31 data sets.

This message is issued by the following panel: DSNITPL

System Action: The value is reduced to the maximum of 31 and the panel is displayed.
User Response: Update any other fields on the panel and continue.

---

**DSNT450I**

type ENTRY MUST BE EXACTLY TWO CHARACTERS

Explanation: These entries are used to complete SYS1.PARMLIB member names and must be exactly two characters. The type is:

- **APF AUTH**
  - For the APF-authorized library list IEAAPFxx
- **LINK LIST**
  - For the link list library concatenation LNKLSTxx
- **MVS SUBSYS**
  - For the MVS subsystem list IEFSSNxx

This message is issued by the following installation CLIST: DSNTINST

Severity: 8 (error)
System Action: The CLIST will continue.
User Response: Check your entries for these fields on the MVS panel and make them exactly two characters. See job DSNTIJMV that was produced and correct the IEBUPDTE CHANGE statement.

---

**DSNT451I**

WARNING-THE LOCAL DATE LENGTH OR LOCAL TIME LENGTH HAS BEEN INCREASED

Explanation: The LOCAL DATE LENGTH or LOCAL TIME LENGTH has been increased and a REBIND command must be issued for any dependent plans.

This message is issued by the following installation CLIST: DSNTINST

Severity: 4 (warning)
System Action: Processing continues.
User Response: Rebind all application plans that depend upon the length of the local format that was changed.

---
DSNT454I  ERROR CODE = errcode, CNT = count  
Explanation:  An error was encountered during CLIST processing for reading the parameter member. Most of these errors are caused by having a mismatch between the level of the CLIST and that of the parameter member being read.

The 'errcode' is an error code defined for the CLIST. The error code values and associated meanings are found in TSO/E CLISTS.

The 'count' value is the number of parameter values already read.

This message is issued by the following installation CLIST: DSNTINST

System Action:  The CLIST will terminate.

User Response:  Be sure the parameter member and the CLIST are at the same level.

Problem Determination:  If you suspect an error in the process, set CONTROL(CONLIST) and invoke the CLIST in batch, so that the tracing can be sent with the error documentation. You will also need the listing of the CLIST and the parameter member being read.

DSNT455I  VALUE MUST BE NUMERIC  
Explanation:  The variable named 'varname' does not have a valid value. Its current value is 'value'. Subsequent messages will describe the reason the value is invalid and the action taken by the CLIST.

If the error is in the CONTROL value, the value was specified when the CLIST was invoked. The value is not valid, and no additional tracing will be done. The permitted values are NONE, LIST, CONLIST, and SYMLIST. Each value produces more CLIST tracing information than those which precede it. If the error is in other values, the value was specified when the CLIST was invoked on the ISPF panels.

This message is issued by the following installation CLIST: DSNTINST

Severity:  8 (error)

System Action:  The CLIST will continue, but will not produce edited jobs or parameter data.

User Response:  Check the subsequent messages. Exit, then invoke the CLIST with a valid value for the variable.

Problem Determination:  If you suspect an error in the process, set CONTROL(CONLIST) and invoke the CLIST in batch, so that the tracing can be sent with the error documentation. The CLIST itself and the parameter member read in should be sent as well.

DSNT456I  VALUE IS TOO LOW, MINIMUM IS min
Explanation:  The variable named 'varname' must be larger than its current value. The minimum value allowed is 'min'.

This message is issued by the following installation CLIST: DSNTINST

Severity:  8 (error)

System Action:  The CLIST will continue, but will not produce edited jobs or parameter data.

User Response:  See message DSNT465I for the CLIST action.

DSNT457I  The SUBSYSTEM NAME MUST BE DIFFERENT THAN THE PROC NAME  
Explanation:  Internal MVS restrictions require that the IRLM subsystem name be different than the procedure name.

This message is issued by the following panel: DSNTIPI

System Action:  The panel is redisplayed and the cursor is placed on the field in error.

User Response:  Change either the SUBSYSTEM NAME or the PROC NAME so these fields are unique with respect to each other.

DSNT458I  VALUE IS TOO HIGH, MAXIMUM IS max  
Explanation:  The variable named 'varname' must be smaller than its current value. The maximum value allowed is 'max'.

This message is issued by the following installation CLIST: DSNTINST

Severity:  8 (error)

System Action:  The CLIST will continue, but will not produce edited jobs or parameter data.

User Response:  See message DSNT465I for the CLIST action.
This message is issued by the following installation
CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs. The CLIST resets the incorrect value to 'max'.

User Response: See message DSNT465I for the CLIST action.

**DSNT461I** THE BUFFER POOL MAXIMUM IS LESS THAN THE MINIMUM VALUE ENTERED

Explanation: Buffer pool maximums must be greater than or equal to the minimum value for the same buffer pool.

This message is issued by the following panel: DSNTIPE

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Either reduce the minimum value or increase the maximum value for the indicated buffer pool buffer.

**DSNT462I** VALUE IS TOO LONG, MAXIMUM IS length CHARACTERS

Explanation: The variable named in message DSNT456I must be shorter than its current value. The maximum length allowed is 'length'.

This message is issued by the following installation CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs. The CLIST resets the value to the default value.

User Response: See message DSNT465I for the CLIST action.

**DSNT463I** DATA SHARING FIELD MUST BE BLANK IN UPDATE MODE.

Explanation: This field is not relevant in Update mode and must be blank. This message is issued by panel: DSNTIPA1

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Replace the value with a blank.

**DSNT464I** VALUES PERMITTED ARE values

Explanation: The variable named in message DSNT456I must be one of the 'values' listed.

This message is issued by the following installation CLIST: DSNTINST

Severity: 4 (warning)

System Action: The CLIST will continue.

User Response: Specify a different name for the output member.
**DSNT468I**  ERROR(S) ENCOUNTERED, OUTPUT IS BYPASSED

Explanation: An error was detected earlier in this run. Because of the error, data set editing was not performed.

This message is issued by the following installation
CLIST: DSNTINST

Severity:  8 (error)

System Action: The CLIST will continue, but will not produce edited jobs.

User Response: Correct the errors noted earlier, and specify the output prefix name again to produce the edited data.

**DSNT469I**  INPUT PARAMETERS MUST BE READ BEFORE MIGRATION

Explanation: The INPUT MEMBER NAME on panel DSNTIPA1 must have a value to allow migration values to be read. This is to permit the new values to be initialized.

This message is issued by the following installation
CLIST: DSNTINST

Severity:  8 (error)

System Action: The CLIST will return to the main install panel, DSNTIPA1.

User Response: Specify DSNTIDA as the INPUT MEMBER NAME and specify the current value for the migration member.

**DSNT470I**  WARNING, ONLY ONE VOLUME WAS SPECIFIED

Explanation: Only one volume serial number was specified on the install panel or CLIST invocation. This does not allow adequate recovery or performance unless it is intended to be a single volume test system.

This message is issued by the following installation
CLIST: DSNTINST

Severity:  4 (warning)

System Action: The CLIST will continue.

User Response: If this subsystem is intended to be recoverable, more than one volume is needed. Rerun the installation tailoring process, specifying at least one more volume on the DSNTIPA2 panel. If this is just a single volume test system, be sure that you specify a single copy of the log data sets. The boot strap data sets are small and not active, so that two are recommended even on a single volume system.

**DSNT471I**  BEGINNING PARAMETER INPUT MEMBER inmem

Explanation: The input parameter member, 'inmem', is being read. This data includes values for all of the installation parameters.

This message is issued by the following installation
CLIST: DSNTINST

Severity:  0 (successful execution)

System Action: The CLIST will continue.

**DSNT472I**  WORK FILE DATABASE NAME CANNOT START WITH DSNDB EXCEPT FOR DSNDB07

Explanation: The work file database name cannot start with the characters DSNDB unless the name is DSNDB07.

This message is issued by the following panel:
DSNTIPK

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the name so that it does not start with DSNDB.

**DSNT473I**  BEGINNING CHECK PHASE

Explanation: This message indicates the following:
- The values entered on the panels are being checked.
- Values which use the K or M suffix are being translated to numbers.

This message is issued by the following installation
CLIST: DSNTINST

Severity:  0 (successful execution)

System Action: The CLIST will continue.

**DSNT474I**  READING count, varname, datatype, data sharing scope, minval, maxval, currentval

Explanation: The values are being read from the parameter member. The count, the variable name, the data type, the data sharing scope, the minimum value, the maximum value, and the current value are shown. This message occurs when the CONTROL keyword requests a trace.

This message is issued by the following installation
CLIST: DSNTINST

Severity:  0 (successful execution)

System Action: The CLIST will continue.
### DSNT475I - CHECK count, varname, type, minval, maxval, currentval

**Explanation:** This message indicates the following:
- The values read in or entered on the panels are being checked.
- Values which use the K or M suffix are being translated to numbers.

The count, the variable name, the data type, the minimum value, the maximum value, and the current value are shown. This message occurs when the CONTROL keyword requests a trace.

This message is issued by the following installation CLIST: DSNTINST

| Severity: | 0 (successful execution) |
| System Action: | The CLIST will continue. |

### DSNT476I - BEGINNING PARAMETER OUTPUT MEMBER outmem

**Explanation:** The output parameter member named 'outmem' is being written. This data includes values for all the install parameters.

This message is issued by the following installation CLIST: DSNTINST

| Severity: | 0 (successful execution) |
| System Action: | The CLIST will continue. |

### DSNT477I - OUTPUT count, varname, type, minval, maxval, currentval

**Explanation:** The values entered on the panels are being written to the output parameter member. The count, the variable name, the data type, the minimum value, the maximum value, and the current value are shown. This message occurs when the CONTROL keyword requests a trace.

This message is issued by the following installation CLIST: DSNTINST

| Severity: | 0 (successful execution) |
| System Action: | The CLIST will continue. |

### DSNT478I - BEGINNING EDITED DATA SET OUTPUT

**Explanation:** The output jobs and data are being edited to tailor them. Edited JCL output was requested and no severe errors were encountered.

This message is issued by the following installation CLIST: DSNTINST

| Severity: | 0 (successful execution) |
| System Action: | The CLIST will continue. |

### DSNT479I - THE IRLM GROUP NAME AND DB2 GROUP NAME MUST BE DIFFERENT

**Explanation:** You entered an IRLM group name on panel DSNTIPJ that is the same as the DB2 group name entered on panel DSNTIPK. The names must be different.

This message is issued by the following panel: DSNTIPJ

**System Action:** The panel is redisplayed and the cursor is placed on the field in error.

**User Response:** Either change the DB2 group name entered on panel DSNTIPK or the IRLM group name on panel DSNTIPJ.

### DSNT480I - NAME MUST BE 1-16 CHARS, BEGIN WITH A-Z, AND NOT INCLUDE #, @, OR $.

**Explanation:** The location name specified on panel DSNTIPR is invalid. The location name must be 1-16 alphanumeric characters, excluding the alphabetic extenders #, @ or $, and must begin with a letter.

This message is issued by panel: DSNTIPR

**System Action:** The panel is redisplayed and the cursor is placed on the field in error.

**User Response:** Change the location name to meet the allowable criteria.

### DSNT481I - DSNTINST data set DATA SET SIZE MAY BE TOO SMALL

**Explanation:** The DSNTINST CLIST encountered an arithmetic overflow during calculation of this data set's size.

**System Action:** DSNTINST continues processing and uses 2147483647 for the result of the calculation that caused the overflow. Thus, the size of the data set might be too small.

**User Response:** Check the data set size in installation job DSNTIJIN. If it is too small, increase it.

### DSNT482I - TOO MANY CONCURRENTLY ALLOCATED DATA SETS, opnds

**Explanation:** The number (opnds) calculated for the number of concurrent databases, tables per database, and table spaces per database, is too large. The maximum number of data sets that are allowed is 100,000. However, please note that virtual storage below the 16 MB line may be the limiting factor for releases prior to z/OS Version 1 Release 2. See DSNT436I and DSNT437I for more information.

The number of concurrently allocated data sets is calculated using the formula:
The storage for buffer pools, sort pools, rid pools, EDMPOOL, and code is above the 16MB line. Most of the main storage for data set control blocks is below the 16MB line and is included in the region size. Working storage includes storage above and below the 16MB line, but storage above the line is not included in the region. Refer to Part 2 of the `DB2 Installation Guide` for more information regarding this calculation.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST continues.

---

**DSNT486I** TOTAL MAIN STORAGE = totregion K

Explanation: This is the estimated total region size. It includes storage above the 16MB line. Refer to Part 2 of the `DB2 Installation Guide` for more details regarding this calculation.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST continues.

---

**DSNT487I** TOTAL STORAGE BELOW 16MB = region k (ASSUMING SWA IS ABOVE THE LINE)

Explanation: This message provides an estimate of the virtual storage required below the 16MB line to check for virtual storage constraints. This calculation presumes that you have moved the SWA for DB2 above the 16MB line. Refer to Part 2 of the `DB2 Installation Guide` for details regarding this calculation.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST continues.

---

**DSNT488I** VOLUME voln WILL REQUIRE AT LEAST nn 4K BLOCKS

Explanation: This message states the number of 4KB blocks of space that will be required for the specified volume in order to install or migrate the current release of DB2.

Volume ‘voln’ is specified in the VOLUME SERIAL fields on install panel DSNTIPA2, or with the VOLSDATn input parameters to the Install CLIST. The message indicates how much space will be needed on the selected volume to install or migrate this release of DB2.
This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: Processing continues.

User Response: Ensure that the volume has at least as much available storage as the message indicates it should have. If it does not, rerun the INSTALL CLIST specifying different volumes, or create more available space on the originally specified volume.

In order to convert the number of 4KB blocks required to the number of cylinders required, use the table below. Divide the number of 4KB blocks (in the DSNT488I message) by the number of 4KB blocks per cylinder (in the table) to get the number of cylinders required.

<table>
<thead>
<tr>
<th>Device Type</th>
<th>4KB Blocks per Cylinder</th>
<th>4KB Blocks per Track</th>
</tr>
</thead>
<tbody>
<tr>
<td>3330</td>
<td>57</td>
<td>3</td>
</tr>
<tr>
<td>3340</td>
<td>24</td>
<td>2</td>
</tr>
<tr>
<td>3350</td>
<td>120</td>
<td>4</td>
</tr>
<tr>
<td>3375</td>
<td>96</td>
<td>8</td>
</tr>
<tr>
<td>3380</td>
<td>150</td>
<td>10</td>
</tr>
</tbody>
</table>

These size estimates are for system data only. They do not include: user data, archive logs, image copies, or temporary work data sets other than the temporary database.

Explanation: The CLIST is editing the data set and member dsname(member). The explanation is the type of data being edited and has one of these values:

INSTALL JCL
Jobs that are edited and run as directed during the installation process.

MIGRATE JCL
Jobs that are edited and run as directed only during the migration process.

FALL BACK JCL
A job that is only run as directed when falling back to the previous release.

RECOVERY JCL
A job that is only run as directed during a recovery process. It deletes the DB2 data sets.

SAMPLE JCL
Jobs that are edited and run during installation verification to add the sample application.

SAMPLE DATA
Edited data that installation verification jobs require.

CLIST
Customized CLISTS to reflect your names used during the installation process.

This message is issued by the following installation CLISTS:

DSNTINST  DSNTINS1  DSNTINS2

Severity: 0 (successful execution)

System Action: The CLIST continues.

---

DSNT490I  SAMPLE DATA UNLOAD PROGRAM

Explanation: This is the header, indicating a normal start for the application program.

---

DSNT491I  TOO MANY TABLES ENTERED
(MAXIMUM OF 100 TABLES)

Explanation: The number of tables entered for unloading exceeded the maximum of 100 tables. The first 100 tables in the input should have been processed.

System Action: The application program is terminated.

User Response: Split the run into multiple runs, none with more than 100 tables.

Problem Determination: Check the application program input. Make sure there are no more than 100 tables.

---

DSNT492I  SQL WARNING DURING SQL STATEMENT func, TABLE ttttttt

Explanation: The SQL statement may not be executed correctly. The function 'func' may be PREPARE, OPEN, FETCH, or CLOSE, indicating the type of SQL statement encountering the error. Table 'ttttttt' is the name of the table or view being unloaded.

System Action: The request may not be executed correctly.

Problem Determination: Determine which SQL statement in the application program caused the warning and see if it is reproducible. Follow the diagnosis approach suggested for the warning.

---

DSNT493I  SQL ERROR DURING SQL STATEMENT func, TABLE ttttttt

Explanation: The SQL statement may not be executed correctly. The function 'func' may be PREPARE, OPEN, FETCH, or CLOSE, indicating the type of SQL statement encountering the error. Table ttttttt is the name of the table or view being unloaded.

System Action: The request was not executed correctly.

Problem Determination: Determine which SQL statement in the application program caused the error and see if it is reproducible. Follow the diagnosis approach suggested for the SQL return code.

DSNT494I ERROR DURING OPEN OF DDNAME SYSRECnn

Explanation: The ddname listed, where 'nn' ranges from 00 to 99, could not be successfully opened. A possible reason is that the DD statement to the data set was not present in the JCL.

System Action: The application program is terminated.

User Response: Notify the system programmer.

System Programmer Response: See the Problem Determination section.

Problem Determination: There is an error in the unload program. The return code from DSNTIAR is given in the MVS output of your job. When reporting this problem, have the return code, the application program listing, and JCL available.

DSNT498I ERROR, NO VALID COLUMNS FOUND

Explanation: The PREPARE returned data which did not produce a valid output record. The data was not recognized as valid, so the columns were not unloaded.

System Action: The next table is processed.

User Response: Notify the system programmer.

System Programmer Response: See the Problem Determination section.

Problem Determination: There is an error in the unload program. When reporting this problem, have the application program listing and its JCL available.

DSNT499I ERROR IN INPUT PARAMETER LIST

Explanation: The parameter list specified when DSNTIAUL or DSNTEP2 was invoked contains one or more invalid values.

System Action: The application program is terminated.

User Response: Notify the system programmer.

System Programmer Response: Check the parameter values entered when DSNTIAUL or DSNTEP2 was invoked. For DSNTIAUL, the correct parameter value is ‘SQL’. This parameter indicates that DSNTIAUL input is in complete SQL statements terminated by a semicolon. For DSNTEP2, the correct parameter values are either ‘ALIGN(LHS)’, ‘ALIGN(MID)’, ‘MIXED’, or ‘NOMIXED’. The first two parameter values represent the two output alignment options available in DSNTEP2 where ‘ALIGN(LHS)’ will align the output on the left margin and ‘ALIGN(MID)’ will center the output. The remaining two parameter values designate whether or not DSNTEP2 will recognize mixed character data where ‘MIXED’ means that it will and ‘NOMIXED’ means that it will not recognize mixed character data.

DSNT500I csect-name RESOURCE UNAVAILABLE

Explanation: The requested function requires a resource that is currently unavailable. In conjunction with other messages this message will identify the

Chapter 18, DB2 Messages 465
system action and the action that should be taken by
the installation or operator.
'type' and 'name' identify the resource that is currently unavailable. The type code identifies the type, format, and content of the resource named.

Operator Response: Note the reason code, the type code, and the name. See the Problem Determination section for an explanation of the collected data.

Problem Determination: The reason the resource is unavailable is identified by a reason code. The reason codes that appear in this message are described in Part 4, “Section 4. DB2 Codes,” on page 771. Use Table 3 in Appendix B, “Problem determination,” on page 1349 to find the type of resource identified in the message.

If type is X'D00' or X'D01', the table name can be determined by using the following SQL statement:

```sql
SELECT CREATOR, NAME
FROM SYIBM.SYSTABLES
WHERE DBID = dbid AND OBID = obid;
```

However, if the failing table has been dropped, then the above SELECT fails or possibly might return an incorrect name.

Collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

**DSNT501I**  
```
csect-name RESOURCE UNAVAILABLE:
```

- CORRELATION-ID = id1
- CONNECTION-ID = id2
- LUW-ID = id3
- REASON = reason
- TYPE = type
- NAME = name

Explanation: The requested function requires a resource that is currently unavailable. This message is issued with other messages that identify the system action and the action the installer or operator should take.

DB2 can recover from a resource not available in some cases and can complete successfully. One example is during setup of a performance enhancement during bind time for execution time. If DB2 recovers successfully, then no action is necessary.

For type=905, reason=00C90092, and name=IRLM, message DSNT501I is usually issued once. It is suppressed at the DB2 subsystem level until the IRLM out-of-storage condition is relieved.

id1 The correlation identifier of the thread associated with the requester of the resource.

id2 The connection identifier of the requester.

**id3** The logical-unit-of-work identifier (LUW-ID) of the thread associated with the requester of the resource. An asterisk (*) indicates that the thread does not have a LUW-ID. If the LUW-ID is not an asterisk, the value is a logical-unit-of-work-id assigned to the thread. This is followed by an equal sign (=) and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

type The type of resource that is currently unavailable. The 'type' identifies the type, as well as the format and content, of the resource 'name'. Use Table 3 in Appendix B, “Problem determination,” on page 1349 to find the type of resource identified in the message.

name The name of the resource that is currently unavailable.

reason The reason code that tells why the resource is unavailable.

Operator Response: Note the 'reason' code, the 'type' code, and the 'name'.

Problem Determination: A type X'401' indicates that a cascading revoke of SYSADM or SYSCTRL in a lower-level release attempted to revoke privileges or grants on objects that are available only in a higher-level release. Because the cascading revoke affects objects that are unknown to the lower-level release, you can only revoke SYSADM or SYSCTRL from the higher-lower release.

Collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

**DSNT502I**  
```
ERROR IN DSNTIAUL SQL INPUT:
```

**statement**

Explanation: The DSNTIAUL input SQL statement could not be prepared.

System Action: The application program terminates.

User Response: Notify the system programmer.

System Programmer Response: Check that the DSNTIAUL input statement is a complete SQL statement, ending with a semicolon.

**DSNT503I**  
```
UNLOAD DATA set dname RECORD LENGTH SET TO nnnnn.
```

Explanation: If the dname is SYSRECnn, the record length specified in the JCL for the data set is not large enough to contain an entire row of unloaded data, or the record length was not specified in the JCL.

If the dname is SYSPUNCH, the record length specified in the JCL is not between 80 and 255, or the record length was not specified in the JCL.

System Action: DB2 sets the record length of the
unload data set to the value specified in the message text.

**DSNT504I**  UNLOAD DATA SET ddname BLOCKSIZE SET TO nnnnn.

Explanation: The block size for the SYSRECnn or SYSPUNCH data set was one of the following:
- Not specified in the JCL
- Set to zero in the JCL
- Less than the required record length
- Not an even multiple of the required record length

System Action: DB2 sets the block size of the unload data set to the value specified in the message text.

**DSNT505I**  DSNTIAUL OPTIONS USED: 'nnn'.

Explanation: You specified these options when you invoked DSNTIAUL: 'SQL' is the only valid option.
Severity: 0 (informational)

**DSNT506I**  INPUT STATEMENT WAS NOT SELECT * FROM A SINGLE TABLE. LOAD STATEMENT WILL NEED MODIFICATION.

Explanation: The SELECT statement used to request a table unload contained one of the following:
- A SELECT clause other than "SELECT * FROM"
- A FROM clause that does not contain exactly one table name

The table to be loaded is therefore not the same as the table from which the data is unloaded. DSNTIAUL is unable to determine the table name and all column names for the table to be loaded.

Severity: 4 (warning)

System Action: DSNTIAUL generates a LOAD statement containing the string 'TBLNAME' for the table name. Some column names may be blank.

User Response: Change the LOAD statement table name to the name of a table with the indicated column descriptions.

**DSNT507I**  csect-name RECORD LENGTH NEEDED IS GREATER THAN MAXIMUM ALLOWED FOR TABLE table-name

Explanation: In order to unload table table-name, DB2 needs an output data set with a record length greater than the system maximum of 32760 bytes. This occurs when the table to be unloaded is in a 32KB page table space and contains a combination of long columns and a number of date, time, or timestamp columns.

Severity: 8 (error)

System Action: The application program is terminated.

**DSNT508I**  WARNING - NONSTANDARD JOB CARD (cardstat), NO JOB CARDS WILL BE ADDED TO THE EDITED JOBS

Explanation: The job card you entered in field 3 of panel DSNTIPY contains one or more of the following errors:
- Less than 7 characters ('cardstat' = TOO SHORT)
- "/" missing as the first 2 characters ('cardstat' = MISSING //)
- Missing the word "JOB" ('cardstat' = MISSING "JOB"TOKEN)

This message is issued by the following installation CLIST: DSNTINST

System Action: The message is written to the screen, after all panels are displayed and before any job editing. No JCL is added to the edited jobs.

User Response: You can continue with job editing and manually add JCL to the edited jobs. Alternatively, you can repeat the installation process and make corrections to the job card entered on panel DSNTIPY.

**DSNT509I**  WARNING - MIGRATION INPUT MEMBER LEVEL IS rel_ind. LEVEL prev_rel IS REQUIRED. RETURN TO PANEL DSNTIPA1 TO CHANGE MIGRATION INPUT MEMBER

Explanation: The migration input member you entered on panel DSNTIPA1 contains incorrect release indicator 'rel_ind'. It should contain the indicator for the prior release ('prev_rel'). If your input member does not contain a release indicator, 'rel_ind' will be <null>. This probably indicates that you are using a down-level member.

This message is issued by the following installation CLIST: DSNTINST

System Action: The message is written to the screen, after display of panel DSNTIPA1.

User Response: Press ENTER to proceed to the next panel, and then PF3 to return to panel DSNTIPA1 in order to enter an input member with the correct release indicator.

**DSNT510I**  WARNING - INPUT MEMBER inmem LEVEL IS rel_ind. LEVEL curr_rel IS REQUIRED. RETURN TO PANEL DSNTIPA1 TO CHANGE INPUT MEMBER

Explanation: The input member 'inmem' you entered in field 6 on panel DSNTIPA1 contains incorrect release indicator 'rel_ind'. It should contain the indicator for the
current release (‘curr_rel’). If your input member does not contain a release indicator, ‘rel_ind’ will be <null>. This probably indicates that you are using a down-level member. 

This message is issued by the following installation CLIST: DSNTINST 

**System Action:** The message is written to the screen, after display of panel DSNTIPA1. 

**User Response:** Press ENTER to proceed to the next panel, and then PF3 to return to panel DSNTIPA1 in order to enter an input member with the correct release indicator.

---

**DSNT5111**  
**FIELDS 2 AND 5 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED**  

**Explanation:** This warning message is issued to remind you that the IRLM SUBSYSTEM and IRLM PROC names must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these names within a group. 

This message is issued by the following panel: DSNTIP1  

**User Response:** Enter unique names in these fields for each member of a DB2 data sharing group.

---

**DSNT512I**  
**DSNT512I WARNING: ENTER UNIQUE NAMES FOR LUNAME AND LOCATION NAME**  

**Explanation:** This warning message is issued to remind you that you must enter values for DB2 LOCATION NAME and DB2 NETWORK LUNAME fields. 

LUNAME is used to uniquely identify this DB2 subsystem within the network and to uniquely identify trace records for correlation of accounting records. The NETWORK LUNAME must be unique within the network. The installation process does not check for uniqueness of this name within a data sharing group. 

The LOCATION NAME must be unique within the network, but must be the same on all members within a DB2 data sharing group. 

This message is issued by the following panel: DSNTIPR  

**User Response:** Enter unique names in these fields.

---

**DSNT513I**  
**FIELD 2 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED**  

**Explanation:** This warning message is issued to remind you that the DB2 PROC NAME field on panel DSNTIPX or the RESYNC PORT field on panel DSNTIPS must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these values within a group. 

This message is issued by the following panels: DSNTIPX and DSNTIP5  

**User Response:** Enter unique values in these fields for each member of a DB2 data sharing group.

---

**DSNT514I**  
**FIELDS 2 AND 3 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED**  

**Explanation:** This warning message is issued to remind you that the MEMBER NAME and WORK FILE DB NAME must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these names within a group. 

This message is issued by the following panel: DSNTIPK  

**User Response:** Enter unique names in these fields for each member of a DB2 data sharing group.

---

**DSNT515I**  
**FIELD 7 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED**  

**Explanation:** This warning message is issued to remind you that the MEMBER IDENTIFIER field on panel DSNTIPJ or the DSNZPARM NAME field on panel DSNTIPO must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these values within a group. 

This message is issued by the following panels: DSNTIPJ and DSNTIPO  

**User Response:** Enter unique values in these fields for each member of a DB2 data sharing group.

---

**DSNT516I**  
**FIELDS 1, 2, AND 4 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED**  

**Explanation:** This warning message is issued to remind you that the SUBSYSTEM NAME, COMMAND PREFIX, and SUBSYSTEM SEQUENCE fields must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these values within a group. 

This message is issued by the following panel: DSNTIPM  

**User Response:** Enter unique values in these fields for each member of a DB2 data sharing group.

---

**DSNT517I**  
**CHARACTERS 2-18 MUST BE A-Z, 0-9, #, @, $, OR UNDERSCORE**  

**Explanation:** WLM environment names that do not meet the following criteria are not allowed. A WLM environment name may contain up to eighteen
characters. The first character of a WLM environment name must either be an alphabetic character (A-Z) or a standard alphabetic extender (in the United States, the standard alphabetic extenders are '#', '@', '$'). For characters two through eighteen, a character may be an alphabetic character (A-Z), an alphabetic extender ('#', '@', '$'), a numeric character (0-9), or the underscore character ('_').

This message is issued by panel: DSNTIPX

**System Action:** The panel is redisplayed, and the cursor is placed on the field with the error.

**User Response:** Change the WLM environment name to meet the criteria described above.

---

### DSNT518I

**THE VALUES FOR DRDA PORT AND RESYNC PORT CANNOT BE THE SAME**

**Explanation:** You entered the same value for DRDA PORT and RESYNC PORT. The values for these fields must be different.

This message is issued by the following panel: DSNTIP5

**System Action:** The panel is redisplayed and the cursor is placed on the field in error.

**User Response:** Change either the DRDA PORT or the RESYNC PORT value so that they are different.

---

### DSNT519I

**IF YOU SPECIFY EITHER DRDA OR RESYNC PORT, BOTH MUST BE SPECIFIED**

**Explanation:** You entered a value for either DRDA PORT or RESYNC PORT, but not the other. If either DRDA PORT or RESYNC PORT is specified, both must be specified.

This message is issued by the following panel: DSNTIP5

**System Action:** The panel is redisplayed and the cursor is placed on the field in error.

**User Response:** Either enter a value for the null field, or blank out both DRDA PORT and RESYNC PORT.

---

### DSNT520I

**DB2’s default sizes for index and table spaces are increased in V8**

**Explanation:** This message appears on DB2 installation panel DSNTIP7 when the CLIST is in MIGRATE mode and an entry of 0 appears in either field 4 TABLE SPACE ALLOCATION or field 5 INDEX SPACE ALLOCATION (or both). An entry of 0 indicates that DB2 default allocation sizes are to be assigned for table spaces or index spaces created without the USING clause. The purpose of the message is to alert you that the DB2 default allocation sizes have changed in Version 8.

---

- If you specify 0 for the TABLE SPACE ALLOCATION field, then 1 cylinder will be the default PRIQTY space allocation for non-LOB tablespaces and 10 cylinders will be the default PRIQTY space allocation for LOB tablespaces.
- If you specify 0 for the INDEX SPACE ALLOCATION field, then 1 cylinder will be the default PRIQTY space allocation for indexes.

The DB2 default SECQTY quantity depends on the setting you specify for DSNTIP7 field 7 OPTIMIZE EXTENT SIZING. See the discussion of OPTIMIZE EXTENT SIZING for more information.

**Severity:** 4

**System Action:** Processing continues.

**User Response:** To assign the new DB2 default allocation sizes to table spaces created without the USING clause, specify 0 in field 4 TABLE SPACE ALLOCATION. Otherwise, specify an explicit size.

To assign the new DB2 default allocation size to index spaces created without the USING clause, specify 0 in field 5 INDEX SPACE ALLOCATION. Otherwise, specify an explicit size.

---

### DSNT522I

**csect-name REQUIRED TCP/IP SUPPORT NOT AVAILABLE**

**Explanation:** The DB2 BSDS indicated that TCP/IP access was required, but the required TCP/IP interfaces were not available on this system. The required TCP/IP interfaces are provided by OS/390 Release 3.

**System Action:** DDF startup terminates abnormally.

**System Programmer Response:** Take one of the following actions:

- Install OS/390 Release 3 or later, so that the required TCP/IP interfaces are available.
- Use the change log inventory utility (DSNJU003) to deactivate DB2's TCP/IP support, by specifying PORT=0 and RESPORT=0 on the DDF statement.

---

### DSNT524I

**SQL PROCEDURE DATA MIGRATION HAS COMPLETED SUCCESSFULLY.**

**Explanation:** DB2 program DSNTIGR issued this message after it completed a one-time migration of SQL procedure data. DSNTIGR migrated the SQL procedure data from user-maintained tables SYSIBM.SYSPSM and SYSIBM.SYSPSMTS to the DB2 catalog tables SYSIBM.SYSPSMTS_SRC and SYSIBM.SYSPSMTS_OPTS.
**DSNT525i**

**System Action:** Migration of SQL procedure data to the DB2 catalog is complete. All changes were committed.

**User Response:** None.

**Explanation:** DB2 program DSNTIGR issued this message after it encountered errors during a once-only migration of SQL procedure data. DSNTIGR attempted to migrate the SQL procedure data from user-maintained tables SYSIBM.SYSPSM and SYSIBM.SYSPSMOPTS to the DB2 catalog tables SYSIBM.SYSROUTINES_SRC and SYSIBM.SYSROUTINES_OPTS. The error-code identifies the specific cause of the problem as follows:

- **01** SQL procedure data cannot be migrated to the DB2 catalog because the user-maintained SQL procedure source table, SYSIBM.SYSPSM, does not exist.
- **02** An SQL error occurred when DSNTIGR searched SYSIBM.SYSTABLES for table SYSIBM.SYSPSM. Message DSNT408I provides more information about the SQL error.
- **03** An object named SYSIBM.SYSPSM exists, but it is not a table. This situation can occur if DSNTIGR was run before, and SYSIBM.SYSPSM is now a view of SYSIBM.SYSROUTINES_SRC.
- **07** SQL procedure data cannot be migrated to the DB2 catalog because the user-maintained SQL procedure options table, SYSIBM.SYSPSMOPTS, does not exist.
- **08** An SQL error occurred when DSNTIGR searched SYSIBM.SYSTABLES for table SYSIBM.SYSPSMOPTS. Message DSNT408I provides more information about the SQL error.
- **09** An object named SYSIBM.SYSPSMOPTS exists but it is not a table. This situation can occur if DSNTIGR was run before, and SYSIBM.SYSPSMOPTS is now a view of SYSIBM.SYSROUTINES_OPTS.
- **10** An SQL error occurred when DSNTIGR requested an exclusive lock on table SYSIBM.SYSPSM. Message DSNT408I provides more information about the SQL error.
- **12** An SQL error occurred when DSNTIGR requested an exclusive lock on table SYSIBM.SYSPSMOPTS. Message DSNT408I provides more information about the SQL error.
- **23** Catalog table SYSIBM.SYSROUTINES_OPTS already contains data. DSNTIGR was cancelled because the migration integrity cannot be guaranteed.
- **30** An SQL error occurred when DSNTIGR copied data from table SYSIBM.SYSPSM to table SYSIBM.SYSROUTINES_SRC. Message DSNT408I provides more information about the SQL error.
- **40** An SQL error occurred when DSNTIGR copied data from table SYSIBM.SYSPSMOPTS to table SYSIBM.SYSROUTINES_OPTS. Message DSNT408I provides more information about the SQL error.
- **50** An SQL error occurred when DSNTIGR requested a row count of table SYSIBM.SYSPSM. Message DSNT408I provides more information about the SQL error.
- **52** An SQL error occurred when DSNTIGR requested a row count of table SYSIBM.SYSPSMOPTS. Message DSNT408I provides more information about the SQL error.
- **54** An SQL error occurred when DSNTIGR requested a row count of table SYSIBM.SYSROUTINES_SRC. Message DSNT408I provides more information about the SQL error.
- **56** An SQL error occurred when DSNTIGR requested a row count of table SYSIBM.SYSROUTINES_OPTS. Message DSNT408I provides more information about the SQL error.
- **57** After all rows were copied from the SYSIBM.SYSPSM to SYSIBM.SYSROUTINES_SRC, the row counts of the tables did not match. This indicates that a data integrity error has occurred.
- **59** After all rows were copied from the SYSIBM.SYSPSMOPTS to SYSIBM.SYSROUTINES_OPTS, the row counts of the tables did not match. This indicates that a data integrity error has occurred.
- **60** An SQL error occurred when DSNTIGR tried to drop the database that contains the user-maintained SQL procedures tables, SYSIBM.SYSPSM and SYSIBM.SYSPSMOPTS. Message DSNT408I provides more information about the SQL error.
- **70** An SQL error occurred when DSNTIGR tried to create view SYSIBM.SYSPSM on table SYSIBM.SYSROUTINES_SRC. Message DSNT408I provides more information about the SQL error.
- **72** An SQL error occurred when DSNTIGR tried to

---

470  Messages and Codes
create view SYSIBM.SYSPSMOPTS on table SYSIBM.SYSROUTINES_OPTS. Message DSNT408I provides more information about the SQL error.

**An SQL error occurred during a COMMIT operation. Message DSNT408I provides more information about the SQL error.**

**An SQL error occurred during a ROLLBACK operation. Message DSNT408I provides more information about the SQL error.**

**System Action:** DB2 discontinues the migration of SQL procedure data to the DB2 catalog, and all changes are rolled back.

**User Response:** If an SQL error has occurred, see message DSNT408I to determine the specific error. Refer to [Part 2, “SQL return codes,” on page 11](#) for more information on the SQL error.

If table SYSIBM.SYSPSM or SYSIBM.SYSPSMOPTS has been deleted, recover database DSNDPSM to restore the table.

You can run DSNTIGR successfully only once. For data sharing migration, run DSNTIGR only on the first member of the group to migrate. Do not run DSNTIGR after remigration.

Catalog tables SYSIBM.SYSPRM and SYSIBM.SYSPSMOPTS must be empty before you run DSNTIGR. If you have already added rows to these catalog tables, drop the SQL procedures whose creation added the rows. Run job DSNTIGR to migrate SYSIBM.SYSPSM and SYSIBM.SYSPSMOPTS, then recreate the dropped SQL procedures.

If the error code indicates a data integrity problem, notify the system programmer.

**DSNT526I** WARNING: DSNHDCEP Specifies an undefined (0) value for **ccsid-parm**. NOTIFY the system programmer.

**Explanation:** The DSNHDCEP module that is supplied by DB2 is being used to run the DB2 precompiler. DB2 requires site-dependent settings that are specified in the DSNHDCEP module that was created when DB2 was installed. The DSNHDCEP that was generated during installation module typically is located in the SDSNEXIT library.

**System Action:** DB2 startup is discontinued.

**User Response:** Notify the System Programmer.

**System Programmer Response:** Check the STEPLIB, JOBLIB, or system linklist concatenation used in the DB2 address spaces. To ensure that the proper DSNHDCEP module is used, verify that the library that contains the DSNHDCEP module that is generated during installation precedes the SDSNLOAD library that contains the DSNHDCEP module that was supplied by DB2.

**DSNT528I** USE PROTECTION MUST BE YES WHEN CACHE DYNAMIC SQL IS YES

**Explanation:** You entered NO for USE PROTECTION on panel DSNTIPP and YES for CACHE DYNAMIC SQL on panel DSNTP4. You must enter YES for USE PROTECTION if CACHE DYNAMIC SQL is YES.

**System Action:** The panel is redisplayed, and the cursor is placed on the field that is in error.

**User Response:** If you see this message on panel DSNTIPP, enter a value of YES for USE PROTECTION, or return to panel DSNTP4 and enter NO for CACHE DYNAMIC SQL. If you see this message on panel DSNTP4, enter a value of NO for CACHE DYNAMIC
DSNT530I  program-name COULD NOT RUN BECAUSE IT WAS NOT INVOKED FROM AN APF-AUTHORIZED LIBRARY

Explanation:  program-name could not run for one of the following reasons:

- program-name was not invoked from an APF-authorized library.
- One or more libraries in the STEPLIB or JOBLIB concatenation that invokes program-name are not APF-authorized.

System Action:  The program terminates.

User Response:  Notify the system programmer.

System Programmer Response:  Ensure that program-name is link-edited with option AC(1) and resides in an APF-authorized library. Ensure that all libraries in the STEPLIB and JOBLIB concatenation for the job that invokes program-name are APF authorized. If program-name is an external module for a DB2 stored procedure or user-defined function, ensure that the corresponding SYSIBM.SYSROUTINES entry specifies a WLM-established address space.

DSNT531I  schema.routine-name RECEIVED SQLCODE sqlcode FROM SQL STATEMENT sql-statement

Explanation:  When schema.routine-name executed sql-statement, DB2 returned the SQL warning or error sql-code.

System Action:  schema.routine-name terminates.

User Response:  Notify the system programmer.

System Programmer Response:  Check the messages in the SYSPRINT data set for the stored procedures address space where routine schema.routine-name runs. Message DSNT408I provides specific information about the SQL warning or error. Refer to Section 2. SQL Return Codes for more information on the SQL error.

DSNT532I  schema.routine-name RECEIVED SAF RETURN CODE return-code FROM RACROUTE COMMAND command.

Explanation:  When schema.routine-name executed RACROUTE command command, the OS/390 System Authorization Facility (SAF) returned an unexpected code return-code.

System Action:  schema.routine-name terminates.

User Response:  Notify the system programmer.

System Programmer Response:  Refer to the OS/390 Security Server RACROUTE Macro Reference for more information about the SAF error.

DSNT540I  wlm-environment-name WAS REFRESHED BY user USING AUTHORITY FROM SQL ID sqlid

Explanation:  DB2 stored procedure WLM_REFRESH refreshed WLM environment wlm-environment-name. User ID user issued the request, using authority from SQL ID sqlid.

System Action:  WLM environment wlm-environment-name is refreshed.

User Response:  None

System Programmer Response:  None

DSNT541I  WLM REFRESH REQUEST FAILED. RESOURCE PROFILE subsystem-name.WLM_REFRESH.wlm-environment-name IS UNDEFINED

Explanation:  DB2 stored procedure WLM_REFRESH rejected a request to refresh WLM environment wlm-environment-name because SAF resource profile subsystem-name.WLM_REFRESH.wlm-environment-name does not exist. WLM_REFRESH uses the resource profile to verify whether the requestor is authorized to refresh the WLM environment. The requestor was connected to DB2 subsystem subsystem-name.

System Action:  WLM_REFRESH rejects the refresh request.

User Response:  Notify the system programmer.

System Programmer Response:  Create the SAF resource profile in resource class DSNR, and permit READ access to all primary and secondary authorization IDs that need to refresh the WLM environment.

DSNT542I  SQL ID sqlid IS NOT AUTHORIZED TO REFRESH WLM ENVIRONMENT wlm-environment-name

Explanation:  DB2 stored procedure WLM_REFRESH rejected a request to refresh WLM environment wlm-environment-name because sqlid is not authorized. sqlid is the current SQID of the requestor.

System Action:  WLM_REFRESH rejects the refresh request.

User Response:  Notify the system programmer.

System Programmer Response:  Give sqlid READ access or higher on the appropriate SAF resource profile. That profile resides in SAF resource class DSNR and has the format ssid.WLM_REFRESH.wlm-environment-name.
DSNT543I  WLM REFRESH REQUEST FAILED:  
PARAMETER parameter IS NULL,  
BLANK, OR CONTAINS INVALID  
CHARACTERS

Explanation: The argument passed to  
WLM_REFRESH for parameter cannot be used for one  
of the following reasons:  

- It is null or blank  
- It contains characters that are not allowed for a SAF  
resource profile or for a DB2 subsystem name

System Action: The program terminates.  
User Response: Notify the system programmer.

System Programmer Response:  
- For the WLM_ENV_NAME parameter, specify a  
non-null, non-blank argument. That argument must  
conform to the rules for a SAF resource profile. See  
Appendix A of z/OS Security Server RACF Auditor's  
Guide for more information.
- For the SSID parameter, specify a null or blank  
argument, or a value that conforms to the rules for a  
DB2 subsystem name, as documented in the DB2  
Installation Guide. If you specify a null or blank value,  
DB2 determines the subsystem name.

DSNT550I  'data-set-name' IS UNAVAILABLE FOR  
CLIST OUTPUT BECAUSE reason

Explanation: Data set data-set-name is required for  
output by the DB2 Install CLIST, but cannot be allocated  
for the reason that is indicated by reason. Possible  
reasons are:  

- IT CANNOT BE ALLOCATED OR OPENED FOR OUTPUT  
  An error occurred during an allocate, open, or close  
  operation on data-set-name.
- ERROR PROCESSING REQUESTED DATA SET  
  The request for data-set-name could not be  
  processed.
- MEMBER SPECIFIED, BUT DATASET IS NOT  
  PARTITIONED  
  data-set-name already exists, but is not a partitioned  
  data set as required by the CLIST.
- PROTECTED DATASET  
  Your userid is not authorized to use data-set-name.
- VOLUME NOT ON SYSTEM  
  data-set-name is registered in the system catalog on  
  a DASD or tape volume which is currently unmounted  
  or unavailable.
- UNAVAILABLE DATASET  
  data-set-name is currently allocated by another user.

System Action: The Install panel for specifying  
data-set-name is redisplayed. You cannot proceed to  
the next DB2 Install panel until the problem is resolved.

User Response: Take one of the following actions  
according to reason:  

- For errors allocating, opening, or processing  
data-set-name, specific diagnostic messages are  
displayed by TSO. If you are not seeing these  
messages, enter the command TSO PROFILE  
WTPMSG in the command line of the current DB2  
install panel. Consult the appropriate MVS system  
messages and codes manual for further information  
about these messages.
- If data-set-name is indicated as a non-partitioned  
data set, verify that you have entered the intended  
data set name for CLIST output. If so, rename or  
delete the existing data set.
- Consult your system security administrator to obtain  
access to a protected data set.
- In the event of an unavailable data set, ask the  
current user(s) to release it. Ask your system  
programmer to identify the user(s) if you are unable  
to do so. Otherwise, try later when the data set has  
been freed.

DSNT552I  csect-name CHARACTER CONVERSION  
FROM from-ccsid TO to-ccsid  
failed WITH ERROR CODE error-code

Explanation: A conversion error occurred during the  
conversion of a string to a different coded character set.

from-ccsid identifies the coded character set of the string  
to be converted.

to-ccsid identifies the coded character set to which it  
must be converted.

error-code indicates the type of error as defined as  
follows:  

- 8  Length exception (for example,  
  expansion required for PC MIXED  
  data exceeds the maximum length of  
  the string).
- 12  Invalid code point.
- 16  Form exception (for example, invalid  
  MIXED data).
- 20  Translate procedure error (for  
  example, an error during Unicode/390  
  stage 2 conversions or an exit set the  
  length control field of the string to an  
  invalid value).
- 24  The conversion services have not  
  been setup correctly or the conversion  
  is not supported.

Severity: 8
**System Action:** The operation is not performed.

**User Response:** If the error code is 24 and the conversion request is correct, refer to [DB2 Installation Guide](#) for information on how to add conversion support. The MVS Command D UNI,ALL can be used to see the conversions that have been defined. For all other error codes, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

---

**DSNT601I THE DESCRIPTOR FOR type name DOES NOT EXIST IN DBD01**

**Explanation:** This message is issued for multiple-line WTO. The database, table space, or index space ‘name’ is in the DB2 catalog but a descriptor for the object does not exist in the DBD01 table space of database DSNDB01. This error can be produced when one of the following is true:

- The Version 8 catalog has been migrated into Version 7. There is an object in the Version 7 catalog but there is not a descriptor for the object in the Version 7 directory (DBD01).
- The user did not completely restore the DBD01 table space during a recovery process.
- There is a DB2 logic error.

In the message, ‘type’ is either ‘DATABASE’ or ‘SPACE’ and ‘name’ is the eight character name of the database, table space, or index space.

**System Action:** The process continues normally.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

---

**DSNT602I NO SPACES FOUND**

**Explanation:** This message is issued for multiple-line WTO. It is produced when a DISPLAY DB(name) SPACENAM(...) is entered and no spaces were found to satisfy the request. SPACENAM(...) might have been entered as a range, a subset, or a list of spaces.

---

**DSNT603I spacetype name NOT type**

**Explanation:** This message is issued for multiple-line WTO. It is produced when the table space or index space listed in the DISPLAY DB(...) SPACENAM(...) satisfies your request.

**spacetype**

- TABLESPACE if the space is a table space or
- INDEXSPACE if the space is an index space.

**name**

The name of the space.

**type**

A character string that indicates the type of request specified. The string is a list of the following, delimited by ‘OR’:

- ‘ACTIVE’ if the keyword ACTIVE is specified
- ‘RESTRICTED’ if the keyword RESTRICT is specified.

**System Action:** Message DSNT301I or DSNT302I is produced if no object is found and the keywords ACTIVE and RESTRICT are omitted.

---

**DSNT604I NO INFORMATION AVAILABLE**

**Explanation:** This message is issued for multiple line WTO. It is produced when there is no LOCK or USE information available. When DISPLAY DB(name) SPACENAM(...) is entered, and SPACENAM(...) is a list of spaces, this message indicates that no table spaces or index spaces whose names are listed have LOCK or USE information available. If DISPLAY DB(name) SPACENAM(...) is entered, and SPACENAM(...) is a range or a subset of spaces, no table spaces and index spaces within the specified database have LOCK or USE information available. This message is produced only when the keywords USE and LOCKS are specified.

---

**DSNT605I DATABASE name CANNOT BE STOPPED. IT CONTAINS THE DDL REGISTRATION TABLES**

**Explanation:** The database specified in the message cannot be stopped because it contains the application and object registration tables. Install SYSADM or install SYSOPR authority is needed to stop the database.

**System Action:** The database specified in the message is not stopped.

**User Response:** Reissue the command with the proper authority.

---

**DSNT605I TABLESPACE name CANNOT BE STOPPED. IT CONTAINS A DDL REGISTRATION TABLE**

**Explanation:** The table space specified in the message cannot be stopped because it contains an application or object registration table. Install SYSADM or install SYSOPR authority is needed to stop the table space.

**System Action:** The table space specified in the message is not stopped.

**User Response:** Reissue the command with the proper authority.

---

**DSNT606I INDEXSPACE name CANNOT BE STOPPED. IT IS DEFINED ON A DDL REGISTRATION TABLE**

**Explanation:** The index space specified in the message cannot be stopped because it is defined on an application or object registration table. Install SYSADM or install SYSOPR authority is needed to stop the index space.
**System Action:** The index space specified in the message is not stopped.

**User Response:** Reissue the command with the proper authority.

**DSNT700I**  
**table-name IS THE ACTIVE RESOURCE LIMIT SPECIFICATION TABLE**

**Explanation:** This is a response message to the DISPLAY RLIMIT command. The resource limit facility (governor) is currently active and is using table 'table-name' to determine resource limits.

**System Action:** The system continues normal processing.

**User Response:** See Operator Response.

**Operator Response:** To have the governor active while utilizing a different resource limit specification table, issue the START RLIMIT command specifying the ID of the desired table. If you do not want the facility to be active, issue the STOP RLIMIT command.

**System Programmer Response:** May be used to resolve questions about what table is being used.

---

**DSNT701I**  
**RESOURCE LIMIT FACILITY IS INACTIVE**

**Explanation:** This is a response message to the DISPLAY RLIMIT command. It results whenever the governor is not active.

**System Action:** Normal processing continues.

**User Response:** See Operator Response.

**Operator Response:** If you want to activate the governor, specify the ID of the resource limit specification table to be used and issue the START RLIMIT command.

**System Programmer Response:** If the facility is already active (that is, a DSNT703 message was previously received), verify that the DSNT703 message appeared before the DISPLAY RLIMIT command was entered. If uncertain, reissue the DISPLAY RLIMIT command. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/docs/en/db2) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[135].

---

**DSNT702I**  
**RESOURCE LIMIT FACILITY HAS BEEN STOPPED. WAS USING table-name**

**Explanation:** This message is the normal response for a STOP RLIMIT command. Table 'table-name' was being used to determine resource limits.

**System Action:** The governor is stopped.

**System Programmer Response:** May be used to resolve questions about what table was being used.

---

**DSNT703I**  
**RESOURCE LIMIT FACILITY IS ALREADY INACTIVE. STOP RLIMIT COMMAND IS IGNORED**

**Explanation:** A STOP RLIMIT command was entered but the resource limit facility was already stopped. The command is ignored.

**System Action:** The system continues normal processing.

---

**DSNT704I**  
**table-name HAS BEEN STARTED FOR THE RESOURCE LIMIT FACILITY**

**Explanation:** This message is the normal response for a START RLIMIT command. Table 'table-name' is currently being used to determine resource limits.

**System Action:** The governor has started utilizing the specified table.

**System Programmer Response:** May be used to resolve questions about what table is being used.

---

**DSNT705I**  
**csect-name DATABASE name CANNOT BE STOPPED. IT CONTAINS AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE**

**Explanation:** Database name cannot be stopped because it contains an active resource limit specification table.

**System Action:** The database is not stopped.

**Operator Response:** If the database must be stopped, either stop the resource limit facility (STOP RLIMIT), or switch it to use a resource limit specification table that is not in the database (START RLIMIT, ID=xx). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that is not in the database.

---

**DSNT706I**  
**table-name DOES NOT EXIST. START RLIMIT COMMAND FAILED**

**Explanation:** The START RLIMIT command has been entered but failed because table 'table-name' does not exist.

**System Action:** The START RLIMIT command is ignored.

**User Response:** See Operator Response.

**Operator Response:** Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears correct, contact the system programmer.
System Programmer Response: DB2 was unable to find the specified table in the catalog. Verify that the FULLY QUALIFIED name is the one expected. The table name is built by appending the 1 or 2 character ID specified on the START RLIMIT command to the authorization ID.DSNRLST. The authorization ID is determined from the DSNZPARMs used when starting the subsystem.

If everything appears to be in order, from a TSO terminal with the proper authorization, enter the following SQL statement:

```
SELECT * FROM SYSIBM.SYSTABLES WHERE NAME=DSNRLSTxx AND CREATOR=authorization ID
```

Where

- DSNRLSTxx : Table-name starting with the DSNRLST
- authorization ID : Table-name up to but not including the period.

If an entry is found, save the output and if you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items:
- Console output showing the failing START command
- The output of the SELECT command.

---

**DSNT707I** START RLIMIT COMMAND FAILED. COLUMN column-name IN TABLE table-name IS INCORRECTLY DEFINED. THE COLUMN DEFINITION IS attribute WITH LENGTH length AND NULL ATTRIBUTE null-attribute. THE COLUMN DEFINITION SHOULD BE attribute WITH LENGTH length AND NULL ATTRIBUTE null-attribute.

**Explanation:** The START RLIMIT command has been entered but failed because TABLE 'table-name' does not have the proper column definition for a resource limit specification table. The current column definition is given as well as the proper column definition.

**System Action:** The START RLIMIT command is ignored.

**User Response:** See Operator Response.

**Operator Response:** Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

**System Programmer Response:** TABLE 'table-name' does not have the proper column definition for a resource limit specification table. Compare the current table column definition to the proper column definition given in the message.

---

**DSNT708I** INDEX index-name DOES NOT EXIST. START RLIMIT COMMAND FAILED

**Explanation:** The START RLIMIT command has been entered but failed because INDEX DSNARLxx does not exist for the corresponding resource limit specification table, DSNRLSTxx.

**System Action:** The START RLIMIT command is ignored.

**User Response:** See Operator Response.

**Operator Response:** Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

**System Programmer Response:** The resource limit specification table DSNRLSTxx does not define the required index DSNARLxx. Create the required index and reissue the START RLIMIT command.

---

**DSNT707I** new-table-name NOW ACTIVE. old-table-name WAS OLD RESOURCE LIMIT SPECIFICATION TABLE

**Explanation:** A START RLIMIT command was entered while the facility was already active. The facility remains active and switches from using the old table name to the new one.

**User Response:** Notify the system programmer.

**Operator Response:** Notify the system programmer.

---

**DSNT710I** table-name ALREADY ACTIVE. START LIMIT COMMAND IGNORED

**Explanation:** A START RLIMIT command was entered and the governor is already active utilizing the specified table. The command is ignored.

**System Action:** The governor continues to use table 'table-name'.

**User Response:** See Operator Response.

**Operator Response:** Verify that the ID specified on the START RLIMIT command was the one desired. If not, reenter the command specifying the correct ID. If it is correct, no action is needed since the facility is already active and is using the desired table.

**System Programmer Response:** If you suspect an
error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNT711**

**Explanation:** The START RLIMIT command has been entered but failed because COLUMN 'column-name' in resource limit specification table 'table-name' is not defined. The proper column definition is given in the message.

**System Action:** The START RLIMIT command is ignored.

**User Response:** See Operator Response.

**Operator Response:** Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

**System Programmer Response:** TABLE 'table-name' does not have COLUMN 'column-name' defined. Use ALTER TABLE to define the column as specified in the message.

**Problem Determination:** Collect the console output showing the failing START command.

---

**DSNT713**

**INDEX index-name IS NOT UNIQUE. START RLIMIT COMMAND FAILED**

**Explanation:** The START RLIMIT command has been entered but failed because INDEX 'index-name' in the resource limit specification table is not defined as a UNIQUE index.

**System Action:** The START RLIMIT command is ignored.

**User Response:** See Operator Response.

**Operator Response:** Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

**System Programmer Response:** INDEX 'index-name' in resource limit specification table is not UNIQUE. Redefine it as unique.

**Problem Determination:** Collect the console output showing the failing START command.

---

**DSNT714**

**INDEX index-name IS INCORRECTLY DEFINED. START RLIMIT COMMAND FAILED**

**Explanation:** The START RLIMIT command has been entered but failed because INDEX 'index-name' in resource limit specification table 'table-name' is not properly defined.

**System Action:** The START RLIMIT command is ignored.

**User Response:** Contact the system programmer.

**Operator Response:** Contact the system programmer.

**System Programmer Response:** INDEX 'index-name' in the resource limit specification table does not have the proper definition. Refer to Part 5 (Volume 2) of DB2 Administration Guide for an example to define the resource limit specification table.

**Problem Determination:** Collect the console output showing the failing START command.
**DSNT715E**  
ERROR reason-code READING  
table-name. default WILL BE  
RESOURCE LIMIT FOR  
CORRELATION-ID correlation-id,  
CONNECTION-ID connection-id,  
LUW-ID luw-id =token

**Explanation:** An error occurred while the resource limit specification table 'table-name' was being read. The limit is determined from the default specified in the system parameters. This default can be:

- **NOLIMIT**  
  No limit applies.
- **NORUN**  
  Zero time limit.
- **integer**  
  The limit to be used.

The reason code that defines the read error is included in the message text, as are the 'connection-ID', 'correlation-ID', and the logical-unit-of-work identifier (LUW-ID) of the thread. An LUW-ID of an '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

**System Action:** Processing continues using the system-defined default.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**DSNT717I**  
csect-name TABLE SPACE name  
CANNOT BE STOPPED. IT CONTAINS  
AN ACTIVE RESOURCE LIMIT  
SPECIFICATION TABLE

**Explanation:** Table space name cannot be stopped because it contains an active resource limit specification table.

**System Action:** The table space is not stopped.

**Operator Response:** If the table space must be stopped, either stop the resource limit facility (STOP RLIMIT), or switch it to use a resource limit specification table that is not in the table space (START RLIMIT, ID=xx). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that is not in the table space.

---

**DSNT718I**  
csect-name INDEX SPACE name  
CANNOT BE STOPPED. IT IS DEFINED  
ON AN ACTIVE RESOURCE LIMIT  
SPECIFICATION TABLE

**Explanation:** Index space name cannot be stopped because it contains an index on an active resource limit specification table.

**System Action:** The index space is not stopped.

**Operator Response:** If the index space must be stopped, either stop the resource limit facility (STOP RLIMIT), or switch it to use a different resource limit specification table that does not have an index in the index space (START RLIMIT, ID=xx). In a DB2 data...
sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a different resource limit specification table that does not have an index in the index space.

**DSNT719I**  
**TABLE table-name CANNOT BE READ. START RLIMIT COMMAND FAILED**

**Explanation:** TABLE 'table-name' cannot be accessed. This message may be preceded by related error messages that explain why the table cannot be accessed.

**System Action:** The START RLIMIT command failed.

**User Response:** See Operator Response.

**Operator Response:** TABLE 'table-name' cannot currently be accessed for reading. In the case of a deadlock or timeout, reissue the START RLIMIT command.

**DSNT720I**  
**csect-name INDEX index-name NEEDS TO BE index-type**

**Explanation:** The START RLIMIT command was entered but failed because the named index defined for the resource limit specification table is not defined properly.

**System Action:** The system ignores the START RLIMIT command.

**User Response:** Contact the system programmer.

**Operator Response:** Contact the system programmer.

**System Programmer Response:** The named index defined on the resource limit specification table does not have the proper definition.

**Problem Determination:** Collect the console output showing the failing START command.

**DSNT721I**  
**csect-name DATABASE name CANNOT BE STARTED WITH ACCESS (UT). IT CONTAINS AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE**

**Explanation:** Database name cannot be started with access (UT) because it contains an active resource limit specification table.

**System Action:** The START DATABASE command is ignored.

**Operator Response:** If the database must be started with access (UT), either stop the resource limit facility (STOP RLIMIT), or switch it to use a different resource limit specification table that is not in the database (START RLIMIT,ID=xx). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that is not in the index space.

**DSNT722I**  
**csect-name TABLE SPACE name CANNOT BE STARTED WITH ACCESS (UT). IT CONTAINS AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE**

**Explanation:** Table space name cannot be started with access (UT) because it contains an active resource limit specification table.

**System Action:** The START DATABASE command is ignored.

**Operator Response:** If the table space must be started with access (UT), either stop the resource limit facility (STOP RLIMIT), or switch it to use a resource limit specification table that is not in the table space (START RLIMIT,ID=xx). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that is not in the table space.

**DSNT723I**  
**csect-name INDEX SPACE name CANNOT BE STARTED WITH ACCESS (UT). IT IS DEFINED ON AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE**

**Explanation:** Index space name cannot be started with access (UT) because it contains an index on an active resource limit specification table.

**System Action:** The START DATABASE command is ignored.

**Operator Response:** If the index space must be started with access (UT), either stop the resource limit facility (STOP RLIMIT), or switch it to use a different resource limit specification table that does not have an index in the index space (START RLIMIT,ID=xx). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that does not have an index in the index space.

**DSNT724E**  
**csect-name ERROR reason-code IN READING RESOURCE LIMIT SPECIFICATION TABLE table-name. FOR AUTHORIZATION ID auth-id RUNNING THREAD WITH CORRELATION ID correlation-id, CONNECTION ID connection-id, AND LUWID lwu-id USE OF operation-name IS NOT GOVERNED.**

**Explanation:** An error occurred reading resource limit specification table 'table-name'. 'Auth-id' is assumed to be allowed to perform 'operation-name'.
'Operation-name' is BIND or PARALLEL PROCESSING.

The reason code defining the read error is included in
the message text as well as the connection ID,
correlation ID, and logical unit of work (LUW) ID of
the thread. An LUW-ID "'" indicates that the request
originated at this site. If not an "'", the LUW-ID is
assigned to the allied thread at the requesting site.
Correlation IDs beginning with '0nn', where 'nn' is
a number from 01 to 28, identify system agents.

System Action: If the 'operation-name' is BIND,
processing continues if the 'auth-id' is authorized
to perform the BIND. If the 'operation-name' is PARALLEL
PROCESSING, query parallelism is disabled and
can be used if the value of the CURRENT DEGREE
special register is 'ANY'.

User Response: Notify the system programmer.

System Programmer Response: Investigate the
problem indicated by the reason code and preceding
messages. If you suspect an error in DB2, refer to Part
2 of the DB2 Diagnosis Guide and Reference
for information on identifying and reporting the problem.

Operator Response: Notify the system programmer.

Problem Determination: Collect the following
diagnostic items listed in Appendix B. "Problem
determination," on page 1349.

---

AN ERROR OCCURRED WHILE
GOVERNING BIND OPERATIONS OF
auth-id RUNNING WITH
CORRELATION-ID correlation-id,
CONNECTION-ID connection-id,
LUW-ID luw-id. auth-id IS ALLOWED
TO PERFORM BIND OPERATIONS

Explanation: An internal error occurred while
determining whether or not 'auth-id' is allowed to
perform bind operations. It is assumed that 'auth-id' is
allowed to perform bind operations.

An LUW-ID "'" indicates that the request originated at
this site. If not an "'", the LUW-ID is assigned to the
allied thread at the requesting site. Correlation IDs
beginning with '0nn' where 'nn' is a number from 01 to
28, identify system agents.

This message is issued by the following module:
DSNTCAUT

System Action: Processing occurs assuming the
authorization ID is allowed to perform bind operations.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an
error in DB2, refer to Part 2 of the DB2 Diagnosis Guide
and Reference for information on identifying and
reporting the problem.

Operator Response: Notify the system programmer.

Problem Determination: Collect the following
diagnostic items listed in Appendix B. "Problem
determination," on page 1349.

---

csect-name DATABASE name AND ANY
SPACE IT CONTAINS CANNOT BE
STARTED WITH ACCESS (UT). IT IS
THE ACTIVE COMMUNICATIONS
DATABASE

Explanation: The database specified in the message
cannot be started with access (UT) because it is the
active communications database. In addition, spaces
within the active communications database cannot be
started with access (UT).

System Action: The START DATABASE command is ignored.

Operator Response: If the database or any space
within it must be started with access (UT), you must
stop the distributed data facility (STOP DDF). In a DB2
data sharing environment, you must stop the distributed
data facility on all members of the DB2 data sharing
group.

object name CANNOT BE STARTED. IT
CONTAINS OR IS DEFINED ON THE
DDL REGISTRATION TABLE(S)

Explanation: The object specified in the message
cannot be started because it contains or is defined on the
DDL registration table(s). Install SYSADM or install
SYSOPR authority is needed to start the object.

In the message, 'object' is either:

- DATABASE if the specified database contains the
  application and object registration tables
- TABLESPACE if the specified table space contains
  an application or object registration table
- INDEXSPACE if the specified index space is defined
  on an application or object registration table

System Action: The object specified in the message
is not started.

User Response: Reissue the command with the
proper authority.

---

csect-name ASYNCHRONOUS STOP
DATABASE COMMAND HAS
COMPLETED FOR COMMAND
command_string

Explanation: Asynchronous processing for the STOP
DATABASE command completed for the command
whose syntax is shown in the message.

command_string is the STOP DATABASE command
string for the command that is completed. The string
always uses the abbreviation DB for DATABASE and
SPACE for SPACENAM to save characters.
Only the first 100 characters of the STOP DATABASE command are displayed.

**System Action:** Asynchronous processing for the STOP DATABASE command is complete.

**System Programmer Response:** No action is required.

---

**DSNT800I csect-name** DB2 CANNOT IDENTIFY TO IRLM. IRLM CANNOT CONNECT TO ITS DATA SHARING GROUP. THE LOCK STRUCTURE THAT IRLM ATTEMPTED TO ACCESS WAS strname.

**Explanation:** IRLM failed to connect to the IRLM data sharing group. This message accompanies abend reason code 00E30806.

**System Action:** DB2 terminates abnormally with reason code 00E30806.

**System Programmer Response:** Some possible reasons why IRLM could not connect to its data sharing group are:

- The lock structure is not properly defined in the active MVS CF RM administrative policy. The lock structure name is a concatenation of the DB2 data sharing group name and the string ‘LOCK1’ separated by an underscore (_). For example, if the DB2 data sharing group name is DSNCAT, DSNCAT_LOCK1 is the lock structure name.

  Ensure that the lock structure is properly defined in the active CF RM policy. The name of the lock structure that IRLM attempted to access is given in this message. IRLM issues message DXR138E to indicate that the lock structure definition could not be accessed in the active CF RM policy.

- IRLM could not connect the lock structure. The reason for the connect failure is given in IRLM message DXR135E.

- IRLM could not join its data sharing group. The reason for the join failure is given in IRLM message DXR134E.

- IRLM joined the wrong group. The set of IRLMs that are connected to a given lock structure must all be members of the same group. Ensure that the GROUP parameter is correctly specified in the IRLM startup procedure. If you give an incorrect group name, IRLM connects the lock structure, and then times out waiting for responses from other connectors. IRLM issues message DXR133I for the timeout.

---

**DSNT800I ACTION A (ADD) DOES NOT ALLOW GENERIC DISPLAY (% IN DATA FIELD).**

**Explanation:** You have to specify a specific data item in the DATA field.

This message is issued by the following panel:

DSN8SSH

---

**System Action:** The panel is redisplayed, and the cursor is placed on the field in error.

**User Response:** Enter specific data in the DATA field.

---

**DSNT802I ONLY ACTION D (DISPLAY) IS ALLOWED FOR DEPARTMENT STRUCTURE.**

**Explanation:** You cannot add, update, or erase a department structure. You can only display it.

This message is issued by the following panel:

DSN8SSH

**System Action:** The panel is redisplayed, and the cursor is placed on the field in error.

**User Response:** Change the ACTION field to D, or change the OBJECT field to DE or EM.

---

**DSNT803I csect-name** DB2 CANNOT IDENTIFY TO IRLM. THE REQUESTED FUNCTION LEVEL IS NOT SUPPORTED.

**Explanation:** An attempt was made to identify to an IRLM that does not support the level of function DB2 needs. This message accompanies abend reason code 00E30800.

**System Action:** DB2 terminates abnormally with reason code 00E30800.

**System Programmer Response:** Ensure that the STEPLIB statement in your IRLM startup procedure is referencing the correct IRLM code library and that IRLM is at the appropriate level of maintenance.

---

**DSNT804I csect-name** THERE ARE MODIFY LOCKS OWNED BY THIS DB2 THAT HAVE BEEN RETAINED

**Explanation:** When DB2 disconnected from IRLM during DB2 shutdown, IRLM indicated that there were still outstanding modify locks. These locks were retained by IRLM. The retained locks continue to protect the resources on which they are held from requests from other DB2s in the data sharing group. That is, IRLM rejects any lock request from another DB2 that is incompatible with the retained state of the lock. The locks are retained until the terminating DB2 subsystem is restarted and the resources on which the locks are held are recovered.

**System Action:** DB2 continues with its shutdown processing.

**System Programmer Response:** No response is necessary.
**Explanation:** This message indicates the beginning of a set of messages used to display information as a result of a DISPLAY DATABASE command when the keyword LPL is specified. This message contains the headings of the display. (The message appears in one continuous line across the screen, not as shown above.) This message is always followed by one or more DSNT806I messages containing the column data. Refer to message DSNT806I for a description of the data these headings identify.

**Explanation:** This message contains the display information resulting from a DISPLAY DATABASE command when the keyword LPL is specified. It contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by its column headings message DSNT805I. The message number for this message is not displayed.

The message fields have the following meanings:

- **space** The table space name or index space name.
- **type** TS for a table space, IX for an index space, LS for a LOB table space.
- **part** The partition number. It is blank for a nonpartitioned table space or index space. For nonpartitioned secondary indexes, it is the logical partition number preceded by the character L (for example, L0001). For data-partitioned secondary indexes, the prefix for this value will be the character D (for example, D0001).
- **status** One or more of the following, delimited by commas. The maximum length is 18 characters:

  **ACHKP** The table space is in aux check pending state. ACHKP on a table space indicates that CHECK DATA detected an orphan or missing LOB or an out-of-sync condition between the row in the base table and the LOB in the LOB table space.

  **AUXW** The table space is in aux warning state. AUXW on a LOB table space indicates that one or more LOBs in the LOB table space is invalid. AUXW on a base table space indicates that CHECK DATA detected an orphan or missing LOB or an out-of-sync condition between the row in the base table and the LOB in the LOB table space.

  **CHKP** The table space is in check pending status.

  **COPY** An image copy is required for this object (table space or data set within this table space). STOP is also displayed. If the image copy is required because DB2 encountered a problem during RESTART, STOPPE is displayed instead of STOP.

  **GRECP** The object (a table space, a table space partition, index space, or index space partition) is marked recovery pending because of the failure of a group buffer pool. This status value appears only on spaces. It does not apply to databases. See [DB2 Data Sharing: Planning and Administration](#) for information about resolving this restricted status.

  **LPL** The object has pages or ranges of pages that are unavailable because of logical or physical damage.

  **LSTOP** The logical partition is stopped.

  **RECP** The table space or index space is in recovery pending status. The member must be restarted to restore full access to the data. For logical partitions, the RECP status can appear as RBDP*.

  **RBDP** indicates that the entire index is inaccessible to SQL applications, however only the logical partition needs to be recovered.

  **RO** The database, table space, or index space is started for read activity only.

  **RW** The database, table space, or index space is started for read and write activity.

  **STOP** The database, table space, or index space is stopped.

  **STOPE** DB2 implicitly stopped the table space or index space because of an internal inconsistency. A DSNT5001 or DSNT501I message is issued at time of error detection to indicate the inconsistency.

  **STOPP** A stop is pending or is in process for this database, table space, or index space.

  **UT** The database, table space, or index space is started for utility processing only.

  **UTRO** Although the table space or index
space is started as RW, a utility is in process and only RO access is allowed.

**UTRW**  The table space or index space is started as RW and a utility is in process.

**UTUT**  Although the table space or index space is started as RW, a utility is in process and only UT access is allowed.

**LPL pages**  The pages in the specified space that are unavailable because of logical or physical damage.

---

**DSNT807I**  

csect-name  IRLM PURGE OF RETAINED LOCKS FAILED. RETURN CODE = retcode  SUB-CODE = subcode

**Explanation:**  DB2 issued a PURGE request to IRLM to purge retained locks for this DB2. The PURGE request did not complete successfully. This message shows the return code and subcode from IRLM.

This message is issued by the following CSECT:  DSNTRSTE

**System Action:**  DB2 abends with reason code 00E30808. Restart processing is terminated.

**System Programmer Response:**  Refer to the IRLM codes.

---

**DSNT809E**  

csect-name  FEEDBACK FROM IRLM IDENTIFY INDICATED IRLM DID NOT CONNECT TO THE LOCK STRUCTURE

**Explanation:**  DB2 identified to IRLM, but cannot continue because IRLM did not connect to the lock structure. Global locking is ignored. This message accompanies abend reason code 00E30809.

**System Action:**  DB2 abnormally terminates with reason code 00E30809.

**System Programmer Response:**  This condition happens if you are running DB2 in data sharing mode, but the associated IRLM is running with local scope (SCOPE=LOCAL in the IRLM startup procedure). If you are running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=GLOBAL. Conversely, if you are not running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=GLOBAL.

---

**DSNT810E**  

csect-name  DB2 CANNOT IDENTIFY TO IRLM. AN INVALID LOCK STRUCTURE NAME WAS DETECTED.

**Explanation:**  DB2 could not identify to IRLM because of an invalid lock structure name. This message accompanies abend reason code 00E30810.

**System Action:**  DB2 startup terminates abnormally with reason code 00E30807.

**System Programmer Response:**  This condition happens if you are not running DB2 in data sharing mode, but the associated IRLM is running with global scope (SCOPE=GLOBAL in the IRLM startup procedure). If you are not running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=LOCAL. Conversely, if you are running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=GLOBAL.

---

**DSNT811E**  

csect-name  DB2 CANNOT IDENTIFY TO IRLM. REQUEST VIOLATES ONE DB2 PER IRLM RULE.

**Explanation:**  DB2 could not identify to IRLM because another DBMS is already identified to the IRLM. This message accompanies abend reason code 00E30802.

**System Action:**  DB2 abends with reason code 00E30802.

**System Programmer Response:**  IRLM Version 2.1 enforces a one to one (1:1) mapping between IRLM and DB2. Multiple DBMS subsystems can no longer use the same IRLM. Ensure that:

- Each DB2 subsystem is associated with its own IRLM subsystem.
- The correct IRLM procedure name and subsystem name are specified in the DB2 system parameters.

---

**DSNT812I**  

---MEMBER NAME member-name

**Explanation:**  This message is issued with messages DSNT389I, DSNT394I or DSNT396I for each thread in a data sharing environment. This additional line reports the member name of the DB2 subsystem accessing this object.

If the characters ’(CO)’ follow the member name, then this member is the castout owner for the page set or partition. The castout owner for a page set or partition is the DB2 member responsible for doing all of the castout I/O for that page set or partition.

The message number and subsystem recognition character are not included in this message.

---

**DSNT813I**  

--- status(es) page(s)

**Explanation:**  This message follows message DSNT389I, DSNT392I, DSNT394I, DSNT396I or DSNT806I to display more statuses, or more pages that are in the logical page list (LPL).

LPL pages can be in two formats, single pages (represented by the page number) or a range of pages (represented by the starting page number followed by a
DSNT814I - DSNT818I

dash and the ending page number in the range).
The message number and subsystem recognition character are not included in this message because this message is part of a DISPLAY DATABASE data line.

---

DSNT814I  NON-LOCAL INFORMATION UNAVAILABLE FOR object = name

Explanation: One member of the DB2 data sharing group was unable to obtain information from another member for one of these reasons:
- Overflow of the maximum buffer area sent to the DB2 subsystem running the DISPLAY. This buffer area contains the DISPLAY information.
- Problems occurred while requesting DISPLAY DB information from peer DB2 subsystems.

Terms pertinent to this message:
object  Either DATABASE or SPACE
name    The name of the DATABASE or SPACE

User Response:
- Issue DISPLAY GROUP to see if any DB2 members are down or unresponsive and then reissue the DISPLAY DATABASE command.
- Specify individual database names or space names instead of specifying "*".

---

DSNT815I  csect-name THE REAL-TIME STATISTICS COLLECTION PROCESS IS NOT STOPPED

Explanation: An error prevents DB2 from externalizing the in-memory statistics. The error is generally a persistent error and must be remedied before the process can be enabled. Look for prior messages to identify the nature of the problem.

Severity:  0 (informational)
System Action: The statistics database is implicitly stopped and no further attempt will be made to externalize the in-memory statistics.
Problem Determination: Inspect the console for prior messages, and refer to those messages for problem determination.
User Response: Notify the system programmer.

---

DSNT818I  csect-name INVALID SPACENAME SPECIFIED

Explanation: Incorrect syntax is specified for the table space name while issuing START/STOP/DISPLAY Database Commands.

Severity:  0 (informational)
System Action: DB2 will not process the command.
Chapter 19. DSNU... messages

The severity values shown for the utility messages that follow are returned as the job-step condition code from the job step during which the message is issued. If additional messages having higher severity values are issued during the same job step, the higher value is reflected as the job-step condition code.

Severity values have the following meanings:

<table>
<thead>
<tr>
<th>Code</th>
<th>Severity</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Informational</td>
<td>No error occurred</td>
</tr>
<tr>
<td>4</td>
<td>Warning</td>
<td>A condition was detected; the user might need to take further action</td>
</tr>
<tr>
<td>8</td>
<td>Error</td>
<td>An error was detected and processing could not continue</td>
</tr>
</tbody>
</table>

**DSNU000I**  
csect-name OUTPUT START FOR  
UTILITY, UTILID = uuuuuuu  

**Explanation:** This message marks the start of output for the given utility job. The utility ID used to identify the utility job is ‘uuuuuuu’.

**Severity:** 0 (informational)

**System Action:** Utility processing continues.

**DSNU001I**  
csect-name RELEASE DEPENDENT MODULE module-name WAS NOT FOUND  

**Explanation:** The system could not find the specified module in the indicated library (private library, job library, or link library).

**System Action:** The utility job is abended.

**User Response:** Ensure that the load module library is indicated correctly and that the indicated library contains the requested program. If the indicated library does not contain the requested program, contact the system programmer.

**System Programmer Response:** The last three characters of the module name indicate the DB2 release level of the subsystem identified in the parameters passed to DSNUILB. However, LOAD could not find the release dependent utility module for that release in the indicated library. This is probably a maintenance problem.

**DSNU002I**  
csect-name - COULD NOT LOAD RELEASE DEPENDENT MODULE module-name CODE=code REASON=reason  

**Explanation:** During the load of 'module-name', MVS returned the indicated system completion code and reason.

**System Action:** The utility job is abended.

**User Response:** Refer to the appropriate MVS publication.

**DSNU003I**  
csect-name NOT INVOKED APF AUTHORIZED  

**Explanation:** The DSNUILS stored procedure was not invoked authorized.

**Severity:** 8 (error)

**System Action:** The utility is not run by the stored procedure.

**User Response:** Notify the system programmer.

**System Programmer Response:** Make sure that the DSNUILS entry in SYSIBM.SYSPROCEDURES specifies that the stored procedure runs in a WLM-established address space (WLM_ENV not blank), make sure that the DSNUILS load module is link edited with AC(1), make sure the DSNUILS load module is in an APF authorized library, and make sure all the libraries in STEPLIB, JOBLIB are APF authorized. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](http://www.ibm.com/support/docview.wss?uid=swg21246601) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**DSNU004I**  
csect-name UTILITY utility NOT SUPPORTED  

**Explanation:** Refer to [DB2 Utility Guide and Reference](http://www.ibm.com/support/docview.wss?uid=swg21246601) for a description of utilities supported by the stored procedure.

**Severity:** 8 (error)

**System Action:** The utility is not run by the stored procedure.
User Response: Run the utility as a batch job.

---

**DSNU005I csect-name input record**

Explanation: This message displays the utility statements as they were provided as input to the utility parser. An additional error message follows this message and identifies why the utility statement caused a parser error.

Severity: 8 (error)

System Action: Utility processing is not initiated. No SYSIBM.SYSUTIL record is created.

User Response: Correct the input error, and resubmit the job. Do not restart the job.

---

**DSNU006I csect-name DB2 SYSTEM system-name HAS NOT BEEN STARTED**

Explanation: Utility startup processing has been unable to connect to the indicated DB2 subsystem, because a -START DB2 command has not been issued for that subsystem.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Correct your JCL to specify the correct subsystem-name on the EXEC statement, and resubmit the job. Otherwise, contact the system programmer to determine when the subsystem will be available for processing.

Operator Response: Contact the system programmer to determine if a -START DB2 command should be issued for the indicated subsystem.

System Programmer Response: Have the operator issue a -START DB2 command for the indicated subsystem.

Problem Determination: DB2 must be started in order to execute DB2 utilities.

---

**DSNU007I csect-name DB2 SYSTEM system-name DOES NOT EXIST**

Explanation: Utility startup processing has been unable to connect to the indicated DB2 subsystem, because it does not exist on this system.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Correct your JCL to specify the correct subsystem-name on the EXEC statement, and resubmit the job. Contact your system programmer if you are not sure which DB2 subsystem you should specify.

System Programmer Response: Ensure that the correct DB2 subsystem has been started via the -START DB2 command.

---

**DSNU008I csect-name SPECIFIED USER FAILED VALIDITY CHECK**

Explanation: Utility startup processing has been unable to connect to DB2, because the user failed the connection validity check.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Contact the system programmer for assistance with your installation’s security checking.

System Programmer Response: Locally defined RACF or equivalent security system connection authorization have denied the user access to DB2. Permit DB2 connection authorization if this user should be allowed access.

---

**DSNU009I csect-name SPECIFIED USER NOT AUTHORIZED FOR DB2 UTILITIES**

Explanation: Utility startup processing for the user indicated on the job statement failed, because the user is not authorized to execute DB2 utilities.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Contact your system programmer for assistance with your installation’s security checking.

System Programmer Response: If the USER specified something on the job statement that is incorrect, correct it, and resubmit the job. Use the SQL GRANT command to give the user the desired authority.

---

**DSNU010I csect-name UTILITY EXECUTION COMPLETE, HIGHEST RETURN CODE = rr**

Explanation: The utility completed processing with a return code of ‘rr’. This indicates that no terminating error was detected.

Severity: 0 (informational) or 4 (warning)

System Action: In most cases, the SYSIBM.SYSUTIL record for this job step is deleted from SYSIBM.SYSUTIL. However, if the utility used was REORG and UNLOAD(PAUSE), the SYSIBM.SYSUTIL record remains intact so that REORG can be restarted at the RELOAD phase.

User Response: If the return code (‘rr’) is 0, no response is required.
If the return code ('r') is 4, the utility output should be examined for other messages.

**DSNU012I**  
*csect-name* **UTILITY EXECUTION TERMINATED, HIGHEST RETURN CODE = *r***

**Explanation:** The utility execution was terminated. An error was detected that would not allow processing to continue. The return code has a value of 8.

**Severity:** 8 (error)

**System Action:** Utility processing is terminated.

**User Response:** Use the -DISPLAY utility command to determine the correct qualifier. The job can then be resubmitted.

**DSNU016I**  
*csect-name* **UTILITY BATCH MEMORY EXECUTION ABENDED, REASON=X0*rr* cause**

**Explanation:** The utility batch address space has abended. If X’0rrr’ is four characters in length (that is, X’00C1’), the abend was a system X’rr’ abend. If X’0rrr’ is four characters in length and system abend X’000’ was indicated, a user abend was issued. If X’0rrr’ is eight characters in length, the abend was a system X’04E’ abend, and X’0rr’ is an abend reason code.

If the value of general register 2 is not zero, then cause will contain CAUSE=X’cccccccc’ where X’cccccccc’ is the value of general register 2. This information is for service purposes only.

**System Action:** The utility job is abended. The SYSIBM.SYSUTIL entry for the job is retained in the SYSUTIL table.

**User Response:** Consult the system programmer to obtain information on failure analysis. If the cause of the failure is correctable, the utility job can be restarted. If the error cannot be corrected, the -TERM command should be used to delete the failing job’s utility id from SYSIBM.SYSUTIL.

**System Programmer Response:** If a system abend was encountered (4 characters), refer to the appropriate MVS publication. If an abend reason code was encountered (8 characters), refer to [DB2 Utility Guide and Reference](#) for problem determination.

**DSNU017I**  
*csect-name* **UTILITY DATA BASE SERVICES MEMORY EXECUTION ABENDED, REASON=X0*rr* cause**

**Explanation:** The database services address space has abended. If X’0rrr’ is four hexadecimal digits in length (for example, X’00C1’), the abend was an MVS X’rr’ abend. If X’0rrr’ is eight hexadecimal digits in length, the abend was a DB2 subsystem X’04E’ abend, and X’0rrr’ is an abend reason code.

If the value of general register 2 is not zero, then cause will contain CAUSE=X’cccccccc’ where X’cccccccc’ is the value of general register 2. This information is for service purposes only.

**System Action:** The utility job is abended. The entry for the job is retained in the SYSIBM.SYSUTIL table.

**User Response:** Consult with the system programmer to obtain information about failure analysis. If the cause of the failure is correctable, the utility job can be restarted. If the error cannot be corrected, the -TERM command should be used to delete the failing job’s utility id from SYSIBM.SYSUTIL.
System Programmer Response: If an MVS system abend was encountered (4 hexadecimal digits), refer to the appropriate MVS publication. If an abend reason code was encountered (8 hexadecimal digits), look up the reason code in Section 4, "Part 4. DB2 Codes," on page 771 and if you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

---

**DSNU018I csect-name JOB IS NOT RESTARTABLE DUE TO -START ACCESS FORCE COMMAND**

Explanation: A utility job was submitted to restart a utility job that previously failed. Although the SYSIBM.SYSUTIL entry for the specified qualifier was found, the job is not restartable because of a -START DATABASE ACCESS FORCE command. The -START DATABASE ACCESS FORCE command deleted the utility-in-process state of one or more (but not all) target objects in the job.

System Action: The utility job is abended with reason code X'00E40018'.

User Response: If the specified qualifier is correct, use the -TERM UTILITY command to terminate the utility and resubmit the job as a nonrestartable job. If the -TERM UTILITY command fails, use the -START DATABASE ACCESS FORCE command to force all target objects (table spaces and indexes) in the job. When the last object is forced, the SYSIBM.SYSUTIL record is deleted. If the qualifier is incorrect, correct it and restart the job.

---

**DSNU019I csect-name THIS UTILITY IS NOT ALLOWED AT A DB2 TRACKER SITE**

Explanation: When a DB2 subsystem serves as a tracker site, it cannot run utility csect-name. A DB2 subsystem is also a tracker site if the value of subsystem parameter TRKRSITE is YES. You may run only the following utilities at a tracker site DB2:

- REPORT
- RECOVER without the TORBA, TOLOGPOINT, or TOCOPY options
- DIAGNOSE

Severity: 8 (error)

System Action: The utility terminates.

System Programmer Response: If this DB2 subsystem does not need to serve as a remote site tracker system, remove its tracker site status before re-trying the utility. You may remove the tracker site status by stopping the DB2 subsystem, then restarting it with TRKRSITE = NO.

User Response: Contact the system programmer.

---

**DSNU020I csect-name JOB STEP INCOMPLETE**

Explanation: The REORG utility was invoked with the UNLOAD PAUSE option. This causes the immediate suspension of the job after the unload phase completes. Subsequent utilities that are invoked in the same job step are not run.

Severity: 4 (warning)

System Action: Further utility processing is terminated.

User Response: Resubmit the job with the RESTART(PHASE) parameter after the desired user action has been taken with the unload data set.

Problem Determination: Refer to [DB2 Utility Guide and Reference] for a description of the REORG utility and the UNLOAD PAUSE option.

---

**DSNU024I csect-name PARM FIELD ERROR**

parm-field

Explanation: An error was detected in the PARM field on the EXEC statement. 'parm-field' was the input parameter field.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the indicated parameter on the EXEC DD statement, and resubmit the job.

Problem Determination: Refer to [DB2 Utility Guide and Reference] for parameter requirements.

---

**DSNU025I csect-name INVALID RESTART PARAMETER (restart)**

Explanation: Only the following values may be specified for the restart parameter: NO or null, CURRENT, or PHASE.

Severity: 8 (error)

System Action: The utility is not run by the stored procedure.

User Response: Correct and re-run.

---

**DSNU028I csect-name UNABLE TO CONNECT TO DB2, REASON=X'reason code'**

Explanation: A connection to the DB2 subsystem failed. 'reason-code' is the DB2 reason code that was returned.

Severity: 8 (error)

System Action: The utility job is terminated.

User Response: Check the subsystem ID specified in the EXEC DD statement. If it is correct, the subsystem was not ready for processing. Ask the subsystem
DSNU030I  csect-name UNABLE TO ALLOCATE
dsn, RC=rr, CODE=ccc

Explanation:  The utility was unable to allocate a necessary image copy data set.  dsn is the data set name that the utility attempted to dynamically allocate.  rr is the return code from the MVS dynamic allocation service, and ccc is the reason code associated with the return code.

System Action:  The utility proceeds along one or the following paths:

If the data set was an incremental image copy data set, the utility proceeds as if it and any later incremental image copies did not exist.

If the data set was a full image copy data set, the utility attempts to use the most recent prior full image copy data set.

If the data set is used by the COPYTOCOPY utility, and the utility job step includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, COPYTOCOPY processes the next item in the list.

The allocation failure may create other problems that will cause the utility to fail.  This is indicated by other messages.

User Response:  If the job fails, contact the system programmer.

System Programmer Response:  If the utility fails because of the allocation error (as shown by a subsequent message), correct the error, then resubmit the job.

Problem Determination:  Refer to the appropriate MVS publication for a complete description of the possible return and reason codes from dynamic allocation.

DSNU031I  csect-name UNABLE TO UNALLOCATE
dsn, RC=rr, CODE=ccc

Explanation:  The recover utility was unable to unallocate an image copy data set.  The data set name that the utility attempted to unallocate is dsn.  The return code from the MVS dynamic unallocation service is rr.  The reason code associated with the return code is ccc.

System Action:  The unallocation error is ignored and the utility execution continues.

Problem Determination:  Refer to MVS/ESA Programming: Authorized Assembler Services Guide for a complete description of the possible return and reason codes from dynamic allocation.

DSNU032I  I/O ERROR ON WORKFILE, xxxxxx

Explanation:  An I/O error was encountered on a necessary OS/VS data set.  'xxxxxx' is a message that describes the error and the data set in error.  This message is returned to the DB2 utility by SVC 68 (SYNADAF) from BSAM.  The data set may have been needed for an unload data set, image copy data set, or load or reorganization work file data set.  The utility is stopped at the beginning of the phase that used the OS/VS data set.

System Action:  The utility job is abended.  The utility job step is in the stopped state.

Operator Response:  Except in the case of an unload data set during the RELOAD phase, the job can be restarted if an undamaged output data set is provided.

Problem Determination:  Refer to the appropriate MVS publication for the format of the error message.

DSNU033I  csect-name THE CONTROL STATEMENT DOES NOT IDENTIFY THE OBJECT ON WHICH THE UTILITY OPERATES

Explanation:  In the utility control statement, a keyword or operand was specified before the name of the table space, index, index space, or list on which the utility operates.

Severity:  8 (error)

System Action:  Parsing is discontinued and utility processing is terminated.

User Response:  Specify the object of the utility before any keywords or operands that relate to the object.

Problem Determination:  Refer to DB2 Utility Guide and Reference for correct utility syntax.

DSNU034I  DATA SET TYPE INVALID FOR DDNAME 'ddddddeen'

Explanation:  A required DD statement with DDNAME='ddddddeen' was found to have a data set type which is not valid for this application.

Severity:  8 (error)

System Action:  The utility is terminated with a return code 8.

User Response:  The data set must be capable of storing intermediate data that can be retrieved by DB2.  Check that the data set is not specified as type DUMMY, SYSIN, or SYSPUT.  If you require assistance in specifying a valid data set type, consult the system programmer.

System Programmer Response:  Correct the JCL and resubmit the job.
**DSNU035I**  csect-name UNABLE TO FIND DD CARD FOR DDNAME, 'dddddddd'

**Explanation:** A DD statement with ddname = 'dddddddd' was expected, but not found.

**Severity:** 8 (error)

**System Action:** The utility is terminated with a return code 8.

**User Response:** If the DDNAME is one you submitted, review and correct it. If the DDNAME was not provided by you, but by the system, consult the system programmer.

**System Programmer Response:** Correct the JCL and resubmit the job.

---

**DSNU036I**  csect-name UNABLE TO OPEN DCB FOR DDNAME dddddd

**Explanation:** The DCB associated with DDNAME 'ddddddd' could not be opened.

**System Action:** The utility job is abandoned with a reason code of X'00E40070'. The utility job step is in the stopped state.

**User Response:** If the ddname is one you submitted, review and correct it. If the ddname was not provided by you but by the system, consult the system programmer.

**System Programmer Response:** Correct the job control language and resubmit the job.

---

**DSNU037I**  csect-name - RECFM=U FOR DDNAME dddddd

**Explanation:** A data set to be used by the utility has an undefined record format RECFM=U. All data sets must be fixed or variable, blocked or unblocked.

**System Action:** The utility job is abandoned with a reason code of X'00E40070'. The utility job step is in the stopped state.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Ensure that no data sets involved in the utility job have RECFM=U. Resubmit the job after ending the stopped utility by the TERM UTILITY command, or do a RESTART(PHASE) of the stopped utility.

---

**DSNU038I**  csect-name BLOCK SIZE FOR DCB, DDNAME dddddd, IS TOO SMALL, MUST BE AT LEAST bbbbbb BYTES

**Explanation:** The data set with DDNAME 'ddddddd' has a block size that is too small to accommodate a record that needs to be written.

**System Action:** The utility job is abandoned with a reason code of X'00E40079'. The utility job step is in the stopped state.

---

**DSNU039I**  csect-name - LRECL=0 FOR DDNAME dddddd

**Explanation:** A data set to be used by the DB2 utility has a record length of zero after OPEN. All data sets with a record format of fixed or fixed blocked must have a valid record length greater than zero.

**System Action:** The utility job is abended with reason code X'00E40070'. The utility job step is in the stopped state.

**User Response:** If the DDNAME is for a data set that you submitted, review and correct it. It might be necessary to provide a valid LRECL in the DCB parameter in the JCL. If the DDNAME was not provided by you but by the system, consult the system programmer.

**System Programmer Response:** Notify the user or system programmer.

**Operator Response:** Notify the user or system programmer.

**System Programmer Response:** Correct the data set definition, or add DCB information to the JCL. Do a RESTART(PHASE) of the stopped utility, or resubmit the job after issuing a -TERM UTILITY command for the stopped utility.

---

**DSNU040I**  csect-name ERROR ACCESSING DDNAME ddname, DECB=Xhex string

**Explanation:** An error has occurred during BSAM access of a utility temporary file identified by 'ddname'. The DECB indicating the error is given as a hexadecimal string.

**System Action:** The executing utility issues an X'04E' abend with abend reason code '00E40071' following this message.

**User Response:** Refer to the information given in the Problem Determination section of this message. Correct the problem. Either issue the -TERM command to terminate the utility job and resubmit it, or specify the RESTART parameter and resubmit it.

**Operator Response:** An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this may not be necessary).

**Problem Determination:** The DECB provided contains the ECB in the first four bytes. The first byte of the ECB contains status bits that indicate the cause of the error. Refer to the appropriate MVS publication for the meaning of the status bits.
**DSNU041I**  
*csect-name* INVALID CONCATENATED DATA SET FOR DDNAME *ddddddd*  

**Explanation:** A non-input concatenated data set was detected. Only input data sets can be concatenated.  
**System Action:** The utility job abended with reason code 'X'00E400070'. The utility job step is in the stopped state.  
**Operator Response:** Notify the system programmer.  
**System Programmer Response:** Remove the concatenated data sets from the data set with DDNAME 'ddddddd'. Resubmit the job after ending the stopped utility with the TERM UTILITY command, or restart the utility at the beginning of the stopped phase by using RESTART(PHASE).  

**DSNU042I**  
*csect-name* SORT PHASE STATISTICS.  
NUMBER OF RECORDS=n ELAPSED TIME=hh/mm/ss  

**Explanation:** This message provides statistics on the SORT phase of a utility. The number of records sorted, 'n', and the duration of the SORT phase in hours, minutes, and seconds are provided.  
**Severity:** 0 (informational)  
**System Action:** The system continues to process normally.  

**DSNU044I**  
*csect-name* ERROR FROM SORT COMPONENT RC=n, UTILITY STOPPED  

**Explanation:** A nonzero return code 'n' was returned from an MVS sort. Error messages from sort are printed on the UTPRINT data set.  
**System Action:** The executing utility job is placed in the stopped state.  
**User Response:** Determine the cause of the error. If the error can be corrected, the utility may be restarted from the beginning of the sort phase by using the RESTART(PHASE) option. If the error is such that the utility cannot complete, the -TERM command should be issued to remove the stopped utility from the system. The -TERM utility option should rarely be exercised when the stopped utility is REORG.  
**Operator Response:** An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this may not be necessary).  
**Problem Determination:** This abend is accompanied by abend reason code X'00E40005', and an SVC dump is requested. In most cases, error messages from MVS sort identify the problem and the dump is not needed. If sort is unable to open the UTPRINT data set, only the message and the abend are provided. For example, if the UTPRINT DD statement is omitted, correct the problem with UTPRINT, and resubmit the job.  

**DSNU046I**  
*csect-name* UTILITY STATEMENT IS TOO LONG OR TOO COMPLEX  

**Explanation:** The utility command and associated control statements have caused internal fields to exceed DB2 subsystem limits.  
**Severity:** 8 (error)  
**System Action:** Utility processing is not initiated.  
**User Response:** Reduce the size or complexity of the utility statement where possible. For example, a LOAD into several tables may be broken up into a separate load statement for each table or the size of comparison fields for 'when', 'continue', and 'nullif' operands may be reduced in size.  
**Problem Determination:** Refer to [DB2 Utility Guide and Reference](#) for correct operand definitions.  

**DSNU047I**  
*csect-name* A REQUIRED DD CAR OR TEMPLATE IS MISSING.  
NAME=missing-dd  

**Explanation:** The DB2 utility being executed requires a data set to continue processing. The DDNAME or TEMPLATE name for the missing data set is provided.  
**Severity:** 8 (error)  
**System Action:** Utility processing terminates.  
**Operator Response:** Notify the system programmer.  
**System Programmer Response:** Correct the JCL to indicate the included DD statement or add a TEMPLATE control statement. Refer to [DB2 Utility Guide and Reference](#) for information about required DD statements.  

**DSNU048I**  
*csect-name* INVALID OPERAND FOR KEYWORD *kkkkkkkk*  

**Explanation:** The utility parser has determined that the operand specified for keyword 'kkkkkkkk' is invalid.  
**Severity:** 8 (error)  
**System Action:** Utility processing is not initiated.  
**User Response:** Correct the operand in error, and resubmit the utility job. Refer to [DB2 Utility Guide and Reference](#) for correct operand definitions.  

**DSNU049I**  
*csect-name* - INVALID OPERAND  
**oooollllll FOR KEYWORD *kkkkkkkk*  

**Explanation:** The utility parser has determined that operand 'oooollllll' cannot be specified for keyword 'kkkkkkkk'. This includes a negative value following the keywords MAXRO or DELAY.  
**Severity:** 8 (error)  
**System Action:** Utility processing is not initiated.
**DSNU050I**  csect-name utility-statement

**Explanation:** This message echoes the utility statement that was input from SYSIN.

**Severity:** 0 (informational)

**System Action:** Utility processing continues.

**DSNU050I**  csect-name INSUFFICIENT OPERANDS FOR KEYWORD 'kkkkkk'

**Explanation:** An operand that is required when the keyword 'kkkkkk' is specified was omitted.

**Severity:** 8 (error)

**System Action:** Utility processing is not initiated.

**User Response:** Correct the operand specification, and resubmit the job. Refer to [DB2 Utility Guide and Reference](#) to determine the correct set of operands for 'kkkkkk'.

**DSNU051I**  csect-name KEYWORD 'kkk' INCOMPATIBLE WITH OTHER KEYWORDS OR OPERANDS

**Explanation:** The specified keyword 'kkk' cannot be used with other keywords or operands.

**Severity:** 8 (error)

**System Action:** Processing terminates.

**User Response:** Refer to the [DB2 Utility Guide and Reference](#) for the right syntax for the specified keyword.

**DSNU052I**  csect-name FIELD 'ccccccc' NOT FOUND

**Explanation:** Either the column name specified, 'ccccccc', was not found in the catalog as a valid column name for the table being processed, or a WHEN keyword field name was not found in the field name list.

**Severity:** 8 (error)

**System Action:** Utility processing is not initiated.

**User Response:** Correct the LOAD utility statement, and resubmit the job.

**DSNU053I**  csect-name DATABASE 'database-name' NOT FOUND

**Explanation:** The operand of the DATABASE keyword, 'database-name', did not specify an existing database name.

**Severity:** 8

**System Action:** The error is sufficient to terminate further processing of the utility job step. The utility job step is terminated, and resources are released to their prior state.

**User Response:** Correct the database name and resubmit the utility job step.

**Problem Determination:** The correct database names can be found by querying the SYSIBM.SYSDATABASE catalog table.

**DSNU054I**  csect-name TABLESPACE 'sssssss' NOT FOUND

**Explanation:** The operand of the TABLESPACE keyword, 'sssssss', did not specify an existing table space name.

**Severity:** 8

**System Action:** Utility processing is not initiated.

**User Response:** Correct the table space name and/or database name, and resubmit the job.

**Problem Determination:** Valid table space names can be found in the SYSIBM.SYSTABLESPACE catalog table.

**DSNU055I**  csect-name INDEX 'iiiiii' NOT FOUND

**Explanation:** The index name specified, 'iiiiii', was invalid.

**Severity:** 8 (error)

**System Action:** Utility processing is not initiated.

**User Response:** Correct the index name, and resubmit the job.

**Problem Determination:** Valid index names can be found in the SYSIBM.SYSINDEXES catalog table.

**DSNU056I**  csect-name TABLE 'tttttt' NOT FOUND

**Explanation:** A utility specified a table name 'tttttt', but the table does not exist.

**Severity:** 8 (error)

**System Action:** The error is sufficient to terminate further processing of the utility job step. The utility job step is terminated, and resources are released to their prior state.

**User Response:** Correct the table name and/or database name, and resubmit the utility job step.

**Problem Determination:** The correct table names can be found by querying the SYSIBM.SYSTABLES catalog table.
Problem the utility.

Multilevel was included database

The util-name owning User

DIAGNOSE, on Explanation:

RECOVER, the

Resubmit REPAIR, User

Severity:

Utility processing is not initiated.

User Response: Remove the object from the RECOVERY PENDING STATE by using either LOAD REPLACE, RECOVER, or REPAIR against the object. Resubmit the job.

System Programmer Response: Determine which of the three utilities, LOAD REPLACE, RECOVER, or REPAIR, should be used to remove the object from the RECOVER PENDING STATE.

Problem Determination: The following catalog tables can be examined to determine who has proper authority: SYSIBM.SYSSERAUTH, SYSIBM.SYSDBAUTH, or SYSIBM.SYSSENDAUTH.

Explanation: An attempt has been made to execute a utility against an object that is in RECOVER PENDING STATE.

The named user issued a utility command and was not authorized to do so.

The -TERM UTILITY command can only be issued by:

• The submitter of the utility job.

• Users with SYSOPR, SYSADM, or SYSCTRL authority.

• Users with DBADM, DBCTRL, or DBMAINT authority over every database used by the utility.

Even for users with sufficient database authority, the TERM UTILITY command will fail in these situations:

– The user issued the command before the utility determined what databases it would access.

– The utility job included the DIAGNOSE, REPORT, or SPACETRACE utility. Those utilities must be terminated by the submitter of the job or by a holder of SYSOPR, SYSCTRL, or SYSADM authority.

Any user can issue a -DISPLAY UTILITY command.

The -TERM UTILITY request for utility identifier utilid is rejected.

• Wait to allow the utility to identify the databases it will access; then resubmit the command.

• Obtain the required authorization and resubmit the command.

• Have another user with proper authorization issue the command.

Explanation: User userid attempted to execute utility 'util-name' against object 'dbase-name'. The user was not authorized to execute utilities for database dbase-name, the user's authorization did not include this utility, or the user's authorization did not have a valid seclabel.

Severity: 12 (severe error)

System Action: Utility processing is not initiated.

User Response: Ensure that the correct database was specified. If this operation involves a table with multilevel security with row level granularity, then this user needs to have a valid security label to execute this utility.

System Programmer Response: Determine why the user was denied access. Either the authorization should be corrected, or another authorized user should invoke the utility.

Explanation: An attempt was made to execute utility 'util-name' against object 'qualifier.object-name'. This is not allowed. The named object cannot be processed by the named DB2 utility.

Severity: 8 (error)

System Action: The utility job is terminated.

User Response: Remove the invalid utility control statements and resubmit the job.

Explanation: An attempt has been made to execute a utility against an object that is in REBUILD PENDING
STATE. CHECK, COPY, MODIFY, LOAD, QUIESCE, REORG, and RUNSTAT are not allowed.

Severity: 8 (error)
System Action: Utility processing is not initiated.
User Response: Remove the object from the REBUILD PENDING STATE by using either LOAD REPLACE, RECOVER, or REPAIR against the object. Resubmit the job.
System Programmer Response: Rebuild the index with the REBUILD utility to remove the object from REBUILD PENDING state.

DSNU064I csect-name - TABLE SPACE table-space-name IS NOT A LOB TABLE SPACE
Explanation: The table space specified, table-space-name, is not a LOB table space. The object of the utility must be LOB table space.
Programmer Response: Correct the utility statement.

DSNU068I csect-name - function IS NOT SUPPORTED FOR LOB TABLE SPACES
Explanation: The function specified, function, is not supported for the LOB table space specified. The LOB table space reported by the message may not be explicitly named in the utility statement.
System Action: The utility processing proceeds.

DSNU069I csect-name - AUXILIARY TABLE table-name NOT PERMITTED AS EXCEPTION TABLE
Explanation: A auxiliary table was specified as an exception table.
Programmer Response: Specify an exception table that is not an auxiliary table.

DSNU070I csect-name KEYWORD OR OPERAND \x not ALLOWED FOR \y utility against \z
Explanation: An attempt has been made to specify the REPLACE option when executing the LOAD utility on a DB2 catalog table. It is not permissible to replace existing rows in a DB2 catalog table. Rows can only be added to the existing rows in a DB2 catalog table.
Severity: 8 (error)
System Action: The control statement in error is rejected and processing is halted.
User Response: Correct the control statement in error and resubmit the job.

DSNU071I csect-name KEYWORD \x requires KEYWORD \y
Explanation: When keyword \x is specified, keyword \y must also be specified.
Severity: 8 (error)
System Action: The control statement in error is rejected and processing is halted.
User Response: Correct the control statement in error, and resubmit the job.

---

**DSNU072I**  
csect-name INVALID KEYWORD(S)  
SPECIFIED FOR TABLESPACE LIST  
Explanation: The specified keyword cannot be included in a list of table spaces.  
Severity: 8 (error)  
System Action: Processing terminates.  
User Response: Remove the specified keyword from the list of table spaces.

---

**DSNU073I**  
csect-name - KEYWORD 'wwwwww'  
IGNORED  
Explanation: The keyword, 'wwwwww' is no longer supported.  
Severity: 0 (informational)  
System Action: Utility processing proceeds.  
Problem Determination: Refer to [DB2 Utility Guide and Reference](#) for the current syntax.

---

**DSNU074I**  
csect-name - utility UTILITY NOT SUPPORTED FOR LOB TABLE SPACE:  
table-space-name  
Explanation: The utility statement failed because the table space specified was a LOB space and the utility does not support LOB table spaces.  
System Action: The statement cannot be executed.  
Programmer Response: Correct the utility statement.

---

**DSNU075I**  
csect-name - TABLE (table_name, LOB COLUMN column-name - DEFINITION IS NOT COMPLETE  
Explanation: The definition of the LOB column, column-name in table table_name is not complete.  
Programmer Response: Complete the LOB column definitions. A LOB column definition is not complete until the LOB table space, auxiliary table and index on the auxiliary table have been created for the LOB column.

---

**DSNU076I**  
csect-name - KEYWORD=keyword  
INVALID FOR type TABLE  
SPACE=table_space_name  
Explanation: The keyword, keyword, is invalid when the object of the utility is a type table space.  
Programmer Response: Correct the utility statement.

---

**DSNU077I**  
csect-name - utility IS PROHIBITED  
BECAUSE object IS pending-state  
Explanation: The utility specified is prohibited because the object is in a pending-state.  
Severity: 8 (error)  
System Action: Utility terminates and returns completion code=8.  
Programmer Response:  
- Run the CHECK LOB utility if the object is a LOB table space and the state is CHECK PENDING.  
- Run the REBUILD INDEX utility if the object is an auxiliary index and the state is REBUILD PENDING.  
- Run the CHECK INDEX utility if the object is an auxiliary index and the state is CHECK PENDING.

---

**DSNU078I**  
csect-name INVALID DBCS IDENTIFIER  
iii  
Explanation: The DBCS identifier iii is invalid. Reason codes are:  
101 An odd number of bytes exists between the shift-out and the shift-in  
102 No shift-in was found at the end of the identifier  
103 DBCS blanks X’4040’ are not allowed  
104 There are no characters between the shift-out and the shift-in  
105 Shift-out can not be the first byte of the DBCS character between the shift-out and the shift-in.  
Severity: 8 (error)  
System Action: Processing is terminated.  
User Response: Correct the DBCS identifier and resubmit the job.  
Problem Determination: Refer to Chapter 2 of [DB2 SQL Reference](#) to determine the correct syntax for DBCS identifiers.

---

**DSNU079I**  
csect-name UNBALANCED PARENTHESES IN CONTROL STATEMENT  
Explanation: The utility parser has determined that there are unbalanced parentheses in the input string.  
Severity: 8 (error)  
System Action: Utility processing is not initiated.  
User Response: Determine the location of the missing parenthesis and insert it. The utility job can then be resubmitted.  
Problem Determination: Refer to [DB2 Utility Guide](#)
and Reference to determine the correct syntax for option specification.

**DSNU080I**

`csect-name NO UTILITY STATEMENTS FOUND IN dd-name`

**Explanation:** The data set identified by `dd-name` did not contain any text. The system might have processed the end of file prematurely, or this job requires that the utility statements be skipped.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** If the data set is `SYSIN`, provide at least one utility statement, if none now exists, or verify that this job executes no utility statements. If the data set is the `LISTDEF` (SYSLISTD) or `TEMPLATE` (SYSTEMEMPL) data set, provide the required control statements in that data set or in `SYSIN`.

**DSNU081I**

`csect-name OPERAND 'ooooooo' EXCEEDS KEYWORD 'kkkkkkkk' MAXIMUM LENGTH`

**Explanation:** The utility parser has determined that operand `ooooooo` exceeds the maximum length for keyword `kkkkkkkk`.

**Severity:** 8 (error)

**System Action:** Utility processing is not initiated.

**User Response:** Correct the operand, and resubmit the job.

**Problem Determination:** Refer to [DB2 Utility Guide and Reference](https://www.ibm.com/docs/DB2) to determine the correct operand specification.

**DSNU082I**

`csect-name INVALID KEYWORD kkkkkkk`

**Explanation:** The given keyword was not recognized within the context of this control statement.

**Severity:** 8 (error)

**System Action:** Utility processing is not initiated.

**User Response:** Correct the keyword, and resubmit the job.

**DSNU083I**

`csect-name INVALID HEXADECIMAL OPERAND hhhhhhhh`

**Explanation:** The utility parser has determined that the operand `hhhhhhhh` is invalid as a hexadecimal operand. It contains one of the following errors:

- the operand contains a character that is not hexadecimal
- it has an odd number of characters

**Severity:** 0 (informational)

**System Action:** Processing continues, but the pages within the error range are no longer accessible.
System Programmer Response: Determine the appropriate level of recovery, and invoke the recovery utility. If user-defined data sets are being used and full data set or table space RECOVER is to be used, then, prior to invoking the RECOVER utility, the table space must be stopped, new data set(s) defined, and the table space restarted. If the data set is part of a ROSHARE READ database, determine whether it was a link or DASD failure. It there was a link failure, then fix the link, and issue a -START DATABASE with the ACCESS(Force) parameter. If the error was caused by a DASD failure, then correct the problem from the system on which the database was defined as ROSHARE OWNER.

Problem Determination: Refer to Part 4 (Volume 1) of DB2 Administration Guide for a discussion of database recovery procedures.

There may be an IOS message on the MVS console SYSLOG indicating the type of I/O error that occurred. If an IOS message was issued, follow the Problem Determination directions for the message.

DSNU087I csect-name INVALID OPERAND TYPE FOR KEYWORD  kkkkkk - 0000000
Explanation: The utility parser has determined that the operand '0000000' is too long for the keyword 'kkkkkk'. An example of such an error would be a decimal operand where only a hexadecimal operand is allowed.
Severity: 8 (error)
System Action: Utility processing is not initiated.
User Response: Correct the keyword, and resubmit the job.
Problem Determination: Refer to DB2 Utility Guide and Reference to determine valid operand types for the designated keyword.

DSNU088I csect-name INVALID CHARACTER OPERAND cccccccc
Explanation: The utility parser has determined that the operand 'cccccccc' is invalid as a character operand.
Severity: 8 (error)
System Action: Utility processing is not initiated.
User Response: Correct the keyword, and resubmit the job.
Problem Determination: Refer to DB2 Utility Guide and Reference for correct specification of the character operand.

DSNU089I csect-name OPERAND oooooooo IS TOO LONG
Explanation: The utility parser has determined that the operand 'ooooooo' is too long for the keyword specified.
Severity: 8 (error)
System Action: Utility processing is not initiated.
User Response: Correct the keyword, and resubmit the job.
Problem Determination: Refer to DB2 Utility Guide and Reference for correct operand length specification.

DSNU090I csect-name DD OR TEMPLATE NAME nnn IS INVALID FOR KEYWORD kkk
Explanation: The DDNAME or TEMPLATE nnn was used as an improper input of the specified keyword kkk or from one of the reserved ddnames: SYSIN, SYSPRINT, UTPRINT, SORTWKnn, SORTLIB.
Severity: 8 (error)
System Action: Processing terminates.
User Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

DSNU091I csect-name DDNAME nnn IS A DUPLICATE
Explanation: The DDNAME 'nnn' was used as operand in the input statement more than once.
Severity: 8 (error)
System Action: Processing terminates.
User Response: Change the ddname to a different one.

DSNU092I csect-name NUMBER OF OPERANDS FOR KEYWORD kkk EXCEEDS MAXIMUM
Explanation: The keyword 'kkk' contains more than the maximum number of operands.
Severity: 8 (error)
System Action: Processing terminates.
User Response: Refer to DB2 Utility Guide and Reference for the limit on the number of operands for the specified keyword.

DSNU093I csect - INVALID CHARACTER STRING string IN CONTROL STATEMENT
Explanation: An invalid character string string was found in a utility control statement where a keyword, operand, operator or punctuation was expected.
DSNU094I  csect-name KEYWORD 'wwwww' IS DUPLICATED
Explanation:  The keyword 'wwwww' is not allowed twice.

Severity:  8  (error)
System Action:  Processing terminates.
User Response:  Correct the utility control statement, and resubmit the job.

DSNU095I  csect-name UTILITY uuuuuuuu INCONSISTENT WITH LAST INVOCATION
Explanation:  This message can occur when a utility job step is restarted and a utility statement was modified, added or deleted from SYSIN.

Severity:  8  (error)
System Action:  Utility processing is terminated. The utility job step remains in SYSIBM.SYSUTIL in the stopped state.
User Response:  Restart the utility job with the statements in the same order as they were in when the job was first run. If a statement was modified, change the statement back to the format in the original invocation and restart the job. Utility statements should not be altered for restart.

DSNU096I  csect-name OPERAND oooooooo INCONSISTENT WITH LAST INVOCATION
Explanation:  When the utility job step was restarted, the indicated operand was found to be inconsistent with the restart point.

Severity:  8  (error)
System Action:  The restart of utility processing is not initiated.
User Response:  To restart, restore the operand to its prior definition. If this is not acceptable, terminate the utility job step, take corrective action, and resubmit the job.

Operator Response:  An operator with SYSOPR authority can terminate the utility job step (this may not be necessary). A REORG utility that is beyond the UNLOAD phase should rarely be terminated.

Problem Determination:  Refer to DB2 Utility Guide and Reference for operand definitions. Refer to Part 4 (Volume 1) of DB2 Administration Guide for a more detailed discussion of utility restart constraints.

DSNU097I  csect-name - input WILL BE REQUIRED SYNTAX IN FUTURE RELEASES
Explanation:  The identified 'input' is not required in this release, but it will be part of the required syntax in future releases.

Severity:  4  (warning)
System Action:  Utility processing continues.
Programmer Response:  Refer to DB2 Utility Guide and Reference for the current syntax.

DSNU099I  csect-name - IRLM 'req-type' REQUEST FAILED, IRLM RETURN CODE = X'return-code' IRLM REASON CODE = X'reason-code'
Explanation:  The request to the IRLM to obtain or release a lock failed for the reasons specified in return-code and reason-code. In a non data-sharing environment, the requested lock is the utility serialization lock. In a data sharing environment, the requested lock is the utility serialization lock, the utility identifier lock, or the utility execution lock. The IRLM return and reason codes are documented in Part 5, "IRLM messages and codes," on page 1303. The type of request is indicated by req-type.

Severity:  4  (warning)
System Action:  Utility and command processing terminates.
User Response:  Refer to the IRLM messages and codes section for problem determination and the appropriate action. Restart the utility by specifying the RESTART parameter, or terminate the utility with the -TERM command and then resubmit the job. If this message was received during the -DIS UTIL, -TERM UTIL, or -START DATABASE ACCESS(FORCE) command, then the command can be reissued.

System Programmer Response:  Determine the cause of the IRLM error and take appropriate action.

Problem Determination:  Obtain the system console log output, dump, and SYS1.LOGREC information. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
The indicated utility and to complete any other utility functions in the utility job step.

To terminate the utility with the -TERM UTILITY command, you must be the originator or have SYSOPR or SYSDAM authority.

**Operator Response:** If necessary, and if you have SYSOPR authority, you can issue the -TERM UTILITY command to release the resources claimed by the stopped utility.

---

**DSNU103I**

csect-name - UNABLE TO ACCESS SYSUTIL TABLE AT THIS TIME

**Explanation:** An -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY command was issued at the same time that the DSNDB01.SYSUTILX table space was the object of an active utility job. The utility job might be holding locks that would cause a deadlock condition to occur.

**Severity:** 8 (error)

**System Action:** The command processing is terminated.

**User Response:** Enter the command again. This message is issued in response to each command until the utility action on the DSNDB01.SYSUTILX table space completes.

---

**DSNU104I**

csect-name - DSNDB01.SYSUTILX IN A PENDING STATE PROHIBITS FURTHER PROCESSING

**Explanation:** The -ALTER UTILITY, -TERM UTILITY, or -DISPLAY UTILITY command was issued when the DSNDB01.SYSUTILX table space was in a pending state, which prohibits further processing. The pending state was either copy or recovery pending.

**Severity:** 0 (informational)

**System Action:** Command processing is terminated.

**User Response:** Notify the system programmer so that the pending condition can be resolved.

**System Programmer Response:** Issue a -DISPLAY DATABASE command to determine the state of the DSNDB01.SYSUTILX table space. If the state is copy pending, do a full image copy. If the state is recovery pending, use the RECOVER utility to recover DSNDB01.SYSUTILX. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.
**Explanation:** This message is issued in response to a DISPLAY UTILITY command. If the utility specified SHRLEVEL REFERENCE or CHANGE and DB2 estimated that the switch phase will not start by the deadline specified by the DEADLINE phrase.

This message gives the user an estimate of how much processing the utility completed. The utility-name utility in the utility job step identified by utilid was executing in phase utility-phase at the time the -DISPLAY UTILITY request was made. In a data sharing environment, member-name identifies the DB2 member. In a non-data-sharing environment, member-name is blank.

COUNT n is the number of pages or records processed in a utility phase. COUNT has different meanings for different utilities. For utilities not mentioned below, ignore this field.

- For CHECK INDEX, LOAD, REBUILD INDEX, and REORG: number of records processed (log records for the LOG phase of REORG), or 0 (for the SWITCH or BUILD2 phase of REORG).
- For COPY, MERGECOPY, RECOVER(restore phase), and RUNSTATS: number of pages processed
- For STOSPACE: number of table spaces or indexes processed.

If the utility is processing a list of objects, list-size gives the total number of objects in the list and last-started gives the item number of the last object on which processing was started. These values may not be accurate in the UTILINIT before the list size has been determined.

**Severity:** 0 (informational)

**System Action:** The DISPLAY UTILITY command ignores the invalid member-name and continues to process the next member name specified.

**User Response:** Correct the member name and reissue the command.

---

**Explanation:** This message is issued in response to a DISPLAY UTILITY command. The utility-name utility in the utility job step identified by utilid was in the process of terminating at the time the DISPLAY UTILITY request was issued. The utility is terminating in response to a previous TERM UTILITY request.

In a data sharing environment, member-name identifies the DB2 member. In a non data-sharing environment, member-name is blank.

**Severity:** 0 (informational)

**System Action:** The system is stopping the utility and releasing all resources associated with the utility. After the utility terminates, DB2 can reuse the utility identifier.

**User Response:** Make sure data sharing is active before issuing the DISPLAY UTILITY command with the MEMBER keyword.

---

**Explanation:** This message is issued by the DISPLAY UTILITY command when the MEMBER keyword is specified, but data sharing is not active.

**Severity:** 4

**System Action:** The DISPLAY UTILITY command ignores the MEMBER keyword and its associated parameters, but continues processing.

**User Response:** Make sure data sharing is active before issuing the DISPLAY UTILITY command with the MEMBER keyword.

---

**Explanation:** The -TERM UTILITY or -ALTER UTILITY command cannot terminate or alter the utility job with identifier utilid, because it belongs to member member-name of the DB2 data sharing group.
Active utility jobs can be terminated or altered only from the system on which they were running.

Severity: 8 (error)

System Action: If this message was issued for the -TERM UTILITY command, the command ignores the utilid and continues to process the next utilid, if any. If this message was issued for the -ALTER UTILITY command, the command is rejected, and further processing of the command is ended.

User Response: Make sure the utilid identifies the utility you want to terminate or alter. If it does, issue the command from the DB2 member identified in the message.

---

**DSNU110I**

csect-name UTILID = uuuu INVALID

Explanation: This message is issued in response to an invalid specification of a UTILID on an -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY command. A UTILID is a 1- to 16-byte alphanumeric token that can contain any number of periods.

Severity: 8 (error)

System Action: The -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY command is rejected. Further processing of the command is ended.

User Response: Review the UTILID provided in the message to determine why it does not conform to the syntax rules of a utility identifier token, and reissue the request.

---

**DSNU111I**
csect-name - SUBPHASE= subphase-name COUNT=n

Explanation: This message is issued in response to a -DISPLAY UTILITY command. It immediately follows a prior DSNU105I message if the utility is using subtasks to perform processing in parallel. There will be one of these messages for each subtask.

This message gives the user an estimate of how much processing the utility subtask has completed.

SUBPHASE subphase-name identifies the activity that the subtask was performing at the time the -DISPLAY UTILITY command was issued.

COUNT n is the number of records processed by the utility subtask.

Severity: 0 (informational)

System Action: The system continues processing.

---

**DSNU112I**
csect-name - NO AUTHORIZED UTILITY FOUND FOR UTILID = utilid

Explanation: This message is issued in response to an -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY command. DB2 has no record of the utility job identified by the utility identifier utilid. The utilid might not be correct, or the utility might have already terminated.

Severity: 4 (warning)

System Action: The system rejects the -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY request for the indicated utility job.

User Response: Verify that the utility identifier of the utility job to be altered, displayed, or terminated was correctly entered. To view all currently valid identifiers, issue the -DISPLAY UTILITY (*) or (partial-utility-id*) command.

---

**DSNU114I**
csect-name UTILITY COMMANDS SUBSYSTEM FAILURE, REASON=Xcode

Explanation: This message indicates an abend has occurred in the utility commands subsystem.

System Action: The command abends. In the case of the -TERM command, termination actions taken previously under this command are backed out.

User Response: Prior messages and/or the SVC dump identify the failure. If the condition can be corrected, the command may be reissued.

Problem Determination: In most cases, the failure is not user related. In some cases, prior messages indicate a user error that may be corrected. The problem may be as simple as SYSIBM.SYSUTIL being temporarily locked by another command or a utility job. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

---

**DSNU115I**
csect-name utility-name UTILITY WITH UTILID = utilid CAN ONLY BE TERMINATED BY A MEMBER WITH THE SAME RELEASE = release

Explanation: Command TERM UTILITY cannot terminate the utility job with identifier utilid because it belongs to a member with a release level identified in the message. Some utilities can be terminated only from a member of the DB2 data sharing group with the same release level.

Severity: 0 (informational)

System Action: Command TERM UTILITY is rejected for the indicated utility job.

User Response: Make sure the utilid identifies the utility you want to terminate. If it does, issue command TERM UTILITY from a member with a release level identified in the message in the DB2 data sharing group.
**DSNU160I** csect-name - utility-name UTILITY, UTILID = utilid REQUESTED TO TERMINATE, PHASE = utility-phase WAS ACTIVE

**Explanation:** This message is issued in response to a -TERM UTILITY command. It acknowledges that the request for termination was received and verified. At the time the -TERM UTILITY request was received, utility 'utility-name' was ACTIVE in the utility job step identified by UTILID 'utilid'.

**System Action:** DB2 has accepted the request to terminate the indicated utility job step. The utility terminates at its next cleanup point.

**User Response:** This message is an acknowledgement that the request has been accepted and is in progress.

---

**DSNU161I** csect-name - utility-name UTILITY WITH UTILID = util-id CAN NOT BE TERMINATED AT THE DB2 TRACKER SITE

**Explanation:** DB2 does not permit the termination of certain utilities at a tracker site because terminating these utilities may leave the target objects in an unpredictable state. The next recovery cycle should cause the utilities to resolve. You may not terminate the following utilities at a tracker site:

- COPY
- LOAD
- REORG
- REPAIR

**Severity:** 8 (error)

**System Action:** The utility does not terminate.

**System Programmer Response:** Monitor the status of these utilities after the next tracker site recovery cycle.

**User Response:** Contact the system programmer.

---

**DSNU162I** csect-name - utility-name UTILITY WITH UTILID = util-id IS TERMINATING WITH OBJECTS THAT HAVE BEEN STARTED WITH ACCESS(FORCE) AND THEN DROPPED

**Explanation:** Database objects that are used by the terminating utility were started with the command START DATABASE ACCESS(FORCE) and then dropped.

**Severity:** 4 (warning)

**System Action:** Termination process continues.

**User Response:** If the terminating utility is Online Reorg, TERM UTILITY does not rename and delete residual DB2-managed or user-defined data sets. Those datasets must be deleted manually.

---

**DSNU164I** csect-name cccccccc UTILITY, UTILID = uuuu ALREADY TERMINATING

**Explanation:** This message is in response to a -TERM UTILITY command. It indicates that the utility job step identified by UTILID 'uuuu' has already been requested to terminate and is in the process of doing so now.

**Severity:** 0 (informational)

**System Action:** DB2 is currently in the process of terminating the indicated utility job step. Upon completion, all resources will have been released to their prior state, and all tracking of the indicated UTILID will have been removed. At that point, the UTILID is available for reuse.

**User Response:** This message indicates that either the request was redundant, or someone else is also interested in the termination of the subject utility job step.

---

**DSNU166I** csect-name utility-name UTILITY, UTILID = uid NOT EXECUTING, CLEANUP COMPLETE

**Explanation:** This message is in response to a -TERM UTILITY command. The 'utility-name' utility identified by UTILID 'uid' was found to be stopped at the time of the request to terminate.

**Severity:** 0 (informational)

**System Action:** Cleanup is performed for the indicated stopped utility. All resources held by the utility are freed and all storage of the utility job is deleted. The utility job is no longer restartable.

**System Programmer Response:** Resources held by this utility may have prevented applications, commands, and other utilities from executing. These have been freed, so that the inhibited tasks may now be performed.

---

**DSNU170I** csect-name UTILITY JOB TERMINATED BY TERM COMMAND

**Explanation:** A -TERM UTILITY command was issued for this utility job step.

**Severity:** 8 (error)

**System Action:** The executing utility terminates processing and frees all held resources. All storage of the utility job has been deleted. Therefore, the job is not restartable. Subsequent utilities in the same job step are not executed.

**User Response:** All or portions of the utility job step can be resubmitted as needed.
**DSNU172I  csect-name  UTILITY JOB STOPPED BY STOP DB2 COMMAND**

**Explanation:** A -STOP DB2 command was issued during execution of the utility job step.

**Severity:** 8 (error)

**System Action:** The executing utility stops processing but continues to hold resources. Subsequent utilities in the same job step are not executed. The storage of the utility job is retained. Therefore, the utility job step is restartable.

**User Response:** Following a -START DB2 command, the utility job step may be restarted. Alternatively, the utility may be terminated using the -TERM UTILITY command and resubmitted as a new job. A REORG utility that has passed the UNLOAD phase should rarely be terminated.

**DSNU182I  csect-name utility-name MUST BE THE ONLY UTILITY IN SYSIN**

**Explanation:** The submitted utility control statements contain a utility on the table space DSNDB01.SYSUTILX. This table space is integral to controlling the execution of utilities. Control over previous or subsequent utilities in the job step would be lost if the utility were allowed to execute. Therefore, the identified utility must be the only utility in a job step.

This message is also issued if you recover the SYSUTILX indexes, DSNLUX01 and DSNLUX02, or table space DSNDB01.DBD01 and include other utility control statements in the same job step.

Additionally, this message will be issued if you invoke either the BACKUP SYSTEM or RESTORE SYSTEM utilities and include additional commands.

**Severity:** 8 (error)

**System Action:** Work performed by utilities in the same utility job step prior to the starting utility persist. The utility identified and subsequent utilities are not allowed to execute, and the utility job step is placed in the stopped state.

**User Response:** Terminate the utility execution that received this message using the -TERM UTILITY command. Submit a subsequent job step containing only the identified utility. Execute additional utilities, if any, in a separate job step.

**DSNU181I  csect-name UTILITY IS NOT COMPATIBLE WITH THE utility-name UTILITY UTILID = uid OBJECT = spacename.object-name**

**Explanation:** Certain utilities cannot process the same table or index space at the same time. The message identifies the objects for which the incompatibility occurred.

These objects might be target objects of the utilities, a mapping table, or they might be catalog or directory table spaces that are updated by the utilities. For example, DSNDB06.SYSCOPY is updated by LOAD.

**Severity:** 8 (error)

**System Action:** The starting utility is not initiated, and further utility processing in that utility job step is terminated.

**User Response:** Use -DISPLAY UTILITY with the provided 'uid' to determine when the utility that caused your utility to be rejected is completed. Refer to Part 5 (Volume 2) of [DB2 Administration Guide] for a discussion of which utilities are mutually compatible.

**DSNU183I  csect-name - utility-name UTILITY NOT COMPATIBLE WITH OTHER ACTIVE UTILITIES**

**Explanation:** The utility identified by 'utility-name' is executing against table space DSNDB01.SYSUTILX. This table space is integral to controlling the execution of utilities. Control over other utilities running at the same time would be lost if the utility were allowed to execute. Therefore, the identified utility must be executed alone. There must be no other active DB2 utilities in the system.

**Severity:** 8 (error)

**System Action:** Utility execution is terminated.

**User Response:** Rerun the utility when there are no other utilities executing. Use the -DISPLAY UTILITY command to see what utilities are ACTIVE. Utilities in the STOPPED state are allowed.

**DSNU184I  csect-name - DO NOT RECOVER OBJECT qual.obj-nm UNTIL THE NEXT TRACKER SITE RECOVERY CYCLE**

**Explanation:** If DB2 detects an inconsistency relating to a utility’s status on object 'qual.obj-nm' at the tracker site, DB2 issues this message. This event can occur if the SYSUTIL record for the utility either does not exist,
or reflects incorrect information about the status of the utility.

Severity:  8 (error)

System Action:  The utility issues ABEND04E with return code 00E40009.

User Response:  Contact the system programmer.

System Programmer Response:  Wait for the next recovery cycle to recover the object named in this message. If the object named in this message is a catalog or directory object, you cannot recover this object, or any other objects in the list of catalog and directory objects, or any user data or indexes. Wait until the next recovery cycle to recover the object.

---

**DSNU202I**  
**csect-name** - RECOVER PENDING ON TABLE SPACE  
database.tablespace-name PROHIBITS PROCESSING

Explanation:  An attempt was made to execute a utility against a table space that is in a rebuild pending state.

Severity:  8 (error)

System Action:  Utility processing is not initiated.

User Response:  Remove the table space from the rebuild pending state by using either LOAD REPLACE, REBUILD, or REPAIR against the object. LOAD REPLACE with KEEPDICTIONARY is not allowed on a table space (with compression active) in the rebuild pending state. Resubmit the job.

System Programmer Response:  Determine which of the three utilities, LOAD REPLACE, REBUILD, or REPAIR, should be used to remove the object from the rebuild pending state.

---

**DSNU203I**  
**csect-name** - RECOVER PENDING ON INDEX  
creator.index-name PROHIBITS PROCESSING

Explanation:  An attempt was made to execute a utility against an index that is in a rebuild pending state.

Severity:  8 (error)

System Action:  Utility processing is not initiated.

User Response:  Remove the index from the rebuild pending state by using the REBUILD INDEX utility against the index. Resubmit the job.

---

**DSNU204I**  
**csect-name** - PAGESET REBUILD PENDING ON INDEX  
creator.name PROHIBITS PROCESSING

Explanation:  An attempt was made to execute a utility against a logical partition of an index when the index is in PAGESET REBUILD pending state.

Severity:  8 (error)

System Action:  Utility processing terminates.

User Response:  Remove the index space from PAGESET rebuild pending state by running the REBUILD INDEX utility against the entire index, not just a single logical partition. Resubmit the job.

---

**DSNU205I**  
**csect-name** - LOGICAL ERROR RANGE (LOGICAL PAGE LIST) ON TABLE SPACE  
database.tablespace-name PROHIBITS PROCESSING

Explanation:  The utility cannot continue because it encountered a logical error range (logical page list) on the identified table space or partition.

Severity:  8 (error)
System Action: The utility terminates.

User Response: Use the -START DATABASE command to correct the logical error range (LPL) for the table space. Then resubmit the original failing utility.

---

**DSNU206I** csect-name - LOGICAL ERROR RANGE (LOGICAL PAGE LIST) ON INDEX creator.index-name PROHIBITS PROCESSING

Explanation: The utility cannot continue because it encountered a logical error range (logical page list) on the identified index space or partition.

Severity: 8 (error)

System Action: The utility terminates.

User Response: Issue the -DISPLAY command for the index to identify the logical error range (LPL). There are two ways to restore the index or index partition that has the LPL before resubmitting the original failed utility.

- Issue the START DATABASE command to clear the LPL status, then run the RECOVER or REBUILD INDEX utility.
- Run the RECOVER or REBUILD INDEX utility to restore the entire nonpartitioning index (NPI).

---

**DSNU207I** csect-name - GROUP BUFFER POOL RECOVERY PENDING ON TABLE SPACE database.tablespace-name PROHIBITS PROCESSING

Explanation: You cannot execute a utility on a table space that is in a group buffer pool recovery pending status.

Severity: 8 (error)

System Action: Utility processing does not start.

User Response: Use the -START DATABASE command to remove the table space from the group buffer pool recovery pending status. Then resubmit the job.

---

**DSNU208I** csect-name - GROUP BUFFER POOL RECOVERY PENDING ON INDEX creator.index-name PROHIBITS PROCESSING

Explanation: You cannot execute a utility on an index that is in a group buffer pool recovery pending (GRECP) status.

Severity: 8 (error)

System Action: Utility processing does not start.

User Response: Run the REBUILD INDEX utility on the index to remove the table space from the group buffer pool recovery pending status. Then resubmit the job.

---

**DSNU209I** csect-name - RESTART PENDING ON obj-type database.tablespace-name PROHIBITS PROCESSING

Explanation: An attempt was made to execute a utility against a table space or index space that is in a restart pending state.

Severity: 8 (error)

System Action: Utility processing is not initiated.

System Programmer Response: Use the DISPLAY THREAD TYPE(POSTPONED) to determine the status of the resource. Use the RECOVER POSTPONED command if recover has not already been started. Resubmit the job.

---

**DSNU210I** csect-name - INFORMATIONAL COPY PENDING ON obj-type obj-qual.obj-name PROHIBITS PROCESSING

Explanation: An attempt was made to execute the RECOVER utility with the ERROR RANGE or PAGE options against an index in the informational copy pending state.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Use the REBUILD INDEX utility instead.

---

**DSNU211I** csect-name CHECK PENDING ON obj-type obj-qual.obj-name PROHIBITS PROCESSING

Explanation: The requested utility cannot be run against an index in the check pending state. The index may be out of sync with its table space.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Run either the CHECK INDEX utility or the REBUILD INDEX utility. The CHECK INDEX utility will identify any errors (for example, if the index keys do not match the data in the table space.) If there are no errors, the check pending state will be reset. The REBUILD INDEX utility will rebuild the index from the data in the table space.

---

**DSNU212I** csect-name - REORG PENDING ON TABLE SPACE database.index-name PROHIBITS PROCESSING

Explanation: An attempt was made to execute a utility against a table space that is in a REORG PENDING state.

Severity: 8 (error)

System Action: Utility processing is not initiated.
User Response: Execute REORG with SHRLEVEL NONE against the partitions in REORG PENDING state to rebalance the partitions and remove the REORG PENDING state.

Explain: The processing is prohibited because the table-space is in an AUX CHECK PENDING state.

System Action: Utility terminates and returns completion code=8.

Programmer Response:
Run the CHECK DATA utility with the AUXERROR INVALIDATE option. If there are no AUX CHECK errors, AUX CHECK PENDING will be reset. If AUX CHECK errors are found, AUX CHECK PENDING will be reset and the table space will be set to an AUX WARNING state. This allows the rows with AUX CHECK errors to be corrected. Correct the errors and rerun CHECK DATA. If no more AUX CHECK errors are found, the AUX WARNING state will be reset.

System Response: csect-name - REBUILD PENDING ON INDEX creator.index-name PROHIBITS PROCESSING

Explain: An attempt was made to execute a utility against an index that is in rebuild pending state.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Remove the index from the rebuild pending state by using REBUILD INDEX against the index, then resubmit the job.

System Response: csect-name REFRESH PENDING ON ob-type database.objectname PROHIBITS PROCESSING

Explain: DB2 attempted to execute a utility against a table space or index that has refresh pending status.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: If the object in refresh pending status is a table space, use the RECOVER utility to recover the table space to a prior point in time. You can also reload the table space with LOAD REPLACE. If the object in refresh pending status is an index, use the REBUILD INDEX utility to rebuild the index from the data.

System Response: csect-name COMPRESSION DICTIONARY DOES NOT EXIST FOR TABLE SPACE table-space-name

Explain: The KEPDICITONARY option was specified in the LOAD or REORG TABLESPACE utility statement for a table space that does not have a compression dictionary.

Severity: 4 (warning)

System Action: Processing continues. A dictionary is built for the table space.
The data in the table space was compressed. This message is issued at the end of the RELOAD phase for the LOAD and REORG utility. The statistics that follow apply only to the data that was loaded or reorganized. For example, RESUME(YES) reports statistics only on the additional rows that were loaded, not what was previously in the table space.

The compression statistics follow:

**noncmpbytes**
The total number of uncompressed KB (where KB = 1024 bytes) for the loaded or reorganized data rows (including the row prefix). This number was rounded to the nearest KB.

**cmpbytes**
The total number of compressed KB for the loaded or reorganized data rows (including the row prefix). This number was rounded to the nearest KB.

**percsave**
The percentage of bytes saved from the loaded or reorganized data rows as a result of compression.

The values above reflect only the number of bytes for the data row and the respective row prefix (6 bytes). DB2 page and dictionary page overhead is not included.

**pctrowcomp**
The percentage of the rows that were compressed within the total number of rows that were loaded or reorganized. The stored length and the external length of a row was compared to determine if the row was compressed. If an EDITPROC is involved, its effect on the length of the row is considered in the calculation.

**noncmppages**
The estimated number of DB2 pages required by the uncompressed data rows that were loaded or reorganized. Space required for PCTFREE and FREEPAGE is included. This number was rounded up to the next integer.

**cmppages**
The estimated number of DB2 pages required by the compressed data rows that were loaded or reorganized. Space required for PCTFREE and FREEPAGE is included. Dictionary pages are also included unless a LOAD RESUME(YES) was run. This number was rounded up to the next integer.

**auncmprowlen**
Average uncompressed row length.

**avgcmprowlen**
Average compressed row length.

**pagesave**
An estimate of the percentage of DB2 pages saved by compressing the loaded or reorganized data rows.

**Severity:** 0 ( informational)

**System Action:** Processing continues.

---

**DSNU235I**

**csect-name** THE COMPRESSION DICTIONARY WAS NOT BUILT FOR TABLE SPACE **table-space-name**

**Explanation:** There is insufficient data to build a compression dictionary. For the LOAD utility, the input data set is empty or all of the input records were discarded. For the REORG TABLESPACE utility, the table space is empty. The data was not compressed.

**Severity:** 4 ( warning)

**System Action:** Processing continues.

**User Response:** The input data set must contain data in order to build a compression dictionary while running the LOAD utility. Ensure that the input records are not discarded by the WHEN clause or conversion errors. For the REORG TABLESPACE utility, the table space must be populated with data in order to build a compression dictionary.

---

**DSNU236I**

**csect-name** DICTIONARY FOR TABLE SPACE **table-space-name** HAS BEEN ERASED.

**Explanation:** The compression dictionary of the specified table space was erased.

The COMPRESS attribute of the table space is NO, and there are no active rows in this table space. In this case, the LOAD RESUME NO utility erases the dictionary.

**Severity:** 0 ( informational)

**System Action:** Processing continues.
**DSNU237I**  
**TABLE** table2 **IS NOT IN SAME**  
**TABLESPACE AS TABLE** table1

**Explanation:** All source tables for a single LOAD utility statement must be in the same table space.

**Severity:** 8 (error)

**System Action:** Utility processing terminates.

**User Response:** Remove the INTO TABLE control statement that specifies table2 from the current LOAD request. Create another LOAD utility statement that contains the INTO TABLE control statement for table2 so that all source tables in a single LOAD request are from the same table space. Resubmit the job.

---

**DSNU241I**  
**csect-name** **DICTIONARY WITH n**  
**ENTRIES HAS BEEN SUCCESSFULLY**  
**BUILT FROM m ROWS FOR TABLE**  
**SPACE** table-space-name, **PARTITION** part-num

**Explanation:** A compression dictionary was built for the specified partition of the table space. This message is issued during the RELOAD phase of the LOAD utility and at the end of the UNLOAD phase of the REORG utility.

The variable n is the number of dictionary entries: 512, 1024, 2048, 4096, or 8192. n depends on the number of rows being loaded or reorganized.

m is the number of rows used to build the dictionary.

**Severity:** 0 (informational)

**System Action:** Processing continues.

---

**DSNU242I**  
**csect-name** **KEEPDICTIONARY**  
**REQUESTED BUT COMPRESS ATTRIBUTE NOT DEFINED ON TABLE**  
**SPACE** table-space-name, **PARTITION** part-num

**Explanation:** The KEEPDICTIONARY option was specified in the LOAD or REORG TABLESPACE utility statement. This keyword should only be used with table space partitions that have the COMPRESS YES attribute. Otherwise, it is ignored. The COMPRESS column of SYSSIBM.SYSTABLEPART contains the current compression status.

**Severity:** 4 (warning)

**System Action:** Processing continues. If the dictionary exists, it is erased if LOAD REPLACE or REORG is specified.

---

**DSNU243I**  
**csect-name** **COMPRESSION**  
**DICTIONARY DOES NOT EXIST FOR**  
**TABLE SPACE** table-space-name, **PARTITION** part-num

**Explanation:** The KEEPDICTIONARY option was specified in the LOAD or REORG TABLESPACE utility statement for a table space partition that does not have a compression dictionary.

**Severity:** 4 (warning)

**System Action:** Processing continues. A dictionary is built for the table space partition.

---

**DSNU244I**  
**csect-name** **COMPRESSION REPORT**  
**FOR TABLE SPACE** table-space-name, **PARTITION** part-num

- **noncmpbytes**  
  KB WITHOUT COMPRESSION
- **cmpbytes**  
  KB WITH COMPRESSION
- **percsave**  
  PERCENT OF THE BYTES SAVED FROM COMPRESSED DATA ROWS
- **pctrowcomp**  
  PERCENT OF THE LOADED ROWS WERE COMPRESSED
- **noncmppages**  
  PAGES REQUIRED WITHOUT COMPRESSION
- **cmppages**  
  PAGES REQUIRED WITH COMPRESSION
- **auncmprowlen**  
  BYTES FOR AVERAGE UNCOMPRESSED ROW LENGTH
- **avgcmprowlen**  
  BYTES FOR AVERAGE COMPRESSED ROW LENGTH
- **pagesave**  
  PERCENT OF THE DB2 DATA PAGES SAVED USING COMPRESSED DATA

**Explanation:** The data in the table space partition was compressed. This message is issued at the end of the RELOAD phase for the LOAD and REORG utility. The statistics that follow apply only to the data that was loaded or reorganized. For example, RESUME(YES) reports statistics only on the additional rows that were loaded, not what was previously in the table space.

The compression statistics follow:

- **noncmpbytes**  
The total number of uncompressed KB (where KB = 1024 bytes) for the loaded or reorganized data rows (including the row prefix). This number was rounded to the nearest KB.

- **cmpbytes**  
The total number of compressed KB for the
Severity: loaded or reorganized data rows (including the row prefix). This number was rounded to the nearest KB.

percsave
The percentage of bytes saved from the loaded or reorganized data rows as a result of compression.

The values above reflect only the number of bytes for the data row and the respective row prefix (6 bytes). DB2 page and dictionary page overhead is not included.

pctrowcomp
The percentage of the rows that were compressed within the total number of rows that were loaded or reorganized. The stored length and the external length of a row was compared to determine if the row was compressed. If an EDITPROC is involved, its effect on the length of the row is considered in the calculation.

noncmppages
The estimated number of DB2 pages required by the uncompressed data rows that were loaded or reorganized. Space required for PCTFREE and FREEPAGE is included. This number was rounded up to the next integer.

cmppages
The estimated number of DB2 pages required by the compressed data rows that were loaded or reorganized. Space required for PCTFREE and FREEPAGE is included. Dictionary pages are also included unless a LOAD RESUME(YES) was run. This number was rounded up to the next integer.

auncmprlen
Average uncompressed row length.

avgcmprlen
Average compressed row length.

pagesave
An estimate of the percentage of DB2 pages saved by compressing the loaded or reorganized data rows.

Severity: 0 (informational)
System Action: Processing continues.

---

**DSNU245I**

csect-name THE COMPRESSION DICTIONARY WAS NOT BUILT FOR TABLE SPACE table-space-name, PARTITION part-num

**Explanation:** There is insufficient data to build a compression dictionary. For the LOAD utility, the input data set is empty or all of the input records were discarded. For the REORG TABLESPACE utility, the partition is empty. The data was not compressed.

Severity: 4 (warning)
System Action: Processing continues.

**User Response:** The input data set must contain data in order to build a compression dictionary while running the LOAD utility. Ensure that the input records are not all being discarded by the WHEN clause or conversion errors. For the REORG TABLESPACE, the partition must be populated with data in order to build a compression dictionary.

---

**DSNU246I**
csect-name DICTIONARY FOR TABLE SPACE table-space-name, PARTITION part-num HAS BEEN ERASED.

**Explanation:** The compression dictionary of the specified partition of the table space was erased.

The COMPRESS attribute of the table space partition is NO, and there are no active rows in this partition. In this case, the LOAD RESUME NO utility erases the dictionary.

Severity: 0 (informational)
System Action: Processing continues.

---

**DSNU250I**
csect-name UNLOAD PHASE COMPLETE, ELAPSED TIME = hh/mm/ss

**Explanation:** The UNLOAD phase of the REORG utility completed normally. The time that elapsed between the beginning of the REORG utility and the completion of the UNLOAD phase was hh/mm/ss, hours, minutes, and seconds, respectively.

Severity: 0 (informational)
System Action: Action subsequent to this message depends on the UNLOAD option of the REORG utility statement:

- If the UNLOAD option is CONTINUE, execution of the utility continues into the RELOAD phase.
- If the UNLOAD option is PAUSE, execution of the utility is stopped at the beginning of the RELOAD phase.
- If the UNLOAD option is ONLY or EXTERNAL, the REORG utility is finished. Processing continues to the next utility in the utility job step, or, if there are no more utility statements, the utility job step terminates normally.

**User Response:** The user’s response depends on the UNLOAD option in the REORG utility statement:

- If the UNLOAD option is CONTINUE, no user response is required. The message is informational only.
- If the UNLOAD option is PAUSE, the REORG utility is stopped in the reload phase. To complete the REORG process, the user must explicitly restart the utility job step using the RESTART(PHASE) option.

---

Chapter 19. DB2 messages 509
DSNU251I • DSNU254I

- If the UNLOAD option is ONLY or EXTERNAL, the REORG utility has completed, and the requested output is on the data set identified by the DD statement of the UNLDDN REORG utility statement option.

Operator Response: The operator’s response depends on the UNLOAD option of the REORG statement:
- If the UNLOAD option is CONTINUE, no operator response is required. The execution of the REORG utility is proceeding.
- If the UNLOAD option is PAUSE, further processing is dependent upon restarting the utility job step with the RESTART(PHASE) option. Until that time, resources are held exclusively by the REORG utility job step.
- If the UNLOAD option is ONLY or EXTERNAL, the REORG utility processing is complete. The data set defined by the DD statement nominated by the UNLDDN option is available for installation disposition.

**System Action:** Only valid table or index records are unloaded. Dropped table record counts are not reported.

**User Response:** Record count represents the current cardinality of the table or index that was specified in the error message. Invocation of the RUNSTATS utility and a subsequent rebinding of the involved PLANs should be considered if this value differs greatly from the SYSTABLE.CARD value, so that the SQL optimizer can bring the PLANs up to date.

Operator Response: Count can be indicative of the amount of processing remaining.

---

**DSNU251I**  
**csect-name UNLOAD PHASE STATISTICS. NUMBER OF RECORDS UNLOADED= mmmmmm FOR obj-type qobj-qual.obj-name PART nn**

**Explanation:** This message is issued at the completion of the UNLOAD phase of the REORG utility. It gives the number of records that were unloaded mmmmmm for partition nn of the tablespace, index, or indexspace that was specified. The count can indicate the amount of processing.

**Severity:** 0 (informational)

**System Action:** Only valid table records are unloaded. Dropped table record counts are not reported.

**User Response:** The record count represents the current cardinality of the table or index that was indicated in the error message. Consider invoking the RUNSTATS utility and then rebinding the involved PLANs if this value differs greatly from the SYSTABLE.CARD value so that the SQL optimizer can bring the PLANs up to date.

**Operator Response:** Count can be indicative of the amount of processing that remains.

---

**DSNU252I**  
**csect-name UNLOAD PHASE STATISTICS. NUMBER OF RECORDS UNLOADED= mmmmmm FOR obj-type qobj-qual.obj-name**

**Explanation:** This message is issued at the completion of the UNLOAD phase of the REORG utility. It gives the number of records that were unloaded mmmmmm for the tablespace, index, or indexspace that was indicated in the error message.

**Severity:** 0 (informational)

---

**DSNU253I**  
**csect-name UNLOAD PHASE STATISTICS. NUMBER OF RECORDS actions mmmmmm FOR TABLE table-name**

**Explanation:** This message is issued at the completion of the UNLOAD phase of the REORG utility. If action is “UNLOAD”, it gives the number of records mmmmmm that were unloaded for the specified table name. If action is “DISCARDED”, it gives the number of records mmmmmm that were discarded for the specified table name.

**Severity:** 0 (informational)

**System Action:** Table records were unloaded or discarded.

---

**DSNU254I**  
**csect-name - RECORD COUNTS INCONSISTENT FOR pppppppp PHASE, NUMBER OF RECORDS EXPECTED = nnnnnnn, NUMBER OF RECORDS PROCESSED = aaaaaaaa**

**Explanation:** This message is issued during the pppppppp phase for the REORG utility to report the condition where the number of records, nnnnnnn, passed to the current phase is not equal to the number of records, aaaaaaaa, processed in this phase.

**Severity:** 4 (warning)

**System Action:** Processing continues if UNLOAD PAUSE option was used.

**User Response:** Check if unload data set was altered by user. Determine if the inconsistent record counts between the unload and reload phases is a potential problem. If it is an internal DB2 problem, report to system programmer.

**System Programmer Response:** Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** If the unload data set was manipulated by user during restart process, make sure it was handled properly. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference].
for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

DSNU255I csect-name - KEY COUNT INCONSISTENT FOR pppppppp PHASE, NUMBER OF KEYS EXPECTED = nnnnnnnn, NUMBER OF KEYS PROCESSED = aaaaaaaa.

Explanation: This message is issued during the pppppppp phase for the LOAD or REORG utility to report the condition where the number of keys, nnnnnnnn, passed to the current phase is not equal to the number of keys, aaaaaaaa, processed in this phase. One or more of the affected indexes may be inconsistent.

Severity: 8 (error)

System Action: Processing stops and all indexes are placed in rebuild pending state.

User Response: TERM the utility and re-access the indexes by running REPAIR utility to reset the rebuild-pending states on indexes. Run the CHECK INDEX utility to determine if any of the affected indexes are inconsistent. Inconsistent indexes can be rebuilt by the REBUILD INDEX utility.

System Programmer Response: Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: If the working data set was manipulated by the user during the restart process, make sure it was handled properly. Refer to DB2 Utility Guide and Reference.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

DSNU256I csect-name INVALID PARTITION SPECIFICATION

Explanation: This message is issued by the utility in response to an invalid PART option specification.

The PART option is invalid in the following situations:

- when it is specified for a nonpartitioned table space
- if the indicated PART integer is not pertinent to the partitions existing for the indicated table space
- if a ROWID column is part of the partitioning key
- if LOAD INTO TABLE PART x is performed on a table space where an identity column is part of the partitioning key

The utility job step is terminated.

System Action: The error is sufficient to terminate further processing of the utility job step. The utility job step is terminated, and resources are released to their previous state.

User Response: Determine the correct partition specification for the table space that was the subject of the specified control utility statement, and resubmit the utility job step. Examine the SYSIBM.SYSTABLESPACE in the DB2 catalog for the correct range of partition numbers for the table space. If a ROWID column is part of the partitioning key, the PART option is invalid.

DSNU257I csect-name UNABLE TO RESTART BUILD PHASE

Explanation: Restarting in the BUILD PHASE or the SORTBILD phase of the LOAD utility with the RESUME(YES) option is not permitted.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Recover all indexes within the table space which were left in a rebuild pending state when the LOAD utility failed.

DSNU258I csect-name BUILD PHASE STATISTICS.
NUMBER OF INDEXES = mmm

Explanation: This message is issued at normal completion of the BUILD phase of the LOAD or REORG or REBUILD INDEX utility. The number of indexes that were updated is indicated as 'mmm'.

Severity: 0 (informational)

System Action: The BUILD phase of either the LOAD or REORG or REBUILD INDEX utility is completed. Upon completion of the utility job step, they are available for REFERENCE processing.

DSNU259I csect-name BUILD PHASE COMPLETE,
ELAPSED TIME = hh/mm/ss

Explanation: This message is issued at the normal completion of the BUILD phase of the REORG, LOAD, and REBUILD INDEX utilities. The time that has elapsed between the beginning of the phase and the completion of this phase was 'hh' hours, 'mm' minutes, and 'ss' seconds.

System Action: Processing continues to the next phase of the LOAD or REORG or REBUILD INDEX utility. If this is the last phase, processing continues to the next utility statement in the utility job step, if any.
DSNU260I  csect-name obj-type obj-qual.obj-name IS EMPTY

Explanation: This message is issued as a warning when REBUILD INDEX(ALL) or REORG TABLESPACE are executed on an empty table space.

This message is also issued when COPY detects that the first space map page in the table space or partition is missing. This is an error condition that might be caused by a delete and redefine of the data set outside of DB2, or by a previous DB2 failure that occurred on the data set.

Severity: 4 (warning) or 8 (error)

System Action: For REBUILD INDEX or REORG TABLESPACE, the return code of 4 will allow the next utility function in the job step, if any, to be initiated.

For COPY, the table space, index space, or partition being copied will be placed in recover pending status. The return code of 8 will prohibit further utility processing in the job step.

User Response: Notify the system programmer if the return code is 8. If the return code is 4, no action is required.

System Programmer Response: If the return code is 8, the table space, index space, or partition being copied should be recovered with the RECOVER utility.

---

DSNU269I  csect-name FIELD field-name IS NOT ALLOWED

Explanation: You specified a ROWID GENERATED ALWAYS in the field specification list. Only a ROWID GENERATED BY DEFAULT is allowed to be specified in the field specification list.

Identity columns that were defined as generated always can not be specified in a load field specification list, nor can these columns be implied in load format unload or load with no field specification list.

Severity: 8 (error)

System Action: The LOAD utility is terminated

User Response: Omit the ROWID GENERATED ALWAYS column from the LOAD field specification list and rerun the job.

---

DSNU270I  csect-name - table-name, column-name IN VIOLATION OF INSTALLATION DEFINED FIELD PROCEDURE procedure-name, function-code, return-code, reason-code, message-token

Explanation: An installation-supplied field procedure has returned an error during encoding for LOAD or decoding for REORG. See SQLCODE -681 for more detail.

---

DSNU271I  csect-name - REORG PENDING ON FOR TABLE SPACE database.index-name PART part number PROHIBITS PROCESSING

Explanation: An attempt was made to execute a REORG utility to redistribute data in a partitioned table space. The partition number stated in this message was found to have the REORP state on, but was not specified on the PART n1:n2 parameter of the REORG utility.

If you are running REORG to materialize identity column values, you must reorganize the entire table space.

Severity: 8 (error)

System Action: Utility processing is not initiated.

System Programmer Response: Identify the correct partition range specification for the REORG utility by issuing the DISPLAY command for the table space, and resubmit the utility job step.

---

DSNU272I  csect-name - FIELD PROCEDURE procedure-name COULD NOT BE LOADED

Explanation: An installation supplied field procedure could not be loaded during encoding for LOAD or decoding for REORG. See SQLCODE -682 for more detail.

Severity: 8 (error)

System Action: The utility will terminate with a return code of 8.

User Response: Take the job output to the system programmer.

System Programmer Response: Determine why the field procedure could not be loaded.

---

DSNU273I  csect-name - REORG WITH SHRLEVEL REFERENCE OR CHANGE CANNOT APPLY TO TABLE SPACE name PART n1:n2

Explanation: REORG with SHRLEVEL REFERENCE or CHANGE cannot be used on table space partitions with REORG PENDING restrictive state.
Severity: 8 (error)

System Action: The REORG utility job is terminated.

User Response: Execute REORG with SHRLEVEL NONE against the partitions in REORG PENDING state to rebalance the partitions and remove the REORG PENDING state.

---

**DSNU280I**

```
csect-name - ERROR=X'reason-code'
FROM EDIT ROUTINE procedure-name
FOR table-name
```

Explanation: The edit routine provided by your installation has returned an error during the load of a record into the table indicated. The reason code is set by the edit routine.

Severity: 8 (error)

System Action: The LOAD or REORG utility will receive ABEND04E RC00E40323.

User Response: Correct any errors in the input data. Ensure that the edit routine provided is correct. The utility can be restarted or terminated.

System Programmer Response: Verify that the edit routine is correct.

---

**DSNU281I**

```
csect-name RECORD (n) OF TABLE table-name VIOLATING VALID ROUTINE validproc-name, ERROR CODE=X'reason-code'
```

Explanation: The validation exit routine provided by your installation blocked the load of record 'n' into TABLE 'table-name'. The reason code was set by the exit routine.

Severity: 4 (warning)

System Action: The LOAD utility continues to process the following input record.

User Response: Check the error input records against the error reason code returned from the validation procedure. Refer to [DB2 Utility Guide and Reference](#) for a definition of LOAD input field column specifications.

System Programmer Response: Verify that the validation routine is correct.

---

**DSNU282I**

```
csect-name UNABLE TO RESTART AT LAST CHECKPOINT WITH DDNAME 'dddddddd'
```

Explanation: The data set with DDNAME 'dddddddd' is a concatenated data set and the utility can be restarted only at the beginning of the phase (RESTART PHASE), not at the last checkpoint (RESTART CURRENT).

Severity: 8

System Action: The utility will issue a system '04E'

---

**DSNU283I**

```
csect-name TRIGGER ERROR:
SQLCODE = sqlcode, SQLERRM = sqlerrm, SQLSTATE = sqlstate,
SQLRPP = sqlrpp, SQLERRD = sqlerrd1 sqlerrd2 sqlerrd3 sqlerrd4
           sqlerrd5 sqlerrd6
```

Explanation: This message contains multiple components. SQLCODE is the SQL return code. If the SQL return code is negative, this indicates that an error has occurred. For more information about this SQL return code, see Part 2, “SQL return codes,” on page 11. SQLRPP is the name of the procedure that detected an error. The SQL diagnostic information can be found in the SQLERRD1, SQLERRD2, SQLERRD3, SQLERRD4, SQLERRD5, and SQLERRD6 fields.

Severity: 8 (Error)

System Action: Processing terminates.

User Response: Determine the cause for the SQL error by using information about the specific SQLCODE. Correct the error, and rerun the utility.

---

**DSNU284I**

```
csect-name - LOAD UTILITY NOT ALLOWED AGAINST A SYSTEM-MAINTAINED MATERIALIZED QUERY TABLE table-name
```

Explanation: An attempt has been made to run the LOAD utility against a system-maintained materialized query table. This is not allowed.

Severity: 8

System Action: Utility processing terminates.

User Response: If the table name was incorrect, correct the table name and resubmit the utility job step. Otherwise, take one of the following actions:

- Use the REFRESH TABLE SQL statement to insert data into the system-maintained materialized query table.
- Use the ALTER statement to change the materialized query table to a user-maintained materialized query table or a base table, and resubmit the utility job step.

---

**DSNU286I**

```
csect-name REORG TABLESPACE dbname.tname OFFPOSLIMIT SYSINDEXPART ROWS
```

Explanation: This is the header message for the SYSINDEXPART section of the REORG TABLESPACE
OFFPOSLIMIT output. This section lists the SYSINDEXPART rows for the table space or table space partition as specified in the REORG TABLESPACE input statement. The fields from SYSINDEXPART are:

**CREATOR**
- Index creator name

**IXNAME**
- Index name

**CREATOR**
- Table creator name

**TBNAME**
- Table name

**PART**
- Partition number

**CARDF**
- Number of rows referenced (floating point)

**FAROFFPOSF**
- Number of rows referenced afar (floating point)

**NEAROFFPOSF**
- Number of rows referenced nearby (floating point)

**STATSTIME**
- TIMESTAMP of RUNSTATS update

Rows which meet the OFFPOSLIMIT criteria are prefaced with "*".

**Severity:** 0 (informational)

**System Action:** Processing continues normally

**User Response:** If the TIMESTAMP reported in the STATSTIME column is not recent, the OFFPOSLIMIT criteria might be evaluated with obsolete statistics.

---

NEARINDREF
- Number of rows relocated nearby

**STATSTIME**
- TIMESTAMP of RUNSTATS update

Rows which meet the INDREFLIMIT criteria are prefaced with "*".

**Severity:** 0 (informational)

**System Action:** Processing continues normally

**User Response:** If the TIMESTAMP reported in the STATSTIME column is not recent, the INDREFLIMIT criteria might be evaluated with obsolete statistics.

---

DSNU289I csect-name REORG INDEX dbname.ixname LEAFDISTLIMIT SYSINDEXPART ROWS

**Explanation:** This is the header message for the SYSINDEXPART section of the REORG INDEX LEAFDISTLIMIT output. This section lists the SYSINDEXPART rows for the index or index partition as specified in the REORG INDEX input statement. The fields from SYSINDEXPART are:

**CREATOR**
- Index creator name

**IXNAME**
- Index name

**PART**
- Partition number

**LEAFDIST**
- Number of pages between leaf pages multiplied by 100

**STATSTIME**
- TIMESTAMP of RUNSTATS update

Rows which meet the LEAFDISTLIMIT criteria are prefaced with "*".

**Severity:** 0 (informational)

**System Action:** Processing continues normally

**User Response:** If the TIMESTAMP reported in the STATSTIME column is not recent, the LEAFDISTLIMIT criteria might be evaluated with obsolete statistics.

---

DSNU289I csect-name type REORG LIMITS HAVE BEEN MET

**Explanation:** The REORG utility is indicating whether any specified limits have been met. For REORG TABLESPACE, this might be the OFFPOSLIMIT or the INDREFLIMIT. For REORG INDEX, this is the LEAFDISTLIMIT. type values:

- **NO**  - If no limits are met.
- **blank**  - If at least one limit is met.

**Severity:** The return codes are:
1 (informational)
   If no limit is met.

2 (informational)
   If at least one limit is met.

System Action:  Utility processing continues.
User Response:  If the REPORTONLY option is specified and the result of this job step is not used to conditionally execute other job steps, examine the utility messages for this table space, partition, or index to determine if a REORG should be performed.

DSNU290I  csect-name type REORG WILL BE PERFORMED

Explanation:  The REORG utility is indicating whether any specified limits have been met and whether a REORG will be performed. For REORG TABLESPACE, this might be the OFFPOSLSLIT or the INDREFLIMIT. For REORG INDEX, this is the LEAFDISSLIMIT. type values:

NO       If no limits are met.
blank    If at least one limit is met.
Severity:  0 (informational)
System Action:  Utility processing continues. A REORG is performed if any limits are met.

DSNU291I  MAXIMUM COMPOSITE UNLOAD RECORD SIZE TOO LARGE FOR SORT. SORTDATA KEYWORD IS IGNORED.

Explanation:  The SORTDATA keyword was specified for a REORG utility job. However, the largest possible record in the table space, prefixed by the largest key, produces a composite record that is too large to be processed by the SORT component. The SORTDATA keyword is ignored.

This message is issued by the following CSECT: DSNURFIT

Severity:  0
System Action:  Processing continues normally.
User Response:  If you must use SORTDATA for the table space, try reducing the size of either the largest record or key field by redefining the table. In some cases, changing a field from LONG VARCHAR to VARCHAR with a specified maximum length might help.

Problem Determination:  This problem should only occur on a table space with a 32KB page size. Analyze the requirement for maximum data length in VARCHAR and LONG VARCHAR columns to see if a shorter length can be specified. It might be necessary to remove the SORTDATA keyword from the utility statement.

DSNU292I  csect-name - ALTER UTILITY CANNOT APPLY TO THIS UTILITY, REASON=c

Explanation:  The -ALTER UTILITY command only applies to a job that is executing REORG with SHRLEVEL REFERENCE or CHANGE. In addition, if -ALTER UTILITY specifies MAXRO, LONGLOG, or DELAY, the job must be executing REORG with SHRLEVEL CHANGE.

1   The job is not executing REORG with SHRLEVEL REFERENCE or CHANGE.

2   -ALTER UTILITY specifies MAXRO, LONGLOG, or DELAY, but the job is executing REORG with SHRLEVEL REFERENCE.

Severity:  8 (error)
System Action:  -ALTER UTILITY does not execute.
User Response:  Apply -ALTER UTILITY to a job that is executing the proper utility.

DSNU293I  csect-name - REORG WITH SHRLEVEL REFERENCE OR CHANGE CANNOT APPLY TO THE name TABLE SPACE

Explanation:  REORG with SHRLEVEL REFERENCE or CHANGE cannot operate on the following catalog and directory table spaces: DSNDB06.SYSDBASE, DSNDB06.SYSDBAUT, DSNDB06.SYSGROUP, DSNDB06.SYSPLAN, DSNDB06.SYSVIEWS, and DSNDB01.DBD01.

Severity:  8 (error)
System Action:  REORG does not execute.
User Response:  Execute REORG with SHRLEVEL NONE.

DSNU294I  csect-name - LARGEST COMPOSITE RECORD IS TOO BIG FOR REORG WITH SHRLEVEL CHANGE

Explanation:  SHRLEVEL CHANGE was specified for a REORG utility job, and the table has a clustering index. However, the largest possible record in the table space, prefixed by the largest key, produces a composite record that is too large to be processed by the SORT component. See the computation of the length under REORG in the [Db2 Utility Guide and Reference]. If the largest possible composite record to be sorted exceeds 32760 bytes in length, which is the maximum record size for a BSAM data set, REORG cannot operate if SHRLEVEL CHANGE is specified.

Severity:  8 (error)
System Action:  REORG does not execute.
User Response:  Execute REORG with SHRLEVEL NONE or REFERENCE. If you must use SHRLEVEL CHANGE for the table space, try reducing the size of either the largest record or key field by redefining the
table. In some cases, changing a field from LONG VARCHAR to VARCHAR with a specified maximum length might help.

Problem Determination: This problem should only occur on a table space with a 32KB page size. Analyze the requirement for maximum data length in VARCHAR and LONG VARCHAR columns to see whether a shorter length can be specified.

DSNU295I  csect-name - IN UTILTERM PHASE OF REORG WITH SHRLEVEL REFERENCE OR CHANGE, DATA SET name COULD NOT BE DELETED, DFP REASON CODE = rrrrrr

Explanation: For the area (table space or partition) being reorganized, REORG with SHRLEVEL REFERENCE or CHANGE unloads data from the original data sets and reloads data into shadow data sets. REORG then exchanges the names of the original and shadow data sets. The original name of a data set is in the form "catname.DSNDBx.dbname.pspname.I0001.Annnn". The shadow name of a data set is in the form "catname.DSNDBx.dbname.pspname.J0001.Annnn". REORG uses such data sets for indexes as well as data.

If a data set is DB2-managed, the utilterm phase of REORG deletes the shadow data set, which was the original data set. This message indicates that the shadow data set name could not be deleted. rrrrrr indicates the DFP reason code.

Severity: 4 (warning)

System Action: REORG continues execution, but it does not delete the specified data set.

User Response: Try to delete the data set. If you cannot delete it, notify the system programmer.

System Programmer Response: Look up the DFP reason code, and try to determine why the data set could not be deleted.

DSNU296I  csect-name - IN REORG WITH SHRLEVEL REFERENCE OR CHANGE, DATA SET name DOES NOTEXIST, CONTEXT=s

Explanation: For the area (table space or partition) being reorganized, REORG with SHRLEVEL REFERENCE or CHANGE unloads data from the original data sets and reloads data into shadow data sets. REORG then exchanges the names of the original and shadow data sets, using temporary names during the renaming. The original name of a data set is in the form "catname.DSNDBx.dbname.pspname.I0001.Annnn". The shadow name of a data set is in the form "catname.DSNDBx.dbname.pspname.J 0001.Annnn". The temporary name of a data set is in the form "catname.DSNDBx.dbname.pspname.T0001.Annnn".

REORG uses such data sets for indexes as well as data.

During its initialization, REORG cannot execute if:

- Data sets with the temporary names already exist
- DB2-managed data sets with the shadow names already exist
- User-managed data sets with the shadow names do not already exist

To exchange the names of the original and shadow data sets, REORG renames in the following ways:

1. In the switch phase, it renames the original data set from the original name to the temporary name.

2. In the switch phase, it renames the shadow data set from the shadow name to the original name.

3. In the utilterm phase, it renames the original data set from the temporary name to the shadow name (for user-managed data sets). It deletes the temporary name for DB2-managed data sets.

If either a -TERM UTILITY command is issued, or the REORG switch phase is restarted after REORG has begun renaming data sets, the names revert back to their original form prior to the utilterm phase of REORG:

The context code indicates the specific type of error:

1. During the switch phase of REORG, on rename 1, REORG detected that a data set with an original name does not exist. This error condition can arise for a DB2-managed or user-managed data set.

2. During the switch phase restart or a -TERM UTILITY during the switch phase, on rename 4, REORG detected that a data set with an original name does not exist. This error condition can arise for a DB2-managed or user-managed data set.

3. During the utilterm phase of REORG, on
rename 3, REORG detected that a data set with a temporary name does not exist. This error condition can arise for a user-managed data set.

7 During initialization of REORG, REORG detected that the shadow data set did not exist. This error can only occur with a table space, index, or partition that is stored in user-managed data sets.

Severity: 4 (warning) or 8 (error)

System Action: For context codes 1 or 2, utility processing is abended. ABEND reason code 00E4031B is issued. The object is left in a recovery pending state.

For context code 3, the utility job step that caused the function to be requested continues with no renaming. The utility job is placed in the stopped state. The object is left in a recovery pending state, and a message will be issued.

For context code 7, REORG does not execute.

For context codes 1, 2, or 3, the following messages are issued:

- If the data set is part of a nonpartitioned table space, the object is the table space, and the message is DSNU562I.
- If the data set is part of a partition of a table space, the object is the partition, and the message is DSNU560I.
- If the data set is part of a nonpartitioned index, the object is the index, and the message is DSNU557I.
- If the data set is part of a partition of a partitioned index, the object is the partition of the index, and the message is DSNU559I.

User Response: For context codes 1 or 2, execute the RECOVER TABLESPACE or RECOVER or REBUILD utilities.

For context code 3, do nothing.

For context code 7, define all shadow objects prior to running REORG.

DSNU297I csect-name COMPOSITE RECORD SIZE TOO LARGE FOR table-name

Explanation: The size of the record that would be unloaded for REORG DISCARD or REORG UNLOAD EXTERNAL is greater than the largest allowed data set logical record length (32760 bytes).

Severity: 8 (error)

System Action: The utility will terminate with a return code of 8.

User Response: If you are attempting to discard records during REORG, you will have to use SQL to DELETE the records prior to the REORG. If you are attempting to unload records in an external format, you must use an application instead. If you are using the SORTDATA option with REORG UNLOAD EXTERNAL or REORG DISCARD, try removing the SORTDATA keyword.

Problem Determination: This problem will most likely occur only on a table with BLOB, CLOB, or DBCLOB columns.

DSNU298I csect-name - RESTART NOT ALLOWED IN phase-name PHASE OF REORG UTILITY WITH SHRLEVEL CHANGE

Explanation: An attempt was made to restart the REORG utility with SHRLEVEL CHANGE in the phase-name phase. DB2 does not allow you to restart the REORG utility with SHRLEVEL CHANGE in that phase.

Severity: 8 (error)

System Action: Utility processing abends. Abend reason code 00E40018 or 00E40310 might be issued.

User Response: Issue the -TERM Utility command to terminate the utility job; then rerun the job without the RESTART parameter.

System Programmer Response: If necessary, take actions to prevent access to the table space or partition before terminating the utility.

DSNU299I csect-name CHARACTER CONVERSION FROM CCSID from-ccsid TO CCSID to-ccsid FAILED WITH ERROR CODE 'error-code' FOR object-type object-name-qualifier.object-name column column-name.

Explanation: A conversion error occurred during the conversion of a string to a different coded character set. The error occurred during the processing of the utility statement.

The from-ccsid identifies the coded character set of the string to be converted.

The to-ccsid identifies the coded character set to which it must be converted.

The error-code indicates the type of error as defined as follows:

- 8 - Length exception (for example, expansion required for PC MIXED data exceeds the maximum length of the string).
- 12 - Invalid code point.
- 16 - Form exception (for example, invalid MIXED data).
- 20 - Translate procedure error (for example, an error during Unicode/390 stage 2 conversions or an exit set the length control field of the string to an invalid value).
The object_type gives the type of the failed object. It could be a USERID or a SQLID or a TABLE with the conversion error. This could be either the target or the source of the conversion.

The object-name-qualifier.object-name is applicable for object type TABLE only. If the failed object type is TABLE, then the object qualifier name will be the table creator id and the object name will be the table name.

The column is applicable only if the failed object is TABLE. 'COLUMN' will be given immediately before the column-name is given.

The column-name gives the column name of the failing object. This could be either the target or the source of the conversion.

Severity: 8 (error)
System Action: The utility job is terminated.
User Response: Refer to DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem. The user may generate a dump by adding the DIAGNOSE ABEND statement in the utility job and re-running the utility. If the error can be fixed, correct the error and resubmit the utility, else issue the TERM utility command to terminate the utility.

Explanation: The reload phase of the REORG or LOAD utility has completed normally. The elapsed time for the execution was 'hh' hours, 'mm' minutes, and 'ss' seconds.

Severity: 0 (informational)
System Action: Processing continues normally.
User Response: If a clustering index was expected to be found for the current table space reorganized, determine the reason the index could not be found.

Problem Determination: Probably a user error.

Determine if a cluster index should be defined on one of the tables in the table space being reorganized. If so, define the cluster index; otherwise, remove the 'SORTDATA' and/or 'NOSYSREC' keyword from the utility statement if necessary.

Explanation: This message is issued at the normal completion of the RELOAD phase of the REORG utility and the LOAD phase of the LOAD utility.

It indicates the number of records processed from the input record data set (that is, the data set identified either by the JCL DD statement identified in the UNLDDN option for REORG or the INDDN option for LOAD).

Severity: 0 (informational)
System Action: The LOAD or RELOAD utility completes the phase in which the records are (re-)introduced into the DB2 database. This is also the last phase of the utility unless there are some indexes that need to be built and/or updated.
User Response: The user can verify that the number of records (re-)loaded is consistent with expectations. For example, in REORG it matches the total number of records unloaded. For LOAD, it matches the number of records submitted minus the number of records reported rejected.

Explanation: This message is issued at the normal completion of the RELOAD phase of the REORG utility and the LOAD phase of the LOAD utility.

It indicates the number of records loaded into PART 'part-number' of 'table-name' from the source record data set. This data set is identified by the JCL DD statement in the UNLDDN option for REORG, or the INDDN option for LOAD.

This message is repeated for each INTO TABLE PART clause in the LOAD utility statement or each TABLESPACE PART clause in the REORG utility statement.

Severity: 0 (informational)
System Action: The LOAD or RELOAD phase maintains a separate count for each table part. Rejected rows are not included in the count. Each count is reported as a separate message at the end of the LOAD or RELOAD phase.

The user can verify the number of records loaded or reloaded into the table part. In REORG, it should match
the number of records unloaded for that table part. In LOAD, it should match the number of records processed.

**DSNU304I csect-name (RE)LOAD PHASE
STATISTICS - NUMBER OF RECORDS = nnnnn FOR TABLE table-name**

**Explanation:** This message is issued at the normal completion of the RELOAD phase of the REORG utility and the LOAD phase of the LOAD utility.

It indicates the number of records loaded into TABLE 'table-name' from the source record data set (that is, the data set identified by the JCL DD statement identified in the UNLDDN option for REORG, or the INDDN option for LOAD).

This message is repeated for each TABLE loaded by the current REORG or LOAD utility statement.

If the LOAD or REORG was restarted in a LOAD or RELOAD phase from the last commit point (i.e., the 'RESTART' parm was specified), the 'nnnnnn' indicates the number of records loaded after the restart.

**Severity:** 0 (informational)

**System Action:** The LOAD or RELOAD phase maintains a separate count for each table populated by this phase. Rejected rows are not included in the count. Each count is reported as a separate message at the end of the LOAD or RELOAD phase.

The user can verify that the number of records (re-)loaded into the table is consistent with expectations. For example, in REORG it matches the number of records unloaded for that table. For LOAD, it matches the number of records processed.

**DSNU305I csect-name - TABLE=table-name HAS AN INCOMPLETE TABLE DEFINITION**

**Explanation:** Table 'table-name' does not have an index defined to enforce the uniqueness of its primary key or unique key.

**Severity:** 8 (error)

**System Action:** Processing stops. No table in the table space is loaded.

**User Response:** The user can resubmit the LOAD job after performing one of the following:

- Creating a unique index over the table's primary key
- Creating a unique index over the table's unique key(s)
- Dropping the definition of the table's primary key
- Dropping the definition of the table's unique key(s)

**Problem Determination:** Issue SQL SELECT against the catalog to determine which indexes and relations exist against 'table-name'. Determine whether uniqueness of the primary key or unique key has been guaranteed through omission or through faulty definition of an index.

**DSNU306I csect-name - UNABLE TO DRAIN WRITERS FROM object-type object-name**

**Explanation:** The utility was unable to drain the writers from an object because the resource was unavailable. The object is identified by type and name. Message DSNT500I tells why the resource was unavailable. If the QUIESCE utility issues this message, DSNT500I is not issued, but message DSNT501I might be issued.

**Severity:** 8 (error)

**System Action:** Utility processing terminates.

**Problem Determination:** Refer to message DSNT500I or DSNT501I.

**DSNU307I csect-name PARENT TABLE
parent-table-name OF table-name IN RELATIONSHIP relationship-name HAS AN INCOMPLETE TABLE DEFINITION**

**Explanation:** The 'table-name' identifies the target table of the job for the LOAD utility or the dependent table to be checked by the CHECK DATA utility. The 'parent-table-name' identifies the parent table of the target table for the LOAD utility or the dependent table for the CHECK DATA utility in RELATIONSHIP 'relationship-name'. The primary index of PARENT TABLE 'parent-table-name' has been dropped.

This message is repeated for each incompletely defined parent table in each relationship where the target table is a child.

**Severity:** 8 (error)

**System Action:** The LOAD and CHECK DATA utilities stop further processing. No data is loaded by the LOAD utility and no relationships are checked by the CHECK DATA utility.

**User Response:** Check the existence of the primary index and its parent tables identified by RELATIONSHIP 'relationship-name'.

**Problem Determination:** If the incompletely defined tables were targets of the LOAD job, message DSNU305I has been issued for each such table. Refer to the catalog to determine if any tables in the table space that were not targets of the LOAD job are incompletely defined.

**DSNU308I csect-name INDEX KEY LIST RECORD LENGTH EXCEEDS MAXIMUM KEY BUFFER SIZE**

**Explanation:** The length of the index key list that will be built in the Data Base Services address space while loading a data record may be larger than the maximum
key buffer size. The LOAD statement may be too complex.

**Severity:** 8 (error)

**System Action:** Utility processing is terminated.

**User Response:** Examine the preceding DSNU650I INTO TABLE statements. The key size and number of indexes affected by each INTO TABLE statement are accumulative. The combination of these elements may produce a list of index keys, including header bytes, that is too large to be contained within the maximum size buffer area during the load of each input data record. It may be necessary to reduce the number of INTO TABLE statements or to drop some of the indexes that are affected by the load.

---

**DSNU309I**

csect-name NOT ALL REQUIRED UNIQUE INDEXES HAVE BEEN DEFINED FOR TABLE table-name

**Explanation:** The table ‘table-name’ was created with unique index requirements. Not all of these indexes have been defined.

**Severity:** 8

**System Action:** Processing stops. No table in the table space is loaded.

**User Response:** The user may resubmit the LOAD job after either:
- Creating all the required unique indexes, or
- Dropping the table and re-creating it without the unique index requirements.

**Problem Determination:** Determine which unique indexes need to be created. Determine if the uniqueness requirement for the table is valid.

---

**DSNU310I**

csect-name RECORD 'n' WILL BE DISCARDED DUE TO INVALID field-name COLUMN SPECIFICATION

**Explanation:** The load utility calculated the location of an input data value using the field specifications supplied and VARCHAR length fields present within the input data set record. The calculated position for the field was determined to be incorrect.

**Severity:** 4 (warning)

**System Action:** The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

**User Response:** Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data. Submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. Refer to [DB2 Utility Guide and Reference](https://www.ibm.com/docs/en/db2) for a definition of LOAD input field column specifications.

---

**DSNU311I**

csect-name RECORD 'n' WILL BE DISCARDED DUE TO INVALID field-name COLUMN SPECIFICATION

**Explanation:** The exit routine provided by your installation blocked the load of record ‘n’ into the table indicated. The reason-code was set by the exit routine.

**Severity:** 4 (warning)

**System Action:** The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

**User Response:** Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Otherwise, correct the input field specification. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility statement and field specifications. Refer to [DB2 Utility Guide and Reference](https://www.ibm.com/docs/en/db2) for a definition of LOAD input field column specifications.

**System Programmer Response:** Verify that the validation routine is correct.
DSNU313I csect-name RECORD 'n' WILL BE DISCARDED DUE TO PART OR HIGH KEY VALUESPECIFICATION(S)

Explanation: The discarded record does not belong to any of the partitions being loaded. For a large table space, this might be because the key is higher than the high key value specified for the last partition.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. Refer to Part 2 of DB2 Utility Guide and Reference for a definition of LOAD input field column specifications.

System Programmer Response: Verify that the validation routine is correct.

DSNU314I csect-name RECORD 'n' WILL BE DISCARDED DUE TO WHEN SPECIFICATION(S)

Explanation: The discarded record satisfies none of the WHEN selection expressions provided.

Severity: 4 (warning)

System Action: The input data set record is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. Refer to DB2 Utility Guide and Reference for a definition of LOAD input field column specifications. If FORMAT UNLOAD was specified on the load statement, the WHEN specifications are built internally. This ensures that the rows are loaded back into the same object from which they were unloaded. Refer to DB2 Utility Guide and Reference for a description of the FORMAT UNLOAD option of LOAD.

DSNU315I csect-name RECORD 'n' WILL BE DISCARDED DUE TO UNEXPECTED ERROR

Explanation: The LOAD of input data set record number 'n' was attempted but was not successful due to an unexpected error.

Severity: 8 (error)

System Action: If the error was caused because a resource was not available, a DSNT500I message will be issued.

The utility step will be abended with a system X'04E' and an abend reason code of '00E40318'. If a DSNT500I message is not issued, an SVC dump will be requested. A SYSABEND dump of batch storage is also requested.

User Response: If a DSNT500I message was issued, refer to the description under that message number. If the unavailable resource becomes available, the utility step is restartable.

If there is no DSNT500I message, the error is an unexpected internal error and you should consult your system programmer.

Operator Response: An operator with SYSOPR authority can issue a TERM UTIL to free any held resources if that is necessary.

System Programmer Response: Refer to DB2 Command Reference for information about the TERM UTIL command. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

DSNU316I csect-name - UNABLE TO DRAIN WRITERS FROM object-type object-name PART part-num

Explanation: The utility was unable to drain the class of writers from a partition of an object because the resource was unavailable. The partition is identified by object type (object-type), object name (object-name), and partition number (part-num). Message DSNT500I tells why the resource was unavailable.

Severity: 8 (error)

System Action: Utility processing terminates.

Problem Determination: Refer to message DSNT500I.

DSNU317I csect-name DISCARD LIMIT HAS BEEN REACHED

Explanation: The DISCARDS limit specified on the LOAD utility statement was reached.

Severity: 8 (error)

System Action: Processing abends to allow users to increase the discard limit and restart the utility.

User Response: Increase the discard limit and restart the utility. Otherwise -TERM the utility. Review the file of input records provided to LOAD and review table definitions to determine why the number of records discarded exceeds expectations.

Problem Determination: See user response.
DSNU318I  csect-name RECORD 'n' WILL BE DISCARDED DUE TO INVALID field-name COLUMN SPECIFICATION FOR table-name

Explanation: The load utility calculated the location of an input data value using the field specifications supplied and VARCHAR length fields present within the input data set record 'n'. The calculated position for the field was determined to be incorrect.

Severity:  4  (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Otherwise, correct the input field specification. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility statement and field specifications. Refer to [DB2 Utility Guide and Reference](https://www.ibm.com/support/docview.wss?uid=swg27032527) for a definition of LOAD input field column specifications.

DSNU319I  csect-name RESUME(YES) WAS SPECIFIED FOR EMPTY PARTITION nn. RESUME(NO) IS ASSUMED

Explanation: This message is issued in response to a LOAD utility request containing a partition level RESUME(YES) option. The RESUME(YES) option implies that the specified partition 'nn' is populated, but in this case it was not. The message alerts the invoker to this fact, and continues as if RESUME(YES) was not specified.

Severity:  4  (warning)

System Action: The LOAD utility, in attempting to honor the RESUME(YES), found the partition was empty, ignored the option, and continued as if RESUME(NO) was specified.

User Response: The user is alerted to the fact that the requested partition was empty rather than populated as the RESUME LOAD option implied.

DSNU320I  csect-name RESUME(YES) WAS SPECIFIED FOR AN EMPTY TABLESPACE

Explanation: RESUME(YES) was specified within the LOAD utility statement. However, the RESUME(YES) option implies that the specified table space is populated.

Severity:  4  (warning)

System Action: Processing continues. The LOAD utility, in attempting to honor the RESUME(YES), found the table space empty, so ignored the option, and proceeded as if RESUME(NO) was specified. If this table is currently defined as COMPRESS YES, a dictionary is not built.

User Response: The user is alerted to the fact that the requested table space was empty rather than populated as the RESUME LOAD option implied. Use the RESUME(NO) option if you want a compression dictionary built.

DSNU321I  csect-name CHECK PENDING ON TABLESPACE tablespace-name PROHIBITS PROCESSING

Explanation: The requested utility cannot be run against a tablespace or tablespace partition in a check pending state.

Severity:  8  (error)

System Action: Processing terminates after the check pending states of all target tablespaces or partitions of the utility are analyzed.

User Response: Remove the named tablespace or partition from its check pending state by using the CHECK DATA or REPAIR utility. If you want more information on the extent of questionable data in the table space, query the SYSTABLES and SYSTABLEPART catalog tables.

DSNU322I  csect-name DEFERRED STATUS OF TABLE SPACE database-name.tablespace-name PROHIBITS PROCESSING

Explanation: The requested utility cannot be run against a table space or table space partition in a deferred state.

Severity:  8  (error)

System Action: Processing terminates after the deferred state of all target table spaces or table space partitions of the utility are analyzed.

User Response: To remove the deferred state, use the RECOVER TABLESPACE, LOAD REPLACE utility, or -START DATABASE command with ACCESS(RW) or ACCESS(RO). If you want more information on the status of the table space, use the -DISPLAY DATABASE command.

DSNU323I  csect-name COLUMN ccc IS OMITTED

Explanation: The column 'ccc' is a nonnullable column and is not being loaded. Field specifications must include all nonnullable columns. The identified column name was missing from the field specification.

Severity:  8  (error)

System Action: Further utility processing is terminated.
User Response: Determine if the input data contains the non nullable column as a field. If it does, change the field specification to include it. If the input data does not contain the non nullable column as a field, determine which is in error, the input data or the column specification. Make the corresponding correction. Resubmit the job if that is still appropriate.

System Programmer Response: Corrective procedures may require that a table be dropped and created again. Refer to Part 2 (Volume 1) of [DB2 Administration Guide] for a discussion of how this can be accomplished. Refer to [DB2 Utility Guide and Reference] for a discussion of field specification constraints with regard to non nullable columns.

DSNU324I csect-name DEFERRED STATUS OF INDEX SPACE creator-name.index-name PROHIBITS PROCESSING

Explanation: The requested utility cannot be run against an index space or index space partition in a deferred state.

Severity: 8 (error)

System Action: Processing terminates after the deferred state of all target index spaces or index partitions of the utility are analyzed.

User Response: The deferred state can be removed through recovery or rebuild of the index space or the physical index partition. It can also be removed by the -START DATABASE command with ACCESS(RW) or ACCESS(RO). The RECOVER or REBUILD INDEX utility can be run at either the index space or index partition level. If more information on the status of the index space is required, use the -DISPLAY DATABASE command.

DSNU325I csect-name - AN INVALID SQL/DS FORMAT RECORD WAS ENCOUNTERED

Explanation: The LOAD utility detected an invalid SQL/DS format record type.

Severity: 8 (error)

System Action: Utility execution is terminated.

User Response: Correct the input data and resubmit the job. Data that has been transmitted from an SQL/DS unload disk data set in a VM/370 system may have extra block descriptors and record descriptors at the beginning of each record. Ensure that this situation does not exist.

Problem Determination: Refer to Part 2 (Volume 1) of [DB2 Administration Guide] for additional information regarding loading data from SQL/DS and resubmitting a partially completed load step.

DSNU326I csect-name - USER NOT AUTHORIZED FOR LOAD REPLACE ON TABLESPACE

Explanation: The user attempted to use the REPLACE option of LOAD, and it will reset to empty all tables in the table space before loading data. This option requires load authorization on each table in the table space, but the user did not have authority for one or more tables. In addition, if a table in the table space has a security label column, the user must have the write-down privilege when write-down is in effect.

Severity: 12 (severe error)

System Action: When LOAD REPLACE validation encounters the first unauthorized table in the table space, the job step is terminated.

User Response: Obtaining the LOAD on DATABASE privilege for the database will allow you to rev="tech" proceed using the REPLACE option. If a table in the table space has a security label column, ensure that the user has write-down privilege when write-down is in effect before using the REPLACE option. The other alternative is to first delete all rows from the tables which are to be loaded, and then use the RESUME option instead of the REPLACE option.

DSNU327I csect-name TABLE b IS NOT IN SAME TABLESPACE AS TABLE a

Explanation: All tables that are the subject of a single LOAD utility statement must belong to the same table space.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Remove the INTO TABLE control statement that specifies TABLE 'b' from the current LOAD request. If the data is to be loaded into TABLE 'b', create another LOAD utility statement that contains the INTO TABLE control statement for TABLE 'b' and resubmit the job.

DSNU328I csect-name CANNOT PROCESS THE NON-EMPTY PARTITION nn WITH RESUME(NO). PROCESSING TERMINATES

Explanation: The partition level RESUME keyword either specified or defaulted to a value of NO, which requires the partition to be empty. However, the LOAD command named partition 'nn', which was not empty.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Determine why the assumption of an empty partition was wrong. This may require
consultation with the system programmer. Either remove the current partition’s rows using an SQL DELETE, or change the LOAD option to RESUME YES. Resubmit the job. Refer to [DB2 Utility Guide and Reference] for a description of the partition-level RESUME option of LOAD.

**System Programmer Response:** Determine whether the partition should be empty. If it should, use SQL DELETE to empty it. Otherwise, instruct the user to use the RESUME(YES) option for that partition.

---

**Severity:** 524  (error)

**Explanation:**

You specified a NULLIF or DEFAULTIF field specification option for:

- A column defined to be not nullable or not defaultable
- A field with no column counterpart.

**Severity:** 8 (error)

**System Action:** The utility abends to allow restart.

**User Response:** Determine whether the field specification refers to the correct column. If it does, remove the NULLIF option from the field specification, and restart the job. Alternatively, TERM the utility. Refer to [DB2 Utility Guide and Reference] for LOAD NULLIF option constraints.

---

**Severity:** 8 (error)

**System Action:** Further utility processing is terminated.

**User Response:** Determine why the assumption of an empty table space was wrong. This may require consultation with the system programmer. Either remove the current table(s) rows using an SQL DELETE, or change the LOAD option to RESUME YES. Resubmit the job. Refer to [DB2 Utility Guide and Reference] for a definition of the RESUME option of LOAD.

**System Programmer Response:** If the table space is used by more than one application, determine whether the table space should be empty. If it should be, use SQL DELETE to make it empty. Otherwise, instruct the user to use the RESUME(YES) option.

---

**Severity:** 8 (error)

**Explanation:** Field lists are not allowed with FORMAT UNLOAD or FORMAT SQL/DS keywords.
Administration Guide for information on resubmitting a partially completed LOAD step.

<table>
<thead>
<tr>
<th>DSNU334I</th>
<th>csect-name INPUT FIELD ‘ffffff’ INVALID FOR ‘tttttt’, ERROR CODE cc</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Explanation:</strong> The LOAD utility found the input data provided for field ‘ffffff’ in table ‘tttttt’ to be incorrect. The error code cc, if present, identifies the problem. Possible error codes are:</td>
<td></td>
</tr>

</table>

Refer to DB2 Utility Guide and Reference to determine input constraints. Refer to Part 2 (Volume 1) of DB2 Administration Guide for information on resubmitting a partially completed LOAD step.
DSNU336I  csect-name INVALID nullif
SPECIFICATION FOR INPUT FIELD

Explanation: The LOAD utility found the 'nullif' field specification to be incorrect.

Severity:  8 (error)

System Action: Further utility processing is terminated.

User Response: Correct the 'nullif' specification and resubmit the job. Refer to DB2 Utility Guide and Reference for a description of 'nullif' field selection options and Part 2 (Volume 1) of DB2 Administration Guide for information on resubmitting a partially completed LOAD step.

---

DSNU337I  csect-name RECORD(n),
CONCATENATED CONTINUEIF
RECORD IS TOO LARGE

Explanation: The CONTINUEIF option was specified during LOAD to concatenate multiple physical records into one logical record for loading. The resultant concatenated record is too large to be processed. The maximum length allowed is 32767 bytes.

Severity:  8

System Action: When discard processing is specified, the input data set logical record is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set, and the severity level is 4. When discard process is not specified, the severity is 8 and the LOAD utility will terminate.

User Response: When discard processing is specified, following the completion of the current LOAD utility invocation, examine the record in the DISCARDs data set. Correct the error in the discarded input data, and submit a RESUME(YES) LOAD invocation with the DISCARDs data set as the input data set. When discard processing is not specified: correct the error in the input data set and resubmit the job.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items: Appendix B, “Problem determination,” on page 1349.

---

DSNU338I  csect-name INVALID COLUMN
SPECIFICATION FOR column name

Explanation: The LOAD utility found the dynamically determined column location for an input field to be incorrect.

Severity:  8 (error)

System Action: The utility abends to allow restart.

User Response: Correct the input field specification or the input data and restart the job. Alternatively, TERM the utility.

---

DSNU339I  csect-name INVALID CONTINUEIF
SPECIFICATION

Explanation: The CONTINUEIF clause of a LOAD utility extends beyond the end of the input record.

Severity:  8 (error)

System Action: The LOAD utility is terminated.

User Response: Correct the CONTINUEIF clause. The column specification must be reduced and/or the value being compared must be shortened. The value being compared must be entirely within the input record.

---

DSNU340I  csect-name - ERROR LOADING INDEX,
DUPLICATE KEY, INDEX=index-name,
TABLE=table-name, RID OF INDEXED
ROW=rid-of-indexed-row, RID OF
NON-INDEXED ROW=rid-of-non-indexed-row

Explanation: A duplicate key was found while building the indicated index during the BUILD phase of the REORG or REBUILD INDEX utility. This violates the uniqueness rule for that index.

Severity:  8 (error)

System Action: All duplicate index entries of the indicated index are reported and the index is in RECOVERY PENDING status. Duplicate rows are present in the indexed table. Utility processing continues with any other utility functions within the utility job step.

User Response: Duplicate rows are present in the indexed table. The system programmer should be informed, so that any applications that are dependent upon the uniqueness of the table rows are not initiated until corrective action has been taken.

Operator Response: Notify the system programmer.

System Programmer Response: Steps should be taken to inhibit any further processing until the index is repaired. If the nonunique keys are correct, DROP and recreate the index as nonunique. If the records with duplicate keys should not be in the table, use REPAIR DELETE to remove the erroneous rows. Use the RID values provided in this message as input to the REPAIR utility. After the duplicate data rows are removed or the unique index has been dropped, issue the -DISPLAY DATABASE command with RESTRICT against the target database. Use the REBUILD INDEX utility to recover any indexes that are in the REBUILD pending state. CHECK INDEX can be run to verify that the data and indexes are consistent.
Problem Determination: Use REPAIR LOCATE RID DUMP to view the records with duplicate keys. SQLSELECT may fail due to the inconsistent index. Use CHECK INDEX to check the validity of the index.

DSNU341 csect-name - IMAGE COPY MUST BE TAKEN BEFORE REORG CAN BE RUN ON A DB2 CATALOG OR DIRECTORY TABLE SPACE

Explanation: The DB2 catalog or directory table space being reorganized does not have an image copy that the RECOVER utility can use to recover the table space to currency. Before running the REORG utility, you must run the COPY utility to create an image copy. This prevents having to recover the DB2 catalog or directory table space to a prior point in time if a problem occurs during REORG processing.

Severity: 8

System Action: Processing terminates

User Response: Run the COPY utility to create an image copy of the DB2 catalog or directory table space. If more than one catalog or directory table space is to be reorganized, consider using the QUIESCE and COPY utilities for the set of table spaces to be reorganized.

Use the REPORT utility to view the recovery information related to the table space. The output from the REPORT utility should indicate either the absence of an image copy, or the presence of a REORG LOG NO SYSCOPY record.

DSNU342I csect-name ERROR LOADING INDEX, ERROR = Xreason-code, INDEX = index-name

Explanation: The LOAD, REORG or REBUILD INDEX utility encountered a processing error, which it could not correct, while extending the index identified by 'index-name'. Refer to Part 4, “Section 4. DB2 Codes,” on page 771 for an explanation of the code given in 'reason-code'.

Severity: 8 (error)

System Action: The building of index entries for the indexed index is not completed. An SVC dump of the database services address space is requested for diagnostic purposes. The extension of other indexes associated with the tables being loaded is attempted. Any subsequent attempt to use the index directly or indirectly will cause the invoker to abort.

User Response: If the indexed table is used by more than one application, the system programmer should be informed so that applications that insert rows into, or delete rows from, the table or use the index directly are inhibited until corrective action is taken.

Normal corrective action would be to use the REBUILD INDEX utility option to reconstruct the index after the processing problem identified by the reason code has been resolved. Alternatively, the index can be dropped and then created again, unless the index in question is the partitioning index.

Operator Response: The table space in question might need to be stopped and started for utility-only processing to inhibit attempted application use of the defective index.

System Programmer Response: If the index is used by more than one application, applications that either insert rows into, or delete rows from, the indexed table or use the index to access rows must be inhibited from executing. One way to accomplish this is to place the table space in question under utility only processing control via the -START and -STOP DATABASE commands until the REBUILD INDEX utility is executed. Alternatively, the index can be dropped. Application execution can then proceed, and the index can be created again (unless the index was the partitioning index). If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem. Refer to Part 4, “Section 4. DB2 Codes,” on page 771 to determine the processing error indicated by the reason code. For a discussion of how a table can be dropped and created again, or what to do if a partitioning index is damaged, refer to the discussion of LOAD processing in Part 2 (Volume 1) of DB2 Administration Guide.

DSNU343I csect-name - BUILD PHASE STATISTICS. nnn DUPLICATE KEY ERRORS ENCOUNTERED

Explanation: The count of duplicate key errors encountered during processing is 'nnn'.

Severity: 4 (warning) or 8 (error)

System Action: Processing continues. For the LOAD utility, the records causing the duplicate key errors will be deleted in a subsequent phase.

DSNU344I csect-name - UNIQUE INDEX KEY DUPLICATES KEY OF INDEXED ROW AT RID rrr INDEX = index-name TABLE = table-name RECNO = input-dataset-record-number RID = duprid

Explanation: The input data set record indicated was loaded into table table-name at RID duprid, but it causes a unique index violation for index index-name. It duplicates the key value of a record already in the table at RID rrr.

Severity: 4 (warning)

System Action: Processing continues. No index entry is created for the record at RID duprid. The record will be deleted in a subsequent phase of processing.
<table>
<thead>
<tr>
<th>csect-name</th>
<th>UNIQUE INDEX KEY DUPLICATES KEY FROM INPUT DATASET RECORD</th>
<th>rrr INDEX = index-name TABLE = table-name RECNO = recono RID = duprid</th>
</tr>
</thead>
</table>
**Explanation:** Input data set record recono was loaded into table table-name at RID duprid, but it causes a unique index violation for index index-name. It duplicates the key value of another record in the load job: the record loaded at RID rrr from input data set record rii.

**Severity:** 4 (warning)

**System Action:** Processing continues. Index entries are not created for either record. Both records will be deleted in a subsequent phase of processing.

<table>
<thead>
<tr>
<th>csect-name</th>
<th>RECORD(n), CONCATENATED SQL/DS RECORD IS TOO LARGE</th>
</tr>
</thead>
</table>
**Explanation:** A LOAD utility was executing with FORMAT SQL/DS input data. Multiple spanned segments of the input data were concatenated into one logical record for loading. The resultant concatenated record is too large to be processed. The maximum length allowed is 32764 bytes.

**Severity:** 4 or 8

**System Action:** When discard processing is specified, the input data set logical record is noted and is discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set and the severity is 4. When discard processing is not specified, the severity is 8 and the LOAD utility terminates.

**User Response:** When discard processing is specified, examine the records in the DISCARDS data set after the LOAD utility completes. Correct the error in the discarded input data. Then run the LOAD utility with the RESUME YES option using the DISCARDS data set as input. When discard processing is not specified, correct the error in the input data set and rerun the job.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem Determination,” on page 1349 [1 2 5].

<table>
<thead>
<tr>
<th>csect-name</th>
<th>DEADLINE = yyyy-mm-dd-hh.mm.ss.mmmmmm</th>
</tr>
</thead>
</table>
**Explanation:** This message is issued in response to a -DISPLAY UTILITY command.

It is also issued by the REORG utility if the user specified SHRLEVEL REFERENCE or CHANGE and DB2 estimates that the switch phase will not start by the deadline specified by the DEADLINE phrase.

This message indicates the most recently specified values of the DEADLINE parameter to REORG. For this parameter, a previous invocation of the -ALTER UTILITY command might have specified a value. If no previous invocation of -ALTER UTILITY has specified a value, then the most recently specified value is the value that was specified with the invocation of the REORG utility.

yyyy-mm-dd-hh.mm.ss.mmmmmm indicates a timestamp, according to the most recently specified value of DEADLINE.

**Severity:** 0 (informational)

**System Action:** The message reflects the state of DB2 at the time of the -DISPLAY UTILITY command or the time when DB2 estimated that the switch phase would not start by the deadline specified by the DEADLINE phrase.

If this message was issued for -DISPLAY UTILITY, the system continues processing. If an -ALTER UTILITY command is then executed, a subsequent -DISPLAY UTILITY command would reflect the results (if any) of the -ALTER UTILITY command.

<table>
<thead>
<tr>
<th>csect-name</th>
<th>BUILD PHASE STATISTICS. NUMBER OF KEYS = nnnnnnnn FOR INDEX index-name PART part-num</th>
</tr>
</thead>
</table>
**Explanation:** This message is issued by the BUILD phase of the REBUILD INDEX utility to report the total number of index key entries used to build the indicated index partition.

**Severity:** 0 (informational)

**System Action:** This message indicates the number of index key entries submitted to the DB2 data manager to build the indicated index partition. Both unique and nonunique key entries are counted. Rejected key entries are not counted.

**User Response:** The user can verify that the number reported is consistent with expectations.

<table>
<thead>
<tr>
<th>csect-name</th>
<th>BUILD PHASE STATISTICS. NUMBER OF KEYS = nnnnnnnn FOR index-name</th>
</tr>
</thead>
</table>
**Explanation:** This message is issued by the BUILD phase of the LOAD, REORG or REBUILD INDEX utility. The message is repeated for each index built by the LOAD, REORG or REBUILD INDEX utility. It indicates the total number of index key entries used to build the indicated index.
Severity: 0 (informational)

System Action: This message indicates the number of index key entries that were submitted to the DB2 data manager to build the indicated index. Both unique and nonunique key entries are counted. Rejected key entries are not counted.

User Response: The user can verify that the number reported is consistent with expectations. For example, the user can determine if it matches the number of records loaded for the table indexed by the indicated index.

---

**DSNU350I csect-name - EXISTING RECORDS DELETED FROM TABLESPACE**

**Explanation:** A LOAD utility execution, in which REPLACE was specified, has deleted all records from the specified table space.

Severity: 0 (informational)

System Action: Processing continues.

---

**DSNU351I csect-name - 'reorg-option' OPTION IS NOT APPLICABLE FOR A DB2 CATALOG OR DIRECTORY OBJECT. THE OPTION IS IGNORED.**

**Explanation:** The identified option does not apply for this DB2 catalog or directory object. Table spaces and indexes within the DB2 catalog and directory may be processed differently than other table spaces and indexes. Consequently, these table spaces and indexes may not make use of reorg option reorg-option.

Severity: 4 (warning)

System Action: The option is ignored and processing continues.

User Response: None is required. However, you can remove the option from the utility input statement.

---

**DSNU352I EXISTING RECORDS DELETED FROM TABLESPACE PARTITION x**

**Explanation:** A LOAD utility execution, in which PART 'x' REPLACE was specified, has deleted all data records from partition 'x'. Index records over partition 'x' will be deleted in a subsequent phase of processing.

Severity: 0 (informational)

System Action: Processing continues.

---

**DSNU353I csect-name RECORD 'n' WILL BE DISCARDED DUE TO CHECK CONSTRAINT constraint-name VIOLATION ON TABLE table-name**

**Explanation:** The discarded record violates the check constraint named constraint-name defined on table table-name. The record is not loaded and is discarded during the DISCARD phase.

Severity: 4 (warning)

System Action: The LOAD utility continues to process additional records in the input data set.

User Response: After the LOAD utility completes, examine the record in the DISCARDS data set. Correct the error in the discarded input data. Submit a RESUME(YES) LOAD job with the DISCARDS data set as the input data set.

---

**DSNU354I csect-name RECORD 'n' VIOLATES CHECK CONSTRAINT constraint-name ON TABLE table-name**

**Explanation:** The LOAD utility cannot load record n into table table-name because the check constraint constraint-name would be violated. The record is not loaded.

Severity: 8 (error)

System Action: Processing terminates. An abend is requested so that the LOAD can be restarted after the error condition is corrected.

User Response: Find the failing record in the input data set, correct the condition that caused the check constraint to be violated, and restart the LOAD utility. You can optionally include a SYSDISC DD statement in the JCL input to hold copies of records that are not loaded.

---

**DSNU355I csect-name INDEXVAL PHASE STATISTICS - nnn DUPLICATE KEY ERRORS CORRECTED BY DELETING rrr DATA ROWS**

**Explanation:** This message reports the results of the INDEXVAL phase of the LOAD utility. Data rows which were added during the LOAD or RELOAD phase of this LOAD utility invocation have been deleted because they caused unique index violations in the BUILD phase. A total of 'rrr' data rows were deleted to correct 'nnn' unique index violations.

Unique index violations are counted in one of two ways. An input data set record which has a value for a uniquely indexed column that duplicates a value that existed in the index prior to the LOAD job is counted as one duplicate key error. Two input data set records which have like values for a uniquely indexed column are counted as two unique index errors (that is, each of the two input data set records is in error).

Severity: 4 (warning)

System Action: Processing continues.

User Response: Compare the number of duplicate key errors corrected in the INDEXVAL phase to the number of duplicate key errors detected in the BUILD phase (reported by message DSNU343I). If the counts...
are unequal, notify the system programmer.

If the counts are equal, following the LOAD utility execution, examine the discards file or the LOAD error summary to determine which input data set records caused the unique index violations. Revisit the input records so they will not introduce duplicate values into unique indexes and reapply the input records to the table space. Alternatively, if appropriate, make the index nonunique and reapply the rejected records to the table space.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide](https://www.ibm.com/support/knowledgecenter/SG24-776_12.1.0/com.ibm.db2.luw.admin.diag.doc/doc/c0024550.html) and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNU356I**

*csect-name* INDEXVAL PHASE COMPLETE, ELAPSED TIME = hh/mm/ss

**Explanation:** The INDEXVAL phase of the LOAD utility has completed normally. The elapsed time for the execution was 'hh' hours, 'mm' minutes, and 'ss' seconds.

**Severity:** 0 (informational)

---

**DSNU357I**

*csect-name* - 'LOG NO' OPTION REQUIRED FOR DB2 CATALOG AND DIRECTORY TABLE SPACES

**Explanation:** The LOG NO option must be specified when reorganizing a DB2 catalog or directory table space.

**Severity:** 8 (error)

**System Action:** Processing terminates.

**User Response:** Add the LOG NO option to the utility input statement.

---

**DSNU358I**

*csect-name* - 'UNLOAD ONLY' OPTION NOT VALID FOR DB2 CATALOG OR DIRECTORY TABLE SPACE

**Explanation:** The UNLOAD ONLY option is not permitted for DB2 catalog or directory table spaces.

**Severity:** 8

**System Action:** Processing terminates.

**User Response:** Determine the purpose for using the UNLOAD ONLY option. There might be alternative ways of accomplishing the required function (for example, the UNLOAD PAUSE option).

---

**DSNU359I**

KEYWORD 'SORTKEYS' SPECIFIED BUT NO INDEX OR FOREIGN KEYS EXIST, KEYWORD IS IGNORED

**Explanation:** The 'SORTKEYS' keyword was specified for a LOAD or REORG utility job; however, it was found that no index and no foreign keys were defined for any of the tables being loaded or reorganized. The keyword is ignored and processing continues normally.

**Severity:** 0 (informational)

**System Action:** Processing continues normally.

**User Response:** If an index or foreign keys were expected to be found for the table or tables being loaded or reorganized, determine the reason the index or foreign keys could not be found.

**Problem Determination:** Probably a user error. Determine if an index should be defined on any of the tables in the table space, or if foreign keys should be defined. If so, define the index or foreign keys; otherwise, remove the 'SORTKEYS' keyword from the utility statement if necessary.

---

**DSNU360I**

*csect-name* - IN REORG WITH SHRLEVEL REFERENCE OR CHANGE, DATA SET name EXISTS, CONTEXT=c

**Explanation:** For the area (table space or partition) being reorganized, REORG with SHRLEVEL REFERENCE or CHANGE unloads data from the original data sets and reloads data into shadow data sets. REORG then exchanges the names of the original and shadow data sets, using temporary names during the renaming. The original name of a data set is in the form "catname.DSNDBx.d dbname.p name.I0001.Annn". The shadow name of a data set is in the form "catname.DSNDBx.d dbname.p name.J0001.Annn". The temporary name of a data set is in the form "catname.DSNDBx.d dbname.p name.T0001.Annn". REORG uses such data sets for indexes as well as data.

During its initialization, REORG cannot execute if:
- Data sets with the temporary names already exist.
- DB2-managed data sets with the shadow names already exist.
- User-managed data sets with the shadow names do not already exist.

To exchange the names of the original and shadow data sets, REORG performs the following renaming:

1. In the switch phase, it renames the original data set from the original name to the temporary name.
2. In the switch phase, it renames the shadow data set from the shadow name to the original name.
3. In the utilization phase, it renames the original...
data set from the temporary name to the shadow name (for user-managed data sets). It deletes the temporary for DB2-managed data sets.

If a -TERM UTILITY command is issued after any renaming, or a restart of the REORG switch phase occurs after any renaming, the data set names revert back to their original form prior to the renaming:

4. The original data set from the shadow name to the temporary name
5. The shadow data set from the original name to the shadow name
6. The original data set from the temporary name to the original name

The context code indicates the specific type of error:

1. During the switch phase of REORG, on rename 1, REORG detected that a data set with a temporary name already exists. This error condition can arise for a DB2-managed or user-managed data set.
2. During the switch phase of REORG, on rename 2, REORG detected that a data set with a original name already exists. This error condition can arise for a DB2-managed or user-managed data set.
3. During the utility phase of REORG, on rename 3, REORG detected that a data set with a shadow name already exists. This error condition can arise for a user-managed data set.
4. During switch phase restart or a -TERM UTILITY during the switch phase, on rename 4 (while reverting back to the original name), -TERM UTILITY detected that a data set with a temporary name already exists. This error condition can arise for a DB2-managed or user-managed data set.
5. During switch phase restart or a -TERM UTILITY during the switch phase, on rename 5 (while reverting back to the original name), -TERM UTILITY detected that a data set with a shadow name already exists. This error condition can arise for a DB2-managed or user-managed data set.
6. During switch phase restart or a -TERM UTILITY during the switch phase, on rename 6 (while reverting back to the original name), -TERM UTILITY detected that a data set with a original name already exists. This error condition can arise for a DB2-managed or user-managed data set.
7. During initialization of REORG, REORG detected that a data set with a temporary name already exists. This error condition can arise for a DB2-managed or user-managed data set.

Severity: 8 (error)

System Action: For context code 1, or 2, the utility job step that caused the function to be requested abends with code 00E4031B. The utility job is placed in the stopped state.

For context code 3, the utility job step that caused the function to be requested continues without performing this renaming.

For context code 4, 5, or 6, the object is left in a recovery pending state, -TERM UTILITY continues to undo renaming, and a message is issued. The objects and messages are as follows:

- If the data set is part of a nonpartitioned table space, the object is the table space, and the message is DSNU562I.
- If the data set is part of a partitioned table space, the object is the partition, and the message is DSNU560I.
- If the data set is part of a nonpartitioned index, the object is the index, and the message is DSNU557I.
- If the data set is part of a partitioned index, the object is the partition of the index, and the message is DSNU559I.

For context code 8, REORG does not execute.

User Response: For context code 1 or 2, you can choose between these actions:

- Delete the data set; then RESTART the utility.
- TERM the utility. Delete the data set before trying to execute REORG again with SHRLEVEL REFERENCE or CHANGE.

For context code 3, if you want to perform the renaming, delete the data set with the shadow name and then perform the renaming.

For context code 4, 5, or 6, execute the RECOVER or REBUILD INDEX utility; then delete the shadow and temporary data sets (if they still exist).

For context code 8, delete the data set and then execute REORG.

---

DSNU361I csect-name FOREIGN KEY HAS NO PRIMARY KEY FOR RELATIONSHIP=r1 INPUT RECORD NUMBER=nnnn, RID=xrrr

Explanation: Input record nnnn caused a row to be loaded into table table at RID rrrr with no primary key for the relationship with the name r1.

Severity: 4 (warning)

System Action: Processing continues.
User Response: None required. The constraint violation described will be rectified later in processing.

**Explanation:** In execution of the REORG utility with SHRLEVEL CHANGE, if the value of MAXRO is DEFER, and the actual time for an iteration and the estimated time for the next iteration are both less than 5 seconds, then DB2 adds a 5 second pause to the next iteration. This pause limits the utility's consumption of processor time.

Within an execution of REORG, the first time that this situation occurs, DB2 produces this message, which announces the pause. On all later occurrences of this situation, DB2 still adds the pause, but DB2 sends the message only if DB2 has not sent the message (for this execution of REORG) within the past 30 minutes. This is a WTO message; it is sent to the console, but it is not an action message. It is not sent to SYSPRINT.

In a data sharing environment, `member-name` identifies the DB2 member. In a non-data-sharing environment, `member-name` is blank. `utilid` identifies the utility job step.

Severity: 0 (informational)

System Action: REORG continues execution, with a 5 second pause. If the conditions in the explanation above continue to be true, DB2 will continue adding 5 second pauses.

User Response: If you have been planning to wait for an appropriate time to execute the `-ALTER UTILITY` command to choose the value of MAXRO and thus cause REORG to finish, now might be an appropriate time. However, you are not required to take any action.

Operational Response: If you have been planning to wait for an appropriate time to execute the `-ALTER UTILITY` command to increase the value of MAXRO and thus cause REORG to finish, now might be an appropriate time. However, you are not required to take any action.

---

**Explanation:** This message is issued by the RELOAD phase of the LOAD utility. The message indicates that the LOAD utility is able to load partitions in parallel. The number of utility tasks used to load partitions is indicated by `nnn`.

Severity: 0

System Action: Processing of the RELOAD phase continues.

User Response: You can verify that the number of tasks reported is consistent with your expectations. For example, if 4 partitions are to be loaded, you might expect to see the number of tasks = 4.

---

**Explanation:** The REORG utility was run with SHRLEVEL CHANGE and a mapping table, but user `auth-id` does not have authority to delete, insert, select, and update in the mapping table specified in the utility statement.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Obtain authorization to delete, insert, select, and update in the mapping table specified in the utility statement.

---

**Explanation:** A mapping table was specified for a utility job executing REORG with SHRLEVEL CHANGE. However, the table has the wrong set of columns. This message can arise for any parameters of CREATE TABLE that are missing from, added to, or different from the CREATE TABLE statement that appears for the mapping table in the REORG section of the DB2 Guide and Reference.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Create a mapping table with the correct set of columns, and no other columns, as specified under REORG in the DB2 Utility Guide and Reference. Execute REORG.
**DSNU367I**

csect-name - ENFORCE PHASE
STATISTICS - n ROWS DELETED FROM
TABLE t

**Explanation:** This message reports the results of the
ENFORCE phase of the LOAD utility. Data rows added
during the RELOAD phase of the LOAD utility have
been deleted because they contained foreign keys
which did not have a corresponding primary key. A total
of n data rows were deleted from table t.

Primary errors may cascade and remove additional
records. The count is the sum of both primary and
secondary constraint violations.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** Determine why no primary key exists
for the deleted record.

**Problem Determination:** All primary errors are
accompanied by a DSNU361I message which identifies
the relationship and input record which does not have a
primary key value. The report phase will report all
secondary errors and indicate the primary error record
which caused this record to be deleted.

The relevant parent table can be found by querying the
SYSIBM.SYSRELS catalog table. The relevant columns
are found by querying the
SYSIBM.SYSFOREIGNKEYS catalog table.

**DSNU368I**
csect-name - REORG MAPPING TABLE
HAS WRONG INDEX

**Explanation:** A mapping table was specified for a
utility job executing REORG with SHRLEVEL CHANGE.
However, the table has the wrong index. This message
can arise for any parameters of CREATE INDEX that
are missing from, added to, or different from the
CREATE INDEX statement that appears for the
mapping table in the REORG section of [DB2 Utility
Guide and Reference](DB2 Utility Guide and Reference). It can also arise for the existence
of any other indexes on the mapping table.

**Severity:** 8 (error)

**System Action:** REORG does not execute.

**User Response:** Create a mapping table with the
correct index, and no other indexes, as specified under
REORG in [DB2 Utility Guide and Reference](DB2 Utility Guide and Reference). Execute
REORG.

**DSNU369I**
csect-name - ENFORCE PHASE
COMPLETE, ELAPSED TIME =
hh/mm/ss

**Explanation:** The ENFORCE phase of the LOAD
utility has completed normally. The elapsed time for the
execution was ‘hh’ hours, ‘mm’ minutes, and ‘ss’
seconds.

**Severity:** 0 (informational)

**DSNU370I**
csect-name - THE LOCAL FORMAT
OPTION HAS BEEN USED WITH A
DATE OR TIME AND NO LOCAL EXIT
HAS BEEN INSTALLED.

**Explanation:** The Installation Application Programming
Defaults Panel indicated that an exit for date or time
was supplied, but the exit supplied by DB2 was not
replaced.

**Severity:** 8 (error)

**System Action:** The statement cannot be executed.

**User Response:** Contact the system programmer
about installation of the date or time exit.

**System Programmer Response:** To replace the
DB2-supplied exit routine, an SMP USERMOD must
be applied. If an SMP USERMOD is undesirable, the
replacement module may be linked into a user library
either included in the MVS LINKLIST or concatenated to
the STEPLIB in the started task JCL for ssnmDBM1
(ssnm is the subsystem name).

**DSNU371I**
csect-name - REORG MAPPING
TABLE’S TABLE SPACE MUST BE
SEGMENTED

**Explanation:** REORG with SHRLEVEL CHANGE
specified a mapping table for a table space that is not
segmented. The table space that contains the mapping
table must be segmented.

**Severity:** 8 (error)

**System Action:** REORG does not execute.

**User Response:** Specify a mapping table that is in a
table space that is segmented.

**DSNU372I**
csect-name - CANNOT REORGANIZE
REORG MAPPING TABLE’S TABLE
SPACE

**Explanation:** REORG with SHRLEVEL CHANGE
specified a mapping table that resides in the table
space that is being reorganized. The table space that
contains the mapping table must not be the table space
that is being reorganized.

**Severity:** 8 (error)

**System Action:** REORG does not execute.

**User Response:** Specify a mapping table that is not in
the table space that is being reorganized.
DSNU373I  csect-name - IN -ALTER UTILITY OR REORG WITH SHRLEVEL REFERENCE OR CHANGE. DEADLINE HAS ALREADY OCCURRED, CONTEXT=c

Explanation: If a deadline is specified in the -ALTER UTILITY command or the REORG utility with SHRLEVEL REFERENCE or CHANGE, the deadline cannot occur before the time of execution of the -ALTER UTILITY or REORG that specified the deadline. Context codes are:

1  The error occurred on -ALTER UTILITY.
2  The error occurred on REORG.

Severity: 8 (error)
System Action: -ALTER UTILITY or REORG does not execute.
User Response: Execute -ALTER UTILITY or REORG with no deadline or with a deadline that has not already occurred. If you want to terminate an execution of REORG, use the -TERM UTILITY command.

DSNU373I  csect-name - REORG WITH SHRLEVEL REFERENCE or CHANGE HAS BEEN TERMINATED, REASON=c

Explanation: REORG with SHRLEVEL REFERENCE or CHANGE has been terminated.

1  REORG with SHRLEVEL CHANGE specified LONGLOG TERM, and at the end of an iteration of log processing, the number of log records that the next iteration would process is not sufficiently lower than the number that the previous iterations processed.
2  DB2 estimated that the switch phase of REORG with SHRLEVEL REFERENCE or CHANGE would not start by the deadline specified in the DEADLINE phrase.

Severity: 8 (error)
System Action: REORG terminates.
User Response: For reason code 1, attempt a new invocation of reorganization later, perhaps when you expect that the application workload is lower or the maximum desired amount of time for applications to have read-only access is longer.

For reason code 2 on SHRLEVEL CHANGE, attempt a new invocation of reorganization later, perhaps when you expect to have a longer time available, you expect that the application workload is lower, or you expect that the maximum desired amount of time for applications to have read-only access is longer. For reason code 2 on SHRLEVEL REFERENCE, attempt a new invocation of reorganization later, perhaps when you expect to have a longer time available.

DSNU375I  csect-name DISCARD PHASE STATISTICS - nnn INPUT DATA SET RECORDS DISCARDED

Explanation: Input data set records were rejected by the LOAD utility for one or several reasons. The rejected records have been placed in a discards data set. The number of records rejected is 'nnn'. Message DSNU399I summarizes the errors causing the records to be rejected.

Severity: 4 (warning)
System Action: Processing continues.
User Response: Examine the LOAD error summary and decide which of the discarded records, if any, should be corrected and reapplied to the table space.

DSNU376I  csect-name DISCARD PHASE COMPLETE, ELAPSED TIME = hh:mm:ss

Explanation: The DISCARD phase of the LOAD utility has completed normally. The elapsed time for the execution was 'hh' hours, 'mm' minutes, and 'ss' seconds.

Severity: 0 (informational)

DSNU377I  csect-name - IN REORG WITH SHRLEVEL CHANGE, THE LOG IS BECOMING LONG, MEMBER=member-name, UTILID=utilid

Explanation: During log processing for REORG with SHRLEVEL CHANGE, the number of log records that the next iteration will process is not sufficiently lower than the number that the previous iterations processed. This situation means that during reorganization, the log is not being read quickly enough to catch up to the application writing the log. This is a WTO message; it is sent to the console, but it is not an action message. It is also sent to SYSPRINT.

DB2 refrains from taking the action specified in the LONGLOG phrase if any one of the following events occurs for this execution of REORG before the delay expires:

- An -ALTER UTILITY command is issued.
- A -TERM UTILITY command is issued.
- DB2 estimates that the time to perform the next iteration will be less than or equal to the time specified in the MAXRO phrase.
- REORG terminates for any reason (including the deadline).

member-name
Identifies the DB2 member in a data sharing environment. Blank in a non-data-sharing environment.

utilid  Identifies the utility job step.
Severity: 4 (warning)

System Action: After a delay (specified by the DELAY phrase of the REORG utility or the -ALTER utility command), REORG performs the action specified by the LONGLOG phrase of the REORG utility or the -ALTER utility command.

User Response: No action is required. However, if the action specified by the LONGLOG phrase is not desired, the operator (or a user-written program that is triggered by the message) can take an action. For a list of possible actions, see the description of LONGLOG in the REORG section of DB2 Utility Guide and Reference.

Operator Response: No action is required. However, if the action specified by the LONGLOG phrase is not desired, the operator (or a user-written program that is triggered by the message) can take an action. For a list of possible actions, see the description of LONGLOG in the REORG section of DB2 Utility Guide and Reference.

---

**DSNU378I**

**csect-name - REORG WITH SHRLEVEL NONE HAS INAPPROPRIATE NOSYSREC KEYWORD, REASON=c**

Explanation: REORG with SHRLEVEL NONE allows the following combinations of the SORTDATA and NOSYSREC keywords:
- Neither keyword
- SORTDATA alone (without NOSYSREC)
- SORTDATA NOSYSREC

These combinations do not trigger this message. However, NOSYSREC alone (without SORTDATA) is inappropriate and triggers this message with a reason code of 1.

Also, for REORG with SHRLEVEL NONE, if you specify UNLOAD PAUSE, UNLOAD ONLY, or UNLOAD EXTERNAL, NOSYSREC is inappropriate and triggers this message with a reason code of 2. If the two conditions (omission of SORTDATA and inclusion of UNLOAD PAUSE, ONLY, or EXTERNAL) are both true, NOSYSREC triggers this message with a reason code of 2.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Specify an invocation of REORG with appropriate parameters. Specifically, for reason code 1, if you want to execute REORG with SHRLEVEL NONE, add SORTDATA and/or remove NOSYSREC. For reason code 2, if you want to execute REORG with SHRLEVEL NONE, remove NOSYSREC, UNLOAD PAUSE, UNLOAD ONLY, or UNLOAD EXTERNAL.

---

**DSNU379I**

**csect-name - ALTER utility, UTILID = utilid: SWITCH PHASE IN REORG HAS ALREADY STARTED, NO ALTER IS PERFORMED**

Explanation: The -ALTER utility command was applied to a job that is executing REORG with SHRLEVEL REFERENCE or CHANGE. However, nothing was altered, because REORG had already started its switch phase.

Severity: 4 (warning)

System Action: ALTER utility has no effect.

---

**DSNU380I**

**csect-name TABLESPACE database.tablespace-name PARTITION part-num IS IN COPY PENDING**

Explanation: An image copy is required to establish a new base from which the table space partition can be recovered. Otherwise, the results of running the RECOVER utility on that table space partition are unpredictable.

If the RECOVER TABLESPACE utility with the keyword TOCOPY is being used, the START_RBA or START_LRSN value of the associated full image copy might be outside the available recovery information. To verify this, look at the REPORT utility output. The RECOVER TABLESPACE utility will process the TOCOPY keyword and put the recovering object in copy pending status.

Severity: 4 (warning)

User Response: Take an image copy of the associated table space partition. If the message was issued after the COPY utility failed, correct all specified errors for the associated table space before attempting another image copy of that table space.

---

**DSNU381I**

**csect-name TABLESPACE database.tablespace-name IS IN COPY PENDING**

Explanation: This message is issued after:
- A LOAD or REORG utility with the LOG(NO) option left the associated table space in an unrecoverable state.
- An image copy failed because broken pages were detected or an image copy was terminated.
- A partial recovery finished successfully.
- A MODIFY RECOVERY left the associated table space in an unrecoverable state.

If the RECOVER TABLESPACE utility with keyword TOCOPY is being used, the START_RBA or START_LRSN value of the associated full image copy might be outside the available recovery information. To verify this, look at the REPORT utility output. The RECOVER TABLESPACE utility will
process the TOCOPY keyword and put the recovering object in copy pending status.

An image copy is required to establish a new base from which the table space can be recovered. Otherwise, the results of running the RECOVER utility on that table space are unpredictable.

Severity: 4 (warning)

User Response: Take an image copy of the associated table space. If the message was issued after the COPY utility failed, correct all specified errors for the associated table space before attempting another image copy on that table space.

**DSNU382I**

```plaintext
DSNU382I  csect-name - REORG UTILITY, UTILID = utilid REQUESTED TO ALTER, PHASE = utility-phase
```

Explanation: This message is issued in response to an -ALTER UTILITY command. It acknowledges that the request for alteration was received and verified. At the time the -ALTER UTILITY request was received, REORG was in the utility job step identified by UTILID utilid.

Severity: 0 (informational)

System Action: DB2 has accepted the request to alter the indicated utility job step. The utility alters its parameter values.

User Response: This message is an acknowledgement that the request has been accepted and is in progress.

**DSNU383I**

```plaintext
```

Explanation: This message applies only during the LOG phase of REORG with SHRLEVEL CHANGE. It supplements message DSNU105I which can appear in any phase (including the LOG phase).

This message is issued in response to a -DISPLAY UTILITY command.

It is also issued by the REORG utility if the user specified SHRLEVEL REFERENCE or CHANGE and DB2 estimates that the switch phase will not start by the deadline specified by the DEADLINE phrase. This message provides the user with an estimate of how far the REORG utility has proceeded in the indicated utility job step.

```
nnnnn  The current iteration number
www  'YES' or 'NO' according to whether write access is allowed in the current iteration of log processing

For the iteration before the previous iteration:

ha:ma:sa  The elapsed time for the iteration
nnnnna  The number of log records processed in the iteration.

These values are 00:00:00 and 0 if the current iteration number is 1 or 2.

For the previous iteration:

hb:mb:sb  The corresponding information.

nnnnnb  The corresponding information.

These values are 00:00:00 and 0 if the current iteration number is 1.

For the current iteration:

hc:mc:sc  The estimated elapsed time
hd:md:sd  The elapsed time so far
nnnnnd  The actual number of log records being processed

For the next iteration:

he:me:se  The currently estimated elapsed time
nnnnne  The currently estimated number of log records to be processed
```

Severity: 0 (informational)

System Action: The message reflects the state of DB2 at the time of the -DISPLAY UTILITY command or the time when DB2 estimated that the switch phase would not start by the deadline specified by the DEADLINE phrase.

If this message was issued for -DISPLAY UTILITY, the system continues processing. A subsequent -DISPLAY UTILITY command reflects that processing.
DSNU384I  csect-name - MAXRO = aaaaaaaaaa
SECONDS LONGLOG = llllllll DELAY = bbbbbbbbb SECONDS

Explanation: This message applies only to REORG with SHRLEVEL CHANGE. It supplements message DSNU105I, which can appear for any utility (including REORG).

This message is issued in response to a -DISPLAY UTILITY command.

It is also issued by the REORG utility if the user specified SHRLEVEL CHANGE and DB2 estimates that the switch phase will not start by the deadline specified by the DEADLINE phrase.

This message indicates the most recently specified values of certain parameters to REORG. For each such parameter, a previous invocation of the -ALTER UTILITY command might have specified a value. If no previous invocation of -ALTER UTILITY has specified a value, the most recently specified value is the value that was specified with the invocation of the REORG utility.

aaaaaaa
A number of seconds, according to the most recently specified value of MAXRO. A value of "DEFER" denotes that the log file will be deferred indefinitely.

llllll "CONTINUE," "TERM," or "DRAIN" according to the most recently specified value of LONGLOG

bbbbbbbbb
A number of seconds, according to the most recently specified value of DELAY

Severity:  0 (informational)

System Action: The message reflects the state of DB2 at the time of the -DISPLAY UTILITY command or the time when DB2 estimated that the switch phase would not start by the deadline specified by the DEADLINE phrase.

If this message was issued for -DISPLAY UTILITY, the system continues processing. If an -ALTER UTILITY command is then executed, a subsequent -DISPLAY UTILITY command reflects the results (if any) of the -ALTER UTILITY command.

DSNU385I  csect-name - LOG PHASE COMPLETE, ELAPSED TIME = hh/mm/ss

Explanation: This message is issued at the normal completion of the log phase of the REORG utility. The time that has elapsed between the beginning and the completion of this phase was:

<table>
<thead>
<tr>
<th>hh</th>
<th>hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>mm</td>
<td>minutes</td>
</tr>
<tr>
<td>ss</td>
<td>seconds</td>
</tr>
</tbody>
</table>

Severity:  0 (informational)

System Action: Processing continues to the next phase of the REORG utility.

DSNU386I  csect-name - LOG PHASE STATISTICS.
NUMBER OF ITERATIONS = iiiiiii,
NUMBER OF LOG RECORDS = rrrrrrr

Explanation: This message is issued at the normal completion of the LOG phase of the REORG utility.

iii The number of iterations of log processing that were performed. This number includes one or more iterations during which applications have read/write access plus one final iteration during which applications have read-only access.

rrrrrr The number of log records that were read.

Application of some of these log records might be unnecessary. Therefore, the LOG phase might apply only a subset of these log records to the shadow copy of the table space or partition.

Severity:  0 (informational)

System Action: The LOG phase of the REORG utility is completed.

DSNU387I  csect-name - SWITCH PHASE COMPLETE, ELAPSED TIME = hh/mm/ss

Explanation: This message is issued at the normal completion of the switch phase of the REORG utility. The time that has elapsed between the beginning and the completion of this phase was:

<table>
<thead>
<tr>
<th>hh</th>
<th>hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>mm</td>
<td>minutes</td>
</tr>
<tr>
<td>ss</td>
<td>seconds</td>
</tr>
</tbody>
</table>

Severity:  0 (informational)

System Action: Processing continues to the next phase of the REORG utility.

DSNU388I  csect-name - BUILD2 PHASE COMPLETE, ELAPSED TIME = hh/mm/ss

Explanation: This message is issued at the normal completion of the BUILD2 phase of the REORG utility. The time that has elapsed between the beginning and the completion of this phase was:

<table>
<thead>
<tr>
<th>hh</th>
<th>hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>mm</td>
<td>minutes</td>
</tr>
<tr>
<td>ss</td>
<td>seconds</td>
</tr>
</tbody>
</table>

Severity:  0 (informational)

System Action: Processing continues to the next utility statement in the utility job step, if any.
DSNU389I  csect-name - BUILD2 PHASE
STATISTICS. NUMBER OF NONPARTITIONED INDEXES = mmm
Explanation: This message is issued at the normal completion of the BUILD2 phase of the REORG utility.

Severity: 0 (informational)
System Action: The BUILD2 phase of the REORG utility is completed.

DSNU390I  csect-name INVALID CONVERSION FOR FIELD cccccccc
Explanation: The input field type for column, 'ccccccc', is incompatible with its data type (as found in the catalog).

Severity: 8 (error)
System Action: Utility processing is terminated.
User Response: Correct the error, and resubmit the job. Refer to DB2 Utility Guide and Reference for compatible data types.

DSNU391I  csect-name - SORTBLD PHASE
STATISTICS. NUMBER OF INDEXES = mmm
Explanation: This message is issued at normal completion of the SORTBLD phase of the LOAD, REORG, or REBUILD INDEX utility. The number of indexes that were built is indicated as mmm.

Severity: 0 (informational)
System Action: The SORTBLD phase of either the LOAD, REORG, or REBUILD INDEX utility is completed.

DSNU392I  csect-name - SORTBLD PHASE COMPLETE, ELAPSED TIME = hh:mm:ss
Explanation: This message is issued at the normal completion of the SORTBLD phase of the LOAD, REORG, and REBUILD INDEX utility. The time that has elapsed between the beginning of the phase and the completion of this phase was hh hours, mm minutes, and ss seconds.

Severity: 0 (informational)
System Action: Processing continues to the next phase of the LOAD, REORG, or REBUILD INDEX utility. If this is the last phase, processing continues to the next utility statement in the utility job step, if any.

DSNU393I  csect-name SORTBLD PHASE
STATISTICS - NUMBER OF KEYS = nnnnnnnn FOR INDEX index-name PART part-num
Explanation: This message is issued by the SORTBLD phase of the LOAD, REORG, or REBUILD INDEX utility to report the total number of index key entries used to build the indicated index partition.

Severity: 0 (informational)
System Action: This message indicates the number of index key entries for the index partition being built. Both unique and nonunique key entries are counted. Rejected key entries are not counted.
User Response: You can verify that the number reported is consistent with expectations.

DSNU394I  csect-name SORTBLD PHASE
STATISTICS. NUMBER OF KEYS = nnnnnnnn FOR INDEX index-name
Explanation: This message is issued by the SORTBLD phase of the LOAD, REORG, or REBUILD INDEX utility. The message is repeated for each index built by the LOAD, REORG, or REBUILD INDEX utility. It indicates the total number of index key entries used to build the indicated index. If the index is a partitioning index, the total will equal the sum of the number of index key entries reported in prior DSNU393I messages.

Severity: 0 (informational)
System Action: This message indicates the number of index key entries for the index being built. Both unique and nonunique key entries are counted. Rejected key entries are not counted.
User Response: You can verify that the number reported is consistent with expectations. For example, you can determine if it matches the number of records loaded for the table indexed by the indicated index, which will have been reported in a DSNU303I message issued during the RELOAD phase.

DSNU395I  csect-name INDEXES WILL BE BUILT IN PARALLEL, NUMBER OF TASKS = nnnn
Explanation: This message is issued by the RELOAD phase of the LOAD or REORG or UNLOAD phase of REBUILD INDEX utility. The message indicates that the LOAD, REORG, or REBUILD INDEX utility is able to build indexes in parallel. The number of utility tasks used to build the indexes is indicated by nnnn.

Severity: 0 (informational)
System Action: Processing of the RELOAD phase continues.
User Response: You can verify that the number of
tasks reported is consistent with expectations. For example, if 3 indexes are to be built, the user might expect to see number of tasks = 6.

DSNU396I  csect-name REPORT PHASE COMPLETE, ELAPSED TIME = hh/mm/ss  
Explanation: The REPORT phase of the LOAD utility has completed normally. The elapsed time for the execution was 'hh' hours, 'mm' minutes, and 'ss' seconds.  
Severity:  0 (informational)

DSNU397I  csect-name NUMBER OF TASKS CONSTRAINED BY xxxxxxxxx  
Explanation: This message indicates that while a utility is able to start subtasks to perform operations in parallel, the number of tasks it will use has been constrained by a lack of some resource. The constraining resource is specified by xxxxxxxxx, which can have the following values and meanings:  
VIRTUAL STORAGE  
The utility could start additional tasks, but there is insufficient virtual storage in the address space in which the utility job is running to make it effective to do so.  
VIRTUAL STORAGE BELOW  
The utility could start additional tasks, but there is insufficient virtual storage below the line in the address space in which the utility job is running to make it effective to do so.  
DD STATEMENTS  
The utility could start additional tasks, but the user has specified DD statements for the data sets to be used by SORT for sort work data sets or for sort message data sets, and fewer sort work data set groups or sort message data sets have been specified than the maximum number of tasks the utility could otherwise start.  
CONNECTIONS  
The utility could start additional tasks, but there are not enough free threads available to DB2 to do so.  
CPUS  
The utility could start additional tasks, but it would not be efficient to do so because it would overtax the available CPUs.  
Severity:  0 (informational)  
System Action:  Processing of the phase continues.  
User Response:  No action is required. However, if you want to increase the number of tasks used by the utility in order to reduce the elapsed time of the utility job, then the possible actions to take depend on the value of xxxxxxxxx in the message:  

VIRTUAL STORAGE  
Increase the amount of virtual storage available to the utility job by specifying a larger region size in the job JCL, altering the JES defaults for region size, or changing the system IEFUSI exit to allow a larger virtual region.  
If the utility is using BSAM data sets for which the number of buffers have been specified (BUFNO specified in the DCB field of the DD statement for the data set), consider reducing the number of buffers.  

VIRTUAL STORAGE BELOW  
If possible, increase the amount of virtual storage below the line available to the utility job by specifying a larger region size in the job JCL or reducing the number of data sets allocated in the job step. It might not be possible to relieve this constraint.  

DD STATEMENTS  
Define additional groups of sort work data sets, or eliminate the SWnWKmm DD statements and specify the SORTDEVT keyword (and, optionally, the SORTNUM keyword) to allow SORT to use dynamic allocation of its work data sets.  
If the limitation is due to sort message data sets rather than sort work data sets, define additional sort message DD statements or eliminate the UTPRINnn DD statements and allocate UTPRINT to SYSOUT so that the sort message data sets can be dynamically allocated.  

CONNECTIONS  
Increase the number of threads available to DB2, or submit the job during a period of reduced DB2 activity.  

CPUS  
Submit the job to a member that has more processors.  

DSNU398I  csect-name UNEXPECTED PROCESSING ERROR, REASON=X00E40318, ON TABLE ttttttt  
Explanation: When attempting to load a record into table 'tttttt', an error was encountered. Refer to Part 4, Section 4. DB2 Codes, on page 777 for an explanation of reason code '00E40318'.  
Severity:  8 (error)  
System Action:  If the error was caused by a resource not being available, a DSNT500I message is issued. The utility step is aborted with a system 'X04E' with an abend reason code of '00E40318'. If a DSNT500I message is not issued, an SVC dump is requested. A SYSABEND dump of batch storage is also requested. The utility step is left in the stopped state.
**User Response:** If a DSNT500I message was issued, refer to its description under that message number in this manual. If the unavailable resource becomes available, the utility step is restartable.

If a DSNT500I message is not issued, the error is an internal error. Notify the system programmer.

**Operator Response:** An operator with SYSOPR authority can issue a TERM UTIL to free any held resources (this may not be necessary).

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

---

### DSNU399I  csect-name - LOAD UTILITY ERROR SUMMARY REPORT

**Explanation:** This message summarizes errors detected during the load job. [Figure 1](https://www.ibm.com) shows the format of the report. It is issued only if unique index or referential constraint violations were detected. The report contains one line for each error. The errors are listed first by error severity and within that by idsm.

<table>
<thead>
<tr>
<th>Error Severity</th>
<th>Input Record</th>
<th>Discard Heading</th>
<th>Error Type</th>
<th>Table Name</th>
<th>Field/Fanset Name</th>
<th>Related Error</th>
</tr>
</thead>
<tbody>
<tr>
<td>sev</td>
<td>idsm</td>
<td>ddsrn</td>
<td>type</td>
<td>name1</td>
<td>name2</td>
<td>idsm2</td>
</tr>
<tr>
<td>:</td>
<td>:</td>
<td>:</td>
<td>:</td>
<td>:</td>
<td>:</td>
<td>:</td>
</tr>
</tbody>
</table>

*Figure 1. LOAD Utility Error Summary Report*

The Discard Heading is either DISCARD RECORD or blank, depending on whether discard processing is in effect.

The report fields have the following meanings:

- **sev** The severity of the error reported on this line:
  - 1 Primary
  - 2 Secondary

- **Type of Error**
  - Primary referential integrity errors and all nonreferential integrity errors.
  - Secondary referential integrity errors (that is, errors that result from a primary referential integrity error in an ancestor).

- **idsrn** The relative record number in the input data set of the record causing the error reported on this line.

- **ddsrn** The relative record number in the input data set of the record causing the error reported on this line, if discard processing is in effect. Otherwise, **ddsrn** is blank.

- **name1** The name of the table for which the record causing the error was targeted, if this information is pertinent for the type of error reported on this line. Otherwise, **name1** is blank. This field has nonblank values for the following error types:
  - Conversion
  - Validation
  - Column specification
  - Referential integrity (primary)
  - Check constraint

- **name2** The name of the field or fanset involved in the error reported on this line, if this information is pertinent for the type of error reported. Otherwise, **name2** is blank. This field contains a field name for the following types of errors:
  - Conversion
  - Field specification
  - Column specification

- **idsm2** The input data set record number of a related error. For duplicate key errors, it gives the input data set record number of the record whose key is duplicated. For secondary referential integrity errors, it gives the input data set record number of the record whose primary referential integrity error cascaded to cause this secondary error. For other types of errors, this field is unused.

**Severity:** 4 (warning)

**System Action:** Processing continues.

---

### DSNU400I  csect-name COPY PROCESSED FOR obj-type obj-qual.obj-name NUMBER OF PAGES=nnnnnn AVERAGE PERCENT FREE SPACE PER PAGE = ff.ff PERCENT OF CHANGED PAGES = pp.pp ELAPSED TIME= hh/mm/ss

**Explanation:** This is an informational message to report the copy statistics. This message is issued by the COPY utility, and it can also be issued from LOAD or REORG if a full image copy has been requested during a table space load or reorganization. The statistics...
apply to pages included in the scope of the COPY request. This can either be a full table space, full index space (DSNUM(ALL)) or a partition (DSNUM(integer)). All the pages in the table space, index space, or partition can be copied (FULL(YES)), or only the changed pages can be copied (FULL(NO)). The message variables are:

ff.ff The average percentage of free space within the copied pages. This indicates the amount of change activity that can occur without significant impairment of reference performance.

nnnnn The number of pages written out. Image copies produced during LOAD or REORG will have more pages written than a full image copy produced by running the COPY utility on the same table space, because some pages will be written more than once.

pp.pp The percentage of changed pages. This indicates the amount of change activity that occurred since the last image copy or reorganization. The percentage of changed pages is obtained by dividing the number of changed pages by the number of pages in the object. Preformatted pages consisting of all zeros are included in the count of pages scanned. Since these preformatted pages are not copied to the output data set, the number of pages scanned is usually larger than the number of pages copied.

When this message is issued for image copies produced during LOAD or REORG, this percentage will always be reported as 100%, because the utility is resetting and reformating the entire table space.

System Action: The COPY, LOAD or REORG utility continues processing this message is for information only. Message DSNU428I will be issued when the copy processing is complete.

User Response: Reported statistics could suggest that either a RUNSTATS or REORG utility should be run on the table space.

---

**DSNU401I**  
`csect-name CONCURRENT COPY COMPLETE, ELAPSED TIME= hh:mm:ss`

**Explanation:** The DFSMS Concurrent Copy utility completed normally.

**Severity:** 0 (informational)

**System Action:** Processing continues to the next utility statement in the utility job step. If there are no more utility statements, the utility job step is normally terminated, and the resources are released to their prior availability state. The utility identifier (UTILID) of the utility job step becomes available for reuse.

**User Response:** No action is required.

---

**DSNU402I**  
`csect-name INCREMENTAL IMAGE COPY DISALLOWED FOR obj-type obj-qual.obj-name FULL IMAGE COPY WILL BE TAKEN`

**Explanation:** An incremental image copy for a table space or data set was requested. However, a full image copy is required. Possible reasons include:

- The request was for one of the DB2-maintained table spaces DSNDB01.DB01, DSNDB06.SYSCOPY, or DSNDB01.SYSUTILX.
- A LOAD or REORG utility was run on the table space or data set with no subsequent full image copy.
- No full image copy was found for the requested sites.
- Copy pending status was set for the requested table space or data set.
- The request was for an entire table space, but the most recent image copy for the table space is on the data set level.
- The previous image copy is a DFSMS concurrent copy.

The request for an incremental image copy is ignored, and a full image copy is taken.

**Severity:** 4 (warning)

**System Action:** The request to take an incremental image copy is treated as a request to take a full image copy.

**User Response:** The capacity of the target image copy data set might not be sufficient if its size was established assuming an incremental image copy. If this condition occurs, terminate and then resubmit the job step.

---

**DSNU403I**  
`csect-name - FULL AND INCREMENTAL COPIES OF THE SAME TABLESPACE ON THE SAME TAPE DISALLOWED DDNAME ddbname`

**Explanation:** The COPY utility has been invoked to take an incremental image copy of a TABLESPACE. The specified output data set is on a tape which contains another FULL or INCREMENTAL image copy of the same TABLESPACE. This is not allowed.

**Severity:** 8 (error)

**System Action:** The utility will terminate with a return code of 8, and will not take the image copy or update the SYSCOPY table.

**User Response:** Change the VOLSER for the image copy output data set or use the MODIFY RECOVERY utility to delete SYSIBM.SYSCOPY records which are no longer needed for the same TABLESPACE and tape volume.

**Problem Determination:** Use the SQL SELECT command to look at the SYSIBM.SYSCOPY table. If the
conflicting image copy data sets on the output tape are no longer needed, use MODIFY RECOVERY to eliminate the related SYSIBM.SYSCOPY records. If the data sets are still needed, you must place the new image copy on a different tape or you must take a FULL image copy.

**DSNU404I**

`csect-name LOCAL SITE AND RECOVERY SITE INCREMENTAL IMAGE COPIES ARE NOT SYNCHRONIZED FOR obj-type obj-qual.obj-name`

**Explanation:** No incremental image copy can be made if

1. The incremental image copy is requested only for a site other than the current site.
2. The incremental image copies are requested for both sites but the most recent full image copy was made only for the current site.
3. The incremental image copies are requested for both sites and the most recent full image copies were made for both sites, but between the most recent full image copy and current request, all incremental image copies were made for current site only.

**Severity:** 8 (error)

**System Action:** The utility will terminate with a return code of 8, and will not take the image copy or update the SYSCOPY table.

**User Response:** Take another full image copy of the TABLESPACE for both LOCAL site and RECOVERY site or change the request to make incremental image copy only for current site.

**DSNU406I**

`FULL IMAGE COPY SHOULD BE TAKEN FOR BOTH LOCAL SITE AND RECOVERY SITE FOR obj-type obj-qual.obj-name`

**Explanation:** The requested full image is for one site only but history shows that there were image copies taken for both local site and recovery site and the table space is in copy pending status, or point in time recover has been done on the table space, or the table space is in copy pending status and the requested full image copy is for a site other than the current site. Be aware of the following situations:

1. If the requested copy is made for current site, then the other site can only do point in time recovery.
2. If the requested copy is for the site other than the current site, then the TABLESPACE will be in the same state as before COPY has been made.

**Severity:** 4 (warning)

**System Action:** COPY, LOAD, or REORG utility will continue to process the image copy.

**DSNU407I**

`csect-name - DATA SET ALREADY USED FOR PREVIOUS IMAGE COPY`

**Explanation:** A COPY, LOAD, or REORG utility has been invoked to take an image copy to a data set which is a duplicate of one already recorded in SYSCOPY. If the specified data set is cataloged, a matching DSNAME exists. If the specified data set is not cataloged, a matching DSNAME, DSVOLSER, and FILESEQNO exists.

**Severity:** 8 (error)

**System Action:** The utility will terminate with a return code of 8, and will not take the image copy or update the SYSCOPY table.

**User Response:** Change the name of the data set or use MODIFY utility to delete the old SYSCOPY record containing the duplicate data set.

**DSNU408I**

`csect-name - dsn EXISTS WITH -VOLUME=vol, FILE SEQUENCE-NUMBER=fseq, RBA=rba, lrsn, DATE=date, TIME=time`

**Explanation:** If this message is issued after DSNU403I, it provides information from the SYSCOPY catalog table about the previously created image copy of the table space. If this message is issued after DSNU407I, it provides information from the SYSCOPY table about the duplicate data set that was detected during image copy processing.

For copies to DASD or MSS, fseq is 0; for copies of cataloged data sets, vol is (CATG).

**Severity:** 8 (error)

**System Action:** The utility terminates with return code 8 and does not take the image copy or update the SYSCOPY table.

**User Response:** Use the information provided to change the name of the data set or to locate the duplicate SYSCOPY record for deletion with the MODIFY RECOVERY utility.

**DSNU409I**

`csect-name NO hardware-or-software SUPPORT FOR obj-type obj-qual.obj-name`

**Explanation:** This message is issued by the COPY or RECOVER utility for one of the following reasons. For

- The COPY utility was invoked to take a DFSMS concurrent copy of a table space or index space that
resides on a device with no hardware or software support for the DFSMSdss DUMP command with the CONCURRENT option.

- The RECOVER utility invoked the DFSMSdss RESTORE command without the supporting software.

Severity: 4 (for RECOVER) or 8 (for COPY)

System Action: The RECOVER utility falls back to the previous image copy data set and continues. The COPY utility job terminates.

User Response: If a list of objects is specified in the COPY job, remove the object that has no hardware or software support from the list. Resubmit the job or use the DB2 COPY utility instead of the DFSMS Concurrent Copy utility.

---

**DSNU410I**  
`csect-name obj-type obj-qual.obj-name CONTAINED NO CHANGED PAGES`

Explanation: An incremental image copy (COPY option FULL(NO)), which copies only changed pages, was requested. However, no changed pages were found.

Severity: 4 (warning)

This message reflects a warning condition that did not prevent subsequent processing.

System Action: This message indicates normal completion of the image copy utility. Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources are released to their prior availability state. The UTILID of the utility job step becomes available for reuse.

Because no output was produced, the SYSIBM.SYSCOPY catalog table remains unchanged.

The requestor may want to determine why the apparent assumption that a change occurred was not true.

Operator Response: The target copy data set identified by the DD statement nominated by the COPY COPYYDDN option was not required. It was not tracked in the DB2 catalog table SYSIBM.SYSCOPY. It need not be kept for subsequent re-call.

---

**DSNU411I**  
`csect-name UNABLE TO LOGICALLY COMPLETE obj-type obj-qual.obj-name RETURN CODE return-code REASON CODE reason-code`

Explanation: The DFSMSdss DUMP command with the CONCURRENT option encountered an error during the initialization of the target object being copied. The return code and reason code are from the DFSMSdss DUMP command.

Severity: 8

System Action: The utility job terminates.

User Response: Issue a -DISPLAY DATABASE command with the USE option to determine if any other DB2 systems hold a retained lock on the table space or index space. If so, you must restart that DB2 system before the COPY job can be successfully run.

---

**DSNU412I**  
`csect-name UNABLE TO PHYSICALLY COMPLETE obj-type obj-qual.obj-name RETURN CODE return-code`

Explanation: The DFSMSdss DUMP command with the CONCURRENT option encountered an error during the backup process. The return code is from the DFSMSdss DUMP command.

Severity: 8

System Action: The utility job terminates.

User Response: See the return code description in z/OS DFSMSdss Storage Administration Reference to determine the problem. Resubmit the job after resolving the problem, or use the DB2 Copy utility instead of the DFSMS Concurrent Copy utility for the failed object.

---

**DSNU413I**  
`csect-name - CONCURRENT COPY SUCCESSFUL FOR obj-type obj-qual.obj-name`

Explanation: The DFSMS Concurrent Copy utility completed normally for the named object. This message is repeated for every copied object in the list.

Severity: 0 (informational)

System Action: Processing continues to the next object in the list. If there are no more objects, the utility ends normally with message DSNU401I.

User Response: No action is required.

---

**DSNU414I**  
`csect-name UNABLE TO RETRIEVE RESTART/REDO LRSN obj-type obj-qual.obj-name`

Explanation: This message is issued by the DB2 COPY utility when an error is encountered during the retrieval of a log record sequence number (LRSN).

This error can occur in these situations:

- Another DB2 in a data sharing group terminated abnormally while trying to update the table space or index space.
- A failure occurred while trying to communicate with other DB2s in the data sharing group.

Severity: 8

System Action: The utility job terminates.

User Response: Issue a -DISPLAY DATABASE command with the USE option to determine if any other DB2 systems hold a retained lock on the table space or index space (status = RSTRT). If so, you must restart that DB2 system before the COPY job can be successfully run.
DSNU415I  csect-name INVALID OUTPUT BLOCK SIZE SPECIFIED DDNAME ddname
Explanation: Valid block sizes for an image copy or merge copy data set are multiples of 4KB and less than the device limitation.

Severity: 8 (error)
System Action: Utility processing is terminated.
User Response: Correct the JCL statement, or use the default. Resubmit the request in a new utility job step. Refer to "DB2 Utility Guide and Reference" for a discussion of image copy and work data set constraints.

DSNU416I  csect-name THE OUTPUT IMAGE COPY DATA SET CANNOT BE PARTITIONED. DDNAME ddname
Explanation: The use of partitioned image copy data sets is restricted. The COPY, MERGECOPY, LOAD, or REORG utility job that was submitted has a partitioned output image copy data set, specified by the COPYDDN ddname parameter.

Severity: 8 (error)
System Action: Utility processing is terminated. The image copy will not be taken or the merge will not be done, and the SYSIBM.SYSCOPY table will not be updated.
User Response: Correct the utility job by specifying a nonpartitioned data set as the output image copy data set.

DSNU417I  csect-name THE NUMBER OF VOLUMES USED BY THE IMAGE COPY DATA SET data-set-name HAS REACHED THE LIMIT
Explanation: The image copy data set reached the limit of 255 volumes and another volume is required.

Severity: 8 (error)
System Action: The utility job is terminated.
User Response: You might want to use the DSNUM option of the COPY utility to identify a partition or data set within the table space to be copied, or specify a partition number to be loaded or reorganized if the copy is being produced from a LOAD or REORG. Refer to "DB2 Utility Guide and Reference" for a description of the COPY utility and the DSNUM option, and descriptions of the LOAD and REORG utilities and the PART option.

DSNU418I  csect-name CANNOT TAKE IMAGE COPY AT DATASET LEVEL FOR NONPARTITIONED TABLESPACE obj-qual.obj-name IN COPY PENDING STATUS
Explanation: An image copy at the data set level was requested. However, it is not allowed for one of the following reasons:
- The table space is in copy pending status.
- The table space is not suitable for image copy at the data set level.

A copy of the entire table space is required.

Severity: 8 (error)
System Action: The COPY utility completes unsuccessfully with return code 8.
System Programmer Response: You must take a full image copy of the entire table space by specifying the DSNUM ALL option with the COPY utility.

DSNU420I  csect-name INCORRECT SHARE LEVEL SPECIFIED FOR TABLE SPACE database-name.tablespace-name DSNUM dsnum
Explanation: When copying a table space that is not recoverable, the share level (SHRLEVEL) must be REFERENCE.

If the object is an entire table space, 'DSNUM dsnum' is not displayed.

Severity: 8 (error)
System Action: Utility processing is terminated.
User Response: Correct the SHRLEVEL to REFERENCE, and resubmit the COPY utility in a new utility job step. Refer to "DB2 Utility Guide and Reference" for a discussion of COPY utility constraints.

DSNU421I  csect-name - START OF DFSMS MESSAGES
Explanation: This message indicates the beginning of the DFSMS messages; DSNU422I indicates the end.

System Action: No action is required, but subsequent DFSMS messages might require action. See the DFSMS message manual.

DSNU422I  csect-name - END OF DFSMS MESSAGE
Explanation: This message indicates the end of the DFSMS messages; DSNU421I indicates the beginning.

System Action: No action is required, but preceding DFSMS messages might require action. See the DFSMS message manual.
**DSNU423I**  csect name CANNOT TAKE CONCURRENT COPY WITH SHRLEVEL CHANGE OPTION FOR obj-type obj-qual.obj-name WITH GREATER THAN 4KB PAGE SIZE

**Explanation:** The DFSMS Concurrent Copy utility is serialized at the extent level. The greater than 4KB page size condition might span more than one extent. This might cause the output data set to contain inconsistent data.

**Severity:** 8 (error)

**System Action:** The COPY utility completes unsuccessfully with return code 8.

**System Programmer Response:** You must take a concurrent copy with the SHRLEVEL REFERENCE option or a DB2 image copy if you prefer the SHRLEVEL CHANGE option.

Convert the data set attribute Control Interval size of the associated tablespace from the 4K Control Interval into the one that matches the page size. DB2 Utilities REORG Tablespace, LOAD with REPLACE, and RECOVER can be used to convert the table space.

---

**DSNU424I**  csect-name INCOMPATIBLE MAINTENANCE DETECTED. REFERENCE APAR NUMBER apar DO THE FOLLOWING:

**Explanation:** This message indicates that there is a maintenance incompatibility detected across restart. This message is followed by the actions the user should take to resolve the incompatibility.

**apar** The number of the APAR with closing text that describes the incompatibility.

**System Action:** Utility execution is abended.

**User Response:** Refer to the action text in the message.

**System Programmer Response:** Refer to the APAR closing text.

---

**DSNU425I**  csect-name obj-type obj-qual.obj-name DOES NOT HAVE THE COPY YES ATTRIBUTE

**Explanation:** The utility cannot process the identified index or index space because it was not defined with the COPY YES attribute. Without the COPY YES attribute, the index cannot be specified as a target for the RECOVER, COPY, or REPORT utilities. If the index needs to be rebuilt from the data in the table space, use the REBUILD INDEX utility instead.

**Severity:** 4 (warning) or 8 (error)

**System Action:** The RECOVER utility terminates processing with a return code of 8. The COPY utility skips this object but continues processing the other objects in the list. The final COPY utility return code will be 8. The REPORT utility issues this message with a return code of 4 and continues processing other objects (if any).

**User Response:** Determine whether the index should be altered to have the COPY YES attribute. If so, alter the index then rerun the utility job. Otherwise remove the index from the utility statement.

---

**DSNU426I**  csect-name CANNOT COPY ONE PIECE OF NON-PARTITIONING obj-type obj-qual.obj-name

**Explanation:** The copy of a nonpartitioning index at the data set level is not allowed.

**Severity:** 8 (error)

**System Action:** The COPY utility skips this object but continues processing the other objects in the list. The final COPY utility return code will be 8.

**User Response:** Either remove the DSNUM option so that it defaults to DSNUM(ALL) or modify your DSNUM option to DSNUM(ALL).

---

**DSNU427I**  csect-name OBJECTS WILL BE PROCESSED IN PARALLEL, NUMBER OF OBJECTS = nnnn

**Explanation:** This message is issued by COPY or RECOVER utilities. The message indicates that COPY or RECOVER is able to process the objects in the list in parallel. The number of objects used is indicated by nnnn.

**Severity:** 0 (informational)

**System Action:** Processing of the utility continues.

**User Response:** You can verify that the number of objects processed is consistent with expectations.

---

**DSNU428I**  csect-name DB2 IMAGE COPY SUCCESSFUL FOR obj-type obj-qual.obj-name

**Explanation:** The image copy of the object processed by the COPY, LOAD, or REORG utility has completed successfully and the image copy data set information has been recorded in the SYSIBM.SYSCOPY catalog table.

**System Action:** The COPY utility continues its processing on the next object in the list. The LOAD and REORG utilities continue processing in the subsequent phases.
DSNU429I  csect-name RECOVERY OF objecttype
database-name.tablespace-name MUST
BE EXECUTED AT THE PARTITION
LEVEL

Explanation: You must recover the partitioned object
at the partition level. You may receive this message if
you are using COPY with the CONCURRENT option.
The use of online REORG (SHRLEVEL REFERENCE
or CHANGE) with the FASTSWITCH YES option
has created a mixture of '0001' and '0001' instance nodes
(fifth qualifier) for the underlying LDS’s for the partitions
of this object.

Severity: 0 (informational)

System Action: Utility processing continues.

DSNU430I  csect-name - ERROR ALLOCATING
TEMPORARY FILTER FOR obj-type
obj-qual.obj-name DSN=DSN
CODE=X'reason-code'

Explanation: SVC 99 returned an error during the
dynamic allocation of a temporary filter data set. This
message is followed by text that explains the
reason-code that is shown.

The COPY utility was specified with the CONCURRENT
option, and has detected that the number of data sets
to be processed will exceed the DFSMSdss DUMP
command limitation of 255. The utility will dynamically
allocate a temporary filter data set for the object and
generate a DFSMSdss DUMP command with the FILT
option.

Severity: 8 (error)

System Action: Utility processing halts for this object.
The utility job completes with a return code of 8.

If the utility job step includes an OPTIONS control
statement with the EVENT(ITEMERROR,SKIP) option,
the utility will process the next item in the list.

User Response: Correct the error that is preventing
dynamic allocation, and resubmit the utility job. In some
cases where dynamic allocation may not be possible,
consider using the FILTERDDN option on the COPY
utility statement.

DSNU431I  csect-name - ERROR ALLOCATING
TEMPORARY FILTER FOR obj-type
obj-qual.obj-name DSNUM=DSNUM
CODE=X'reason-code'

Explanation: An error returned during the dynamic
allocation of a temporary filter data set. This message is
followed by text that explains reason-code.

The RECOVER utility was run with the
CURRENTCOPYONLY option and has detected that the
number of data sets to be processed exceeds the
DFSMSdss RESTORE command limitation of 255. DB2
dynamically allocates a temporary filter data set for the
object and generates a DFSMSdss RESTORE
command with the FILT option.

Severity: 8 (error)

System Action: If the utility job step includes an
OPTIONS control statement with the
EVENT(ITEMERROR,SKIP) option, the utility processes
the next item in the list. Otherwise, utility processing
stops with return code of 8.

User Response: Correct the error that prevents
dynamic allocation and resubmit the utility job. If
dynamic allocation is not possible, remove be possible,
remove the CURRENTCOPYONLY option on the
RECOVER utility statement.

DSNU432I  csect-name - ERROR DURING DFDSS
RESTORE OBJECT FOR obj-type
obj-qual.obj-name. THE OBJECT IS NOT
RECOVERED

Explanation: The RECOVER utility received an error
notification from DFds on object obj-qual.obj-name.
The object has not been restored, but recovery of the
other objects continues.

Severity: 4 (warning)

System Action: RECOVER processes the other
objects.

When RECOVER completes, it displays all objects for
which CURRENTCOPYONLY was specified.

User Response: Remove the CURRENTCOPYONLY
keyword from the utility control statements.

DSNU433I  csect-name - TEMPLATE
TEMPLATE-NAME HAS THE STACK
YES OPTION, WHICH IS NOT
SUPPORTED FOR CONCURRENT
COPY.

Explanation: The COPY utility attempted to execute a
concurrent copy, using a TEMPLATE statement that
contains the STACK YES option.

Severity: 8 (error)

System Action: If the utility job step includes an
OPTIONS control statement with the
EVENT(ITEMERROR,SKIP) option, the utility processes
the next item in the list. Otherwise, utility processing
stops with return code of 8.

User Response: Remove the STACK YES option from
the TEMPLATE Statement, then resubmit the COPY
job. Use the FILTERDDN option on the COPY
statement to dump multiple objects to a concurrent copy
dump data set.
DSNU440I  csect-name IMAGE COPY
INFORMATION

Explanation: This message gives statistical information about the results of running the COPY utility. It applies to a table space, partition, or data set, and is based on the information in the space page map at the time the utility is executed. The output contains the following information:

DBNAME
The name of the database to which the table space belongs.

TSNAME
The table space specified in the utility statement.

DSNUM
The partition or data set number of the table space. The value is ALL if information is about the entire table space.

nnKB PAGES
The total number of nnKB pages in the partition, data set, or entire table space. This value includes preformatted pages that contain all zeroes.

EMPTY PAGES
The total number of empty pages in the data set of the segmented table space, or entire segmented table space. Empty pages can result from deletes, or are pages that are not yet formatted. They are not copied by the utility.

CHANGED PAGES
The number of pages in the partition, data set, or table space that were changed since the last time an image copy was created. If an incremental image copy is taken, this value is the number of pages that are copied.

PERCENT OF CHANGED PAGES
The percent of changed pages in the table space, data set, or partition specified.

ICTYPE
The type of image copy recommended for the partition, data set, or table space specified. ICTYPE is based on the comparison between the percent of changed pages and the change limit values. ICTYPE values:

| I | If the percent of changed pages is greater or equal to the low CHANGELIMIT value and less than the high CHANGELIMIT value. An incremental image copy is recommended, or COPY takes one if the REPORTONLY option is not specified. |
| F | If the percent of changed pages is equal to or greater than the high CHANGELIMIT value. A full image copy is recommended, and COPY takes one if the REPORTONLY option is not specified. |

NONE If no pages were changed. An image copy is not recommended, and COPY does not take one.

blank For the partition or data set if DSNUM ALL is specified, or if CONCURRENT is specified and the percent of changed pages is less than the CHANGELIMIT value.

Severity: 0 (informational)

System Action: Utility processing continues

User Response: If the message indicates, “INFORMATION CANNOT BE DETERMINED” for a table space, partition, or data set, examine the utility output for the DSNU441I message which lists the page numbers of the broken pages. See message DSNU441I for further instructions on repairing pages.

DSNU441I  csect-name BROKEN PAGE FOUND
DBNAME = dbname TSNAME = tsname
DSNUM = dnum PAGE = page

Explanation: The COPY utility found a broken space map page.

dbname
The name of the database to which the table space belongs.

tsname
The table space containing the broken page.

dnum
The partition or data set number of the table space containing the broken page.

page The hexadecimal page number of the broken page.

Severity: 8 (error)

System Action: Utility execution continues.

User Response: The data sets identified are in an indeterminate state. Use RECOVER, RECOVER PAGE, or the REPAIR utility to correct the broken page. Refer to Part 2 of DB2 Diagnosis Guide and Reference for more information.

DSNU442I  csect-name CHANGELIMIT REPORT
INFORMATION UNAVAILABLE FOR
obj-type obj-qual.obj-name WITH TRACKMOD NO

Explanation: This message is issued in response to a COPY utility. The CHANGELIMIT option cannot produce statistical information for a table space or a partition that is defined with TRACKMOD NO, or before a copy has been taken after the TRACKMOD attribute has been changed from NO to YES.

Chapter 19. DB2 messages 547
Severity: 4 (informational)

System Action: If REPORTONLY is not specified then a full image copy will be taken.

User Response: To obtain complete statistical information run CHANGELIMIT REPORTONLY after a copy has been taken.

```
DSNU443I  csect-name type CHANGE LIMIT MET FOR obj-type obj-qual.obj-name
```

Explanation: The COPY utility is indicating whether the percent of changed pages in the specified table space, partition, or data set meets the CHANGELIMIT values. Type values:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO</td>
<td>If no CHANGELIMIT met.</td>
</tr>
<tr>
<td>INCREMENTAL</td>
<td>If the percent of changed pages is greater than the low CHANGELIMIT value and less than the high CHANGELIMIT value.</td>
</tr>
<tr>
<td>FULL</td>
<td>If the percent of changed pages is greater than or equal to the the high CHANGELIMIT value.</td>
</tr>
</tbody>
</table>

Severity: The return codes are:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>(informational) If no CHANGELIMIT was met.</td>
</tr>
<tr>
<td>2</td>
<td>(informational) If the percent of changed pages is greater than the low CHANGELIMIT and less than the high CHANGELIMIT value.</td>
</tr>
<tr>
<td>3</td>
<td>(informational) If the percent of changed pages is greater than or equal to the high CHANGELIMIT value.</td>
</tr>
</tbody>
</table>

System Action: Utility processing continues.

User Response: If the REPORTONLY option is specified and the result of this job step is not used to conditionally execute other job steps, examine the utility messages for this table space, partition, or data set to determine if it has changed to such a degree that an image copy or other step should be performed.

```
DSNU445I  csect-name ictype IMAGE COPY WILL BE TAKEN FOR obj-type obj-qual.obj-name
```

Explanation: The COPY utility is indicating whether the percent of changed pages in the table space meets the change limit value, and whether an image copy will be taken. Ictype values:

<table>
<thead>
<tr>
<th>Ictype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO</td>
<td>If no CHANGELIMIT value met.</td>
</tr>
<tr>
<td>INCREMENTAL</td>
<td>If the percent of changed pages is greater than the low CHANGELIMIT value and less than the high CHANGELIMIT value.</td>
</tr>
</tbody>
</table>

Severity: If the percent of changed pages is greater than or equal to the high CHANGELIMIT value.

```
DSNU446I  csect-name - CHANGELIMIT REPORT INFORMATION UNAVAILABLE FOR obj-type obj-qual.obj-name, A FULL IMAGE COPY MUST BE TAKEN
```

Explanation: The changelimit dataset statistical information was requested, but is unavailable. A full image copy is required. Possible reasons are as follows:

- The request was for one of the DB2-maintained table spaces: DSNDB01.DBD01, DSNDB06.SYSCOPY, or DSNDB01.SYSSUTILX.
- A LOAD or REORG utility was run on the table space or data set with no subsequent full image copy.
- No full image copy was found for the requested sites.
- Copy pending status was set for the requested table space or data set.
- The request was for an entire table space, but the most recent image copy for the table space is on the data set level.
- The previous image copy is a DFSMS concurrent copy.

The statistical information report will not be generated. If REPORTONLY was omitted, then a FULL image copy is taken.

Severity: 4 (warning)

System Action: The request for CHANGELIMIT without REPORTONLY is treated as a request to take a full image copy. The request for CHANGELIMIT with REPORTONLY will not generate the report.

User Response: If REPORTONLY is specified, then submit a job to take a full image copy.

```
DSNU454I  csect-name COPY MERGE COMPLETE. NUMBER OF COPIES = iiiii, NUMBER OF COPIES MERGED = ccccccc, TOTAL NUMBER OF PAGES MERGED = ttttt, ELAPSED TIME = hh/mm/ss
```

Explanation: This message marks the normal completion of the MERGECOPY utility. The variables are:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iiiii</td>
<td>The number of copies found.</td>
</tr>
</tbody>
</table>
| ccccccc  | The number of image copies that were merged. The number merged can be less than

548  Messages and Codes
The number found if a work data set was not specified using the MERGECOPY WORKDDN option.

The total number of pages that were merged.

The merged incremental copies were consolidated either into a single new incremental image copy or into a new full image copy, depending upon the MERGECOPY NEWCOPY option. The DB2 catalog table SYSIBM.SYSCOPY was updated to reflect the results.

This message may indicate that prior data set entries were deleted and, consequently, that backup data set resources were freed.

Severity: 0/4 (informational/warning)

System Action: Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources are released to their prior availability state. The UTILID of the utility job step becomes available for reuse.

User Response: You can review the reported statistics to assess the effectiveness of performing incremental image copies. You can examine the SYSIBM.SYSCOPY catalog table to review the incremental and full image copies that are subject to DB2 recovery.

The full or incremental image copy data set identified by the DD statement specified in the COPYDDN option was recorded in SYSIBM.SYSCOPY. DB2 assumes that the image copy data set is now available for subsequent recovery. Ensure that the data set is available for recovery.

**DSNU459I**

SYSCOPY P RECORD ENCOUNTERED
FOR obj-type obj-qual.obj-name, PIT RBA = xxxxxx

Explanation: The utility encountered a SYSCOPY P record which requires that the SYSCOPY record at the given RBA or LRSN be used. The utility properly traverses the SYSCOPY records following this SYSCOPY P record.

Severity: 0 (informational)

User Response: For further information on how the SYSCOPY records are traversed, see Part 4 (Volume 1) of [DB2 Administration Guide](https://www.ibm.com). A severe 4 condition is given to alert the user that processing did not proceed as defined. However, processing is proceeding; nothing was encountered that would invalidate further processing.

System Action: This message indicates the completion of the MERGECOPY utility. Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources that were held become available for reference processing. The UTILID of the utility job step becomes available for reuse.

The requester may want to determine why the assumption that incremental copies existed was not true.

**Operator Response:** The target copy data set identified by the DD statement nominated by the MERGECOPY COPYDDN option was not required. It was not tracked in the DB2 catalog table SYSIBM.SYSCOPY. It need not be kept for subsequent re-call.

**DSNU460I**

csect-name IMAGE COPIES INCONSISTENT. MERGECOPY REQUEST REJECTED

Explanation: MERGECOPY was requested for an entire table space. However, the most recent image copy for the associated table space was on the data set level. In addition, if the associated table space was partitioned, this might indicate that any or all of its partitions were being reorganized or loaded without logging after the MERGECOPY starting point. The MERGECOPY starting point is the most recent full image copy for the entire table space.

Severity: 4 (warning)

A severity 4 condition is given to alert the user that processing did not proceed as defined. However, processing is proceeding; nothing was encountered that would invalidate further processing.

System Action: This message indicates the completion of the MERGECOPY utility. Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources that were held become available for reference processing. The UTILID of the utility job step becomes available for reuse.

No output was produced and the SYSIBM.SYSCOPY catalog table remains unchanged.

User Response: A full image copy of the associated table space should be taken. However, if it is preferred...
DSNU461I - DSNU471I

that a recovery be done on the data set level, a MERGECOPY job should be submitted by specifying 'DSNUM(data set number)' for each data set for which MERGECOPY is required.

DSNU461I  csect-name PRIMARY FULL COPY DATA SET NOT FOUND, BACKUP WILL BE USED INSTEAD

Explanation: The primary full image copy cannot be found. The backup full image copy will be located and used for the merge process.

Severity: 0 (informational)

User Response: If the MERGECOPY utility can use the backup full image copy, the utility continues to process. If no backup full image copy can be used, the utility terminates.

DSNU462I  csect-name MERGECOPY DISALLOWED FOR REQUESTED TABLE SPACE

Explanation: MERGECOPY was requested for table space DSNDB01.DB01, DSNDB01.SYSCOPY, or DSNDB06.SYSCOPY. MERGECOPY is not permitted for one of the following reasons:

- Only full image copies are allowed on these DB2-maintained tables.
- There is no record of the full image copies in the SYSIMB.SYSCOPY catalog; the copy information is in the DB2 log.

Severity: 8 (error)

System Action: Further utility processing is terminated.

System Programmer Response: Refer to Part 4 (Volume 1) of the [DB2 Administration Guide] for more information about MERGECOPY utility constraints.

DSNU463I  csect - THE xxxxxxx IMAGE COPY DATA SET data-set-name WITH DATE=ddddddd AND TIME=ttttt, IS PARTICIPATING IN MERGECOPY.

Explanation: This informational message indicates the image copy that is used in the merge process. The variables have the following meanings:

- xxxxxxx: PRIMARY or BACKUP, indicating a primary or backup image copy
- data-set-name: The image copy data set name
- ddddd: The image copy date
- ttttt: The image copy time

Severity: 0 (informational)

User Response: The utility continues to process normally.

DSNU464I  THIS IS A sitetype; outputtype WITH NEWCOPY NO IS NOT ALLOWED.

Explanation: The 'NEWCOPY NO' option to create incremental image copies is not supported for the current site. This error can be caused by:

- Running the MERGECOPY utility at sitetype LOCALSITE, but selecting the RECOVERYDDN with the 'NEWCOPY NO' option.
- Running the MERGECOPY utility at sitetype RECOVERYSITE, but selecting the COPYDDN with the 'NEWCOPY NO' option.

Severity: 8 (error)

System Action: The command cannot be executed.

User Response: Correct the error and resubmit the job. Refer to [DB2 Utility Guide and Reference] for detailed information.

DSNU470I  TABLESPACE DSNDB01.SYSCOPY, ITS TABLES AND INDEXES CANNOT BE INCLUDED IN A LIST OF OBJECTS.

Explanation: This message is issued by the running utility when a control statement contains a list of objects, or references a LISTDEF, which includes any of the following SYSCOPY related objects: TABLESPACE DSNDB01.SYSCOPY, INDEXSPACE DSNDB01.DSNLUX01, INDEXSPACE DSNDB01.DSNLUX02, TABLE SYSDM.SYSCOPY, TABLE SYSDM.SYSCUTIL, TABLE SYSDM.SYSCUTILX, INDEX SYSDM.DSNLUX01 or INDEX SYSDM.DSNLUX02.

Severity: 8 (error)

System Action: The utility job terminates.

User Response: Remove the invalid object from the control statement and run the utility against DSNDB01.SYSCOPY, its tables and indexes separately.

DSNU471I  csect-name - COPY PENDING ON TABLESPACE databasename.tablespacename PROHIBITS PROCESSING

Explanation: An attempt was made to execute a utility against a table space. Either the table space was in copy pending state or DSNDB06.SYSCOPY was in copy pending state.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Remove the table space from the copy pending state and resubmit the job.

Problem Determination: Refer to Part 4 (Volume 1) of
**DB2 Administration Guide** for a discussion of the database recovery function.

---

**DSNU472I**

`csect-name - TABLESPACE tablespace-name HAS WRITE ERROR RANGE OR IS IN DEFERRED RESTART.`

**Explanation:** The attempt to externalize table space 'tablespace-name' pages to the media has failed.

**Severity:** 4 (warning)

**System Action:** QUIESCE still continues but you cannot make an image copy of the table space. Processing continues for all indexes within the table space and continues to the next table space in the tablespace-list, if any.

**User Response:** Run DISPLAY DATABASE to determine what exception state, if any, would prevent image copy on the table space.

**Problem Determination:** Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of the database recovery function.

---

**DSNU473I**

`csect-name - UNABLE TO EXTERNALIZE TABLESPACE tablespace-name PAGES`

**Explanation:** The attempt to externalize TABLESPACE 'tablespace-name' pages to the media has failed.

**Severity:** 4 (warning)

**System Action:** QUIESCE still continues but the table space cannot be volume-dumped.

**Problem Determination:** The problem may be an I/O error.

---

**DSNU474I**

`csect-name - QUIESCE AT RBA rrrrrrrrr AND AT LRSN xxxxxxxxxx`

**Explanation:** This message displays the log RBA and LRSN at the time of the quiesce. This value is unique for all quiesced table spaces in the list and is recorded in the START_RBA column of the SYSCOPY catalog table entry for each quiesced table space in the list.

**Severity:** 0 (informational)

**System Action:** Processing continues.

---

**DSNU475I**

`csect-name - QUIESCE UTILITY COMPLETE, ELAPSED TIME=tttttt`

**Explanation:** The message marks the normal completion of the QUIESCE utility. The elapsed clock time that the QUIESCE utility uses is shown by 'tttttt'.

**Severity:** 0 (informational)

**System Action:** Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources are released to their prior available state. The UTILID of the utility job step becomes available for reuse.

---

**DSNU476I**

`csect-name - INDEX index-name HAS WRITE ERROR RANGE OR IS IN DEFERRED RESTART`

**Explanation:** The attempt to externalize index 'index-name' pages to the media failed.

**Severity:** 4 (warning)

**System Action:** QUIESCE processing continues.

**User Response:** Issue the DISPLAY DATABASE command to determine the exception state.

**Problem Determination:** Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of the database recovery function.

---

**DSNU477I**

`csect-name - QUIESCE SUCCESSFUL FOR obj-type obj-qual.obj-name`

**Explanation:** The QUIESCE for this object was successful. If the object is a table space, then the quiesce for all of its indexes was successful. This message will also be issued for each index with the COPY YES attribute over the quiesced table space. This message will be repeated for every quiesced table space in list.

**Severity:** 0 (informational)

**System Action:** All data held in the DB2 buffer pool(s) for the table space and its indexes have been written out to the media if no message DSNU473 or DSNU479 were issued earlier. A SYSCOPY record of ICTYPE 'Q' has been recorded in the SYSCOPY catalog table for the table space and for each of its indexes with the COPY YES attribute. The START-RBA value in the SYSCOPY record(s) is the same for all objects quiesced during this invocation of the utility. This RBA/LRSN value will be printed in the message DSNU474 following this message. Processing continues to the next table space in the table space list, if any.

---

**DSNU478I**

`csect-name - INDEX index-name HAS PENDING STATE`

**Explanation:** Index 'index-name' has a PENDING state. This message is repeated for all PENDING stated indexes in a table space.

**Severity:** 8 (error)

**System Action:** QUIESCE stops processing but continues to check all table spaces and indexes for any additional table space or index that has a PENDING state. There is no update in SYSCOPY table for any table space in the list.

**User Response:** Issue the DISPLAY DATABASE
command to look at the utility status byte in the DBA table for a specified PENDING state.

**Problem Determination:** Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of the database recovery function.

---

**DSNU479I**

csect-name - UNABLE TO EXTERNALIZE INDEX index-name PAGES

**Explanation:** The attempt to externalize index 'index-name' pages to the media has failed.

**Severity:** 4 (warning)

**System Action:** QUIESCE still continues but the table space cannot be volume-dumped.

**Problem Determination:** The problem might be an I/O error.

---

**DSNU480I**

csect-name - UNABLE TO EXTERNALIZE TABLESPACE 'tablespace-name' PARTITION partition-number PAGES

**Explanation:** The attempt to externalize TABLESPACE 'tablespace-name' PARTITION 'partition-number' pages to the media failed.

**Severity:** 4 (warning)

**System Action:** QUIESCE still continues, but the table space cannot be volume-dumped.

**Problem Determination:** The problem might be an I/O error.

---

**DSNU481I**

csect-name - QUIESCE SUCCESSFUL FOR obj-type obj-qual.obj-name PARTITION partition

**Explanation:** The QUIESCE for PARTITION 'partition-number' of this object was successful. If the object is a table space partition, then the quiesce for all of its indexes was successful. This message will also be issued for each index with the COPY YES attribute over the quiesced table space. This message is repeated for every quiesced table space in the list.

**Severity:** 0 (informational)

**System Action:** All data held in the DB2 buffer pool(s) for the table space and its indexes have been written out to the media if message DSNU480 or DSNU482 was not issued earlier. A SYSCOPY record of ICTYPE 'O' was recorded in the SYSCOPY catalog table for the table space and for each of its indexes with the COPY YES attribute. The START-RBA value in this SYSCOPY record is the same for all objects quiesced during this invocation of the utility. This RBA value is printed in message DSNU474 following this message. Processing continues to the next table space in the table space list, if any.

---

**DSNU482I**

csect-name - UNABLE TO EXTERNALIZE INDEX index-name PARTITION partition-number PAGES

**Explanation:** The attempt to externalize index 'index-name' 'partition-number' pages to the media failed.

**Severity:** 4 (warning)

**System Action:** QUIESCE still continues, but the table space cannot be volume-dumped.

**Problem Determination:** The problem might be an I/O error.

---

**DSNU483I**

csect-name - TABLESPACE 'tablespace-name' PARTITION partition-number HAS WRITE ERROR RANGE OR IS IN DEFERRED RESTART.

**Explanation:** The attempt to externalize table space 'tablespace-name' partition 'partition-number' pages to the media failed.

**Severity:** 4 (warning)

**System Action:** QUIESCE still continues, but you cannot make an image copy of the table space or partition. Processing continues for the index partition and all nonpartitioned indexes within the table space, and then proceeds to the next table space in the table space list, if any.

**User Response:** Issue DISPLAY DATABASE to determine what exception state, if any, would prevent image copy on the table space or partition.

**Problem Determination:** Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of the database recovery function.

---

**DSNU484I**

csect-name - INDEX index-name PARTITION partition-number HAS WRITE ERROR RANGE OR IS IN DEFERRED RESTART

**Explanation:** The attempt to externalize index 'index-name' pages partition 'partition-number' pages to the media failed.

**Severity:** 4 (warning)

**System Action:** QUIESCE processing continues.

**User Response:** Issue DISPLAY DATABASE to determine the exception state.
